The LINQ to SQL can be used as the data source of the Grid. And the Object Relation class which is used to map with Relational table, can be used as the type of the Grid to leverage the Data Annotation.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<OrdersView>("Grid")
.Datasource((IEnumerable<OrdersView>)ViewBag.datasource)
.AllowPaging()
.Columns(col =>
{
col.Field(p => p.OrderID).HeaderText("Order
ID").TextAlign(TextAlign.Right).Add();
col.Field(p => p.CustomerID).HeaderText("Customer ID").Add();
col.Field(p => p.EmployeeID).HeaderText("Employee
ID").TextAlign(TextAlign.Right).Add();
col.Field(p =>
p.Freight).HeaderText("Freight").Format("{0:C2}").TextAlign(TextAlign.Right)
.Add();
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
})
```

C#

```
namespace Grid.Controllers
{
public class HomeController : Controller
{
public ActionResult Index()
{
ViewBag.datasource = new NorthwindDataContext().OrdersViews.ToList();
return View();
}
}
}
```

The following output is displayed as a result of the above code example.

Order ID	Customer ID	Employee ID	Freight
10643	ALFKI	6	$29.46
10692	ALFKI	4	$61.02
10702	ALFKI	4	$23.94
10835	ALFKI	1	$69.53
10952	ALFKI	1	$40.42
11011	ALFKI	3	$1.21
10926	ANATR	4	$39.92
10759	ANATR	3	$11.99
10625	ANATR	3	$43.90
10308	ANATR	7	$1.61
10365	ANTON	3	$22.00
10507	ANTON	7	$47.45

1 2 3 4 5 6 7 8 ... 1 of 70 pages (830 items)

ITypedList Binding

ITypedList provides functionality to discover the schema for a binding list, where the properties available to bind differ from the public properties of the object to bind.

To implement ITypedList binding, create a generic type named class that derives from ITypedList interface. Define the named class based on properties descriptor of the Grid Model class, to return list according to the custom implementation.

Create a collection of ITypedList and bind it to Grid using DataSource property.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.dataSource)
.AllowPaging()
.Columns(col =>
{
col.Field("OrderID").Add();
col.Field("CustomerID").Add();
col.Field("Freight").Add();
col.Field("ShipCountry").Add();
col.Field("ShipCity").Add();
})
)
```

C#

```
[Serializable()]
public class SortableBindingList<T> : BindingList<T>, ITypedList
{
[NonSerialized()]
private PropertyDescriptorCollection properties;
public SortableBindingList()
: base()
{
// Get the 'shape' of the list.
// Only get the public properties marked with Browsable = true.
PropertyDescriptorCollection propertyDescriptorCollection =
TypeDescriptor.GetProperties(
typeof(T),
new Attribute[] { new BrowsableAttribute(true) });
// Sort the properties.
properties = propertyDescriptorCollection.Sort();
}
public PropertyDescriptorCollection GetItemProperties(PropertyDescriptor[]
listAccessors)
{
PropertyDescriptorCollection propertyDescriptorCollection;
if (listAccessors != null && listAccessors.Length > 0)
{
// Return child list shape.
propertyDescriptorCollection =
ListBindingHelper.GetListItemProperties(listAccessors[0].PropertyType);
}
else
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
{
// Return properties in sort order.
propertyDescriptorCollection = properties;
}
return propertyDescriptorCollection;
}
// This method is only used in the design-time Framework
// and by the obsolete DataGrid control.
public string GetListName(PropertyDescriptor[] listAccessors)
{
return typeof(T).Name;
}
}
namespace EJGrid.Controllers
{
public class HomeController : Controller
{
public ActionResult Index()
{
var data = OrderRepository.GetAllRecords();
SortableBindingList<EditableOrder> order = new
SortableBindingList<EditableOrder>();
foreach (var temp in data)
{
order.Add(temp);
}
ViewBag.dataSource = order;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.

See Also

For more information on ITypedList interface please refer to this link.

Complex Binding

The Grid can display nested or navigation properties in the column that would provide the way to display the field from another entity. The complex property can be provided in the Field property builder either as string value concatenated by dot or using lambda Expression.

Note: 1. To use lambda Expression, the Grid should be associated with some business object and Field definition using lambda expression will not work for dynamic object.

2. To display navigation properties using complex binding, the corresponding property should be eager loaded. Lazy loading is not supported for complex binding.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<Person>("Grid")
.Datasource((IEnumerable<Person>)ViewBag.datasource)
.Columns(col =>
{
col.Field(p => p.FirstName).HeaderText("First
Name").TextAlign(TextAlign.Left).Add();
col.Field(p => p.LastName).HeaderText("Last
Name").TextAlign(TextAlign.Left).Add();
col.Field(p =>
p.Designation.Position).HeaderText("Designation").TextAlign(TextAlign.Left).
Add();
col.Field(p => p.Email).HeaderText("Email").TextAlign(TextAlign.Left).Add();
})
)
```

C#

```
namespace Grid.Controllers
{
public class HomeController : Controller
{
public ActionResult Index()
{
List<Person> Persons = new List<Person>();
Persons.Add(new Person() { FirstName = "John", LastName = "Beckett", Email =
"john@syncfusion.com", Designation = new Designation{ Position = "Manager"
} });
Persons.Add(new Person() { FirstName = "Ben", LastName = "Beckett", Email =
"ben@syncfusion.com", Designation = new Designation{ Position = "Asst.
Manager" } });
Persons.Add(new Person() { FirstName = "Andrew", LastName = "Beckett", Email
= "andrew@syncfusion.com", Designation = new Designation{ Position =
"Engineer"  } });
ViewBag.datasource = Persons;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.

Copyright © 2001 - 2020 Syncfusion Inc.

First Name	Last Name	Designation	Email
John	Beckett	Manager	john@syncfusion.com
Ben	Beckett	Asst. Manager	ben@syncfusion.com
Andrew	Beckett	Engineer	andrew@syncfusion.com

Waring: A navigation property that represents the "many" end of a relationship cannot be specified using lambda expression. Instead Field name can be provide as string in such as case.

WCF DataService / OData Service

WCF Data Services is a component of the .NET Framework that enables you to create services that use the Open Data Protocol (OData) to expose and consume data over the Web or intranet by using the semantics of representational state transfer (REST).

To consume WCF DataService in Grid control, provide the service link directly to the Grid DataSource property.

We have an online OData Service http://js.syncfusion.com/demos/ejServices/Wcf/Northwind.svc/Orders created specifically for Syncfusion Controls

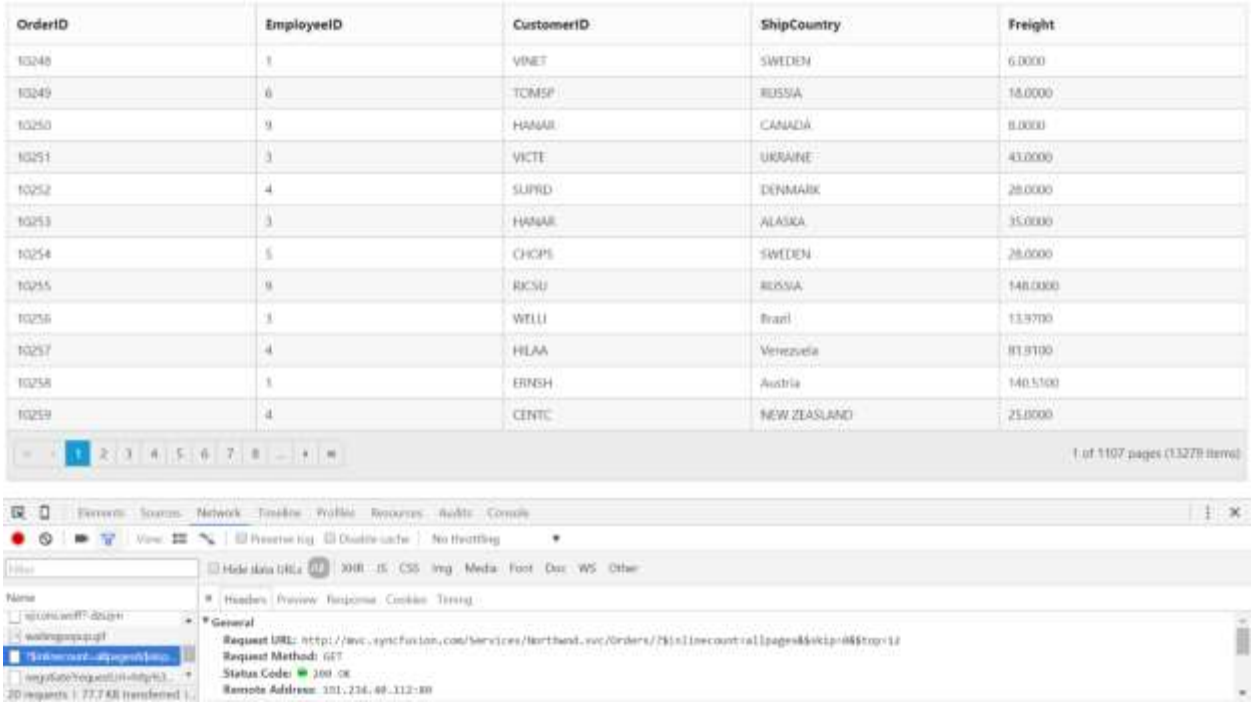
The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<object>("FlatGrid")
.Datasource("http://js.syncfusion.com/demos/ejServices/Wcf/Northwind.svc/Orders")
.AllowPaging()
.Columns(col =>
{
col.Field("OrderID").Add();
col.Field("EmployeeID").Add();
col.Field("CustomerID").Add();
col.Field("ShipCountry").Add();
col.Field("Freight").Add();
})
)
```

The following output is displayed as a result of the above code example.

Copyright © 2001 - 2020 Syncfusion Inc.



See Also

To create WCF Data Service in your web application refer here.

ODataV4 Service

ODataV4Adaptor is used for consuming data from OData V4 Service. To consume OData V4 service, set the service link to the URL property of Grid DataSource and set AdaptorType.ODataV4Adaptor to the Adaptor Property of Grid DataSource

Waring: ODL supports to parse the $search query option, however, Web API OData doesn't support it so far.

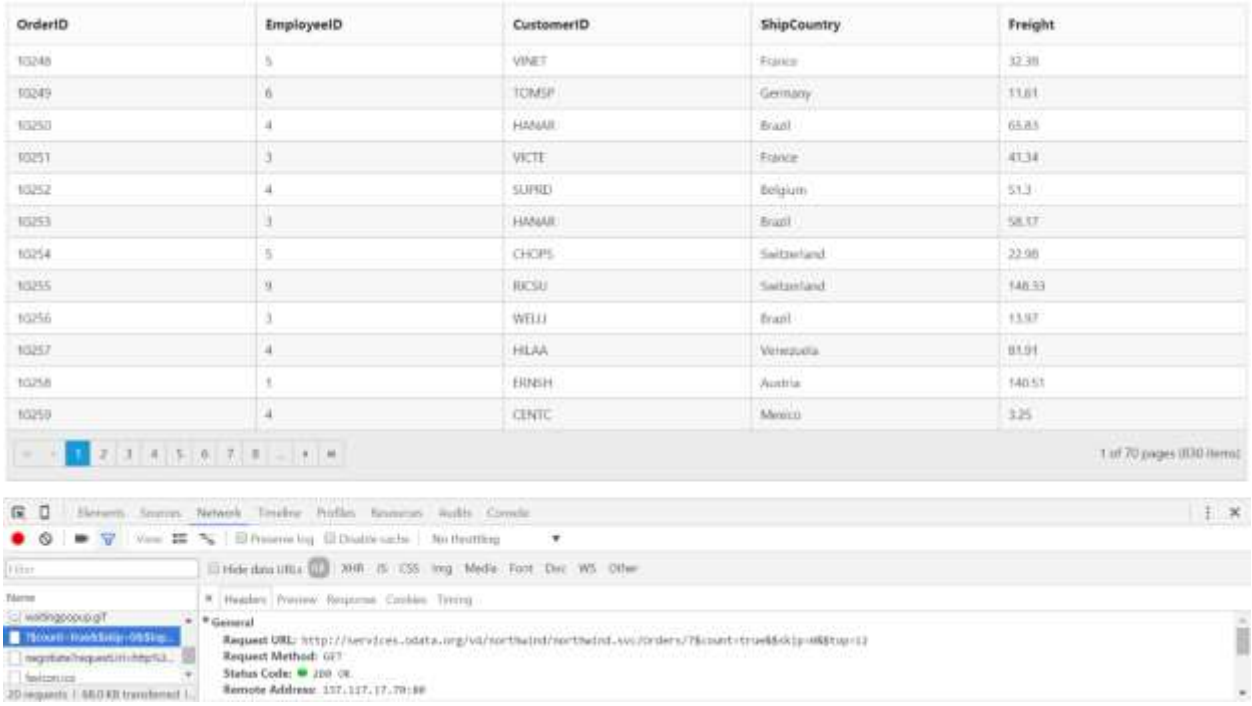
The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<object>("FlatGrid")
.Datasource(datasource =>
datasource.URL("http://services.odata.org/v4/northwind/northwind.svc/Orders"
).Adaptor(AdaptorType.ODataV4Adaptor))
.AllowPaging()
.Columns(col =>
{
col.Field("OrderID").Add();
col.Field("EmployeeID").Add();
col.Field("CustomerID").Add();
col.Field("ShipCountry").Add();
col.Field("Freight").Add();
})
)
```

The following output is displayed as a result of the above code example.

Copyright © 2001 - 2020 Syncfusion Inc.



Web API Service

Web API Adaptor is used for processing request and response messages from Web API Service.

To consume Web API service, set the service link to the URL property of Grid DataSource and you can set adaptor type as AdaptorType.WebApiAdaptor to the Adaptor Property of Grid DataSource

Information: The datasource from Web API service must be returned as object that has property Items with its value as datasource and another property Count with its value as datasource's total records count.

DataOperation queries such as sorting, filtering, etc., would be sent to Web API Service corresponding to Grid actions performed and they need to be handled manually as Web API Service does not process it by default.

Note: In ASP.NET core default casing as camelCase.So, we need to return the data as JSON and the JSON object must contain a property as result with dataSource as its value and one more property count with the dataSource total records count as its value.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<object>("FlatGrid")
.Datasource(datasource =>
datasource.URL("/api/Orders").Adaptor(AdaptorType.WebApiAdaptor))
.AllowPaging()
.Columns(col =>
{
col.Field("OrderID").Add();
col.Field("EmployeeID").Add();
col.Field("CustomerID").Add();
col.Field("ShipCountry").Add();
```

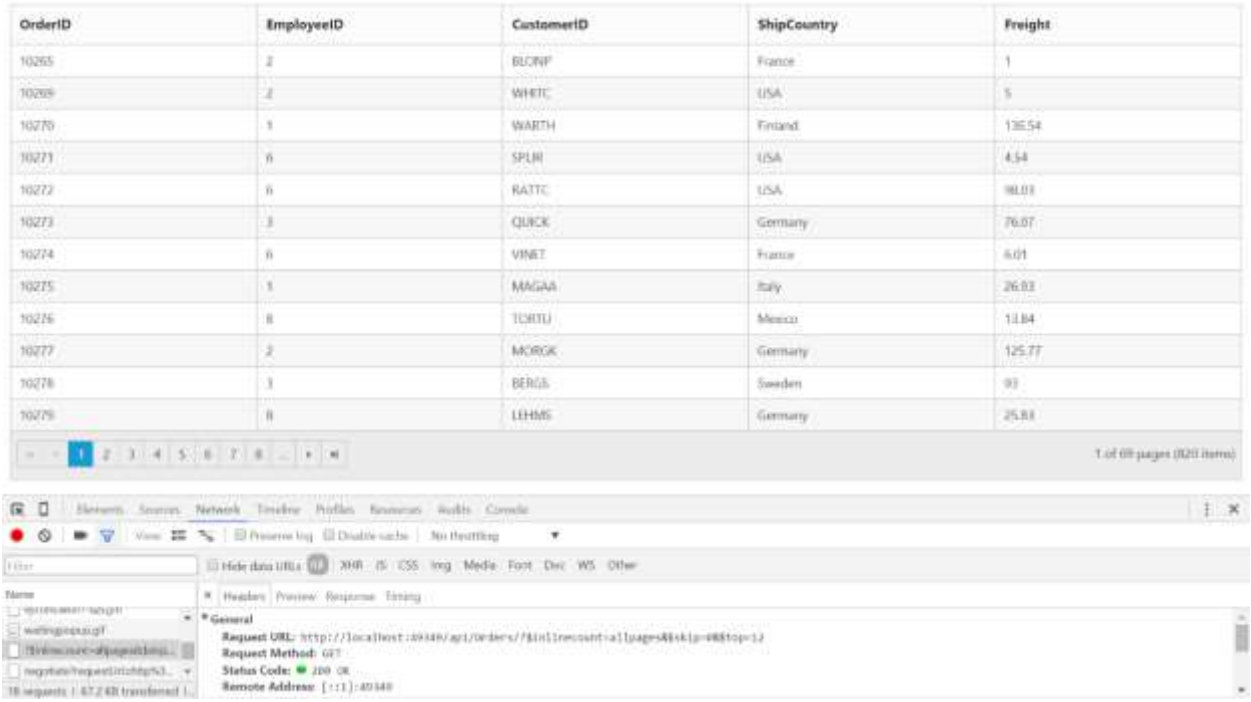
Copyright © 2001 - 2020 Syncfusion Inc.

```
col.Field("Freight").Add();
})
)
```

C#

```
namespace EJGrid.Controllers
{
public class OrdersController: ApiController
{
// GET: api/Orders
NORTHWNDEntities db = new NORTHWNDEntities();
public object Get()
{
var queryString = HttpContext.Current.Request.QueryString;
int skip = Convert.ToInt32(queryString["$skip"]);
int take = Convert.ToInt32(queryString["$top"]);
var data = db.Orders.ToList();
return new { Items = data.Skip(skip).Take(take), Count = data.Count() };
}
}
}
```

The following output is displayed as a result of the above code example.



HTML Table binding

HTML table can be set as a data source for grid. The ID of the HTML table should be assigned to the `Table` property of the `DataSource` API.

Information: HTML table is the only valid element to use through `DataManager`.

Copyright © 2001 - 2020 Syncfusion Inc.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<object>("Grid")
.Datasource(datasource => datasource.Table("#GridTable"))
.Columns(col =>
{
col.Field("Laptop").HeaderText("Laptop").TextAlign(TextAlign.Left).Add();
col.Field("Model").HeaderText("Model").TextAlign(TextAlign.Left).Add();
col.Field("Price").HeaderText("Price").Add();
col.Field("OS").HeaderText("OS").TextAlign(TextAlign.Left).Add();
col.Field("RAM").HeaderText("RAM").TextAlign(TextAlign.Left).Add();
col.Field("ScreenSize").HeaderText("Screen size").Add();
})
)
```

JS

```
<script id="GridTable" type="text/template">
<table>
<thead>
<tr>
<th>Laptop</th>
<th>Model</th>
<th>Price</th>
<th>OS</th>
<th>RAM</th>
<th>ScreenSize</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dell Vostro</td>
<td>2520</td>
<td>39990</td>
<td>Windows 8</td>
<td>4GB</td>
<td>15.6</td>
</tr>
<tr>
<td>HP Pavilion Sleekbook</td>
<td>14-B104AU</td>
<td>22800</td>
<td>Windows 8</td>
<td>2GB</td>
<td>14</td>
</tr>
<tr>
<td>Sony Vaio</td>
<td>E14A15</td>
<td>42500</td>
<td>Windows 7 Home Premium</td>
<td>4GB DDR3 RAM</td>
<td>14</td>
</tr>
<tr>
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
<td>Lenovo</td>
<td>Yoga 13</td>
<td>57000</td>
<td>Windows 8 RT</td>
<td>2GB DDR3 RAM</td>
<td>11.6</td>
</tr>
<tr>
<td>Toshiba</td>
<td>L850-Y3110</td>
<td>57700</td>
<td>Windows 8 SL</td>
<td>8GB DDR3 RAM</td>
<td>15.6</td>
</tr>
</tbody>
</table>
</script>
```

The following output is displayed as a result of the above code example.

Laptop	Model	Price	OS	RAM	Screen size
Dell Vostro	2520	$39,990.00	Windows 8	4GB	15.6
HP Pavilion Sleek	14-B104AU	$22,800.00	Windows 8	2GB	14
Sony Vaio	E14A15	$42,500.00	Windows 7 Hom	4GB DDR3 RAM	14
Lenovo	Yoga 13	$57,000.00	Windows 8 RT	2GB DDR3 RAM	11.6
Toshiba	L850-Y3110	$57,700.00	Windows 8 SL	8GB DDR3 RAM	15.6

Miscellaneous

Load On Demand

By default, Grid with remote data binding will work in On-Demand concept for which either Paging or VirtualScrolling feature should be enabled in Grid. It helps improving performance of loading a large data set.

The following code example describes the above behavior.

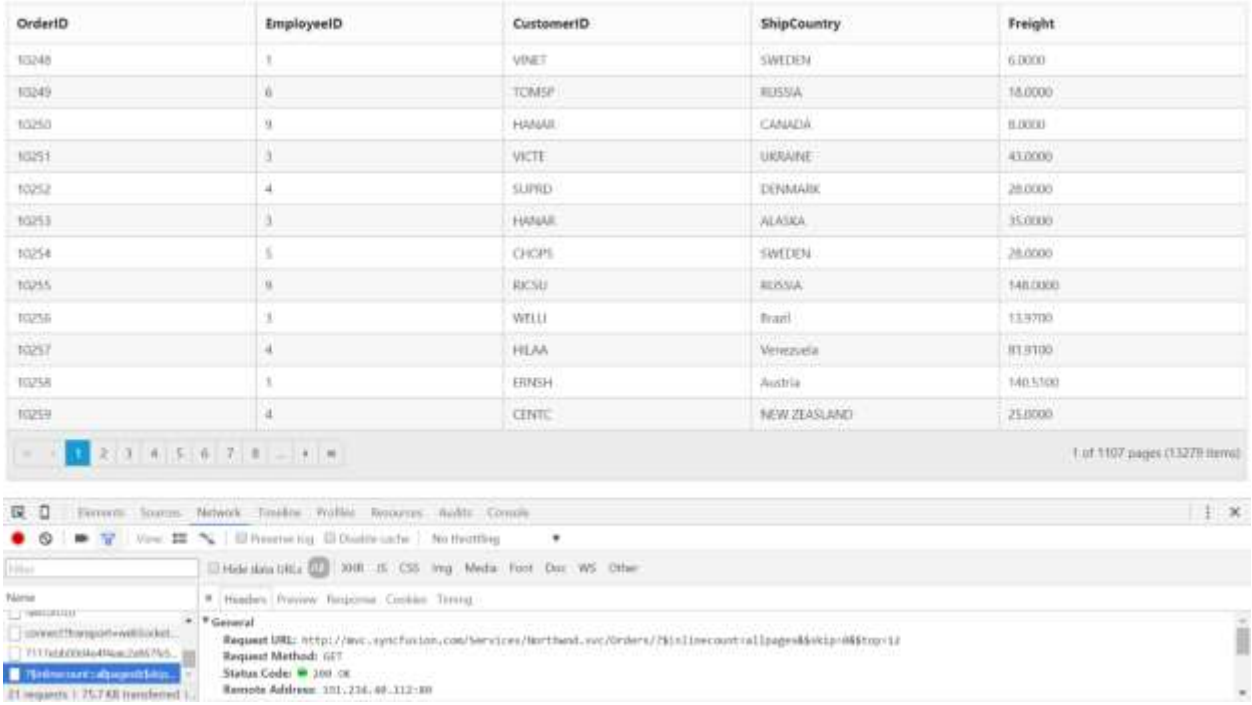
RAZOR

```
@(Html.EJ().Grid<object>("FlatGrid")
.Datasource("http://js.syncfusion.com/demos/ejServices/Wcf/Northwind.svc/Orders")
.AllowPaging()
.Columns(col =>
{
col.Field("OrderID").Add();
col.Field("EmployeeID").Add();
col.Field("CustomerID").Add();
col.Field("ShipCountry").Add();
col.Field("Freight").Add();
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
})
)
```

The following output is displayed as a result of the above code example.



Load at once

Load at once concept in Grid can be used to load all data from remote service at a single request and all further Grid action will be performed at client-side on the cached data.

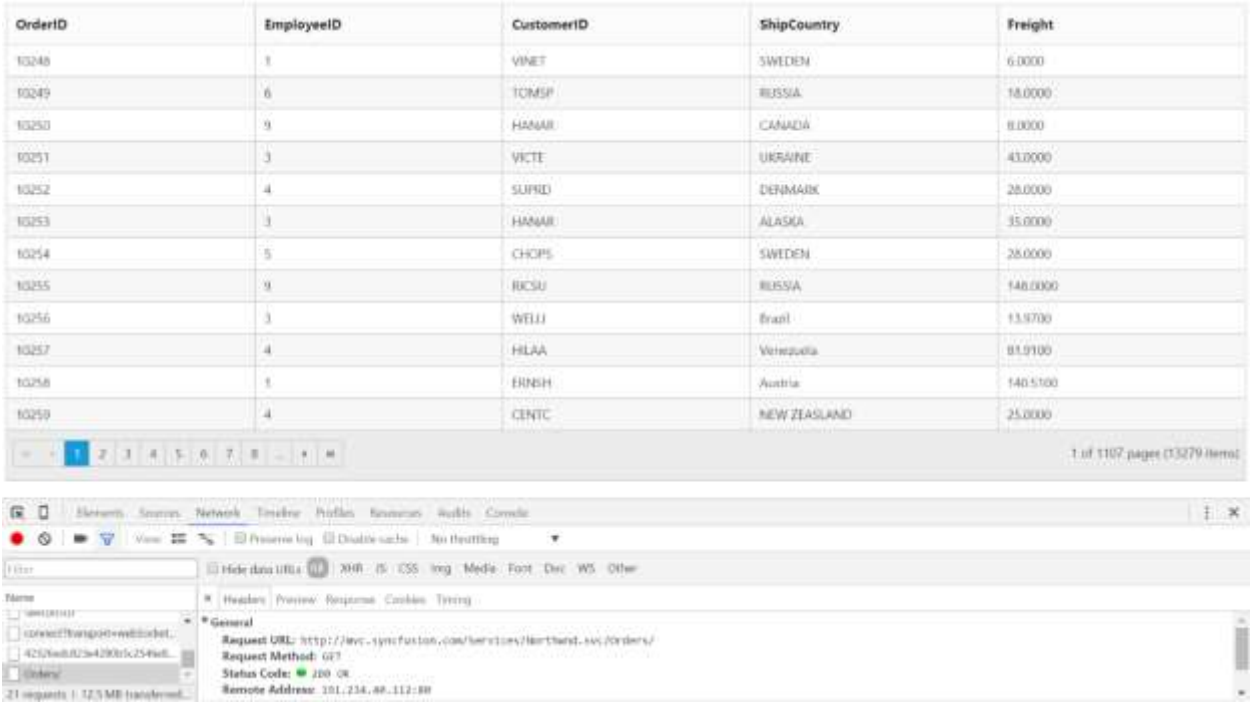
Offline property of Grid DataSource is used to enable Load at once in Grid control

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<object>("FlatGrid")
.Datasource(datasource =>
datasource.URL("http://js.syncfusion.com/demos/ejServices/Wcf/Northwind.svc/
Orders").Offline(true))
.AllowPaging()
.Columns(col =>
{
col.Field("OrderID").Add();
col.Field("EmployeeID").Add();
col.Field("CustomerID").Add();
col.Field("ShipCountry").Add();
col.Field("Freight").Add();
})
)
```

The following output is displayed as a result of the above code example.



Data caching

The DataManager can cache loaded data. The caching functionality can be enabled by setting the EnableCaching property in DataManager.

The TimeTillExpiration and CachingPageSize properties are used to control the expiration time of data and the cache page size settings respectively.

Note: window`s localStorage is used to cache the loaded data.

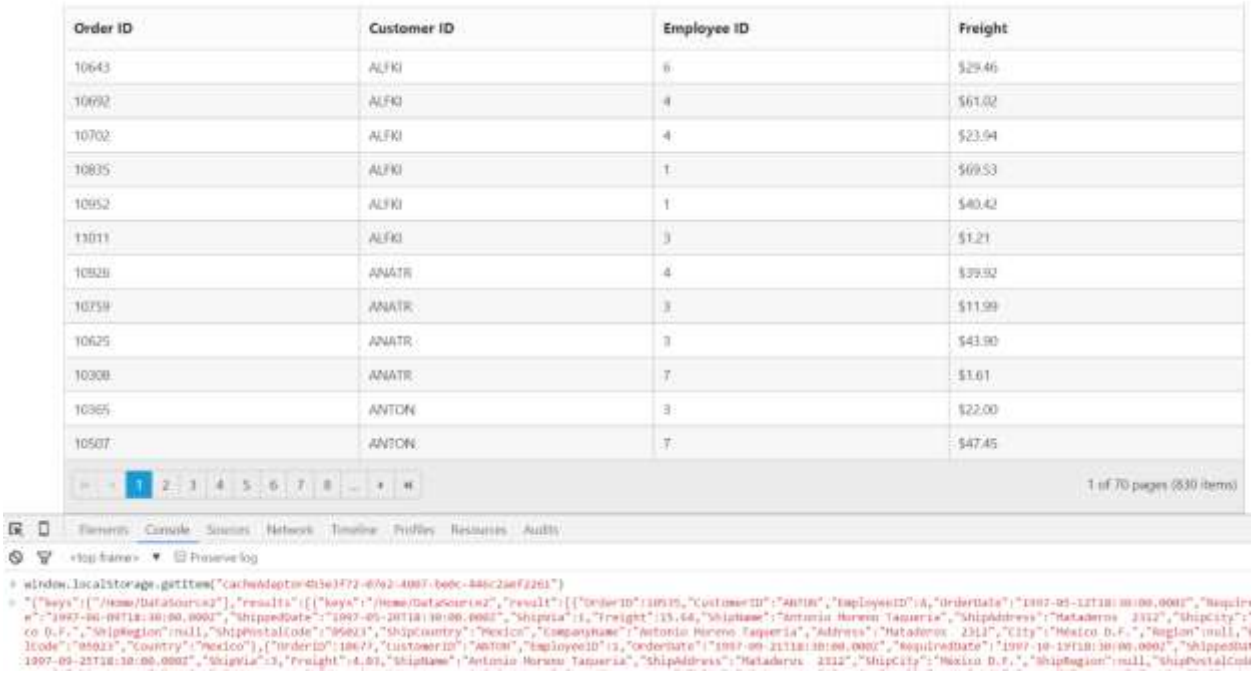
The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<OrdersView>("Grid")
.Datasource(datasource => datasource.URL(@Url.Action("DataSource"))
.EnableCaching()
.CachingPageSize(4)
.TimeTillExpiration(120000)
.Adaptor(AdaptorType.UrlAdaptor))
.AllowPaging()
.Columns(col =>
{
col.Field(p => p.OrderID).HeaderText("Order ID").Add();
col.Field(p => p.CustomerID).HeaderText("Customer
ID").TextAlign(TextAlign.Left).Add();
col.Field(p => p.EmployeeID).HeaderText("Employee ID").Add();
col.Field(p => p.Freight).HeaderText("Freight").Format("{0:C2}").Add();
})
)
```

The following output is displayed as a result of the above code example.

Copyright © 2001 - 2020 Syncfusion Inc.



Custom request parameters and HTTP Header

Adding request parameters

The 'addParams' function in DataManager's Query class can be used to add additional custom parameter in data requests. The Grid has an option to set default Query which can be used to add custom parameter.

The following code example describes the above behavior.

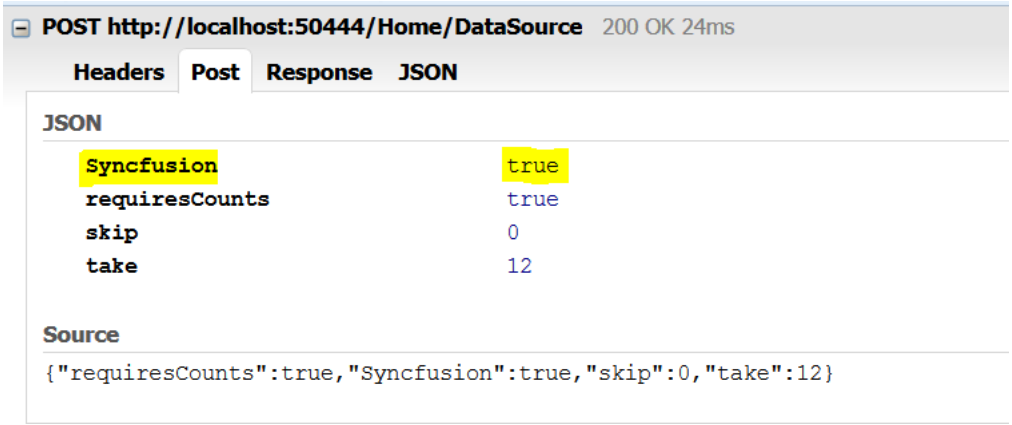
RAZOR

```
@(Html.EJ().Grid<OrdersView>("Grid")
.Datasource(datasource => datasource.URL(@Url.Action("DataSource"))
.Adaptor(AdaptorType.UrlAdaptor))
.Query("ej.Query().addParams('Syncfusion', true)")
.AllowPaging()
.Columns(col =>
{
col.Field(p => p.OrderID).HeaderText("Order ID").Add();
col.Field(p => p.CustomerID).HeaderText("Customer
ID").TextAlign(TextAlign.Left).Add();
col.Field(p => p.EmployeeID).HeaderText("Employee ID").Add();
col.Field(p => p.Freight).HeaderText("Freight").Format("{0:C2}").Add();
})
)
```

Attempting to add custom parameters with key name same as any default AJAX parameters used by DataManager will results in error.

The following output is displayed as a result of the above code example.

Copyright © 2001 - 2020 Syncfusion Inc.



Adding custom HTTP headers

The Custom header can be added through DataManager Headers options. While performing, CRUD operations, the addParams cannot be used to send additional parameters to the server in such cases the parameters can be send as custom header.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<OrdersView>("Grid")
.Datasource(datasource => datasource.URL(@Url.Action("DataSource"))
.Headers(new { Syncfusion = false })
.Adaptor(AdaptorType.UrlAdaptor))
.AllowPaging()
.Columns(col =>
{
col.Field(p => p.OrderID).HeaderText("Order ID").Add();
col.Field(p => p.CustomerID).HeaderText("Customer
ID").TextAlign(TextAlign.Left).Add();
col.Field(p => p.EmployeeID).HeaderText("Employee ID").Add();
col.Field(p => p.Freight).HeaderText("Freight").Format("{0:C2}").Add();
})
)
```

Note: To add custom headers to the DataManager through JavaScript, refer to this link

The following output is displayed as a result of the above code example.

Copyright © 2001 - 2020 Syncfusion Inc.

Handling HTTP Errors

During server interaction from the Grid, there may occur some server-side exceptions and you can acquire those error messages or exception details in client-side using ActionFailure event of Grid control.

The argument passed to the ActionFailure Grid event contains the error details returned from server. Please refer the following table for some error details that would be acquired in client-side event arguments.

Parameter	Description
arguments.error.status	It returns the response error code.
arguments.error.statusText	It returns the error message.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<OrdersView>("Grid")
.Datasource(datasource => datasource.URL(@Url.Action("DataSources"))
.Adaptor(AdaptorType.UrlAdaptor))
.Columns(col =>
{
col.Field(p => p.OrderID).HeaderText("Order ID").Add();
col.Field(p => p.CustomerID).HeaderText("Customer
ID").TextAlign(TextAlign.Left).Add();
col.Field(p => p.EmployeeID).HeaderText("Employee ID").Add();
col.Field(p => p.Freight).HeaderText("Freight").Format("{0:C2}").Add();
})
.ClientSideEvents(event => event.ActionFailure("OnActionFailure"))
)
```

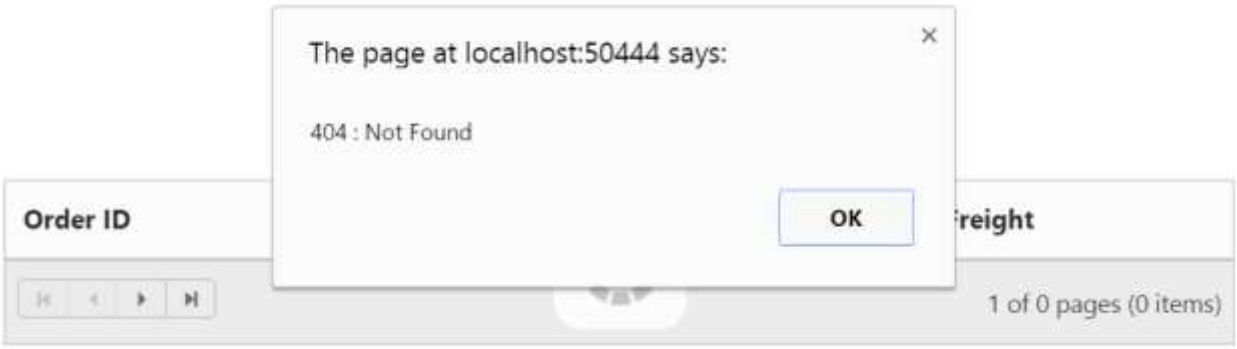
JS

```
<script>
function OnActionFailure(args) {
alert(args.error.status + " : " + args.error.statusText);
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
}
</script>
```

The following output is displayed as a result of the above code example.



Data Adaptors

The Data Adaptor is a mechanism through which the DataManager interact with the remote service or local dataSource. The DataManager has several preconfigured Data Adaptors, refer to the link.

In Grid, the Adaptor can be specified using the Adaptor property of the DataSource builder.

Note: For the Adaptor builder, you can assign Adaptor name either as string value (”JsonAdaptor”) or Enum value as AdaptorType.JsonAdaptor.

JSON Adaptor

The JSON Adaptor is used when the grid is bound with local datasource. It can be enabled in Grid using Adaptor property as AdaptorType.JsonAdaptor. The JsonAdaptor is the default Adaptor used by DataManager when bind with local dataSource such as IEnumerable, DataTable etc.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<Person>("Grid")
.Datasource(datasource =>
datasource.Json((IEnumerable<Person>)ViewBag.datasource).Adaptor(AdaptorType
.JsonAdaptor))
.Columns(col =>
{
col.Field(p => p.FirstName).HeaderText("First
Name").TextAlign(TextAlign.Left).Add();
col.Field(p => p.LastName).HeaderText("Last
Name").TextAlign(TextAlign.Left).Add();
col.Field(p => p.Email).HeaderText("Email").TextAlign(TextAlign.Left).Add();
})
)
```

C#

```
namespace Grid.Controllers
{
public class HomeController : Controller
```

```
{
public ActionResult Index()
{
List<Person> Persons = new List<Person>();
Persons.Add(new Person() { FirstName = "John", LastName = "Beckett", Email =
"john@syncfusion.com" });
Persons.Add(new Person() { FirstName = "Ben", LastName = "Beckett", Email =
"ben@syncfusion.com" });
Persons.Add(new Person() { FirstName = "Andrew", LastName = "Beckett", Email
= "andrew@syncfusion.com" });
ViewBag.datasource = Persons;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.

First Name	Last Name	Email
John	Beckett	john@syncfusion.com
Ben	Beckett	ben@syncfusion.com
Andrew	Beckett	andrew@syncfusion.com

Url Adaptor

The Url Adaptor is the base Adaptor that would interact with remote services. It can be enabled in Grid using Adaptor property of DataSource as AdaptorType.UrlAdaptor. For every operations, an AJAX post will be send to the specified data service.

Note: When using UrlAdaptor, grid actions such as Paging, Filtering and Sorting should be handled at the server side itself. We have DataOperation class to do these server side operations. Please refer to the Knowledge Base link. These operations can also be done using the QueryableDataOperations class which accepts the IQueryable Data. Please refer the Kb link.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<OrdersView>("Grid")
.Datasource(datasource => datasource.URL(@Url.Action("DataSource"))
.Adaptor(AdaptorType.UrlAdaptor))
.AllowPaging()
.Columns(col =>
{
col.Field(p => p.OrderID).HeaderText("Order ID").Add();
col.Field(p => p.CustomerID).HeaderText("Customer
ID").TextAlign(TextAlign.Left).Add();
col.Field(p => p.EmployeeID).HeaderText("Employee ID").Add();
col.Field(p => p.Freight).HeaderText("Freight").Format("{0:C2}").Add();
})
)
```

Copyright © 2001 - 2020 Syncfusion Inc.

C#

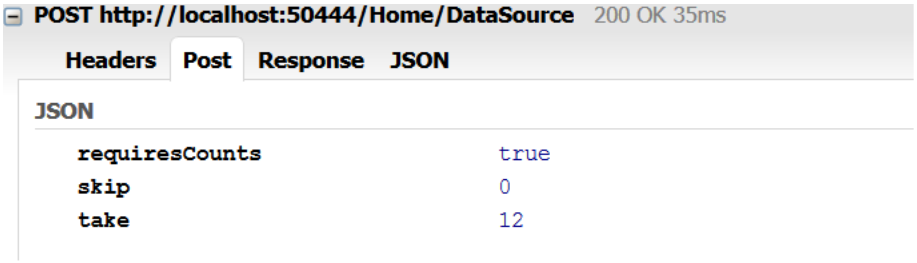
```
namespace Grid.Controllers
{
using Syncfusion.JavaScript;
using Syncfusion.JavaScript.DataSources;
public class HomeController : Controller
{
public IEnumerable OrderData = new
NorthwindDataContext().OrdersViews.ToList();
public ActionResult Index()
{
return View();
}
public ActionResult DataSource(DataManager dataManager)
{
IEnumerable data = OrderData;
DataOperations operation = new DataOperations();
if (dataManager.Sorted != null && dataManager.Sorted.Count > 0) //Sorting
{
data= operation.PerformSorting(data, dataManager.Sorted);
}
if (dataManager.Where != null && dataManager.Where.Count > 0) //Filtering
{
data= operation.PerformWhereFilter(data, dataManager.Where,
dataManager.Where[0].Operator);
}
int count = data.Cast<OrdersView>().Count();
if (dataManager.Skip != 0)
{
data= operation.PerformSkip(data, dataManager.Skip);
}
if (dataManager.Take != 0)
{
data= operation.PerformTake(data, dataManager.Take);
}
return Json(new { result = data, count = count });
}
}
}
```

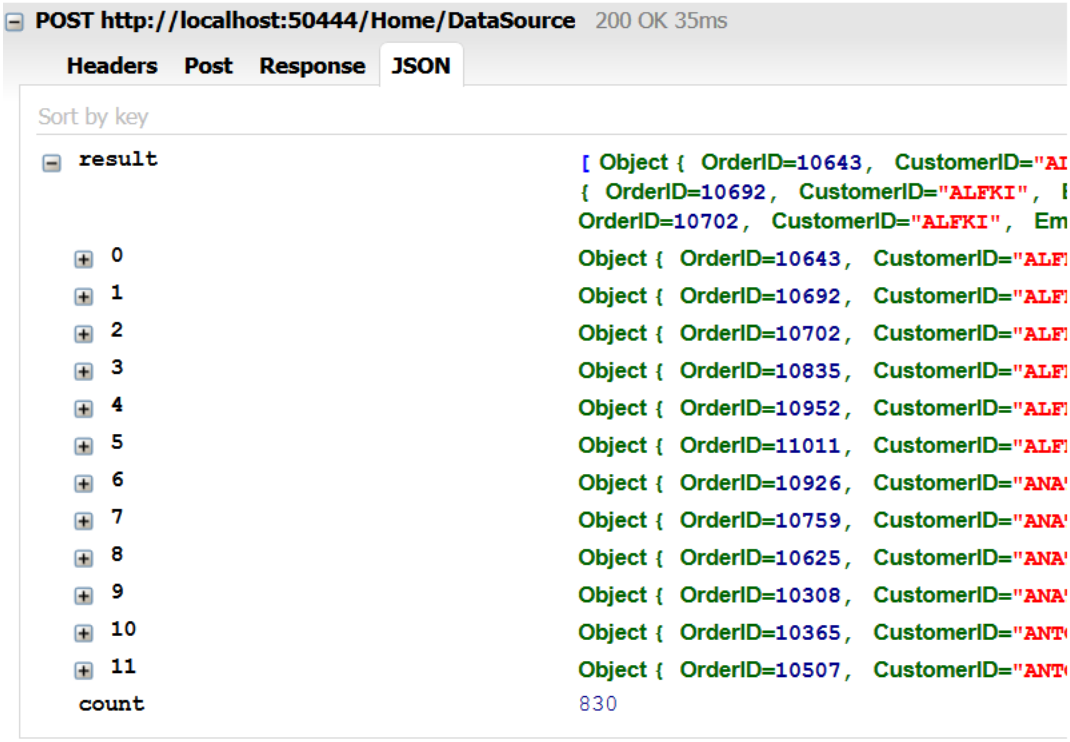
Information: 1. The response from server should be wrapped in an object with properties named result to hold the data and count to hold the total records count.

Information: 2. The count must be returned along with response when paging is enabled in Grid.

The following output is displayed as a result of the above code example.

Copyright © 2001 - 2020 Syncfusion Inc.





OData Adaptor

OData Adaptor that is extended from UrlAdaptor, is used for consuming data through OData Service.

We have an online OData Service http://js.syncfusion.com/demos/ejServices/Wcf/Northwind.svc/Orders created specifically for Syncfusion Controls

Note: ODataAdaptor is the default Adaptor of DataManager and so no need to specify Adaptor when binding OData service

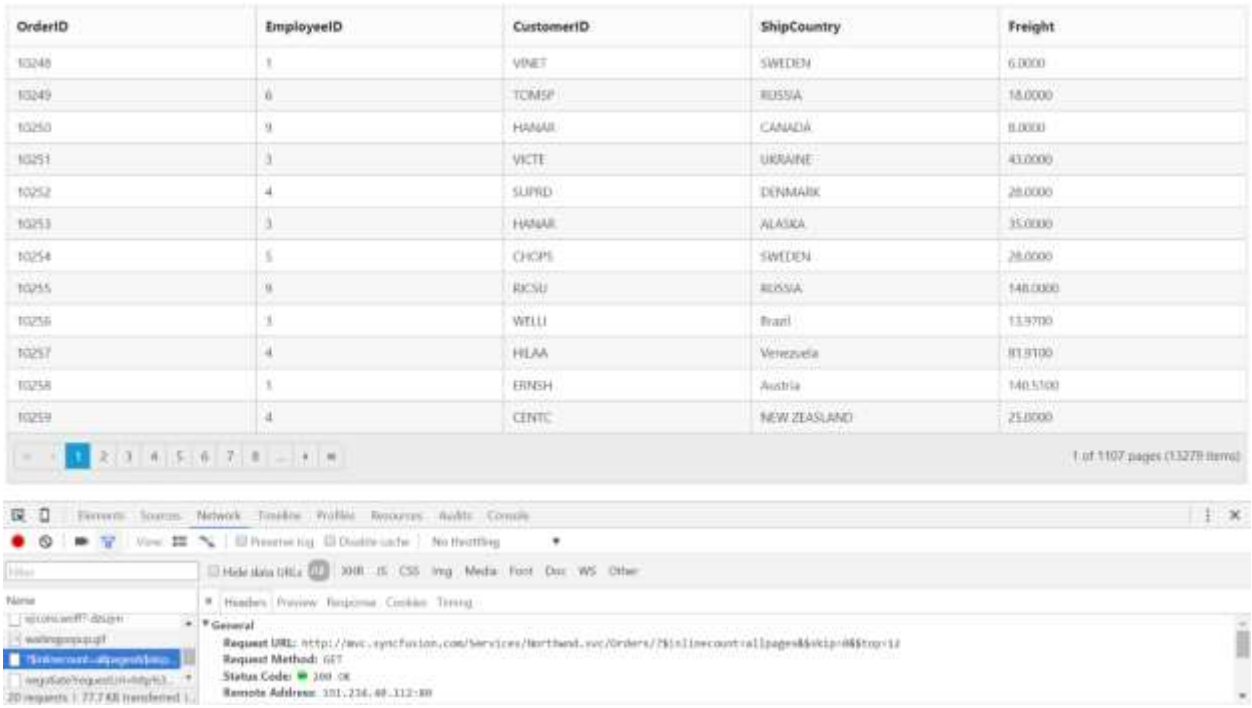
You can use the following code example to use OData Adaptor.

RAZOR

```
@(Html.EJ().Grid<object>("FlatGrid")
.Datasource(datasource =>
datasource.URL("http://js.syncfusion.com/demos/ejServices/Wcf/Northwind.svc/
Orders").Adaptor(AdaptorType.ODataAdaptor))
.AllowPaging()
.Columns(col =>
{
col.Field("OrderID").Add();
col.Field("EmployeeID").Add();
```

```
col.Field("CustomerID").Add();
col.Field("ShipCountry").Add();
col.Field("Freight").Add();
})
)
```

The following output is displayed as a result of the above code example.



ODataV4 Adaptor

ODataV4 Adaptor that is extended from ODataAdaptor, is used for consuming data from ODataV4 Service

To consume ODataV4 service, set the service link to the Url property of Grid DataSource and you can set Adaptor type as AdaptorType.ODataV4Adaptor to the Adaptor Property of Grid DataSource

You can use the following code example to use ODataV4 Adaptor.

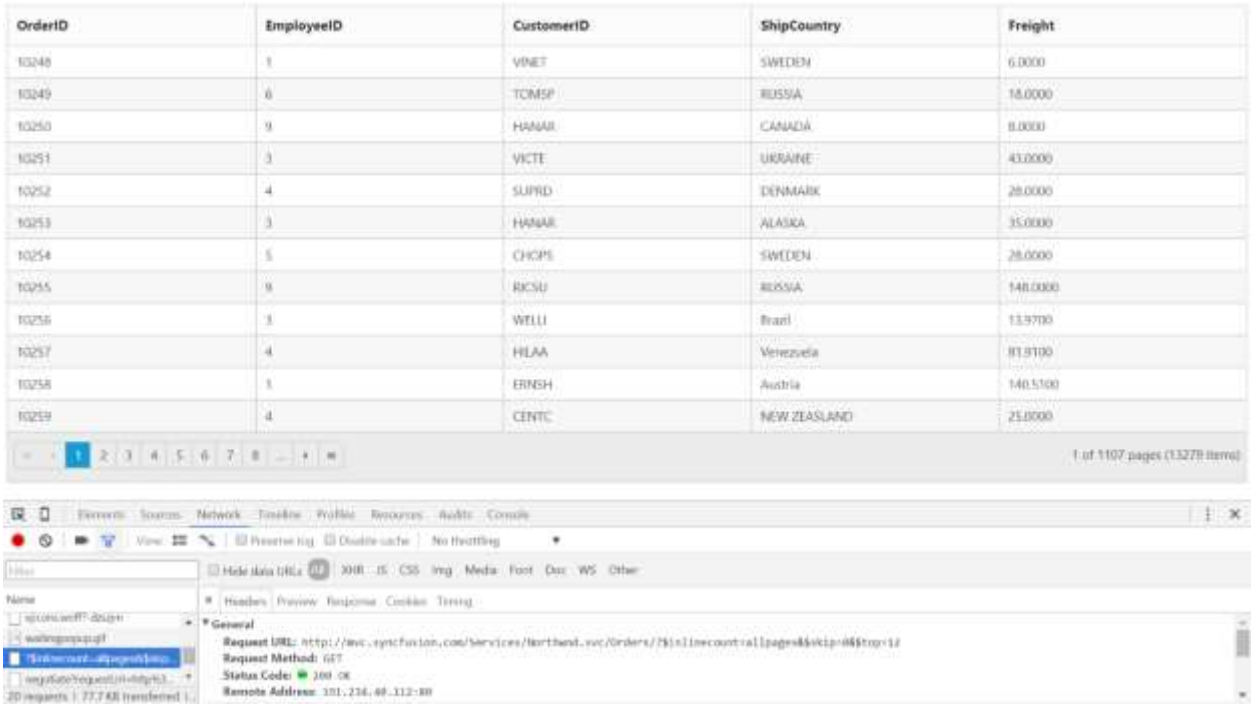
RAZOR

```
@(Html.EJ().Grid<object>("FlatGrid")
.Datasource(datasource =>
datasource.URL("http://services.odata.org/v4/northwind/northwind.svc/Orders"
).Adaptor(AdaptorType.ODataV4Adaptor))
.AllowPaging()
.Columns(col =>
{
col.Field("OrderID").Add();
col.Field("EmployeeID").Add();
col.Field("CustomerID").Add();
col.Field("ShipCountry").Add();
col.Field("Freight").Add();
})
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
)
```

The following output is displayed as a result of the above code example.



WebAPI Adaptor

WebAPI Adaptor that is extended from ODataAdaptor, is used for consuming data from WebAPI Service

To consume Web API service, set the service link to the Url property of Grid DataSource and you can set Adaptor type as AdaptorType.WebApiAdaptor to the Adaptor Property of Grid DataSource.

You can use the following code example to use WebAPI Adaptor.

RAZOR

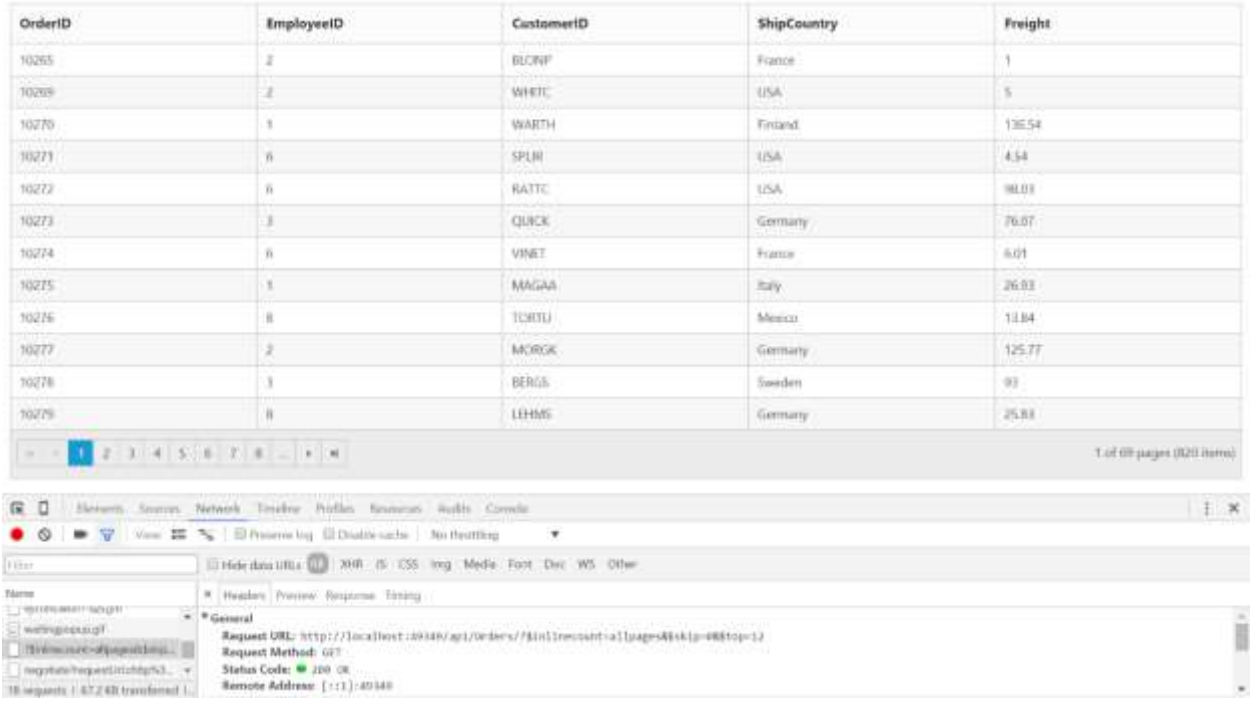
```
@(Html.EJ().Grid<object>("FlatGrid")
.Datasource(datasource =>
datasource.URL("/api/Orders").Adaptor(AdaptorType.WebApiAdaptor))
.AllowPaging()
.Columns(col =>
{
col.Field("OrderID").Add();
col.Field("EmployeeID").Add();
col.Field("CustomerID").Add();
col.Field("ShipCountry").Add();
col.Field("Freight").Add();
})
)
```

C#

```
namespace EJGrid.Controllers
```

```
{
public class OrdersController: ApiController
{
// GET: api/Orders
NORTHWNDEntities db = new NORTHWNDEntities();
public object Get()
{
var queryString = HttpContext.Current.Request.QueryString;
int skip = Convert.ToInt32(queryString["$skip"]);
int take = Convert.ToInt32(queryString["$top"]);
var data = db.Orders.ToList();
return new { Items = data.Skip(skip).Take(take), Count = data.Count() };
}
}
}
```

The following output is displayed as a result of the above code example.



RemoteSave Adaptor

Sometimes you may need to perform all Grid Actions in client-side except the CRUD operations that should be interacted with server-side to persist data. It can be achieved in Grid by using RemoteSaveAdaptor.

Datasource must be set to Json Property and set Adaptor type as AdaptorType.RemoteSaveAdaptor to the Adaptor Property of Grid DataSource. CRUD operations can be mapped to server-side using UpdateUrl, InsertUrl, RemoveUrl, BatchUrl, CrudUrl properties.

You can use the following code example to use RemoteSaveAdaptor.

RAZOR

```
@(Html.EJ().Grid<object>("FlatGrid")
```

```
.Datasource(datasource =>
datasource.Json((IEnumerable<object>)ViewBag.datasource).UpdateURL("/Home/Up
date")
.InsertURL("/Home/Insert").RemoveURL("/Home/Remove").Adaptor(AdaptorType.Rem
oteSaveAdaptor))
.AllowPaging()
.EditSettings(edit => { edit.AllowAdding().AllowDeleting().AllowEditing();
})
.ToolbarSettings(toolbar =>
{
toolbar.ShowToolbar().ToolbarItems(items =>
{
items.AddTool(ToolBarItems.Add);
items.AddTool(ToolBarItems.Edit);
items.AddTool(ToolBarItems.Delete);
items.AddTool(ToolBarItems.Update);
items.AddTool(ToolBarItems.Cancel);
});
})
.Columns(col =>
{
col.Field("OrderID").IsPrimaryKey(true).Add();
col.Field("EmployeeID").Add();
col.Field("CustomerID").Add();
col.Field("ShipCountry").Add();
col.Field("Freight").Add();
})
)
```

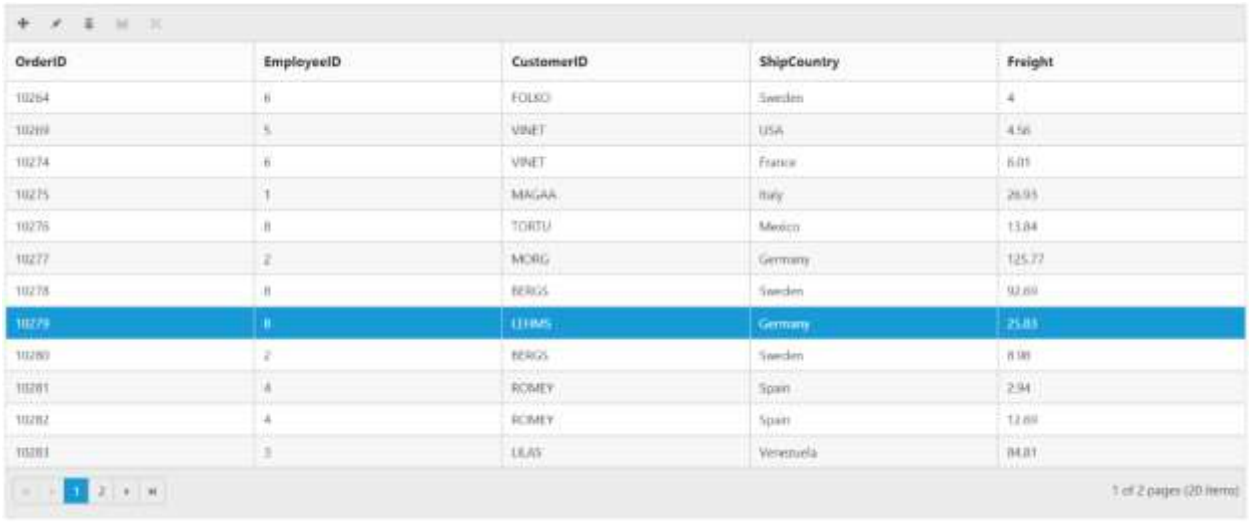
C#

```
namespace EJGrid.Controllers
{
public class HomeController : Controller
{
public ActionResult Index()
{
var data = OrderRepository.GetAllRecords();
ViewBag.dataSource = data;
return View();
}
public ActionResult Update(EditableOrder value)
{
OrderRepository.Update(value);
var data = OrderRepository.GetAllRecords();
return Json(data, JsonRequestBehavior.AllowGet);
}
public ActionResult Insert(EditableOrder value)
{
OrderRepository.Add(value);
var data = OrderRepository.GetAllRecords();
return Json(data, JsonRequestBehavior.AllowGet);
}
public ActionResult Remove(int key)
{
OrderRepository.Delete(key);
```

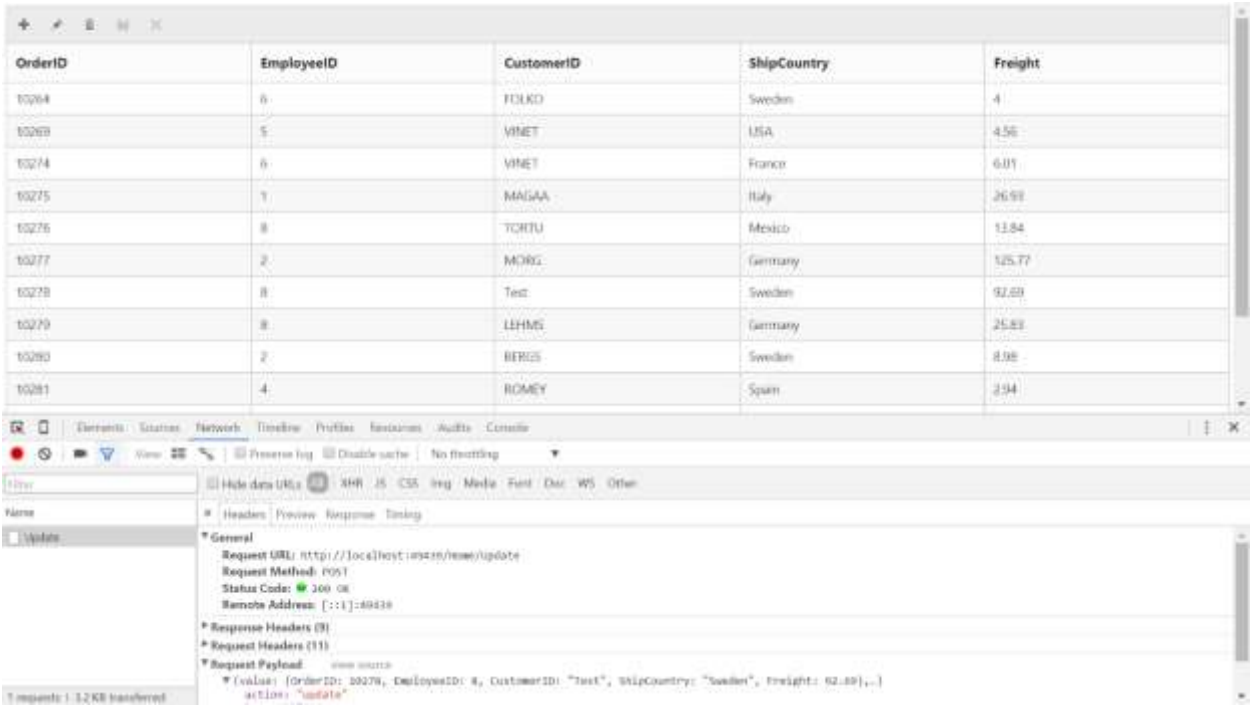
Copyright © 2001 - 2020 Syncfusion Inc.

```
var data = OrderRepository.GetAllRecords();
return Json(data, JsonRequestBehavior.AllowGet);
}
}
}
```

The following output is displayed as a result of the above code example.



On performing CRUD operations in Grid, the record changes will be sent to server-side as in the following screenshot.



Foreign Key Adaptor

The Grid can have a look up column. The Foreign key column using ForeignKeyField has some limitations such as sort/group operations on column will happen based on Field instead of ForeignKeyField. The ForeignKeyAdaptor can be used to overcome this limitation.

Note: It works by specifying a virtual column (which is not in the grid datasource) in the Grid. This Adaptor should be initialized in the Load event of the grid. ForeignKeyAdaptor supported for only local data binding.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<OrdersView>("Grid")
.Datasource((IEnumerable<OrdersView>)ViewBag.datasource)
.AllowPaging()
.AllowSorting()
.Columns(col =>
{
col.Field(p => p.OrderID).HeaderText("Order
ID").TextAlign(TextAlign.Right).Add();
col.Field(p => p.CustomerID).HeaderText("Customer ID").Add();
col.Field("FirstName").HeaderText("Name").Add();
col.Field(p =>
p.Freight).HeaderText("Freight").TextAlign(TextAlign.Right).Format("{0:C2}")
.Add();
})
.ClientSideEvents(event => event.Load("onLoad"))
)
```

C#

```
namespace Grid.Controllers
{
public class HomeController : Controller
{
public ActionResult Index()
{
ViewBag.datasource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.employeeData = new JavaScriptSerializer().Serialize(new
NorthwindDataContext().EmployeeViews.ToList());
return View();
}
}
}
```

JS

```
<script>
var employeeData = @Html.Raw(ViewBag.employeeData);
function onLoad(args) {
this.model.dataSource.adaptor = new ej.ForeignKeyAdaptor([{ foreignKeyField:
"EmployeeID", foreignKeyValue: "FirstName", dataSource: employeeData }],
"JsonAdaptor");
}
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
</script>
```

Information: 1. The Field name of the virtual column should be the name of the field to display from foreign datasource.

Information: 2. By default, the ForeignKeyAdaptor uses JsonAdaptor, to use other Adaptors specify the Adaptor name as the second argument during initialization.

The following output is displayed as a result of the above code example.

Order ID	Customer ID	Name	Freight
10280	BERGS	Andrew	$8.98
10265	BLONP	Andrew	$55.28
10663	BONAP	Andrew	$113.15
10982	BOTTM	Andrew	$14.01
10949	BOTTM	Andrew	$74.44
10471	BSBEV	Andrew	$45.59
10819	CACTU	Andrew	$19.76
11042	COMMI	Andrew	$29.99
10462	CONSH	Andrew	$6.17
10683	DUMON	Andrew	$4.40
10595	ERNSH	Andrew	$96.78
10368	ERNSH	Andrew	$101.95

1 2 3 4 5 6 7 8 ... 1 of 70 pages (830 items)

Custom Adaptor

Instead of using the pre-configured Adaptors, the DataManager allow us to write our own data Adaptor.

Please refer here for more details about creating custom Adaptor.

The custom Adaptor should be assigned to the Grid DataSource in the Load event.

For instance, though we have not provided in-built support to bind XML data, you can achieve by creating custom Adaptor as explained in below KB.

https://www.syncfusion.com/kb/3375/how-to-process-xml-data-from-server-using-datamanager-and-bound-to-grid

Copyright © 2001 - 2020 Syncfusion Inc.

Note: To create a custom Adaptor for remote service, the UrlAdaptor can be used as base Adaptor.

Data Annotation

Data Annotations help us to define the rules to the model classes or properties for data validation and displaying suitable messages to end users.

You can enable Data Annotation by binding the corresponding Class to Grid helper and thus data annotations attributes will be mapped to the corresponding Grid Column property.

Please find the following list of annotation attributes that are supported in Grid Control.

Attribute Name	Functionality in Grid
BindAttribute - Exclude	To exclude the corresponding field from Grid Columns property in AutoGenerate Grid
DisplayName	It sets HeaderText property of Grid Column
ReadOnly	It sets AllowEditing for a particular column
Key	To Set PrimaryKey in Grid Columns
ScaffoldColumn	It sets Visible property of Grid Columns which is used to hide or show a Column in Grid
DisplayFormat - DataFormatString	To sets Format property of Grid Column that renders corresponding Grid Column data in respective format.
DatabaseGenerated(DatabaseGeneratedOption.Identity)	To set isIdentity Property of Grid Column
Validation • RequiredAttribute • StringLengthAttribute • RangeAttribute • RegularExpressionAttribute • MinLengthAttribute • MaxLengthAttribute • CompareAttribute • DataTypeAttribute • DataType.Custom • DataType.Date • DataType.DateTime • DataType.EmailAddress • DataType.ImageUrl • DataType.Url • Custom DataType	The data annotation validations attribute would used as validation rules in Grid CRUD operations
ForeignKey	Set ForeignKeyField Property of Grid Column

Copyright © 2001 - 2020 Syncfusion Inc.

Note: Grid Properties has more priority than Data Annotation. For Instance, if DisplayName Attribute is set to a Field in Grid Model class and also we set different value to the respective Grid Columns property HeaderText, then the value of HeaderText property will be considered and shown in Grid header.

The following code example shows how data annotation works in Grid Control.

RAZOR

```
@model IEnumerable<EditableOrder>
@(Html.EJ().Grid<EditableOrder>("FlatGrid")
.Datasource(Model)
.EditSettings(edit => { edit.AllowAdding().AllowDeleting().AllowEditing();
})
.ToolbarSettings(toolbar =>
{
toolbar.ShowToolbar().ToolbarItems(items =>
{
items.AddTool(ToolBarItems.Add);
items.AddTool(ToolBarItems.Edit);
items.AddTool(ToolBarItems.Delete);
items.AddTool(ToolBarItems.Update);
items.AddTool(ToolBarItems.Cancel);
});
})
.AllowPaging()
)
```

C#

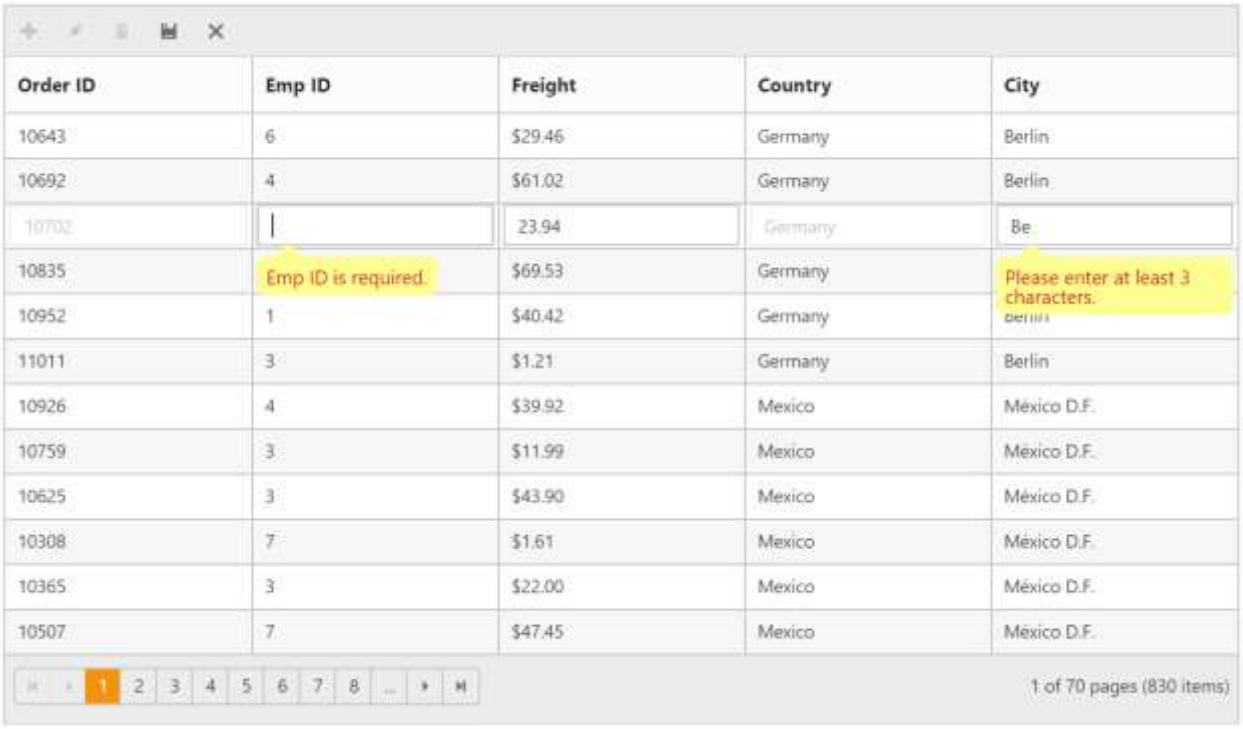
```
namespace EJGrid.Controllers
{
public class EditableOrder
{
[Display(Name = "Order ID")]
[Key]
[DatabaseGenerated(DatabaseGeneratedOption.Identity)]
public int OrderID
{
get;
set;
}
[Display(Name = "Emp ID")]
[Required]
public int? EmployeeID
{
get;
set;
}
[Display(Name = "Freight")]
[DisplayFormat(DataFormatString = "{0:C2}")]
public decimal? Freight
{
get;
set;
}
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
[Display(Name = "Country")]
[Editable(false)]
public string ShipCountry
{
get;
set;
}
[Display(Name = "City")]
[MinLength(3)]
[MaxLength(10)]
public string ShipCity
{
get;
set;
}
[Display(Name = "Ship Name")]
[ScaffoldColumn(false)]
public string ShipName
{
get;
set;
}
}
public class HomeController : Controller
{
public ActionResult Index()
{
List<EditableOrder> data = OrderRepository.GetAllRecords() ;
return View(data);
}
}
}
```

The following output is displayed as a result of the above code example.

Copyright © 2001 - 2020 Syncfusion Inc.



Columns

Column definitions are used as the DataSource schema in the grid and it plays vital role in rendering the column values in required format and sorting, filtering, editing based on its type. The Field property of the columns is necessary to map the datasource values in grid columns.

Note: 1. The column with Field which are not in the datasource, then the column values will be displayed as empty.

2. If the Field name contains "dot" then it is considered as complex binding.

Auto Generation

The columns are automatically generated when Columns declaration is empty or undefined while initializing the grid. Also, all the columns which are in DataSource are bound as a grid Columns.

RAZOR

```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
)
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.DataSource = DataSource;
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
return View();
}
}
}
```

The following output is displayed as a result of the above code example.

OrderID	EmployeeID	Freight	ShipCountry	ShipCity
10248	5	32.38	France	Reims
10249	6	11.61	Germany	Münster
10250	4	65.83	Brazil	Rio de Janeiro
10251	3	41.34	France	Lyon
10252	4	51.3	Belgium	Charleroi
10253	3	58.17	Brazil	Rio de Janeiro
10254	5	22.98	Switzerland	Bern
10255	9	148.33	Switzerland	Genève
10256	3	13.97	Brazil	Resende
10257	4	81.91	Venezuela	San Cristóbal
10258	1	140.51	Austria	Graz
10259	4	3.25	Mexico	México D.F.

1 2 3 4 5 6 7 8 ... 1 of 17 pages (200 items)

How to set the `IsPrimaryKey` for auto generated columns when editing is enabled:

Using the DataBound event, you can set the IsPrimaryKey value as true by two ways. The following code example demonstrates the above behavior.

1. If primary key "column index" is known then refer to the following code example.

RAZOR

```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
.EditSettings(edit =>
{
edit.AllowEditing(true);
})
.ClientSideEvents(eve => { eve.DataBound("dataBound"); })
)
<script type="text/javascript">
function dataBound(args) {
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
var column = args.model.columns[0];
//(or)
var column = this.getColumnByIndex(0);
column.isPrimaryKey = true;
//Here columns method used to update the particular column
this.columns(column, "update");
}
</script>
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.DataSource = DataSource;
return View();
}
}
}
```

2. If primary key "column field name" is known then refer to the following code example.

RAZOR

```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
.EditSettings(edit =>
{
edit.AllowEditing(true);
})
.ClientSideEvents(eve => { eve.DataBound("dataBound"); })
)
<script type="text/javascript">
function dataBound(args) {
var column = this.getColumnByField("OrderID");
column.isPrimaryKey = true;
//Here columns method used to update the particular column
this.columns(column, "update");
}
</script>
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.DataSource = DataSource;
return View();
}
}
}
```

JS

```
function dataBound(args) {
var column = this.getColumnByField("OrderID");
column.isPrimaryKey = true;
//Here columns method used to update the particular column
this.columns(column, "update");
}
```

Headers

HeaderText

It represents the title for particular column. To enable header text, set the HeaderText property of Columns. The following code example describes the above behavior.

Note: If HeaderText is not defined then the Field name is considered as header text for that particular column. If Field name and HeaderText also not defined then the column is rendered with "empty" header text.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order ID").Add();
col.Field("EmployeeID").HeaderText("Employee ID").Add();
col.Field("Freight").HeaderText("Freight").Add();
col.Field("ShipCountry").HeaderText("Country").Add();
col.Field("ShipCity").HeaderText("City").Add();
}))
```

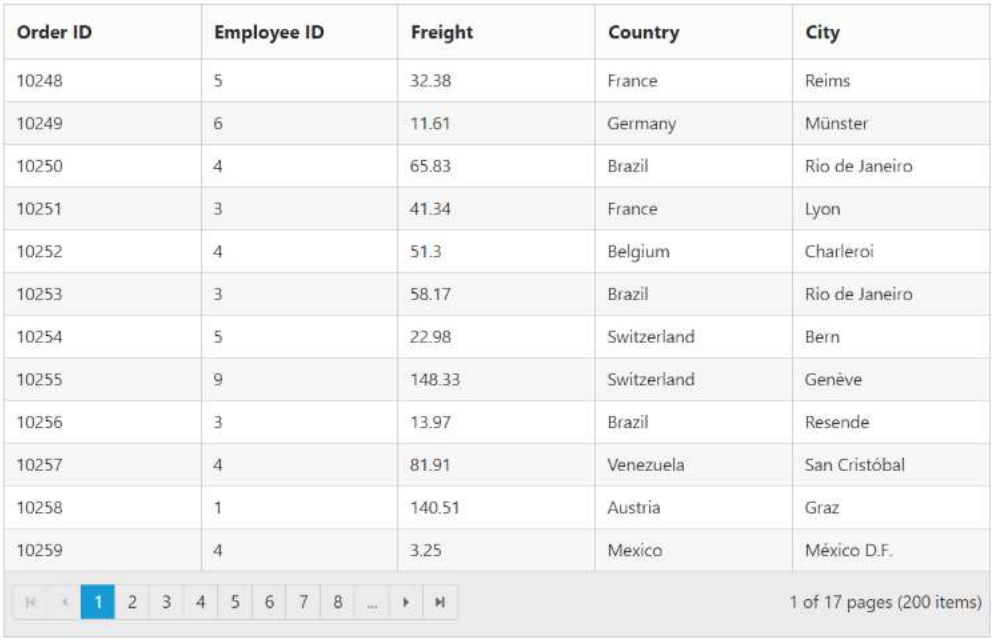
C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.DataSource = DataSource;
return View();
}
}
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
}
```

The following output is displayed as a result of the above code example.



Order ID	Employee ID	Freight	Country	City
10248	5	32.38	France	Reims
10249	6	11.61	Germany	Münster
10250	4	65.83	Brazil	Rio de Janeiro
10251	3	41.34	France	Lyon
10252	4	51.3	Belgium	Charleroi
10253	3	58.17	Brazil	Rio de Janeiro
10254	5	22.98	Switzerland	Bern
10255	9	148.33	Switzerland	Genève
10256	3	13.97	Brazil	Resende
10257	4	81.91	Venezuela	San Cristóbal
10258	1	140.51	Austria	Graz
10259	4	3.25	Mexico	México D.F.

1 2 3 4 5 6 7 8 ... 1 of 17 pages (200 items)

Header Text alignment

Align the header text of column header using the HeaderTextAlign property of the Columns. There are four possible ways to align header text, they are.

1. Right
2. Left
3. Center
4. Justify

Note: For the HeaderTextAlign property you can assign enum value (TextAlign.Right).

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
.Columns(col =>
{
col.Field("OrderID").HeaderTextAlign(TextAlign.Right).HeaderText("Order
ID").Add();
col.Field("EmployeeID").HeaderText("Employee ID").Add();
col.Field("Freight").HeaderText("Freight").Add();
col.Field("ShipCountry").HeaderText("Country").Add();
col.Field("ShipCity").HeaderText("City").Add();
}))
```

Copyright © 2001 - 2020 Syncfusion Inc.

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.DataSource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.

Order ID	Employee ID	Freight	Country	City
10248	5	32.38	France	Reims
10249	6	11.61	Germany	Münster
10250	4	65.83	Brazil	Rio de Janeiro
10251	3	41.34	France	Lyon
10252	4	51.3	Belgium	Charleroi
10253	3	58.17	Brazil	Rio de Janeiro
10254	5	22.98	Switzerland	Bern
10255	9	148.33	Switzerland	Genève
10256	3	13.97	Brazil	Resende
10257	4	81.91	Venezuela	San Cristóbal
10258	1	140.51	Austria	Graz
10259	4	3.25	Mexico	México D.F.

1 2 3 4 5 6 7 8 ... 1 of 17 pages (200 items)

Header Template

The template design that applies on for the column header. To render template, use the HeaderTemplateID property of Columns.

You can use JsRender syntax in the template. For more information about JsRender syntax, please refer this link.

Note: It's a standard way to enclose the template within the script tag with type as text/x-jsrender.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
.Columns(col =>
{
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
col.Field("OrderID").HeaderText("Order ID").Add();
col.Field("EmployeeID").HeaderTemplateID("#employeeTemplate").Add();
col.Field("Freight").HeaderText("Freight").Add();
col.Field("ShipCountry").HeaderText("Country").Add();
col.Field("ShipCity").HeaderText("City").Add();
}))
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.DataSource = DataSource;
return View();
}
}
}
```

JS

```
<script id="employeeTemplate" type="text/x-jsrender">
Employee ID
<span class="e-userlogin e-icon employee"></span>
</script>
```

The following output is displayed as a result of the above code example.

Order ID	Employee ID	Freight	Country	City
10248	5	32.38	France	Reims
10249	6	11.61	Germany	Münster
10250	4	65.83	Brazil	Rio de Janeiro
10251	3	41.34	France	Lyon
10252	4	51.3	Belgium	Charleroi
10253	3	58.17	Brazil	Rio de Janeiro
10254	5	22.98	Switzerland	Bern
10255	9	148.33	Switzerland	Genève
10256	3	13.97	Brazil	Resende
10257	4	81.91	Venezuela	San Cristóbal
10258	1	140.51	Austria	Graz
10259	4	3.25	Mexico	México D.F.

Text alignment

You can align both content and header text of particular column using the TextAlign property. There are four possible ways to align content and header text of column, they are.

1. Right
2. Left
3. Center
4. Justify

Note: 1. For TextAlign property you can assign the enum value (TextAlign.Right).

2. The TextAlign property will affect both content and header text of the grid.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
.Columns(col =>
{
col.Field("OrderID").TextAlign(TextAlign.Right).Add();
col.Field("EmployeeID").TextAlign(TextAlign.Right).Add();
col.Field("Freight").TextAlign(TextAlign.Right).Add();
col.Field("ShipCountry").TextAlign(TextAlign.Center).Add();
col.Field("ShipCity").TextAlign(TextAlign.Justify).Add();
}))
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.DataSource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.

Format

Format is the process of customizing the particular column data with specified jQuery recognized globalize formats, such as currency, numeric, decimal, percentage or dates. To specify the globalize format, by using Format property of Columns.

The Format value should be wrapped within "{0:" and "}". (For ex: "{0:C3}"). The data format strings available for the Date and Number types.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
.Columns(col =>
{
col.Field("OrderID").Add();
col.Field("EmployeeID").Add();
col.Field("Freight").Format("{0:C2}").Add();
col.Field("OrderDate").Format("{0:dd/MM/yyyy}").Add();
col.Field("ShipCity").Add();
}))
```

C#

```
namespace MVCSampleBrowser.Controllers
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.DataSource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.

OrderID	EmployeeID	Freight	OrderDate	ShipCity
10248	5	$32.38	04/07/1996	Reims
10249	6	$11.61	05/07/1996	Münster
10250	4	$65.83	08/07/1996	Rio de Janeiro
10251	3	$41.34	08/07/1996	Lyon
10252	4	$51.30	09/07/1996	Charleroi
10253	3	$58.17	10/07/1996	Rio de Janeiro
10254	5	$22.98	11/07/1996	Bern
10255	9	$148.33	12/07/1996	Genève
10256	3	$13.97	15/07/1996	Resende
10257	4	$81.91	16/07/1996	San Cristóbal
10258	1	$140.51	17/07/1996	Graz
10259	4	$3.25	18/07/1996	México D.F.

1 2 3 4 5 6 7 8 ... 1 of 17 pages (200 items)

Width

You can specify the width for the particular column by setting Width property of Columns as in pixel (ex: 100) or in percentage (ex: 40%).

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
.Columns(col =>
{
col.Field("OrderID").Width("10%").Add();
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
col.Field("EmployeeID").Width("15%").Add();
col.Field("Freight").Width(100).Add();
col.Field("ShipCity").Width(150).Add();
col.Field("ShipCountry").Width(100).Add();
}))
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.DataSource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.

OrderID	EmployeeID	Freight	ShipCity	ShipCountry
10248	5	32.38	Reims	France
10249	6	11.61	Münster	Germany
10250	4	65.83	Rio de Janeiro	Brazil
10251	3	41.34	Lyon	France
10252	4	51.3	Charleroi	Belgium

10254	5	22.98	Bern	Switzerland
10255	9	148.33	Genève	Switzerland
10256	3	13.97	Resende	Brazil
10257	4	81.91	San Cristóbal	Venezuela
10258	1	140.51	Graz	Austria
10259	4	3.25	México D.F.	Mexico

1 2 3 4 5 6 7 8 ... 1 of 17 pages (200 items)

Resizing

The AllowResizing property enables the grid to set the width to columns based on resizing the grid column manually.

Copyright © 2001 - 2020 Syncfusion Inc.

Resizing modes

ResizeMode property of ResizeSettings is used to change the resizing modes. It indicates whether to define mode of resizing.

Name	Description
Normal	New column size will be adjusted by all other Columns
NextColumn	New column Size will be adjusted using next column
Control	New column Size will be adjusted using entire control

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<EmployeeView>("Grid")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.AllowResizing()
.ResizeSettings(emp => { emp.ResizeMode(ResizeMode.NextColumn); })
.Columns(col =>
{
col.Field("ShipCity").HeaderText("Ship
City").IsPrimaryKey(true).Width(80).Add();
col.Field("ShipPostalCode").HeaderText("Ship Postal Code").Width(40).Add();
col.Field("ShipName").HeaderText("Ship Name").Width(40).Add();
col.Field("ShipAddress").HeaderText("Ship Address").Width(100).Add();
})
)
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public partial class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource = new NorthwindDataContext().EmployeeViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

Resize to fit

The AllowResizeToFit property enable the grid to set width to columns based on maximum width of the particular column's content to facilitate full visibility of data in all the grid rows and this automatic behavior is applicable only for the columns which does not have width specified.

On columns where "width is defined", double click on the particular column header's resizer symbol to resize the column to show the whole text. For example, refer to the "ShipCity" column in the below code snippet and output screen shot.

Copyright © 2001 - 2020 Syncfusion Inc.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
.AllowResizeToFit()
.Columns(col =>
{
col.Field("OrderID").Width(100).Add();
col.Field("EmployeeID").Add();
col.Field("Freight").Width(75).Add();
col.Field("ShipCity").Width(50).Add();
col.Field("ShipAddress").Add();
}))
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.DataSource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.

Copyright © 2001 - 2020 Syncfusion Inc.

OrderID	EmployeeID	Freight	ShipCity	ShipAddress
10248	5	32.38	Reims	59 rue de l'Abbaye
10249	6	11.61	Münster	Luisenstr. 48
10250	4	65.83	Rio de Ja	Rua do Paço, 67
10251	3	41.34	Lyon	2, rue du Commerce
10252	4	51.3	Charleroi	Boulevard Tirou, 255
10253	3	58.17	Rio de Ja	Rua do Paço, 67
10254	5	22.98	Bern	Hauptstr. 31
10255	9	148.33	Genève	Starenweg 5
10256	3	13.97	Resende	Rua do Mercado, 12
10257	4	81.91	San Cristó	Carrera 22 con Ave. Carlos Soublette #8-35
10258	1	140.51	Graz	Kirchgasse 6
10259	4	3.25	México D	Sierras de Granada 9993

Reorder

Reordering can be done by drag and drop of the particular column header from one index to another index within the grid. Reordering can be enabled by setting the AllowReordering property as true.

The following code example describes the above behavior.

RAZOR

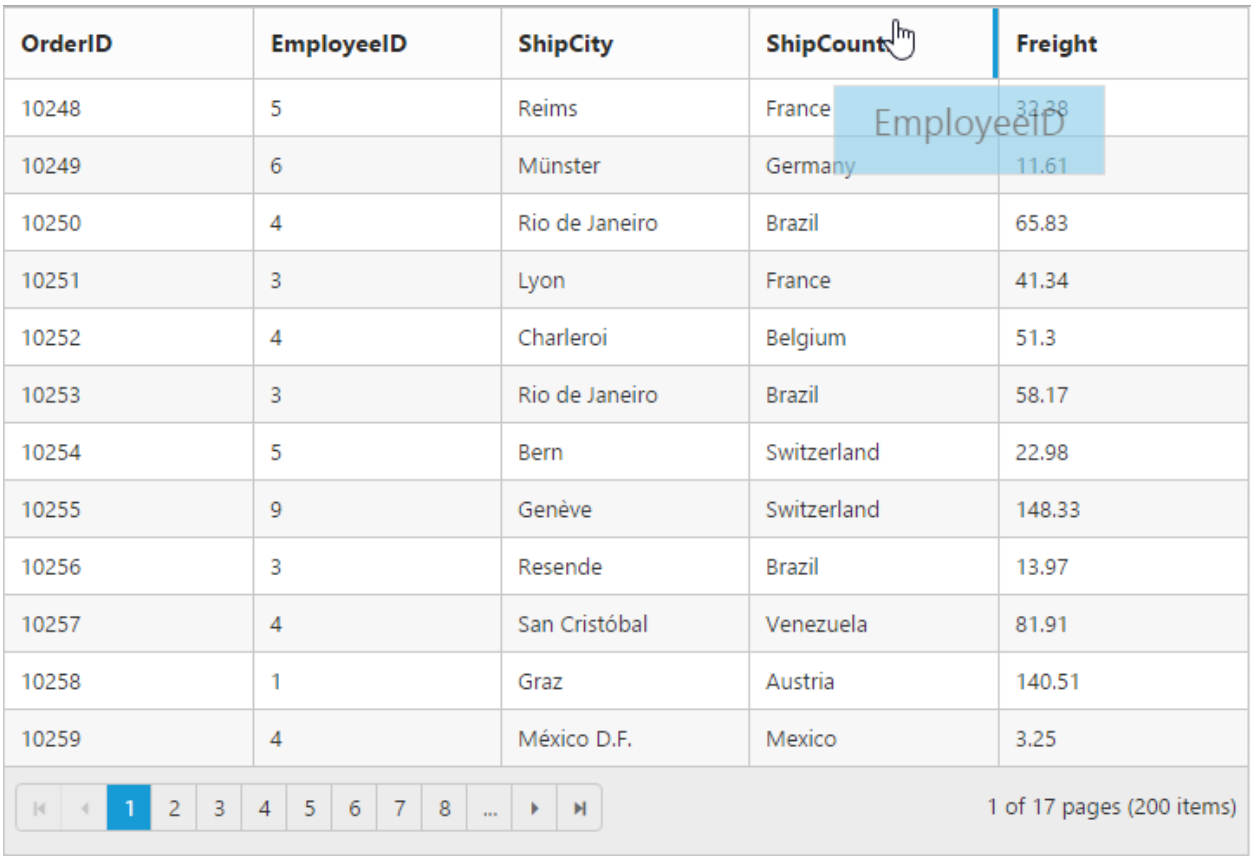
```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
.AllowReordering()
.Columns(col =>
{
col.Field("OrderID").Add();
col.Field("EmployeeID").Add();
col.Field("ShipCity").Add();
col.Field("ShipCountry").Add();
col.Field("Freight").Add();
}))
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
```

```
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.DataSource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.



OrderID	EmployeeID	ShipCity	ShipCountry	Freight
10248	5	Reims	France	32.38
10249	6	Münster	Germany	11.61
10250	4	Rio de Janeiro	Brazil	65.83
10251	3	Lyon	France	41.34
10252	4	Charleroi	Belgium	51.3
10253	3	Rio de Janeiro	Brazil	58.17
10254	5	Bern	Switzerland	22.98
10255	9	Genève	Switzerland	148.33
10256	3	Resende	Brazil	13.97
10257	4	San Cristóbal	Venezuela	81.91
10258	1	Graz	Austria	140.51
10259	4	México D.F.	Mexico	3.25

Visibility

You can hide particular column in grid view by setting the Visible property of it as false.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
.Columns(col =>
{
col.Field("EmployeeID").Add();
col.Field("OrderID").Visible(false).Add();
col.Field("Freight").Add();
col.Field("ShipCity").Add();
col.Field("ShipCountry").Add();
}))
```

Copyright © 2001 - 2020 Syncfusion Inc.

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.DataSource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.

EmployeeID	Freight	ShipCity	ShipCountry
5	32.38	Reims	France
6	11.61	Münster	Germany
4	65.83	Rio de Janeiro	Brazil
3	41.34	Lyon	France
4	51.3	Charleroi	Belgium
3	58.17	Rio de Janeiro	Brazil
5	22.98	Bern	Switzerland
9	148.33	Genève	Switzerland
3	13.97	Resende	Brazil
4	81.91	San Cristóbal	Venezuela
1	140.51	Graz	Austria
4	3.25	México D.F.	Mexico

1 2 3 4 5 6 7 8 ... 1 of 17 pages (200 items)

Unbound Column

You can define the unbound columns in grid by not defining the Field property for that particular. Value for this columns can be populated either by manually using the QueryCellInfo event or by using the ColumnTemplate.

Note: Editing, grouping, filtering, sorting, summary and searching support are not available for unbound columns.

Copyright © 2001 - 2020 Syncfusion Inc.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
.EditSettings(edit => { edit.AllowDeleting(); })
.Columns(col =>
{
col.Field("OrderID").IsPrimaryKey(true).Add();
col.Field("EmployeeID").Add();
col.Field("CustomerID").Add();
col.Field("Freight").Add();
col.HeaderText("").Format("<a onclick=\"click(this)\"
href=#>Delete</a>").Add();
})
)
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.DataSource = DataSource;
return View();
}
}
}
```

JS

```
<script type="text/javascript">
function click(e) {
var obj = $("#FlatGrid").data("ejGrid");
obj.deleteRecord("OrderID", obj.getSelectedRecords()[0]);
}
</script>
```

The following output is displayed as a result of the above code example.

Copyright © 2001 - 2020 Syncfusion Inc.

Column Template

HTML templates can be specified in the `Template` property of the particular column as a string (html element) or ID of the template's HTML element.

You can use JsRender syntax in the template. For more information about JsRender syntax, please refer this link.

For template manipulation using JavaScript, either you can use JsRender helper function or `TemplateRefresh` grid event. For more information on `TemplateRefresh` event, refer this link.

Note: If `Field` is not specified, you will not able to perform editing, grouping, filtering, sorting, search and summary functionalities in particular column.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
.PageSettings(page => { page.PageSize(4); })
.Columns(col =>
{
col.HeaderText("Photo").Template("<img style='width: 75px; height: 70px'
src='/13.2.0.29/themes/web/images/employees/{{"{{"}}:EmployeeID{{}}}}.png'
alt='{{"{{"}}:EmployeeID{{}}}}.png' />").Add();
col.Field("EmployeeID").Add();
col.Field("FirstName").Add();
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
col.Field("LastName").Add();
col.Field("Country").Add();
}))
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource = new NorthwindDataContext().EmployeeViews.ToList();
ViewBag.DataSource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.

Photo	EmployeeID	FirstName	LastName	Country
	1	Nancy	Davolio	USA
	2	Andrew	Fuller	USA
	3	Janet	Leverling	USA
	4	Margaret	Peacock	USA

1 2 3 1 of 3 pages (9 items)

Controlling Grid actions

You can control the grid actions of a particular column by setting the AllowSorting,AllowGrouping, AllowFiltering and AllowEditing properties of it as false.

The following code example describes the above behavior.

RAZOR

Copyright © 2001 - 2020 Syncfusion Inc.

```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
.AllowResizing()
.AllowSorting()
.AllowGrouping()
.AllowFiltering()
.EditSettings(edit => { edit.AllowEditing(); })
.Columns(col =>
{
col.Field("OrderID").IsPrimaryKey(true).Add();
col.Field("EmployeeID").AllowEditing(false).AllowResizing(false).AllowSortin
g(false).AllowGrouping(false).AllowFiltering(false).Add();
col.Field("Freight").Add();
col.Field("ShipCity").Add();
col.Field("ShipCountry").Add();
}) )
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.DataSource = DataSource;
return View();
}
}
}
```

Read only

To make a column as "read-only" then set AllowEditing property of Columns as false.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
.EditSettings(edit => { edit.AllowEditing(); })
.Columns(col =>
{
col.Field("OrderID").IsPrimaryKey(true).Add();
col.Field("EmployeeID").AllowEditing(false).Add();
col.Field("Freight").Add();
col.Field("ShipCity").Add();
col.Field("ShipCountry").Add();
})
)
```

C#

Copyright © 2001 - 2020 Syncfusion Inc.

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.DataSource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.

OrderID	EmployeeID	Freight	ShipCity	ShipCountry
10248	5	32.38	Reims	France
10249	6	11.61	Münster	Germany
10250	4	65.83	Rio de Janeiro	Brazil
10251	3	41.34	Lyon	France
10252	4	51.3	Charleroi	Belgium
10253	3	58.17	Rio de Janeiro	Brazil
10254	5	22.98	Bern	Switzerland
10255	9	148.33	Genève	Switzerland
10256	3	13.97	Resende	Brazil
10257	4	81.91	San Cristóbal	Venezuela
10258	1	140.51	Graz	Austria
10259	4	3.25	México D.F.	Mexico

1 2 3 4 5 6 7 8 ... 1 of 17 pages (200 items)

Expression Column

Expression column is possible only for Template column. You can use JsRender syntax in the template.

You can use JsRender syntax in the template. For more information about JsRender syntax, please refer this link.

Note: This expression column is supported at read only mode.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<Object>("FlatGrid")
```

```
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
.Columns(col =>
{
col.Field("FoodName").Add();
col.Field("Protein").Add();
col.Field("Fat").Add();
col.Field("Carbohydrate").Add();
col.HeaderText("Calories In Take").Template("<span>{{"{{"}}:Protein * 4  +
Fat * 4 + Carbohydrate * 9 {{}}}}</span>").Add();
})
)
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource = new NorthwindDataContext().FoodInformation.ToList();
ViewBag.DataSource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.

FoodName	Protein	Fat	Carbohydrate	Calories In Take
CHEESE BURGER	15	15	28	372
PIZZA	15	9	39	447
CHICKEN NOODLE	4	2	9	105
YOGURT	10	2	43	435
BEEF SANDWICH	22	13	34	446
CHICKEN BURGER	15	10	25	325

Command Column

Default action buttons

Using Command column, you can add CRUD action buttons as one of the grid column, through Type property of the Commands. The Type property supports the below default UnboundType buttons.

1. Edit

Copyright © 2001 - 2020 Syncfusion Inc.

2. Save
3. Delete
4. Cancel

Through ButtonOptions property of Commands, you can specify all the button options which are supported by Essential Studio ASP.NET MVC Button control.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
.EditSettings(edit => { edit.AllowEditing().AllowDeleting().AllowAdding();
})
.Columns(col =>
{
col.Field("OrderID").IsPrimaryKey(true).Add();
col.Field("EmployeeID").Add();
col.Field("Freight").EditType(EditingType.NumericEdit).Add();
col.Field("ShipCountry").Add();
col.HeaderText("Manage Records").Commands(command =>
{
command.Type(UnboundType.Edit)
.ButtonOptions(new Syncfusion.JavaScript.Models.ButtonProperties()
{
Text = "Edit"
}).Add();
command.Type(UnboundType.Delete)
.ButtonOptions(new Syncfusion.JavaScript.Models.ButtonProperties()
{
Text = "Delete"
}).Add();
command.Type(UnboundType.Save)
.ButtonOptions(new Syncfusion.JavaScript.Models.ButtonProperties()
{
Text = "Save"
}).Add();
command.Type(UnboundType.Cancel)
.ButtonOptions(new Syncfusion.JavaScript.Models.ButtonProperties()
{
Text = "Cancel"
}).Add();
}).Width(150).Add();
}) )
```

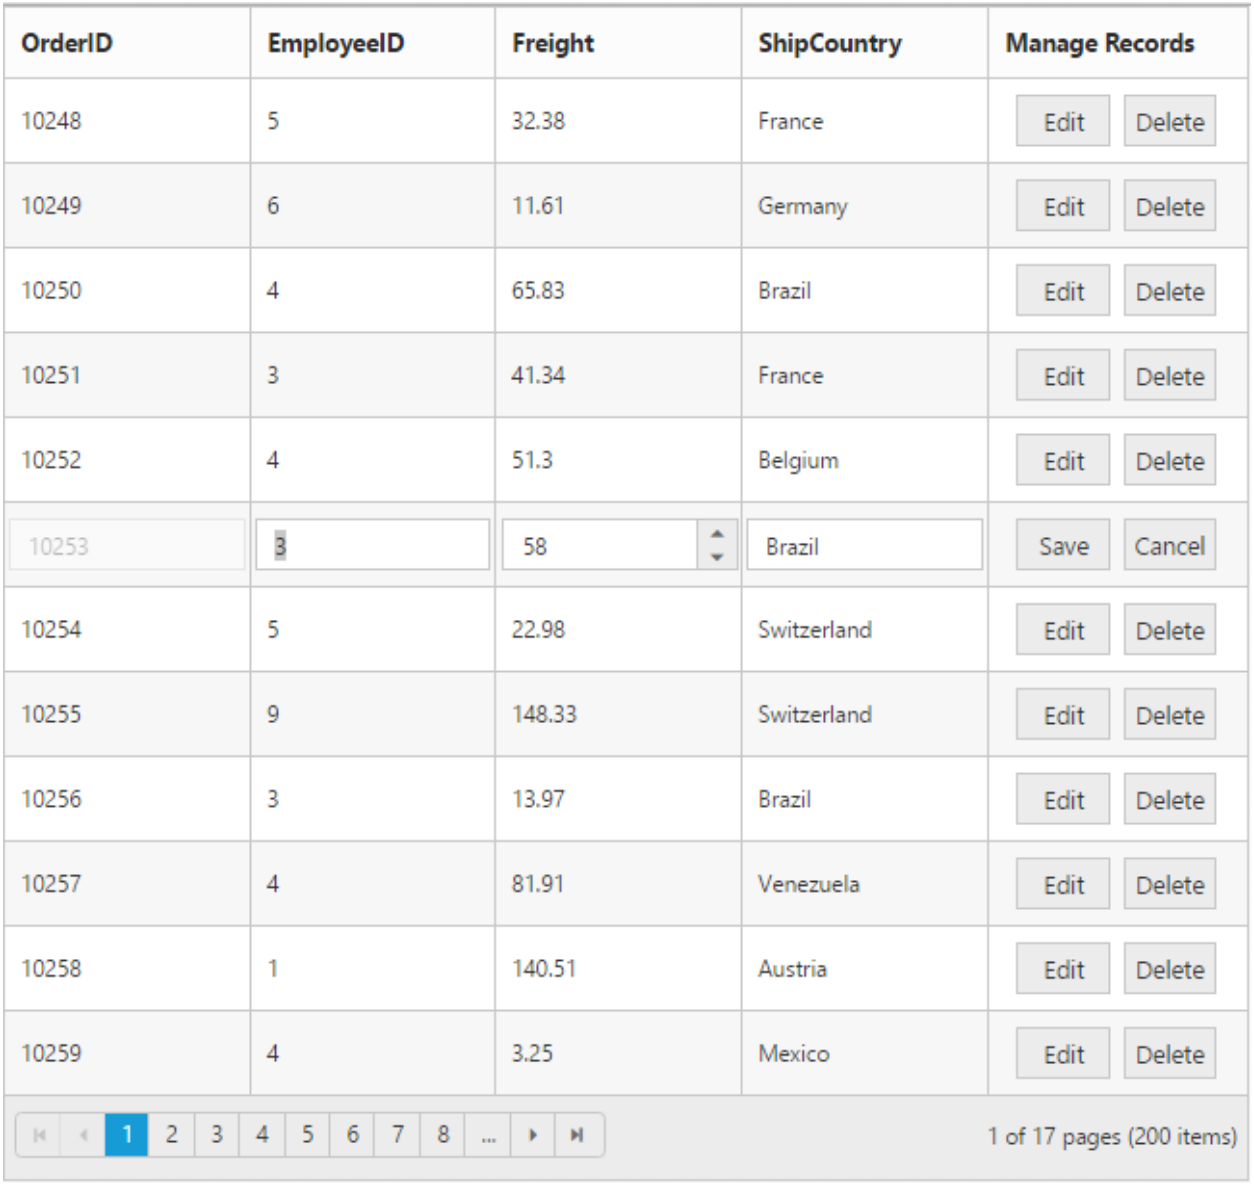
C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource = new NorthwindDataContext().OrdersView.ToList();
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
ViewBag.DataSource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.



OrderID	EmployeeID	Freight	ShipCountry	Manage Records
10248	5	32.38	France	Edit Delete
10249	6	11.61	Germany	Edit Delete
10250	4	65.83	Brazil	Edit Delete
10251	3	41.34	France	Edit Delete
10252	4	51.3	Belgium	Edit Delete
10253	3	58	Brazil	Save Cancel
10254	5	22.98	Switzerland	Edit Delete
10255	9	148.33	Switzerland	Edit Delete
10256	3	13.97	Brazil	Edit Delete
10257	4	81.91	Venezuela	Edit Delete
10258	1	140.51	Austria	Edit Delete
10259	4	3.25	Mexico	Edit Delete

1 2 3 4 5 6 7 8 ... 1 of 17 pages (200 items)

Custom buttons

You can add custom button in the command column by specifying the `Type` property of the `Commands` as `empty` or any other `string` instead of `enum` values.

Note: 1. For the Type property, assign any string value other than the default UnboundType.

2. In command column you can add only buttons.

The following code example describes the above behavior.

Copyright © 2001 - 2020 Syncfusion Inc.

RAZOR

```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
.Columns(col =>
{
col.Field("EmployeeID").Add();
col.HeaderText("Employee Details").Commands(command =>
{
command.Type("detail")
.ButtonOptions(new Syncfusion.JavaScript.Models.ButtonProperties()
{
Text = "Details",
Width = "100px",
Click = "onClick"
}).Add();
})
.TextAlign(TextAlign.Center)
.Width(150)
.Add();
})
)
```

C#

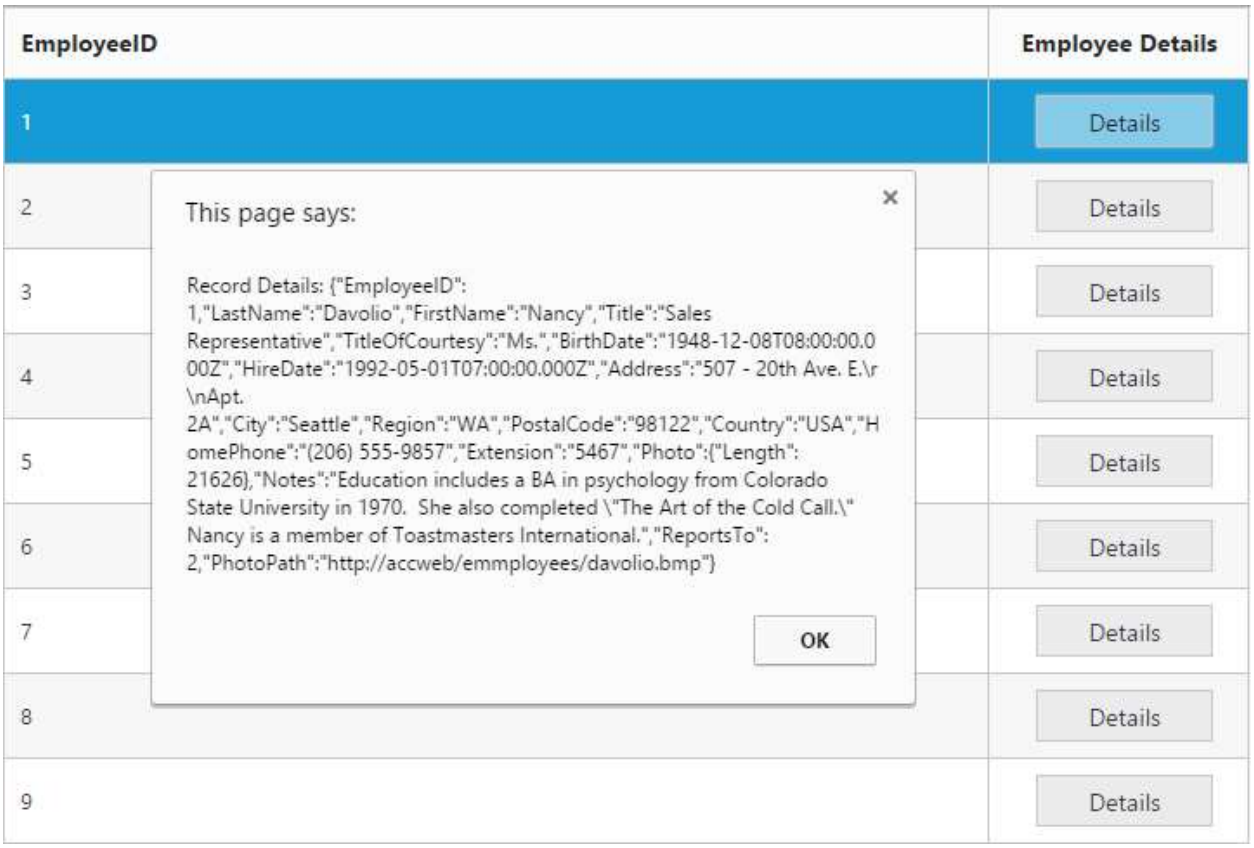
```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource = new NorthwindDataContext().OrdersView.ToList();
ViewBag.DataSource = DataSource;
return View();
}
}
}
```

JS

```
<script type="text/javascript">
function onClick(args) {
var grid = $("#FlatGrid").ejGrid("instance");
var index = this.element.closest("tr").index();
var record = grid.getCurrentViewData()[index];
alert("Record Details: " + JSON.stringify(record));
}
</script>
```

The following output is displayed as a result of the above code example.

Copyright © 2001 - 2020 Syncfusion Inc.



Column Chooser

Column chooser contains all the columns which are defined in the Columns property, using this you can control the visibility of columns in grid. You can prevent to show the particular column in column chooser by setting the ShowInColumnChooser property of Columns as false. It can be shown in the right corner of grid. To enable column chooser, set the ShowColumnChooser property as true.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
.ShowColumnChooser()
.Columns(col =>
{
col.Field("OrderID").IsPrimaryKey(true).Add();
col.Field("EmployeeID").ShowInColumnChooser(false).Add();
col.Field("Freight").Add();
col.Field("ShipCity").Add();
col.Field("ShipCountry").Add();
}) )
```

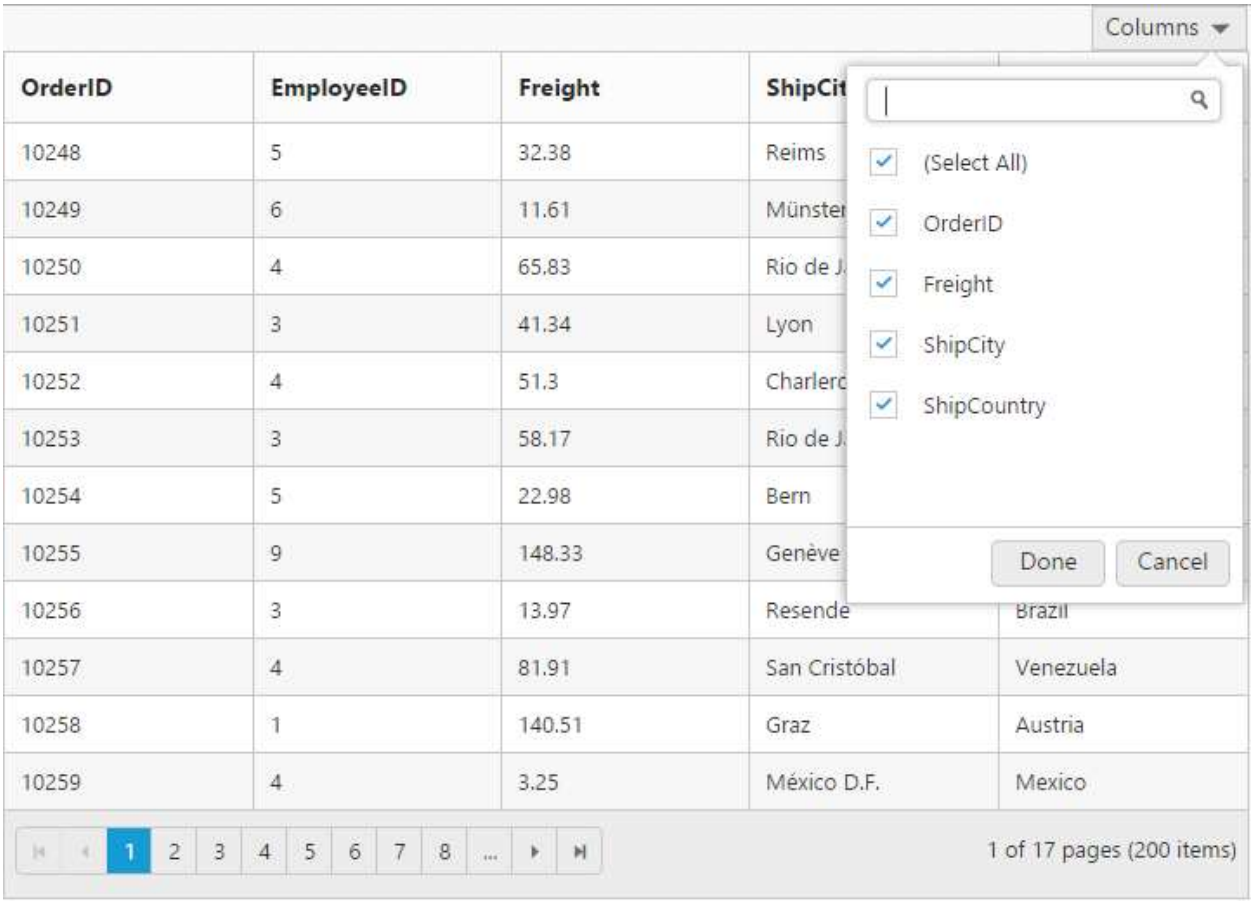
C#

```
namespace MVCSampleBrowser.Controllers
{
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource = new NorthwindDataContext().OrdersView.ToList();
ViewBag.DataSource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.



Foreign Key Column

Lookup data source can be bound to DataSource property of Columns. Data field and text can be set using the ForeignKeyField and ForeignKeyValue property of Columns.

In the DataSource property, we can bound local and remote data.

Information: For foreign key column the sorting and grouping is based on the ForeignKeyField instead of ForeignKeyValue. You can refer Foreign Key Adaptor to sort and group the foreign key column based on ForeignKeyValue.

Note: In remote data, server should be configured to perform select and filter operations since the Grid will try to fetch required columns using select operation and the required data using filter operation.

Copyright © 2001 - 2020 Syncfusion Inc.

Note: To render a Hierarchy Grid with different ForeignKeyField in parent and child table, click here.

The following code example describes the above behavior.

RAZOR

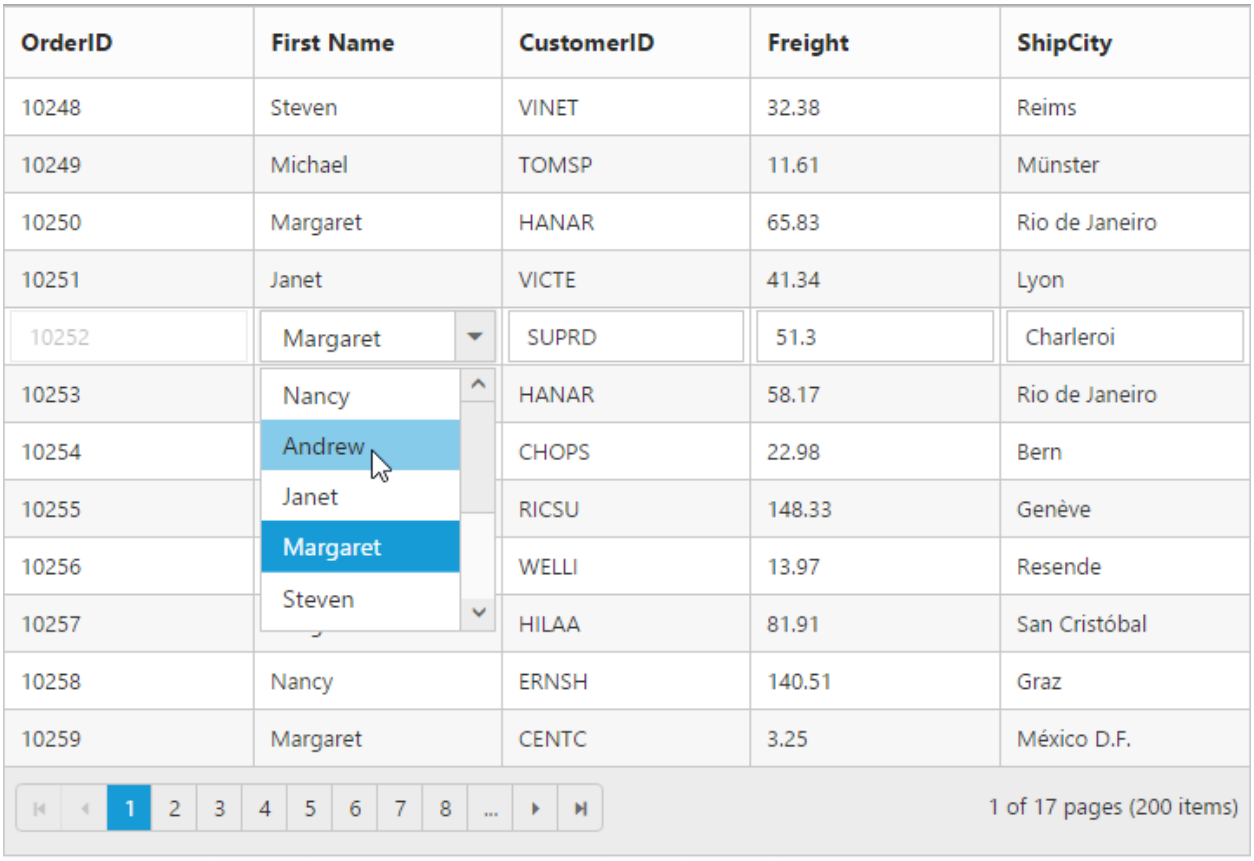
```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource1)
.AllowPaging()
.EditSettings(edit => { edit.AllowAdding().AllowDeleting().AllowEditing();
})
.Columns(col =>
{
col.Field("OrderID").IsPrimaryKey(true).Add();
col.Field("EmployeeID").HeaderText("First
Name").ForeignKeyField("EmployeeID").ForeignKeyValue("FirstName").DataSource
((IEnumerable<object>)ViewBag.DataSource2).Add();
//(or)
col.Field("EmployeeID").HeaderText("First
Name").ForeignKeyField("EmployeeID").ForeignKeyValue("FirstName").DataSource
("http://mvc.syncfusion.com/Services/Northwnd.svc/Employees/").Add();
col.Field("CustomerID").Add();
col.Field("Freight").Add();
col.Field("ShipCity").Add();
}) )
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource1 = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.DataSource1 = DataSource1;
var DataSource2 = new NorthwindDataContext().EmployeeViews.ToList();
ViewBag.DataSource2 = DataSource2;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.

Copyright © 2001 - 2020 Syncfusion Inc.



Customize column

You can customize the header and content of that particular column by the CssClass property of the column.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
.Columns(col =>
{
col.Field("OrderID").Add();
col.Field("CustomerID").Add();
col.Field("EmployeeID").CssClass("customizes").Add();
col.Field("Freight").Add();
})
)
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
var DataSource1 = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.DataSource = DataSource1;
return View();
}
}
}
```

CSS

```
.customizes.e-headercell {
background-color: #2382c3;
color: white;
font-family: 'Bell MT';
font-size: 20px;
}
.customizes.e-rowcell {
background-color: #ecedee;
font-family: 'Bell MT';
color: red;
font-size: 20px;
}
```

The following output is displayed as a result of the above code example.

Copyright © 2001 - 2020 Syncfusion Inc.

Type

Used to define the type of the particular column data. If the Type property of Columns is not specified then its type is automatically defined based on the first row data of that column.

Note: The Type is needed for filtering feature when first row of the data is null or empty.

The available column data type is tabulated as follows.

Type	Description
string	Gets or sets the type of the column value as string.
number	Gets or sets the type of the column value as number.
date	Gets or sets the type of the column value as date.
datetime	Gets or sets the type of the column value as datetime.
boolean	Gets or sets the type of the column value as true or false.
guid	Gets or sets the type of the column value as guid.

Copyright © 2001 - 2020 Syncfusion Inc.

checkbox	Gets or sets the type of the column value as checkbox for row selection.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
.Columns(col =>
{
col.Field("OrderID").Add();
col.Field("CustomerID").Type("string").Add();
col.Field("EmployeeID").Type("number").Add();
col.Field("Freight").Add();
col.Field("ShipCountry").Add();
}) )
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource1 = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.DataSource = DataSource1;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.

Column Layout

You can set the Grid's columns layout based on either Grid width or its columns width using the ColumnLayout property of Grid. There are two ways to set the column layout, they are.

1. Auto
2. Fixed

RAZOR

```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
.ColumnLayout(ColumnLayout.Fixed)
.Columns(col =>
{
col.Field("OrderID").Width(80).Add();
col.Field("EmployeeID").Width(80).Add();
col.Field("ShipCity").Width(90).Add();
col.Field("ShipName").Width(110).Add();
col.Field("ShipCountry").Width(100).Add();
col.Field("Freight").Width(80).Add();
}))
```

C#

```
namespace MVCSampleBrowser.Controllers
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.DataSource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.

OrderID	Employeel	ShipCity	ShipName	ShipCountry	Freight
10248	5	Reims	Vins et alcools Ch	France	32.38
10249	6	Münster	Toms Spezialitäte	Germany	11.61
10250	4	Rio de Janeiro	Hanari Carnes	Brazil	65.83
10251	3	Lyon	Victuailles en stoc	France	41.34
10252	4	Charleroi	Suprêmes délices	Belgium	51.3
10253	3	Rio de Janeiro	Hanari Carnes	Brazil	58.17
10254	5	Bern	Chop-suey Chine:	Switzerland	22.98
10255	9	Genève	Richter Supermar	Switzerland	148.33
10256	3	Resende	Wellington Impor	Brazil	13.97

10258	1	Graz	Ernst Handel	Austria	140.51
10259	4	México D.F.	Centro comercial	Mexico	3.25

1 2 3 4 5 6 7 8 ... 1 of 17 pages (200 items)

Row

It represents the record details that are fetched from the datasource.

Row hover

You can see the mouse hovering effect on the corresponding Grid rows using the EnableRowHover property. By default its value is true.

The following code example describes the previous behavior.

RAZOR

```
@(Html.EJ().Grid<OrdersView>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.AllowPaging()
.EnableRowHover(true)
.Columns(col =>
{
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
col.Field("OrderID").Add();
col.Field("EmployeeID").Add();
col.Field("ShipCity").Add();
col.Field("ShipCountry").Add();
col.Field("Freight").Add();
}))
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult Default()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the previous code example.

OrderID	EmployeeID	ShipCity	ShipCountry	Freight
10248	5	Reims	France	32.38
10249	6	Münster	Germany	11.61
10250	4	Rio de Janeiro	Brazil	65.83
10251	3	Lyon	France	41.34
10252	4	Charleroi	Belgium	51.3
10253	3	Rio de Janeiro	Brazil	58.17
10254	5	Bern	Switzerland	22.98

Details template

It provides a detailed view /additional information about each row of the grid. You can render any type of JsRender template and assign the script template id in the DetailsTemplate property. Also, you can change HTML elements in detail template row into JavaScript controls using the DetailsDataBound event.

On enabling details template, new column will be added in the grid with an expander button in it and that can be expanded or collapsed to show or hide the underlying details row respectively.

Note: It's a standard way to enclose the template within the script tag with type as "text/x-jsrender".

The following code example describes the previous behavior.

RAZOR

```
@(Html.EJ().Grid<EmployeeView>("DetailTemplate")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.DetailsTemplate("#tabGridContents")
.ClientSideEvents(eve => { eve.DetailsDataBound("detailGridData"); })
.Columns(col =>
{
col.Field("EmployeeID").Add();
col.Field("FirstName").Add();
col.Field("Title").Add();
col.Field("City").Add();
col.Field("Country").Add();
})
)
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult DetailTemplate()
{
var DataSource = new NorthwindDataContext().EmployeeViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

JS

```
<script id="tabGridContents" type="text/x-jsrender">
<div class="tabcontrol" id="Test">
<ul>
<li><a href="#gridTab{{"{{"}}:EmployeeID {{}}}}">Stock Grid</a></li>
</ul>
<div id="gridTab{{"{{"}}:EmployeeID {{}}}}">
<div id="detailGrid">
</div>
</div>
</div>
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
</script>
<script src="~/Scripts/jsondata.min.js"></script>
<script type="text/javascript">
function detailGridData(e) {
var filteredData = e.rowData["EmployeeID"];
// the datasource "window.ordersView" is referred from jsondata.min.js
var data =
ej.DataManager(window.ordersView).executeLocal(ej.Query().where("EmployeeID"
, "equal", parseInt(filteredData), true).take(5));
e.detailsElement.find("#detailGrid").ejGrid({
dataSource: data,
columns: [
{field: "OrderID"},
{field: "EmployeeID"},
{field: "ShipCity"},
{field: "ShipCountry"},
{field: "Freight"}
]
});
e.detailsElement.find(".tabcontrol").ejTab();
}
</script>
```

The following output is displayed as a result of the previous code example.

Row Template

Row template enables you to set the customized look and behavior to grid all rows. The `RowTemplate` property can be used bind the `id` of HTML template.

The following code example describes the previous behavior.

JS

```
<script id="templateData" type="text/x-jsrender">
<tr>
<td class="photo">
<img style="width:130px;height: 160px"
src="/13.2.0.29/themes/web/images/employees/{{"{{"}}:EmployeeID {{}}}}.png"
alt="{{"{{"}}:EmployeeID {{}}}}" />
</td>
<td class="details">
<table class="CardTable" cellpadding="3" cellspacing="2">
<colgroup>
<col width="50%">
<col width="50%">
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
</colgroup>
<tbody>
<tr>
<td class="CardHeader">First Name</td>
<td>{{"{{"}}:FirstName {{}}}} </td>
</tr>
<tr>
<td class="CardHeader">Last Name</td>
<td>{{"{{"}}:LastName {{}}}}</td>
</tr>
<tr>
<td class="CardHeader">Title</td>
<td>{{"{{"}}:Title {{}}}}</td>
</tr>
</tbody>
</table>
</td>
</tr>
</script>
```

CSS

```
<style>
.photo img {
width: 130px;
}
.photo, .details {
border-color: #c4c4c4;
border-style: solid;
}
.photo {
border-width: 1px 0px 0px 0px;
}
.details {
border-width: 1px 0px 0px 1px;
}
.details > table {
width: 100%;
}
.CardHeader {
font-weight: bolder;
}
</style>
```

RAZOR

```
@(Html.EJ().Grid<EmployeeView>("RowTemplate")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.Query("new ej.Query().take(2)")
.Columns(col =>
{
col.HeaderText("Photo").Width(30).Add();
col.HeaderText("Employee Details").Width(70).Add();
})
.RowTemplate("#templateData")    // row template
)
```

Copyright © 2001 - 2020 Syncfusion Inc.

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult RowTemplate()
{
var DataSource = new NorthwindDataContext().EmployeeViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the previous code example.

Photo	Employee Details	
	First Name Last Name Title	Nancy Davolio Sales Representative
	First Name Last Name Title	Andrew Fuller Vice President, Sales

Alternate row styling

Alternate row styling enhances the readability of grid rows by setting different background color for every alternate row. You can enable the alternative row styling in grid by using the EnableAltRow property.

By default its value is true, so the following code example describes the how to turn off alternate row behavior.

RAZOR

```
@(Html.EJ().Grid<OrdersView>("Grid")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.AllowPaging()
.EnableAltRow(false)
.Columns(col =>
{
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
col.Field("OrderID").Add();
col.Field("EmployeeID").Add();
col.Field("ShipCity").Add();
col.Field("ShipCountry").Add();
col.Field("Freight").Add();
})
)
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult Default()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the previous code example.

OrderID	EmployeeID	ShipCity	ShipCountry	Freight
10248	5	Reims	France	32.38
10249	6	Münster	Germany	11.61
10250	4	Rio de Janeiro	Brazil	65.83
10251	3	Lyon	France	41.34
10252	4	Charleroi	Belgium	51.3
10253	3	Rio de Janeiro	Brazil	58.17
10254	5	Bern	Switzerland	22.98
10255	9	Genève	Switzerland	148.33
10256	3	Resende	Brazil	13.97
10257	4	San Cristóbal	Venezuela	81.91
10258	1	Graz	Austria	140.51
10259	4	México D.F.	Mexico	3.25

Drag-and-Drop

The grid rows can be reordered, dropped to another grid or custom control by enabling the AllowRowDragAndDrop grid property.

Note: To enable selection of multiple rows by mouse dragging on grid rows, the SelectionType property of grid must be set to the “multiple”.

Reorder

By simply enabling the property AllowRowDragAndDrop, grid rows can be reordered within the same grid.

The following code example describes the previous behavior.

RAZOR

```
@(Html.EJ().Grid<OrdersView>("Grid")
.Datasource(datasource =>
datasource.Json((IEnumerable<object>)ViewBag.datasource).Adaptor(AdaptorType
.RemoteSaveAdaptor))
.AllowSorting()
.AllowPaging()
.SelectionType(SelectionType.Multiple)
.AllowRowDragAndDrop()
.RowDropSettings(drop => drop.RowDropMapper("RowDropHandler"))
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order
ID").IsPrimaryKey(true).TextAlign(TextAlign.Right).Width(75).Add();
col.Field("CustomerID").HeaderText("Customer ID").Width(80).Add();
col.Field("EmployeeID").HeaderText("Employee
ID").TextAlign(TextAlign.Right).Width(75).Add();
col.Field("Freight").HeaderText("Freight").TextAlign(TextAlign.Right).Width(
75).Format("{0:C}").Add();
col.Field("ShipCity").HeaderText("Ship City").Width(110).Add();
})
)
```

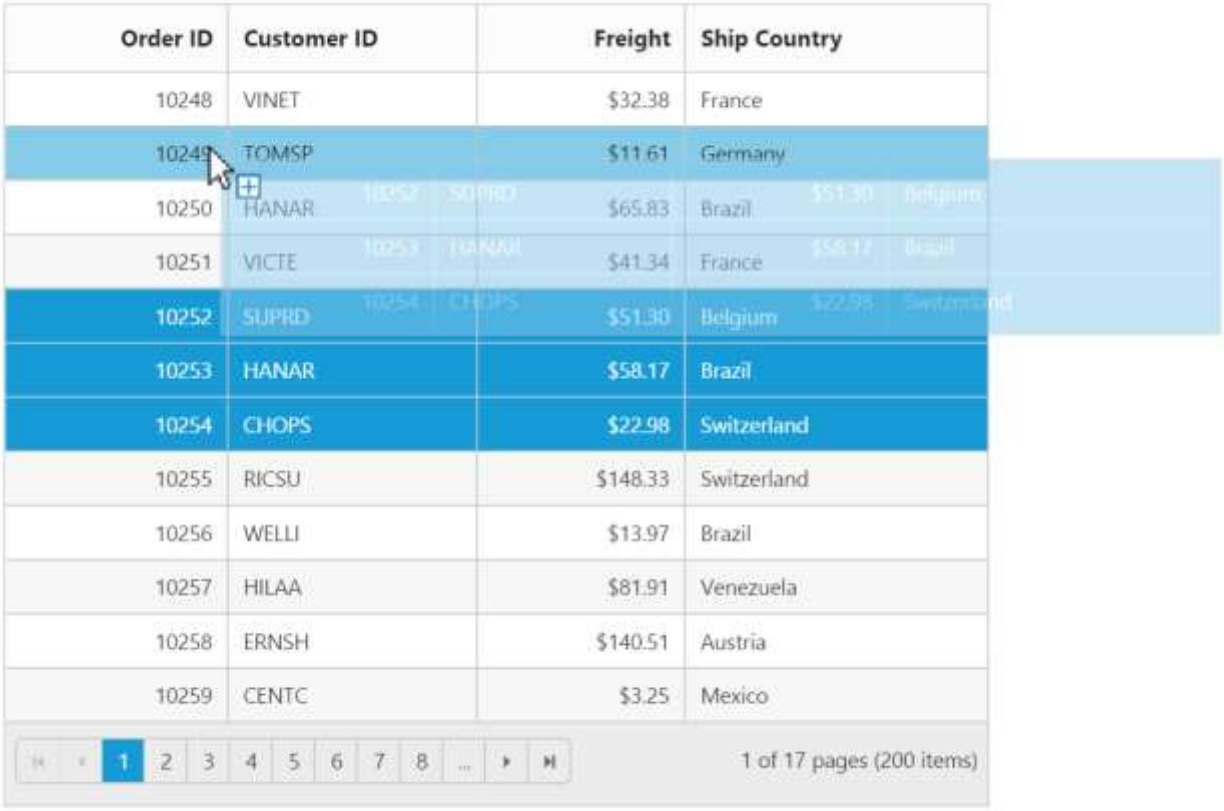
C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult Default()
{
ViewBag.datasource =OrderRepository.GetAllRecords();
return View();
}
public ActionResult RowDropHandler(List<EditableOrder> changed)
{
JavaScriptSerializer ser = new JavaScriptSerializer();
RowDropModel dropDetails =
(RowDropModel)ser.Deserialize(Request.Headers["rowDropDetails"],
typeof(RowDropModel));
var count = 0;
foreach (var item in changed)
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
{
EditableOrder result = OrderRepository.GetAllRecords().Where(o => o.OrderID
== item.OrderID).FirstOrDefault();
OrderRepository.GetAllRecords().Remove(result);
OrderRepository.GetAllRecords().Insert(dropDetails.DestinationRowIndex +
count, item);
count++;
}
return Json(changed, JsonRequestBehavior.AllowGet);
}
}
}
```

The following output is displayed before reordering rows.



Order ID	Customer ID	Freight	Ship Country
10248	VINET	$32.38	France
10249	TOMSP	$11.61	Germany
10250	HANAR	$65.83	Brazil

Grid-to-grid

To drag and drop rows between two grid, enable the grid property AllowRowDragAndDrop and specify the target grid ID in DropTargetID property of the grid RowDropSettings.

Dragged and Dropped rows can be mapped to server-side using the RowDragMapper and RowDropMapper property of grid RowDropSettings.

The following code example describes the previous behavior.

RAZOR

```
<div style="float:left;width:49%">
@(Html.EJ().Grid<OrdersView>("Grid")
.Datasource(datasource =>
datasource.Json((IEnumerable<object>)ViewBag.datasource).Adaptor(AdaptorType
.RemoteSaveAdaptor))
.AllowSorting()
.AllowPaging()
.SelectionType(SelectionType.Multiple)
.AllowRowDragAndDrop()
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
.RowDropSettings(drop =>
drop.RowDragMapper("RowDragHandler").RowDropMapper("RowDropHandler").DropTar
getID("#DesignationGrid"))
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order
ID").IsPrimaryKey(true).TextAlign(TextAlign.Right).Width(75).Add();
col.Field("CustomerID").HeaderText("Customer ID").Width(80).Add();
col.Field("EmployeeID").HeaderText("Employee
ID").TextAlign(TextAlign.Right).Width(75).Add();
col.Field("Freight").HeaderText("Freight").TextAlign(TextAlign.Right).Width(
75).Format("{0:C}").Add();
col.Field("ShipCity").HeaderText("Ship City").Width(110).Add();
}))
</div>
<div style="float:right;width:49%">
@(Html.EJ().Grid<OrdersView>("DesignationGrid")
.Datasource(datasource =>
datasource.Json((IEnumerable<object>)ViewBag.datasource2).Adaptor(AdaptorTyp
e.RemoteSaveAdaptor))
.AllowSorting()
.AllowPaging()
.SelectionType(SelectionType.Multiple)
.AllowRowDragAndDrop()
.RowDropSettings(drop =>
drop.RowDragMapper("RowDragHandler2").RowDropMapper("RowDropHandler2").DropT
argetID("#Grid"))
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order
ID").IsPrimaryKey(true).TextAlign(TextAlign.Right).Width(75).Add();
col.Field("CustomerID").HeaderText("Customer ID").Width(80).Add();
col.Field("EmployeeID").HeaderText("Employee
ID").TextAlign(TextAlign.Right).Width(75).Add();
col.Field("Freight").HeaderText("Freight").TextAlign(TextAlign.Right).Width(
75).Format("{0:C}").Add();
col.Field("ShipCity").HeaderText("Ship City").Width(110).Add();
}))
</div>
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public partial class GridController : Controller
{

}
}
}
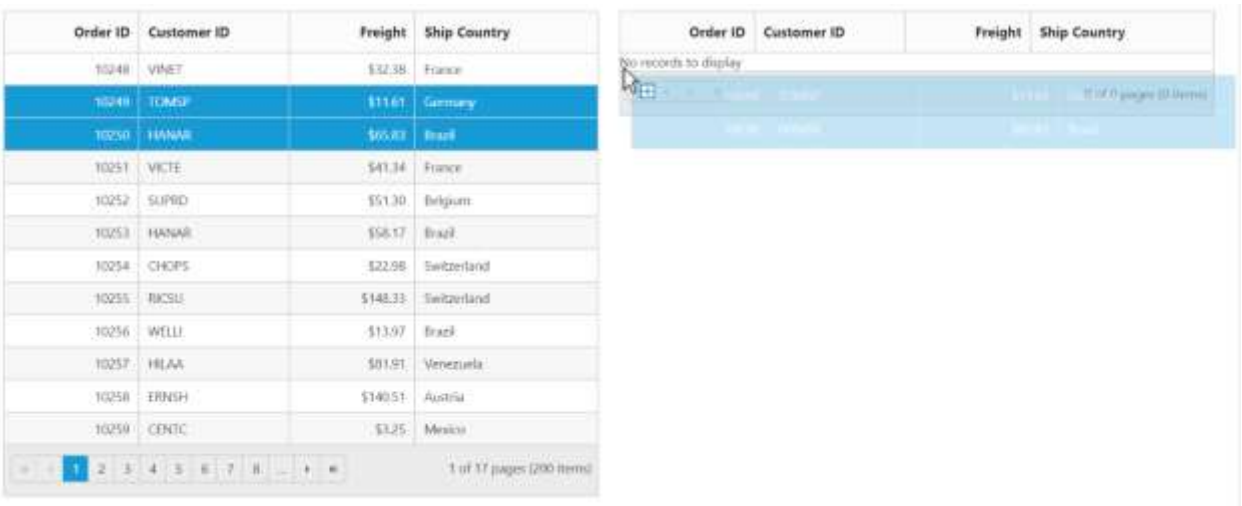
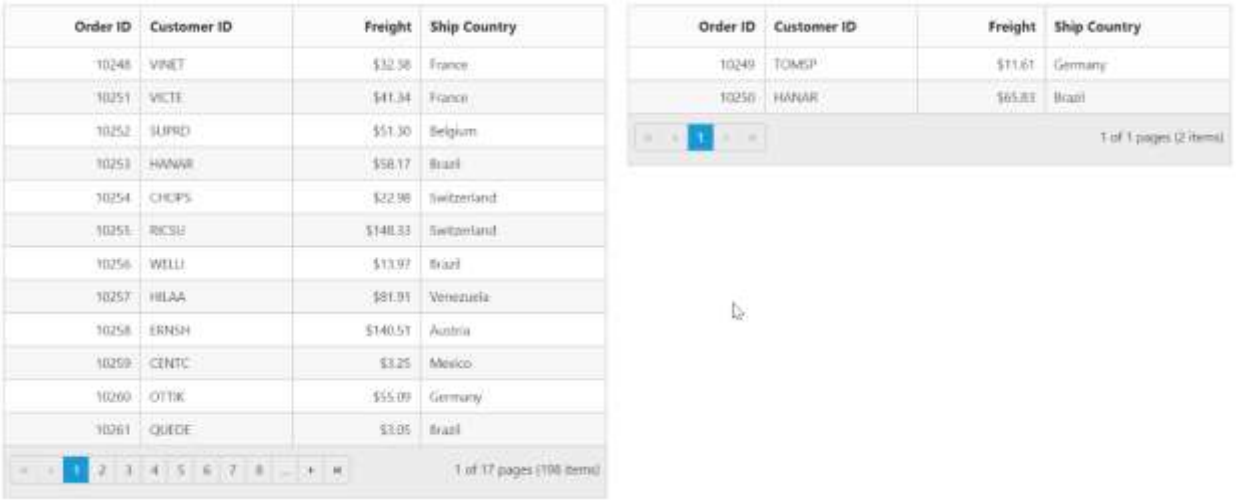
```

The following output is displayed before dropping grid rows.

Copyright © 2001 - 2020 Syncfusion Inc.



The following output is displayed after dropping grid rows.



Grid-to-custom control

You can also drag and drop grid rows to any custom control. For instance, let it be a form.

Enable the grid property AllowRowDragAndDrop and specify the target form element ID in DropTargetID property of grid RowDropSettings.

On dropping the grid records on form element, grid event “RowDrop” would be triggered by which we can populate input elements in form.

The following code example describes the previous behavior.

RAZOR

```
<div style="float:left;width:49%">
@(Html.EJ().Grid<OrdersView>("Grid")
.Datasource(datasource =>
datasource.Json((IEnumerable<object>)ViewBag.datasource).Adaptor(AdaptorType
.RemoteSaveAdaptor))
.AllowSorting()
.AllowPaging()
.AllowRowDragAndDrop()
```

```
.RowDropSettings(drop => drop.DropTargetID("#DropForm"))
.ClientSideEvents(eve => eve.RowDrop("rowDropHandler"))
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order
ID").IsPrimaryKey(true).TextAlign(TextAlign.Right).Width(75).Add();
col.Field("CustomerID").HeaderText("Customer ID").Width(80).Add();
col.Field("EmployeeID").HeaderText("Employee
ID").TextAlign(TextAlign.Right).Width(75).Add();
col.Field("Freight").HeaderText("Freight").TextAlign(TextAlign.Right).Width(
75).Format("{0:C}").Add();
col.Field("ShipCity").HeaderText("Ship City").Width(110).Add();
}))
</div>
<div style="float:right;width:38%">
<form role="form" id="dropForm" style="width:98%">
<fieldset style="text-align:center; font-weight:700"><legend>Record
Details</legend></fieldset>
<div class="form-group row">
<label for="OrderID">Order ID:</label>
<input class="form-control" name="OrderID">
</div>
<div class="form-group row">
<label for="CustomerID">Customer ID:</label>
<input name="CustomerID" class="form-control">
</div>
<div class="form-group row">
<label for="EmployeeID">Employee ID:</label>
<input name="EmployeeID" class="form-control">
</div>
<div class="form-group row">
<label for="Freight">Freight:</label>
<input name="Freight" class="form-control">
</div>
<div class="form-group row">
<label for="ShipCity">Ship City:</label>
<input name="ShipCity" class="form-control">
</div>
<br />
</form>
</div>
```

C#

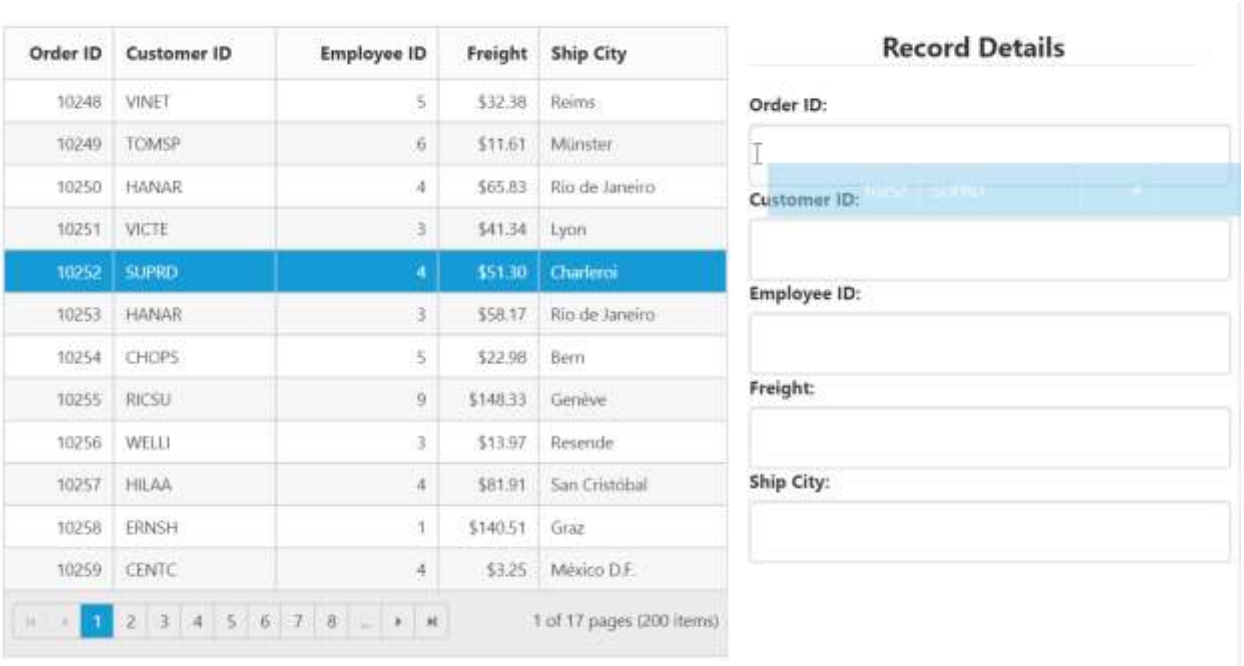
```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult Default()
{
ViewBag.datasource =OrderRepository.GetAllRecords();
return View();
}
}
}
```

Copyright © 2001 - 2020 Syncfusion Inc.

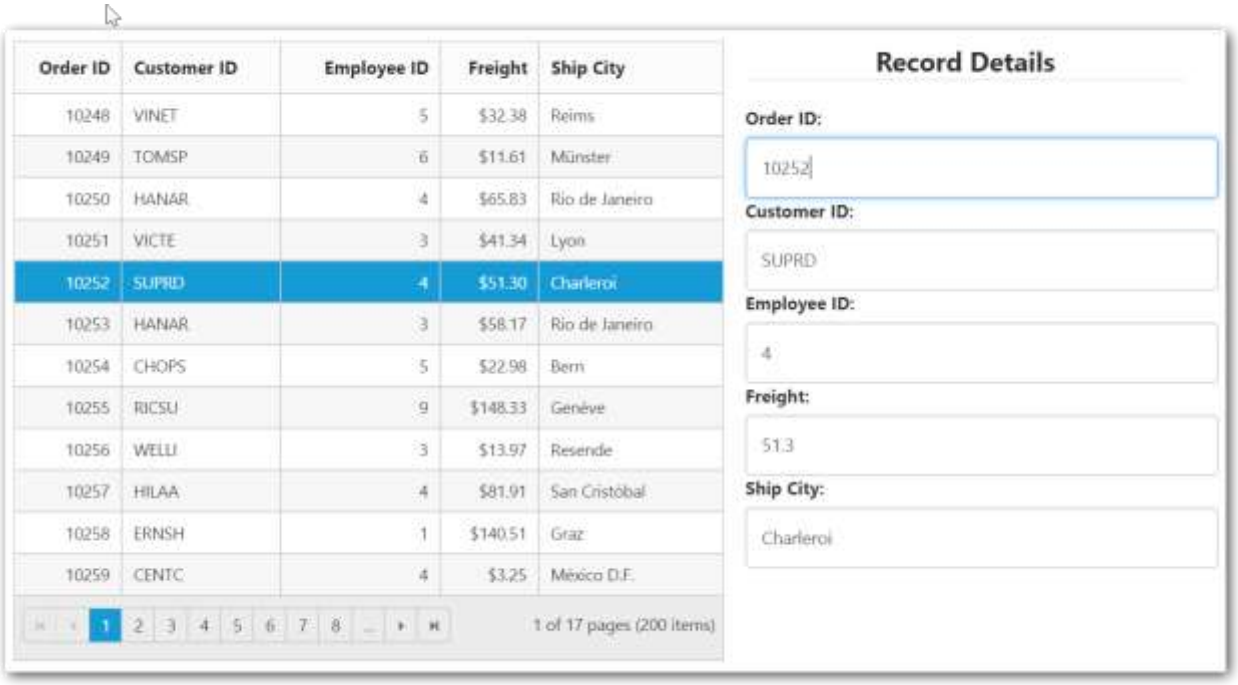
JS

```
<script type="text/javascript">
function rowDropHandler(args) {
for (var key in args.rowData[0]) {
$('#dropForm input[name=' + key + ']').val(args.rowData[0][key]);
}
}
</script>
```

The following output is displayed before dropping the rows on form.



The following output is displayed after dropping the rows on form.



Note: The default behavior of drag and drop between grid or any other controls is as cut and paste. For copy and paste behavior specify the drag behavior in the DragBehavior property of RowDropSettings as "DragBehavior.Copy".

Cell

Auto wrap

Auto wrap enables the Grid to wrap the cell content or header content to next line when the content exceeds the boundary of the cell width. To enable auto wrap, set the AllowTextWrap property as true.

We can specify the mode of auto wrap using WrapMode property of the TextWrapSettings.

Three types of WrapMode are available and they are.

1. Both
2. Header
3. Content

Note: 1. By default the WrapMode will be set as Both.

2. While using the TextWrapSettings then it is must to set the AllowTextWrap as true.

3. For the WrapMode property you can assign enum value (Syncfusion.JavaScript.WrapMode.Both).

Both

When the WrapMode of TextWrapSettings property is set as Both then the auto wrap will be enabled for both grid content and header.

The following code example describes the above behavior.

RAZOR

Copyright © 2001 - 2020 Syncfusion Inc.

```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
.AllowTextWrap()
.TextWrapSettings(wrap => { wrap.WrapMode(WrapMode.Both); })
.Columns(col =>
{
col.Field("OrderID").Width(100).Add();
col.Field("EmployeeID").Width(100).Add();
col.Field("Freight").Width(100).Add();
col.Field("ShipCity").Width(150).Add();
col.Field("ShipAddress").HeaderText("Ship Address").Width(100).Add();
}))
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.DataSource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.

OrderID	EmployeeID	Freight	ShipCity	Ship Address
10248	5	32.38	Reims	59 rue de l'Abbaye
10249	6	11.61	Münster	Luisenstr. 48
10250	4	65.83	Rio de Janeiro	Rua do Paço, 67
10251	3	41.34	Lyon	2, rue du Commerce
10252	4	51.3	Charleroi	Boulevard Tirou, 255
10253	3	58.17	Rio de Janeiro	Rua do Paço, 67
10254	5	22.98	Bern	Hauptstr. 31

Copyright © 2001 - 2020 Syncfusion Inc.

Header

When the WrapMode of TextWrapSettings property is set as Header then the auto wrap will be enabled only for Grid header alone.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
.AllowTextWrap()
.TextWrapSettings(wrap => { wrap.WrapMode(WrapMode.Header); })
.Columns(col =>
{
col.Field("OrderID").Width(100).Add();
col.Field("EmployeeID").Width(100).Add();
col.Field("Freight").Width(100).Add();
col.Field("ShipCity").Width(150).Add();
col.Field("ShipAddress").HeaderText("Ship Address").Width(100).Add();
}))
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.DataSource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.

Content

When the WrapMode of TextWrapSettings property set as Content then the auto wrap will be enabled only for the Grid content alone.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
.AllowTextWrap()
.TextWrapSettings(wrap => { wrap.WrapMode(WrapMode.Header); })
.Columns(col =>
{
col.Field("OrderID").Width(100).Add();
col.Field("EmployeeID").Width(100).Add();
col.Field("Freight").Width(100).Add();
col.Field("ShipCity").Width(150).Add();
col.Field("ShipAddress").HeaderText("Ship Address").Width(100).Add();
}))
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
ViewBag.DataSource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.

OrderID	EmployeeID	Freight	ShipCity	Ship Address
10248	5	32.38	Reims	59 rue de l'Abbaye
10249	6	11.61	Münster	Luisenstr. 48
10250	4	65.83	Rio de Janeiro	Rua do Paço, 67
10251	3	41.34	Lyon	2, rue du Commerce
10252	4	51.3	Charleroi	Boulevard Tirou, 255

10254	5	22.98	Bern	Hauptstr. 31

1 2 3 4 5 6 7 8 ... 1 of 29 pages (200 items)

Cell Merging

The grid has options to merge the grid cells based on the required conditions. This can be enabled by setting the `AllowCellMerging` property as `true` and the merge conditions can be defined in `MergeCellInfo` event. In this event, you can get the column details and data of that particular row and column which is helpful in defining conditions.

You can merge the rows and cells of grid, using the `rowMerge`, `colMerge` and `merge` functions available in `MergeCellInfo` event's argument.

Note: The following features are not supported with Cell Merging

1. Normal Mode Editing
2. Inline Mode Editing
3. Inline TemplateForm Mode Editing
4. Grouping
5. Virtual Scrolling
6. Frozen Columns
7. Cell Selection Modes

Copyright © 2001 - 2020 Syncfusion Inc.

8. Column Selection

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
.AllowCellMerging()
.Columns(col =>
{
col.Field("OrderID").Add();
col.Field("EmployeeID").Add();
col.Field("ShipCity").Add();
col.Field("ShipCountry").Add();
col.Field("Freight").Add();
})
.ClientSideEvents(eve => { eve.MergeCellInfo("mergeCellInfo"); })
)
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.DataSource = DataSource;
return View();
}
}
}
```

C#

```
<script type="text/javascript">
function mergeCellInfo(args)
{
if (args.column.field == "EmployeeID" && args.rowData.OrderID == 10248)
args.rowMerge(3);
else if (args.column.field == "ShipCity" && args.rowData.OrderID == 10252)
args.colMerge(3);
else if (args.column.field == "ShipCity" && args.rowData.OrderID == 10255)
args.merge(0, 3);
}
</script>
```

The following output is displayed as a result of the above code example.

Custom Attribute

You can add custom attribute for the particular column's td element by using CustomAttributes property of the column.

Based on custom attribute you can customize the style and appearance of the td element or handling jQuery functionalities.

You can use JsRender syntax in the template. For more information about JsRender syntax, please refer this link.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
.Columns(col =>
{
col.Field("OrderID").Add();
col.Field("CustomerID").Add();
col.Field("EmployeeID").Add();
col.Field("ShipCity").CustomAttributes(custom => {
custom.AddAttribute("title","'{{"{{"}}:ShipCity {{}}}}'"); }).Add();
col.Field("ShipCountry").Add();
})
)
```

Displaying HTML content

This will helps you to show actual HTML value in grid content and header. To disable HTML code, set the DisableHtmlEncode property of Columns as true.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
.Columns(col =>
{
col.Field("OrderID").Add();
col.Field("CustomerID").HeaderText("<div>Customer
ID</div>").disableHtmlEncode(true).Add();
col.Field("EmployeeID").HeaderText("<div>Employee
ID</div>").disableHtmlEncode(false).Add();
col.Field("ShipCountry").Add();
})
)
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource1 = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.DataSource = DataSource1;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.

OrderID	Customer ID	Employee ID	ShipCountry
10248	VINET	5	France

1 2 3 4 5 6 7 8 ... 1 of 17 pages (200 items)

Tooltip

When you move the cursor over the particular cell it provides an information about the corresponding cell value.

Template

Copyright © 2001 - 2020 Syncfusion Inc.

HTML templates can be specified in the Tooltip property of the particular column cell as a string (HTML element) or ID of the template's HTML element.You can use JsRender syntax in the template. For more information about JsRender syntax, please refer this link.

Note: It's a standard way to enclose the template within the script tag with type as "text/x-jsrender".

The Tooltip template must contain value property to bind the corresponding cell text in tooltip

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
.Columns(col =>
{
col.Field("OrderID").Add();
col.Field("EmployeeID").Add();
col.Field("ShipCity").Tooltip("#colTip").Add();
col.Field("Freight").Add();
})
)
```

C#

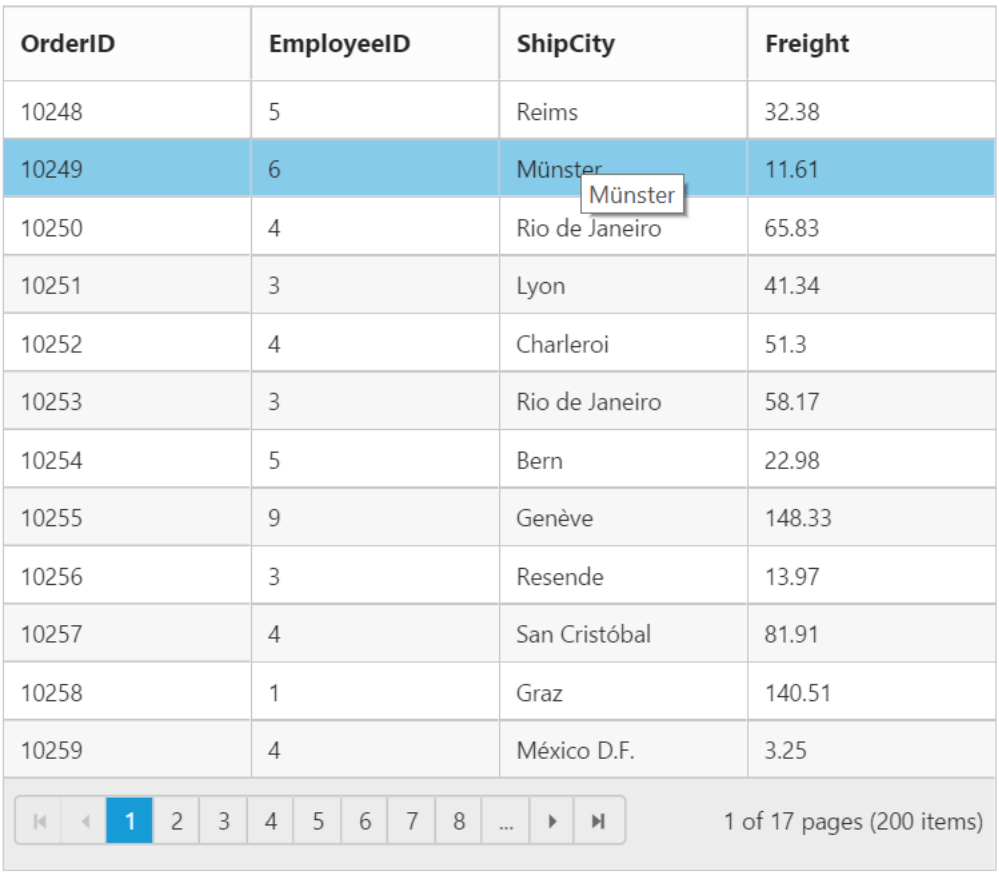
```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult DetailTemplate()
{
var DataSource = new NorthwindDataContext().EmployeeViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

JS

```
<script type="text/template" id="colTip">
{{"{{"}}:value{{}}}}
</script>
```

The following output is displayed as a result of the above code example.

Copyright © 2001 - 2020 Syncfusion Inc.



ClipMode

When the cell value contains a long text that will not fit into the grid column cell, the ClipMode property is used. By using the ClipMode, the cell value will be displayed with ellipsis or with clipped content when the text overflows inside a column cell.

Note: By default the ClipMode will be set as Clip.

List of types

1. Clip
2. Ellipsis
3. EllipsisWithTooltip

Clip

When the content overflows, the remaining content will be hidden in the particular cell

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
.Columns(col =>
{
col.Field("OrderID").Add();
```

```
col.Field("ShipCity").Add();
col.Field("ShipName").ClipMode(ClipMode.Clip).Add();
col.Field("Freight").Add();
})
)
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult DetailTemplate()
{
var DataSource = new NorthwindDataContext().EmployeeViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.

OrderID	ShipCity	ShipName	Freight
10248	Reims	Vins et alcools Cl	32.38
10249	Münster	Toms Spezialitäte	11.61
10250	Rio de Janeiro	Hanari Carnes	65.83

10259	México D.F.	Centro comercial	3.25

1 2 3 4 5 6 7 8 ... 1 of 17 pages (200 items)

Ellipsis

Ellipsis will be displayed when the content overflows its column width. Here the Tooltip will not be shown for corresponding columns.

Copyright © 2001 - 2020 Syncfusion Inc.

The following code example describes the above behavior.

RAZOR

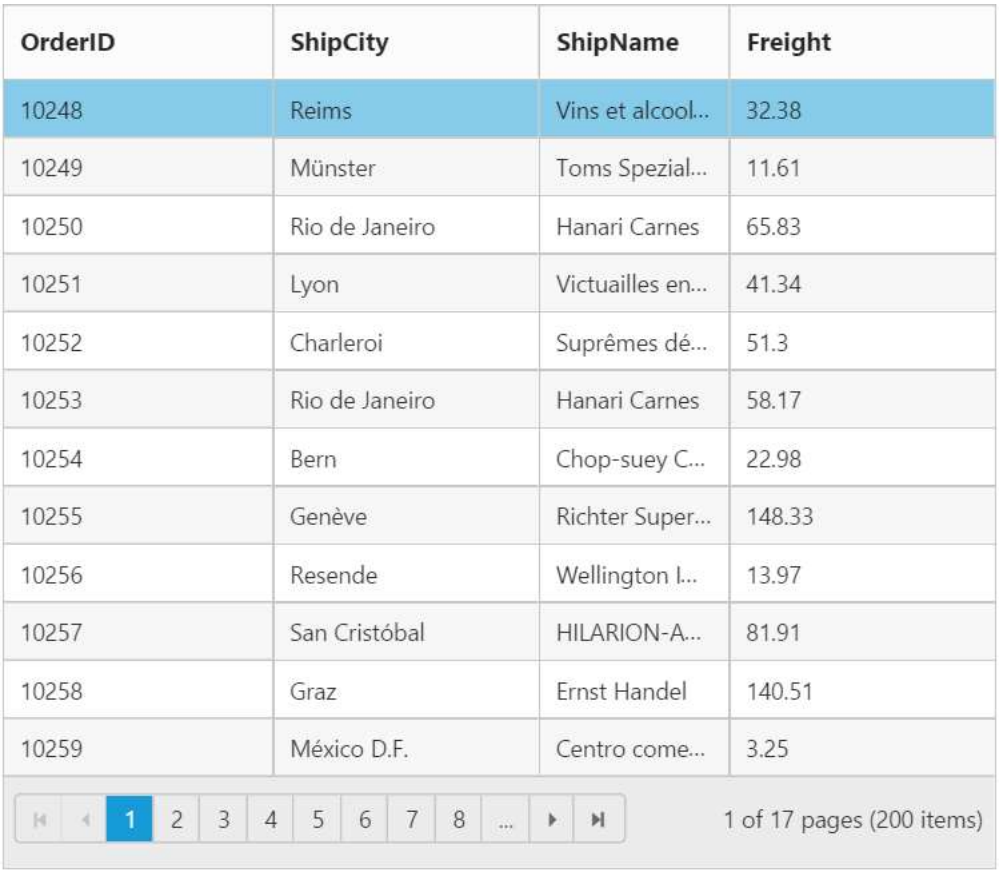
```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
.Columns(col =>
{
col.Field("OrderID").Add();
col.Field("ShipCity").Add();
col.Field("ShipName").ClipMode(ClipMode.Ellipsis).Add();
col.Field("Freight").Add();
})
)
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult DetailTemplate()
{
var DataSource = new NorthwindDataContext().EmployeeViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.

Copyright © 2001 - 2020 Syncfusion Inc.



Ellipsis With Tooltip

Ellipsis will be displayed when the content overflows its column width. Here tooltip will be shown only for the corresponding column cells that shows ellipsis.

Note: If `ClipMode` is set as `EllipsisWithTooltip`, then `Tooltip` must be given.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
.Columns(col =>
{
col.Field("OrderID").Add();
col.Field("ShipCity").Add();
col.Field("ShipName").Tooltip("#colTip").ClipMode(ClipMode.EllipsisWithTooltip).Add();
col.Field("Freight").Add();
})
)
```

C#

```
namespace MVCSampleBrowser.Controllers
{
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
public class GridController : Controller
{
public ActionResult DetailTemplate()
{
var DataSource = new NorthwindDataContext().EmployeeViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

JS

```
<script type="text/template" id="colTip">
{{"{{"}}:value{{}}}}
</script>
```

The following output is displayed as a result of the above code example.

OrderID	ShipCity	ShipName	Freight

Sorting

The Grid control has support to sort data bound columns in ascending or descending order. This can be achieved by setting the AllowSorting property as true.

To dynamically sort a particular column, click on its column header. The order switch between ascending and descending each time you click a column header for sorting.

Copyright © 2001 - 2020 Syncfusion Inc.

The following code example describes the previous behavior.

RAZOR

```
@(Html.EJ().Grid<object>("Grid")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.AllowPaging()
.AllowSorting()
.Columns(col =>
{
col.Field("OrderID").Add();
col.Field("EmployeeID").Add();
col.Field("ShipCity").Add();
col.Field("ShipCountry").Add();
col.Field("Freight").Add();
})
)
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource = OrderRepository.GetAllRecords();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the previous code sample.

Copyright © 2001 - 2020 Syncfusion Inc.

Initial sorting

Through the SortedColumns property of SortSettings, you can sort the columns while initializing the grid itself. You need to specify the Field (Columns) name and Direction in the SortedColumns.

Note: 1. For the Direction property you can assign either string value ("Descending") or enum value (SortOrder.Descending).

2. You can add multiple columns in the SortedColumns for multi column sorting while initializing the grid itself.

The following code example describes the previous behavior.

RAZOR

```
@(Html.EJ().Grid<object>("Grid")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.AllowPaging()
.AllowSorting()
.SortSettings(sort => sort.SortedColumns(col =>
col.Field("EmployeeID").Direction(SortOrder.Descending).Add()))
.Columns(col =>
{
col.Field("OrderID").Add();
col.Field("EmployeeID").Add();
col.Field("CustomerID").Add();
col.Field("ShipCountry").Add();
col.Field("Freight").Add();
})
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
)
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource = OrderRepository.GetAllRecords();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the previous code example.

OrderID	EmployeeID	CustomerID	ShipCountry	Freight
10255	9	RICSU	Switzerland	148.33
10263	9	ERNSH	Austria	146.06
10324	9	SAVEA	USA	214.27

10278	8	BERGS	Sweden	92.69
10279	8	LEHMS	Germany	25.83
10286	8	QUICK	Germany	229.24

1 2 3 4 5 6 7 8 ... 1 of 17 pages (200 items)

Multi-column sorting

Sort multiple columns in the grid by setting the AllowMultiSorting property as true. The sorting order is displayed in the header while doing multi sorting.

You can sort more than one column by pressing the "Ctrl key + mouse left click" on the column header. To clear sorting for particular column, press the "Shift + mouse left click".

Copyright © 2001 - 2020 Syncfusion Inc.

Note: The AllowSorting must be true while enabling multi sort.

The following code example describes the previous behavior.

RAZOR

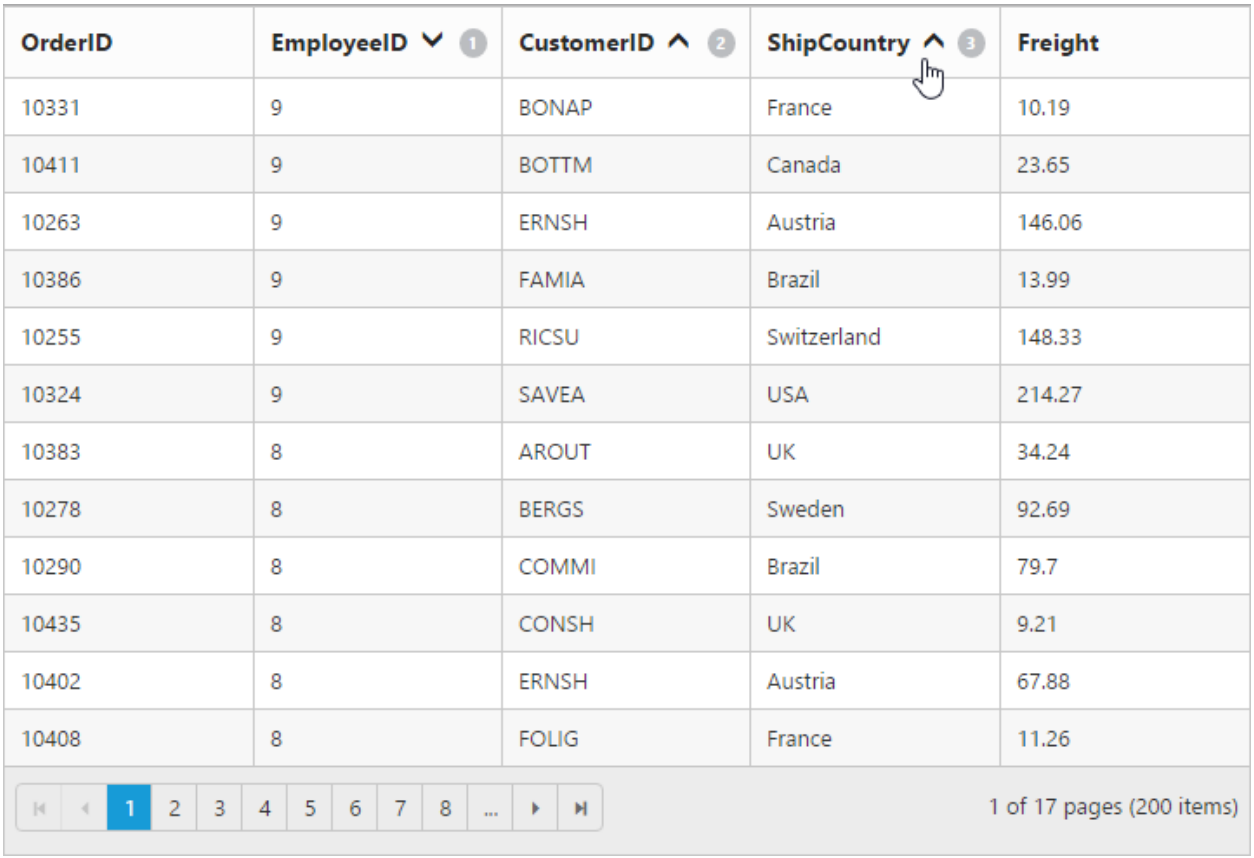
```
@(Html.EJ().Grid<object>("Grid")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.AllowPaging()
.AllowSorting()
.AllowMultiSorting()
.SortSettings(sort =>
{
sort.SortedColumns(col =>
col.Field("EmployeeID").Direction(SortOrder.Descending).Add());
sort.SortedColumns(col => col.Field("CustomerID").Add());
})
.Columns(col =>
{
col.Field("OrderID").Add();
col.Field("EmployeeID").Add();
col.Field("CustomerID").Add();
col.Field("ShipCountry").Add();
col.Field("Freight").Add();
})
)
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource = OrderRepository.GetAllRecords();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the previous code example.

Copyright © 2001 - 2020 Syncfusion Inc.



OrderID	EmployeeID	CustomerID	ShipCountry	Freight

1 2 3 4 5 6 7 8 ... 1 of 17 pages (200 items)

Stable sorting

For sorting, grid uses default browser's sort function for better performance. On multi column sorting in some browsers like chrome, the records order will be different due to unstable implementation of sorting algorithm in it.

To resolve this, you need to set `ej.support.stableSort` as `false`.

This will tell the "DataManager" to use custom sort function for sorting data.

Please refer to the link, to know more information about stable sort.

The following code example describes the previous behavior.

RAZOR

```
@(Html.EJ().Grid<object>("Grid")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.AllowPaging()
.AllowSorting()
.AllowMultiSorting()
.Columns(col =>
{
col.Field("OrderID").Add();
col.Field("EmployeeID").Add();
col.Field("ShipCity").Add();
col.Field("ShipCountry").Add();
col.Field("Freight").Add();
})
)
```

Copyright © 2001 - 2020 Syncfusion Inc.

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource = OrderRepository.GetAllRecords();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

JS

```
<script type="text/javascript">
ej.support.stableSort = true
</script>
```

The following output is displayed as a result of the previous code example.

OrderID	EmployeeID	ShipCity	ShipCountry	Freight
10409	3	Buenos Aires	Argentina	29.83

Touch options

While using the grid in a touch device, you have an option for multi sorting in single tap on the grid header. By tapping on the grid header, it will show the toggle button in small popup with sort icon. Now, tap the button to enable multi sorting in single tap.

Again if you tap the popup symbol, then the single tap multi sorting will be disabled.

Note: The AllowMultiSorting and AllowSorting should be true then only the popup will be shown.

The following code example describes the previous behavior.

RAZOR

```
@(Html.EJ().Grid<object>("Grid")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.AllowPaging()
.AllowMultiSorting()
.AllowSorting()
.Columns(col =>
{
col.Field("OrderID").Add();
col.Field("EmployeeID").Add();
col.Field("CustomerID").Add();
col.Field("ShipCountry").Add();
col.Field("Freight").Add();
})
)
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource = OrderRepository.GetAllRecords();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the previous code example.

Note: To get the sorted data of the grid after sorting a column you can refer the How To.

Filtering

Filtering helps to view the particular or related records from dataSource which meets a given filtering criteria. To enable filter, set the AllowFiltering property astrue.

The Grid supports three types of filter, they are the following.

1. Filter Bar
2. Menu
3. Excel

Four types of filter menu is available in all filter types, they are the following.

1. String
2. Numeric
3. Date
4. Boolean

The corresponding filter menu is opened based on the column type.

Note: 1. Need to specify the Type of column, when first record data value is empty or null otherwise the filter menu is not opened.

2. The default filter type is Filter bar, when the AllowFiltering is enabled and FilterType is not set.

The following code example describes the previous behavior.

RAZOR

```
@(Html.EJ().Grid<Object>("FlatGrid")
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
.AllowFiltering()
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order ID").Add();
col.Field("EmployeeID").HeaderText("Employee ID").Add();
col.Field("CustomerID").HeaderText("Customer ID").Add();
col.Field("ShipCountry").HeaderText("Ship Country").Add();
col.Field("Freight").HeaderText("Freight").Add();
}))
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.DataSource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the previous code example.

Copyright © 2001 - 2020 Syncfusion Inc.

OrderID	EmployeeID	CustomerID	ShipCountry	Freight
10248	5	VINET	France	32.38
10249	6	TOMSP	Germany	11.61

1 2 3 4 5 6 7 8 ... 1 of 17 pages (200 items)

Menu filter

You can enable menu filter by setting FilterType as Menu in FilterSettings

There is an option to show or hide the additional filter options in the menu by setting the ShowPredicate as true or false in FilterSettings respectively.

Note: For the FilterType property you can assign either string value ("Menu") or enum value (Syncfusion.JavaScript.FilterType.Menu).

A specified range of values can be filtered by using the between operator for the column type number, date and datetime.

The following code example describes the previous behavior.

RAZOR

```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
.AllowFiltering()
.FilterSettings(filter => { filter.FilterType(FilterType.Menu); })
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order ID").Add();
col.Field("EmployeeID").HeaderText("Employee ID").Add();
col.Field("CustomerID").HeaderText("Customer ID").Add();
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
col.Field("ShipCountry").HeaderText("Ship Country").Add();
col.Field("Freight").HeaderText("Freight").Add();
}))
```

C#

```
namespace MVCSampleBrowser.Controllers

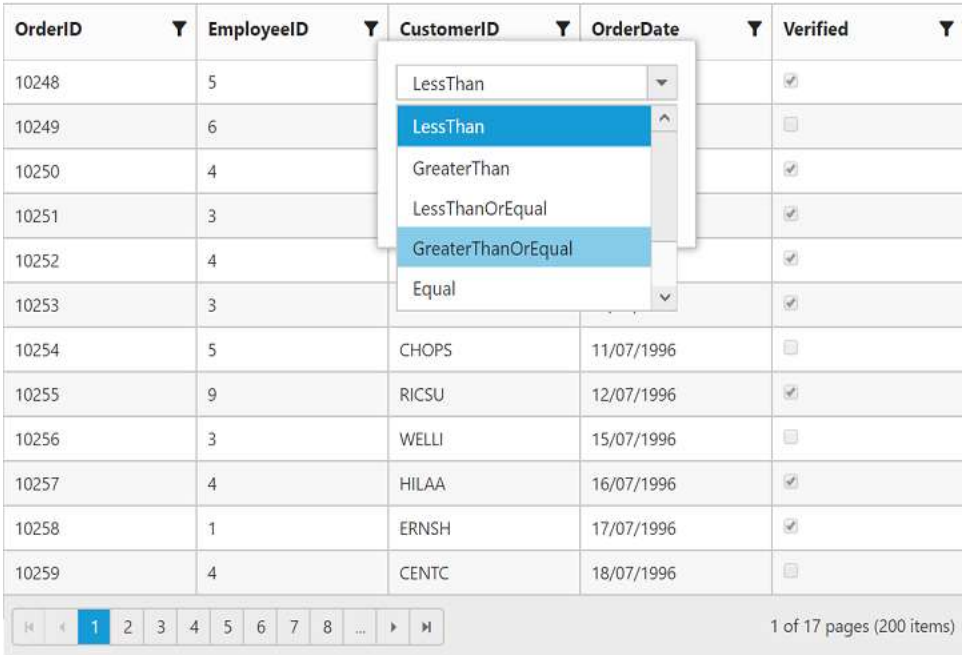
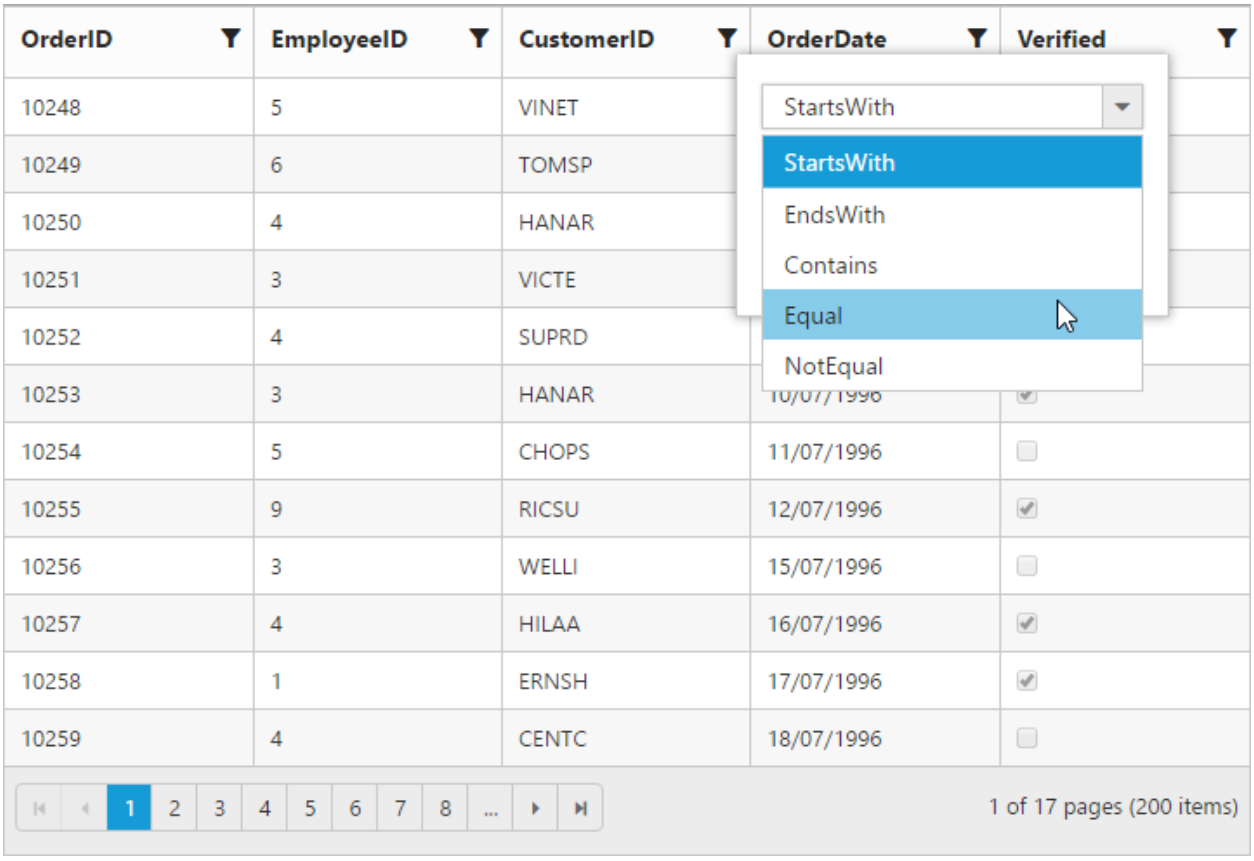
public ActionResult GridFeatures()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.DataSource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the previous code example.

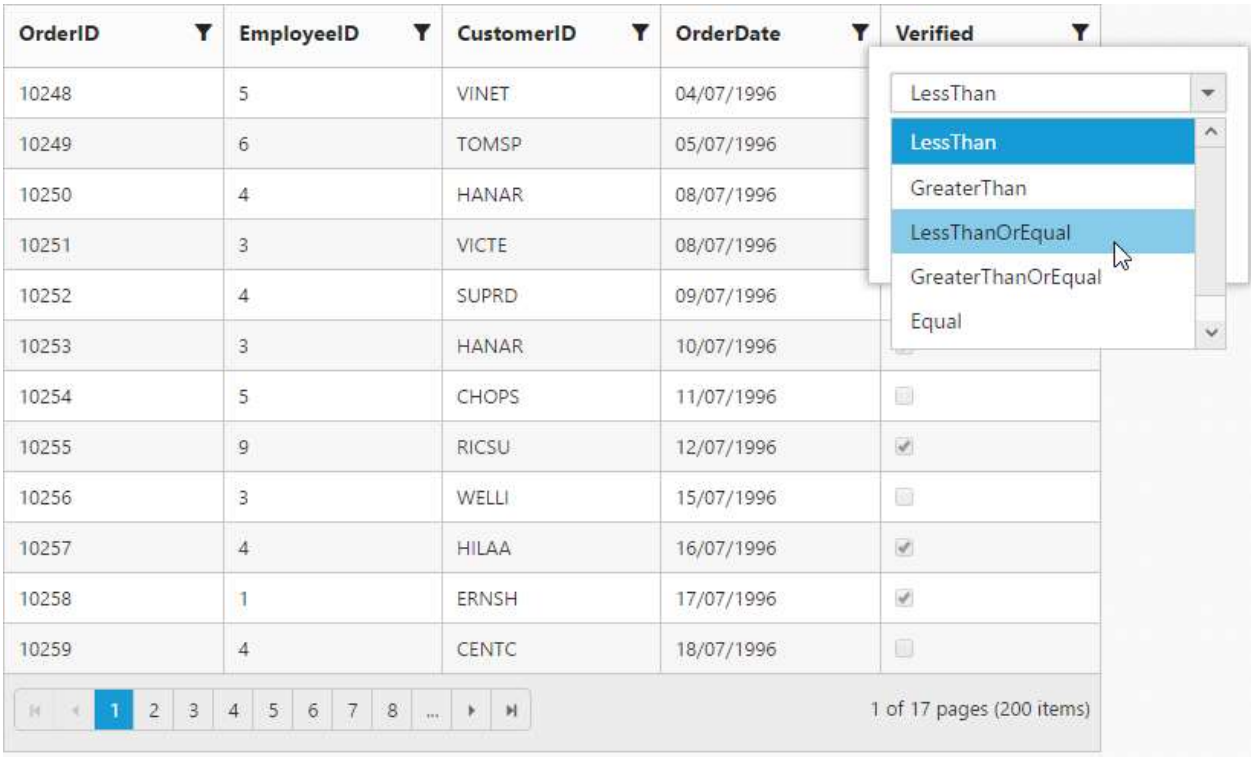


Numeric Filter

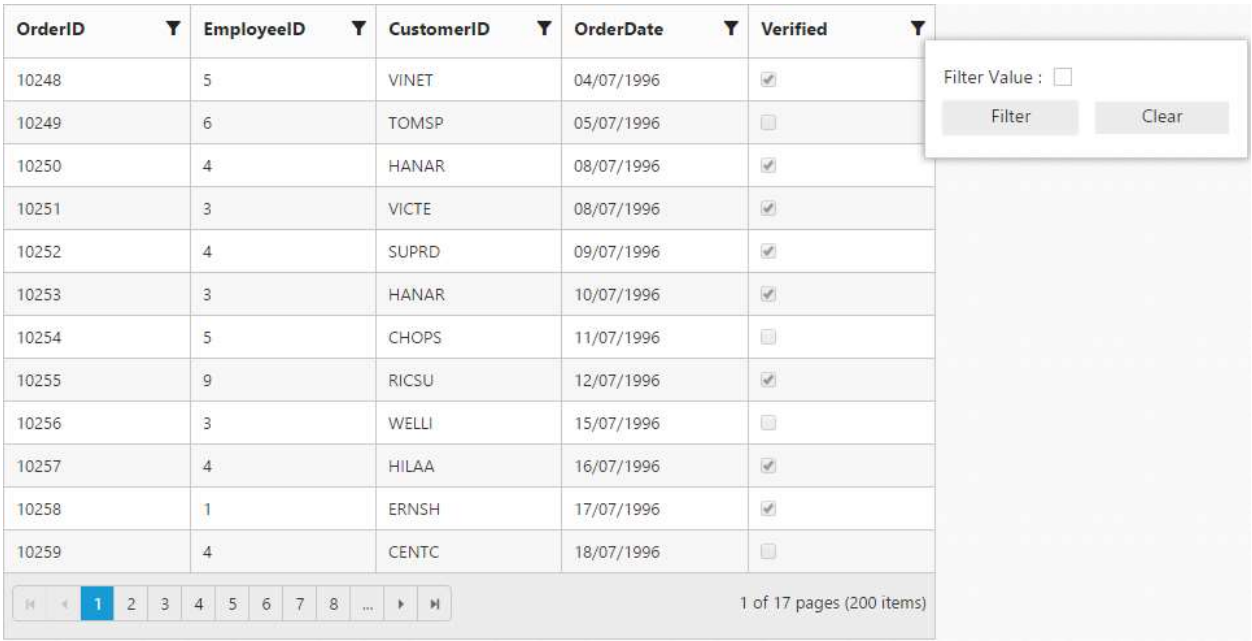
Copyright © 2001 - 2020 Syncfusion Inc.



String Filter



Date Filter



Boolean Filter

Excel-like filter

You can enable excel menu by setting `FilterType` as `Excel` in the `FilterSettings` . The excel menu contains an option such as sorting, clear filter, submenu for advanced filtering.

The following code example describes the previous behavior.

RAZOR

```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
.AllowFiltering()
.FilterSettings(filter => { filter.FilterType(FilterType.Excel); })
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order ID").Add();
col.Field("EmployeeID").HeaderText("Employee ID").Add();
col.Field("CustomerID").HeaderText("Customer ID").Add();
col.Field("ShipCountry").HeaderText("Ship Country").Add();
col.Field("Freight").HeaderText("Freight").Add();
}))
```

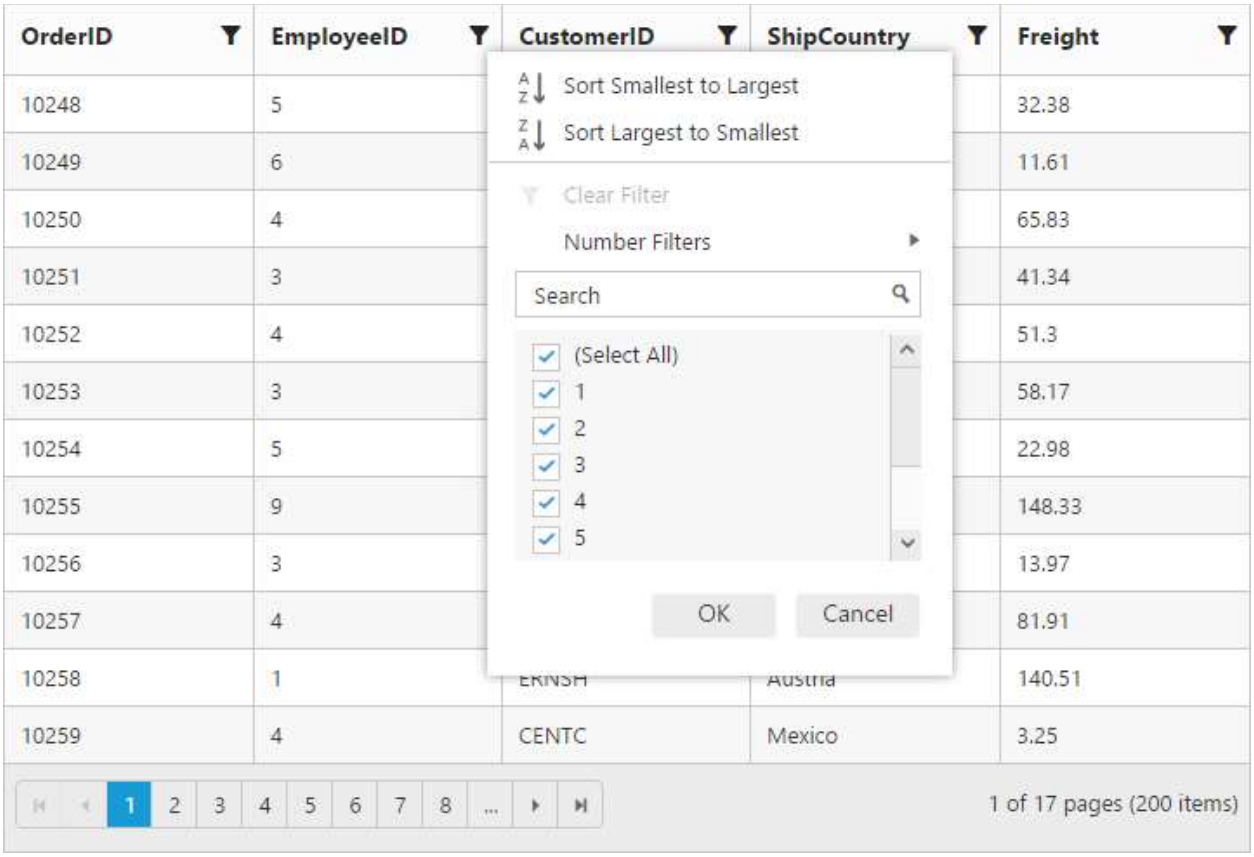
C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.DataSource = DataSource;
return View();
```

Copyright © 2001 - 2020 Syncfusion Inc.

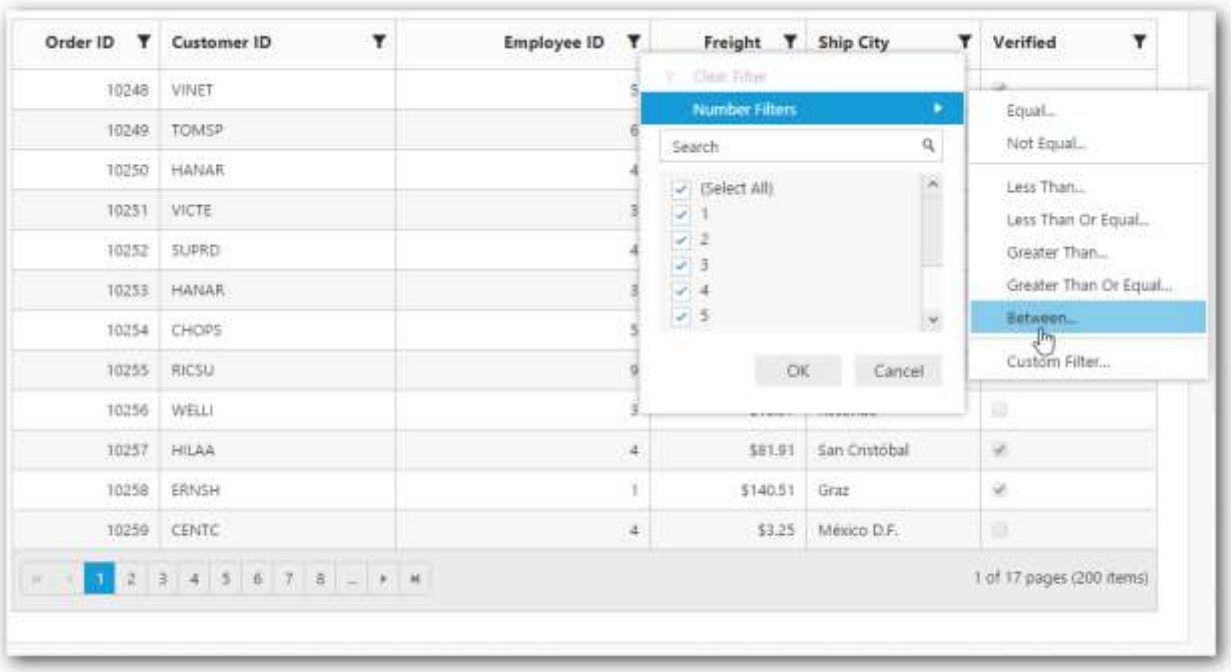
```
}
}
}
```

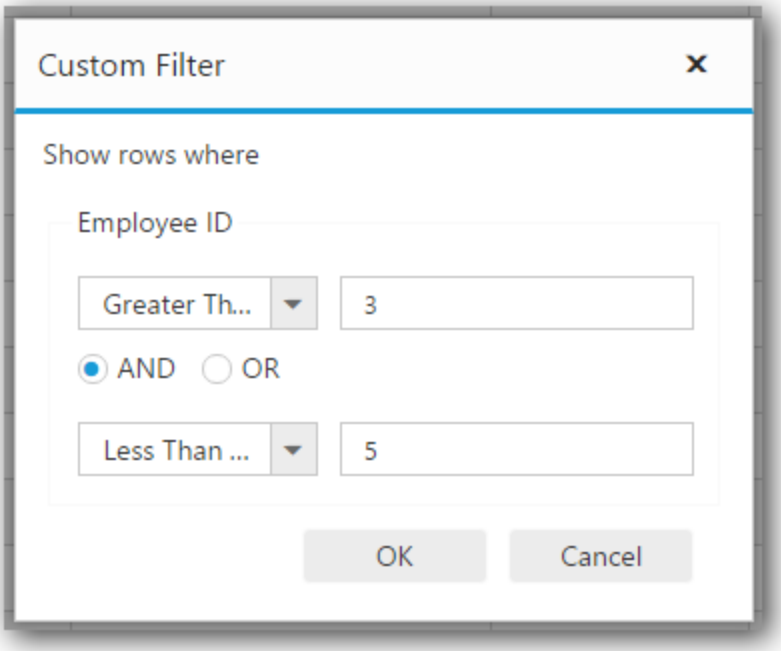
The following output is displayed as a result of the previous code example.



Filtering between values

By using the custom filter feature of the Excel filter, we can filter between values of the column. The following screenshot depicts the usage of "Between" option of the custom filter dialog.





Checkbox list generation:

By default, the checkbox list is generated from the distinct values of the filter column from dataSource which gives an option to search and select the required items.

Also, on checkbox list generation, if the number of distinct values are greater than 1000, then the excel filter will display only first 1000 values and show "Not all items shown" label to ensure the best performance on rendering and searching. However this limit has been customized according to your requirement by setting the MaxFilterChoices with required limit in integer.

Note: 1. Using excel filter events you can change the dataSource of the checkbox list.

Copyright © 2001 - 2020 Syncfusion Inc.

2. Query of checkbox list can also be changed using excel filter events.

The following code example describes the previous behavior.

RAZOR

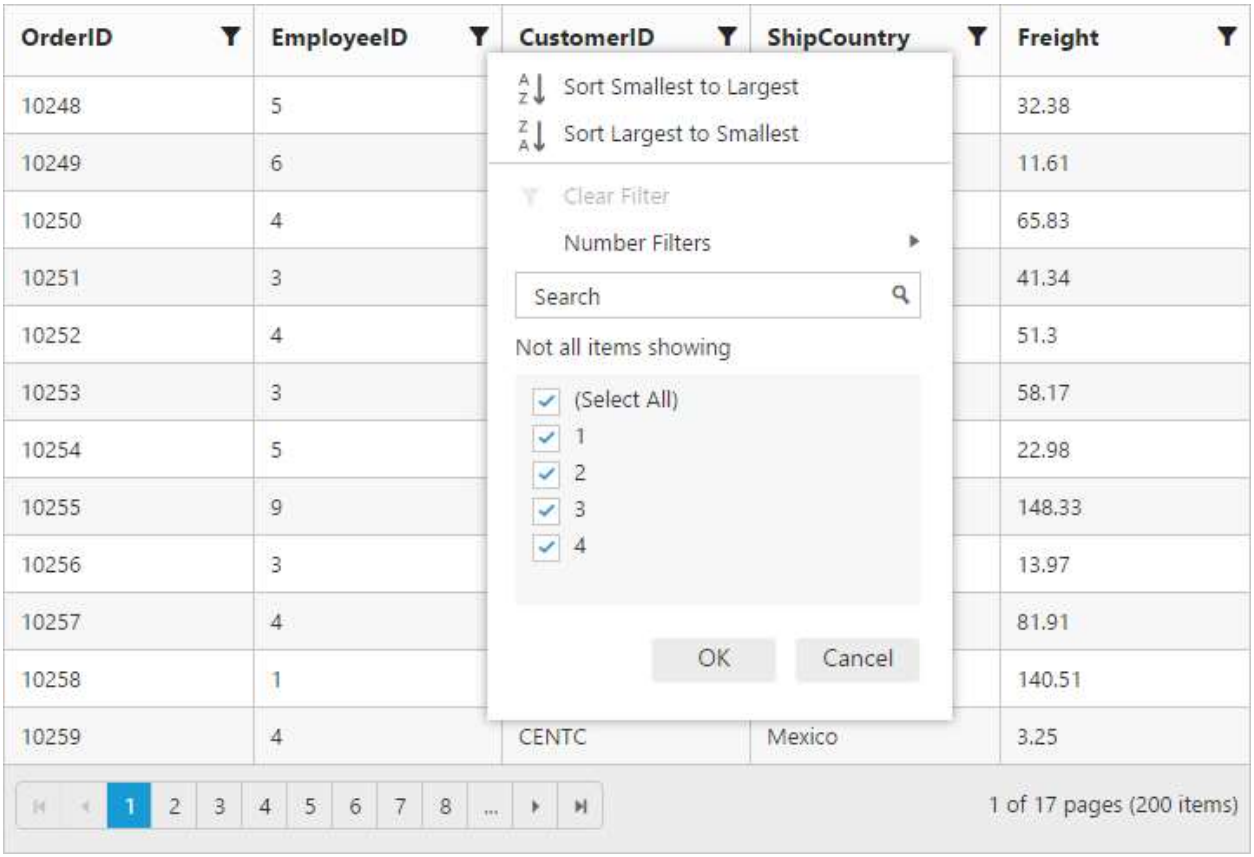
```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
.AllowFiltering()
.FilterSettings(filter => {
filter.FilterType(FilterType.Excel).MaxFilterChoices(4); })
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order ID").Add();
col.Field("EmployeeID").HeaderText("Employee ID").Add();
col.Field("CustomerID").HeaderText("Customer ID").Add();
col.Field("ShipCountry").HeaderText("Ship Country").Add();
col.Field("Freight").HeaderText("Freight").Add();
}))
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.DataSource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the previous code example.

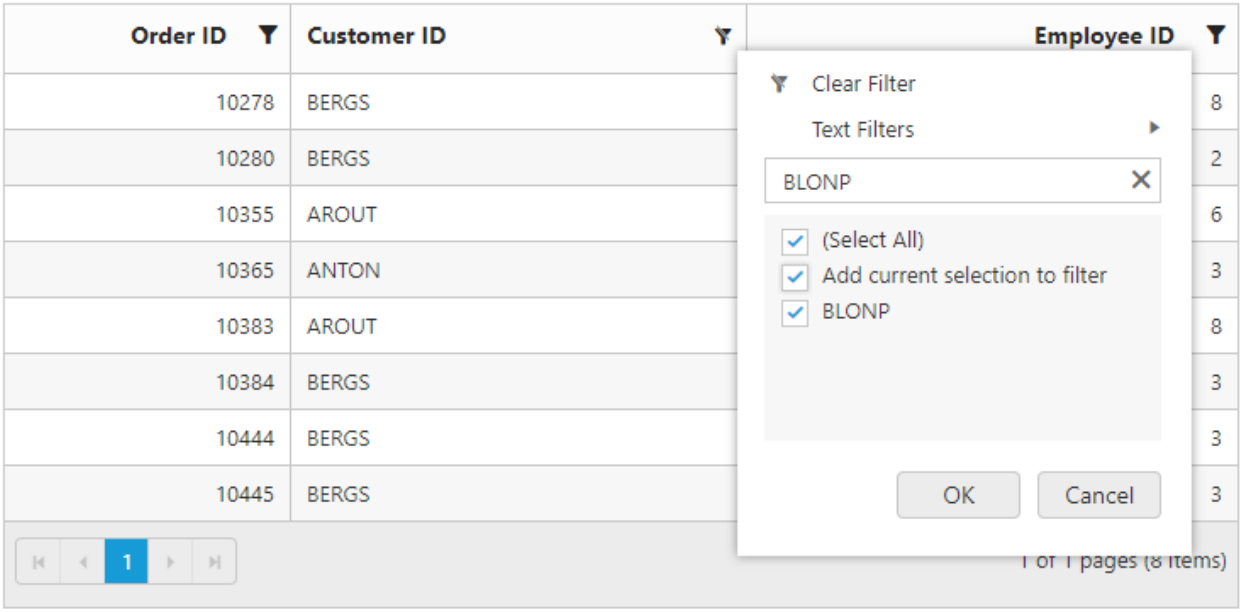
Copyright © 2001 - 2020 Syncfusion Inc.



Add current selection to filter checkbox:

When filtering is done multiple times on the same column then the previously filtered values on the column will be cleared. So, to retain the old values Add current selection to filter checkbox can be used which is displayed when data is searched in the search bar.

The following image describes the previous mentioned behavior.



Copyright © 2001 - 2020 Syncfusion Inc.

Case sensitivity

To perform filter operation with case sensitive in excel styled filter menu mode by setting EnableCaseSensitivity as true.

The following code example describes the previous behavior.

RAZOR

```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
.AllowFiltering()
.FilterSettings(filter => {
filter.FilterType(FilterType.Excel).EnableCaseSensitivity(true);  })
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order ID").Add();
col.Field("EmployeeID").HeaderText("Employee ID").Add();
col.Field("CustomerID").HeaderText("Customer ID").Add();
col.Field("ShipCountry").HeaderText("Ship Country").Add();
col.Field("Freight").HeaderText("Freight").Add();
}))
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.DataSource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the previous code example.

Filter bar

The 'Filter bar' row is located next to column header of grid. You can filter the records with different expressions depending upon the column type. To show the filter bar row, set the `FilterType` as `FilterBar`.

List of filter bar expressions:

You can enter the below filter expressions manually in the filter bar.

Expression	Example	Description	Column Type
=	= value	Equal	Numeric
!=	!= value	NotEqual	
>	> value	GreaterThan	
<	< value	LessThan	
>=	>= value	GreaterThanOrEqual	
<=	<= value	LessThanOrEqual	
N/A	N/A	Always `StartsWith` operator will be used for the string filter	String
N/A	N/A	Always `Equal` operator will be used for the Date filter	Date
N/A	N/A	Always `Equal` operator will be used for the Boolean filter	Boolean

Copyright © 2001 - 2020 Syncfusion Inc.

The following code example describes the previous behavior.

RAZOR

```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
.AllowFiltering()
.FilterSettings(filter => { filter.FilterType(FilterType.FilterBar); })
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order ID").Add();
col.Field("EmployeeID").HeaderText("Employee ID").Add();
col.Field("CustomerID").HeaderText("Customer ID").Add();
col.Field("ShipCountry").HeaderText("Ship Country").Add();
col.Field("Freight").HeaderText("Freight").Add();
}))
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.DataSource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the previous code example.

Filter bar modes:

This specifies the grid to start the filter action while typing in the filter bar or after pressing the enter key based on the FilterBarMode.There are two types of FilterBarMode, they are the following.

1. OnEnter
2. Immediate

Note: For the FilterBarMode property you can assign either string value (OnEnter) or enum value (Syncfusion.JavaScript.FilterBarMode.OnEnter).

Filter bar message:

The filter bar message is supported only for the FilterType as 'FilterBar'. The filtered data with column name is displayed in the grid pager itself. By default the ShowFilterBarStatus is 'true'.

The following code example describes the previous behavior.

RAZOR

```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
```

Filter Operators

The grid controls uses filter operators from the DataManager, which are used at the time of filtering.

List of column type and filter operators.

Column Type	Filter Operators
Number	FilterOperatorType.GreaterThan
	FilterOperatorType.GreaterThanOrEqual
	FilterOperatorType.LessThan
	FilterOperatorType.LessThanOrEqual
	FilterOperatorType.Equal
	FilterOperatorType.NotEqual
String	FilterOperatorType.StartsWith
	FilterOperatorType.EndsWith
	FilterOperatorType.Contains
	FilterOperatorType.Equal

Copyright © 2001 - 2020 Syncfusion Inc.

	FilterOperatorType.NotEqual
Boolean	FilterOperatorType.Equal
	FilterOperatorType.NotEqual
Date	FilterOperatorType.GreaterThan
	FilterOperatorType.GreaterThanOrEqual
	FilterOperatorType.LessThan
	FilterOperatorType.LessThanOrEqual
	FilterOperatorType.Equal
	FilterOperatorType.NotEqual

FilterBar template

Usually enabling the AllowFiltering, will create default textbox in grid FilterBar. So, Using the [FilterBarTemplate] property of Columns we can render any other controls like AutoComplete, DropDownList etc in filterbar to filter the grid data for the particular column.

It has three functions. They are the following:

1. create - It is used to create the control at time of initialize.
2. read - It is used to read the filter value selected.
3. write - It is used to render the control and assign the value selected for filtering.

The following code example describes the previous behavior.

RAZOR

```
@(Html.EJ().Grid<EditableOrder>("Filtering")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.AllowFiltering()
.AllowPaging()
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order
ID").TextAlign(TextAlign.Right).Width(75).Add();
col.Field("CustomerID").HeaderText("CustomerID").FilterBarTemplate(filterbar
=>
filterbar.Create("autoComplete_create").Write("autoComplete_write").Read("au
toComplete_read")).Width(90).Add();
col.Field("EmployeeID").HeaderText("EmployeeID").FilterBarTemplate(filterbar
=>
filterbar.Write("dropdown_write").Read("dropdown_read")).TextAlign(TextAlign
.Right).Width(75).Add();
col.Field("Freight").HeaderText("Freight").FilterBarTemplate(filterbar =>
filterbar.Write("numeric_write").Read("numeric_read")).TextAlign(TextAlign.R
ight).Width(75).Format("{0:C}").Add();
col.Field("ShipCountry").HeaderText("Ship Country").Width(90).Add();
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
col.Field("Verified").HeaderText("Verified").TextAlign(TextAlign.Center).Fil
terBarTemplate(filterbar =>
filterbar.Write("check_write").Read("check_read")).Width(80).Add();
})
)
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public partial class GridController : Controller
{
public ActionResult Filtering()
{
var DataSource = OrderRepository.GetAllRecords().ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

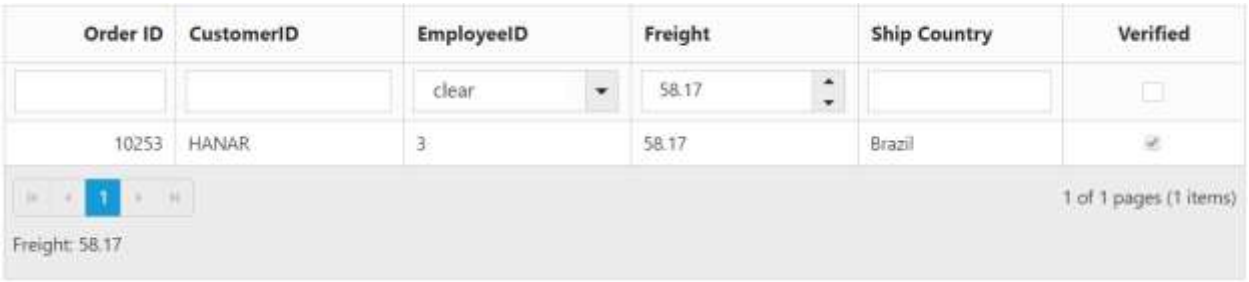
JS

```
<script type="text/javascript">
function autoComplete_create(args) {
return "<input>"
}
function autoComplete_write(args) {
var gridObj = $("#Filtering").ejGrid("instance");
var data = ej.DataManager(gridObj.model.dataSource).executeLocal(new
ej.Query().select("CustomerID"));
args.element.ejAutocomplete({ width: "100%", dataSource: data,
enableDistinct: true, focusOut: ej.proxy(args.column.filterBarTemplate.read,
this, args) });
}
function autoComplete_read(args) {
this.filterColumn(args.column.field, "equal", args.element.val(), "and",
true)
}
function dropdown_write(args) {
var data = [{ text: "clear", value: "clear" }, { text: "1", value: 1 }, {
text: "2", value: 2 }, { text: "3", value: 3 }, { text: "4", value: 4 },
{ text: "5", value: 5 }, { text: "6", value: 6 }, { text: "7", value: 7 }, {
text: "8", value: 8 }, { text: "9", value: 9 }
]
args.element.ejDropDownList({ width: "100%", dataSource: data, change:
ej.proxy(args.column.filterBarTemplate.read, this, args) })
}
function dropdown_read(args) {
if (args.element.val() == "clear") {
this.clearFiltering(args.column.field);
args.element.val("")
}
this.filterColumn(args.column.field, "equal", args.element.val(), "and",
true)
}
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
function numeric_write(args) {
args.element.ejNumericTextbox({ width: "100%",decimalPlaces: 2, focusOut:
ej.proxy(args.column.filterBarTemplate.read, this, args) });
}
function numeric_read(args) {
this.filterColumn(args.column.field, "equal", args.element.val(), "and",
true)
}
function check_write(args) {
args.element.ejCheckBox({ change:
ej.proxy(args.column.filterBarTemplate.read, this, args) });
}
function check_read(args) {
this.filterColumn(args.column.field, "equal",
args.element.parent().attr('aria-checked'), "and", true)
}
</script>
```

The following output is displayed as a result of the previous code example.



After Filtering

Editing

The grid control has support for dynamic insertion, updating and deletion of records. You can start the edit action either by double clicking the particular row or by selecting the required row and clicking on Edit icon in toolbar. Similarly, you can add new record to grid either by clicking on insert icon in toolbar or on an external button which is bound to call addRecord method of grid. Save and Cancel while on edit mode is possible using respective toolbar icon in grid.

Deletion of the record is possible by selecting the required row and clicking on Delete icon in toolbar.

The primary key for the data source should be defined in Columns definition, for editing to work properly. In Columns definition, particular primary column's IsPrimaryKey property should be set to true. Refer the Knowledge base link for more information.

Note: 1. In grid, the primary key column will be automatically set to read only while editing the row, but you can specify primary key column value while adding a new record.

2. The column which is specified as IsIdentity will be in readonly mode both while editing and adding a record. Also, auto incremented value is assigned to that IsIdentity column.

Copyright © 2001 - 2020 Syncfusion Inc.

Toolbar with edit option

Using toolbar which is rendered at the top of the grid header, you can show all the CRUD related action. To enable toolbar and toolbar items, set `ShowToolbar` property as true and `ToolbarItems`. The default toolbar items are `Add`, `Edit`, `Delete`, `Update` and `Cancel`.

Note: For `ToolbarItems` property you can assign either `string` value ("Add") or `enum` value (`Syncfusion.JavaScript.ToolBarItems.Add`).

The following code example describes the above behavior.

RAZOR

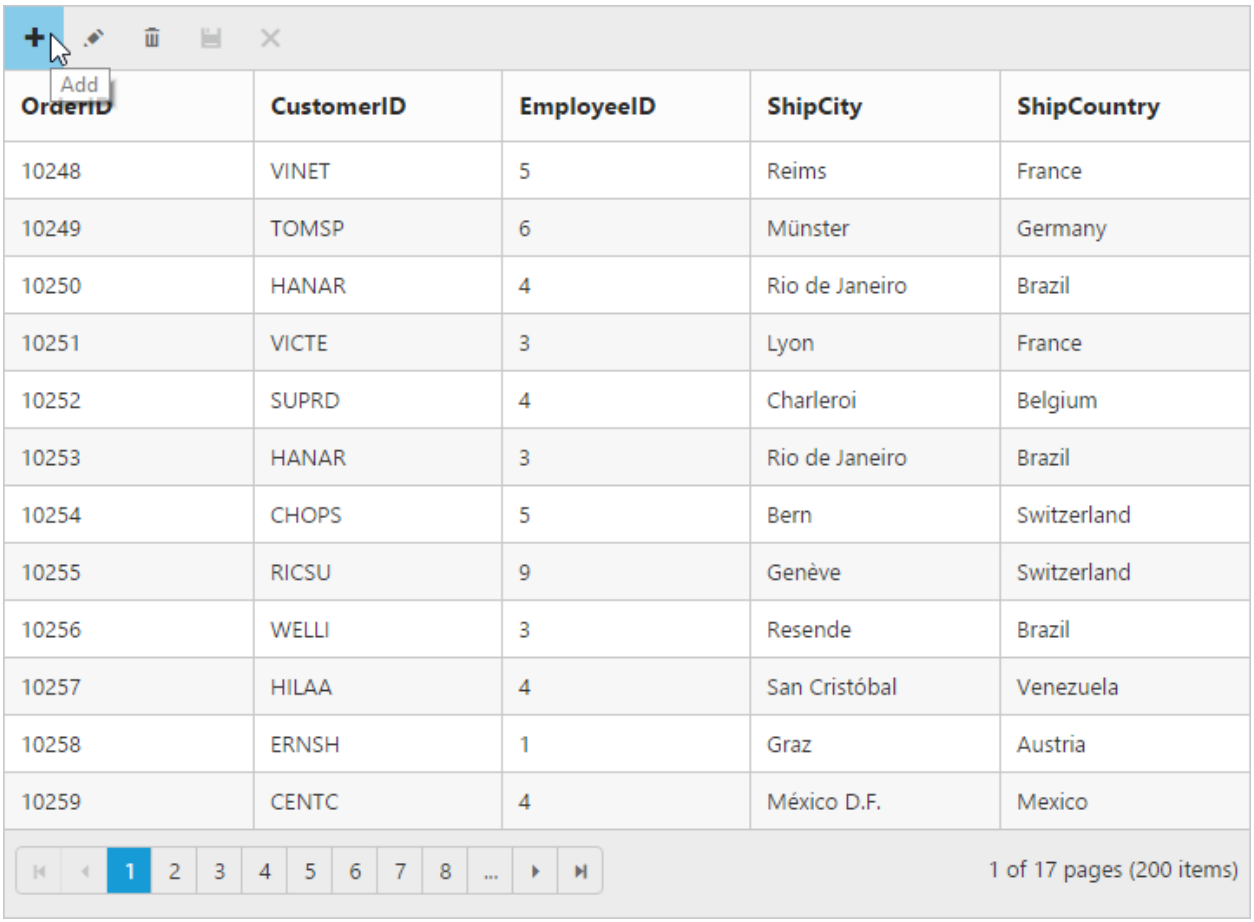
```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
.EditSettings(edit => { edit.AllowAdding().AllowDeleting().AllowEditing();
})
.ToolbarSettings(toolbar =>
{
toolbar.ShowToolbar().ToolbarItems(items =>
{
items.AddTool(ToolBarItems.Add);
items.AddTool(ToolBarItems.Edit);
items.AddTool(ToolBarItems.Delete);
items.AddTool(ToolBarItems.Update);
items.AddTool(ToolBarItems.Cancel);
});
})
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order ID").IsPrimaryKey(true).Add();
col.Field("CustomerID").HeaderText("Customer ID").Add();
col.Field("EmployeeID").HeaderText("Employee ID").Add();
col.Field("ShipCity").HeaderText("Ship City").Add();
col.Field("ShipCountry").HeaderText("Ship Country").Add();
}))
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.DataSource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.

Copyright © 2001 - 2020 Syncfusion Inc.



Cell edit type and its edit options

The edit type of bound column can be customized using `EditType` property of `Columns`. The following Essential JavaScript controls are supported built-in by `EditType`. You can set the `EditType` based on specific data type of the column.

- `NumericTextBox` control for integers, double, and decimal data types.
- `DatePicker` control for date data type.
- `DateTimePicker` control for date-time data type.
- `DropDownList` control for list of data type.

And also you can define the model for all the editTypes controls while editing through EditOptions.

The following table describes `EditType` and their corresponding EditOptions of the specific data type of the column.

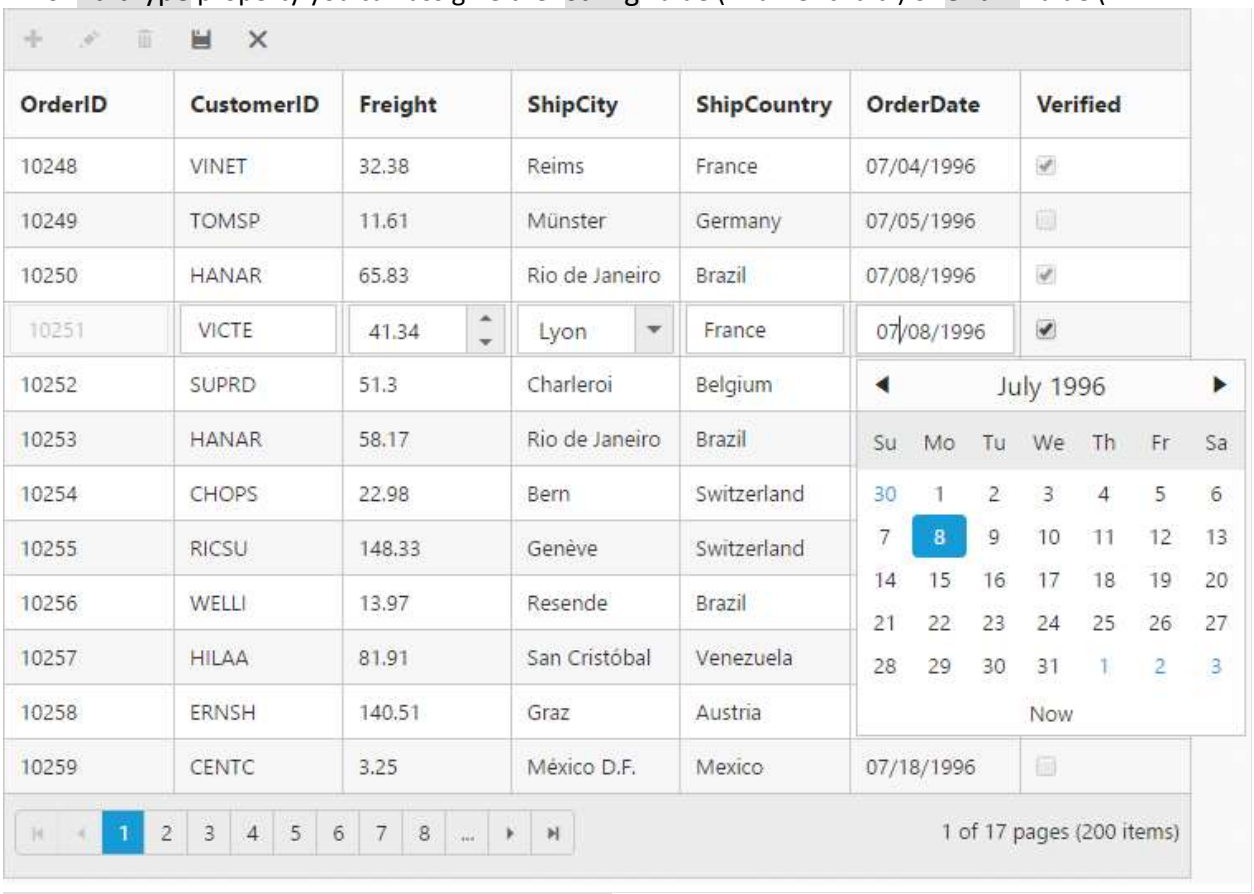
EditType	EditParams	Example
NumericTextBox	TextBoxes	NumericEditOptions(new EditorProperties() { DecimalPlaces = 2, })
DatePicker	DatePicker	DateEditOptions(new DatePickerProperties() { ButtonText="Now"})
DateTimePicker	DateTimePicker	DateTimeEditOptions(new DateTimePickerProperties() {Enabled=False})

Copyright © 2001 - 2020 Syncfusion Inc.

DropDownList	DropDownList	<DropDownEditOptions(new DropDownListProperties() {ShowCheckbox=True})/>

Note: 1. If EditType is not set, then by default it will display the input element ("stringEdit") while editing a column.

2. For EditType property you can assign either string value ("NumericEdit") or enum value (



Syncfusion.JavaScript.EditingType.NumericEdit).

The following code example describes the above behavior

RAZOR

```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
.EditSettings(edit => { edit.AllowAdding().AllowDeleting().AllowEditing();
})
.ToolbarSettings(toolbar =>
{
toolbar.ShowToolbar().ToolbarItems(items =>
{
items.AddTool(ToolBarItems.Add);
items.AddTool(ToolBarItems.Edit);
items.AddTool(ToolBarItems.Delete);
items.AddTool(ToolBarItems.Update);
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
items.AddTool(ToolBarItems.Cancel);
});
})
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order
ID").IsPrimaryKey(true).TextAlign(TextAlign.Right).Add();
col.Field("CustomerID").HeaderText("Customer
ID").EditType(EditingType.StringEdit).Add();
col.Field("Freight").HeaderText("Freight").EditType(EditingType.NumericEdit)
.NumericEditOptions(new EditorProperties() { DecimalPlaces = 2 }).Add();
col.Field("ShipCity").HeaderText("Ship
City").EditType(EditingType.DropdownEdit).Add();
col.Field("ShipCountry").HeaderText("Ship Country").Add();
col.Field("OrderDate").HeaderText("Order
Date").EditType(EditingType.Datepicker).DateEditOptions(new
DatePickerProperties() { ButtonText="Now"}).Format("{0:MM/dd/yyyy}").Add();
col.Field("Verified").HeaderText("Verified").EditType(EditingType.BooleanEdi
t).Add();
}))
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.DataSource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.

Cell Edit Template

On editing the column values, custom editor can be created by using EditTemplate property of Columns. It has three functions, they are

1. Create - It is used to create the control at time of initialize.
2. Read - It is used to read the input value at time of save.

Copyright © 2001 - 2020 Syncfusion Inc.

Write - It is used to assign the value to control at time of editing.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
.EditSettings(edit => { edit.AllowAdding().AllowDeleting().AllowEditing();
})
.ToolbarSettings(toolbar =>
{
toolbar.ShowToolbar().ToolbarItems(items =>
{
items.AddTool(ToolBarItems.Add);
items.AddTool(ToolBarItems.Edit);
items.AddTool(ToolBarItems.Delete);
items.AddTool(ToolBarItems.Update);
items.AddTool(ToolBarItems.Cancel);
});
})
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order ID").IsPrimaryKey(true).Add();
col.Field("CustomerID").HeaderText("Customer ID").Add();
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
col.Field("Freight").HeaderText("Freight").Add();
col.Field("ShipCountry").HeaderText("Ship Country").Add();
col.Field("ShipPostalCode").HeaderText("Ship Postal Code").EditTemplate(a =>
{ a.Create("create").Read("read").Write("write"); }).Add();
}))
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.DataSource = DataSource;
return View();
}
}
}
```

JS

```
<script id="template" type="application/javascript">
function create()
{
return $("<input>");
}
function write(args)
{
args.element.ejMaskEdit({
maskFormat : "99-99-9999",
value : args.rowdata["ShipPostalCode"]
});
}
function read(args)
{
return args.ejMaskEdit("get_StrippedValue");
}
</script>
```

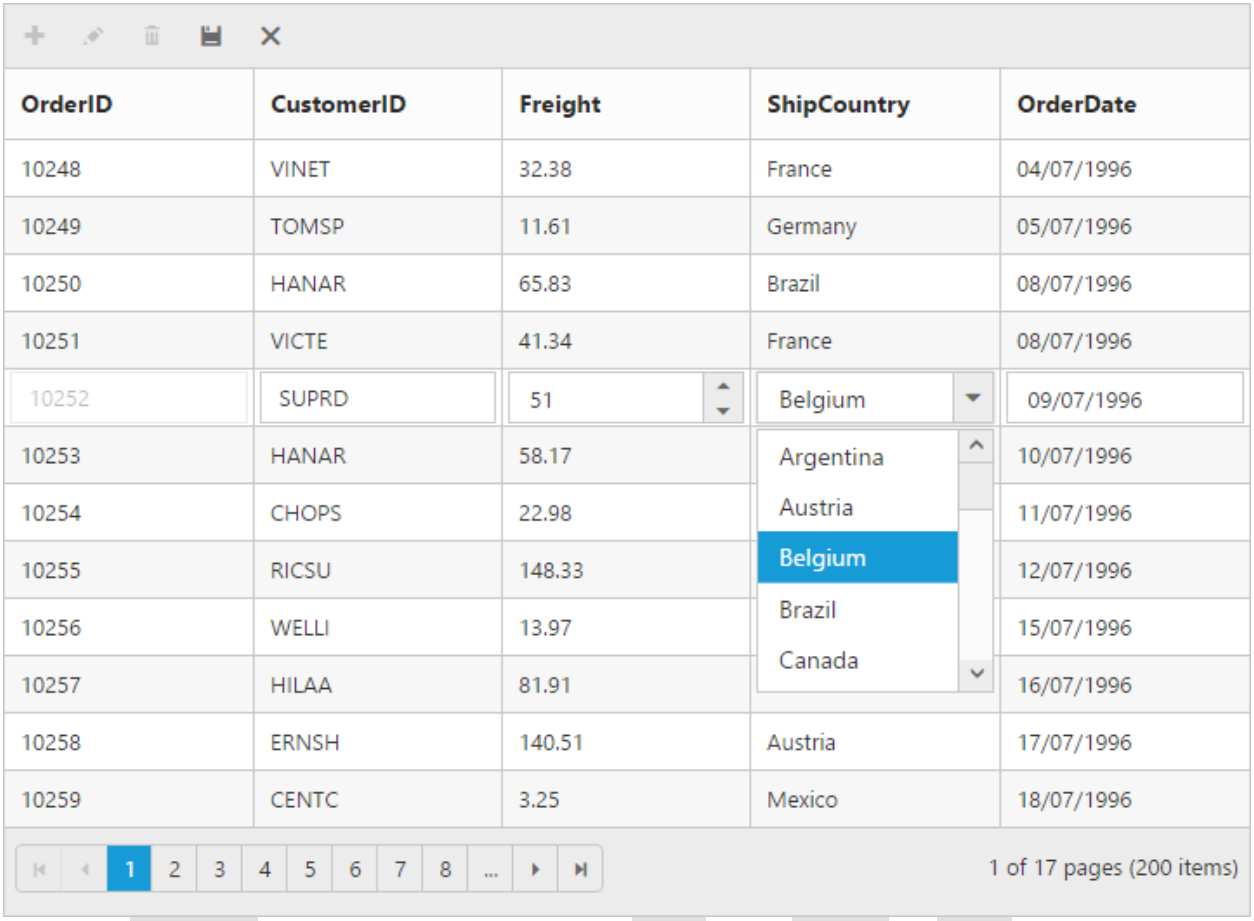
The following output is displayed as a result of the above code example.

Edit Modes

Inline

Set `EditMode` as `Normal`, then the row itself is changed as edited row.

Copyright © 2001 - 2020 Syncfusion Inc.



Note: For EditMode property you can assign either string value (Normal) or enum value (Syncfusion.JavaScript.EditMode.Normal).

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
.EditSettings(edit => {
edit.AllowAdding().AllowDeleting().AllowEditing().EditMode(EditMode.Normal);
})
.ToolbarSettings(toolbar =>
{
toolbar.ShowToolbar().ToolbarItems(items =>
{
items.AddTool(ToolBarItems.Add);
items.AddTool(ToolBarItems.Edit);
items.AddTool(ToolBarItems.Delete);
items.AddTool(ToolBarItems.Update);
items.AddTool(ToolBarItems.Cancel);
});
})
.Columns(col =>
{
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
col.Field("OrderID").HeaderText("Order
ID").IsPrimaryKey(true).TextAlign(TextAlign.Right).Add();
col.Field("CustomerID").HeaderText("Customer
ID").EditType(EditingType.StringEdit).Add();
col.Field("Freight").HeaderText("Freight").EditType(EditingType.NumericEdit)
.NumericEditOptions(new EditorProperties() { DecimalPlaces = 2 }).Add();
col.Field("ShipCountry").HeaderText("Ship
Country").EditType(EditingType.DropdownEdit).Add();
col.Field("OrderDate").HeaderText("Order
Date").EditType(EditingType.Datepicker).Format("{0:MM/dd/yyyy}").Add();
}))
```

C#

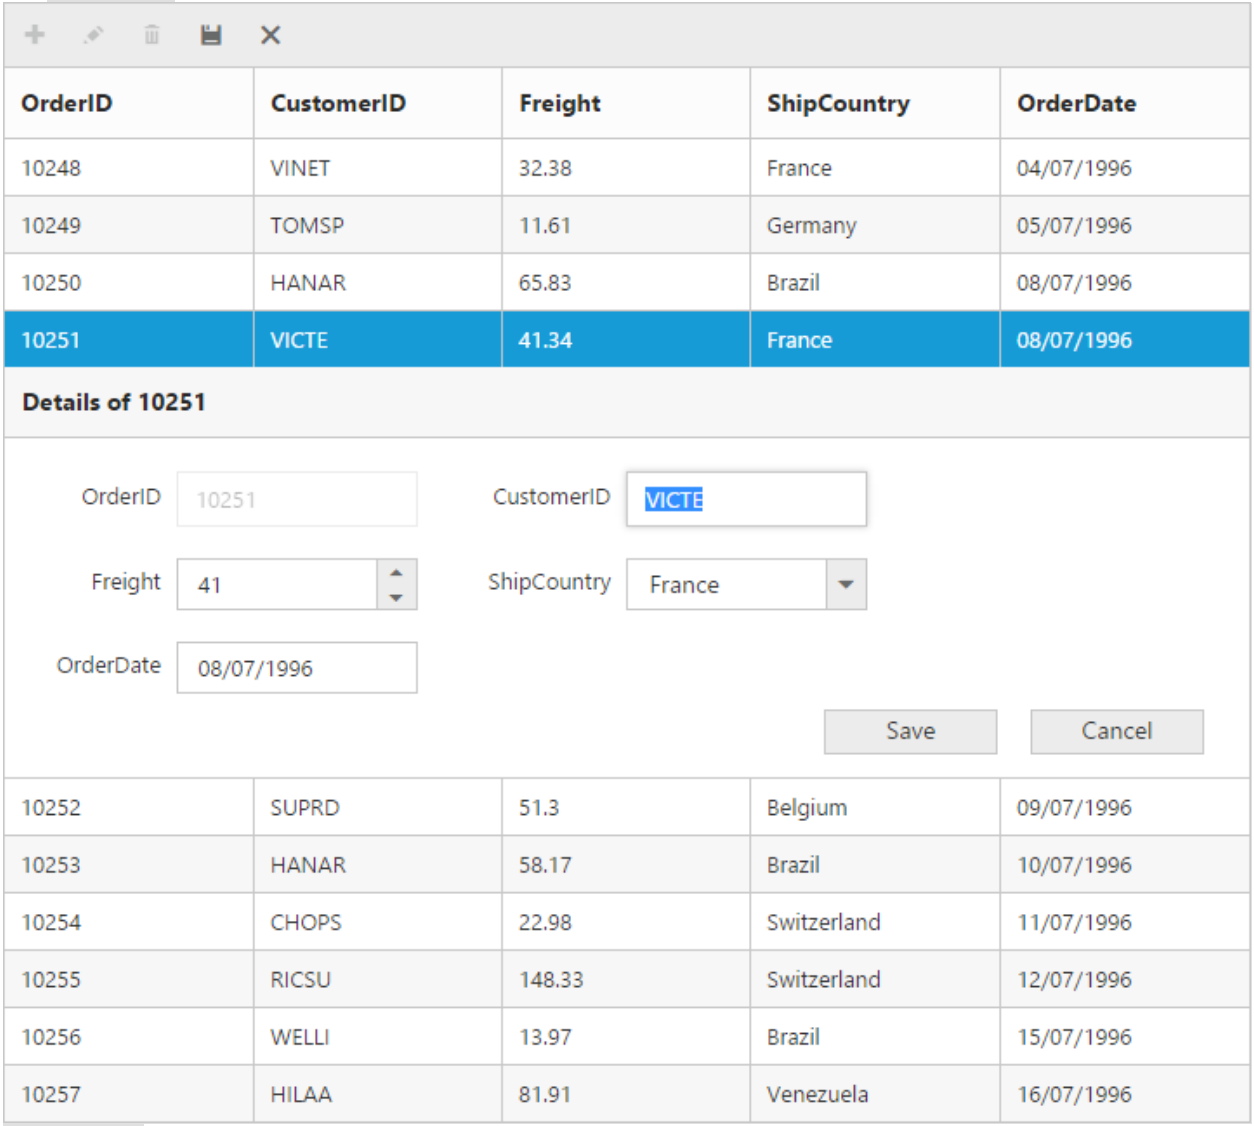
```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.DataSource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.

Copyright © 2001 - 2020 Syncfusion Inc.

Inline Form

Set EditMode as



InlineForm, then edit form will be inserted next to the row which is to be edited.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
.EditSettings(edit => {
edit.AllowAdding().AllowDeleting().AllowEditing().EditMode(EditMode.InlineFo
rm); })
.ToolbarSettings(toolbar =>
{
toolbar.ShowToolbar().ToolbarItems(items =>
{
items.AddTool(ToolBarItems.Add);
items.AddTool(ToolBarItems.Edit);
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
items.AddTool(ToolBarItems.Delete);
items.AddTool(ToolBarItems.Update);
items.AddTool(ToolBarItems.Cancel);
});
})
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order
ID").IsPrimaryKey(true).TextAlign(TextAlign.Right).Add();
col.Field("CustomerID").HeaderText("Customer
ID").EditType(EditingType.StringEdit).Add();
col.Field("Freight").HeaderText("Freight").EditType(EditingType.NumericEdit)
.NumericEditOptions(new EditorProperties() { DecimalPlaces = 2 }).Add();
col.Field("ShipCountry").HeaderText("Ship Country").Add();
col.Field("OrderDate").HeaderText("Order
Date").EditType(EditingType.Datepicker).Format("{0:MM/dd/yyyy}").Add();
}))
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.DataSource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.

Inline Template Form

You can edit any of the fields pertaining to a single record of data and apply it to a template so that the same format is applied to all the other records that you may edit later.

Using this template support, you can edit the fields that are not bound to grid columns.

To edit the records using Inline template form, set `EditMode` as `InlineFormTemplate` and specify the template ID to `InlineFormTemplateID` property of `EditSettings`.

While using template form, you can change the HTML elements to appropriate JS controls based on the column type. This can be achieved by using `ActionComplete` event of grid.

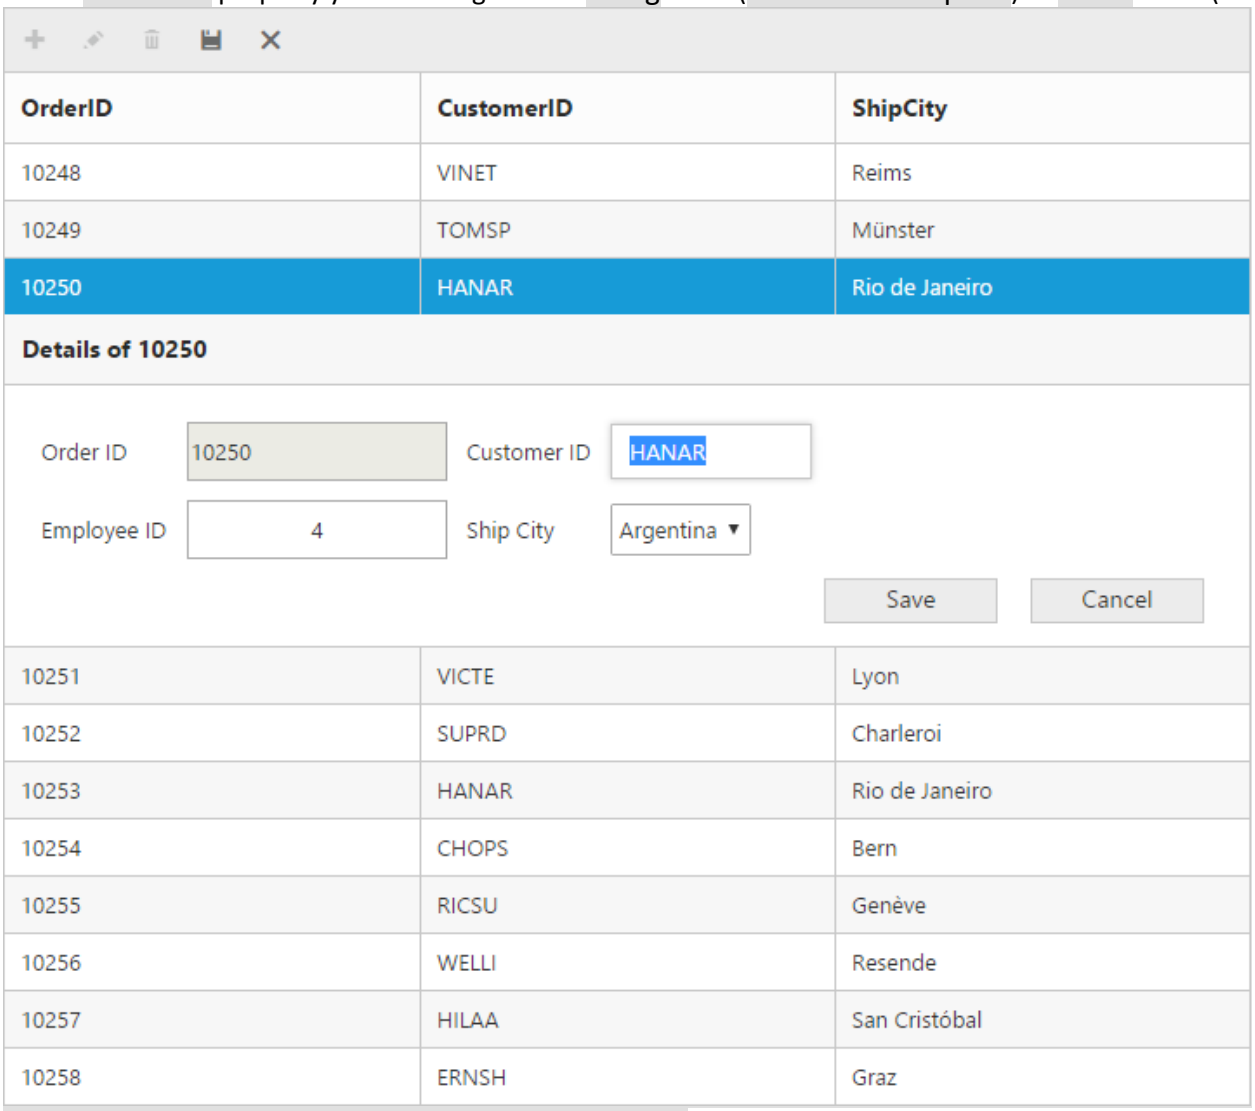
Note: 1. `value` attribute is used to bind the corresponding field value while editing.

2. `name` attribute is used to get the changed field values while saving the edited record.

3. It's a standard way to enclose the `Template` within the `script` tag with `type` as "text/x-jsrender".

Copyright © 2001 - 2020 Syncfusion Inc.

4. For EditMode property you can assign either string value (InlineFormTemplate) or enum value (



Syncfusion.JavaScript.EditMode.InlineTemplateForm)

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
.ClientSideEvents(eve => { eve.ActionComplete("complete"); })
.EditSettings(edit => {
edit.AllowAdding().AllowDeleting().AllowEditing().EditMode(EditMode.InlineFo
rmTemplate).InlineFormTemplateID("#template");})
.ToolbarSettings(toolbar =>
{
toolbar.ShowToolbar().ToolbarItems(items =>
{
items.AddTool(ToolBarItems.Add);
items.AddTool(ToolBarItems.Edit);
items.AddTool(ToolBarItems.Delete);
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
items.AddTool(ToolBarItems.Update);
items.AddTool(ToolBarItems.Cancel);
});
})
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order
ID").IsPrimaryKey(true).TextAlign(TextAlign.Right).Add();
col.Field("CustomerID").HeaderText("Customer
ID").EditType(EditingType.StringEdit).Add();
col.Field("ShipCity").HeaderText("Ship
City").EditType(EditingType.DropdownEdit).Add();
}))
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.DataSource = DataSource;
return View();
}
}
}
```

JS

```
<script id="template" type="text/template">
<table cellspacing="10">
<tr>
<td>Order ID</td>
<td>
<input id="OrderID" name="OrderID" disabled="disabled"
value="{{"{{"}}:OrderID{{}}}}" class="e-field e-ejinputtext"
style="width:116px;height:28px" />
</td>
<td>Customer ID</td>
<td>
<input id="CustomerID" name="CustomerID" value="{{"{{"}}:CustomerID{{}}}}"
class="e-field e-ejinputtext" style="width: 116px; height: 28px" />
</td>
</tr>
<tr>
<td>Employee ID</td>
<td>
<input type="text" id="EmployeeID" name="EmployeeID"
value="{{"{{"}}:EmployeeID{{}}}}" />
</td>
<td>Ship City</td>
<td>
<select id="ShipCity" name="ShipCity">
<option value="Argentina">Argentina</option>
```

External Form

By setting the EditMode as ExternalForm, the edit form is opened outside the grid content.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
.EditSettings(edit => {
edit.AllowAdding().AllowDeleting().AllowEditing().EditMode(EditMode.External
Form); })
.ToolbarSettings(toolbar =>
{
toolbar.ShowToolbar().ToolbarItems(items =>
{
items.AddTool(ToolBarItems.Add);
items.AddTool(ToolBarItems.Edit);
items.AddTool(ToolBarItems.Delete);
items.AddTool(ToolBarItems.Update);
items.AddTool(ToolBarItems.Cancel);
});
})
.Columns(col =>
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
{
col.Field("OrderID").HeaderText("Order
ID").IsPrimaryKey(true).TextAlign(TextAlign.Right).Add();
col.Field("CustomerID").HeaderText("Customer
ID").EditType(EditingType.StringEdit).Add();
col.Field("Freight").HeaderText("Freight").EditType(EditingType.NumericEdit)
.NumericEditOptions(new EditorProperties() { DecimalPlaces = 2 }).Add();
col.Field("ShipCountry").HeaderText("Ship Country").Add();
col.Field("OrderDate").HeaderText("Order
Date").EditType(EditingType.Datepicker).Format("{0:MM/dd/yyyy}").Add();
}))
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.DataSource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.

Form Position:

You can position an External edit form in the following two ways.

1. Top-right
2. Bottom left

This can be achieved by setting the FormPosition property of EditSettings as 'TopRight' or 'BottomLeft'.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
.EditSettings(edit => {
edit.AllowAdding().AllowDeleting().AllowEditing().EditMode(EditMode.External
Form).FormPosition(FormPosition.TopRight);  })
.ToolbarSettings(toolbar =>
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
{
toolbar.ShowToolbar().ToolbarItems(items =>
{
items.AddTool(ToolBarItems.Add);
items.AddTool(ToolBarItems.Edit);
items.AddTool(ToolBarItems.Delete);
items.AddTool(ToolBarItems.Update);
items.AddTool(ToolBarItems.Cancel);
});
})
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order
ID").IsPrimaryKey(true).TextAlign(TextAlign.Right).Add();
col.Field("CustomerID").HeaderText("Customer
ID").EditType(EditingType.StringEdit).Add();
col.Field("Freight").HeaderText("Freight").EditType(EditingType.NumericEdit)
.Add();
col.Field("ShipCountry").HeaderText("Ship Country").Add();
}))
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.DataSource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.

External Template Form

You can edit any of the fields pertaining to a single record of data and apply it to a template so that the same format is applied to all the other records that you may edit later.

Using this template support, you can edit the fields that are not bound to grid columns.

To edit the records using External template form, set EditMode as ExternalFormTemplate and specify the template id to ExternalFormTemplateID property of EditSettings.

While using template, you can change the elements that are defined in the template, to appropriate JS controls based on the column type. This can be achieved by using ActionComplete event of grid.

Note: 1. value attribute is used to bind the corresponding field value while editing.

2. name attribute is used to get the changed field values while save the edited record.

3. For EditMode property you can assign either string value (ExternalFormTemplate) or enum value (Syncfusion.JavaScript.EditMode.ExternalFormTemplate).

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
.ClientSideEvents(eve => { eve.ActionComplete("complete"); })
.EditSettings(edit => {
edit.AllowAdding().AllowDeleting().AllowEditing().EditMode(EditMode.External
FormTemplate).ExternalFormTemplateID("#template");})
.ToolbarSettings(toolbar =>
{
toolbar.ShowToolbar().ToolbarItems(items =>
{
items.AddTool(ToolBarItems.Add);
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
items.AddTool(ToolBarItems.Edit);
items.AddTool(ToolBarItems.Delete);
items.AddTool(ToolBarItems.Update);
items.AddTool(ToolBarItems.Cancel);
});
})
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order
ID").IsPrimaryKey(true).TextAlign(TextAlign.Right).Add();
col.Field("CustomerID").HeaderText("Customer
ID").EditType(EditingType.StringEdit).Add();
col.Field("ShipCity").HeaderText("Ship
City").EditType(EditingType.DropdownEdit).Add();
}))
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.DataSource = DataSource;
return View();
}
}
}
```

JS

```
<script id="template" type="text/template">

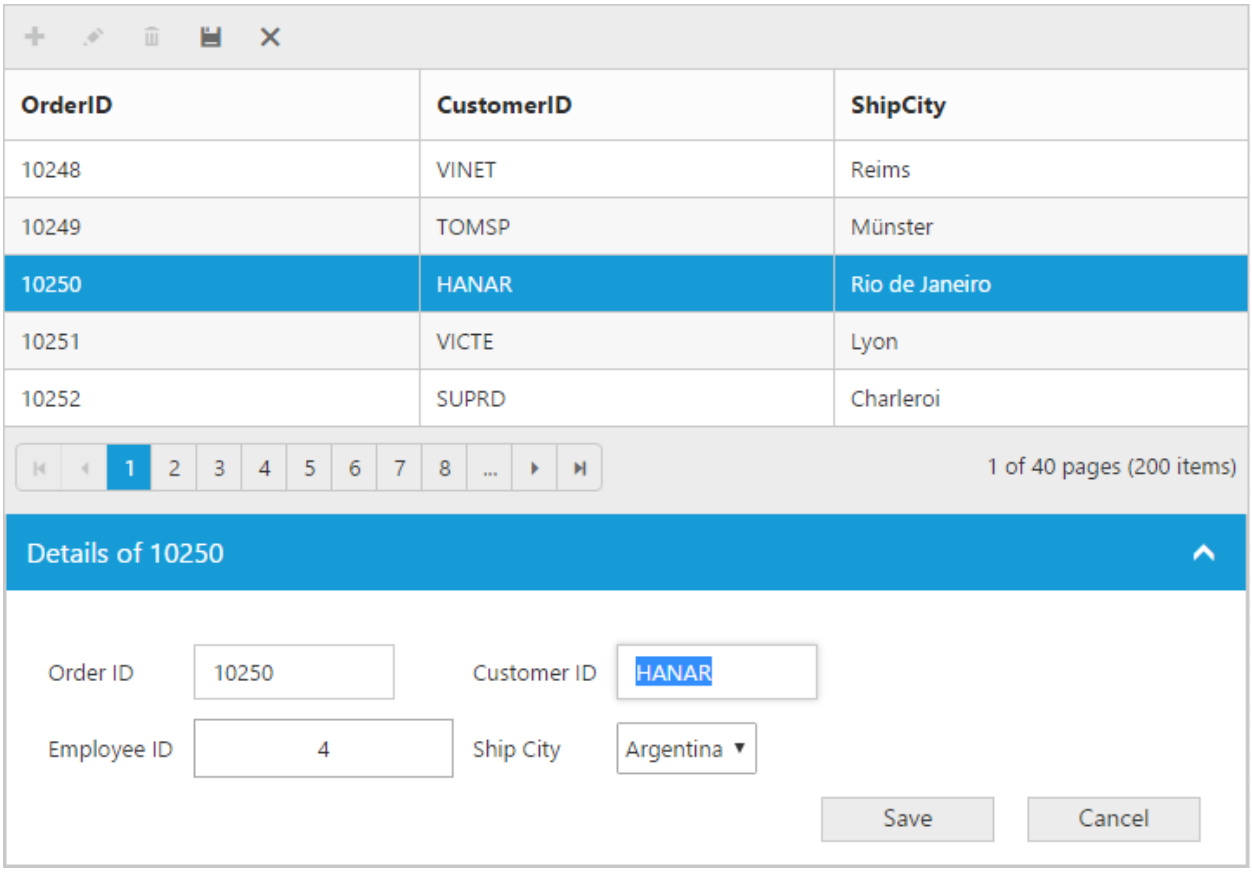
<td>
<input id="OrderID" name="OrderID" disabled="disabled"
value="{{"{{"}}:OrderID{{}}}}" class="e-field e-ejinputtext"
style="width:116px;height:28px" />
</td>
<td>Customer ID</td>
<td>
<input id="CustomerID" name="CustomerID" value="{{"{{"}}:CustomerID{{}}}}"
class="e-field e-ejinputtext" style="width: 116px; height: 28px" />
</td>
</tr>
<tr>
<td>Employee ID</td>
<td>
<input type="text" id="EmployeeID" name="EmployeeID"
value="{{"{{"}}:EmployeeID{{}}}}" />
</td>
<td>Ship City</td>
<td>
```

Copyright © 2001 - 2020 Syncfusion Inc.

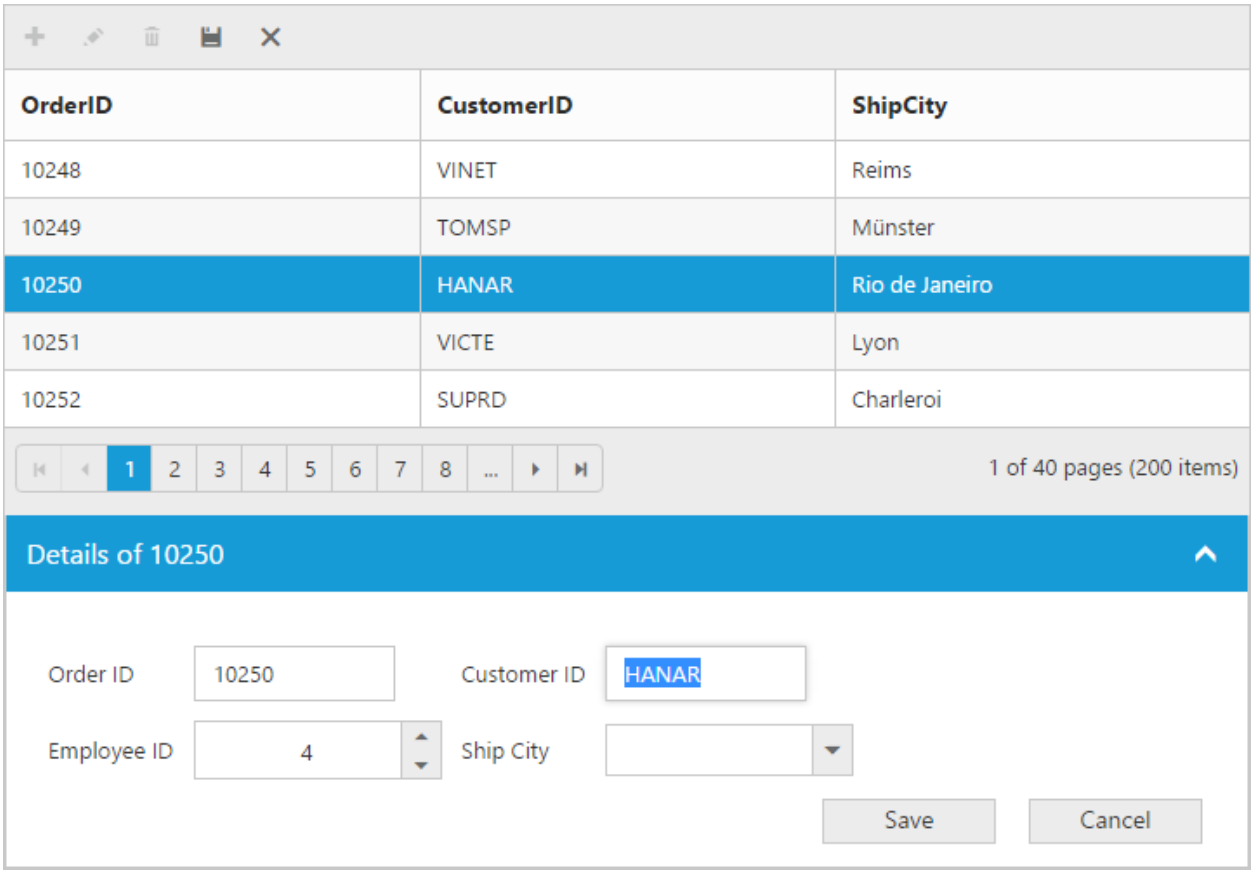
```
<select id="ShipCity" name="ShipCity">
<option value="Argentina">Argentina</option>
<option value="Austria">Austria</option>
<option value="Belgium">Belgium</option>
<option value="Brazil">Brazil</option>
<option value="Canada">Canada</option>
<option value="Denmark">Denmark</option>
</select>
</td>
</tr>
</table>
</script>
<script>
function complete(args) {
$("#EmployeeID").ejNumericTextbox();
$("#Freight").ejNumericTextbox();
$("#ShipCity").ejDropDownList();
}
</script>
```

The following output is displayed as a result of the above code example.



Before the template elements are converted to JS controls

Copyright © 2001 - 2020 Syncfusion Inc.



After the template elements are converted to JS controls using actionComplete event.

Note: To render the EJ MVC form controls like DatePicker, Dropdownlist, NumericTextBox in the template edit form, from the partial view, refer the KB How render ejControls in the Edit Form Template of the MVC Grid.

Batch / Excel-like

Users can start editing by clicking a cell and typing data into it. Edited cell will be marked while navigating to next cell or any other row, so that you know which fields or cells has been edited. Set `EditMode` as `Batch` to enable batch editing.

Note: `getBatchChanges` method of grid holds the unsaved record changes.

Refer the KB link for "How to suppress grid confirmation messages" in batch mode.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
.EditSettings(edit => {
edit.AllowAdding().AllowDeleting().AllowEditing().EditMode(EditMode.Batch);
})
.ToolbarSettings(toolbar =>
{
toolbar.ShowToolbar().ToolbarItems(items =>
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
{
items.AddTool(ToolBarItems.Add);
items.AddTool(ToolBarItems.Edit);
items.AddTool(ToolBarItems.Delete);
items.AddTool(ToolBarItems.Update);
items.AddTool(ToolBarItems.Cancel);
});
})
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order
ID").IsPrimaryKey(true).TextAlign(TextAlign.Right).Add();
col.Field("CustomerID").HeaderText("Customer
ID").EditType(EditingType.StringEdit).Add();
col.Field("Freight").HeaderText("Freight").EditType(EditingType.NumericEdit)
.NumericEditOptions(new EditorProperties() { DecimalPlaces = 2 }).Add();
col.Field("ShipCountry").HeaderText("Ship Country").Add();
col.Field("OrderDate").HeaderText("Order
Date").EditType(EditingType.Datepicker).Format("{0:MM/dd/yyyy}").Add();
}))
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.DataSource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.

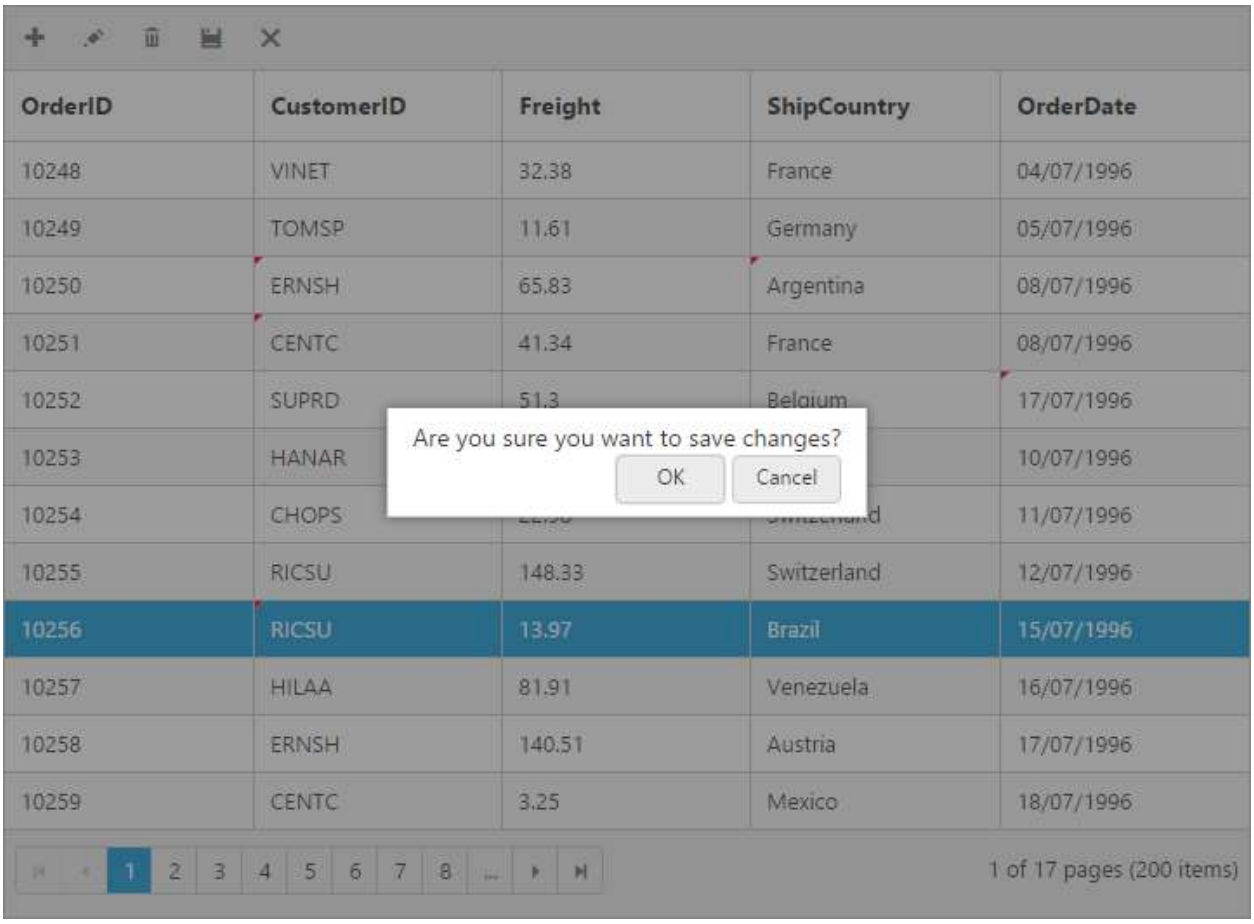
col.Field("Freight").HeaderText("Freight").EditType(EditingType.NumericEdit)
.NumericEditOptions(new EditorProperties() { DecimalPlaces = 2 }).Add();
col.Field("ShipCountry").HeaderText("Ship Country").Add();
col.Field("OrderDate").HeaderText("Order
Date").EditType(EditingType.Datepicker).Format("{0:MM/dd/yyyy}").Add();
}))
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.DataSource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.

Copyright © 2001 - 2020 Syncfusion Inc.



To show delete confirm dialog while deleting a record, set ShowDeleteConfirmDialog as true.

Note: ShowDeleteConfirmDialog property is for all type of EditMode.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
.EditSettings(edit => {
edit.AllowAdding().AllowDeleting().AllowEditing().ShowDeleteConfirmDialog();
})
.ToolbarSettings(toolbar =>
{
toolbar.ShowToolbar().ToolbarItems(items =>
{
items.AddTool(ToolBarItems.Add);
items.AddTool(ToolBarItems.Edit);
items.AddTool(ToolBarItems.Delete);
items.AddTool(ToolBarItems.Update);
items.AddTool(ToolBarItems.Cancel);
});
})
.Columns(col =>
{
```

Copyright © 2001 - 2020 Syncfusion Inc.

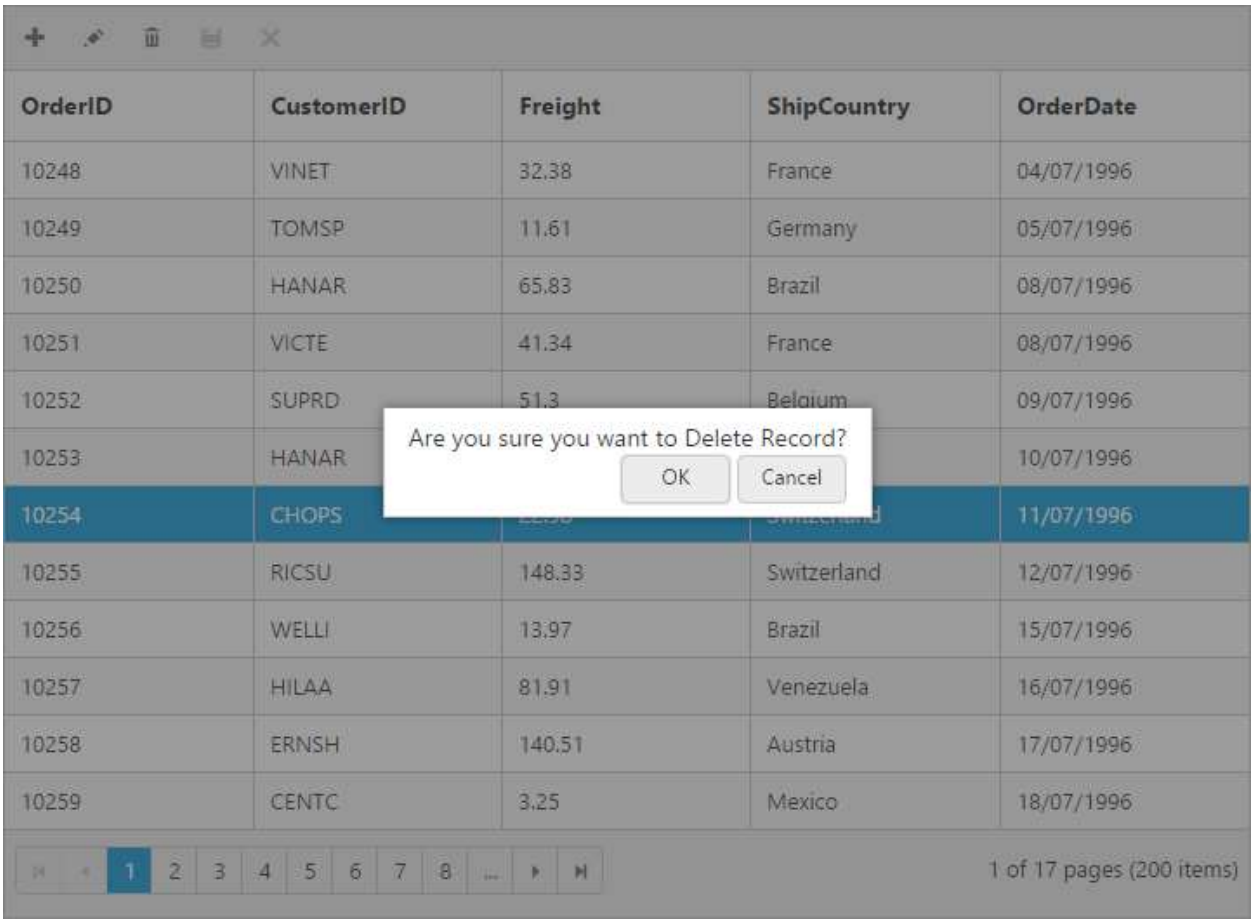
```
col.Field("OrderID").HeaderText("Order
ID").IsPrimaryKey(true).TextAlign(TextAlign.Right).Add();
col.Field("CustomerID").HeaderText("Customer
ID").EditType(EditingType.StringEdit).Add();
col.Field("Freight").HeaderText("Freight").EditType(EditingType.NumericEdit)
.NumericEditOptions(new EditorProperties() { DecimalPlaces = 2 }).Add();
col.Field("ShipCountry").HeaderText("Ship Country").Add();
col.Field("OrderDate").HeaderText("Order
Date").EditType(EditingType.Datepicker).Format("{0:MM/dd/yyyy}").Add();
}))
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.DataSource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.

Copyright © 2001 - 2020 Syncfusion Inc.



Column Validation

We can validate the value of the added or edited record cell before saving.

The below validation script files are needed when editing is enabled with validation.

1. jquery.validate.min.js
2. jquery.validate.unobtrusive.min.js

jQuery Validation

You can set validation rules using `ValidationRules` property of `Columns`. The following are jQuery validation methods.

List of Jquery validation methods

Rules	Description
required	Requires an element.
remote	Requests a resource to check the element for validity.
minlength	Requires the element to be of given minimum length.
maxlength	Requires the element to be of given maximum length.

Copyright © 2001 - 2020 Syncfusion Inc.

range	Requires the element to be in given value range.
min	The element requires a given minimum.
max	The element requires a given maximum.
email	The element requires a valid email.
url	The element requires a valid URL
date	Requires the element to be a date.
dateISO	The element requires an ISO date.
number	The element requires a decimal number.
digits	The element requires digits only.
creditcard	Requires the element to be a credit card number.
equalTo	Requires the element to be the same as another.

Grid supports all the standard validation methods of jQuery, please refer the jQuery validation documentation link for more information.

To return custom validation message from server end, please refer this KB link.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
.EditSettings(edit => { edit.AllowAdding().AllowDeleting().AllowEditing();
})
.ToolbarSettings(toolbar =>
{
toolbar.ShowToolbar().ToolbarItems(items =>
{
items.AddTool(ToolBarItems.Add);
items.AddTool(ToolBarItems.Edit);
items.AddTool(ToolBarItems.Delete);
items.AddTool(ToolBarItems.Update);
items.AddTool(ToolBarItems.Cancel);
});
})
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order
ID").IsPrimaryKey(true).ValidationRules(v =>
v.AddRule("required",true).AddRule("number", true)).Add();
col.Field("CustomerID").HeaderText("Customer ID").ValidationRules(v =>
v.AddRule("required", true).AddRule("minlength", 3)).Add();
col.Field("ShipCity").HeaderText("Ship City").Add();
col.Field("Freight").HeaderText("Freight").EditType(EditingType.NumericEdit)
.ValidationRules(v => v.AddRule("range", "[0,1000]")).Add();
```

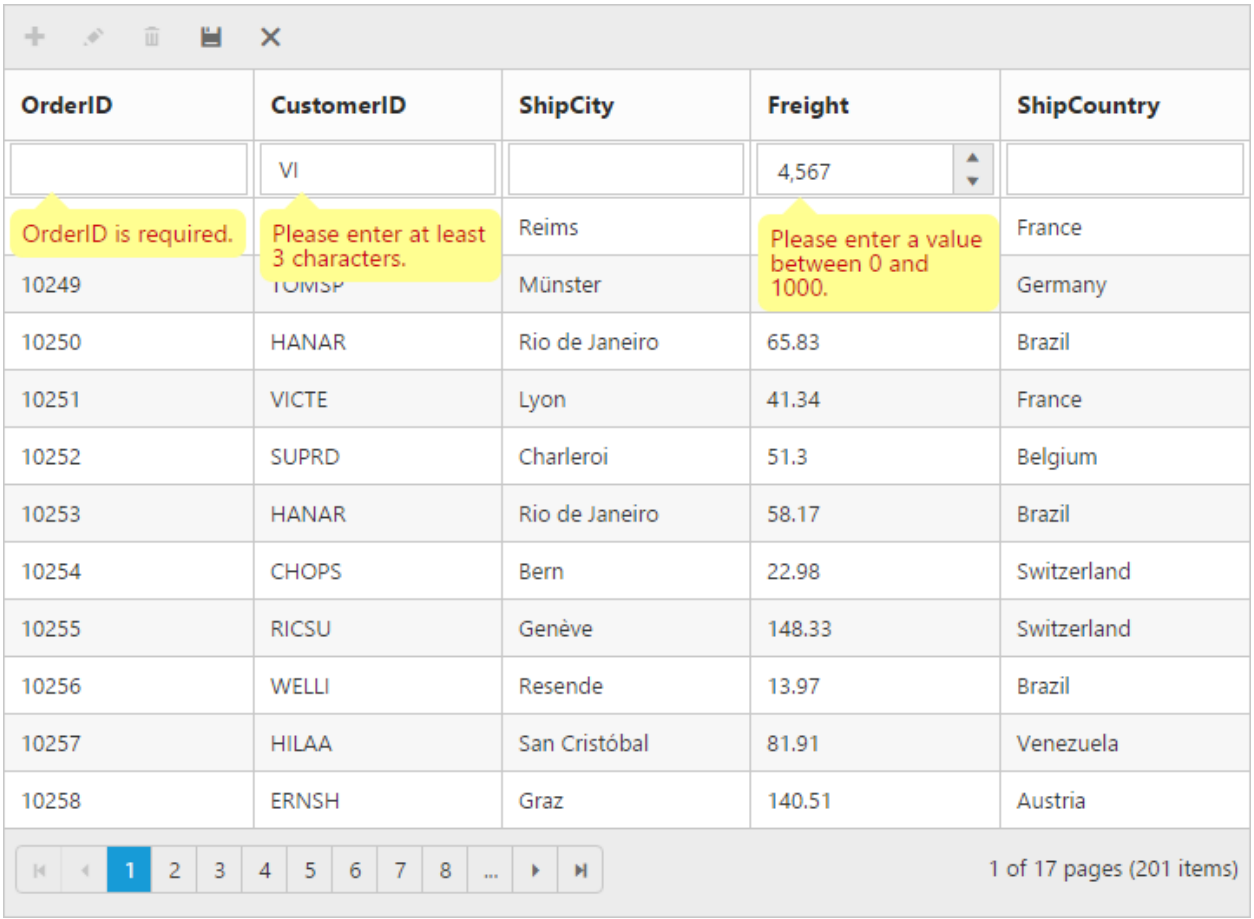
Copyright © 2001 - 2020 Syncfusion Inc.

```
col.Field("ShipCountry").HeaderText("Ship Country").Add();
}))
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.DataSource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.



Note: 1. Refer this Knowledge Base link to perform server side validation in Grid.

Custom Validation

In addition to jQuery validation methods, you can also add your own custom validation methods for a specific column. Function call to custom validator function to be mentioned within ValidationRules property of Columns.

Using messages property of ValidationRules you can specify the error message for that column.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
.EditSettings(edit => { edit.AllowAdding().AllowDeleting().AllowEditing();
})
.ToolbarSettings(toolbar =>
{
toolbar.ShowToolbar().ToolbarItems(items =>
{
items.AddTool(ToolBarItems.Add);
items.AddTool(ToolBarItems.Edit);
items.AddTool(ToolBarItems.Delete);
items.AddTool(ToolBarItems.Update);
items.AddTool(ToolBarItems.Cancel);
});
})
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order ID").IsPrimaryKey(true).Add();
col.Field("CustomerID").HeaderText("Customer ID").ValidationRules(v =>
v.AddRule("customRegex", 5)).Add();
col.Field("ShipCity").HeaderText("Ship City").Add();
col.Field("Freight").HeaderText("Freight").EditType(EditingType.NumericEdit)
.ValidationRules(rule => rule.AddRule("customCompare", new List<object>() {
0, 1000 })).Add();
col.Field("ShipCountry").HeaderText("Ship Country").Add();
}))
```

JS

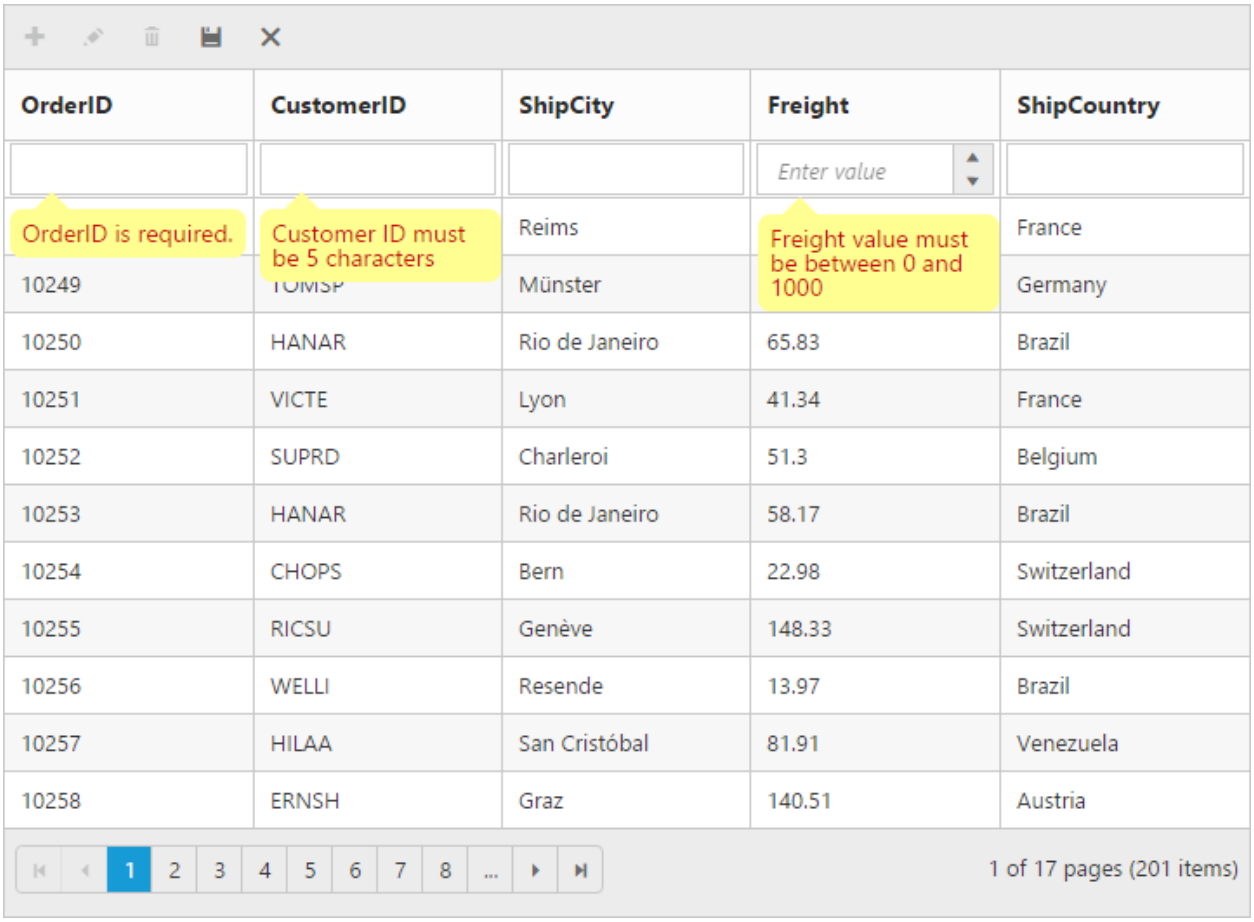
```
<script type="text/javascript">
$(function () {
$.validator.addMethod("customCompare", function (value, element, params) {
return element.value > params[0] && element.value < params[1];
}, "Freight value must be between 0 and 1000");
$.validator.addMethod("customRegex", function (value, element, params) {
if (element.value.length == params)
return true;
return false;
}, "Customer ID must be 5 characters");
});
</script>
```

C#

Copyright © 2001 - 2020 Syncfusion Inc.

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.DataSource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.



Persisting data in Server

Edited data can be persisted in database using RESTful web services.

All the CRUD operations in grid are done through DataManager. DataManager have an option to bind all the CRUD related data in server side. Please refer the ['link'] to know about the DataManager.

For you information ODataAdaptor persist data in server as per OData protocol.

In the below section, we have explained how to get the edited data details at the server side using URLAdaptor.

Copyright © 2001 - 2020 Syncfusion Inc.

URL Adaptor

You can use the UrlAdaptor of DataManger when binding datasource from remote data. At initial load of Grid, using URL property of DataManager, data are fetched from remote data and bound to Grid. You can map CRUD operation in Grid to Server-Side Controller action using the properties InsertURL, RemoveURL, UpdateURL, CrudURL and BatchURL.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource(datasource =>
datasource.URL("Home/DataSource").UpdateURL("Home/Update").InsertURL("Home/I
nsert").RemoveURL("Home/Delete").Adaptor(AdaptorType.UrlAdaptor))
.AllowPaging()
.EditSettings(edit => { edit.AllowAdding().AllowDeleting().AllowEditing();
})
.ToolbarSettings(toolbar =>
{
toolbar.ShowToolbar().ToolbarItems(items =>
{
items.AddTool(ToolBarItems.Add);
items.AddTool(ToolBarItems.Edit);
items.AddTool(ToolBarItems.Delete);
items.AddTool(ToolBarItems.Update);
items.AddTool(ToolBarItems.Cancel);
});
})
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order ID").IsPrimaryKey(true).Add();
col.Field("CustomerID").HeaderText("Customer ID").Add();
col.Field("EmployeeID").HeaderText("Employee ID").Add();
col.Field("Freight").HeaderText("Freight").EditType(EditingType.NumericEdit)
.Add();
col.Field("ShipCity").HeaderText("Ship City").Add();
col.Field("ShipCountry").HeaderText("Ship Country").Add();
}))
```

Also when you use UrlAdaptor, you need to return the data as JSON and the JSON object must contain a property as result with dataSource as its value and one more property count with the dataSource total records count as its value.

The following code example describes the above behavior.

C#

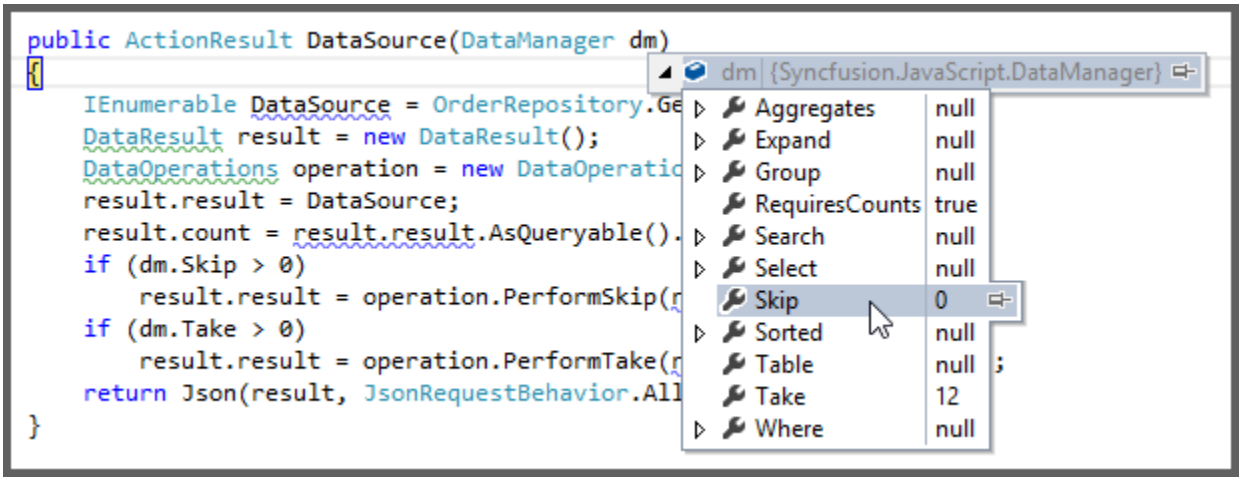
```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult DataSource(DataManager dataManager)
{
IEnumerable DataSource = OrderRepository.GetAllRecords();
DataResult result = new DataResult();
DataOperations operation = new DataOperations();
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
result.result = DataSource;
result.count = result.result.AsQueryable().Count();
if (dataManager.Skip > 0)
result.result = operation.PerformSkip(result.result, dataManager.Skip);
if (dataManager.Take > 0)
result.result = operation.PerformTake(result.result, dataManager.Take);
return Json(result, JsonRequestBehavior.AllowGet);
}
public class DataResult
{
public IEnumerable result { get; set; }
public int count { get; set; }
}
}
}
```

The grid actions (sorting, filtering, paging, searching, and aggregates) details are obtained in the 'DataManager' class. While initializing the grid, paging only enabled hence in the below screen shot paging details are bound to the DataManager class.

Please refer the below screen shot.



Also, using 'DataOperations' helper class you can perform grid action at server side. The in-built methods that we have provided in the DataOperations class are listed below.

1. PerformSorting
2. PerformFiltering
3. PerformSearching
4. PerformSkip
5. PerformTake
6. PerformWhereFilter
7. PerformSelect
8. Execute

RemoteSave Adaptor:

RemoteSaveAdaptor is used for binding local data and performs all data operations in client-side. It interacts with server-side only for CRUD operations to pass the modified records.

Copyright © 2001 - 2020 Syncfusion Inc.

Refer to the following code example

RAZOR

```
@(Html.EJ().Grid<object>("FlatGrid")
.Datasource(dataSource =>
dataSource.Json((IEnumerable<object>)ViewBag.datasource).UpdateURL("/Home/Up
date")
.InsertURL("/Home/Insert").RemoveURL("/Home/Remove").Adaptor(AdaptorType.Rem
oteSaveAdaptor))
.AllowPaging()
.EditSettings(edit => { edit.AllowAdding().AllowDeleting().AllowEditing();
})
.ToolbarSettings(toolbar =>
{
toolbar.ShowToolbar().ToolbarItems(items =>
{
items.AddTool(ToolBarItems.Add);
items.AddTool(ToolBarItems.Edit);
items.AddTool(ToolBarItems.Delete);
items.AddTool(ToolBarItems.Update);
items.AddTool(ToolBarItems.Cancel);
});
})
.Columns(col =>
{
col.Field("OrderID").IsPrimaryKey(true).Add();
col.Field("EmployeeID").Add();
col.Field("CustomerID").Add();
col.Field("ShipCountry").Add();
col.Field("Freight").Add();
})
)
```

Accessing CRUD action request details in server side:

The 'Server-Side' function must be declared with the following parameter name for each editing functionality.

Parameters Table

Action	Parameter Name	Example
Update,Insert	value	public ActionResult Update(EditableOrder value){ }
	public ActionResult Insert(EditableOrder value){ }	
Remove	key	public ActionResult Remove(int key){ }
Batch Add	added	public ActionResult BatchUpdate(string action, List <EditableOrder> added, List <EditableOrder> changed, List <EditableOrder> deleted, int? key){ }
Batch Update	changed	
Batch Delete	deleted	

Copyright © 2001 - 2020 Syncfusion Inc.

Crud Update,Crud Insert	value, action	public ActionResult CrudUrl(EditableOrder value, string action){ }
Crud Remove	action, key, keyColumn	public ActionResult CrudUrl(string action, int? key, string keyColumn){ }
Crud Remove - Multi Delete	action, key, deleted	public ActionResult CrudUrl(string action, string key, List <EditableOrder> deleted){ }

Insert Record:

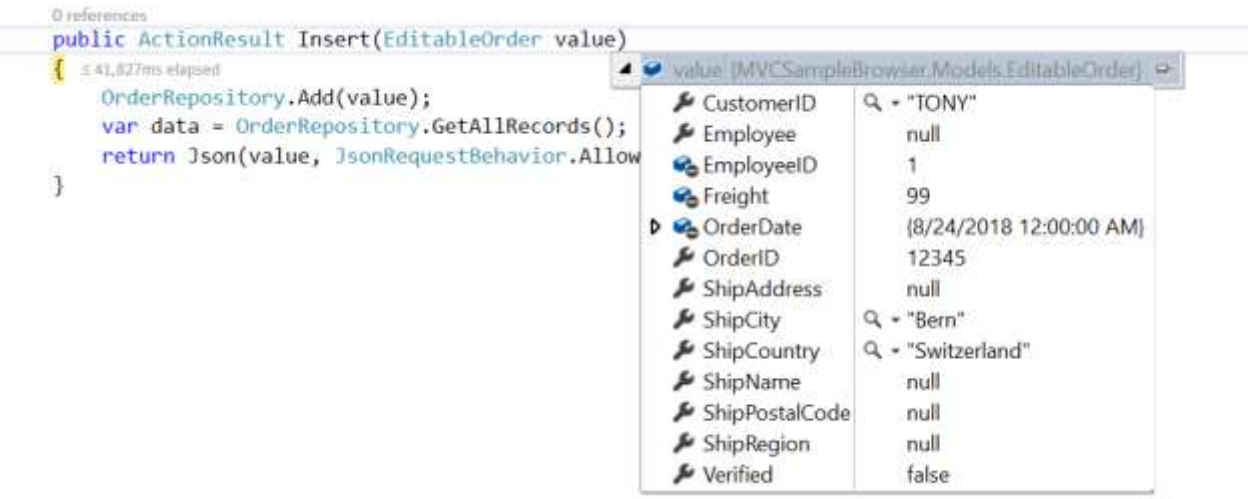
Using InsertURL property, you can specify the controller action mapping URL to perform insert operation at server side.

The following code example describes the above behavior.

C#

```
public ActionResult Insert(EditableOrder value)
{
OrderRepository.Add(value);
var data = OrderRepository.GetAllRecords();
return Json(value, JsonRequestBehavior.AllowGet);
}
```

The newly added record details are bound to the 'value' parameter. Please refer the below image.



Update Record:

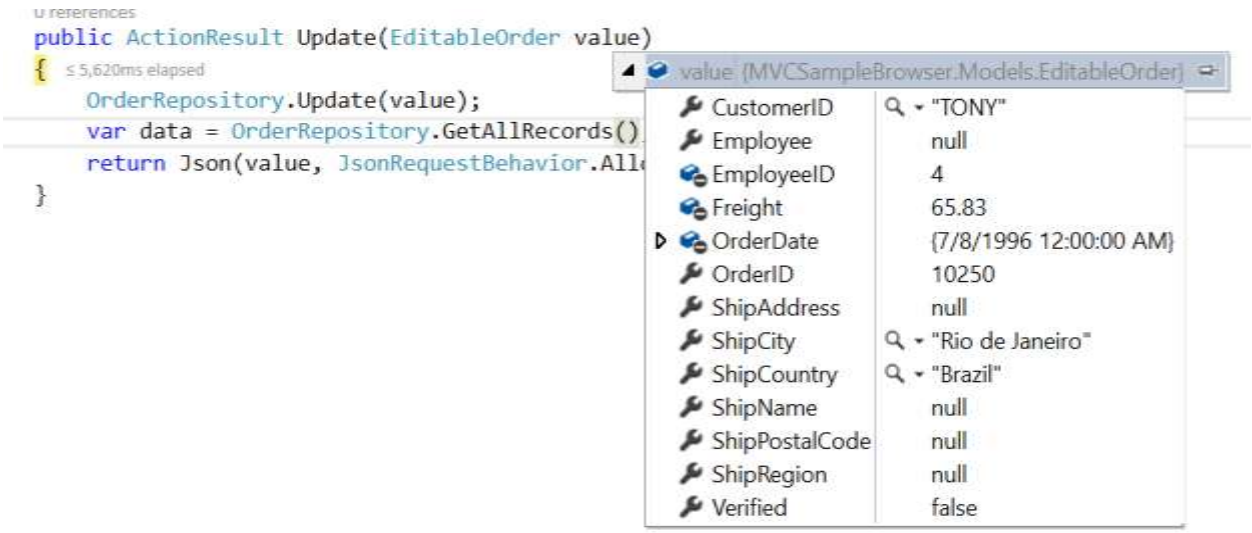
Using UpdateURL property, you can specify the controller action mapping URL to perform save/update operation at server side.

The following code example describes the above behavior.

C#

```
public ActionResult Update(EditableOrder value)
{
OrderRepository.Update(value);
var data = OrderRepository.GetAllRecords();
return Json(value, JsonRequestBehavior.AllowGet);
}
```

The updated record details are bound to the 'value' parameter. Please refer the below image.



Delete Record:

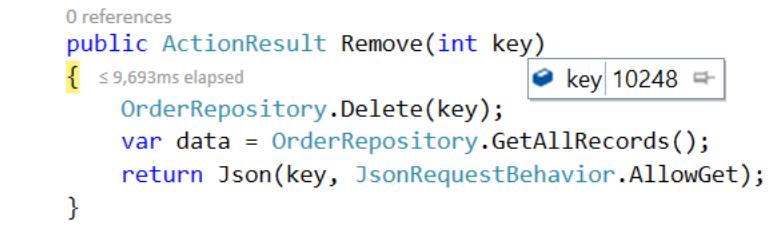
Using RemoveURL property, you can specify the controller action mapping URL to perform delete operation at server side.

The following code example describes the above behavior.

C#

```
public ActionResult Remove(int key)
{
OrderRepository.Delete(key);
var data = OrderRepository.GetAllRecords();
return Json(key, JsonRequestBehavior.AllowGet);
}
```

The deleted record primary key value is bound to the 'key' parameter. Please refer the below image.



Copyright © 2001 - 2020 Syncfusion Inc.

CRUD URL:

Instead of specifying separate controller action method for CRUD (insert, update and delete)operation, using CrudURL property you can specify the controller action mapping URL to perform all the CRUD operation at server side using single method.

The action parameter of CrudURL is used to get the corresponding CRUD action.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource(datasource =>
datasource.URL("Home/DataSource").CrudURL("Home/CrudUpdate").Adaptor(Adaptor
Type.UrlAdaptor))
.AllowPaging()
.EditSettings(edit => { edit.AllowAdding().AllowDeleting().AllowEditing();
})
.ToolbarSettings(toolbar =>
{
toolbar.ShowToolbar().ToolbarItems(items =>
{
items.AddTool(ToolBarItems.Add);
items.AddTool(ToolBarItems.Edit);
items.AddTool(ToolBarItems.Delete);
items.AddTool(ToolBarItems.Update);
items.AddTool(ToolBarItems.Cancel);
});
})
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order ID").IsPrimaryKey(true).Add();
col.Field("CustomerID").HeaderText("Customer ID").Add();
col.Field("EmployeeID").HeaderText("Employee ID").Add();
col.Field("Freight").HeaderText("Freight").EditType(EditingType.NumericEdit)
.Add();
col.Field("ShipCity").HeaderText("Ship City").Add();
col.Field("ShipCountry").HeaderText("Ship Country").Add();
}))
```

C#

```
public ActionResult CrudUpdate(EditableOrder value, string action, int key)
{
if (action == "update")
OrderRepository.Update(value);
else if (action == "insert")
OrderRepository.Add(value);
else if (action == "remove")
OrderRepository.Delete(key);
return Json(value, JsonRequestBehavior.AllowGet);
}
```

Please refer the below image to know about the action parameter

Copyright © 2001 - 2020 Syncfusion Inc.

```
public ActionResult CrudUrl(EditableOrder value, int? key, string action)
{
    if (action == "update")
        OrderRepository.Update(value);
    else if (action == "insert")
        OrderRepository.Add(value);
    else if (action == "remove")
        OrderRepository.Delete(key);
    return Json(value, JsonRequestBehavior.AllowGet);
}
```

Note: If you specify InsertURL along with CrudURL then while adding InsertURL only called.

Batch URL:

The BatchURL property supports only for batch editing mode. You can specify the controller action mapping URL to perform Batch operation at server side.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource(datasource =>
datasource.Json((IEnumerable<object>)ViewBag.dataSource).BatchURL("Home/Batc
hUpdate").Adaptor(AdaptorType.UrlAdaptor))
.AllowPaging()
.EditSettings(edit => { edit.AllowAdding().AllowDeleting().AllowEditing();
})
.ToolbarSettings(toolbar =>
{
toolbar.ShowToolbar().ToolbarItems(items =>
{
items.AddTool(ToolBarItems.Add);
items.AddTool(ToolBarItems.Edit);
items.AddTool(ToolBarItems.Delete);
items.AddTool(ToolBarItems.Update);
items.AddTool(ToolBarItems.Cancel);
});
})
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order ID").IsPrimaryKey(true).Add();
col.Field("CustomerID").HeaderText("Customer ID").Add();
col.Field("EmployeeID").HeaderText("Employee ID").Add();
col.Field("Freight").HeaderText("Freight").EditType(EditingType.NumericEdit)
.Add();
col.Field("ShipCity").HeaderText("Ship City").Add();
col.Field("ShipCountry").HeaderText("Ship Country").Add();
}))
```

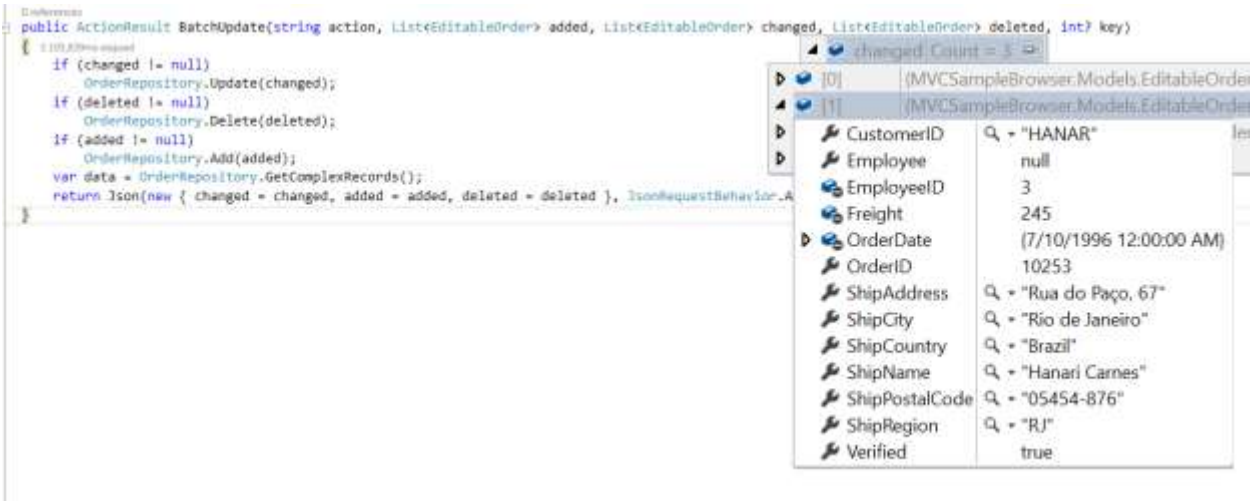
C#

```
public ActionResult BatchUpdate(string action, List<EditableOrder> added,
List<EditableOrder> changed, List<EditableOrder> deleted, int? key)
{
if (changed != null)
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
OrderRepository.Update(changed);
if (deleted != null)
OrderRepository.Delete(deleted);
if (added != null)
OrderRepository.Add(added);
var data = OrderRepository.GetComplexRecords();
return Json(new { changed = changed, added = added, deleted = deleted },
JsonRequestBehavior.AllowGet);
}
```

Please refer the below image for more information about batch parameters



Performing CRUD Operation on ODataV4 Adaptor

ODataV4 Adaptor that is extended from ODataAdaptor, is used for consuming data from ODataV4 Service

To consume ODataV4 service, set the service link to the Url property of Grid DataSource and you can set Adaptor type as AdaptorType.ODataV4Adaptor to the Adaptor Property of Grid DataManager. We can bind this DataManager as dataSource for the Grid.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<object>("Grid")
.Datasource(datasource => {
datasource.URL("/odata/Orders").Adaptor(AdaptorType.ODataV4Adaptor); })
.EditSettings(edit => {
edit.AllowAdding().AllowDeleting().AllowEditing().EditMode(EditMode.Normal);
})
.ToolbarSettings(toolbar =>
{
toolbar.ShowToolbar().ToolbarItems(items =>
{
items.AddTool(ToolBarItems.Add);
items.AddTool(ToolBarItems.Edit);
items.AddTool(ToolBarItems.Delete);
items.AddTool(ToolBarItems.Update);
items.AddTool(ToolBarItems.Cancel);
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
});
})
.AllowPaging()
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order
ID").IsPrimaryKey(true).IsIdentity(true).Width(50).Add();
col.Field("EmployeeID").HeaderText("Employee ID").Width(50).Add();
col.Field("ShipCity").HeaderText("ShipCity").Width(50).Add();
})
)
```

To perform the CRUD Operation in ODataV4 we need not explicitly mention any URL for Insert, Update or Delete operations in grid instead we can retrieve it using the PUT, POST and DELETE semantics of the OData which will be handled on the URL property already specified.

The following code example describes the above behavior.

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : ODataController
{
// GET: Orders
NORTHWNDEntities db = new NORTHWNDEntities();
[EnableQuery]
public IQueryable<Order> Get()
{
return db.Orders;
}
}
}
```

The Get method returns the entire Order collection. This Get Method returns the data to the Grid from the database.

Insert Record:

To add a new data to the database, add the following method to controller page.

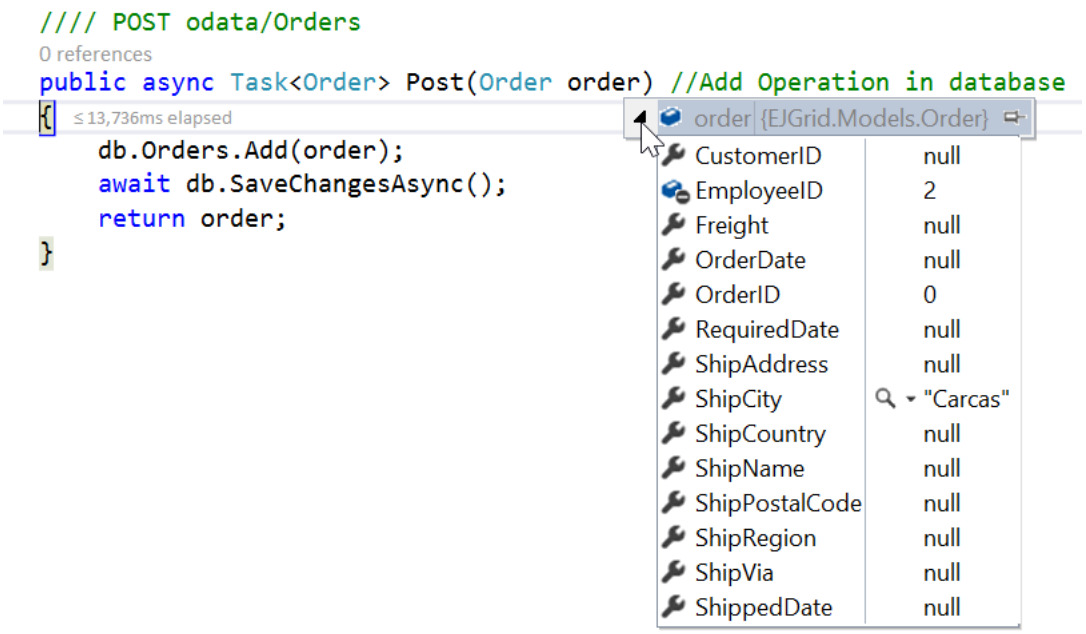
The following code example describes the above behavior.

C#

```
// POST odata/Orders
public async Task<Order> Post(Order order)
{
db.Orders.Add(order);
await db.SaveChangesAsync();
return order;
}
```

Please refer the below image.

Copyright © 2001 - 2020 Syncfusion Inc.



Here the newly added record details are bound to the 'order' parameter.

Update Record:

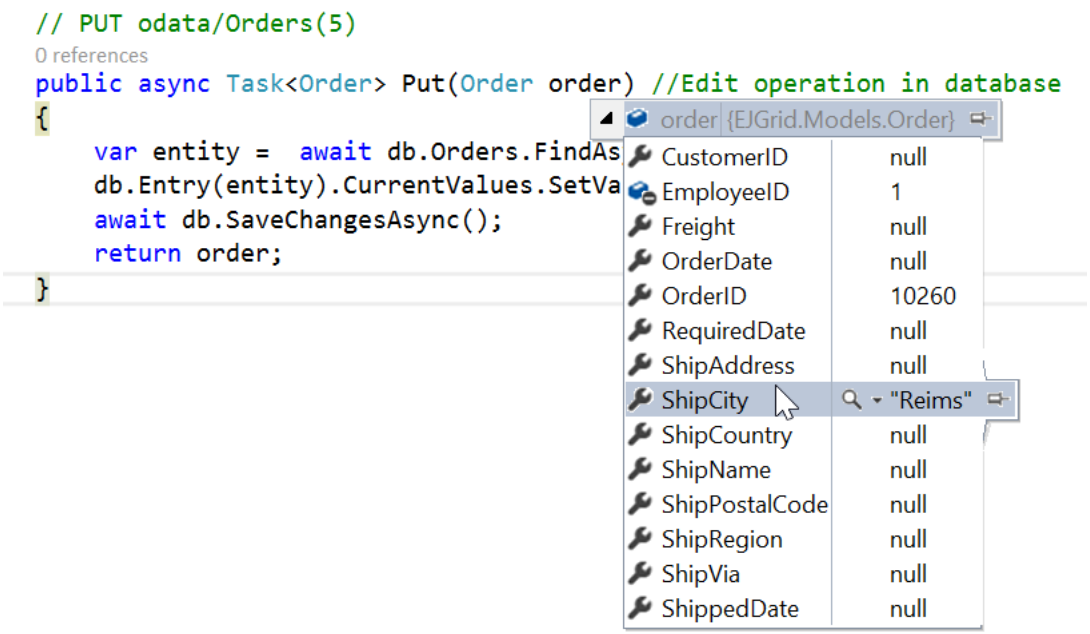
To update an existing data from the database, add the following method to Controller page.

The following code example describes the above behavior.

C#

```
// PUT odata/Orders(5)
public async Task<Order> Put(Order order)
{
var entity =  await db.Orders.FindAsync(order.OrderID);
db.Entry(entity).CurrentValues.SetValues(order);
await db.SaveChangesAsync();
return order;
}
```

Please refer the below image.



Here the modified row data will be obtained in the order parameter.

Delete Record:

To delete a data from the database, add the following method to controller.

The following code example describes the above behavior.

C#

```
// DELETE odata/Orders(5)
public async Task<IHttpActionResult> Delete([FromODataUri] int key)
{
var data = await db.Orders.FindAsync(key);
if (data == null)
{
return NotFound();
}
db.Orders.Remove(data);
await db.SaveChangesAsync();
return StatusCode(HttpStatusCode.NoContent);
}
```

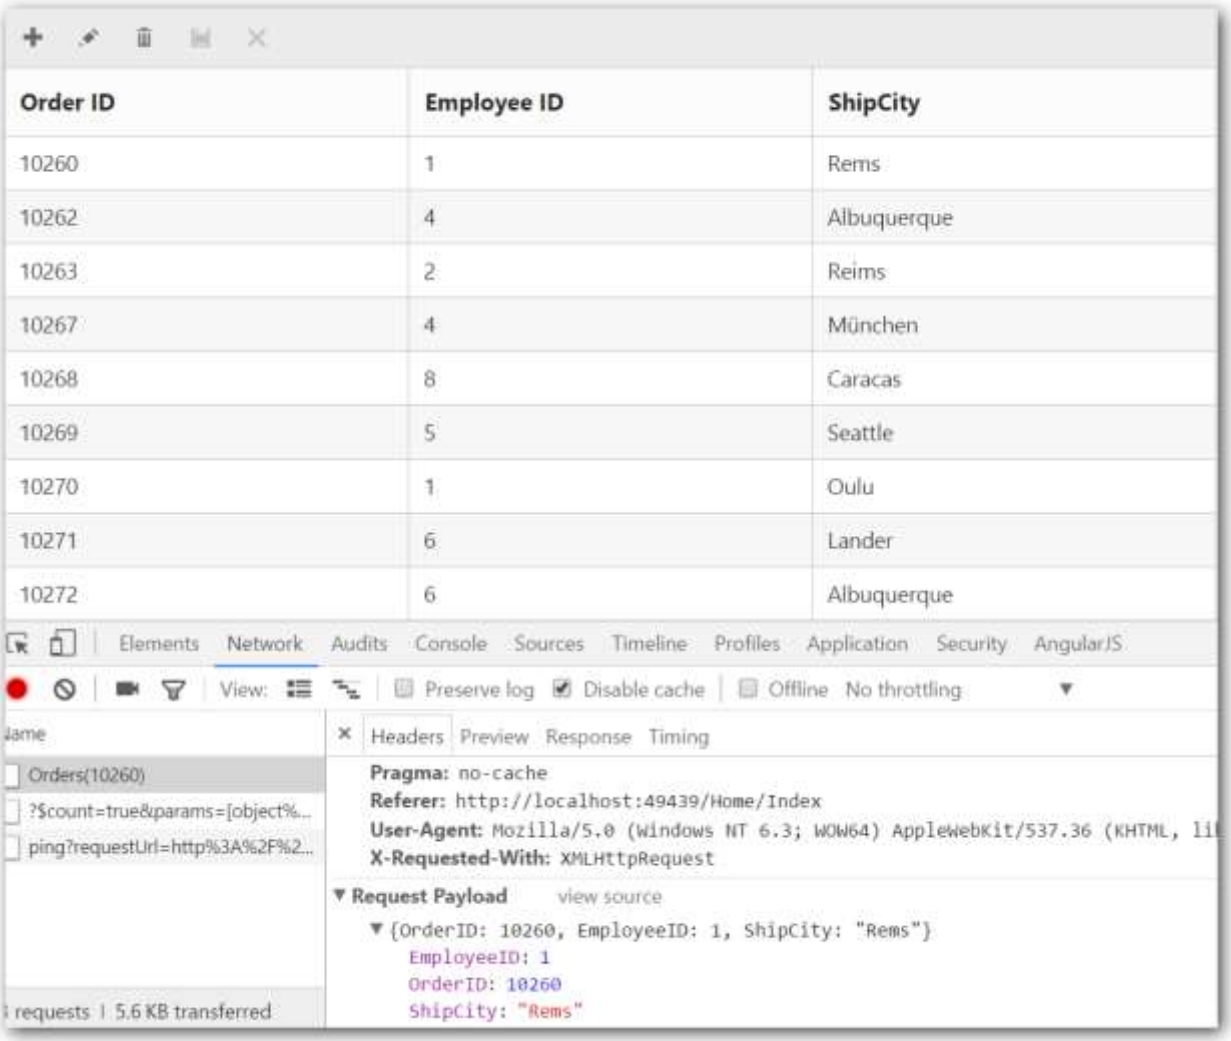
Please refer the below image.

Copyright © 2001 - 2020 Syncfusion Inc.

```
// DELETE odata/Orders(5)
 0 references
public async Task<IHttpActionResult> Delete([FromODataUri] int key)
{  ≤5,179ms elapsed                                          key 10260
    var od = await db.Orders.FindAsync(key);
     if (od == null)
     {
         return NotFound();
     }
     db.Orders.Remove(od);
     await db.SaveChangesAsync();
     return StatusCode(HttpStatusCode.NoContent);
}
```

The deleted record primary key value is bound to the ‘key’ parameter.

Please refer the below image.



Copyright © 2001 - 2020 Syncfusion Inc.

Adding New Row Position

To add new row in the top or bottom position of grid content, set RowPosition property of EditSettings depending on the requirement.

The following code example describes the above behavior.

RAZOR

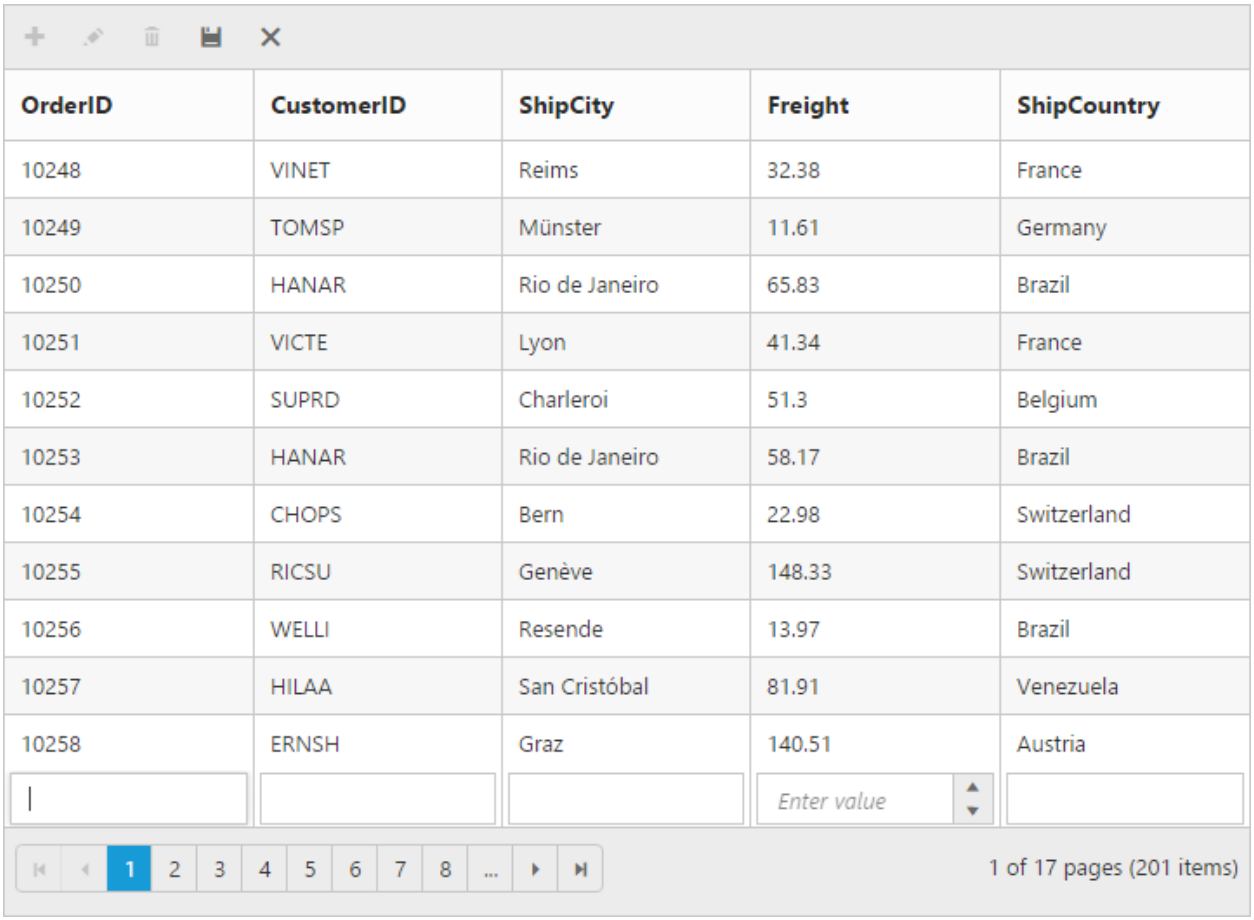
```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
.EditSettings(edit => {
edit.AllowAdding().AllowDeleting().AllowEditing().RowPosition(RowPosition.Bo
ttom) })
.ToolbarSettings(toolbar =>
{
toolbar.ShowToolbar().ToolbarItems(items =>
{
items.AddTool(ToolBarItems.Add);
items.AddTool(ToolBarItems.Edit);
items.AddTool(ToolBarItems.Delete);
items.AddTool(ToolBarItems.Update);
items.AddTool(ToolBarItems.Cancel);
});
})
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order ID").IsPrimaryKey(true).Add();
col.Field("CustomerID").HeaderText("Customer ID").Add();
col.Field("ShipCity").HeaderText("Ship City").Add();
col.Field("Freight").HeaderText("Freight").EditType(EditingType.NumericEdit)
.Add();
col.Field("ShipCountry").HeaderText("Ship Country").Add();
}))
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.DataSource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.

Copyright © 2001 - 2020 Syncfusion Inc.



Render with blank row for easy add new

The blank add new row is displayed in the grid content during grid initialization itself to add a new record easily. To enable show add new row by default, set ShowAddNewRow property of EditSettings as true.

The blank add new row is displayed either in the top or bottom of the corresponding page, its position is based on the RowPosition property of EditSettings.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
.EditSettings(edit => {
edit.AllowAdding().AllowDeleting().AllowEditing().ShowAddNewRow(); })
.ToolbarSettings(toolbar =>
{
toolbar.ShowToolbar().ToolbarItems(items =>
{
items.AddTool(ToolBarItems.Add);
items.AddTool(ToolBarItems.Edit);
items.AddTool(ToolBarItems.Delete);
items.AddTool(ToolBarItems.Update);
items.AddTool(ToolBarItems.Cancel);
```

Copyright © 2001 - 2020 Syncfusion Inc.

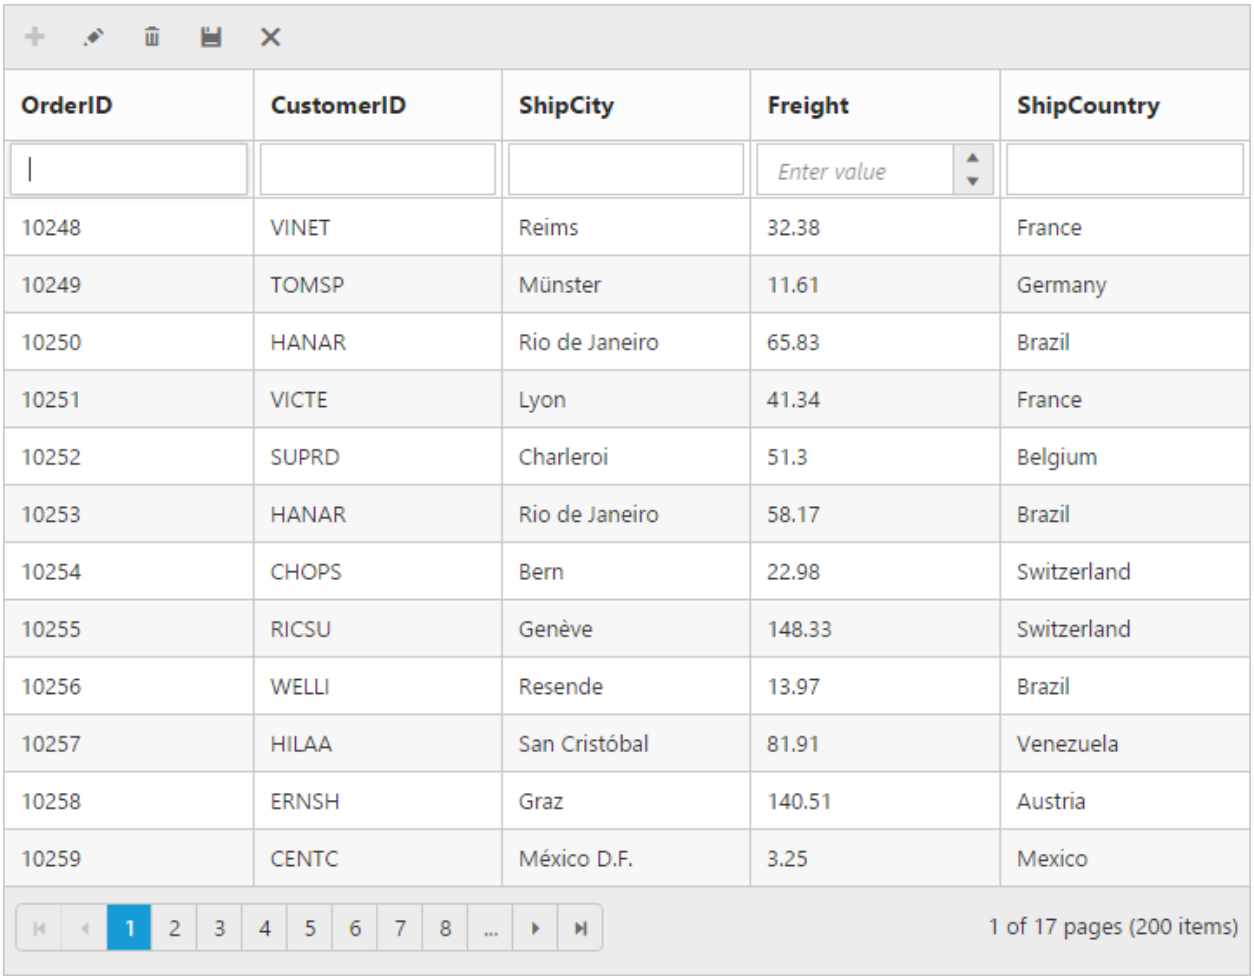
```
});
})
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order ID").IsPrimaryKey(true).Add();
col.Field("CustomerID").HeaderText("Customer ID").Add();
col.Field("ShipCity").HeaderText("Ship City").Add();
col.Field("Freight").HeaderText("Freight").EditType(EditingType.NumericEdit)
.Add();
col.Field("ShipCountry").HeaderText("Ship Country").Add();
}))
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.DataSource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.

Copyright © 2001 - 2020 Syncfusion Inc.



Note: 1. If it is remote, then the newly added record is placed based on the index from current view data.

2. If it is local, then the newly added record is added at the top of the page even if the added new `RowPosition` is mentioned as "Bottom".

Default column values on add new

While adding new record in grid, there is an option to set the default value for the columns. Using `DefaultValue` property of `Columns` you can set the default values for that particular column while editing or adding a new row.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
.EditSettings(edit => {
edit.AllowAdding().AllowDeleting().AllowEditing().ShowAddNewRow(); })
.ToolbarSettings(toolbar =>
{
toolbar.ShowToolbar().ToolbarItems(items =>
{
```

Copyright © 2001 - 2020 Syncfusion Inc.

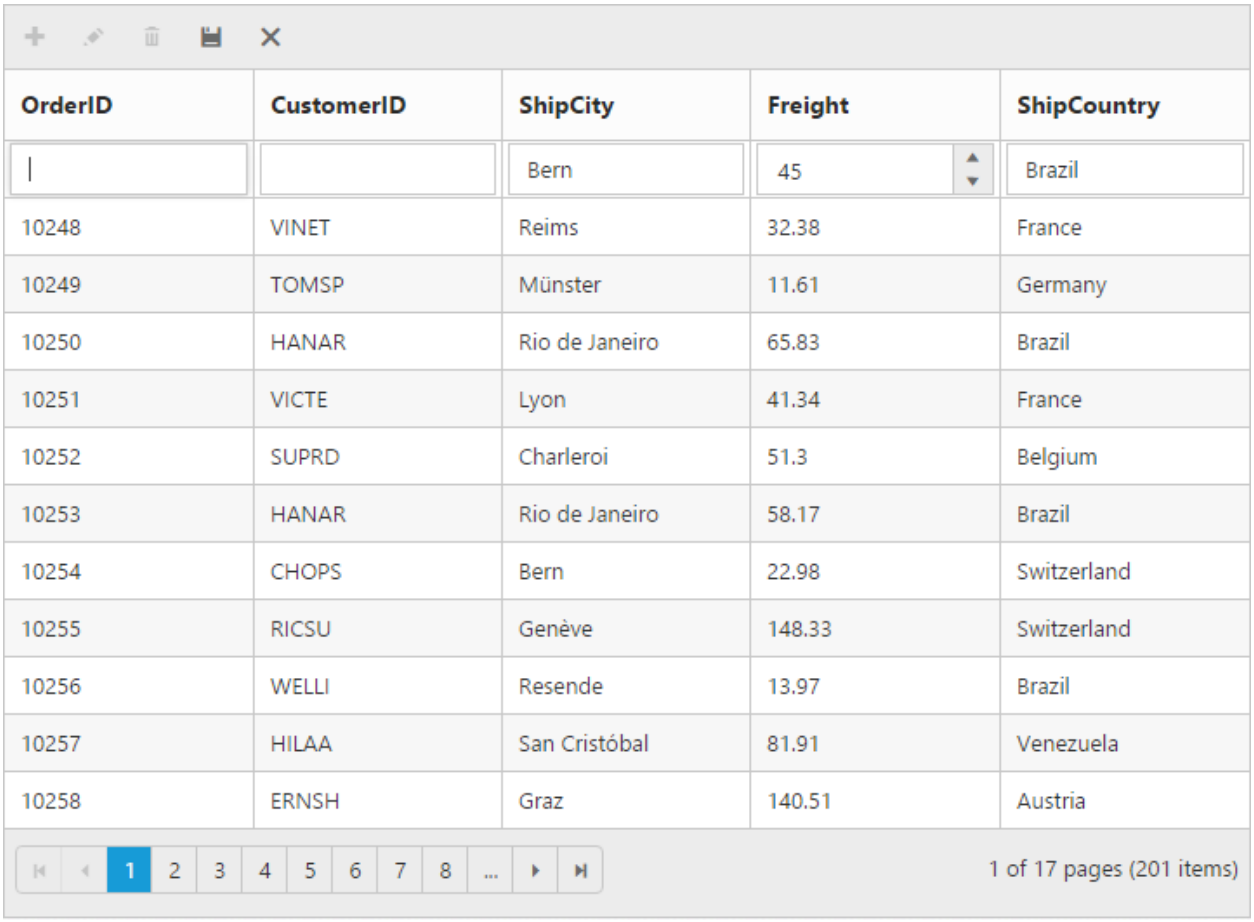
```
items.AddTool(ToolBarItems.Add);
items.AddTool(ToolBarItems.Edit);
items.AddTool(ToolBarItems.Delete);
items.AddTool(ToolBarItems.Update);
items.AddTool(ToolBarItems.Cancel);
});
})
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order ID").IsPrimaryKey(true).Add();
col.Field("CustomerID").HeaderText("Customer ID").Add();
col.Field("ShipCity").HeaderText("Ship City").DefaultValue("Bern").Add();
col.Field("Freight").HeaderText("Freight").EditType(EditingType.NumericEdit)
.DefaultValue(45).Add();
col.Field("ShipCountry").HeaderText("Ship
Country").DefaultValue("Brazil").Add();
}))
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.DataSource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.

Copyright © 2001 - 2020 Syncfusion Inc.



Grouping

The Grid control has options to group the records based on the required column. When grouping is applied, grouped records are organized into a hierarchical structure to facilitate easier expand and collapse of records. To enable grouping, set AllowGrouping property as true.

Columns can be grouped by simply dragging the column header and drop on the group drop area or simply click the group button which is displayed in the column. By default, sorting is done while grouping the column.

The following code example describes the above behavior.

RAZOR

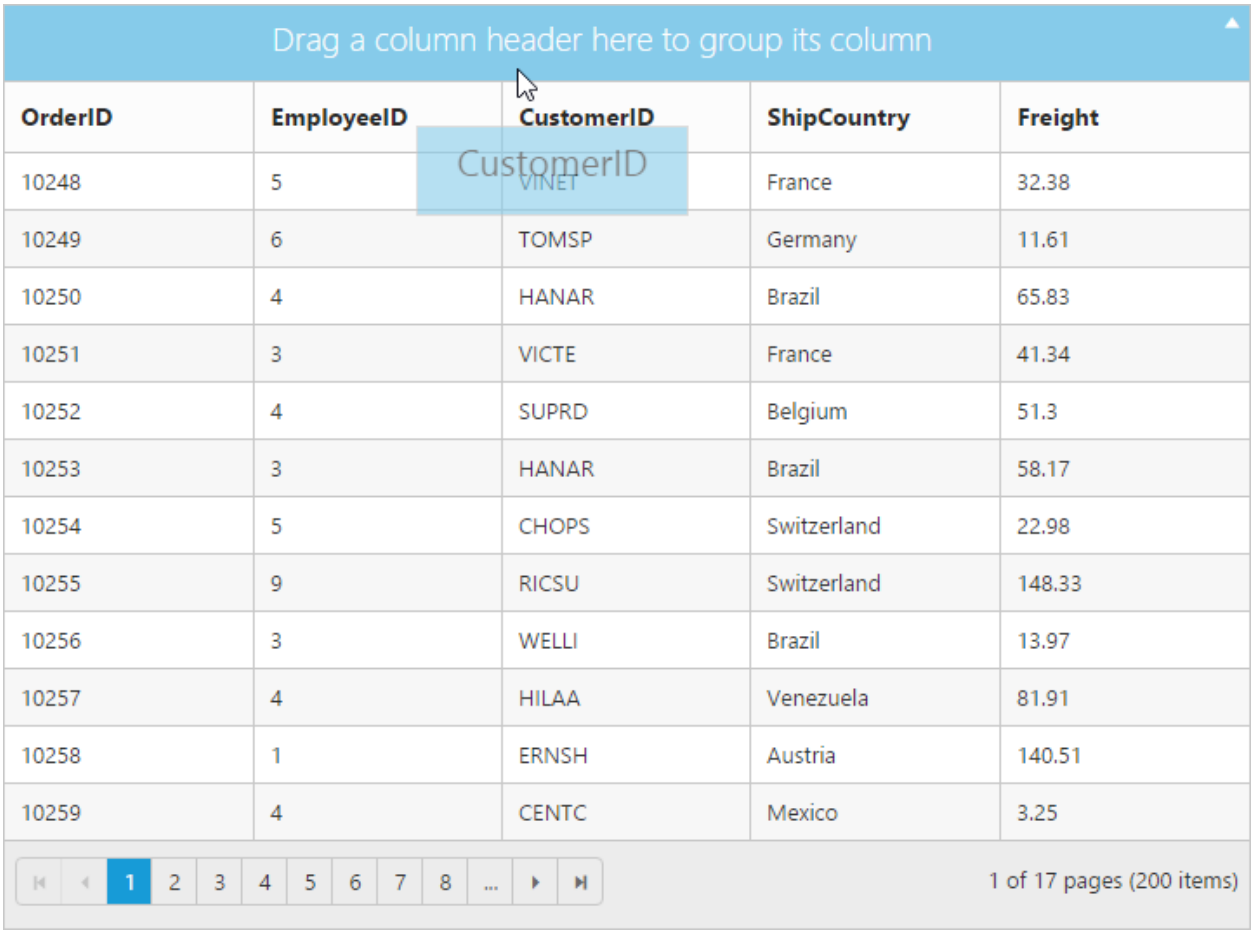
```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
.AllowGrouping()
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order ID").Add();
col.Field("EmployeeID").HeaderText("Employee ID").Add();
col.Field("CustomerID").HeaderText("Customer ID").Add();
col.Field("ShipCountry").HeaderText("Ship Country").Add();
col.Field("Freight").HeaderText("Freight").Add();
}))
```

Copyright © 2001 - 2020 Syncfusion Inc.

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.DataSource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.



Initial Grouping

While initializing the grid itself, there is an option to group the column and display it in a hierarchical structure. To enable initial grouping, set array of column's `Field` name to be grouped in `GroupedColumns` property of `GroupSettings`.

The following code example describes the above behavior.

RAZOR

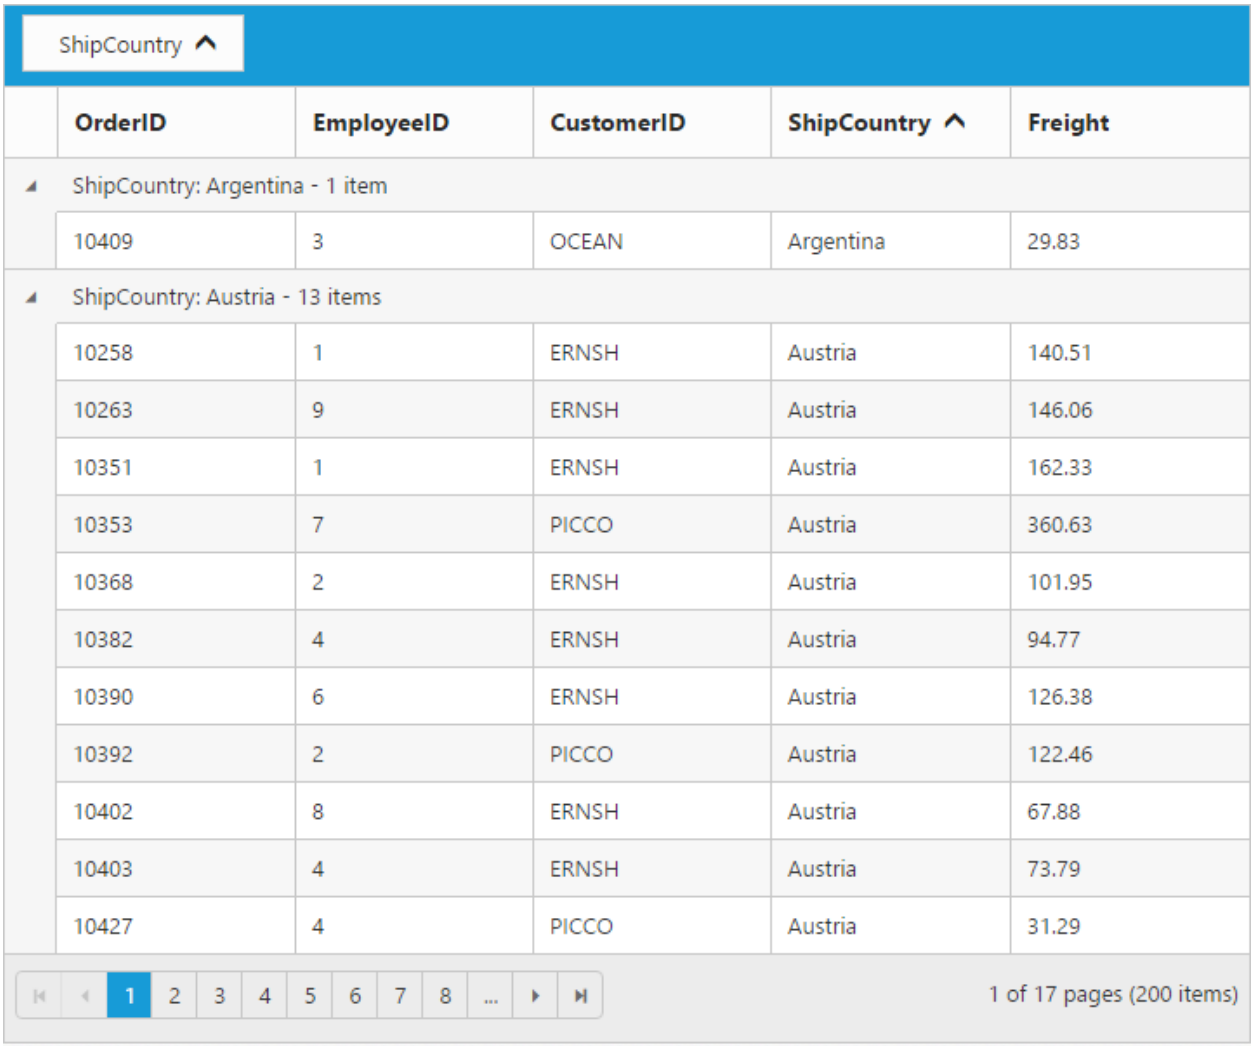
```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
.AllowGrouping()
.GroupSettings(group => { group.GroupedColumns(col => {
col.Add("ShipCountry"); }); })
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order ID").Add();
col.Field("EmployeeID").HeaderText("Employee ID").Add();
col.Field("CustomerID").HeaderText("Customer ID").Add();
col.Field("ShipCountry").HeaderText("Ship Country").Add();
col.Field("Freight").HeaderText("Freight").Add();
}))
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.DataSource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.

Copyright © 2001 - 2020 Syncfusion Inc.



Multi-Column Grouping

Group multiple columns by simply drag and drop the columns one by one from column header into group drop area.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
.AllowGrouping()
.GroupSettings(group => { group.GroupedColumns(col => {
col.Add("ShipCountry"); col.Add("CustomerID"); }); })
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order ID").Add();
col.Field("EmployeeID").HeaderText("Employee ID").Add();
col.Field("CustomerID").HeaderText("Customer ID").Add();
col.Field("ShipCountry").HeaderText("Ship Country").Add();
col.Field("Freight").HeaderText("Freight").Add();
}))
```

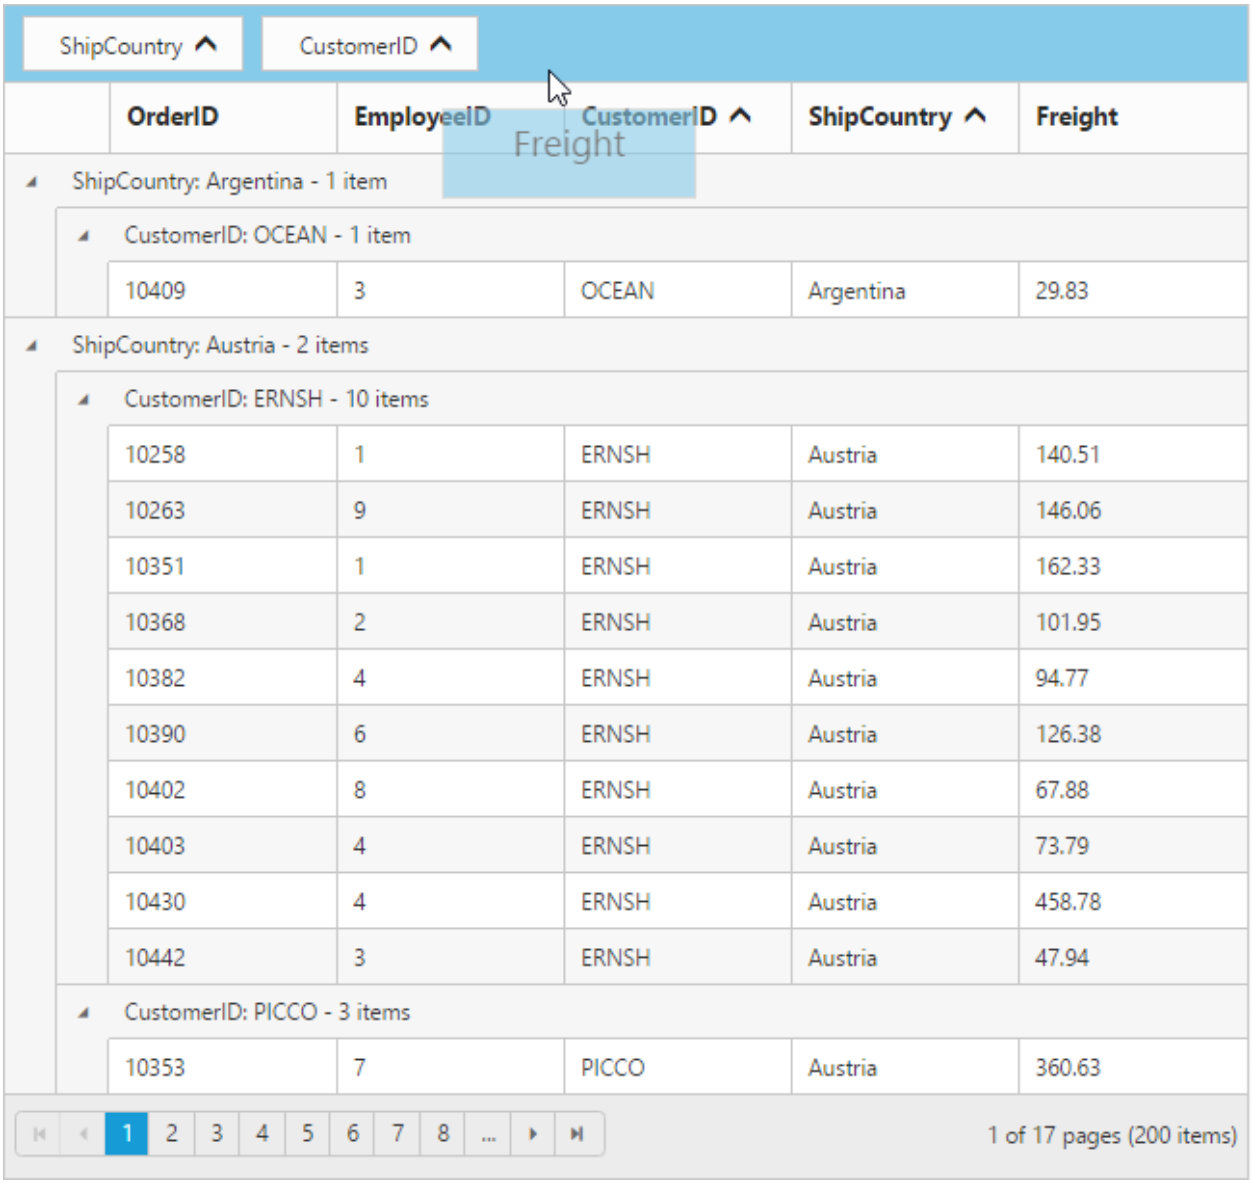
Copyright © 2001 - 2020 Syncfusion Inc.

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.DataSource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.

Copyright © 2001 - 2020 Syncfusion Inc.



Group Buttons

To do grouping easily without doing drag and drop column header by setting ShowToggleButton property of GroupSettings as true.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
.AllowGrouping()
.GroupSettings(group => { group.ShowToggleButton(true); })
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order ID").Add();
col.Field("EmployeeID").HeaderText("Employee ID").Add();
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
col.Field("CustomerID").HeaderText("Customer ID").Add();
col.Field("ShipCountry").HeaderText("Ship Country").Add();
col.Field("Freight").HeaderText("Freight").Add();
}))
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.DataSource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.

OrderID	EmployeeID	CustomerID	ShipCountry	Freight
10248	5	VINET	France	32.38
10249	6	TOMSP	Germany	11.61
10250	4	HANAR	Brazil	65.83
10251	3	VICTE	France	41.34
10252	4	SUPRD	Belgium	51.3
10253	3	HANAR	Brazil	58.17
10254	5	CHOPS	Switzerland	22.98
10255	9	RICSU	Switzerland	148.33
10256	3	WELLI	Brazil	13.97
10257	4	HILAA	Venezuela	81.91
10258	1	ERNSH	Austria	140.51
10259	4	CENTC	Mexico	3.25

1 2 3 4 5 6 7 8 ... 1 of 17 pages (200 items)

Hide Ungroup Button

Hide ungroup button from grouped columns which is in the group drop area by setting the ShowUngroupButton property of GroupSettings as false.

Copyright © 2001 - 2020 Syncfusion Inc.

The following code example describes the above behavior.

RAZOR

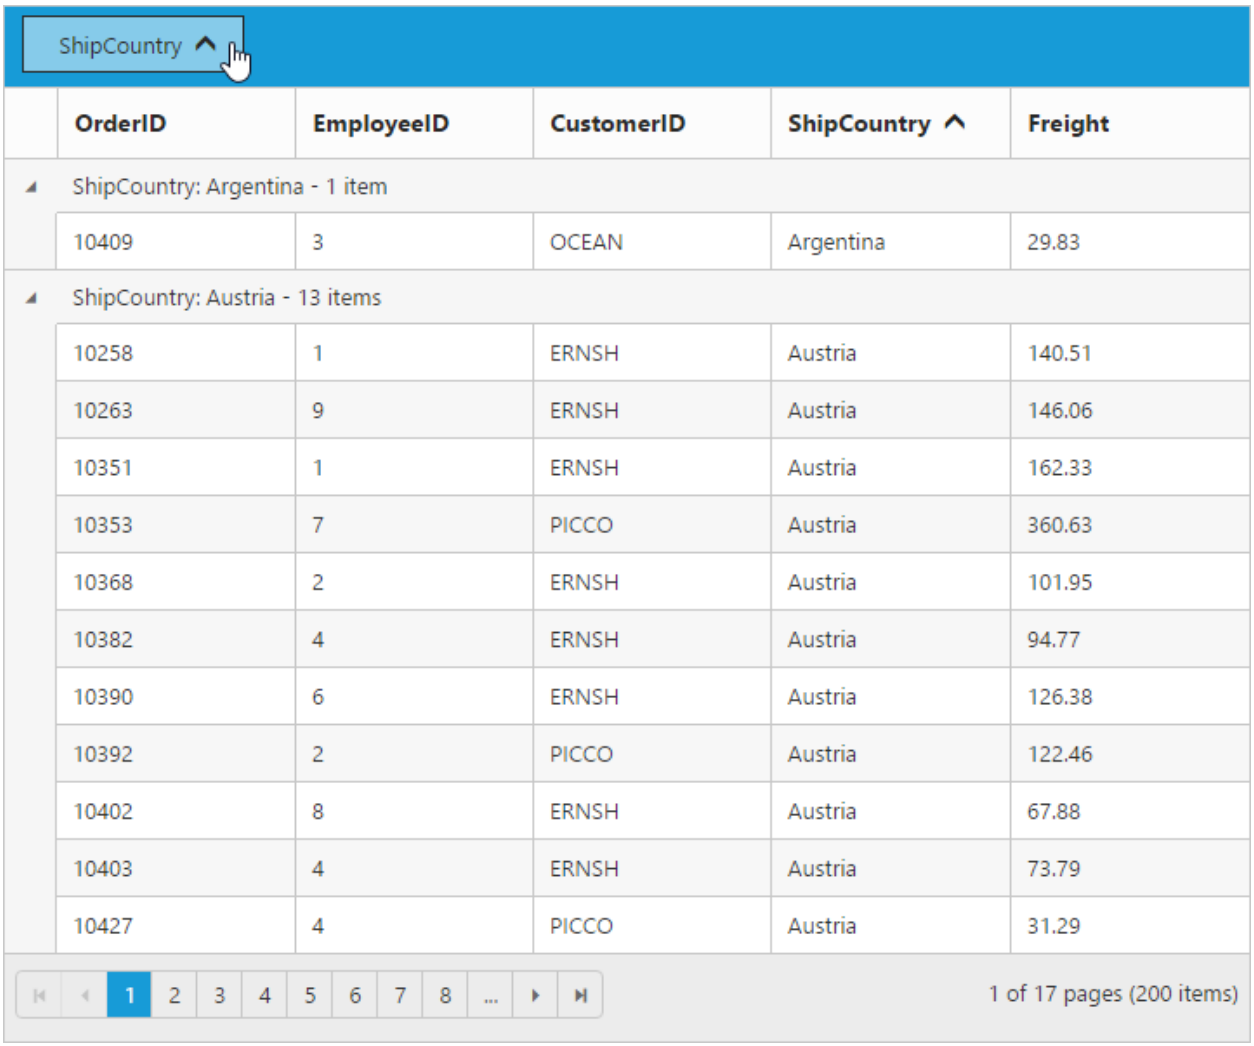
```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
.AllowGrouping()
.GroupSettings(group => { group.ShowUngroupButton(false); })
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order ID").Add();
col.Field("EmployeeID").HeaderText("Employee ID").Add();
col.Field("CustomerID").HeaderText("Customer ID").Add();
col.Field("ShipCountry").HeaderText("Ship Country").Add();
col.Field("Freight").HeaderText("Freight").Add();
}))
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.DataSource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.

Copyright © 2001 - 2020 Syncfusion Inc.



Hide Grouped Column

While grouping a particular column, there is an option to hide the grouped columns from grid. To enable hide grouped column option, set `ShowGroupedColumn` property of `GroupSettings` as `false`.

The following code example describes the above behavior.

RAZOR

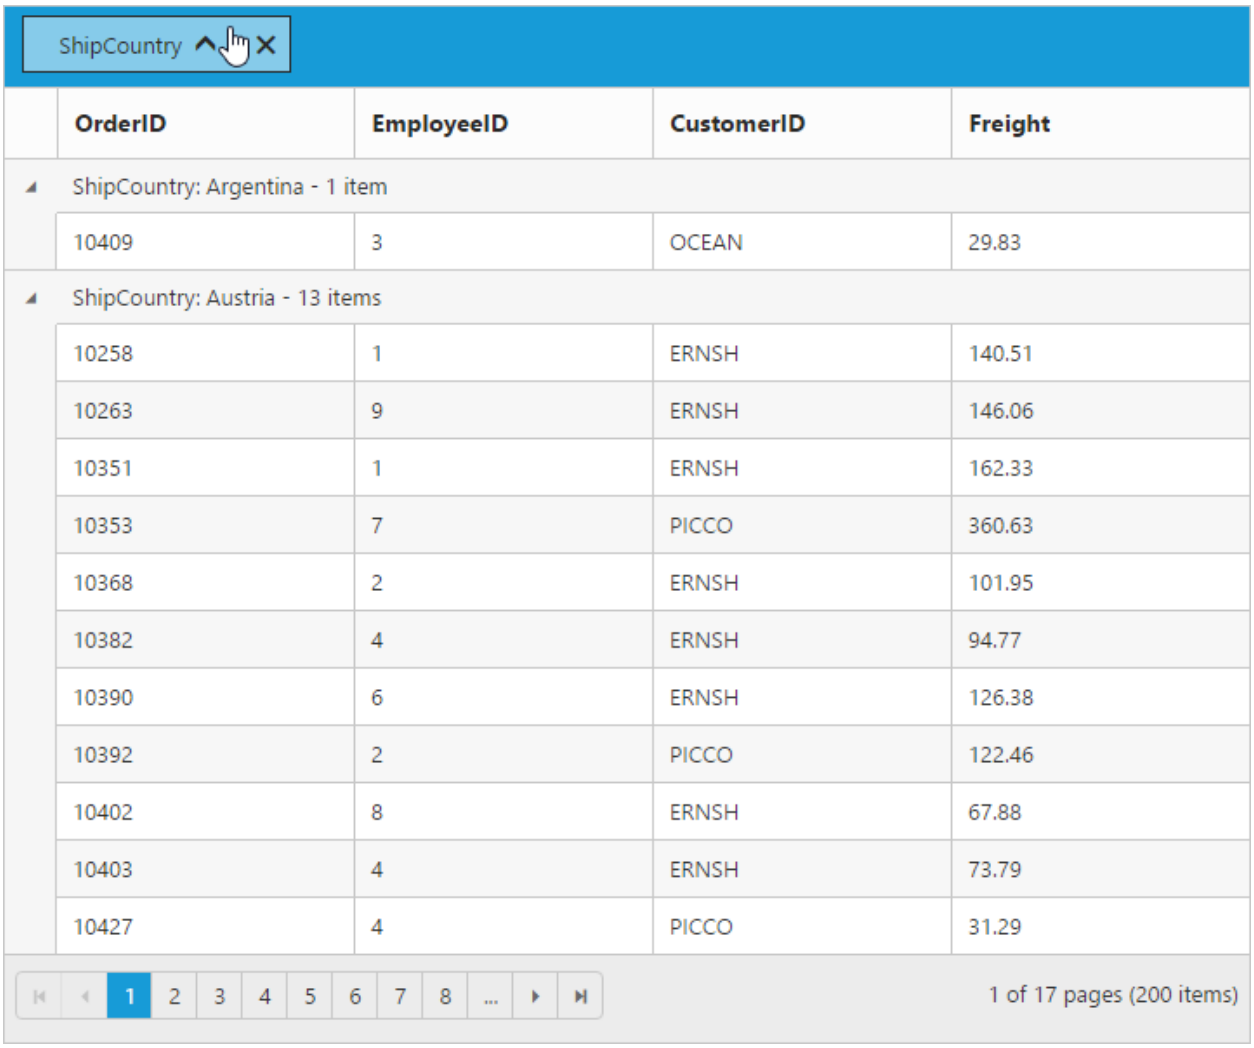
```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
.AllowGrouping()
.GroupSettings(group => { group.ShowGroupedColumn(false); })
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order ID").Add();
col.Field("EmployeeID").HeaderText("Employee ID").Add();
col.Field("CustomerID").HeaderText("Customer ID").Add();
col.Field("ShipCountry").HeaderText("Ship Country").Add();
col.Field("Freight").HeaderText("Freight").Add();
}))
```

Copyright © 2001 - 2020 Syncfusion Inc.

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.DataSource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.



AutoSize Drop Area

Drag any column header and move it to the group drop area, then its portion expands smoothly. Stop this animation by setting `EnableDropAreaAutoSizing` property of `GroupSettings` as `false`.

The following code example describes the above behavior.

RAZOR

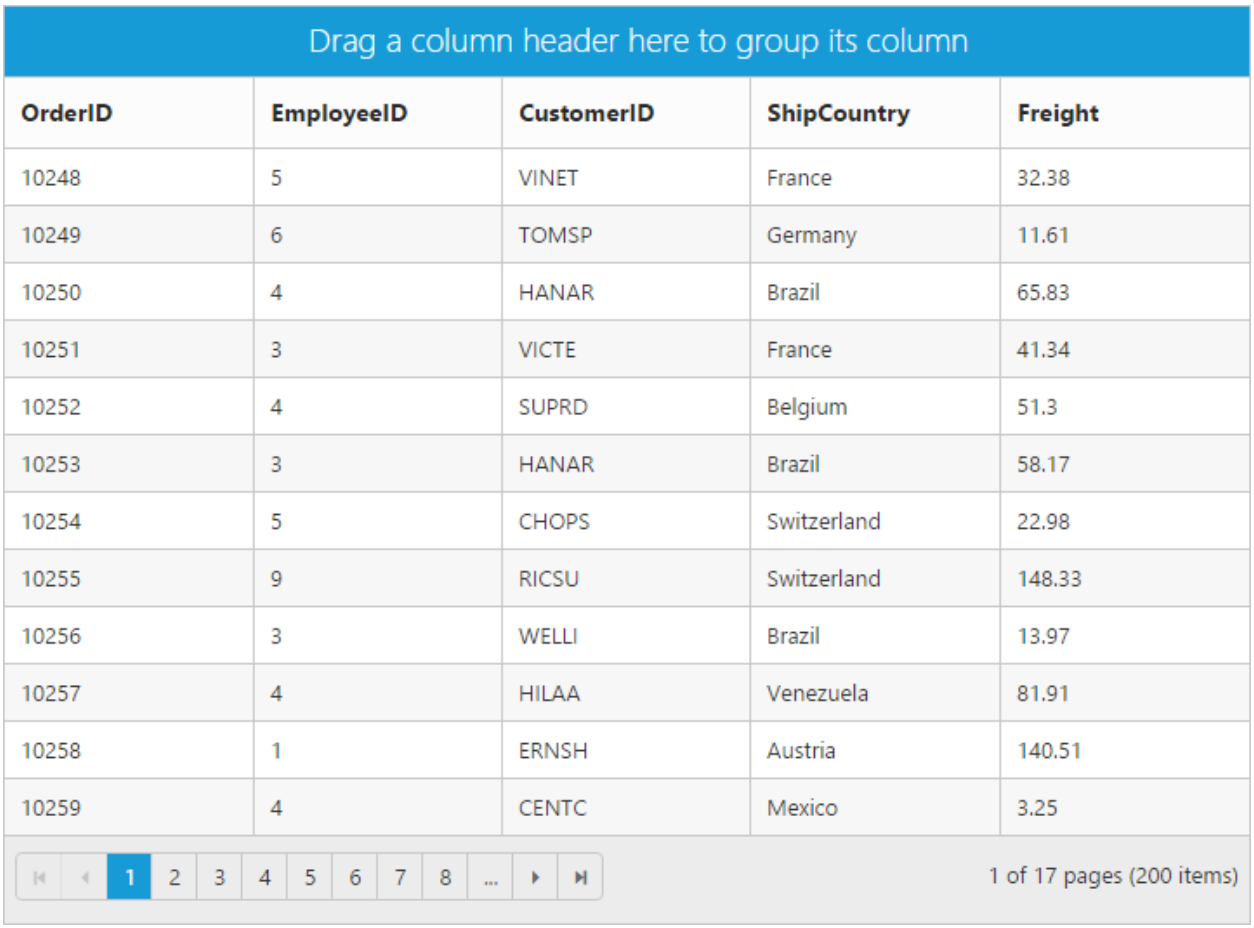
```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
.AllowGrouping()
.GroupSettings(group => { group.EnableDropAreaAutoSizing(false); })
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order ID").Add();
col.Field("EmployeeID").HeaderText("Employee ID").Add();
col.Field("CustomerID").HeaderText("Customer ID").Add();
col.Field("ShipCountry").HeaderText("Ship Country").Add();
col.Field("Freight").HeaderText("Freight").Add();
}))
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.DataSource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.

Copyright © 2001 - 2020 Syncfusion Inc.



Hide Drop Area

To avoid ungrouping or further grouping of a column after an initial column grouping by setting ShowDropArea property of GroupSettings as false.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
.AllowGrouping()
.GroupSettings(group => { group.ShowDropArea(false).GroupedColumns(col => {
col.Add("ShipCountry"); }); })
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order ID").Add();
col.Field("EmployeeID").HeaderText("Employee ID").Add();
col.Field("CustomerID").HeaderText("Customer ID").Add();
col.Field("ShipCountry").HeaderText("Ship Country").Add();
col.Field("Freight").HeaderText("Freight").Add();
}))
```

C#

Copyright © 2001 - 2020 Syncfusion Inc.

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.DataSource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.

	OrderID	EmployeeID	CustomerID	ShipCountry	Freight
▲	ShipCountry: Argentina - 1 item				
	10409	3	OCEAN	Argentina	29.83
▲	ShipCountry: Austria - 13 items				
	10258	1	ERNSH	Austria	140.51
	10263	9	ERNSH	Austria	146.06
	10351	1	ERNSH	Austria	162.33
	10353	7	PICCO	Austria	360.63
	10368	2	ERNSH	Austria	101.95
	10382	4	ERNSH	Austria	94.77

Group Caption Format/Group Caption Template

Using CaptionFormat property of GroupSettings you can render any type of JsRender templates or customizing the group caption text.

You can use JsRender syntax in the template.For more information about JsRender syntax, please refer the link.

Copyright © 2001 - 2020 Syncfusion Inc.

Note: 1. It's a standard way to enclose the template within the script tag with type as "text/x-jsrender".

2. Using locale property of GroupCaptionFormat, you can only customize the default group caption text.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<Object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
.AllowGrouping()
.GroupSettings(group => { group.CaptionFormat("#template"); })
.ClientSideEvents(eve => { eve.ActionComplete("complete"); })
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order ID").Add();
col.Field("EmployeeID").HeaderText("Employee ID").Add();
col.Field("CustomerID").HeaderText("Customer ID").Add();
col.Field("ShipCountry").HeaderText("Ship Country").Add();
col.Field("Freight").HeaderText("Freight").Add();
}))
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.DataSource = DataSource;
return View();
}
}
}
```

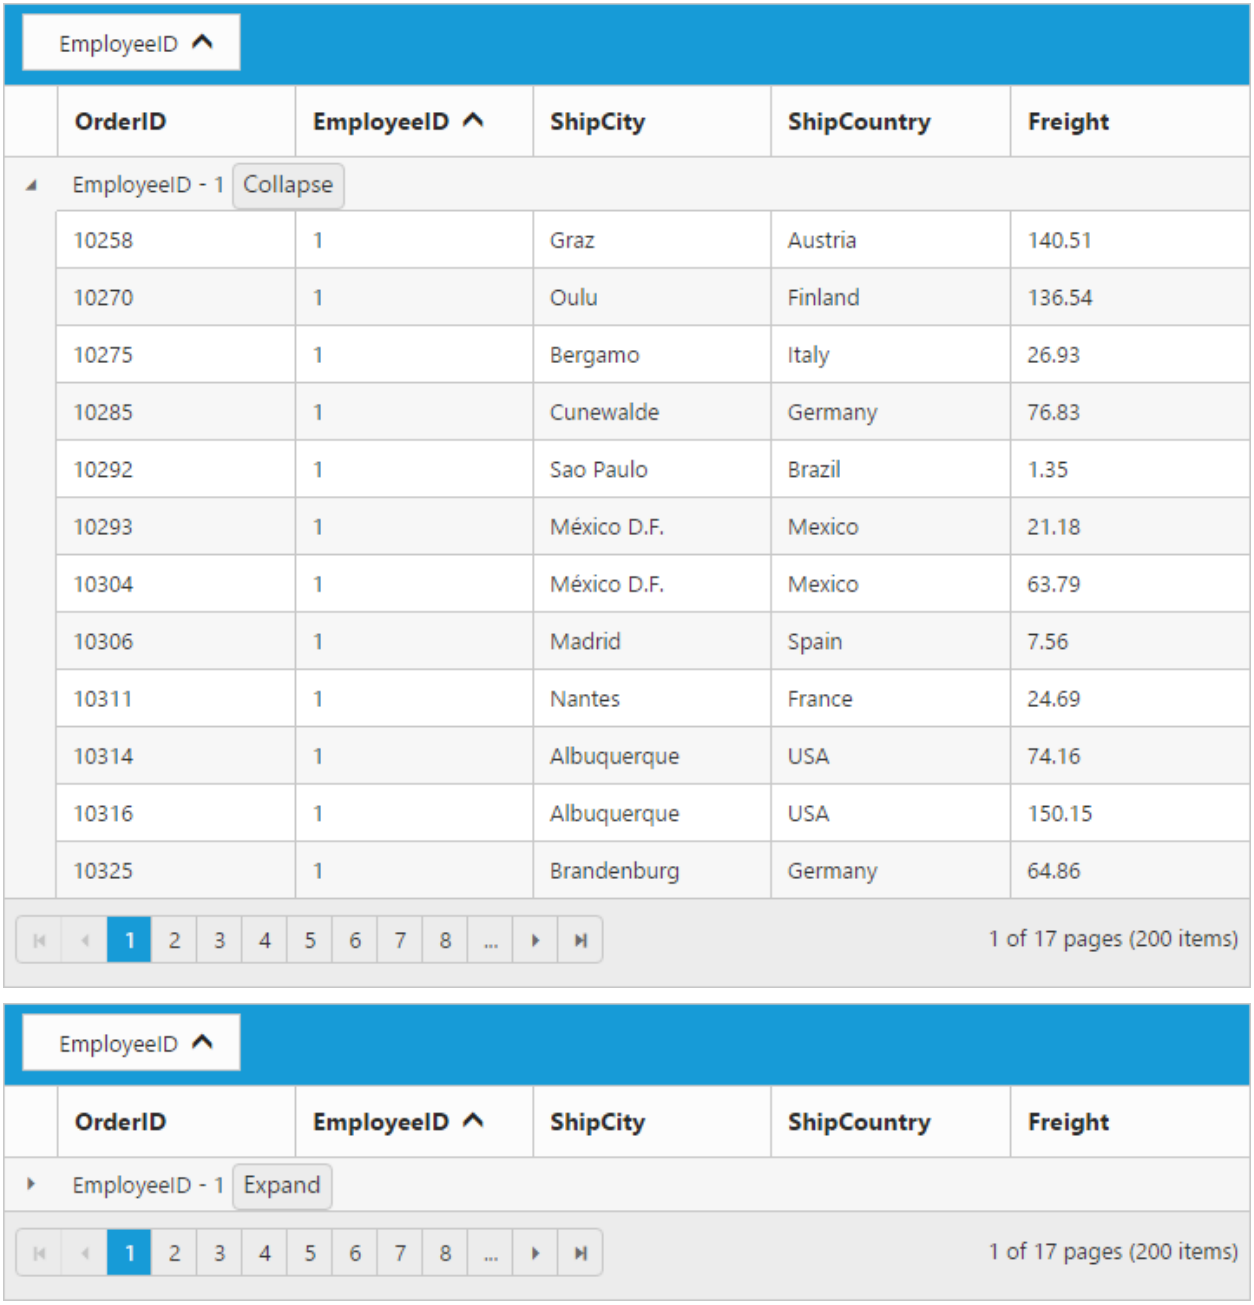
JS

```
<script id="template" type="text/x-jsrender">
"{{"{{"}}:field{{}}}}-"{{"{{"}}:key{{}}}}
<button id="btn" class="btn">Collapse</button>
</script>
<script>
function complete(args) {
$(".btn").ejButton({
click: "btnClick"
});
}
function btnClick(args) {
var gridObj = $("#FlatGrid").data("ejGrid");
gridObj.expandCollapse(this.element.parent().prev());
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
$("#btn").ejButton("model.text", args.model.text == "Collapse" ? "Expand" :
"Collapse");
}
</script>
```

The following output is displayed as a result of the above code example.



Handling grouped records count in server-side

When binding remote data to grid with on-demand data loading, only current page data knowledge is available to grid and so grouped records count would be shown based on current Page only.

Copyright © 2001 - 2020 Syncfusion Inc.

This can be rectified when binding data to grid using UrlAdaptor of DataManager. The grouped column values should be passed into the groupDs property of return object from server-side along with datasource and count.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<OrdersView>("Grouping")
.Datasource(datasource =>
datasource.URL("/Grid/UrlDataSource").Adaptor("UrlAdaptor"))
.AllowSorting()
.AllowGrouping()
.GroupSettings(group => { group.GroupedColumns(col => {
col.Add("EmployeeID"); }); })
.AllowPaging()
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order
ID").IsPrimaryKey(true).TextAlign(TextAlign.Right).Width(75).Add();
col.Field("CustomerID").HeaderText("Customer ID").Width(80).Add();
col.Field("EmployeeID").HeaderText("Employee
ID").TextAlign(TextAlign.Right).Width(75).Add();
col.Field("Freight").HeaderText("Freight").TextAlign(TextAlign.Right).Width(
75).Format("{0:C}").Add();
col.Field("OrderDate").HeaderText("Order
Date").TextAlign(TextAlign.Right).Width(80).Format("{0:MM/dd/yyyy}").Add();
})
)
```

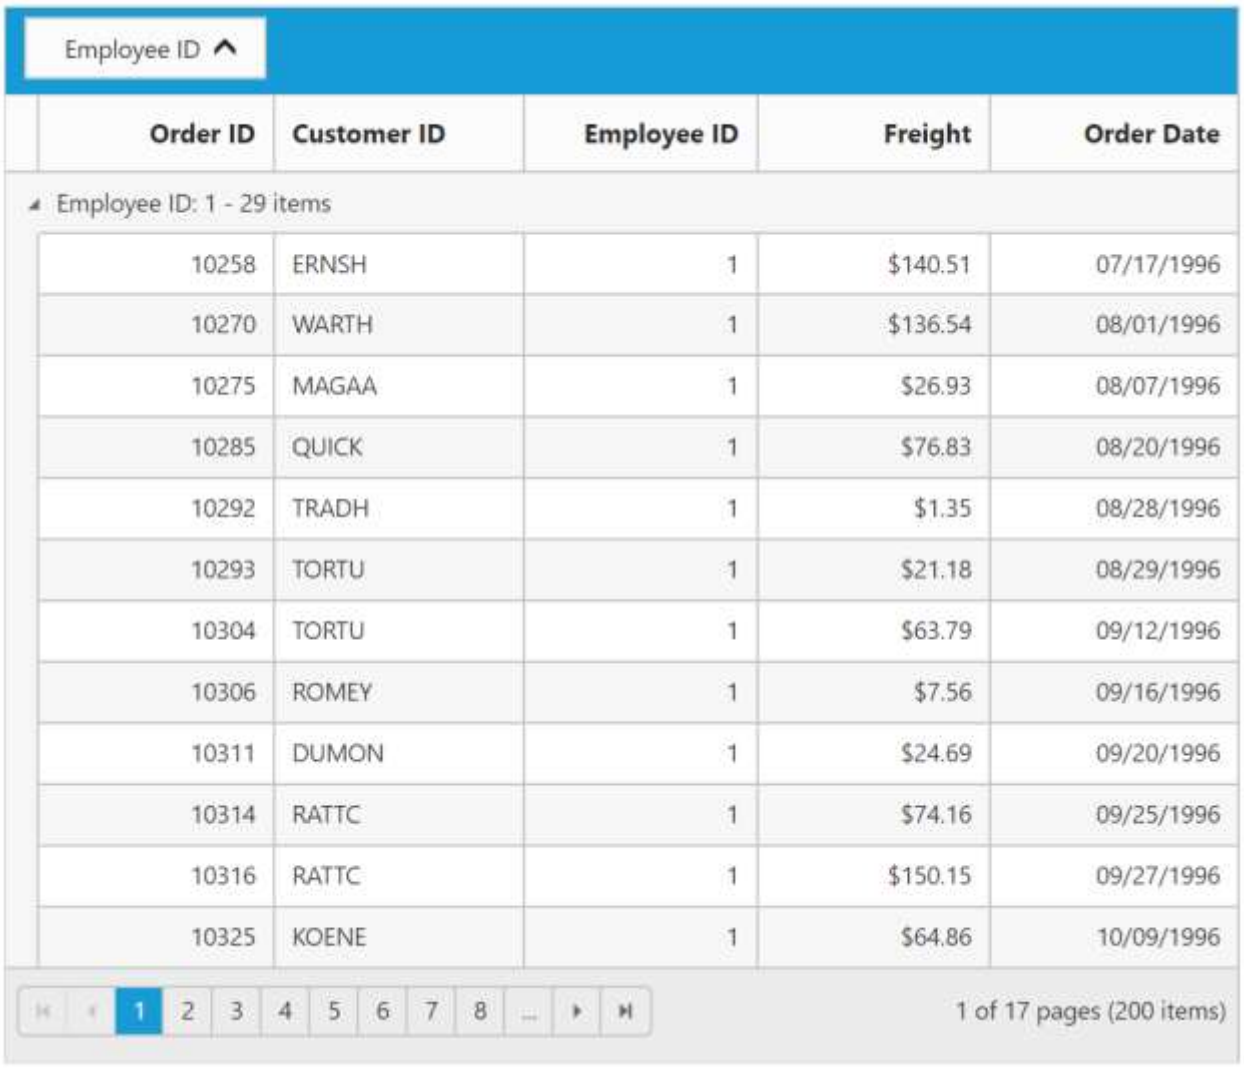
C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.DataSource = DataSource;
return View();
}
public ActionResult UrlDataSource(DataManager dm)
{
IEnumerable DataSource = new NorthwindDataContext().OrdersViews.ToList();
int count = DataSource.AsQueryable().Count();
IEnumerable GroupDs = new List<object>(); ;
DataOperations ds = new DataOperations();
List<string> str = new List<string>();
if (dm.Group != null)
GroupDs = ds.PerformSelect(DataSource, dm.Group); //Pass grouped column
records
if (dm.Sorted != null)
DataSource = ds.PerformSorting(DataSource, dm.Sorted);
DataSource = ds.PerformSkip(DataSource, dm.Skip);
DataSource = DataSource.AsQueryable().Take(dm.Take);
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
return Json(new {result = DataSource, count =count, groupDs = GroupDs },
JsonRequestBehavior.AllowGet);
}
}
}
```

The following output is displayed as a result of the above code example.



Summary

Summary rows visibility can be controlled by the ShowSummary property and it can be added to grid by using the SummaryRow array property. The following code sample describes this.

RAZOR

```
@(Html.EJ().Grid<OrdersView>("Summary")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.ShowSummary()
.SummaryRow(row =>
{
```

```
row.Title("Sum").SummaryColumns(col => {
col.SummaryType(SummaryType.Sum).Format("{0:C}").DisplayColumn("Freight").Da
taMember("Freight").Add(); }).Add();
})
.AllowPaging()
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order
ID").IsPrimaryKey(true).TextAlign(TextAlign.Right).Width(80).Add();
col.Field("EmployeeID").HeaderText("Employee
ID").TextAlign(TextAlign.Right).Width(80).Add();
col.Field("ShipCity").HeaderText("Ship City").Width(90).Add();
col.Field("ShipCountry").HeaderText("Ship Country").Width(100).Add();
col.Field("Freight").HeaderText("Freight").TextAlign(TextAlign.Right).Width(
80).Format("{0:C}").Add();
})
)
```

C#

```
namespace SyncfusionMvcApplication3.Controllers
{
public class HomeController : Controller
{
public ActionResult Index()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

Supported aggregates

Following are the supported list of aggregates:

- Sum
- Average
- Maximum
- Minimum
- False Count
- True Count

Sum, average, maximum and minimum

Summaries with Sum,average,maximum and minimum aggregate can be defined by using the SummaryType in SummaryColumns collections. These aggregate are used in the Number column.

RAZOR

```
@(Html.EJ().Grid<OrdersView>("Summary")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.ShowSummary()
.SummaryRow(row =>
{
row.Title("Sum").SummaryColumns(col => {
col.SummaryType(SummaryType.Sum).Format("{0:C}").DisplayColumn("Freight").Da
taMember("Freight").Add(); }).Add();
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
row.Title("Average").SummaryColumns(col => {
col.SummaryType(SummaryType.Average).Format("{0:C}").DisplayColumn("Freight"
).DataMember("Freight").Add(); }).Add();
row.Title("Maximum").SummaryColumns(col => {
col.SummaryType(SummaryType.Maximum).Format("{0:C}").DisplayColumn("Freight"
).DataMember("Freight").Add(); }).Add();
row.Title("Minimum").SummaryColumns(col => {
col.SummaryType(SummaryType.Minimum).Format("{0:C}").DisplayColumn("Freight"
).DataMember("Freight").Add(); }).Add();
})
.AllowPaging()
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order
ID").IsPrimaryKey(true).TextAlign(TextAlign.Right).Width(80).Add();
col.Field("EmployeeID").HeaderText("Employee
ID").TextAlign(TextAlign.Right).Width(80).Add();
col.Field("ShipCity").HeaderText("Ship City").Width(90).Add();
col.Field("ShipCountry").HeaderText("Ship Country").Width(100).Add();
col.Field("Freight").HeaderText("Freight").TextAlign(TextAlign.Right).Width(
80).Format("{0:C}").Add();
})
)
```

C#

```
namespace SyncfusionMvcApplication3.Controllers
{
public class HomeController : Controller
{
public ActionResult Index()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

Custom summary

Custom summary can be used to create summary values based on your required custom logic and calculations. To enable custom summary, the SummaryType should be Custom and CustomSummaryValue property need to defined as function. In the CustomSummaryValue function, you need to use the grid instance to access model.dataSource and model.currentViewData. After the custom calculation, the returned value will be displayed in corresponding summary cell.

RAZOR

```
@(Html.EJ().Grid<OrdersView>("Summary")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.ShowSummary()
.SummaryRow(row =>
{
row.Title("Currency").SummaryColumns(col => {
col.SummaryType(SummaryType.Custom).CustomSummaryValue("currency").DisplayCo
lumn("Freight").Format("{0:C2}").Add(); }).Add(););
})
.AllowPaging()
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order
ID").IsPrimaryKey(true).TextAlign(TextAlign.Right).Width(70).Add();
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
col.Field("CustomerID").HeaderText("CustomerID").TextAlign(TextAlign.Right).
Width(70).Add();
col.Field("ShipCity").HeaderText("Ship City").Width(70).Add();
col.Field("EmployeeID").HeaderText("Employee
ID").TextAlign(TextAlign.Right).Width(70).Add();
col.Field("Freight").HeaderText("Freight").TextAlign(TextAlign.Right).Width(
70).Format("{0:C}").Add();
})
)
```

C#

```
namespace SyncfusionMvcApplication3.Controllers
{
public class HomeController : Controller
{
public ActionResult Index()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

JS

```
<script type="text/javascript">
function currency(args,data) {
//ej.sum is aggregate to add data's of freight from datasource
return ej.sum(data, "Freight");
}
</script>
```

Copyright © 2001 - 2020 Syncfusion Inc.

Group summary

Group summary is used to summarize values of a particular column based on group and it shows at bottom of each group. To enable group Summary for particular group, you need to define the ShowTotalSummary as false.

RAZOR

```
@(Html.EJ().Grid<OrdersView>("Summary")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.ShowSummary()
.SummaryRow(row =>
{
row.ShowTotalSummary(false).SummaryColumns(col =>
{
col.SummaryType(SummaryType.Sum)
.Format("{0:C2}")
.DisplayColumn("Freight")
.DataMember("Freight")
.Prefix("Sum = ")
.Add();
}).Add();
})
.AllowPaging()
.AllowSorting()
.AllowGrouping()
```

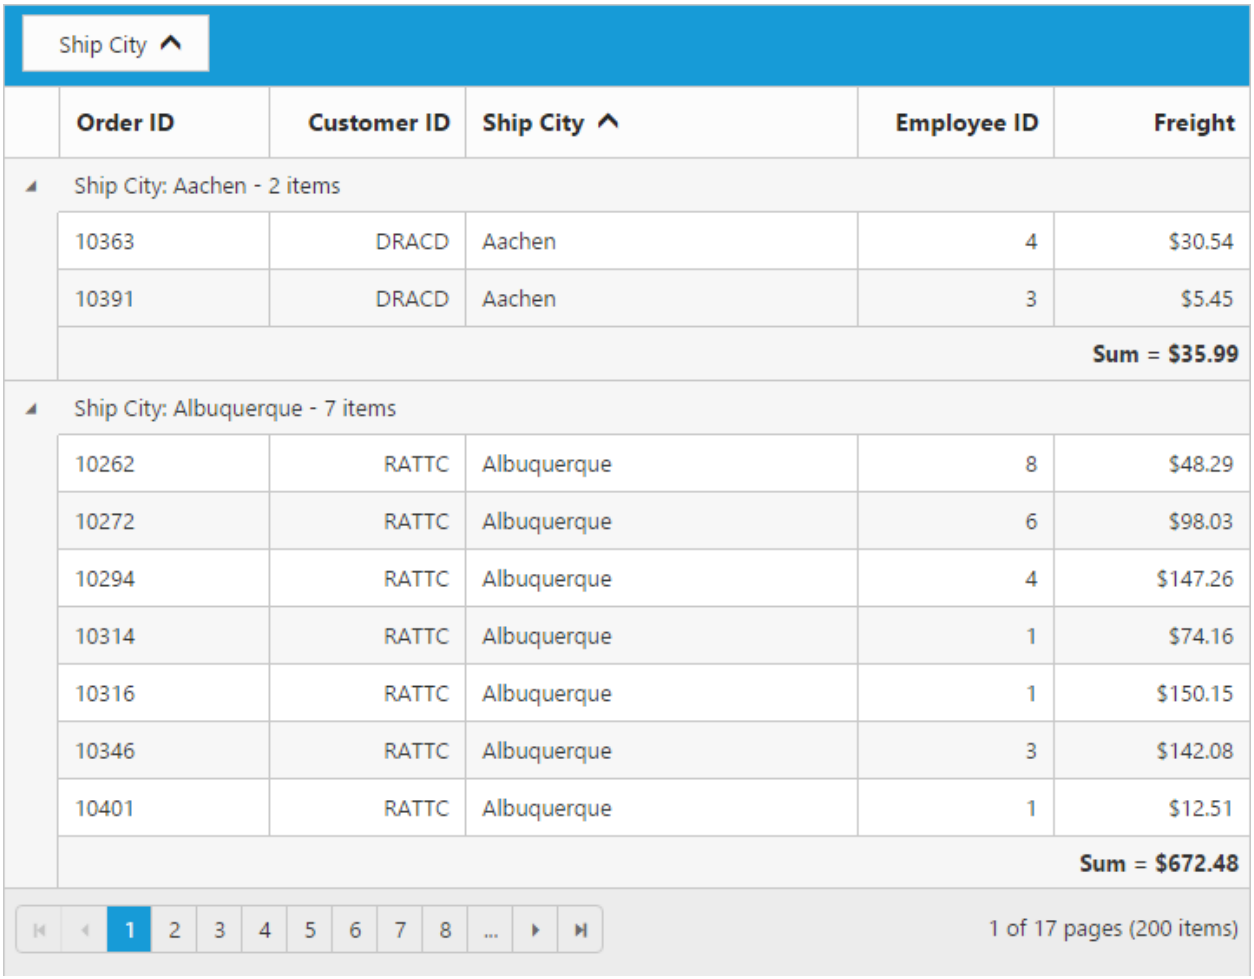
Copyright © 2001 - 2020 Syncfusion Inc.

```
.GroupSettings(group => { group.GroupedColumns(col => {
col.Add("CustomerID"); }); })
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order
ID").IsPrimaryKey(true).Width(80).Add();
col.Field("CustomerID").HeaderText("CustomerID").TextAlign(TextAlign.Right).
Width(75).Add();
col.Field("ShipCity").HeaderText("Ship City").Width(150).Add();
col.Field("EmployeeID").HeaderText("Employee
ID").TextAlign(TextAlign.Right).Width(75).Add();
col.Field("Freight").HeaderText("Freight").TextAlign(TextAlign.Right).Width(
75).Format("{0:C}").Add();
})
)
```

C#

```
namespace SyncfusionMvcApplication3.Controllers
{
public class HomeController : Controller
{
public ActionResult Index()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

Copyright © 2001 - 2020 Syncfusion Inc.



Waring: Minimum one column should be grouped to show the summary details.

Group caption summary

To show summaries in each group's caption row, particular summary row should have the ShowTotalSummary as false and the ShowCaptionSummary as true.

RAZOR

```
@(Html.EJ().Grid<OrdersView>("Summary")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.ShowSummary()
.SummaryRow(row =>
{
row.ShowTotalSummary(false).SummaryColumns(col =>
{
col.SummaryType(SummaryType.Average)
.Format("{0:C2}")
.DisplayColumn("Freight")
.DataMember("Freight")
.Prefix("Average = ")
.Add();
}).Add();
})
.AllowPaging()
```

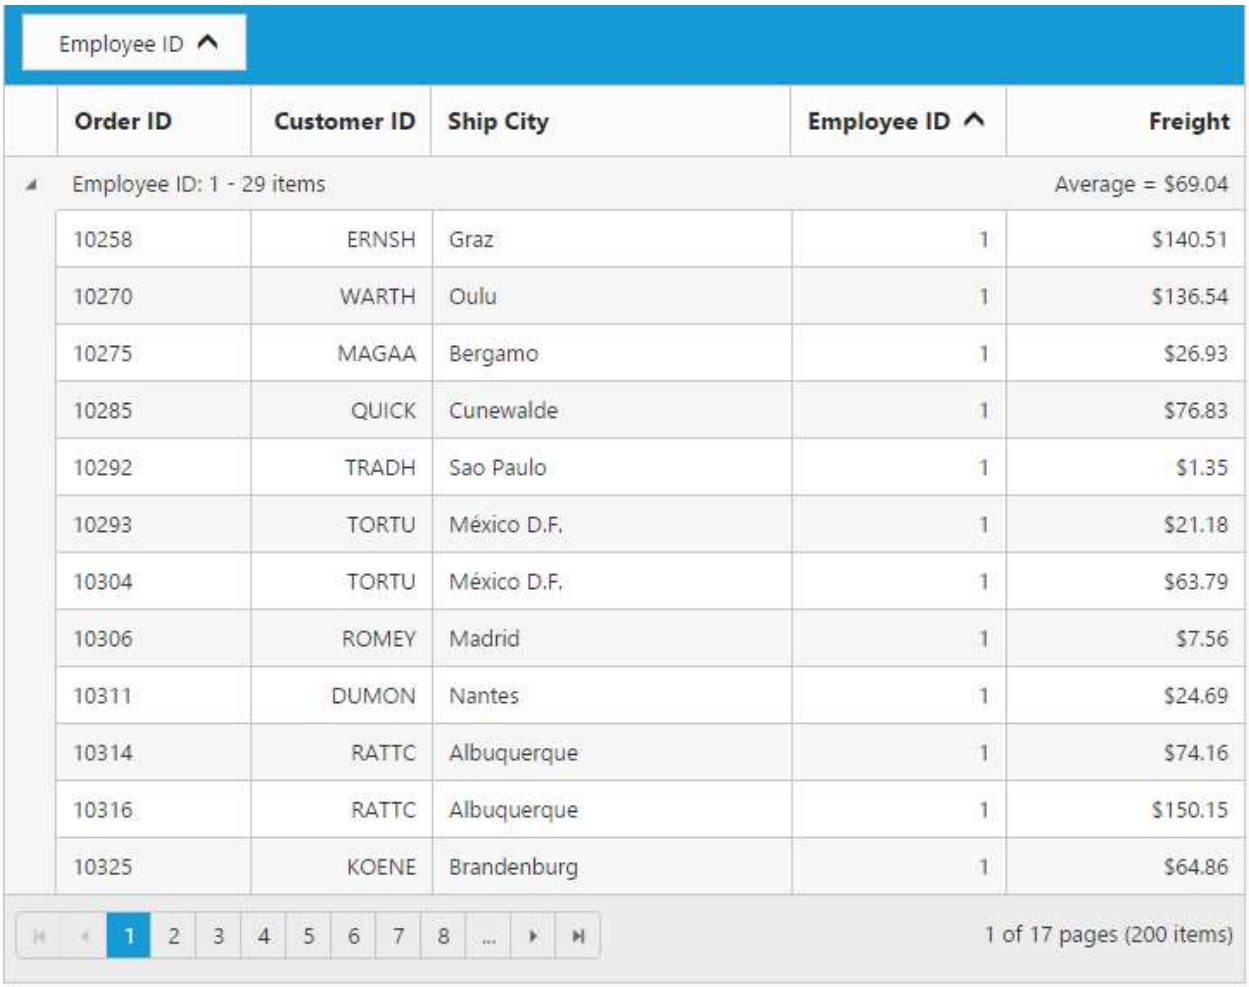
Copyright © 2001 - 2020 Syncfusion Inc.

```
.AllowSorting()
.AllowGrouping()
.GroupSettings(group => { group.GroupedColumns(col => {
col.Add("EmployeeID"); }); })
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order
ID").IsPrimaryKey(true).Width(80).Add();
col.Field("CustomerID").HeaderText("CustomerID").TextAlign(TextAlign.Right).
Width(75).Add();
col.Field("ShipCity").HeaderText("Ship City").Width(150).Add();
col.Field("EmployeeID").HeaderText("Employee
ID").TextAlign(TextAlign.Right).Width(75).Add();
col.Field("Freight").HeaderText("Freight").TextAlign(TextAlign.Right).Width(
75).Format("{0:C}").Add();
})
)
```

C#

```
namespace SyncfusionMvcApplication3.Controllers
{
public class HomeController : Controller
{
public ActionResult Index()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

Copyright © 2001 - 2020 Syncfusion Inc.



Waring: Minimum one column should be grouped to the show summary details.

Summary template

Using the Template property of SummaryColumns you can render any type of JsRender templates or customizing the summary value.

The following code example describes the previous behavior.

RAZOR

```
@(Html.EJ().Grid<OrdersView>("Summary")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.ShowSummary()
.SummaryRow(row =>
{
row.Title("Average").SummaryColumns(col =>
{
col.SummaryType(SummaryType.Average)
.Format("{0:C2}")
.DisplayColumn("Freight")
.DataMember("Freight")
.Template("#templateData")
.Add();
}).Add();
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
})
.Columns(col =>
{
col.Field("OrderID").Add();
col.Field("EmployeeID").Add();
col.Field("Freight").Format("{0:C}").Add();
})
)
```

C#

```
namespace SyncfusionMvcApplication3.Controllers
{
public class HomeController : Controller
{
public ActionResult Index()
{
var DataSource = new NorthwindDataContext().OrdersViews.Take(5).ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

JS

```
<script id="templateData" type="text/x-jsrender">
Freight has Average of {{"{{"}}:summaryValue{{"}}"}} in  dollars
</script>
```

The following output is displayed as a result of the previous code example.

OrderID	EmployeeID	Freight
10248	5	$32.38
10249	6	$11.61
10250	4	$65.83
10251	3	$41.34
10252	4	$51.30
Average		**Freight has Average of $40.49 in dollars**

Format

To format summary values, the Format property needs to be assigned in SummaryColumns collection object. To know more about formatting options. Please refer to the globalize.js

RAZOR

```
@(Html.EJ().Grid<OrdersView>("Summary")
.Datasource((IEnumerable<object>)ViewBag.datasource)
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
.ShowSummary()
.SummaryRow(row =>
{
row.Title("Sum").SummaryColumns(col => {
col.SummaryType(SummaryType.Sum).Format("{0:C}").DisplayColumn("Freight").Da
taMember("Freight").Add(); }).Add();
})
.AllowPaging()
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order
ID").IsPrimaryKey(true).TextAlign(TextAlign.Right).Width(80).Add();
col.Field("EmployeeID").HeaderText("Employee
ID").TextAlign(TextAlign.Right).Width(80).Add();
col.Field("ShipCity").HeaderText("Ship City").Width(90).Add();
col.Field("ShipCountry").HeaderText("Ship Country").Width(100).Add();
col.Field("Freight").HeaderText("Freight").TextAlign(TextAlign.Right).Width(
80).Format("{0:C}").Add();
})
)
```

C#

```
namespace SyncfusionMvcApplication3.Controllers
{
public class HomeController : Controller
{
public ActionResult Index()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

Copyright © 2001 - 2020 Syncfusion Inc.

Order ID	Employee ID	Ship City	Ship Country	Freight
10248	5	Reims	France	$32.38
10249	6	Münster	Germany	$11.61
10250	4	Rio de Janeiro	Brazil	$65.83
10251	3	Lyon	France	$41.34

Handling aggregation in server-side

The Aggregation at server-side is handled by using the aggregate key. While using remote data, summary row must be handled by returning summary column datasource into the aggregate property of result object.

The following code example describes the previous behavior.

RAZOR

```
@(Html.EJ().Grid<OrdersView>("Summary")
.Datasource(datasource =>
datasource.URL("/Grid/DataSource").Adaptor("UrlAdaptor"))
.ShowSummary()
.AllowPaging()
.SummaryRow(row =>
{
row.ShowTotalSummary(true)
row.Title("Sum").SummaryColumns(col ={
col.SummaryType(SummaryType.Sum)
.DisplayColumn("Freight")
.DataMember("Freight")
.Format("{0:C}")
.Add();
}).Add();
})
.Columns(col =>
```

```
{
col.Field("OrderID").HeaderText("Order ID").Width(100).Add();
col.Field("EmployeeID").HeaderText("Employee ID").Width(100).Add();
col.Field("Freight").HeaderText("Freight").Width(100).Format("{0:C}").Add();
col.Field("ShipCity").HeaderText("Ship City").Width(100).Add();
})
)
}
```

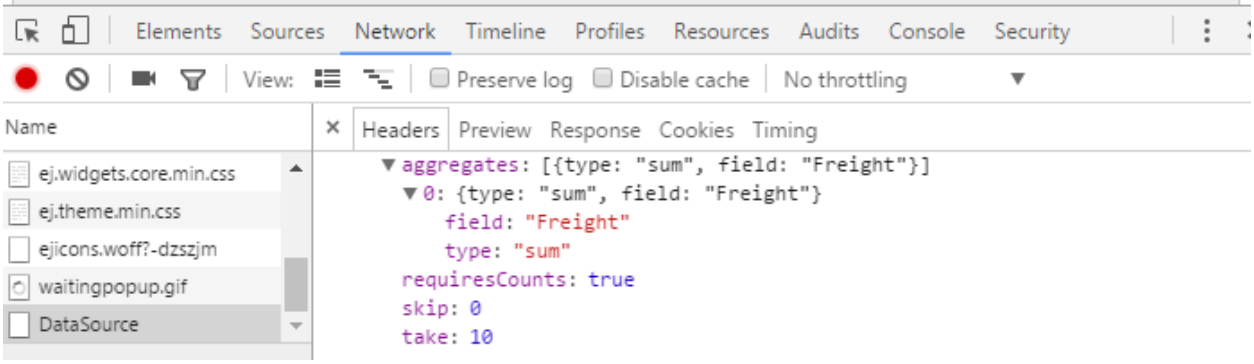
C#

```
namespace MvcApplication4.Controllers
{
public partial class GridController: Controller
{
public ActionResult GridFeatures()
{
ViewBag.dataSource = OrderRepository.GetAllRecords().ToList();
return View();
}
public ActionResult DataSource(DataManager dataManager)
{
IEnumerable DataSource = OrderRepository.GetAllRecords();
DataResult result = new DataResult();
DataOperations dataOperations = new DataOperations();
List<string> aggregateFields = new List<string>();
if (dataManager.Aggregates != null)
{
for (var i = 0; i < dataManager.Aggregates.Count; i++)
string.Add(dataManager.Aggregates[i].Field);
result.aggregate = dataOperations.PerformSelect(DataSource,
aggregateFields);
}
DataSource = dataOperations.PerformSkip(DataSource, dataManager.Skip);
result.result = dataOperations.PerformTake(DataSource, dataManager.Take);
result.count = DataSource.AsQueryable().Count();
return Json(result, JsonRequestBehavior.AllowGet);
}
public class DataResult
{
public IEnumerable result { get; set; }
public int count { get; set; }
public IEnumerable aggregate { get; set; }
public IEnumerable groupDs { get; set; }
}
}
}
```

The following output is displayed as a result of the previous code example.

Copyright © 2001 - 2020 Syncfusion Inc.

Order ID	Employee ID	Freight	Ship City
10248	5	32.38	Reims
10249	6	11.61	Münster
10250	4	65.83	Rio de Janeiro
10251	3	41.34	Lyon
10252	4	51.3	Charleroi
10253	3	58.17	Rio de Janeiro
10254	5	22.98	Bern
10255	9	148.33	Genève
10256	3	13.97	Resende
10257	4	81.91	San Cristóbal
Sum		**$64,942.69**	



Paging

You can display the grid records in paged view, by setting the AllowPaging property as true.

The code sample to enable paging is as follows.

RAZOR

```
@(Html.EJ().Grid<Object>("Paging")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.AllowPaging()
.Columns(col =>
{
col.Field("OrderID").Add();
col.Field("EmployeeID").Add();
col.Field("CustomerID").Add();
col.Field("ShipCountry").Add();
col.Field("Freight").Format("{0:C}").Add();
})
)
```

Copyright © 2001 - 2020 Syncfusion Inc.

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult Paging()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the previous code example.

OrderID	EmployeeID	CustomerID	ShipCountry	Freight
10248	5	VINET	France	32.38
10249	6	TOMSP	Germany	11.61
10250	4	HANAR	Brazil	65.83
10251	3	VICTE	France	41.34
10252	4	SUPRD	Belgium	51.3
10253	3	HANAR	Brazil	58.17
10254	5	CHOPS	Switzerland	22.98
10255	9	RICSU	Switzerland	148.33
10256	3	WELLI	Brazil	13.97
10257	4	HILAA	Venezuela	81.91
10258	1	ERNSH	Austria	140.51
10259	4	CENTC	Mexico	3.25

1 2 3 4 5 6 7 8 ... 1 of 17 pages (200 items)

Pager with query string

You can pass the current page information as a query string while navigating to other page. To enable query string, set the `EnableQueryString` property of `PageSettings` as `true`.

The following code example describes the previous behavior.

RAZOR

```
@(Html.EJ().Grid<Object>("Paging")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.AllowPaging()
```

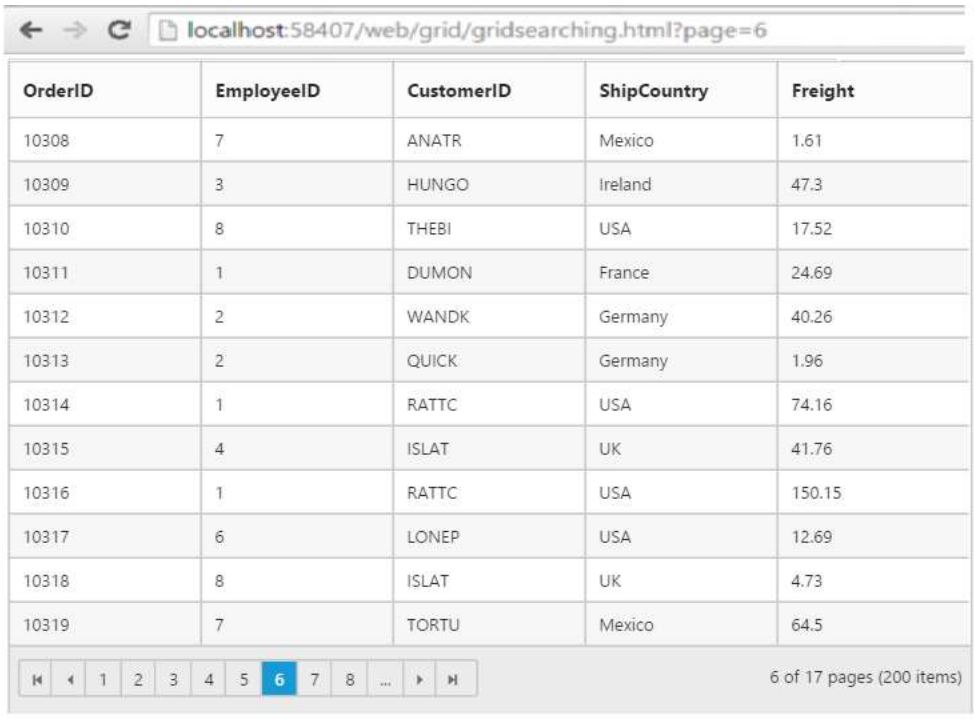
Copyright © 2001 - 2020 Syncfusion Inc.

```
.PageSettings(Page => { Page.EnableQueryString(true); })
.Columns(col =>
{
col.Field("OrderID").Add();
col.Field("EmployeeID").Add();
col.Field("CustomerID").Add();
col.Field("ShipCountry").Add();
col.Field("Freight").Format("{0:C}").Add();
})
)
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult Paging()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the previous code example.



Pager template

Apart from default pager, there is an option to render a specific custom template in a grid pager. To render template in pager, set `EnableTemplates` as true and `Template` properties of `PageSettings`.

Prevent to show the default pager while enabling the pager Template by setting ShowDefaults property of PageSettings as false.

Note: It's a standard way to enclose the Template within the script tag with type as "text/x-jsrender".

The following code example describes the previous behavior.

RAZOR

```
@(Html.EJ().Grid<OrdersView>("Paging")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.AllowPaging()
.PageSettings(Page => {
Page.EnableTemplates().Template("#template").ShowDefaults(false); })
.Columns(col =>
{
col.Field("OrderID").Add();
col.Field("EmployeeID").Add();
col.Field("ShipCity").Add();
col.Field("ShipCountry").Add();
col.Field("Freight").Format("{0:C}").Add();
}).ClientSideEvents(e=>e.Create("create"))
)
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public partial class GridController : Controller
{
public ActionResult Paging()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

JS

```
<script id="template" type="text/x-jsrender">
<input id="currentPage" type="text" style="text-align: center; width: 32px;
height: 21px; background: white;" value="1" />
<label>of 200</label>
<button id="btn">Go to</button>
</script>
<script>
function create(args) {
$("#btn").ejButton({
click : "btnClick"
});
}
function btnClick(args) {
var val = $("#currentPage").val();
var gridObj = $("#Grid").data("ejGrid");
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
gridObj.gotoPage(args.val);
}
</script>
```

CSS

```
.e-grid .e-pager .e-pagercontainer {
border-width: 0px;
overflow: visible;
}
```

The following output is displayed as a result of the previous code example.

OrderID	EmployeeID	ShipCity	ShipCountry	Freight
10248	5	Reims	France	32.38
10249	6	Münster	Germany	11.61
10250	4	Rio de Janeiro	Brazil	65.83
10251	3	Lyon	France	41.34
10252	4	Charleroi	Belgium	51.3
10253	3	Rio de Janeiro	Brazil	58.17
10254	5	Bern	Switzerland	22.98
10255	9	Genève	Switzerland	148.33
10256	3	Resende	Brazil	13.97
10257	4	San Cristóbal	Venezuela	81.91
10258	1	Graz	Austria	140.51
10259	4	México D.F.	Mexico	3.25

Pager with pageSize drop down

There is an option to set the size of page by means of selecting from the page size values available at the dropdown in pager. Once selected it updates the pageSize value accordingly. To render drop down in pager, provide the pageSize values you wish to display in drop down as `List` to the `PageSizeList` property of `PageSettings`.

The following code sample describes the previous behavior.

RAZOR

```
@(Html.EJ().Grid<object>("Paging")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.AllowPaging()
.PageSettings(p => { p.PageSizeList(new List<int>() { 7, 2 });
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
})
.Columns(col =>
{
col.Field("OrderID").Add();
col.Field("CustomerID").Add();
col.Field("EmployeeID").Add();
col.Field("Freight").Format("{0:C}").Add();
col.Field("ShipCity").Add();
col.Field("ShipCountry").Add();
})
)
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult Paging()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the previous code example.

OrderID	CustomerID	EmployeeID	Freight	ShipCity	ShipCountry
10248	VINET	5	$32.38	Reims	France
10249	TOMSP	6	$11.61	Münster	Germany
10250	HANAR	4	$65.83	Rio de Janeiro	Brazil
10251	VICTE	3	$41.34	Lyon	France
10252	SUPRD	4	$51.30	Charleroi	Belgium

Pager with pageSettings

We can customize the default page settings, such as the pageCount, pageSize of the grid's pager by using the pageSettings property of grid control.

The following code example describes the previous behavior.

RAZOR

```
@(Html.EJ().Grid<object>("Paging")
.Datasource((IEnumerable<object>)ViewBag.datasource)
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
.AllowPaging()
.PageSettings(page => page.PageSize(8).PageCount(3))
.Columns(col =>
{
col.Field("OrderID").Add();
col.Field("CustomerID").Add();
col.Field("EmployeeID").Add();
col.Field("Freight").Format("{0:C}").Add();
col.Field("ShipCity").Add();
col.Field("ShipCountry").Add();
})
)
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult Paging()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the previous code example.

OrderID	EmployeeID	CustomerID	OrderDate	Verified
10248	5	VINET	04/07/1996	☑
10249	6	TOMSP	05/07/1996	☐
10250	4	HANAR	08/07/1996	☑
10251	3	VICTE	08/07/1996	☑
10252	4	SUPRD	09/07/1996	☑
10253	3	HANAR	10/07/1996	☑
10254	5	CHOPS	11/07/1996	☐
10255	9	RICSU	12/07/1996	☑

1 2 3 ... 1 of 25 pages (200 items)

Scrolling

Scrolling can be enabled by setting the AllowScrolling as true. The height and width can be set to grid by using the properties Height and Width property of the ScrollSettings.

Note: If Width and Height is not defined in the ScrollSettings property then the horizontal and vertical scrollbar is enabled, only when the grid width exceeds the browser width.

Copyright © 2001 - 2020 Syncfusion Inc.

The height and width can be set in percentage and pixel. The default value for Height and Width in ScrollSettings is 0 and auto respectively.

The following code example describes the previous behavior.

RAZOR

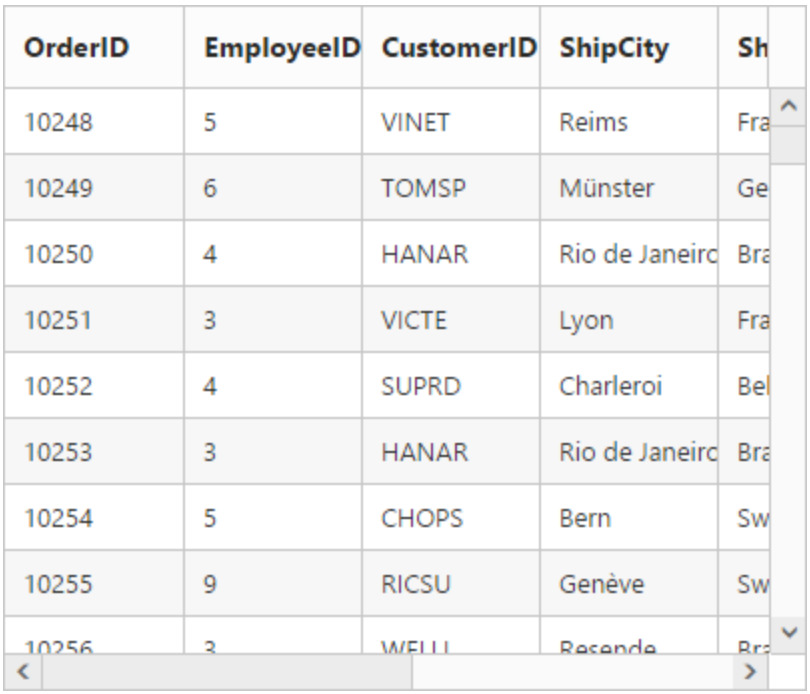
```
@(Html.EJ().Grid<OrdersView>("Scrolling")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.AllowScrolling()
.ScrollSettings(col => { col.Width(400).Height(300); })
.Columns(col =>
{
col.Field("OrderID").Add();
col.Field("EmployeeID").Add();
col.Field("CustomerID").Add();
col.Field("ShipCity").Add();
col.Field("ShipCountry").Add()
col.Field("ShipAddress").Add();
col.Field("ShipPostalCode").Add();
col.Field("Freight").Format("{0:C}").Add();
})
)
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public partial class GridController : Controller
{
public ActionResult Scrolling()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the previous code example.

Copyright © 2001 - 2020 Syncfusion Inc.



Set width and height in pixel

To specify the Width and Height property of ScrollSettings in pixel, by set the pixel value as integer.

The following code example describes the previous behavior.

RAZOR

```
@(Html.EJ().Grid<OrdersView>("Scrolling")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.AllowScrolling()
.ScrollSettings(col => { col.Width(500).Height(300); })
.Columns(col =>
{
col.Field("OrderID").Add();
col.Field("EmployeeID").Add();
col.Field("CustomerID").Add();
col.Field("ShipCity").Add();
col.Field("ShipCountry").Add();
col.Field("ShipAddress").Add();
col.Field("ShipPostalCode").Add();
col.Field("Freight").Format("{0:C}").Add();
})
)
```

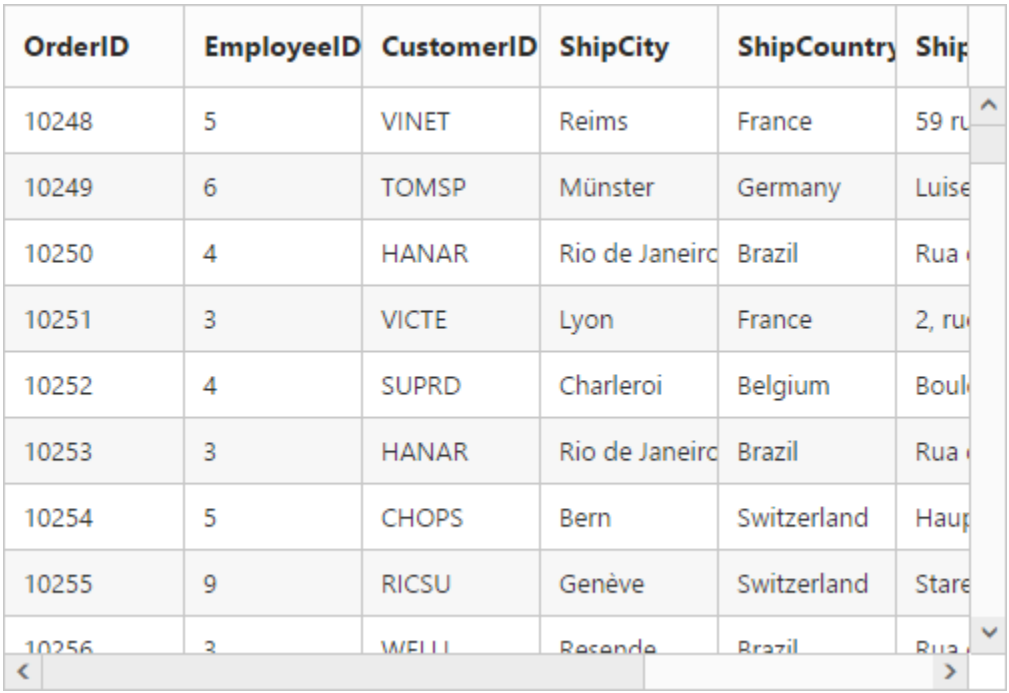
C#

```
namespace MVCSampleBrowser.Controllers
{
public partial class GridController : Controller
{
public ActionResult Scrolling()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
ViewBag.datasource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the previous code example.



OrderID	EmployeeID	CustomerID	ShipCity	ShipCountry	Ship
10248	5	VINET	Reims	France	59 ru
10249	6	TOMSP	Münster	Germany	Luise
10250	4	HANAR	Rio de Janeirc	Brazil	Rua
10251	3	VICTE	Lyon	France	2, ru
10252	4	SUPRD	Charleroi	Belgium	Boul
10253	3	HANAR	Rio de Janeirc	Brazil	Rua
10254	5	CHOPS	Bern	Switzerland	Haup
10255	9	RICSU	Genève	Switzerland	Stare
10256	3	WELLI	Resende	Brazil	Rua

Set width and height in percentage

To specify the `Width` and `Height` property of `ScrollSettings` in percentage, by set the percentage value as string.

The following code example describes the previous behavior.

RAZOR

```
@(Html.EJ().Grid<OrdersView>("Scrolling")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.AllowScrolling()
.ScrollSettings(col => { col.Width("70%").Height("5%"); })
.Columns(col =>
{
col.Field("OrderID").Add();
col.Field("EmployeeID").Add();
col.Field("CustomerID").Add();
col.Field("ShipCity").Add();
col.Field("ShipCountry").Add();
col.Field("ShipAddress").Add();
col.Field("ShipPostalCode").Add();
col.Field("Freight").Format("{0:C}").Add();
})
)
```

Copyright © 2001 - 2020 Syncfusion Inc.

C#

```
namespace MVCSampleBrowser.Controllers
{
public partial class GridController : Controller
{
public ActionResult Scrolling()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the previous code example.

OrderID	EmployeeID	CustomerID	ShipCity	ShipCountry	ShipA
10248	5	VINET	Reims	France	59 rue
10249	6	TOMSP	Münster	Germany	Luisens
10250	4	HANAR	Rio de Janeirc	Brazil	Rua do
10251	3	VICTE	Lyon	France	2, rue c
10252	4	SUPRD	Charleroi	Belgium	Boulev
10253	3	HANAR	Rio de Janeirc	Brazil	Rua do
10254	5	CHOPS	Bern	Switzerland	Haupts

10256	3	WELLI	Resende	Brazil	Rua do
10257	4	HILAA	San Cristóbal	Venezuela	Carrer

Set width as auto

Specify the Width property of ScrollSettings as auto, then the scrollbar is rendered only when the grid width exceeds the browser window width.

The following code example describes the previous behavior.

RAZOR

```
@(Html.EJ().Grid<OrdersView>("Scrolling")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.AllowScrolling()
.ScrollSettings(col => { col.Width("auto").Height(300); })
.Columns(col =>
{
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
col.Field("OrderID").Add();
col.Field("EmployeeID").Add();
col.Field("CustomerID").Add();
col.Field("ShipCity").Add();
col.Field("ShipCountry").Add();
col.Field("ShipAddress").Add();
col.Field("ShipPostalCode").Add();
col.Field("Freight").Format("{0:C}").Add();
})
)
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public partial class GridController : Controller
{
public ActionResult Scrolling()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the previous code example.

OrderID	EmployeeID	CustomerID	ShipCity	ShipCountry	ShipAddress	ShipPostalC	Freight
10248	5	VINET	Reims	France	59 rue de l'Ab	51100	32.38
10249	6	TOMSP	Münster	Germany	Luisenstr. 48	44087	11.61

Frozen columns

Specify the `FrozenColumns` property of `ScrollSettings` to freeze the columns(upto the specified frozenColumns value) at the time of scrolling. Horizontal scrollbar must be enabling while specifying the `FrozenColumns` then only you can scroll and see the remaining columns with freeze pane.

Note: The `AllowScrolling` must be `true` while specifying `FrozenColumns` .

Copyright © 2001 - 2020 Syncfusion Inc.

The following code example describes the previous behavior.

RAZOR

```
@(Html.EJ().Grid<OrdersView>("Scrolling")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.AllowScrolling()
.ScrollSettings(col => { col.Width(550).Height(300).FrozenColumns(2); })
.Columns(col =>
{
col.Field("OrderID").Add();
col.Field("EmployeeID").Add();
col.Field("CustomerID").Add();
col.Field("ShipCity").Add();
col.Field("ShipCountry").Add();
col.Field("ShipAddress").Add();
col.Field("ShipPostalCode").Add();
col.Field("Freight").Format("{0:C}").Add();
})
)
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public partial class GridController : Controller
{
public ActionResult Scrolling()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the previous code example.

Copyright © 2001 - 2020 Syncfusion Inc.

Freeze particular columns:

To freeze selected columns in grid at the time of scrolling, by setting the `IsFrozen` property of columns as `true`. The `IsFrozen` columns are rendered first in the grid even the columns index is different while declaring the `Columns` .

The following code example describes the previous behavior.

RAZOR

```
@(Html.EJ().Grid<OrdersView>("Scrolling")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.AllowScrolling()
.ScrollSettings(col => { col.Width(550).Height(400); })
.Columns(col =>
{
col.Field("OrderID").Add();
col.Field("EmployeeID").Add();
col.Field("CustomerID").Add();
col.Field("Freight").Format("{0:C}").IsFrozen(true).Add();
col.Field("OrderDate").Format("{0:dd/MM/yyyy}").Add();
col.Field("ShipCity").Add();
col.Field("ShipCountry").Width(100).IsFrozen(true).Add();
col.Field("ShipAddress").Add();
col.Field("ShipPostalCode").Add();
})
)
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public partial class GridController : Controller
{
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
public ActionResult Scrolling()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the previous code example.

Freight	ShipCountry	OrderID	Employeel	Customerl	OrderDate	Ship
32.38	France	10248	5	VINET	04/07/1996	Reim
11.61	Germany	10249	6	TOMSP	05/07/1996	Mün

Frozen columns alert messages:

1. If the AllowScrolling is false while using FrozenColumns then "Enable AllowScrolling while using frozen Columns" alert message is thrown.
2. If the FrozenColumns is specified out of the grid column view then "Frozen columns should be in grid view area" alert message is thrown.
3. Frozen Rows and Columns are not supported in the following features.

Grouping

Row Template

Detail Template

Copyright © 2001 - 2020 Syncfusion Inc.

Hierarchy Grid

Batch Editing

Virtual Scrolling

If any one of the previous feature is enabled along with Frozen rows and columns, then the "Frozen Columns and Rows are not supported for Grouping, Row Template, Detail Template, Hierarchy Grid and Batch Editing" alert message is thrown.

Frozen rows

Specify the FrozenRows property of ScrollSettings to freeze rows(upto the specified FrozenRows value) at the time of scrolling. Vertical scrollbar must be enabling while specifying the FrozenRows then only you can scroll and see the remaining rows with freeze pane.

Note: The AllowScrolling must be true while specifying FrozenRows .

The following code example describes the previous behavior.

RAZOR

```
@(Html.EJ().Grid<OrdersView>("Scrolling")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.AllowScrolling()
.ScrollSettings(col => { col.Width(550).Height(300).FrozenRows(4); })
.Columns(col =>
{
col.Field("OrderID").Add();
col.Field("EmployeeID").Add();
col.Field("CustomerID").Add();
col.Field("ShipCity").Add();
col.Field("ShipCountry").Add();
col.Field("ShipAddress").Add();
col.Field("ShipPostalCode").Add();
col.Field("Freight").Format("{0:C}").Add();
})
)
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public partial class GridController : Controller
{
public ActionResult Scrolling()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the previous code example.

Touch scroll

In touch supported devices you can scroll and show the content by swipe left, right, top and bottom. Disable touch scroll by setting the `EnableTouchScroll` property of `ScrollSettings` as `false`.

The following code example describes the previous behavior.

RAZOR

```
@(Html.EJ().Grid<OrdersView>("Scrolling")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.AllowScrolling()
.ScrollSettings(col => {
col.Width(550).Height(300).EnableTouchScroll(false); })
.Columns(col =>
{
col.Field("OrderID").Add();
col.Field("EmployeeID").Add();
col.Field("CustomerID").Add();
col.Field("ShipCity").Add();
col.Field("ShipCountry").Add();
col.Field("ShipAddress").Add();
col.Field("ShipPostalCode").Add();
col.Field("Freight").Format("{0:C}").Add();
})
)
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public partial class GridController : Controller
{
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
public ActionResult Scrolling()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

Virtual scrolling

The virtual scrolling support allows you to load data that you require (load data based on page size) without buffering the entire huge database. To enable virtual scrolling by setting the AllowVirtualScrolling property of ScrollSettings as true.

We also have an enhanced virtual scrolling feature with an improvised virtual scrolling performance. To enable improvised virtual scrolling feature by setting EnableVirtualization property of ScrollSettings as true and it doesn't requires AllowVirtualScrolling to enabled. It allows you to load the grid with data while scrolling. In order to enable this, you need to enable EnableVirtualization property of the ScrollSettings. Some of the relevant functionalities of this are,

1. White space will not be appeared in the grid. 2. Improved page rendering performance. 3. It can render nearly 500 thousand records.

It supports two mode of virtualization. They are:

1. Normal Mode
2. Continuous Mode

Note: Enhanced Virtual Scrolling supports only normal mode

The following features are not supported by virtual scrolling

1. Grouping

2. Frozen Rows

3. Cell merging

4. Detail template

5. Hierarchy

6. Editing

Normal mode:

It allows you to load the grid with data while scrolling. This can be achieved by setting the VirtualScrollMode as Normal.

The following code example describes the previous behavior.

RAZOR

```
@(Html.EJ().Grid<OrdersView>("Scrolling")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.AllowScrolling()
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
.ScrollSettings(col => {
col.Width(550).Height(300).AllowVirtualScrolling(true).VirtualScrollMode(Vir
tualScrollMode.Normal); })
.Columns(col =>
{
col.Field("OrderID").Add();
col.Field("EmployeeID").Add();
col.Field("CustomerID").Add();
col.Field("ShipCity").Add();
col.Field("ShipCountry").Add();
col.Field("ShipAddress").Add();
col.Field("ShipPostalCode").Add();
col.Field("Freight").Format("{0:C}").Add();
})
)
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public partial class GridController : Controller
{
public ActionResult Scrolling()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the previous code example.

Copyright © 2001 - 2020 Syncfusion Inc.

Enhanced virtual scrolling:

In order to enable this, you need to set the EnableVirtualization property of the ScrollSettings as true.

The following code example describes the previous behavior.

RAZOR

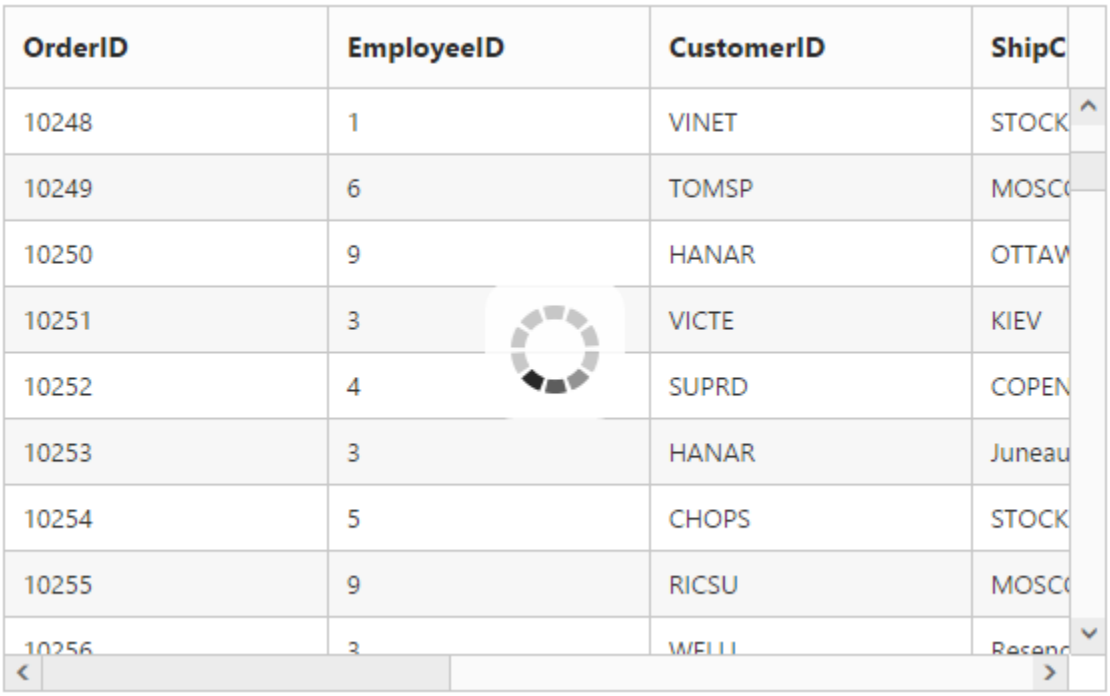
```
@(Html.EJ().Grid<OrdersView>("Scrolling")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.AllowScrolling()
.ScrollSettings(col => {
col.Width(550).Height(300).EnableVirtualization(true); })
.Columns(col =>
{
col.Field("OrderID").Add();
col.Field("EmployeeID").Add();
col.Field("CustomerID").Add();
col.Field("ShipCity").Add();
col.Field("ShipCountry").Add();
col.Field("ShipAddress").Add();
col.Field("ShipPostalCode").Add();
col.Field("Freight").Format("{0:C}").Add();
})
)
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public partial class GridController : Controller
{
```

```
public ActionResult Scrolling()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the previous code example.



OrderID	EmployeeID	CustomerID	ShipC
10248	1	VINET	STOCK
10249	6	TOMSP	MOSC
10250	9	HANAR	OTTAW
10251	3	VICTE	KIEV
10252	4	SUPRD	COPEN
10253	3	HANAR	Juneau
10254	5	CHOPS	STOCK
10255	9	RICSU	MOSC
10256	3	WELL	Resen

Continuous mode:

In continuous mode, the data is loaded in grid when the scrollbar reaches the end. You can enable the continuous mode by setting the VirtualScrollMode property as Continuous.

The following code example describes the previous behavior.

RAZOR

```
@(Html.EJ().Grid<OrdersView>("Scrolling")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.AllowScrolling()
.ScrollSettings(col => {
col.Width(550).Height(300).AllowVirtualScrolling(true).VirtualScrollMode(Vir
tualScrollMode.Continuous); })
.Columns(col =>
{
col.Field("OrderID").Add();
col.Field("EmployeeID").Add();
col.Field("CustomerID").Add();
col.Field("ShipCity").Add();
col.Field("ShipCountry").Add();
col.Field("ShipAddress").Add();
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
col.Field("ShipPostalCode").Add();
col.Field("Freight").Format("{0:C}").Add();
})
)
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public partial class GridController : Controller
{
public ActionResult Scrolling()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the previous code example.

OrderID	EmployeeID	CustomerID	ShipCity	ShipCountry	ShipAddres
10249	6	TOMSP	MOSCOW	RUSSIA	CENTRAL ST
10250	9	HANAR	OTTAWA	CANADA	Hamilton

Responsive

The Grid control has support for responsive behavior based on the client browser's width and height. To enable responsive, the IsResponsive property should be true. In Desktop and Tablet mode, to render scroller set MinWidth property. There are three modes of responsive layout is available in grid based on client width. They are.

Copyright © 2001 - 2020 Syncfusion Inc.

- Mobile(<321px)
- Tablet (321px to 800px)
- Desktop(>800px)

Note: The following features are not supported by grid's responsive:

1. Virtual Scrolling

2. Frozen Rows and Frozen Columns

3. Hierarchy

4. Detail template

Mobile layout

If client width is less than 321px, the grid will render in mobile mode. In which, you can see that grid user interface is customized and redesigned for best view in small screens. The customized features includes responsive row rendering, filtering, sorting, searching and editing.

Responsive row

Enabling responsive row makes the grid to render the record values in vertical order which removes the need for horizontal scrolling to view complete record details. It can be enabled by defining the `EnableResponsiveRow` property as `true`.

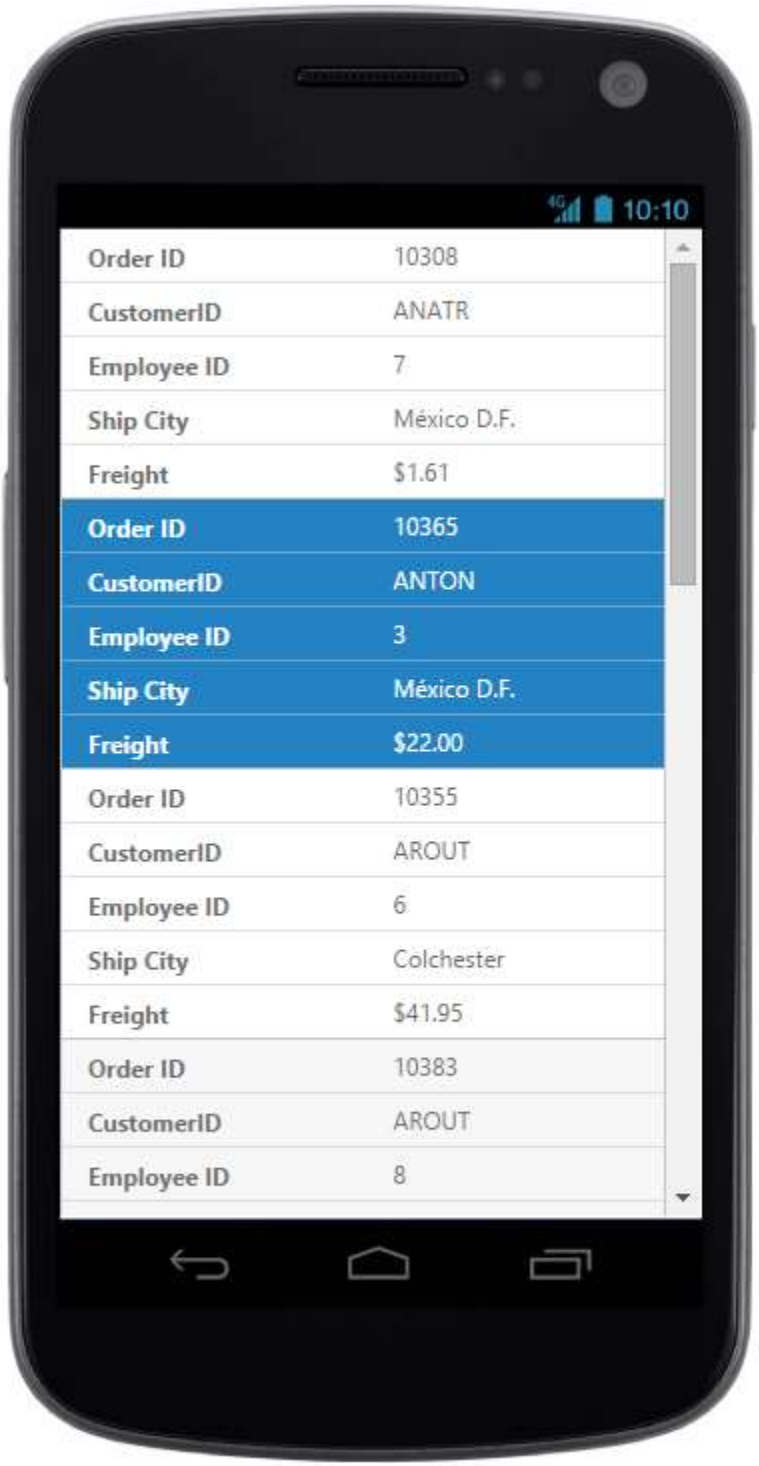
RAZOR

```
@(Html.EJ().Grid<OrdersView>("Grid")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.IsResponsive(true)
.EnableResponsiveRow(true)
.AllowPaging()
.PageSettings(p => p.PageCount(3).PageSize(7))
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order ID").IsPrimaryKey(true).Add();
col.Field("CustomerID").HeaderText("Customer ID").Add();
col.Field("EmployeeID").HeaderText("Employee ID").Add();
col.Field("ShipCity").HeaderText("Ship City").Add();
col.Field("Freight").HeaderText("Freight").Format("{0:C}").Add();
})
)
```

C#

```
namespace SyncfusionMvcApplication3.Controllers
{
public class HomeController : Controller
{
public ActionResult Index()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

Copyright © 2001 - 2020 Syncfusion Inc.

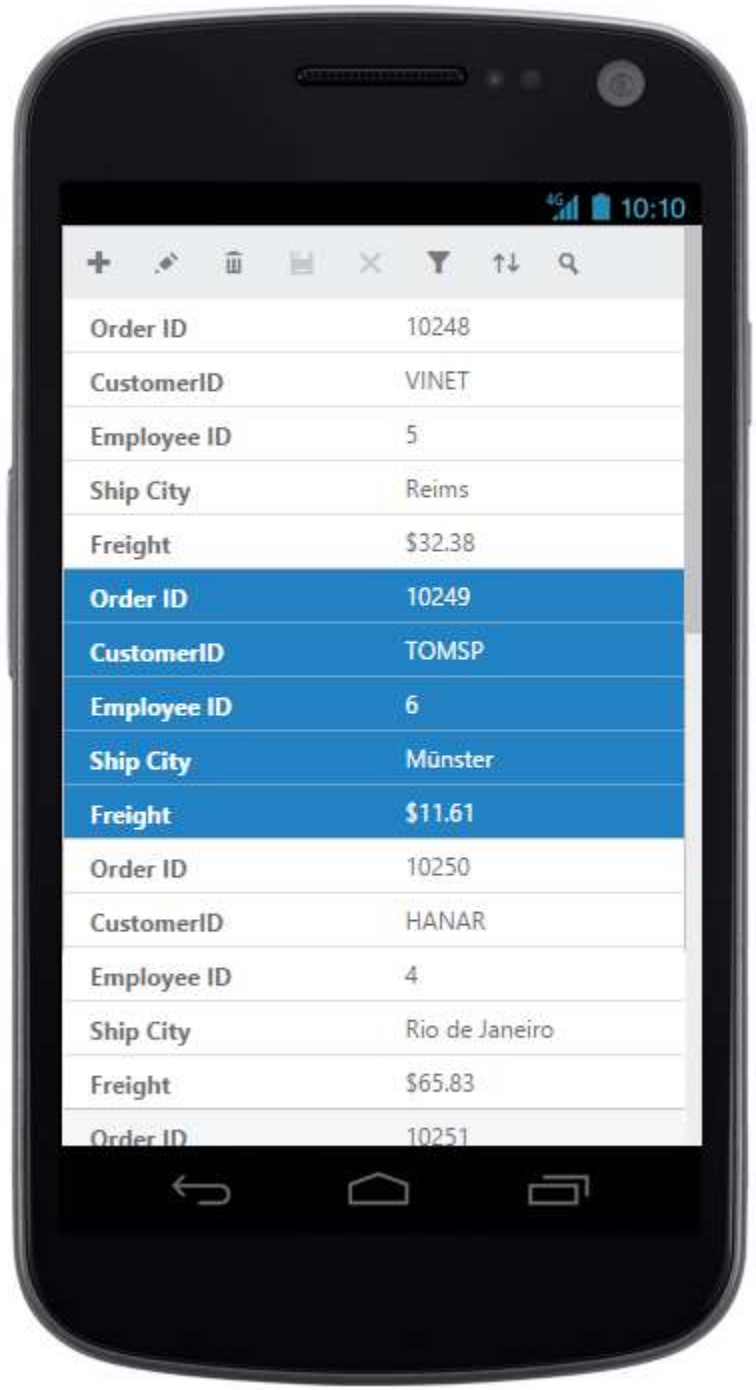


Waring: IE8 and IE9 does not support responsive row. The ejgrid.responsive.css should be referred to display responsive row.

Copyright © 2001 - 2020 Syncfusion Inc.

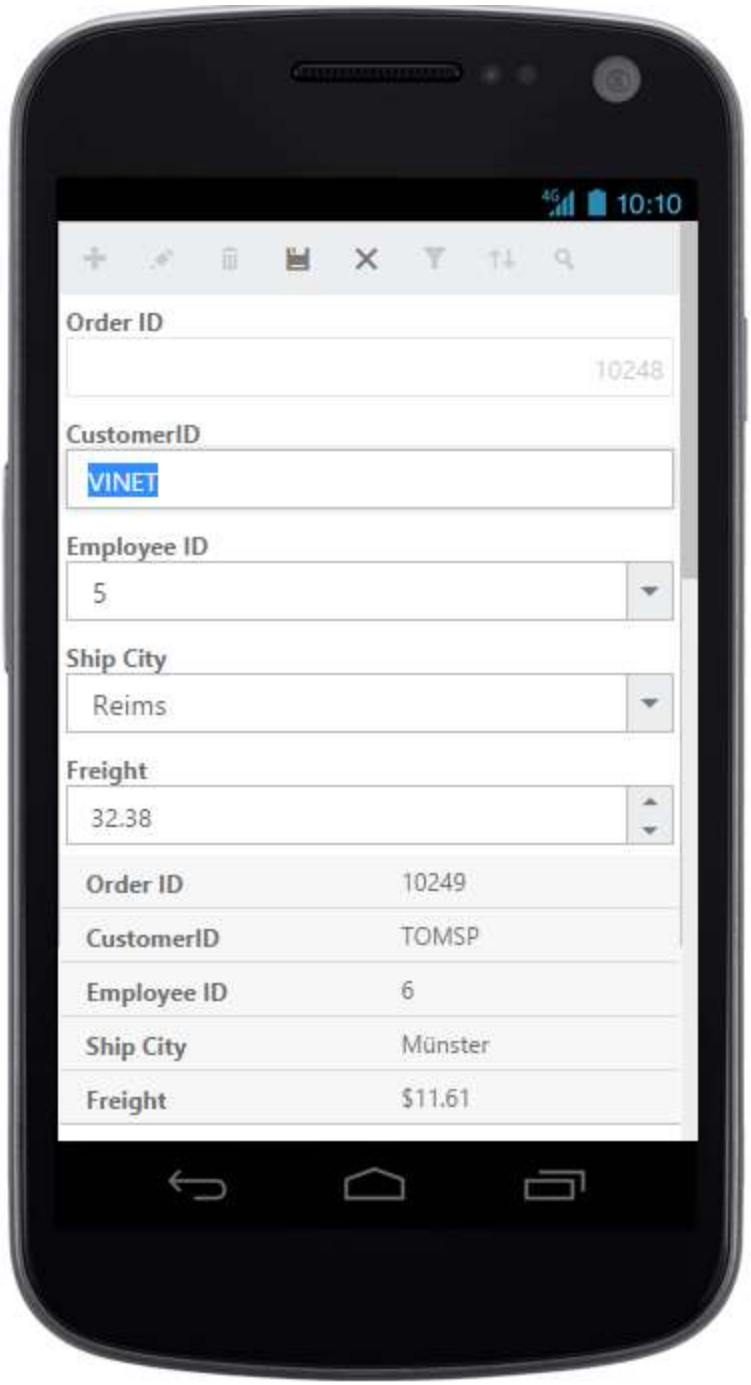
Customized features

The customized layout for filtering, sorting, searching and CRUD operations in mobile device can be seen in the following screen shots.



Responsive row with filtering , sorting and searching

Copyright © 2001 - 2020 Syncfusion Inc.



CRUD in mobile layout

{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

Copyright © 2001 - 2020 Syncfusion Inc.

Tablet layout

If the client width is between 321px and 800px, then the grid will render in tablet mode. Also, it has customized filtering design to match tablet screen size.

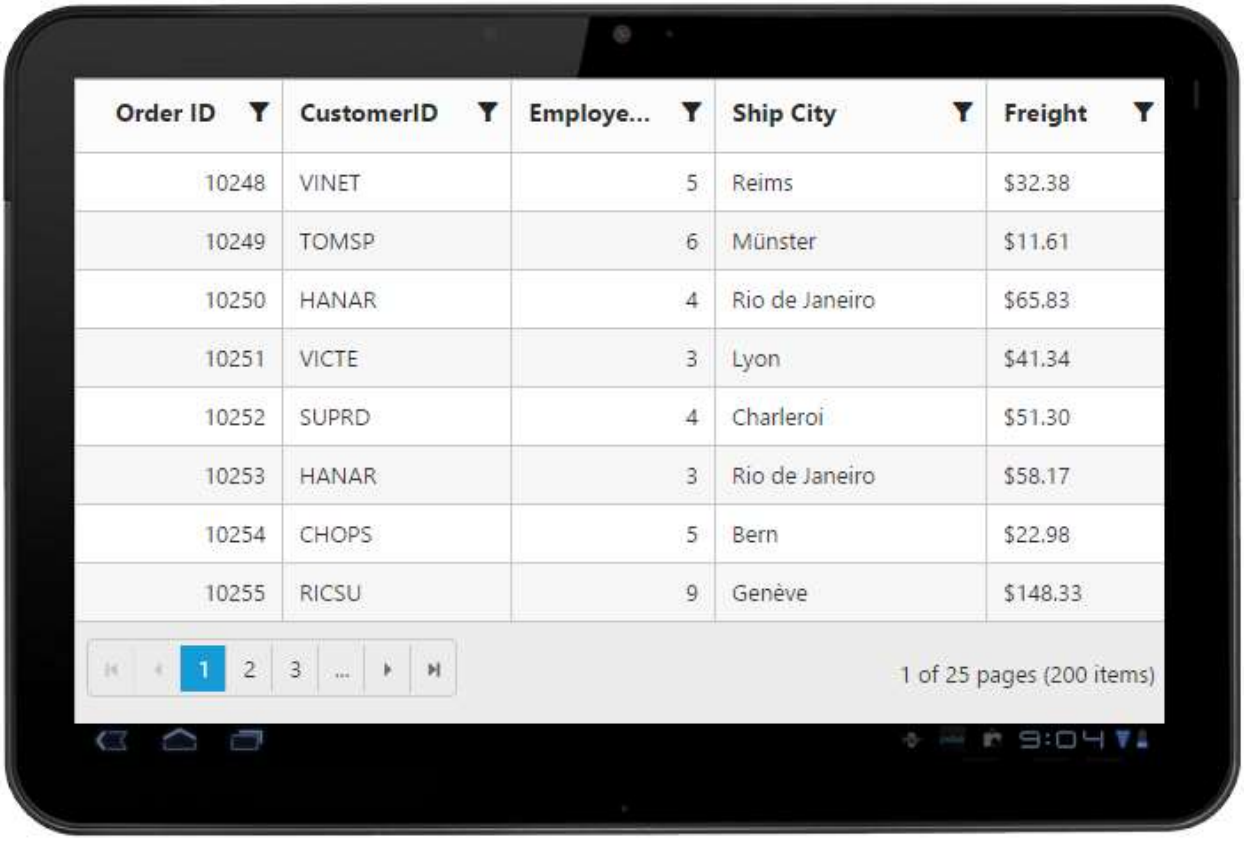
RAZOR

```
@(Html.EJ().Grid<OrdersView>("Grid")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.IsResponsive(true)
.AllowFiltering()
.FilterSettings(filterSettings =>
filterSettings.FilterType(FilterType.Menu))
.AllowPaging()
.PageSettings(p => p.PageCount(3).PageSize(8))
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order
ID").IsPrimaryKey(true).TextAlign(TextAlign.Right).Width("90").Add();
col.Field("CustomerID").HeaderText("Customer ID").Width("100").Add();
col.Field("EmployeeID").HeaderText("Employee
ID").TextAlign(TextAlign.Right).Width("90").Add();
col.Field("ShipCity").HeaderText("Ship City").Width("120").Add();
col.Field("Freight").HeaderText("Freight").Width("80").Format("{0:C}").Add()
;
})
)
```

C#

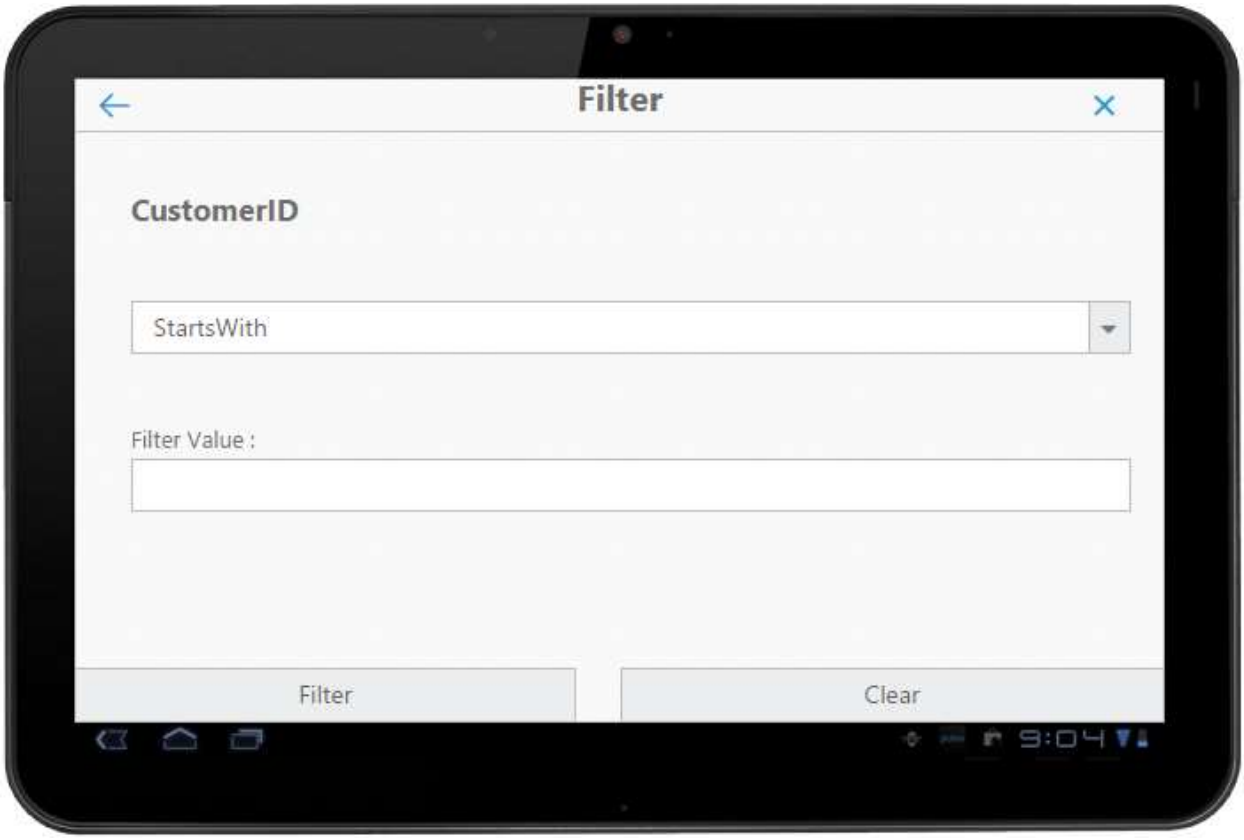
```
namespace SyncfusionMvcApplication3.Controllers
{
public class HomeController : Controller
{
public ActionResult Index()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

Copyright © 2001 - 2020 Syncfusion Inc.



Default tab layout

Copyright © 2001 - 2020 Syncfusion Inc.



Filtering design in tab layout.

Width

By default, the grid is adaptable to its parent container. It can adjust its width of columns based on parent container width. You can also assign the Width of Columns in percentage.

RAZOR

```
@(Html.EJ().Grid<OrdersView>("Grid")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order
ID").IsPrimaryKey(true).TextAlign(TextAlign.Right).Width("10%").Add();
col.Field("CustomerID").HeaderText("Customer ID").Width("15%").Add();
col.Field("EmployeeID").HeaderText("Employee
ID").TextAlign(TextAlign.Right).Width("10%").Add();
})
)
```

C#

```
namespace SyncfusionMvcApplication3.Controllers
{
public class HomeController : Controller
{
public ActionResult Index()
{
```

```
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

Information: The AllowScrolling should be false while defining Width in percentage.

Min width

Min width is used to maintain minimum width for the grid. To enable min width, MinWidth should be defined. If the grid width is less than MinWidth then the scrollbar will be displayed to maintain minimum width.

RAZOR

```
@(Html.EJ().Grid<OrdersView>("Grid")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.AllowPaging()
.MinWidth(700)
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order
ID").IsPrimaryKey(true).TextAlign(TextAlign.Right).Width("90").Add();
col.Field("CustomerID").HeaderText("Customer ID").Width("100").Add();
col.Field("EmployeeID").HeaderText("Employee
ID").TextAlign(TextAlign.Right).Width("90").Add();
col.Field("ShipCity").HeaderText("Ship City").Width("120").Add();
col.Field("Freight").HeaderText("Freight").Width("110").Format("{0:C}").Add(
);
})
)
```

C#

```
namespace SyncfusionMvcApplication3.Controllers
{
public class HomeController : Controller
{
public ActionResult Index()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

MinWidth set to grid

Note: We can render the grid with height responsive by setting the scrollSettings heightas 100%. If the grid height is greater than its parent container's height then the vertical scrollbar will be displayed to view the content.

Copyright © 2001 - 2020 Syncfusion Inc.

Priority for columns

Priority makes column to be visible or hidden based on the Priority value and browser's width to best accommodate the possible columns. To enable Priority for Columns, Priority needs to be defined in columns collection. These Priority values are from one to six.

RAZOR

```
@(Html.EJ().Grid<OrdersView>("Grid")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.AllowPaging()
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order
ID").IsPrimaryKey(true).Priority(1).TextAlign(TextAlign.Right).Width("90").A
dd();
col.Field("CustomerID").HeaderText("Customer
ID").Width("100").Priority(2).Add();
col.Field("EmployeeID").HeaderText("Employee
ID").TextAlign(TextAlign.Right).Priority(1).Width("90").Add();
col.Field("ShipCity").HeaderText("Ship
City").Width("120").Priority(3).Add();
col.Field("Freight").HeaderText("Freight").Width("110").Format("{0:C}").Prio
rity(4).Add();
})
)
```

C#

```
namespace SyncfusionMvcApplication3.Controllers
{
public class HomeController : Controller
{
public ActionResult Index()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

Information: The ejgrid.responsive.css should be referred.

Selection

Selection provides an interactive support to highlight the row, cell or column that you select. Selection can be done through simple Mouse down or Keyboard interaction. To enable selection, set the AllowSelection as true.

Types of selection

There are two types of selections available in grid. They are:

1. Single
2. Multiple

Copyright © 2001 - 2020 Syncfusion Inc.

Single selection

Single selection is an interactive support to select a specific row, cell or column in the grid by mouse or keyboard interactions. To enable single selection by setting the SelectionType property as Single and also set the AllowSelection property as true.

Multiple selections

Multiple selections is an interactive support to select a group of rows, cells or columns in grid by mouse or keyboard interactions. To enable multiple selections by set the SelectionType property as Multiple and also set the AllowSelection property as true.

Row selection

Row selection is enabled by setting the SelectionMode property of SelectionSettings as Row. For random row selection, press the **"Ctrl + mouse left"** click and for continuous row selection press the **"Shift + mouse left"** click on the grid rows. To unselect the selected rows, press the **"Ctrl + mouse left"** click on selected row.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<OrdersView>("Selection")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.AllowPaging()
.AllowSelection()
.SelectionType(SelectionType.Multiple)
.SelectionSettings(select => { select.SelectionMode(mode => {
mode.AddMode(SelectionMode.Row); }); })
.Columns(col =>
{
col.Field("OrderID").Add();
col.Field("EmployeeID").Add();
col.Field("ShipCity").Add();
col.Field("ShipCountry").Add();
col.Field("Freight").Add();
})
)
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public partial class GridController : Controller
{
public ActionResult Selection()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example

Multiple row selection using checkbox column

Select multiple rows in grid by using the checkbox column and it can be enabled by setting the column Type as checkbox. It also provides the option to select/deselect all the rows in the grid using a checkbox in the corresponding column header.

If the Field property of Checkbox column is not defined, then it acts as a template column. So Field property is necessary to perform grid actions like sorting, editing, etc., for the corresponding checkbox column.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<OrdersView>("Selection")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.AllowPaging()
.AllowSelection()
.Columns(col =>
{
col.Type("checkbox").Width(50).Add();
col.Field("OrderID").IsPrimaryKey(true).Width(80).TextAlign(TextAlign.Right)
.Add();
col.Field("CustomerID").HeaderText("Customer ID").Width(75).Add();
col.Field("EmployeeID").HeaderText("Employee
ID").Width(75).TextAlign(TextAlign.Right).Add();
col.Field("Freight").HeaderText("Freight").Format("{0:C}").Width(75).TextAli
gn(TextAlign.Right).Add();
})
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
)
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public partial class GridController : Controller
{
public ActionResult Selection()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example

Cell selection

Cell selection is enabled by setting the SelectionMode property of SelectionSettings as Cell. For random cell selection, press the **"Ctrl + mouse left"** click and for continuous cell selection, press the **"Shift + mouse left"** click on the grid cells. To unselect selected cells, press the **"Ctrl + mouse left"** on selected cell click.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<OrdersView>("Selection")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.AllowPaging()
.AllowSelection()
.SelectionType(SelectionType.Multiple)
.SelectionSettings(select => { select.SelectionMode(mode => {
mode.AddMode(SelectionMode.Cell); }); })
.Columns(col =>
```

```
{
col.Field("OrderID").Add();
col.Field("EmployeeID").Add();
col.Field("ShipCity").Add();
col.Field("ShipCountry").Add();
col.Field("Freight").Add();
})
)
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public partial class GridController : Controller
{
public ActionResult Selection()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example

OrderID	EmployeeID	ShipCity	ShipCountry	Freight
10248	5	Reims	France	32.38
10249	6	Münster	Germany	11.61
10250	4	Rio de Janeiro	Brazil	65.83
10251	3	Lyon	France	41.34
10252	4	Charleroi	Belgium	51.3
10253	3	Rio de Janeiro	Brazil	58.17
10254	5	Bern	Switzerland	22.98
10255	9	Genève	Switzerland	148.33

Cell selection mode

There are two types of cell selection available in grid. They are:

1. Continuous Selection
2. Box Selection

Box cell selection is to select multiple cells vertically based on the initial column index selection.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<OrdersView>("Selection")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.AllowPaging()
.AllowSelection()
.SelectionType(SelectionType.Multiple)
.SelectionSettings(select => { select.SelectionMode(mode => {
mode.AddMode(SelectionMode.Cell);}).CellSelectionMode(CellSelectionMode.Box)
; })
.Columns(col =>
{
col.Field("OrderID").Add();
col.Field("EmployeeID").Add();
col.Field("ShipCity").Add();
col.Field("ShipCountry").Add();
col.Field("Freight").Add();
})
)
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public partial class GridController : Controller
{
public ActionResult Selection()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example

Copyright © 2001 - 2020 Syncfusion Inc.

OrderID	EmployeeID	ShipCity	ShipCountry	Freight
10248	5	Reims	France	32.38
10249	6	Münster	Germany	11.61
10250	4	Rio de Janeiro	Brazil	65.83
10251	3	Lyon	France	41.34
10252	4	Charleroi	Belgium	51.3
10253	3	Rio de Janeiro	Brazil	58.17
10254	5	Bern	Switzerland	22.98
10255	9	Genève	Switzerland	148.33
10256	3	Resende	Brazil	13.97
10257	4	San Cristóbal	Venezuela	81.91
10258	1	Graz	Austria	140.51
10259	4	México D.F.	Mexico	3.25

1 2 3 4 5 6 7 8 ... 1 of 17 pages (200 items)

Column selection

Column selection can be enabled by setting the SelectionMode property of SelectionSettings as Column. For random column selection, press the **“Ctrl + mouse left click”** and for continuous column selection, press the **“Shift + mouse left click”** on the top of the column header. To unselect selected columns, press the **“Ctrl + mouse left click”** on top of the selected column header.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<OrdersView>("Selection")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.AllowPaging()
.AllowSelection()
.SelectionType(SelectionType.Multiple)
.SelectionSettings(select => { select.SelectionMode(mode => {
mode.AddMode(SelectionMode.Column); }); })
.Columns(col =>
{
col.Field("OrderID").Add();
col.Field("EmployeeID").Add();
col.Field("ShipCity").Add();
col.Field("ShipCountry").Add();
col.Field("Freight").Add();
})
)
```

Copyright © 2001 - 2020 Syncfusion Inc.

C#

```
namespace MVCSampleBrowser.Controllers
{
public partial class GridController : Controller
{
public ActionResult Selection()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code sample.

OrderID	EmployeeID	ShipCity	ShipCountry	Freight
10248	5	Reims	France	32.38
10249	6	Münster	Germany	11.61
10250	4	Rio de Janeiro	Brazil	65.83
10251	3	Lyon	France	41.34
10252	4	Charleroi	Belgium	51.3
10253	3	Rio de Janeiro	Brazil	58.17
10254	5	Bern	Switzerland	22.98
10255	9	Genève	Switzerland	148.33
10256	3	Resende	Brazil	13.97
10257	4	San Cristóbal	Venezuela	81.91
10258	1	Graz	Austria	140.51
10259	4	México D.F.	Mexico	3.25

1 2 3 4 5 6 7 8 ... 1 of 17 pages (200 items)

Touch options

While using the grid in a touch device environment, there is an option for multi selection through single tap on the row and it will shows a popup with multi-selection symbol. Tap the icon to enable multi selection in a single tap.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<OrdersView>("Selection")
.Datasource((IEnumerable<object>)ViewBag.datasource)
```

Copyright © 2001 - 2020 Syncfusion Inc.

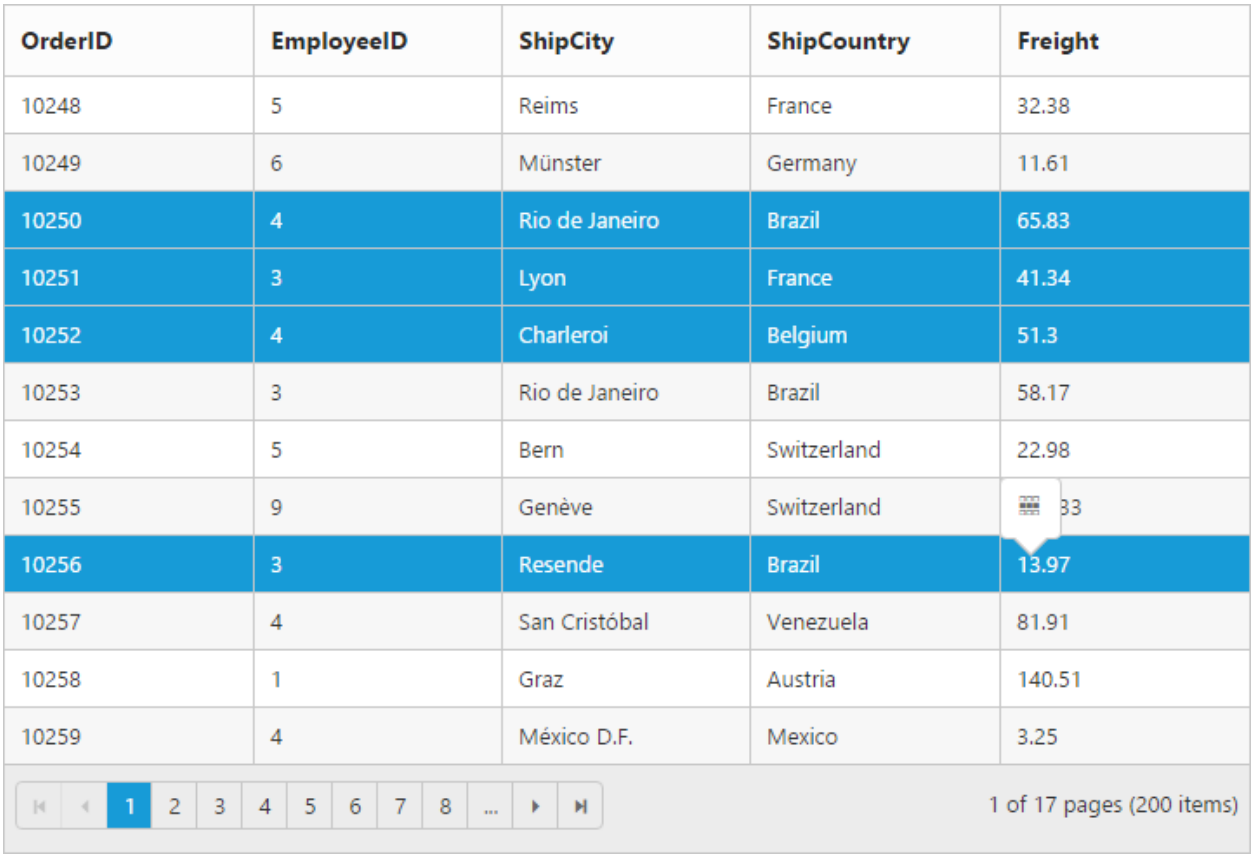
```
.AllowPaging()
.AllowSelection()
.SelectionType(SelectionType.Multiple)
.Columns(col =>
{
col.Field("OrderID").Add();
col.Field("EmployeeID").Add();
col.Field("ShipCity").Add();
col.Field("ShipCountry").Add();
col.Field("Freight").Add();
})
)
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public partial class GridController : Controller
{
public ActionResult Selection()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.

Copyright © 2001 - 2020 Syncfusion Inc.



OrderID	EmployeeID	ShipCity	ShipCountry	Freight
10248	5	Reims	France	32.38
10249	6	Münster	Germany	11.61
10250	4	Rio de Janeiro	Brazil	65.83
10251	3	Lyon	France	41.34
10252	4	Charleroi	Belgium	51.3
10253	3	Rio de Janeiro	Brazil	58.17
10254	5	Bern	Switzerland	22.98
10255	9	Genève	Switzerland	33
10256	3	Resende	Brazil	13.97
10257	4	San Cristóbal	Venezuela	81.91
10258	1	Graz	Austria	140.51
10259	4	México D.F.	Mexico	3.25

1 2 3 4 5 6 7 8 ... 1 of 17 pages (200 items)

Toggle selection

The Toggle selection allows to perform selection and unselection of the particular row, cell or column. To enable toggle selection, set EnableToggle property of SelectionSettings as true. If you click on the selected row, cell or column then it will be unselected and vice versa.

Note: If multi selection is enabled, then in first click on any selected row (without pressing Ctrl key), it will clear multi selection and in second click on the same row, it will be unselected.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<OrdersView>("Selection")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.AllowPaging()
.EnableRowHover(false)
.SelectionSettings(select => { select.EnableToggle(true); })
.Columns(col =>
{
col.Field("OrderID").Add();
col.Field("EmployeeID").Add();
col.Field("ShipCity").Add();
col.Field("ShipCountry").Add();
col.Field("Freight").Add();
})
)
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public partial class GridController : Controller
{
public ActionResult Selection()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

Toolbar

Toolbar can be shown by defining the ShowToolbar property in ToolbarSettings. Toolbar has option to add default items in the ToolbarItems and customized items in the CustomToolbarItems.

Default toolbar items

The following table shows default toolbar items and its action.

Default toolbar items.	Action
Add	Add a new row.
Edit	Edit an existing.
Delete	Delete a row.
Update	Update edited or added row.
Cancel	Cancel edited or added row.
Search	Search text in records.

C#

Information: The AllowAdding, AllowEditing and AllowDeleting need to be enabled for add, delete, edit and save & cancel in the ToolbarItems. The AllowSearching to be enabled while adding Search in toolbar to perform search action.

Custom toolbar items

Custom toolbar is used to create your own toolbar items in toolbar. It can be added by defining CustomToolbarItems in the ToolbarSettings. Actions for this customized toolbar is defined in the ToolbarClick event.

C#

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Web;
using System.Web.Mvc;
using SyncfusionMvcApplication1;
using SyncfusionMvcApplication1.Models;
namespace SyncfusionMvcApplication1.Controllers
{
public class GridController : Controller
{
//
// GET: /Grid/
public ActionResult GridFeatures()
```

```
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

RAZOR

```
@(Html.EJ().Grid<OrdersView>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.AllowPaging()
.EditSettings(edit => { edit.AllowAdding().AllowDeleting().AllowEditing();
})
.ToolbarSettings(toolbar =>
{
toolbar.ShowToolbar(true).CustomToolbarItems(new List<object>() {
"Collapse", new Syncfusion.JavaScript.Models.CustomToolbarItem() {
TemplateID = "#Refresh" } });
})
.AllowGrouping()
.GroupSettings(group => { group.GroupedColumns(new List<String>() {
"ShipCity" }); })
.ClientSideEvents(eve => { eve.ToolbarClick("onToolBarClick"); })
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order
ID").IsPrimaryKey(true).TextAlign(TextAlign.Right).Width(75).Add();
col.Field("CustomerID").HeaderText("Customer ID").Width(100).Add();
col.Field("EmployeeID").HeaderText("Employee
ID").TextAlign(TextAlign.Right).Width(75).Add();
col.Field("Freight").HeaderText("Freight").TextAlign(TextAlign.Right).Width(
70).Format("{0:C}").Add();
col.Field("ShipCity").HeaderText("Ship City").Width(110).Add();
})
)
<style type="text/css" class="cssStyles">
.Collapse:before {
content: "\e625";
}
.refresh:before {
content: "\e677";
}
</style>
<script id="Refresh" type="text/x-jsrender">
<a class="e-toolbaricons e-icon refresh" />
</script>
<script type="text/javascript">
function onToolBarClick(args) {
var toolbar = $(args.target),
grid = this;
if (toolbar.hasClass("Collapse")) grid.collapseAll(); //collapse Grid using
grid instance, `this` is grid instance
else grid.refreshContent(); //refresh content using grid instance
}
```

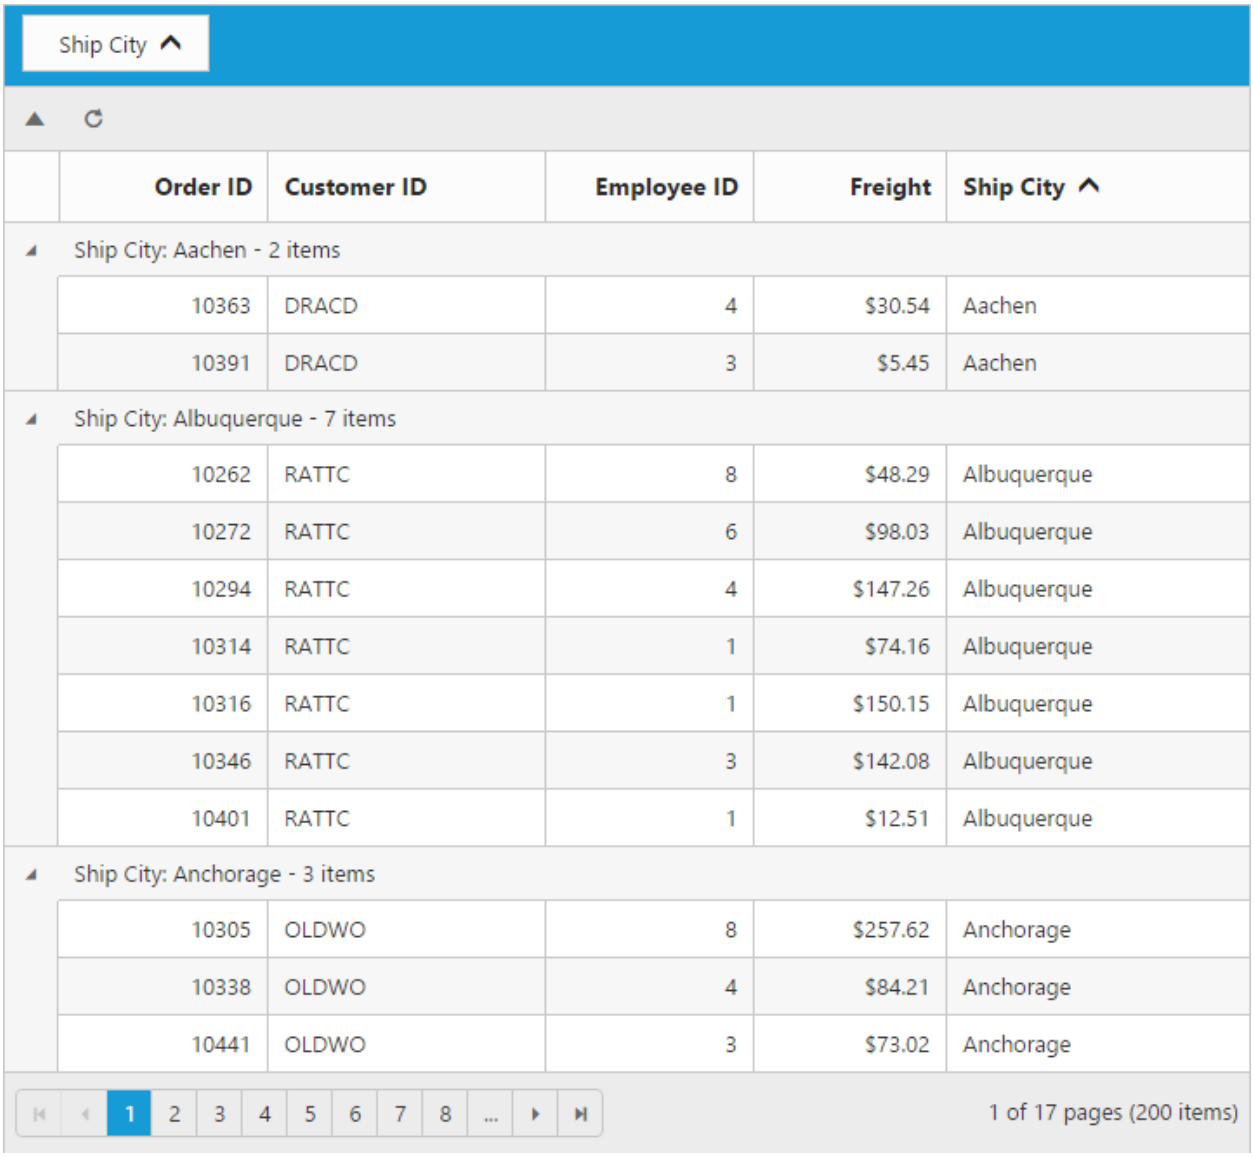
```
</script>
```



Web Accessibility

Web Accessibility is achieved in Grid control through the Keyboard Navigation and WAI-ARIA Standard.

Keyboard Navigation

Supported Keyboard Interactions keys with its description are tabulated as follows.

Interaction Keys	Description
Alt + j	Focus the Grid
Insert	Insert record in Grid
Delete	Delete record in Grid
F2	Edit record in Grid

Copyright © 2001 - 2020 Syncfusion Inc.

Enter	Save edited or added
Esc	Cancel add or edit state
PgDn	Go to next Page
PgUp	Go to previous Page
Ctrl +Alt +PgDn	Go to last page
Ctrl + Alt + PgUp	Go to first page
Alt + PgDown	Go to next Pager
Alt + PgUp	Go to previous Pager
Home	Go to first cell
End	Go to last cell
Ctrl + Home	Go to first row
Ctrl + End	Go to last row
Up arrow	Move to up cell selection
Down arrow	Move to down cell selection
Right arrow	Move to right cell selection
Left arrow	Move to left cell selection
Tab	Go to next cell
Shift + tab	Go to previous cell
Alt + DownArrow	Expand selected group
Ctrl + DownArrow	Expand All visible groups
Alt + UpArrow	Collapse selected group
Ctrl + UpArrow	Collapse All visible groups

WAI - ARIA

This helps to enable better user interaction in ejGrid and uses the W3C's Widget Design Patterns in the WAI specification and added customize attributes. Please find the list of ARIA attribute used in Grid.

- grid (role)
- row (role)
- gridcell (role)
- aria-selected (attribute)

Copyright © 2001 - 2020 Syncfusion Inc.

Styling

List of classes and its purposes

To modify the Grid appearance, you need to override default CSS of the grid. Please find the list of CSS classes and its corresponding section in the grid. Also you have an option to create your own custom theme for all the ASP.NET MVC controls using our Theme Studio.

Section	CSS class	Purpose of the CSS class
Root	e-grid	This classes are in this root element (div) of the grid control.
	e-js	
Header	e-gridheader	This is class is added in the root element of header element.
	e-table	This class is added at 'table' of grid header. This CSS class makes table width as 100 %.
	e-columnheader	This class is added at 'tr' of the grid header.
	e-headercell	This class is added in 'th' element of grid header. You can override the background color of header and border color.
	e-headercelldiv	This class is add in div which present 'th' element in header. It is recommended to use the e-headercelldiv to override skeleton of header.
Body	e-gridcontent	This class is added at root of body content. This is to override the background color of body.
	e-table	This class is added to table of content. This CSS class makes the table width as 100 %.
	e-alt_row	This class is added to alternate rows of grid. This is to override the alternate row color of grid.
	e-rowcell	This class is added to all cells in the grid. This is to override cell's appearance and styling.
	e-groupcaption	This class is added to 'td' of group caption which is to change the background color of caption cell.
	e-selectionbackground	This class is added to the row cells of grid. This is override selection.
	e-hover	This class adds to the row of grid when hovering on grid rows.
Pager	e-pager	This class is added to root element of the pager. This to change appearance of background color and color of font.
	e-pagercontainer	This class is added to numeric items of the pager.
	e-parentmsgbar	This class is added to pager info of the pager.
Summary	e-gridfooter	This class is added to root of the summary div.

Copyright © 2001 - 2020 Syncfusion Inc.

	e-gridsummary	This class is added to table of summary. This CSS class makes table width as 100 %.
	e-gridSummaryRows	This class is added to rows of grid summary.
	e-summaryrow	This class is added to cells of summary row. This to override the background color of summary.

Toolbar customization

To customize toolbar, you need to use the toolbar default CSS class to override icon in toolbar.

customize toolbar

Context Menu

Context menu is used to improve the user action with Grid using popup menu. It can be shown by defining the EnableContextMenu property of ContextMenuSettings as true. Context menu has option to add default items in the ContextMenuItems property of ContextMenuSettings and customized items in the CustomContextMenuItems property of ContextMenuSettings.

Default Context Menu items

Please find the below table for default context menu items and its actions.

Section	Context menu items	Action
Header	Sort in Ascending Order	Sort column in Ascending order.
	Sort in Descending Order	Sort column in Descending order.
	Group	Group the current column.
	Ungroup	Ungroup the current column if already grouped.
Body	Add Record	Start Add new record.
	Edit Record	Start Edit in current record.
	Delete Record	Delete the current record.
	Save	Save the record if Add/Edit record is started.
	Cancel	Cancel Added/Edited state.
Pager	Next Page	Go to Next Page.
	Last Page	Go to Last page.
	Previous page	Go to previous page.
	First page	Go to first page.

RAZOR

```
@(Html.EJ().Grid<object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.datasource)
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
.EditSettings(edit =>
{
edit.AllowAdding().AllowDeleting().AllowEditing();
})
.ToolbarSettings(toolbar =>
{
toolbar.ShowToolbar().ToolbarItems(items =>
{
items.AddTool(ToolBarItems.Add);
items.AddTool(ToolBarItems.Edit);
items.AddTool(ToolBarItems.Delete);
items.AddTool(ToolBarItems.Update);
items.AddTool(ToolBarItems.Cancel);
});
})
.ContextMenuSettings(contextMenu =>

{
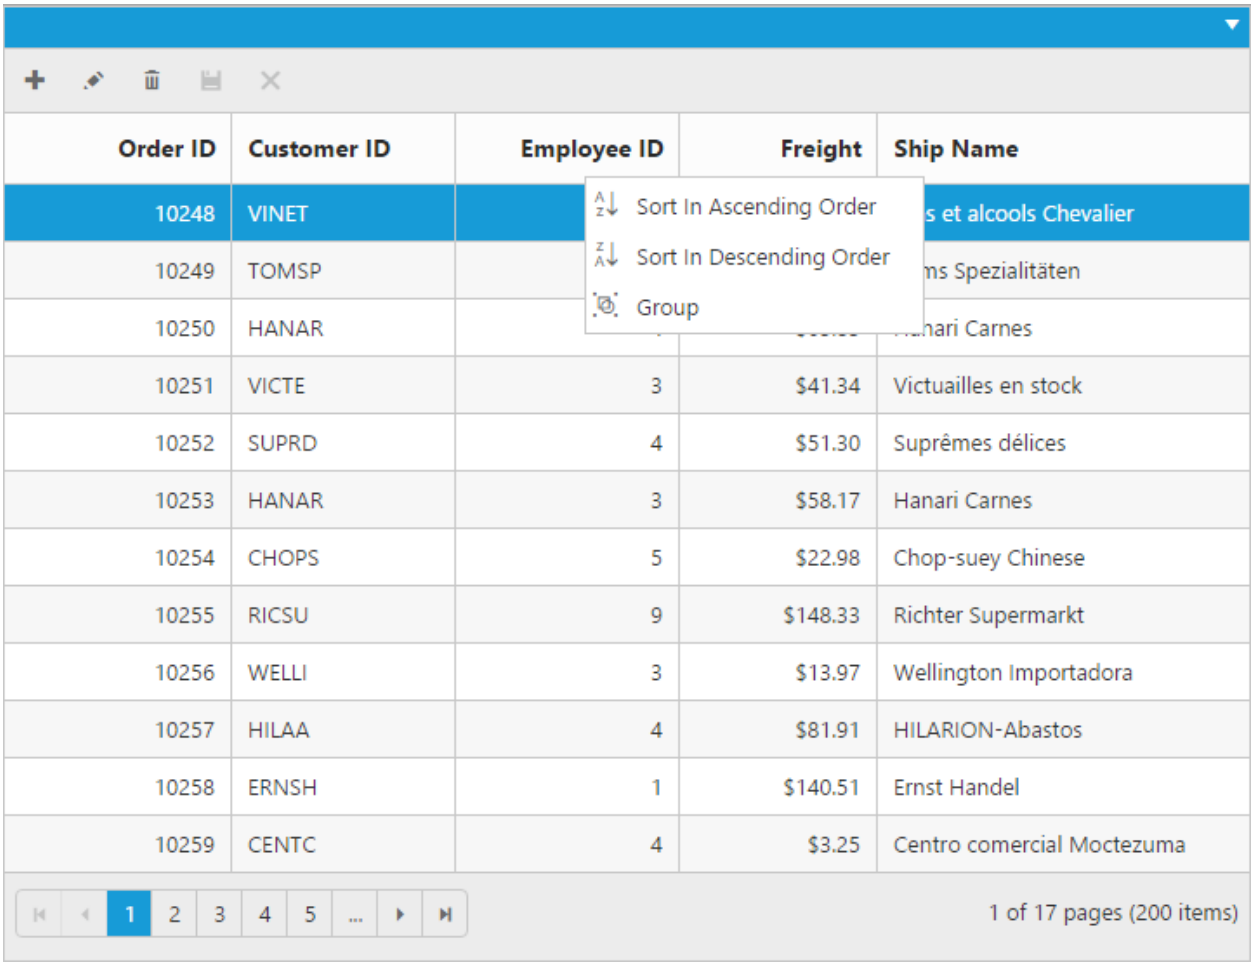
col.Field("OrderID").IsPrimaryKey(true).HeaderText("Order
ID").TextAlign(TextAlign.Right).Width(90).Add();
col.Field("CustomerID").HeaderText("Customer ID").Width(90).Add();
col.Field("EmployeeID").HeaderText("Employee
ID").TextAlign(TextAlign.Right).Width(90).Add();
col.Field("Freight").Format("{0:c2}").HeaderText("Freight").Width(80).TextAl
ign(TextAlign.Right).Add();
col.Field("ShipName").HeaderText("Ship Name").Width(150).Add();
})
)
```

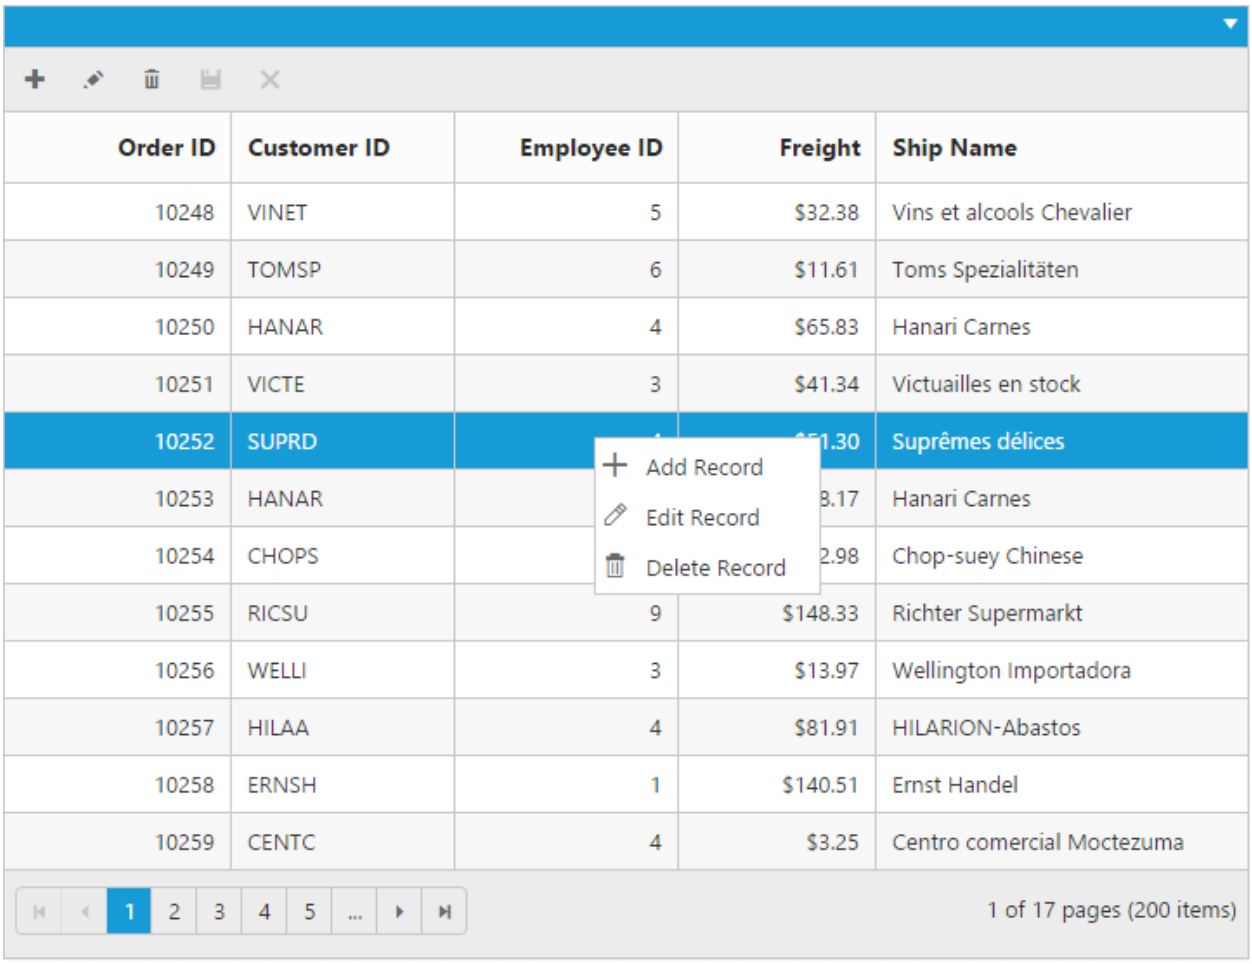
C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult Index(){
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

Copyright © 2001 - 2020 Syncfusion Inc.

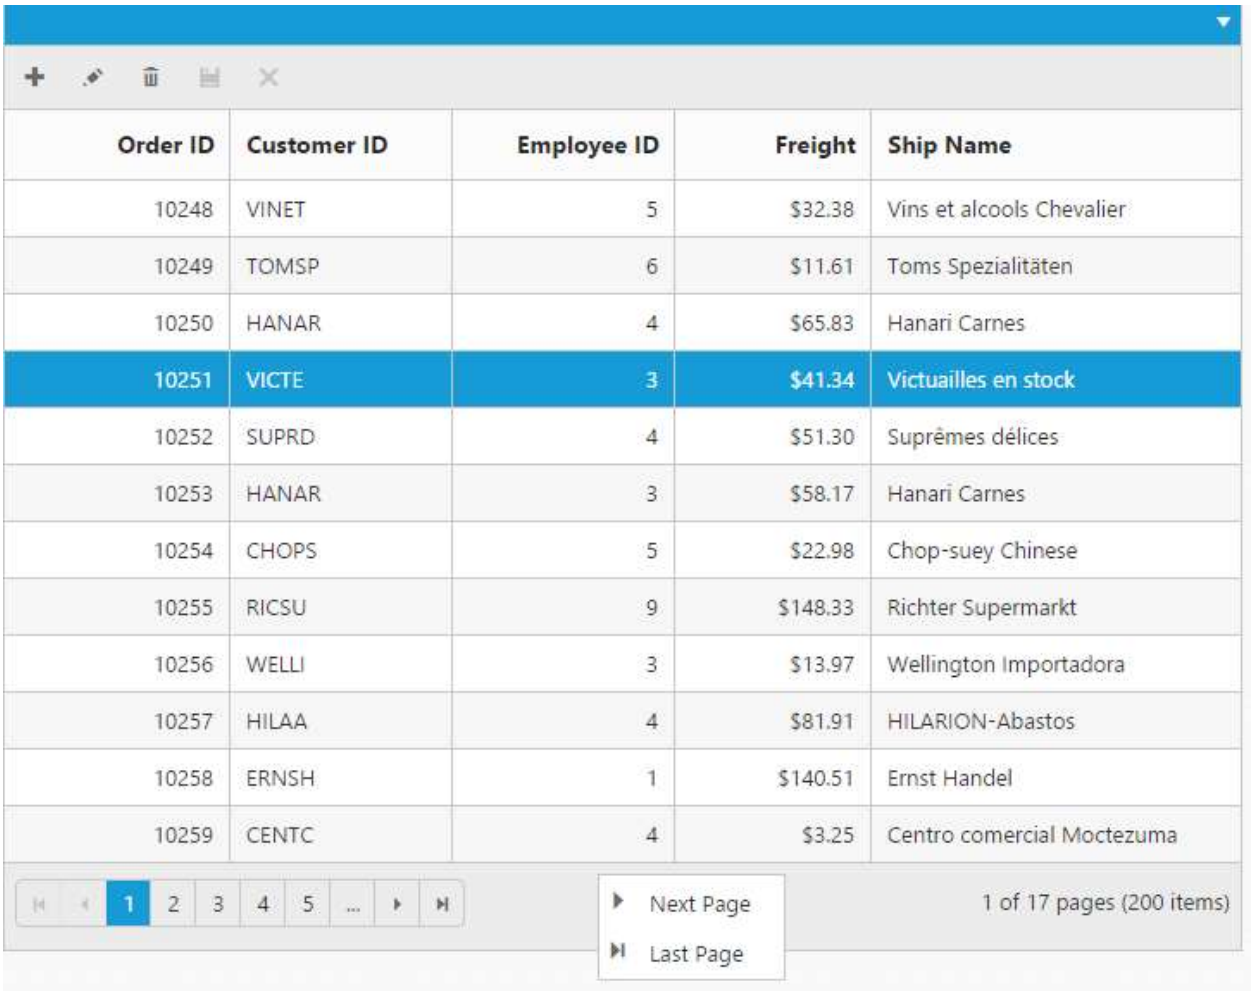


Context menu at header



Context menu at body

Copyright © 2001 - 2020 Syncfusion Inc.



Context menu at pager

Note: AllowGrouping, AllowSorting should be enabled to perform default context menu actions in Grid header. AllowEditing, AllowDeleting and AllowAdding should be enabled to perform default actions in body.

Custom Context Menu

Custom context menu is used to create your own menu item and its action. To add customized context menu items, you need to use the ContextMenuSettings.CustomContextMenuItems property and to bind required actions for this, use the ContextClick event.

RAZOR

```
@(Html.EJ().Grid<object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.ContextMenuSettings(contextMenu =>
{
contextMenu.EnableContextMenu();
contextMenu.DisableDefaultItems();
contextMenu.CustomContextMenuItems(new List<CustomContextMenuItems> { new
CustomContextMenuItems() { Id = "clear", Text = "Clear Selection" }});
})
.AllowPaging()
```

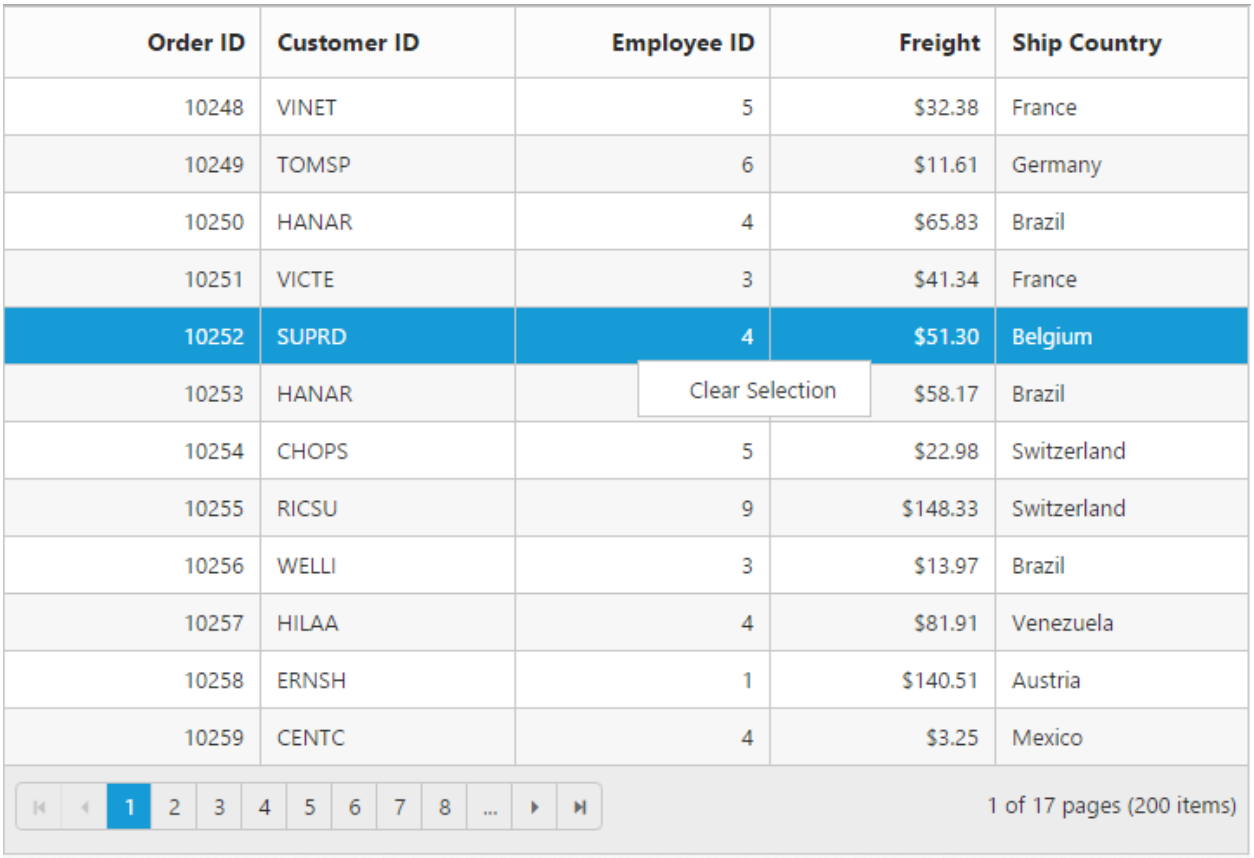
Copyright © 2001 - 2020 Syncfusion Inc.

```
.ClientSideEvents(eve => {eve.ContextClick("context_click");})
.Columns(col =>
{
col.Field("OrderID").IsPrimaryKey(true).HeaderText("Order
ID").TextAlign(TextAlign.Right).Width(90).Add();
col.Field("CustomerID").HeaderText("Customer ID").Width(90).Add();
col.Field("EmployeeID").HeaderText("Employee
ID").TextAlign(TextAlign.Right).Width(90).Add();
col.Field("Freight").Format("{0:c2}").HeaderText("Freight").Width(80).TextAl
ign(TextAlign.Right).Add();
col.Field("ShipCountry").HeaderText("Ship Country").Width(150).Add();
})
)
<script type="text/javascript">
function context_click(args) {
if (args.text == "Clear Selection")
this.clearSelection();
}
</script>
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult Index(){
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

Copyright © 2001 - 2020 Syncfusion Inc.



Sub Context Menu

Sub context menu is used to add customized sub menu to the custom context menu item. To add a sub context menu, you need to use the ContextMenuSettings.SubContextMenu property and to bind required actions for this, use the ContextClick event.

RAZOR

```
@(Html.EJ().Grid<object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.ContextMenuSettings(contextMenu =>
{
contextMenu.EnableContextMenu();
contextMenu.DisableDefaultItems();
contextMenu.CustomContextMenuItems(new List<CustomContextMenuItems> { new
CustomContextMenuItems() { Id = "clear", Text = "Clear Selection" }, new
CustomContextMenuItems() { Id = "hide", Text = "Hide Column" } });
contextMenu.SubContextMenu(submenu =>
{
submenu.ContextMenuItem("hide").SubMenu(new List<string>() { "Order ID",
"Customer ID", "Employee ID" }).Add();
});
})
.AllowPaging()
.ClientSideEvents(eve => {eve.ContextClick("context_click");})
.Columns(col =>
{
```

```
col.Field("OrderID").IsPrimaryKey(true).HeaderText("Order
ID").TextAlign(TextAlign.Right).Width(90).Add();
col.Field("CustomerID").HeaderText("Customer ID").Width(90).Add();
col.Field("EmployeeID").HeaderText("Employee
ID").TextAlign(TextAlign.Right).Width(90).Add();
col.Field("Freight").Format("{0:c2}").HeaderText("Freight").Width(80).TextAl
ign(TextAlign.Right).Add();
col.Field("ShipCountry").HeaderText("Ship Country").Width(150).Add();
})
)
<script type="text/javascript">
function context_click(args) {
if (args.text == "Clear Selection")
this.clearSelection();
else if (args.text == "Hide Column")
this.hideColumns(args.text);
}
</script>
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult Index(){
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

Sub Context Menu with Template

On rendering the Sub context menu items, the customized sub menu items is created by using the ContextMenuSettings.SubContextMenu.Template property.

RAZOR

```
@(Html.EJ().Grid<object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.ContextMenuSettings(contextMenu =>
{
contextMenu.EnableContextMenu();
contextMenu.DisableDefaultItems();
contextMenu.CustomContextMenuItems(new List<CustomContextMenuItems> { new
CustomContextMenuItems() { Id = "clear", Text = "Clear Selection" }, new
CustomContextMenuItems() { Id = "hide", Text = "Hide Column" } });
contextMenu.SubContextMenu(submenu =>
{
submenu.ContextMenuItem("hide").Template("#template").Add();
});
})
.AllowPaging()
.ClientSideEvents(eve => {eve.ContextClick("context_click");})
.Columns(col =>
{
col.Field("OrderID").IsPrimaryKey(true).HeaderText("Order
ID").TextAlign(TextAlign.Right).Width(90).Add();
col.Field("CustomerID").HeaderText("Customer ID").Width(90).Add();
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
col.Field("EmployeeID").HeaderText("Employee
ID").TextAlign(TextAlign.Right).Width(90).Add();
col.Field("Freight").Format("{0:c2}").HeaderText("Freight").Width(80).TextAl
ign(TextAlign.Right).Add();
col.Field("ShipCountry").HeaderText("Ship Country").Width(150).Add();
})
)
```

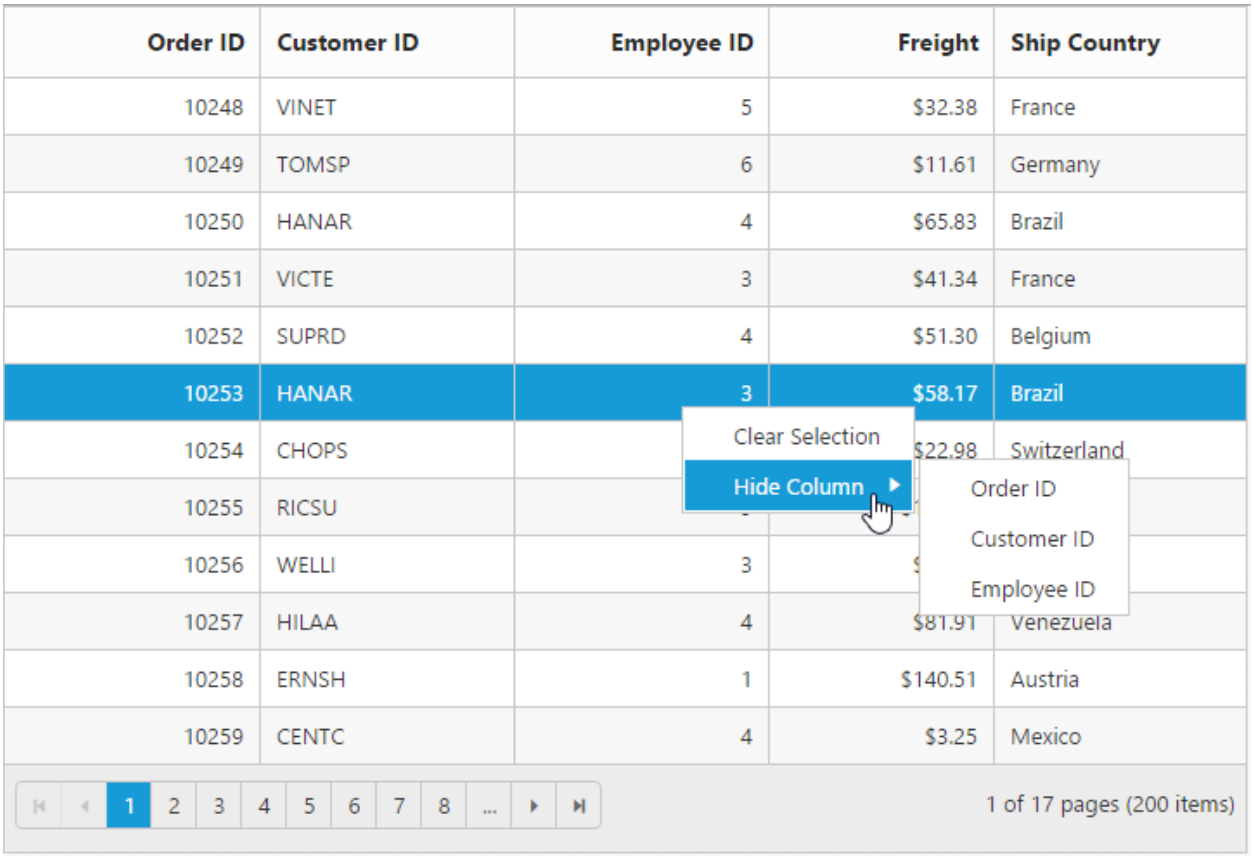
JS

```
<script type="text/javascript">
function context_click(args) {
if (args.text == "Clear Selection")
this.clearSelection();
else if (args.text != "Hide Column")
this.hideColumns(args.text);
}
</script>
<script type= "text/x-jsrender" id=template>
<ul>
<li><a>OrderID</a></li>
<li><a>CustomerID</a></li>
<li><a>EmployeeID</a></li>
</ul>
</script>
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public class GridController : Controller
{
public ActionResult Index(){
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

Copyright © 2001 - 2020 Syncfusion Inc.



Hierarchical Bindings

Hierarchical binding can be used to create the Grid with parent and child relation, this facilitate you to view the child records for a particular row by clicking on the Expander button present in first column of each grid row. This can be enabled by defining ChildGrid and QueryString.

The ChildGrid property is used to define the model properties that has to be applied on the child grid. The ChildGrid is the extended class of the base class grid such that it holds all the properties of the grid. The QueryString is a property that has to be specified within the ChildGrid, which defines the relation between the parent and child grid. The QueryString property is used to denote the primaryKey field of the parent grid which is to be mapped with the foreignKey field of the child grid. Based on the mapping, the child grid records are filtered from the table and is bound as datasource for the child grid.

If the foreign key column name differs for parent and child grid then use ForeignKeyField property of child grid. Refer here for more information.

Note: The responsive and exporting support is not applicable for Hierarchical binding.

RAZOR

```
@(Html.EJ().Grid<EmployeeView>("HierarchyGrid")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.Columns(col =>
{
col.Field("EmployeeID").HeaderText("Employee
ID").TextAlign(TextAlign.Right).Width(85).Add();
col.Field("FirstName").HeaderText("First Name").Width(100).Add();
col.Field("Title").Width(120).Add();
```

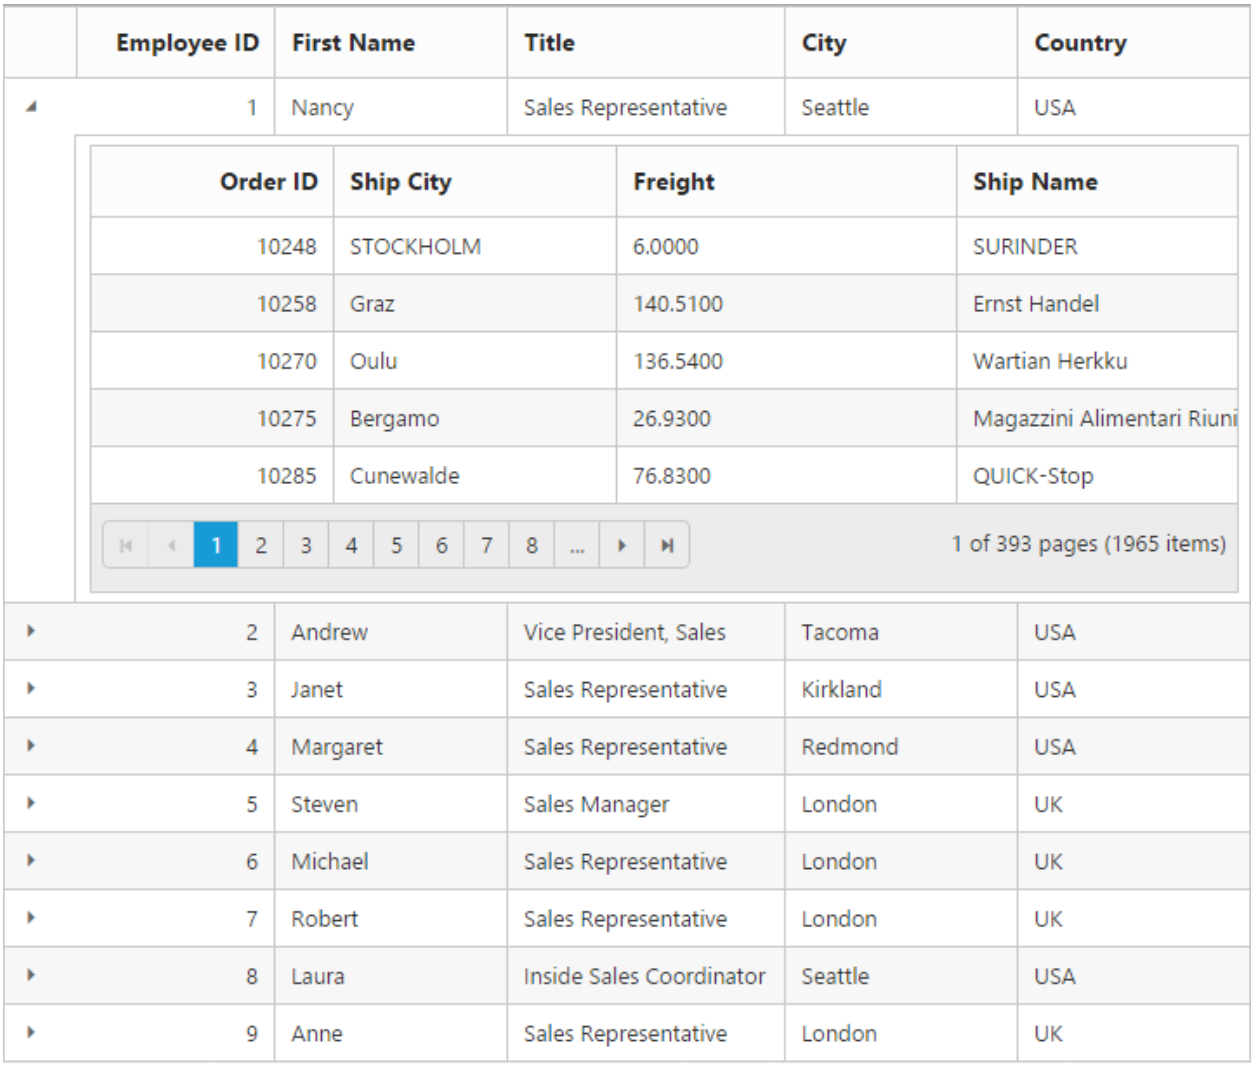
Copyright © 2001 - 2020 Syncfusion Inc.

```
col.Field("City").Width(100).Add();
col.Field("Country").Width(100).Add();
})
.ChildGrid(child =>
{
child.Datasource("http://js.syncfusion.com/demos/ejServices/Wcf/Northwind.svc/Orders")
.QueryString("EmployeeID")
.AllowPaging()
.PageSettings(page => page.PageSize(5))
.Columns(col =>
{
col.Field("OrderID").HeaderText("OrderID").TextAlign(TextAlign.Right).Width(75).Add();
col.Field("ShipCity").HeaderText("ShipCity").Width(100).Add();
col.Field("Freight").Width(120).Add();
col.Field("ShipName").Width(100).Add();
});
})
)
```

C#

```
public partial class GridController : Controller
{
//
// GET: /HierarchyGrid/
public ActionResult HierarchyGrid()
{
var DataSource = new NorthwindDataContext().EmployeeViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
}
```

Copyright © 2001 - 2020 Syncfusion Inc.



Expand or collapse all child's

The grid can able to expand and collapse all the ChildGrid through programmatically using the expandAll and collapseAll method.

RAZOR

```
<button id="expand">expandAll</button>
<button id="collapse">collapseAll</button>
@(Html.EJ().Grid<EmployeeView>("HierarchyGrid")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.ChildGrid(child =>
{
child.Datasource((IEnumerable<object>)ViewBag.datasource2)
.QueryString("EmployeeID")
.AllowPaging()
.PageSettings(page => page.PageSize(5))
.Columns(col =>
{
col.Field("OrderID").HeaderText("OrderID").TextAlign(TextAlign.Right).Width(
75).Add();
col.Field("ShipCity").HeaderText("ShipCity").Width(100).Add();
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
col.Field("Freight").Width(120).Add();
col.Field("ShipName").Width(100).Add();
});
})
)
<script type="text/javascript">
$("#expand,#collapse").ejButton({
showRoundedCorner: true,
size: "mini",
width: 150,
click: function (args) {
$("#HierarchyGrid").ejGrid(args.model.text); //invokes expandAll &
collapseAll method based on button name
}
});
</script>
```

C#

```
public partial class GridController : Controller
{
//
// GET: /HierarchyGrid/
public ActionResult HierarchyGrid()
{
var DataSource = new NorthwindDataContext().EmployeeViews.ToList();
var DataSource2 = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.datasource = DataSource;
ViewBag.datasource2 = DataSource2;
return View();
}
}
```

Stacked Headers

The stacked headers helps you to group the logical columns in the Grid. It can be shown by setting the ShowStackedHeader as true and by defining the StackedHeaderRows.

Adding stacked header columns

To stack the columns in stacked header, you need to define the Column property in StackedHeaderColumns with field names of visible columns.

ASPX-CS

```
@(Html.EJ().Grid<OrdersView>("Grid")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.ShowStackedHeader()
.StackedHeaderRows(row =>
{
row.StackedHeaderColumns(column =>
{
column.HeaderText("OrderDetails").Column(col =>
{
col.Add("OrderID");
col.Add("OrderDate");
col.Add("Freight");
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
}).Add();
column.HeaderText("Ship Details").Column(col =>
{
col.Add("ShipName");
col.Add("ShipCity");
col.Add("ShipCountry");
}).Add();
}).Add();
})
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order ID").Width(80).Add();
col.Field("OrderDate").HeaderText("Order
Date").Width(80).Format("{0:MM/dd/yyyy}").TextAlign(TextAlign.Right).Add();
col.Field("Freight").HeaderText("Freight").TextAlign(TextAlign.Right).Width(
75).Format("{0:C}").Add();
col.Field("ShipName").HeaderText("Ship Name").Width(110).Add();
col.Field("ShipCity").HeaderText("Ship City").Width(110).Add();
col.Field("ShipCountry").HeaderText("Ship Country").Width(110).Add();
}))
```

C#

```
namespace SyncfusionMvcApplication3.Controllers
{
public class HomeController : Controller
{
public ActionResult Index()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

Copyright © 2001 - 2020 Syncfusion Inc.

Exporting

The Exporting feature provides support to export Grid data into excel, word and PDF files. To export the grid, the export JavaScript method should be called with export action as parameter. To make it work from grid tool bar the ExcelExport, WordExport and PdfExport toolbar items needs to be added in grid tool bar using the ToolbarItems property of ToolbarSettings which are used to perform exporting. When you click the toolbar exporting icon, it internally invokes the export public method of grid object to export. The code sample for this is as follows.

RAZOR

```
@(Html.EJ().Grid<OrdersView>("FlatGrid")
.DataSource((IEnumerable<object>)ViewBag.datasource)
.ToolbarSettings(toolBar => toolBar.ShowToolbar().ToolbarItems(items =>
{
items.AddTool(ToolBarItems.ExcelExport);
items.AddTool(ToolBarItems.WordExport);
items.AddTool(ToolBarItems.PdfExport);
}))
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
.AllowPaging()
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order
ID").TextAlign(TextAlign.Right).Add();
col.Field("CustomerID").HeaderText("Customer ID").Add();
col.Field("EmployeeID").HeaderText("Employee
ID").TextAlign(TextAlign.Right). Add();
col.Field("Freight").HeaderText("Freight").TextAlign(TextAlign.Right).Add();
col.Field("OrderDate").HeaderText("Order Date").TextAlign(TextAlign.Right).
Add();
col.Field("ShipCity").HeaderText("Ship City").Add();
}))
```

C#

```
public partial class GridController : Controller
{
public ActionResult ExportingGrid()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
public void ExportToExcel(string GridModel)
{
ExcelExport exp = new ExcelExport();
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
GridProperties obj
=(GridProperties)Syncfusion.JavaScript.Utils.DeserializeToModel(typeof(GridP
roperties), GridModel);
exp.Export(obj, DataSource, "Export.xlsx", ExcelVersion.Excel2010, false,
false, "flat-saffron");
}
public void ExportToWord(string GridModel)
{
WordExport exp = new WordExport();
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
GridProperties obj
=(GridProperties)Syncfusion.JavaScript.Utils.DeserializeToModel(typeof(GridP
roperties), GridModel);
exp.Export(obj, DataSource, "Export.docx", false, false, "flat-saffron");
}
public void ExportToPdf(string GridModel)
{
PdfExport exp = new PdfExport();
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
GridProperties obj
=(GridProperties)Syncfusion.JavaScript.Utils.DeserializeToModel(typeof(GridP
roperties), GridModel);
exp.Export(obj, DataSource, "Export.pdf", false, false, "flat-saffron");
}
}
```

Copyright © 2001 - 2020 Syncfusion Inc.

Hierarchy grid exporting

The grid will be exported with its child grid. This can be achieved by enabling the IncludeChildGrid property of the respective exporting classes like GridExcelExport, GridWordExport and GridPdfExport and include the dataSource needed for ChildGrid in the GridProperties object after deserializing them. Remaining procedures will be same as the normal grid exporting.

Note: Excel file will be exported in the collapsed state with the expand/collapse icon whereas other file-formats like PDF and Word will be exported in the expanded state.

RAZOR

```
@(Html.EJ().Grid<object>("HierarchyGrid")
.Datasource((IEnumerable<object>)ViewBag.parentData)
.ToolbarSettings(toolBar => toolBar.ShowToolbar().ToolbarItems(items =>
{
items.AddTool(ToolBarItems.ExcelExport);
items.AddTool(ToolBarItems.WordExport);
items.AddTool(ToolBarItems.PdfExport);
}))
.Columns(col =>
{
col.Field("EmployeeID").HeaderText("Employee
ID").TextAlign(TextAlign.Right).Width(75).Add();
col.Field("FirstName").HeaderText("First Name").Width(100).Add();
col.Field("Title").Width(120).Add();
col.Field("City").Width(100).Add();
col.Field("Country").Width(100).Add();
})
.ChildGrid(child =>
{
child.Datasource((IEnumerable<object>)ViewBag.childData)
.QueryString("EmployeeID")
.AllowPaging()
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order
ID").TextAlign(TextAlign.Right).Width(75).Add();
col.Field("ShipCity").HeaderText("Ship City").Width(100).Add();
col.Field("Freight").TextAlign(TextAlign.Right).Format("{0:C2}").Width(120).
Add();
col.Field("ShipName").HeaderText("Ship Name").Width(100).Add();
});
})
)
```

C#

```
public class HomeController : Controller
{
public ActionResult Index()
{
var order = new NorthWndDataContext().Orders.Take(100).ToList();
var emp = new NorthWndDataContext().Employees.ToList();
ViewBag.childData = order;
ViewBag.parentData = emp;
return View();
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
}
public void ExportToExcel(string GridModel)
{
ExcelExport exp = new ExcelExport();
var DataSource = new NorthWndDataContext().Employees.ToList();
GridProperties obj = ConvertGridObject(GridModel);
obj.ChildGrid.DataSource = new
NorthWndDataContext().Orders.Take(100).ToList();
GridExcelExport expo = new GridExcelExport();
expo.IncludeChildGrid = true;
exp.Export(obj, DataSource, expo);
}
public void ExportToWord(string GridModel)
{
WordExport exp = new WordExport();
var DataSource = new NorthWndDataContext().Employees.ToList();
GridProperties obj = ConvertGridObject(GridModel);
obj.ChildGrid.DataSource = new
NorthWndDataContext().Orders.Take(100).ToList();
GridWordExport expo = new GridWordExport();
expo.IncludeChildGrid = true;
exp.Export(obj, DataSource, expo);
}
public void ExportToPdf(string GridModel)
{
PdfExport exp = new PdfExport();
var DataSource = new NorthWndDataContext().Employees.ToList();
GridProperties obj = ConvertGridObject(GridModel);
obj.ChildGrid.DataSource = new
NorthWndDataContext().Orders.Take(100).ToList();
GridPdfExport expo = new GridPdfExport();
expo.IncludeChildGrid = true;
expo.Unicode = true;
exp.Export(obj, DataSource, expo);
}
private GridProperties ConvertGridObject(string gridProperty)
{
JavaScriptSerializer serializer = new JavaScriptSerializer();
IEnumerable div = (IEnumerable)serializer.Deserialize(gridProperty,
typeof(IEnumerable));
GridProperties gridProp = new GridProperties();
foreach (KeyValuePair<string, object> ds in div)
{
var property = gridProp.GetType().GetProperty(ds.Key, BindingFlags.Instance
| BindingFlags.Public | BindingFlags.IgnoreCase);
if (property != null)
{
Type type = property.PropertyType;
object value = null;
string serialize = serializer.Serialize(ds.Value);
if (ds.Key == "childGrid")
value = ConvertGridObject(serialize);
else
value = serializer.Deserialize(serialize, type);
property.SetValue(gridProp, value, null);
}
}
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
return gridProp;
}
}
```

Note: 1. The dataSource passed to the exporting method is compared with grid column while exporting, when a column is not defined in the grid dataSource, it is obtained as null value and hence throws a null exception. To avoid the above exception ensure that the columns bound to the grid are defined in the grid dataSource before exporting the grid.

Note: 2. To export the dynamic list of objects in the grid use the TypeBuilder concept refer to this link

Server dependencies

Export Helper functions are available in the assembly Syncfusion.EJ.Export, which is available in the Essential Studio builds. Full list of assemblies needed for the grid export is as follows.

1. Syncfusion.EJ
2. Syncfusion.EJ.Export
3. Syncfusion.Linq.Base
4. Syncfusion.Compression.Base
5. Syncfusion.DocIO.Base
6. Syncfusion.XlsIO.Base
7. Syncfusion.PDF.Base

Support export types

Currently server helper function allows following three types of exporting.

1. Word
2. Excel
3. PDF

Server side handlers

In MVC, exporting is achieved by using action controller method. In controller method, grid property is passed as string parameter and you need to deserialize it into the grid Property. By using the Export server method, you can export the grid into excel, PDF and word documents.

RAZOR

```
@(Html.EJ().Grid<OrdersView>("FlatGrid")
.DataSource((IEnumerable<object>)ViewBag.datasource)
.ToolbarSettings(toolBar => toolBar.ShowToolbar().ToolbarItems(items =>
{
items.AddTool(ToolBarItems.ExcelExport);
items.AddTool(ToolBarItems.WordExport);
items.AddTool(ToolBarItems.PdfExport);
}))
.AllowPaging()
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order
ID").TextAlign(TextAlign.Right).Add();
col.Field("CustomerID").HeaderText("Customer ID").Add();
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
col.Field("EmployeeID").HeaderText("Employee
ID").TextAlign(TextAlign.Right). Add();
col.Field("Freight").HeaderText("Freight").TextAlign(TextAlign.Right).Add();
col.Field("OrderDate").HeaderText("Order Date").TextAlign(TextAlign.Right).
Add();
col.Field("ShipCity").HeaderText("Ship City").Add();
}))
```

C#

```
public partial class GridController : Controller
{
public ActionResult ExportingGrid()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
public void ExportToExcel(string GridModel)
{
ExcelExport exp = new ExcelExport();
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
GridProperties obj
=(GridProperties)Syncfusion.JavaScript.Utils.DeserializeToModel(typeof(GridP
roperties), GridModel);
exp.Export(obj, DataSource, "Export.xlsx", ExcelVersion.Excel2010, false,
false, "flat-saffron");
}
public void ExportToWord(string GridModel)
{
WordExport exp = new WordExport();
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
GridProperties obj
=(GridProperties)Syncfusion.JavaScript.Utils.DeserializeToModel(typeof(GridP
roperties), GridModel);
exp.Export(obj, DataSource, "Export.docx", false, false, "flat-saffron");
}
public void ExportToPdf(string GridModel)
{
PdfExport exp = new PdfExport();
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
GridProperties obj
=(GridProperties)Syncfusion.JavaScript.Utils.DeserializeToModel(typeof(GridP
roperties), GridModel);
exp.Export(obj, DataSource, "Export.pdf", false, false, "flat-saffron");
}
}
```

On exporting, the default routing path to server-side that contains the action name as ExportToExcel for Excel exporting, ExportToWord for Word exporting and ExportToPdf for PDF exporting. The default controller name in routing path is the grid view page's controller name. For instance, when the grid is rendered in GridFeatures View Page of the Home Controller, then on Excel exporting grid Content the default routing path will be ~/Home/ExportToExcel.

Copyright © 2001 - 2020 Syncfusion Inc.

Export mapper in MVC

The Mappers grid property is used to modify the default routing path during exporting. By using Mappers, you can use any action name in controller for exporting and the action can be in any controller (Need not to be in grid view page controller).

RAZOR

```
@(Html.EJ().Grid<OrdersView>("FlatGrid")
.DataSource((IEnumerable<object>)ViewBag.datasource)
.ToolbarSettings(toolBar => toolBar.ShowToolbar().ToolbarItems(items =>
{
items.AddTool(ToolBarItems.ExcelExport);
items.AddTool(ToolBarItems.WordExport);
items.AddTool(ToolBarItems.PdfExport);
}))
.Mappers(map => map.ExportToExcelAction("ExcelAction")
.ExportToPdfAction("PdfAction").ExportToWordAction("WordAction")
)
.AllowPaging()
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order
ID").TextAlign(TextAlign.Right).Add();
col.Field("CustomerID").HeaderText("Customer ID").Add();
col.Field("EmployeeID").HeaderText("Employee
ID").TextAlign(TextAlign.Right). Add();
col.Field("Freight").HeaderText("Freight").TextAlign(TextAlign.Right).Add();
col.Field("OrderDate").HeaderText("Order Date").TextAlign(TextAlign.Right).
Add();
col.Field("ShipCity").HeaderText("Ship City").Add();
}))
```

C#

```
public partial class GridController : Controller
{
public ActionResult ExportingGrid()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
public void ExcelAction(string GridModel)
{
ExcelExport exp = new ExcelExport();
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
GridProperties obj
=(GridProperties)Syncfusion.JavaScript.Utils.DeserializeToModel(typeof(GridP
roperties), GridModel);
exp.Export(obj, DataSource, "Export.xlsx", ExcelVersion.Excel2010, false,
false, "flat-saffron");
}
public void WordAction(string GridModel)
{
WordExport exp = new WordExport();
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
GridProperties obj
=(GridProperties)Syncfusion.JavaScript.Utils.DeserializeToModel(typeof(GridP
roperties), GridModel);
exp.Export(obj, DataSource, "Export.docx", false, false, "flat-saffron");
}
public void PdfAction(string GridModel)
{
PdfExport exp = new PdfExport();
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
GridProperties obj
=(GridProperties)Syncfusion.JavaScript.Utils.DeserializeToModel(typeof(GridP
roperties), GridModel);
exp.Export(obj, DataSource, "Export.pdf", false, false, "flat-saffron");
}
}
```

ColumnTemplate exporting

To export the grid with columnTemplate we have to set the IsTemplateColumnIncluded as true in the parameter of the export method. You can handle the template elements in server-side event while exporting the grid to various files such as Excel, PDF and Word.

The server-side events available in template column exporting and its argument types are listed in the following table.

Event Name	Argument	Description
ExcelColumnTemplateInfo	currentCell, Row	It returns the current cell and row of excel sheet.
WordColumnTemplateInfo	currentCell, Row	It returns the current cell and row of word.
PdfColumnTemplateInfo	currentCell, Row	It returns the current cell and row of PDF.
ExcelChildGridInfo	current row, row data, GridProperties	Customize the cell and child grid
PdfChildGridInfo	current row, row data, GridProperties	Customize the cell and child grid
WordChildGridInfo	current row, row data, GridProperties	Customize the cell and child grid

You can modify the template column of exporting files using server events. The code sample for this is as follows.

RAZOR

```
<script type="text/x-jsrender" id="columnTemplate">
<a href="https://www.syncfusion.com">{{:FirstName}}</a>
</script>
@(Html.EJ().Grid<EmployeeView>("ColumnTemplate")
.Datasource((IEnumerable<object>)ViewBag.datasource)
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
.AllowPaging()
.ToolbarSettings(toolBar => toolBar.ShowToolbar().ToolbarItems(items =>
{
items.AddTool(ToolBarItems.ExcelExport);
items.AddTool(ToolBarItems.WordExport);
items.AddTool(ToolBarItems.PdfExport);
}))
.Mappers(map =>
map.ExportToExcelAction("ColumnTemplateExportToExcel").ExportToPdfAction("Co
lumnTemplateExportToPdf").ExportToWordAction("ColumnTemplateToWord"))
.Columns(col =>
{
col.HeaderText("First
Name").Template("#columnTemplate").TextAlign(TextAlign.Center).Width(80).Add
();
col.Field("EmployeeID").HeaderText("Employee
ID").TextAlign(TextAlign.Right).Width(100).Add();
col.Field("LastName").HeaderText("Last Name").Width(100).Add();
col.Field("BirthDate").HeaderText("Birth
Date").TextAlign(TextAlign.Right).Width(100).Format("{0:MM/dd/yyyy}").Add();
col.Field("Country").Width(100).HeaderText("Country").Add();
})
)
```

C#

```
public partial class GridController : Controller
{
public void ColumnTemplateExportToExcel(string GridModel)
{
ExcelExport exp = new ExcelExport();
var DataSource =  new NorthwindDataContext().EmployeeViews.ToList();

RegexOptions.IgnoreCase);
var urls = regex.Matches(range.Value.ToString()).OfType<Match>().Select(m =>
m.Groups["href"].Value).SingleOrDefault();
RectangleF rectangle = new RectangleF(10, 40, 30, 30);
```

```
PdfUriAnnotation uriAnnotation = new PdfUriAnnotation(rectangle, urls);
uriAnnotation.Text = templates.ToString();
range.Value = uriAnnotation;
}
}
}
}
```

DetailTemplate exporting

To export the grid with detail template we have to set the IncludeDetailRow as true in the parameter of the export method. You can handle template elements using server-side event while exporting grid to various files such as Excel, PDF and Word.

The server-side events available in detail template exporting and its argument types are listed in the following table.

Event Name	Argument	Description
ExcelDetailTemplateInfo	currentCell, Row	It returns the current cell and row of excel sheet.
WordDetailTemplateInfo	currentCell, Row	It returns the current cell and row of word.
PdfDetailTemplateInfo	currentCell, Row	It returns the current cell and row of PDF.

You can modify the detailTemplate of exporting files using server events. The code sample for this is as follows:

RAZOR

```
<script id="tabGridContents" type="text/x-jsrender">
<b> More Details: </b> <br /><br /> <b class='detail'>Last Name</b> -
{{:LastName}} <br /> <br /> <b class='detail'>Home Phone</b> -
{{:HomePhone}} <br /> <br /> <b class='detail'>Extension No.</b> -
{{:Extension}}
</script>
@(Html.EJ().Grid<EmployeeView>("DetailTemplate")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.ToolbarSettings(toolBar => toolBar.ShowToolbar().ToolbarItems(items =>
{
items.AddTool(ToolBarItems.ExcelExport);
items.AddTool(ToolBarItems.WordExport);
items.AddTool(ToolBarItems.PdfExport);
}))
.Columns(col =>
{
col.Field("EmployeeID").HeaderText("Employee
ID").IsPrimaryKey(true).TextAlign(TextAlign.Right).Width(75).Add();
col.Field("FirstName").HeaderText("First Name").Width(100).Add();
col.Field("Title").Width(120).Add();
col.Field("City").Width(100).Add();
col.Field("Country").Width(100).Add();
})
.DetailsTemplate("#tabGridContents")
)
```

Exporting with Custom Summary

In Exporting, custom summary needs to be handled using QueryCustomSummaryInfo server-side event.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Grid<object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.ToolbarSettings(toolBar => toolBar.ShowToolbar().ToolbarItems(items =>
{
items.AddTool(ToolBarItems.ExcelExport);
items.AddTool(ToolBarItems.WordExport);
items.AddTool(ToolBarItems.PdfExport);
}))
.AllowPaging()
.ShowSummary()
.SummaryRow(row =>
{
row.Title("Currency").SummaryColumns(col => {
col.SummaryType(SummaryType.Custom).CustomSummaryValue("currency").DisplayCo
lumn("Freight").Format("{0:C2}").Add();
}).Add();
})
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order
ID").TextAlign(TextAlign.Right).Width(75).Add();
col.Field("OrderDate").HeaderText("Order
Date").Width(80).TextAlign(TextAlign.Right).Format("{0:MM/dd/yyyy}").Add();
col.Field("Freight").HeaderText("Freight").TextAlign(TextAlign.Right).Width(
75).Format("{0:C}").Add();
col.Field("ShipName").HeaderText("Ship Name").Width(110).Add();
col.Field("ShipCity").HeaderText("Ship City").Width(90).Add();
col.Field("ShipCountry").HeaderText("Ship Country").Width(90).Add();
}))
```

}
</script>
```

Multiple exporting

The AllowMultipleExporting property allows you to export multiple grids into the same file. Once you enable the AllowMultipleExporting, grid properties of all the grid which are available in current page are passed as string array parameter to controller action method.

In controller action method you are able to export all the grids available in the current page. The code sample for this is as follows.

RAZOR

```
<div class="label1">
Employee Grid
</div>
@(Html.EJ().Grid<EmployeeView>("MasterGrid")
.Datasource((IEnumerable<object>)ViewBag.datasource1)
.SelectedRowIndex(0)
.AllowMultipleExporting()
.ToolbarSettings(toolBar => toolBar.ShowToolbar().ToolbarItems(items =>
{
items.AddTool(ToolBarItems.ExcelExport);
items.AddTool(ToolBarItems.WordExport);
items.AddTool(ToolBarItems.PdfExport);
}))
.Mappers(map =>
map.ExportToExcelAction("MultipleExportToExcel").ExportToPdfAction("Multiple
ExportToPdf").ExportToWordAction("MultipleExportToWord"))
.Columns(col =>
{
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
col.Field("EmployeeID").HeaderText("Employee
ID").IsPrimaryKey(true).TextAlign(TextAlign.Right).Width(100).Add();
col.Field("FirstName").HeaderText("First Name").Width(100).Add();
col.Field("LastName").HeaderText("Last Name").Width(100).Add();
col.Field("Title").HeaderText("Title").Width(90).Add();
col.Field("BirthDate").HeaderText("Birth
Date").TextAlign(TextAlign.Right).Width(100).Format("{0:MM/dd/yyyy}").Add();
col.Field("Country").Width(120).HeaderText("Country").Add();
})
)
<div class="label1">
Orders Grid
</div>
@(Html.EJ().Grid<OrdersView>("DetailGrid")
.Datasource((IEnumerable<object>)ViewBag.datasource2)
.AllowPaging(false)
.Columns(col =>
{
col.Field("EmployeeID").HeaderText("Employee
ID").TextAlign(TextAlign.Right).Width(125).Add();

DataTable exporting

The grid has support to export DataTable type datasource. This support helps when a grid has no view model, and a DataTable is bound to a grid.

RAZOR

```
@(Html.EJ().Grid<object>("DataTableGrid")
.Datasource((DataTable)ViewBag.dataTable)
.AllowPaging()
.ToolbarSettings(toolBar => toolBar.ShowToolbar().ToolbarItems(items =>
{
items.AddTool(ToolBarItems.ExcelExport);
items.AddTool(ToolBarItems.WordExport);
items.AddTool(ToolBarItems.PdfExport);
}))
.Columns(col =>
{
col.Field("ProductID").HeaderText("Product
ID").IsPrimaryKey(true).TextAlign(TextAlign.Right).Width(75).Add();
col.Field("ProductName").HeaderText("Product Name").Width(80).Add();
col.Field("SupplierID").HeaderText("Supplier
ID").TextAlign(TextAlign.Right).Width(75).Add();
col.Field("CategoryID").HeaderText("Category ID").Width(80).Add();
})
)
```

C#

```
public class GridController : Controller
{
DataTable _dTable = new DataTable();
List<Product> data = new List<Product>();
public void GetGridDT()
{
var connection =
ConfigurationManager.ConnectionStrings["NORTHWNDConnectionString"].Connectio
nString;
using (var dataAdapter = new SqlDataAdapter("SELECT * from Products",
connection))
{
dataAdapter.Fill(_dTable);
}
}
public ActionResult GridFeatures()
{
GetGridDT();
ViewBag.dataTable = _dTable;
return View();
}
public void ExportToExcel(string GridModel)
{
ExcelExport exp = new ExcelExport();
GetGridDT();
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
DataTable DataSource = _dTable;
GridProperties properties =
(GridProperties)Syncfusion.JavaScript.Utils.DeserializeToModel(typeof(GridPr
operties), GridModel);
exp.Export(properties, DataSource, "Export.xlsx", ExcelVersion.Excel2010,
false, false, "flat-saffron");
}
public void ExportToWord(string GridModel)
{
WordExport exp = new WordExport();
GetGridDT();
DataTable DataSource = _dTable;
GridProperties properties =
(GridProperties)Syncfusion.JavaScript.Utils.DeserializeToModel(typeof(GridPr
operties), GridModel);
exp.Export(properties, DataSource, "Export.docx", false, false, "flat-
saffron");
}
public void ExportToPdf(string GridModel)
{
PdfExport exp = new PdfExport();
GetGridDT();
DataTable DataSource = _dTable;
GridProperties properties =
(GridProperties)Syncfusion.JavaScript.Utils.DeserializeToModel(typeof(GridPr
operties), GridModel);
exp.Export(properties, DataSource, "Export.pdf", false, false, "flat-
saffron");
}
}
```

Export required grid in single file

You can export required grids in single file using the ej.Grid.exportAll method. This method can be used with export action and array of jQuery selector of grid which need to be export. The code sample for it is as follows:

JS

```
$('#exportAll').click(function(){
ej.Grid.exportAll('MultipleExportToExcel',['Grid1', 'Grid2']);
});
```

List of properties ignored on export

Following are the list of properties that are excluded during grid export, to reduce the unwanted data transfer to server.

- dataSource
- query
- rowTemplate
- detailsTemplate
- pageSettings
- enableRTL
- cssClass

Copyright © 2001 - 2020 Syncfusion Inc.

Export only visible records

By default the pageSettings is ignored in export to facilitate all pages export. To achieve current visible page record export, the pageSettings should be removed from ignore list using the following code.

The sample for this is as follows:

JS

```
var grid = $('#Grid').ejGrid('instance');
grid.ignoreOnExport.splice(grid.ignoreOnExport.indexOf('pageSettings'), 1);
```

On server before calling the Export function, the data source should be processed using the DataOperations's execute function.

C#

```
public void ExportToExcel(string GridModel)
{
ExcelExport exp = new ExcelExport();
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
GridProperties properties
=(GridProperties)Syncfusion.JavaScript.Utils.DeserializeToModel(typeof(GridP
roperties), GridModel);
var dataSource = new DataOperations().Execute(GridModel, DataSource);
exp.Export(properties, dataSource, "Export.xlsx", ExcelVersion.Excel2010,
false, false, "flat-saffron");
}
public void ExportToWord(string GridModel)
{
WordExport exp = new WordExport();
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
GridProperties properties
=(GridProperties)Syncfusion.JavaScript.Utils.DeserializeToModel(typeof(GridP
roperties), GridModel);
var dataSource = new DataOperations().Execute(GridModel, DataSource);
exp.Export(properties, dataSource, "Export.docx", false, false, "flat-
saffron");
}
public void ExportToPdf(string GridModel)
{
PdfExport exp = new PdfExport();
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
GridProperties properties =
(GridProperties)Syncfusion.JavaScript.Utils.DeserializeToModel(typeof(GridPr
operties), GridModel);
var dataSource = new DataOperations().Execute(GridModel, DataSource);
exp.Export(properties, dataSource, "Export.pdf", false, false, "flat-
saffron");
}
```

Local data

By default, client data source is not sent to server to prevent the unwanted data transfer since all data origin is in server. In case, if you don't want to query the data source again for exporting in server, the

Copyright © 2001 - 2020 Syncfusion Inc.

grid's client dataSource can be sent to server on export PostBack by removing the dataSource property in grid's ignore list. The code sample for this is as follows.

JS

```
var grid = $('#GridId').ejGrid('instance');
grid.ignoreOnExport.splice(grid.ignoreOnExport.indexOf('dataSource'), 1);
```

Themes

The grid export have 13 theme option to match with our built-in control themes. They are as follows.

Enum	Equivalent string input
ExportTheme.FlatAzure	default-theme
ExportTheme.FlatSaffron	flat-saffron
ExportTheme.FlatLime	flat-lime
ExportTheme.FlatDarkAzure	flat-azure-dark
ExportTheme.FlatDarkSaffron	flat-saffron-dark
ExportTheme.FlatDarkLime	flat-lime-dark
ExportTheme.GradientAzure	gradient-azure
ExportTheme.GradientSaffron	gradient-saffron
ExportTheme.GradientLime	gradient-lime
ExportTheme.GradientDarkAzure	gradient-azure-dark
ExportTheme.GradientDarkSaffron	gradient-saffron-dark
ExportTheme.GradientDarkLime	gradient-lime-dark
ExportTheme.BootstrapTheme	bootstrap-theme
ExportTheme.None	none

Also, it has `none` option which will export the grid without any theme. The desired theme name can be passed as a parameter to `Export` method and the code sample for this is as follows.

C#

```
public partial class GridController : Controller
{
public void ExportToExcel(string GridModel)
{
ExcelExport exp = new ExcelExport();
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
GridProperties obj
=(GridProperties)Syncfusion.JavaScript.Utils.DeserializeToModel(typeof(GridP
roperties),GridModel);
```

Copyright © 2001 - 2020 Syncfusion Inc.

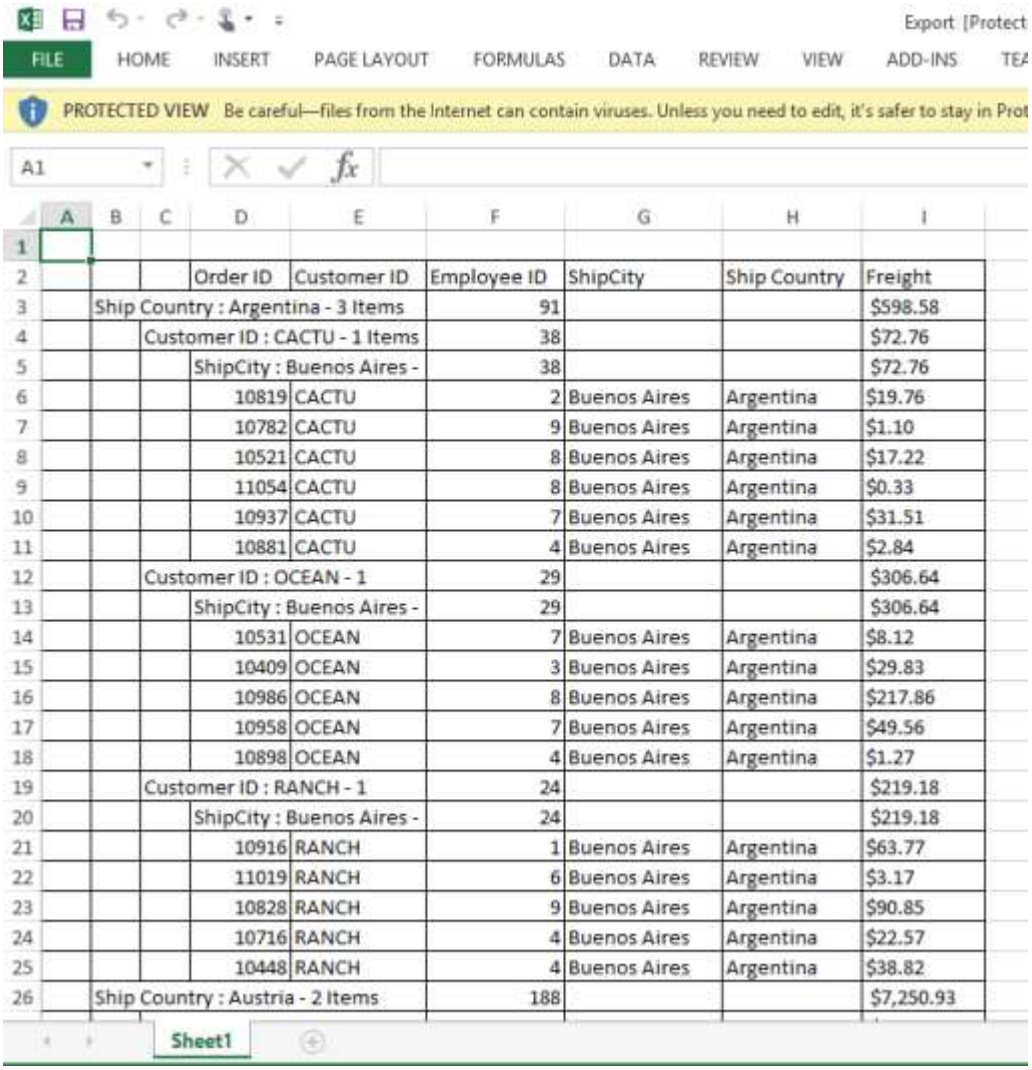
```
exp.Export(obj, DataSource, "Export.xlsx", ExcelVersion.Excel2010, false,
false, "none");
}
public void ExportToWord(string GridModel)
{
WordExport exp = new WordExport();
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
GridProperties obj
=(GridProperties)Syncfusion.JavaScript.Utils.DeserializeToModel(typeof(GridP
roperties),GridModel);
exp.Export(obj, DataSource, "Export.docx", false, false,
ExportTheme.FlatSaffron);
}
public void ExportToPdf(string GridModel)
{
PdfExport exp = new PdfExport();
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
GridProperties obj
=(GridProperties)Syncfusion.JavaScript.Utils.DeserializeToModel(typeof(GridP
roperties),GridModel);
exp.Export(obj, DataSource, "Export.pdf", false, false, "flat-saffron");
}
public ActionResult ExportingGrid()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
}
```

RAZOR

```
@(Html.EJ().Grid<OrdersView>("FlatGrid")
.DataSource((IEnumerable<object>)ViewBag.datasource)
.ToolbarSettings(toolBar => toolBar.ShowToolbar().ToolbarItems(items =>
{
items.AddTool(ToolBarItems.ExcelExport);
items.AddTool(ToolBarItems.WordExport);
items.AddTool(ToolBarItems.PdfExport);
}))
.AllowPaging()
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order
ID").TextAlign(TextAlign.Right).Add();
col.Field("CustomerID").HeaderText("Customer ID").Add();
col.Field("EmployeeID").HeaderText("Employee
ID").TextAlign(TextAlign.Right). Add();
col.Field("Freight").HeaderText("Freight").TextAlign(TextAlign.Right).Add();
col.Field("OrderDate").HeaderText("Order Date").TextAlign(TextAlign.Right).
Add();
col.Field("ShipCity").HeaderText("Ship City").Add();
}))
```

Copyright © 2001 - 2020 Syncfusion Inc.

When the theme is set as none and the autoFormat is not set to the grid, then no theme is applied to the exported grid. The grid is exported without any theme as in the following screenshots:



Order ID	Customer ID	Employee ID	ShipCity	Ship Country	Freight
Ship Country : Argentina - 3 Items		91			$598.58
Customer ID : CACTU - 1 Items		38			$72.76

Customer ID : RANCH - 1		24			$219.18
ShipCity : Buenos Aires -		24			$219.18
10916	RANCH	1	Buenos Aires	Argentina	$63.77
11019	RANCH	6	Buenos Aires	Argentina	$3.17
10828	RANCH	9	Buenos Aires	Argentina	$90.85
10716	RANCH	4	Buenos Aires	Argentina	$22.57
10448	RANCH	4	Buenos Aires	Argentina	$38.82
Ship Country : Austria - 2 Items		188			$7,250.93

AutoFormat class

The **AutoFormat** class can be used to customize the styles or themes applied to the exported grid. With the autoFormat class, you can provide required color to the grid content, alt row background or border color.

The various properties available under the autoFormat class are listed in the following table.

Properties	Type	Description
FontFamily	String	The font name
HeaderBorderColor	System.Drawing.Color	The border color of the grid header.
HeaderFontSize	int	The size of the grid header font.
GHeaderBgColor	System.Drawing.Color	The column header cell color and the group header indent cell color.

Copyright © 2001 - 2020 Syncfusion Inc.

ContentBgColor	System.Drawing.Color	The background color of the content.
ContentBorderColor	System.Drawing.Color	The border color of the grid content.
ContentFontSize	int	The font size of the grid content.
GContentFontColor	System.Drawing.Color	The font color of the record field cell.
GCaptionBorderColor	System.Drawing.Color	The border color of the group caption cell.
AltRowBgColor	System.Drawing.Color	The background color of the alternative row of the grid content.

RAZOR

```
@(Html.EJ().Grid<OrdersView>("FlatGrid")
.DataSource((IEnumerable<object>)ViewBag.datasource)
.ToolbarSettings(toolBar => toolBar.ShowToolbar().ToolbarItems(items =>
{
items.AddTool(ToolBarItems.ExcelExport);
items.AddTool(ToolBarItems.WordExport);
items.AddTool(ToolBarItems.PdfExport);
}))
.AllowPaging()
.Columns(col =>
{

Exporting server events

The Exporting feature supports server-side event handler. You can handle server-side event while exporting grid to various files such as Excel, PDF and Word. The various server-side events available in exporting and its argument types are listed in the following table.

Event Name	Argument	Description
ServerExcelQueryCellInfo	currentCell	It returns the current cell of excel sheet.
ServerExcelRowInfo	range	It returns the current row of excel sheet.
ServerWordQueryCellInfo	currentCell	It returns the current cell of word.
ServerWordRowInfo	range	It returns the current row of word.
ServerPdfQueryCellInfo	currentCell	It returns the current cell of PDF.
ServerPdfRowInfo	range	It returns the current row of PDF.

Copyright © 2001 - 2020 Syncfusion Inc.

You can customize the particular cell or particular row of exporting files using server events. The code sample for this is as follows.

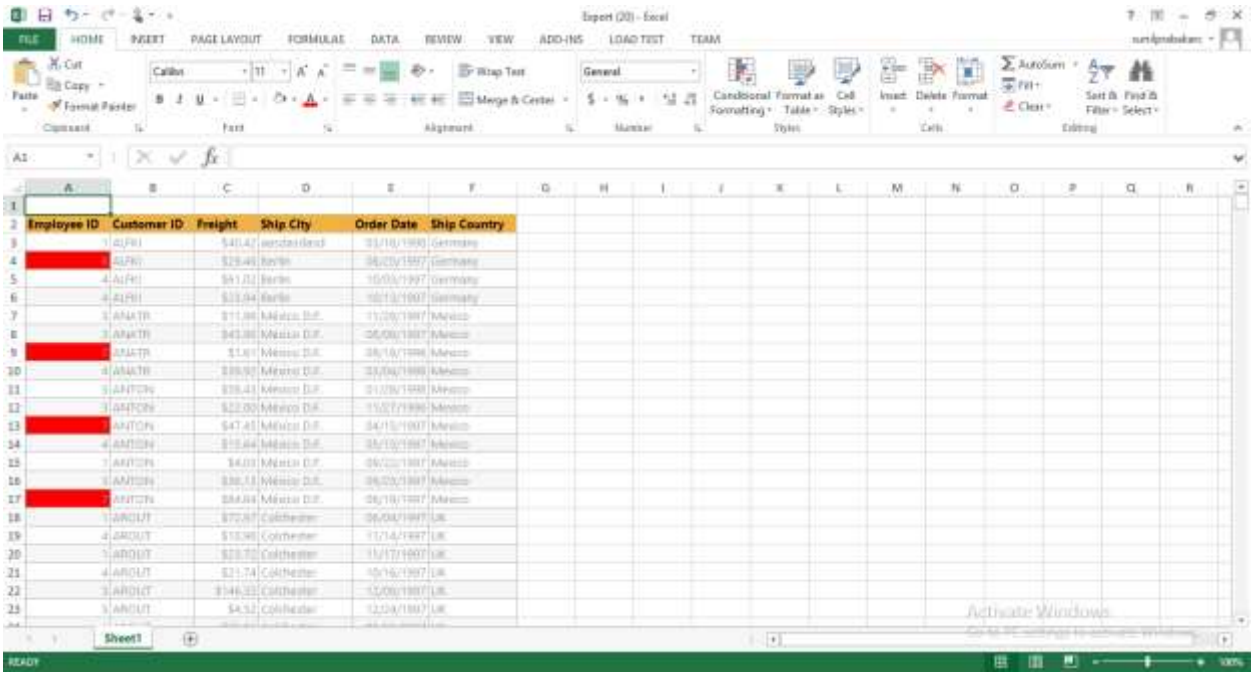
RAZOR

```
@(Html.EJ().Grid<OrdersView>("FlatGrid")
.DataSource((IEnumerable<object>)ViewBag.datasource)
.ToolbarSettings(toolBar => toolBar.ShowToolbar().ToolbarItems(items =>
{
items.AddTool(ToolBarItems.ExcelExport);
items.AddTool(ToolBarItems.WordExport);
items.AddTool(ToolBarItems.PdfExport);
}))
.AllowPaging()
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order
ID").TextAlign(TextAlign.Right).Add();
col.Field("CustomerID").HeaderText("Customer ID").Add();
col.Field("EmployeeID").HeaderText("Employee
ID").TextAlign(TextAlign.Right). Add();
col.Field("Freight").HeaderText("Freight").TextAlign(TextAlign.Right).Add();
col.Field("OrderDate").HeaderText("Order Date").TextAlign(TextAlign.Right).
Add();
col.Field("ShipCity").HeaderText("Ship City").Add();
}))
```

C#

```
public partial class GridController : Controller
{
public void ExportToExcel(string GridModel)
{
ExcelExport exp = new ExcelExport();
var DataSource = new
NorthwindDataContext().EmployeeViews.Take(100).ToList();
GridProperties obj
=(GridProperties)Syncfusion.JavaScript.Utils.DeserializeToModel(typeof(GridP
roperties), GridModel);
obj.ServerExcelQueryCellInfo = QueryCellInfo;
exp.Export(obj, DataSource, "Export.xlsx", ExcelVersion.Excel2010, false,
false, "flat-saffron");
}
public void QueryCellInfo(object currentCell)
{
IRange range = (IRange)currentCell;
if (range.Column==1 && int.Parse(range.Value) == 5)
range.CellStyle.Color = Color.Red;
}
public ActionResult ExportingGrid()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
}
```

Copyright © 2001 - 2020 Syncfusion Inc.



Print

Use the print() method from Grid instance to print the grid. You can add Print option in Toolbar item by adding the PrintGrid in ToolbarItems.

RAZOR

```
@(Html.EJ().Grid<OrdersView>("PrintGrid")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.ToolbarSettings(toolbar =>
{
toolbar.ShowToolbar().ToolbarItems(items =>
{
items.AddTool(ToolBarItems.PrintGrid);
});
})
.AllowPaging()
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order
ID").TextAlign(TextAlign.Right).Width(75).Add();
col.Field("CustomerID").HeaderText("Customer ID").Width(90).Add();
col.Field("EmployeeID").HeaderText("Employee
ID").TextAlign(TextAlign.Right).Width(80).Add();
col.Field("Freight").HeaderText("Freight").TextAlign(TextAlign.Right).Width(
80).Add();
col.Field("ShipCity").HeaderText("Ship City").Width(90).Add();
}))
```

C#

```
using System;
using System.Collections.Generic;
```

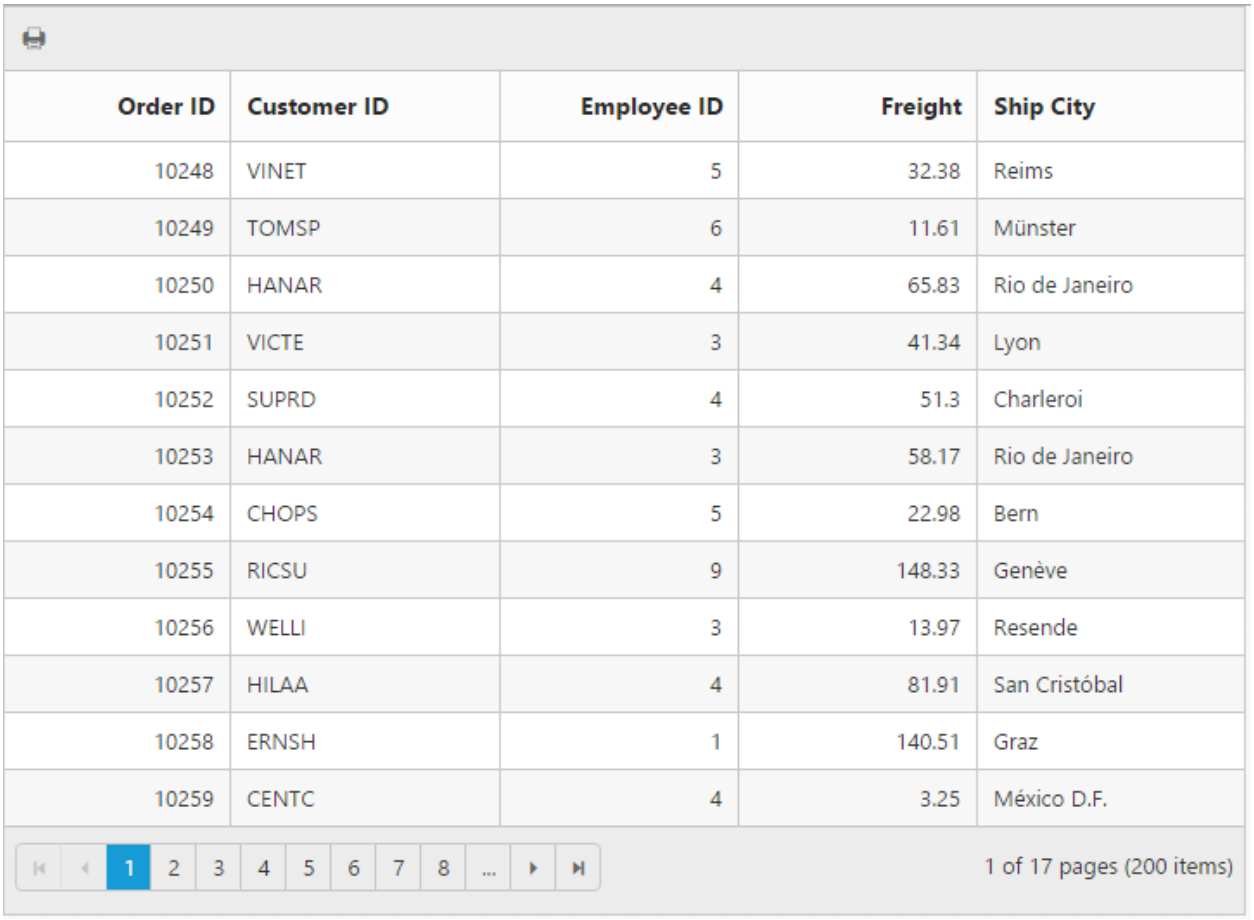
```
using System.Linq;
using System.Web;
using System.Web.Mvc;
using SyncfusionMvcApplication1;
using SyncfusionMvcApplication1.Models;
namespace SyncfusionMvcApplication1.Controllers
{
public class GridController : Controller
{
//
// GET: /Grid/
public ActionResult GridFeatures()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```



Order ID	Customer ID	Employee ID	Freight	Ship City
10248	VINET	5	32.38	Reims
10249	TOMSP	6	11.61	Münster
10250	HANAR	4	65.83	Rio de Janeiro
10251	VICTE	3	41.34	Lyon
10252	SUPRD	4	51.3	Charleroi

10259	CENTC	4	3.25	México D.F.

Page setup

Some of the print options are not configurable through JavaScript code. You need to customize layout, paper size and margins options through browser's page setup dialog. Please find the following guidelines link to browser page setup.

Copyright © 2001 - 2020 Syncfusion Inc.

- Chrome
- Firefox
- Safari
- IE

Print on external button click

By default, the grid can be print from toolbar. To print from external button action, you need to call the grid's print() method from the required button event.

RAZOR

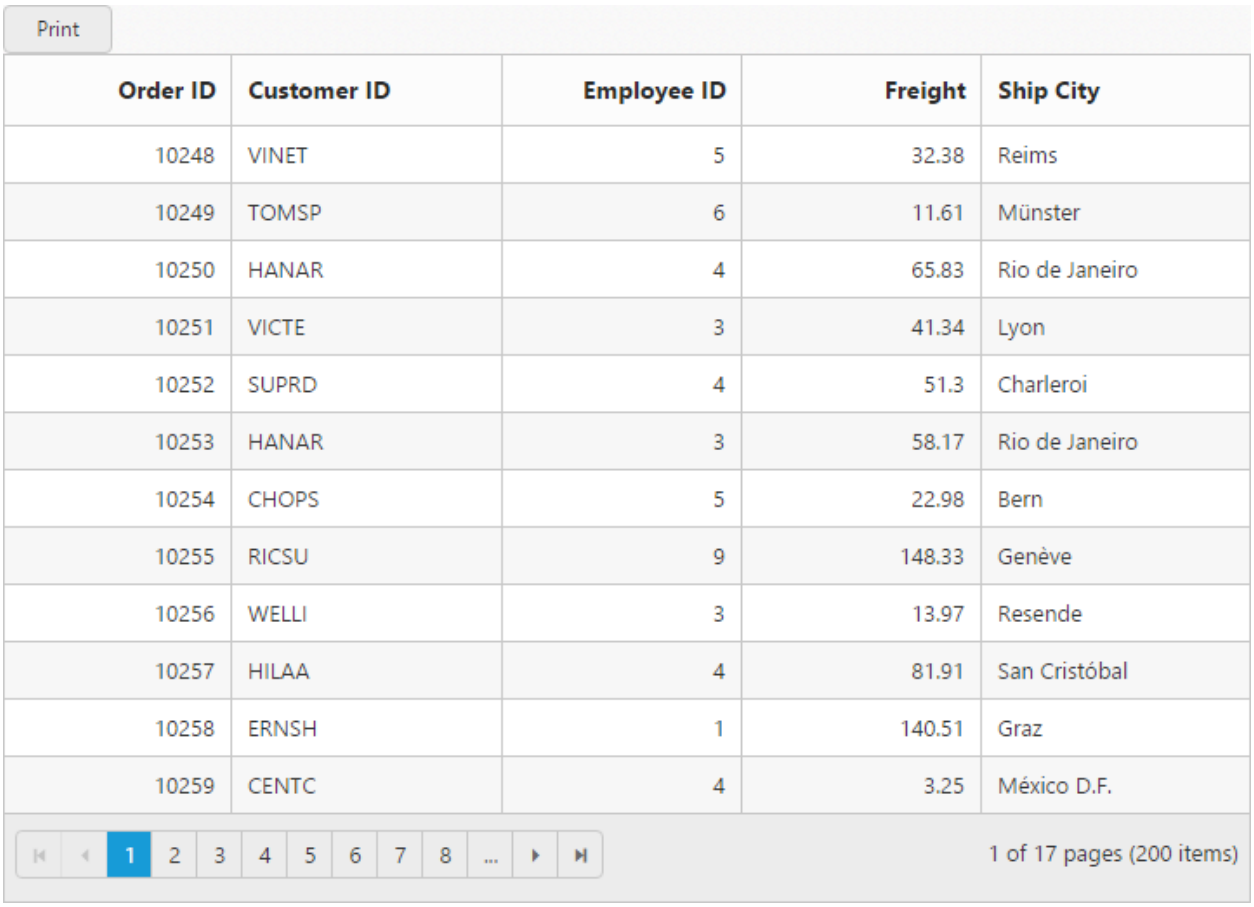
```
<button id="print">Print</button>
@(Html.EJ().Grid<OrdersView>("PrintGrid")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.AllowPaging()
.EnableHeaderHover()
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order
ID").TextAlign(TextAlign.Right).Width(75).Add();
col.Field("CustomerID").HeaderText("Customer ID").Width(90).Add();
col.Field("EmployeeID").HeaderText("Employee
ID").TextAlign(TextAlign.Right).Width(80).Add();
col.Field("Freight").HeaderText("Freight").TextAlign(TextAlign.Right).Width(
80).Add();
col.Field("ShipCity").HeaderText("Ship City").Width(90).Add();
}))
<script type="text/javascript">
$("#print").ejButton({
showRoundedCorner: true,
size: "mini",
click: function () {
$("#PrintGrid").ejGrid("print");
}
});
</script>
```

C#

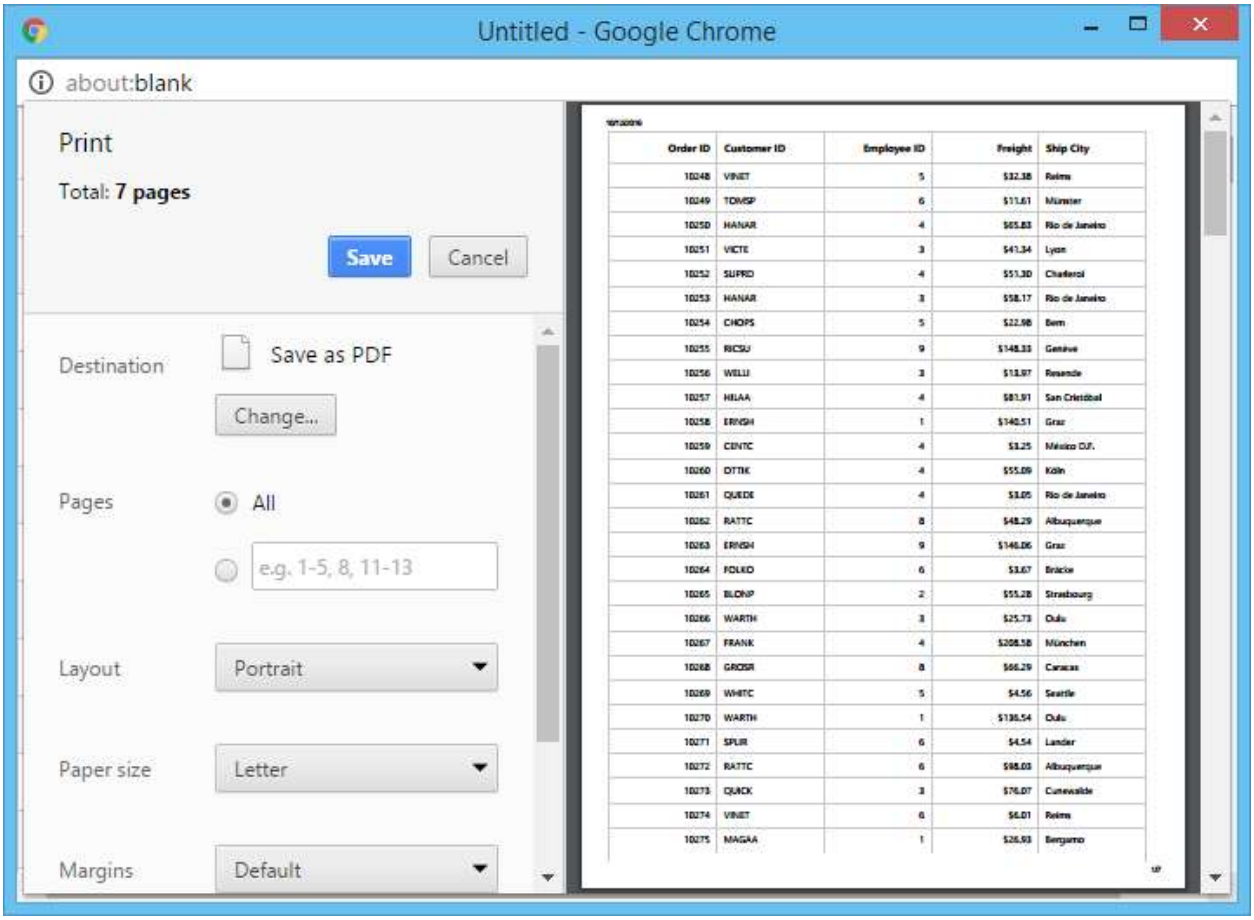
```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Web;
using System.Web.Mvc;
using SyncfusionMvcApplication1;
using SyncfusionMvcApplication1.Models;
namespace SyncfusionMvcApplication1.Controllers
{
public class GridController : Controller
{
//
// GET: /Grid/
public ActionResult GridFeatures()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
ViewBag.datasource = DataSource;
return View();
}
}
}
```



Grid with external button for Print



Print dialog in Chrome browser

Print visible page

By default, the grid will print all records. To print current page, you need to set the PrintMode as CurrentPage in the PageSettings property.

RAZOR

```
@(Html.EJ().Grid<OrdersView>("PrintGrid")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.AllowPaging()
.PageSettings(page=> page.PrintMode(PrintMode.CurrentPage))
.ToolbarSettings(toolbar =>
{
toolbar.ShowToolbar().ToolbarItems(items =>
{
items.AddTool(ToolBarItems.PrintGrid);
});
})
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order
ID").TextAlign(TextAlign.Right).Width(75).Add();
col.Field("CustomerID").HeaderText("Customer ID").Width(90).Add();
col.Field("EmployeeID").HeaderText("Employee
ID").TextAlign(TextAlign.Right).Width(80).Add();
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
col.Field("Freight").HeaderText("Freight").TextAlign(TextAlign.Right).Width(
80).Add();
col.Field("ShipCity").HeaderText("Ship City").Width(90).Add();
}))
```

C#

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Web;
using System.Web.Mvc;
using SyncfusionMvcApplication1;
using SyncfusionMvcApplication1.Models;
namespace SyncfusionMvcApplication1.Controllers
{
public class GridController : Controller
{
//
// GET: /Grid/
public ActionResult GridFeatures()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

State Persistence

State persistence is to maintain the grid state in browser's local storage even if browser refreshes or move to the next page. State persistence stores grid's model object in local storage while defining the enablePersistence as true.

Information: The localStorage is not supported below IE9 then grid state persistence technique is fallback to cookie.

List of properties are not persisted by default

The following properties are not included while maintaining the grid state in local storage to keep localStorage compact.

- Query
- isEdit
- toolbarClick
- queryCellInfo
- mergeCellInfo
- currentViewData
- enableAltRow
- enableRTL
- contextClick
- contextOpen
- rowDataBound

Copyright © 2001 - 2020 Syncfusion Inc.

- rowTemplate
- detailsDataBound
- detailsTemplate
- childGrid
- summaryRows
- toolbarSettings
- editSettings
- allowMultiSorting
- enableAutoSaveOnSelectionChange
- locale
- allowScrolling
- allowCellMerging
- allowTextWrap
- cssClass
- dataSource
- groupSettings.enableDropAreaAnimation
- enableRowHover
- showSummary
- allowGrouping
- enableHeaderHover
- allowKeyboardNavigation
- scrollSettings.frozenRows
- scrollSettings.frozenColumns
- enableTouch
- editSettings.rowPosition
- editSettings.showAddNewRow
- contextMenuSettings.enableContextMenu

Information: The given excluded properties can be included in persist state using the `_ignoreOnPersist` in grid prototype.

Accessing currently stored state

The persisted state can be accessed through local storage using the corresponding key name. Key name is the combination of plugin name and control id.

JS

```
var gridStateString = window.localStorage.ejGridGrid; // grid state as
string
var gridStateObject = JSON.parse(window.localStorage.ejGridGrid);//grid
state as object
```

Information: In the above example, the "ejGrid" is plugin name and "Grid" is control id.

Globalization and localization

Localization

All text in the grid can be localized using the `ej.Grid.Locale` object. Please find the table with list of properties and its value in locale object.

Copyright © 2001 - 2020 Syncfusion Inc.

Locale key words	Text
EmptyRecord	No records to display
PagerInfo	{0} of {1} pages ({2} items)
GroupDropArea	Drag a column header here to group its column
DeleteOperationAlert	No records selected for delete operation
EditOperationAlert	No records selected for edit operation
SaveButton	Save
OKButton	OK
CancelButton	Cancel
EditFormTitle	Details of
AddFormTitle	Add New Record
GroupCaptionFormat	{{"{{"}}:headerText{{}}}}: {{"{{"}}:key{{}}}} - {{"{{"}}:count{{}}}} {{"{{"}}if count == 1 {{}}}} item {{"{{"}}else{{}}}} items {{"{{"}}/if{{}}}}
BatchSaveConfirm	Are you sure you want to save changes?
BatchSaveLostChanges	Unsaved changes will be lost. Are you sure you want to continue?
ConfirmDelete	Are you sure you want to Delete Record?
FrozenColumnsViewAlert	Frozen columns should be in grid view area
FrozenColumnsScrollAlert	Enable allowScrolling while using frozen Columns
FrozenNotSupportedException	Frozen Columns and Rows are not supported for Grouping, Row Template, Detail Template, Hierarchy Grid and Batch Editing
Add	Add
Edit	Edit
Delete	Delete
Update	Update
Cancel	Cancel
Done	Done
Columns	Columns
PrintGrid	Print
ExcelExport	Excel Export
WordExport	Word Export

Copyright © 2001 - 2020 Syncfusion Inc.

PdfExport	PDF Export
StringMenuOptions	[{text: "StartsWith",value: "StartsWith"},{text: "EndsWith",value: "EndsWith"},{text: "Contains",value: "Contains"},{text: "Equal",value: "Equal"},{text: "NotEqual",value: "NotEqual"}]
NumberMenuOptions	[{text: "LessThan",value: "LessThan"},{text: "GreaterThan",value: "GreaterThan"},{text: "LessThanOrEqual",value: "LessThanOrEqual"},{text: "GreaterThanOrEqual",value: "GreaterThanOrEqual"},{text: "Equal",value: "Equal"},{text: "NotEqual",value: "NotEqual"}]
PredicateAnd	AND
PredicateOr	OR
Filter	Filter
FilterMenuCaption	Filter Value
FilterbarTitle	's filter bar cell
MatchCase	Match Case
Clear	Clear
ResponsiveFilter	Filter
ResponsiveSorting	Sort
Search	Search
DatePickerWaterMark	Select date
EmptyDataSource	DataSource must not be empty at initial load since columns are generated from the dataSource in AutoGenerate Column Grid
True	True
False	False
UnGroup	Click here to ungroup
AddRecord	Add Record
EditRecord	Edit Record
DeleteRecord	Delete Record
Save	Save
Grouping	Grouping
Ungrouping	Ungrouping
SortInAscendingOrder	Sort In Ascending Order

Copyright © 2001 - 2020 Syncfusion Inc.

SortInDescendingOrder	Sort In Descending Order

Pager Localization

Paging in Grid can also be localized using the ej.Pager.Locale object. Please find the table with list of properties and its value in locale object.

Locale key words	Text
PagerInfo	{0} of {1} pages ({2} items)
firstPageTooltip	Go to first page
lastPageTooltip	Go to last page
nextPageTooltip	Go to next page
previousPageTooltip	Go to previous page
nextPagerTooltip	Go to next Pager
previousPagerTooltip	Go to previous Pager

RAZOR

```
@(Html.EJ().Grid<OrdersView>("Localization")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.AllowGrouping()
.AllowPaging()
.Locale("de-DE")
.GroupSettings(group=>group.EnableDropAreaAnimation(false))
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order
ID").IsPrimaryKey(true).TextAlign(TextAlign.Right).Width(75).Add();
col.Field("CustomerID").HeaderText("Customer ID").Width(95).Add();
col.Field("EmployeeID").HeaderText("Employee
ID").TextAlign(TextAlign.Right).Width(95).Add();
col.Field("Freight").HeaderText("Freight").TextAlign(TextAlign.Right).Width(
75).Format("{0:C}").Add();
col.Field("ShipCity").HeaderText("Ship City").Width(80).Add();
})
)
```

C#

```
public partial class GridController : Controller
{
//
// GET: /Localization/
public ActionResult Localization()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.dataSource = DataSource;
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
return View();
}
}
```

JS

```
<script type="text/javascript">
ej.Grid.Locale["de-DE"] = {
EmptyRecord: "Keine Aufzeichnungen angezeigt",
GroupDropArea: "Ziehen Sie eine Spaltenüberschrift hier",
DeleteOperationAlert: "Keine Einträge für Löschvorgang ausgewählt",
EditOperationAlert: "Keine Einträge für Bearbeiten Betrieb ausgewählt",
SaveButton: "Speichern",
CancelButton: "stornieren",
EditFormTitle: "Korrektur von",
GroupCaptionFormat: "{{"{{"}}:field{{}}}}: {{"{{"}}:key{{}}}} -
{{"{{"}}:count{{}}}} {{"{{"}}if count ==
1{{}}}}Beiträge{{"{{"}}else{{}}}}Beiträges{{"{{"}}/if{{}}}}",
UnGroup: "Klicken Sie hier, um die Gruppierung aufheben"
};
ej.Pager.Locale["de-DE"] = {
pagerInfo: "{0} von {1} Seiten ({2} Beiträge)",
firstPageTooltip: "Zur ersten Seite",
lastPageTooltip: "Zur letzten Seite",
nextPageTooltip: "Zur nächsten Seite",
previousPageTooltip: "Zurück zur letzten Seite",
nextPagerTooltip: "Zum nächsten Pager",
previousPagerTooltip: "Zum vorherigen Pager"
};
</script>
```

Copyright © 2001 - 2020 Syncfusion Inc.

Information: You need to change pager locale in `ej.Pager.Locale` object.

Excel-filter Localization

All text in Excel-filter can be localized using the `ej.ExcelFilter.Locale` object. Please find the table with list of properties and its value in locale object.

Locale key words	Text
SortNoSmaller	Sort Smallest to Largest
SortNoLarger	Sort Largest to smallest
SortTextAscending	Sort A to Z
SortTextDescending	Sort Z to A
SortDateOldest	Sort By Oldest
SortDateNewest	Sort By Newest
SortByColor	Sort By Color
SortByCellColor	Sort By Cell Color
SortByFontColor:	Sort By Font Color:

Copyright © 2001 - 2020 Syncfusion Inc.

FilterByColor	Filter By Color
SortColorOptions:	[{ id: 1, background:"#FFFFFF"}, {id: 2, background:"#5EABDA"}],

Information: We have uploaded the pre-defined language packs for some commonly used cultures in this github location. Refer to the github location for getting the pre-defined language packs for the corresponding culture. The culture file has localized texts for all the Syncfusion controls.

Globalization

The ej.globalize library is used to globalize numeric values in the grid control using Format property in Columns. Globalize values will be automatically used when Locale property is set with locale string value for example en-US.

RAZOR

```
@(Html.EJ().Grid<OrdersView>("Localization")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.Locale("de-DE")
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order
ID").TextAlign(TextAlign.Right).Width(75).Add();
col.Field("CustomerID").HeaderText("Customer ID").Width(95).Add();
col.Field("EmployeeID").HeaderText("Employee
ID").TextAlign(TextAlign.Right).Width(95).Add();
col.Field("Freight").HeaderText("Freight").TextAlign(TextAlign.Right).Width(
75).Format("{0:C}").Add();
col.Field("ShipCity").HeaderText("Ship City").Width(80).Add();
})
)
```

Information: To translate our control content from default English to any of the culture, say For example - German language, then you need to refer the **ej.culture.de-DE.min.js** file in your application, after the reference of ej.web.all.min.js file. For all culture files, please download from the GitHub location.

localization

Right to left - RTL

By default, the grid render its text and layout from left to right. To customize grid's direction, you can change direction from LTR to RTL by using EnableRTL as true.

RAZOR

```
@(Html.EJ().Grid<OrdersView>("Localization")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.AllowPaging()
.EnableRTL()
.Columns(col =>
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
{
col.Field("OrderID").HeaderText("Order
ID").TextAlign(TextAlign.Right).Width(120).Add();
col.Field("CustomerID").HeaderText("Customer ID").Width(120).Add();
col.Field("EmployeeID").HeaderText("Employee
ID").TextAlign(TextAlign.Right).Width(120).Add();
col.Field("Freight").HeaderText("Freight").TextAlign(TextAlign.Right).Width(
120).Format("{0:C}").Add();
col.Field("ShipCity").HeaderText("Ship City").Width(120).Add();
})
)
```

C#

```
public partial class GridController : Controller
{
//
// GET: /Localization/
public ActionResult Localization()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.dataSource = DataSource;
return View();
}
}
```

How to

Apply formatting for columns dynamically

Column format can be used dynamically to change data values format with the help of the public method. The following code sample illustrates the Essential JavaScript with column formatting in public method.

JS

```
var grid = $("#Grid").data("ejGrid");
var column = grid.getColumnByField("fieldName");
column.format = "{0:n2}";
grid.refreshContent(true);
```

Disable double-click edit

The AllowEditOnDblClick property can be set as true to enable editing the record by double-clicking it. When it is set as false, it cannot be edited by double-clicking it. In that case, you can edit the record by using the Toolbar option only.

RAZOR

```
@(Html.EJ().Grid<object>("Editing")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.EditSettings(edit => { edit.AllowAdding().AllowDeleting().AllowEditing()
.AllowEditOnDblClick(false);})
.ToolbarSettings(toolbar =>
{
toolbar.ShowToolbar().ToolbarItems(items =>
{
items.AddTool(ToolBarItems.Add);
items.AddTool(ToolBarItems.Edit);
items.AddTool(ToolBarItems.Delete);
items.AddTool(ToolBarItems.Update);
items.AddTool(ToolBarItems.Cancel);
});
})
.AllowPaging(true)
.PageSettings(page => { page.PageSize(8); })
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order
ID").IsPrimaryKey(true).TextAlign(TextAlign.Right).Add();
col.Field("CustomerID").HeaderText("Customer
ID").EditType(EditingType.StringEdit).Add();
col.Field("EmployeeID").HeaderText("Employee
ID").TextAlign(TextAlign.Right).EditType(EditingType.NumericEdit).Add();
col.Field("ShipCity").HeaderText("Ship
City").EditType(EditingType.DropdownEdit).Add();
})
)
```

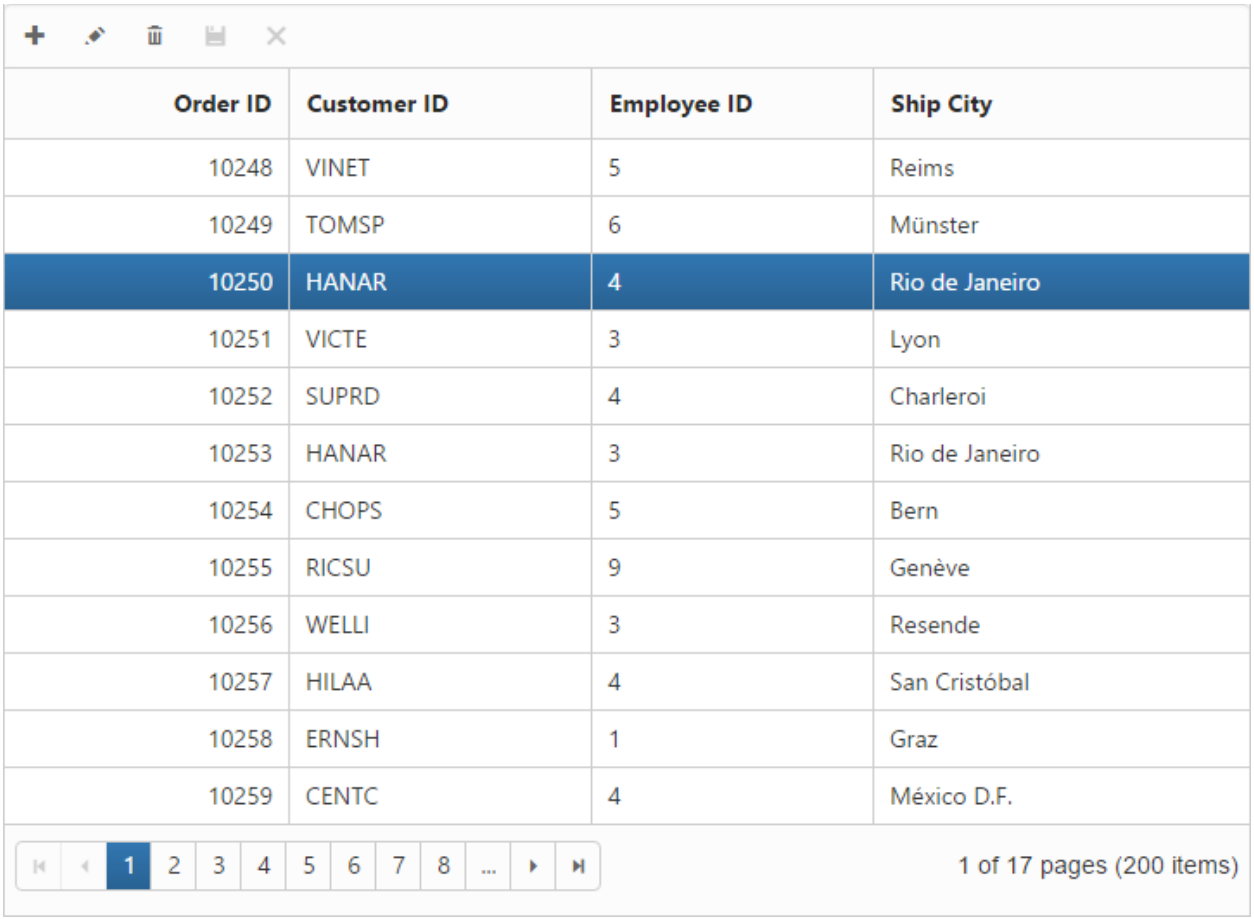
C#

```
namespace SyncfusionMvcApplication3.Controllers
{
public class HomeController : Controller
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
{
public ActionResult Index()
{
ViewBag.datasource = OrderRepository.GetAllRecords();
return View();
}
}
}
```

The following output is displayed as a result of the previous code example.



Order ID	Customer ID	Employee ID	Ship City
10248	VINET	5	Reims
10249	TOMSP	6	Münster
10250	HANAR	4	Rio de Janeiro
10251	VICTE	3	Lyon
10252	SUPRD	4	Charleroi
10253	HANAR	3	Rio de Janeiro
10254	CHOPS	5	Bern
10255	RICSU	9	Genève
10256	WELLI	3	Resende
10257	HILAA	4	San Cristóbal
10258	ERNSH	1	Graz
10259	CENTC	4	México D.F.

Customize drag and drop element while grouping

In this section, you can learn how to customize drag and drop element. This drag and drop element is framed by using CSS classes with default values. When you want to change or customize drag and drop element, then just override default values of CSS class values. The e-cloneproperties is the name of drag and drop element in CSS class.

RAZOR

```
<style type="text/css">
.e-grid .e-cloneproperties
{
background-color: black;
}
</style>
```

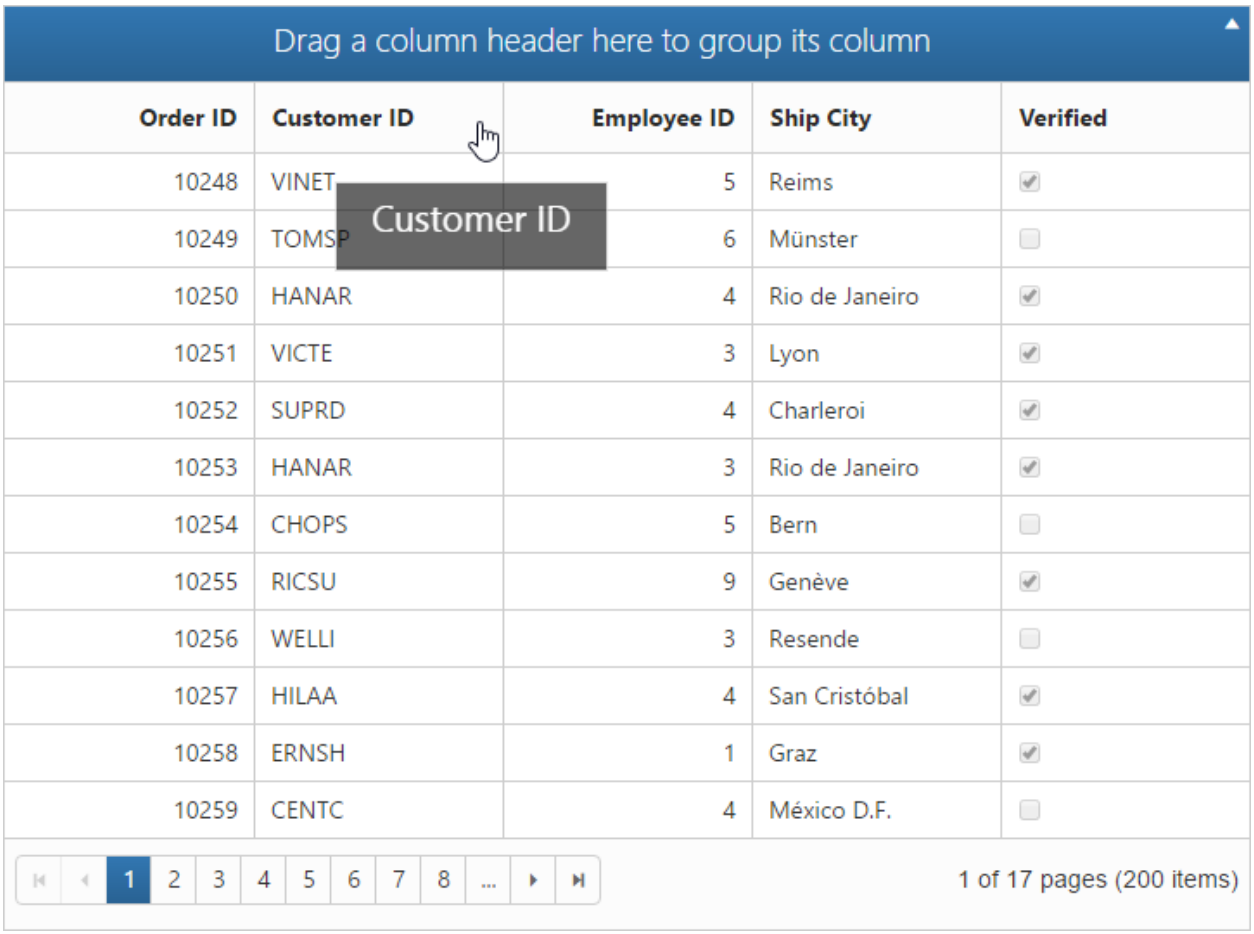
Copyright © 2001 - 2020 Syncfusion Inc.

```
@(Html.EJ().Grid<EditableOrder>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.AllowGrouping(true)
.AllowPaging()
)
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public partial class GridController : Controller
{
public ActionResult Default()
{
ViewBag.datasource = OrderRepository.GetAllRecords();
return View();
}
}
}
```

The following output is displayed as a result of the previous code example.



Copyright © 2001 - 2020 Syncfusion Inc.

Display tooltip

To apply tooltip for cells, You need to use the CustomAttributes in columns. For more reference, about the CustomAttributes.

RAZOR

```
@(Html.EJ().Grid<OrdersView>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.AllowPaging()
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order
ID").TextAlign(TextAlign.Right).Width(75).Add();
col.Field("CustomerID").HeaderText("Customer
ID").Width(80).CustomAttributes(customAttributes =>
customAttributes.AddAttribute("title","")).Add();
col.Field("EmployeeID").HeaderText("Employee
ID").Width(75).TextAlign(TextAlign.Right).Add();
col.Field("Freight").HeaderText("Freight").TextAlign(TextAlign.Right).Width(
75).Format("{0:C}").Add();
})
)
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public partial class GridController : Controller
{
// GET: /Custom Attributes/
public ActionResult Default()
{
// Data gets from DataContext
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

Set dynamic dataSource to grid

Grid control is capable of updating its dataSource as and when required. The grid method “DataSource” helps in achieving this and in this method parameter, you have to pass the new dataSource as list collection.

For instance, consider a textbox above the grid and depending on its value, you can update a new datasource to the grid dynamically.

RAZOR

```
Enter EmployeeID Field Value:
<input type="text" id="colValue" />
<input type="button" id="customButton" value="Change DataSource">
@(Html.EJ().Grid<EJGrid.Models.Order>("Grid")
.Datasource((IEnumerable<object>)ViewBag.datasource)
```

Copyright © 2001 - 2020 Syncfusion Inc.

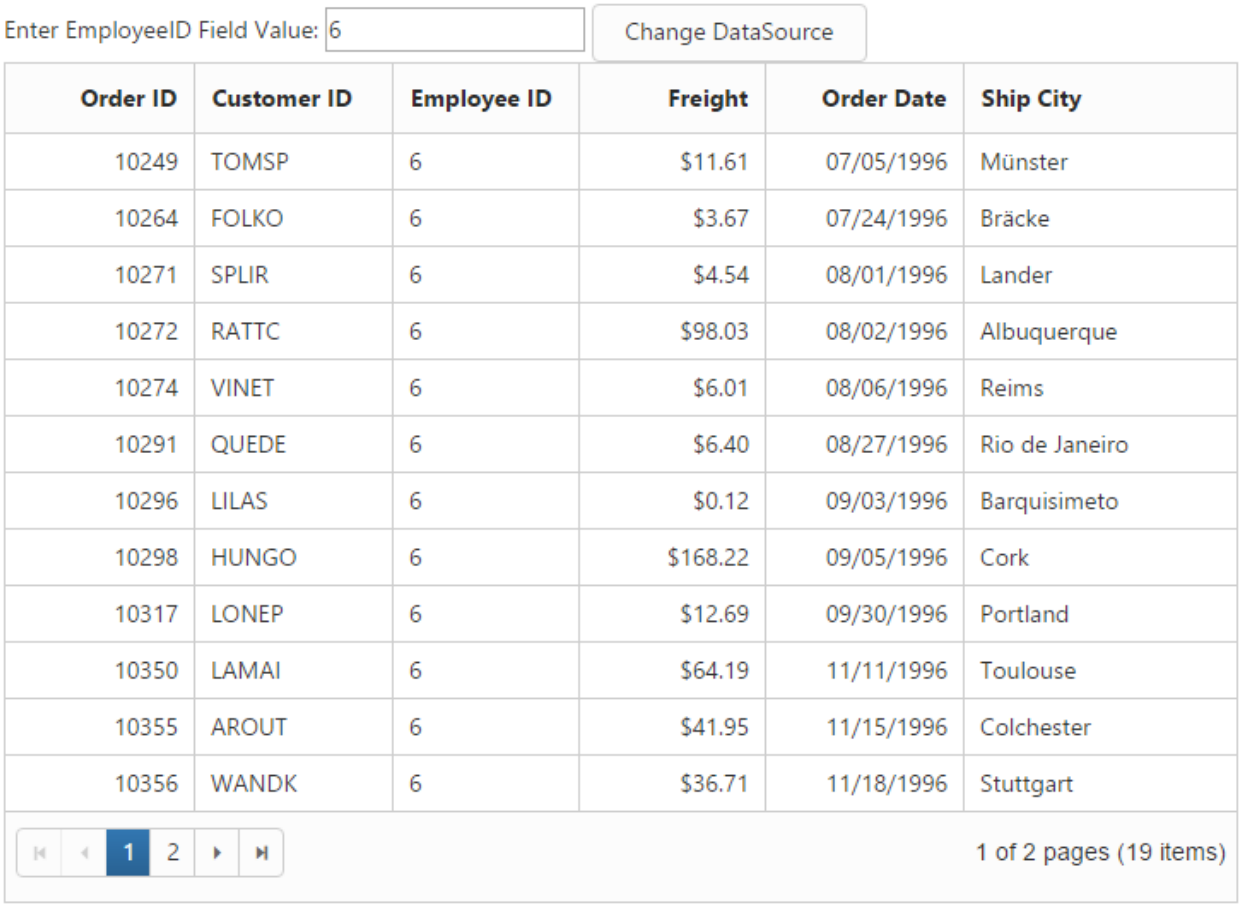
```
.AllowPaging()
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order
ID").TextAlign(TextAlign.Right).Width(75).Add();
col.Field("EmployeeID").HeaderText("Employee
ID").TextAlign(TextAlign.Right).Width(90).Add();
col.Field("Freight").HeaderText("Freight").Format("{0:c}").TextAlign(TextAli
gn.Right).Width(90).Add();
col.Field("ShipCity").HeaderText("Ship City").Width(90).Add();
col.Field("Child.Test").HeaderText("TEst").Format("{0:c}").Width(90).Add();
col.Field("ShipCountry").HeaderText("Ship Country").Width(90).Add();
})
)
<script>
$("#customButton").ejButton({
size: "Normal", click: function (args) {
var obj = $("#Grid").ejGrid("instance");
var value = $("#colValue").val();
//Add custom parameter to the server
var query = new ej.Query().addParams("EmployeeID", value);
//Creating ejDataManager with UrlAdaptor
var dataManager = ej.DataManager({ url: "/Home/GetData", adaptor: new
ej.UrlAdaptor() });
var promise = dataManager.executeQuery(query);
promise.done(function (e) {
//Assign the result to the grid dataSource using "dataSource" method.
obj.dataSource(e.result);
});
}})
</script>
```

C#

```
namespace EJGrid.Controllers
{
public class HomeController : Controller
{
public ActionResult Index()
{
ViewBag.datasource = null;
return View();
}
public JsonResult GetData(int EmployeeID)
{
var data = new DataClasses1DataContext().Orders.Where(datasource =>
datasource.EmployeeID ==        EmployeeID).ToList();
return Json(data, JsonRequestBehavior.AllowGet);
}
}
}
```

The following screenshot illustrates the output.

Copyright © 2001 - 2020 Syncfusion Inc.



Custom binding for grid CRUD operation

In the grid control DataManager is used for data processing. The adaptors of dataManager are customizable that can be extended for custom binding with server-side for grid CRUD operation.

For instance bind the data to grid by using the “remoteSaveAdaptor” and extend it to modify its update method to bind edited record values of grid as “FormCollection” in the server-side.

RAZOR

```
@(Html.EJ().Grid<EJGrid.Models.Order>("Grid")
.Datasource(datasource =>
datasource.Json((IEnumerable<object>)ViewBag.datasource).UpdateURL("Home/Upd
ate")
.InsertURL("Home/Insert").RemoveURL("Home/Remove").Adaptor("remoteSaveAdapto
r"))
.AllowSorting()
.AllowPaging()
.EditSettings(edit => { edit.AllowAdding().AllowDeleting().AllowEditing();
})
.ToolbarSettings(toolbar =>
{
toolbar.ShowToolbar().ToolbarItems(items =>
{
items.AddTool(ToolBarItems.Add);
items.AddTool(ToolBarItems.Edit);
items.AddTool(ToolBarItems.Delete);
```

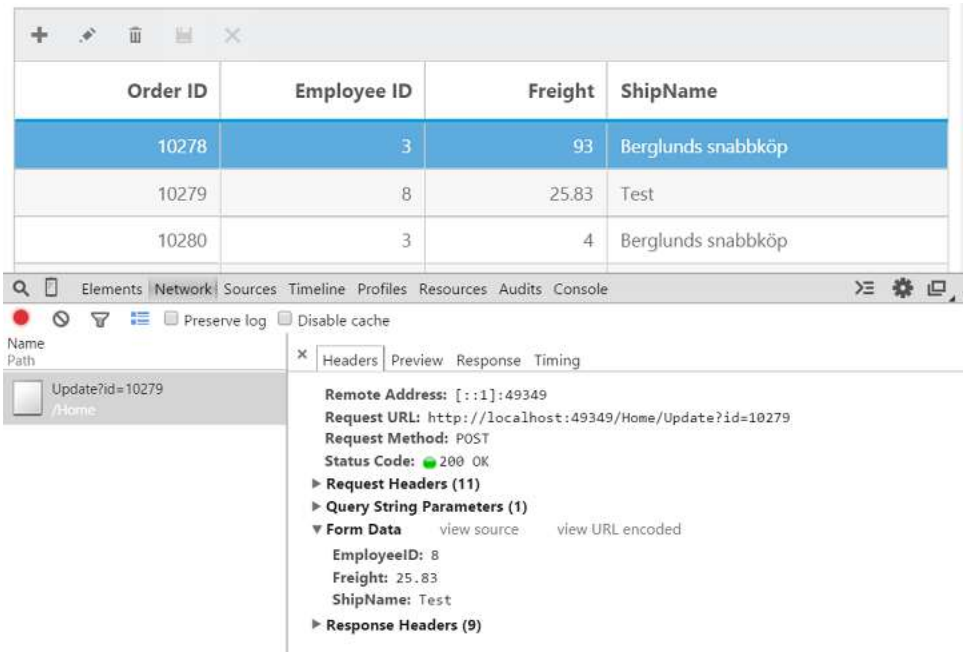
Copyright © 2001 - 2020 Syncfusion Inc.

```
items.AddTool(ToolBarItems.Update);
items.AddTool(ToolBarItems.Cancel);
});
})
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order
ID").IsPrimaryKey(true).TextAlign(TextAlign.Right).Width(90).ValidationRules
(v => v.AddRule("required", true).AddRule("number", true)).Add();
col.Field("EmployeeID").HeaderText("Employee
ID").TextAlign(TextAlign.Right).Width(90).ValidationRules(v =>
v.AddRule("required", true)).Add();
col.Field("Freight").HeaderText("Freight").TextAlign(TextAlign.Right).Width(
80).Add();
col.Field("ShipName").HeaderText("ShipName").Width(150).Add();
})
.ClientSideEvents(eve => eve.Load("load"))
)
var adaptor = new ej.remoteSaveAdaptor().extend({
insert: function (dataManager, data, tableName) {
return {
url: dataManager.dataSource.insertUrl,
dataType: 'json',
contentType: "application/x-www-form-urlencoded; charset=utf-8",
data: $("#GridEditForm").serialize()
};
},
update: function (dataManager, keyField, value, tableName) {
return {
type: "POST",
url: dataManager.dataSource.updateUrl+"?id="+value.OrderID,
dataType: 'json',
contentType: "application/x-www-form-urlencoded; charset=utf-8",
data: $("#GridEditForm").serialize()
};
},
})
function load(args) {
this.model.dataSource.adaptor = new adaptor();
}
```

C#

```
namespace EJGrid.Controllers
{
public class HomeController : Controller
{
public ActionResult Index()
{
ViewBag.datasource = OrderRepository.GetAllRecords();
return View();
}
public ActionResult Update(int id, FormCollection value)
{
var order = new EditableOrder();
order.OrderID = id;
```

```
if (value["EmployeeID"] != "")
order.EmployeeID = Convert.ToInt32(value["EmployeeID"]);
if (value["Freight"] != "")
order.Freight = Convert.ToDecimal(value["Freight"]);
if (value["ShipCity"] != null)
order.ShipCity = value["ShipCity"];
OrderRepository.Update(order);
var data = OrderRepository.GetAllRecords();
return Json(data, JsonRequestBehavior.AllowGet);
}
public ActionResult Insert(FormCollection value)
{
var order = new EditableOrder();
order.OrderID = Convert.ToInt32(value["OrderID"]);
if (value["EmployeeID"] != "")
order.EmployeeID = Convert.ToInt32(value["EmployeeID"]);
if (value["Freight"] != "")
order.Freight = Convert.ToDecimal(value["Freight"]);
if (value["ShipCity"] != null)
order.ShipCity = value["ShipCity"];
OrderRepository.Add(order);
var data = OrderRepository.GetAllRecords();
return Json(data, JsonRequestBehavior.AllowGet);
}
}
}
```



Binding SignalR endpoint

Grid supports the SignalR features for live updates in record. Please find the below option to configure signalR with Grid.

1) Before configure SignalR with the ejGrid. You need to setup the SignalR configuration in Visual Studio project. For reference, please find the link given below.

Copyright © 2001 - 2020 Syncfusion Inc.

Note: signalR

2) After configuration of SignalR, you have to create Hub for communication between different actions of grid.

C#

```
public class SignalHub: Hub
{
public void modify(string action, string details)
{
Clients.All.modify(action, details);
}
}
```

3) Implementation of SignalR communication with Grid through Hub.

RAZOR

```
@(Html.EJ().Grid<OrdersView>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.AllowPaging()
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order
ID").IsPrimaryKey(true).TextAlign(TextAlign.Right).Width(75).Add();
col.Field("CustomerID").HeaderText("Customer ID").Width(80).Add();
col.Field("EmployeeID").HeaderText("Employee
ID").TextAlign(TextAlign.Right).Width(75).Add();
col.Field("Freight").HeaderText("Freight").TextAlign(TextAlign.Right).Width(
75).Format("{0:C}").Add();
col.Field("ShipCity").HeaderText("Ship City").Width(80).Add();
})
)
<!--Reference the SignalR library. -->
<script src="~/Scripts/jquery.signalR-1.1.4.min.js"></script>
<!--Reference the autogenerated SignalR hub script. -->
<script src="@Url.Content("~/signalr/hubs")"
type="text/javascript"></script>
<script>
$(function () {
window.signal = $.connection.signalHub;
window.signal.client.modify = function (action, details) {
details = JSON.parse(details);
if (action == "add") $("#FlatGrid").ejGrid("addRecord", details);
else if (action == "beginedit") $("#Editing").ejGrid("updateRecord",
"OrderID", details);
else $("#Editing").ejGrid("deleteRecord", "OrderID", details);
};
$.connection.hub.start().done(function () {
window.actionComplete = function (args) {
if (args.requestType == "save" || args.requestType == "delete")
window.signal.server.modify(args.requestType == "delete" ? args.requestType
: window.previousAction, JSON.stringify(args.rowData));
if (args.requestType != "delete") window.previousAction = args.requestType;
}
});
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
})
</script>
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public partial class GridController : Controller
{
// GET: /Custom Attributes/
public ActionResult Default()
{
// Data gets from DataContext
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

Copy data from Excel to grid

This blog is about conversion of Excel to JSON data. After got JSON data you can bind it to the grid.

Use NHibernate with grid

NHibernate

NHibernate is an object-relational mapping (ORM) solution for the Microsoft .NET platform. It provides a Framework for mapping an object-oriented domain model to a traditional relational database.

Populate Grid with data by using NHibernate

You can populate the grid with data obtained by using the NHibernate. The UrlAdaptor can be used for data binding and to handle the request and response from the server. You can use the CRUD URL mappers (InsertUrl/UpdateUrl/RemoveUrl/CrudUrl) to provide the action/method to be called while editing.

The grid initialization is as follows.

RAZOR

```
@(Html.EJ().Grid<EmployeeMap>("Grid")
.Datasource(datasource =>
datasource.URL("Home/GetData") //Action which returns data
.InsertURL("Home/PerformInsert")
.UpdateURL("Home/PerformUpdate")
.RemoveURL("Home/PerformDelete")
.Adaptor(AdaptorType.UrlAdaptor)
)
.AllowPaging()
.EditSettings(edit =>
edit.AllowEditing().AllowAdding().AllowDeleting().EditMode(EditMode.Normal))
.ToolbarSettings(tools => tools.ShowToolbar().ToolbarItems(items =>
{
items.AddTool(ToolBarItems.Add);
items.AddTool(ToolBarItems.Edit);
items.AddTool(ToolBarItems.Delete);
items.AddTool(ToolBarItems.Update);
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
items.AddTool(ToolBarItems.Cancel);
}))
.Columns(col =>
{
col.Field("EmployeeID").HeaderText("Employee
ID").IsPrimaryKey(true).TextAlign(TextAlign.Right).Width(75).Add();
col.Field("FirstName").HeaderText("First Name").Width(80).Add();
col.Field("LastName").HeaderText("Last Name").Add();
col.Field("Designation").HeaderText("Designation"). Width(75).Add();
})
)
```

C#

```
namespace UsingNHibernate.Controllers
{
public class HomeController : Controller
{
public IEnumerable<EmployeeMap> list { get; set; }
public ActionResult Index()
{
return View();
}
//PROVIDE GRID DATASOURCE
public ActionResult GetData()
{
using (ISession session = AppSession.OpenSession())
{
list = session.Query<EmployeeMap>().ToList();
}
return Json(new { result = list, count = list.Count() },
JsonRequestBehavior.AllowGet);
}
//PERFORM INSERT
public ActionResult PerformInsert(string action, EmployeeMap value)
{
using (ISession session = AppSession.OpenSession())
{
using (ITransaction transaction = session.BeginTransaction())
{
session.Save(value);
transaction.Commit();
}
list = session.Query<EmployeeMap>().ToList();
}
return Json(new { result = value, count = list.Count() },
JsonRequestBehavior.AllowGet);
}
//PERFORM UPDATE
public ActionResult PerformUpdate(int key, EmployeeMap value)
{
using (ISession session = AppSession.OpenSession())
{
var employeeUpdate = session.Get<EmployeeMap>(key);
employeeUpdate.Designation = value.Designation;
employeeUpdate.FirstName = value.FirstName;
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
employeeUpdate.LastName = value.LastName;
using (ITransaction transaction = session.BeginTransaction())
{
session.Save(employeeUpdate);
transaction.Commit();
}
list = session.Query<EmployeeMap>().ToList();
}
return Json(new { result = value, count = list.Count() },
JsonRequestBehavior.AllowGet);
}
//PERFORM DELETE
public ActionResult PerformDelete(int key)
{
using (ISession session = AppSession.OpenSession())
{
using (ITransaction transaction = session.BeginTransaction())
{
session.Delete(session.Get<EmployeeMap>(key));
transaction.Commit();
}
list = session.Query<EmployeeMap>().ToList();
}
return Content("Success"); // Json(new { result = list, count = list.Count()
}, JsonRequestBehavior.AllowGet);
}
}
}
```

The SessionFactory used by the application is as follows.

C#

```
public static class AppSession
{
public static ISession OpenSession()
{
var configuration = new Configuration();
var configurationPath =
HttpContext.Current.Server.MapPath(@"~\Models\nHibernateConfig\Employee.cfg.
xml");
configuration.Configure(configurationPath);
var employeeConfigurationFile =
HttpContext.Current.Server.MapPath(@"~\Models\nHibernateConfig\EmployeeMap.h
bm.xml");
configuration.AddFile(employeeConfigurationFile);
ISessionFactory sessionFactory = configuration.BuildSessionFactory();
return sessionFactory.OpenSession();
}
}
```

Note: In the previous code example, the ORM mapping is performed by using the XML-documents and the mapping files are Employee.cfg.xml and EmployeeMap.hbm.xml

Adding comments in the exported file (Excel, Word or PDF)

We can add comments in the exported file while exporting the grid control.

Adding comments in Excel sheet

Using the Range property and AddComment method of the XlsIO IRange Class, we will add comments to any cell of particular range in Excel sheet.

RAZOR

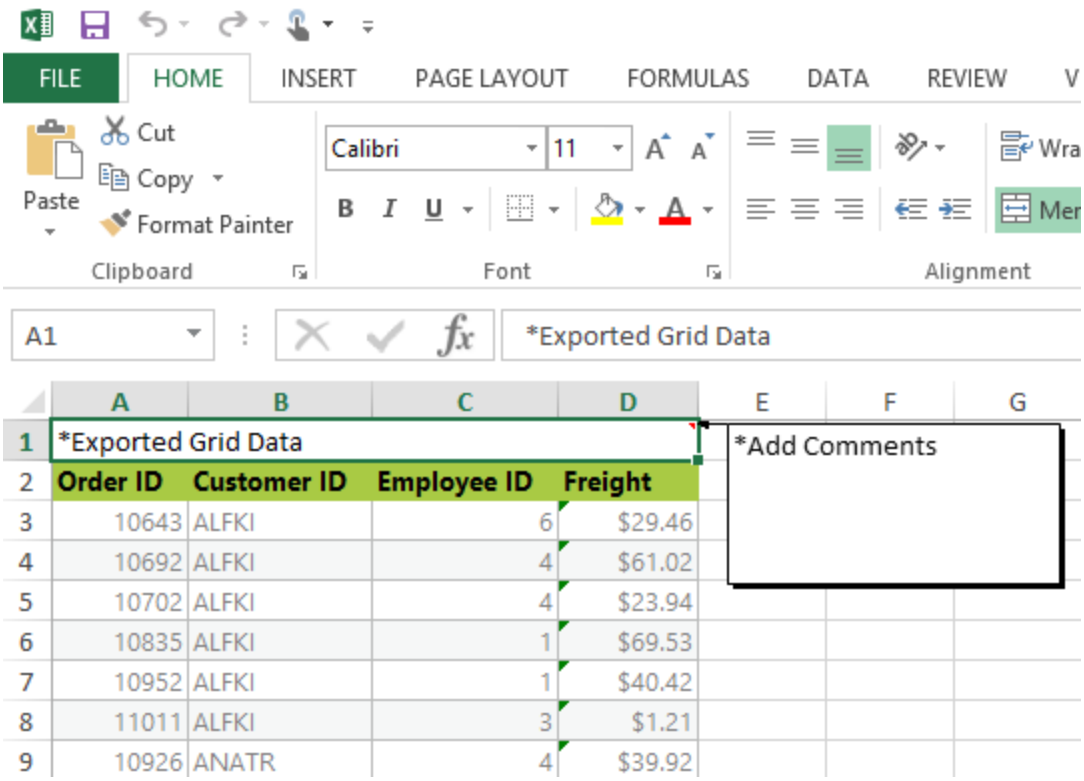
```
@(Html.EJ().Grid<OrdersView>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.ToolbarSettings(toolBar => toolBar.ShowToolbar().ToolbarItems(items =>
{
items.AddTool(ToolBarItems.ExcelExport);
}))
.AllowPaging()
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order
ID").TextAlign(TextAlign.Right).Add();
col.Field("CustomerID").HeaderText("Customer ID").Add();
col.Field("EmployeeID").HeaderText("Employee
ID").TextAlign(TextAlign.Right). Add();
col.Field("Freight").HeaderText("Freight").TextAlign(TextAlign.Right).Add();
}))
```

C#

```
public partial class GridController : Controller
{
public ActionResult ExportingGrid()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
public void ExportToExcel(string GridModel)
{
GridProperties gridProperty =
(GridProperties)Utils.DeserializeToModel(typeof(GridProperties), GridModel);
ExcelExport exp = new ExcelExport();
IEnumerable data = new NorthwindDataContext().OrdersViews.ToList();
IWorkbook book = exp.Export(gridProperty, (IEnumerable)data, "Export.xlsx",
ExcelVersion.Excel2010, false, false, "flat-lime", true);
book.ActiveSheet.Range["A1:D1"].Merge();
book.ActiveSheet.Range["A1"].Text = "*Exported Grid Data";//Adding text to
the cells of particular range
book.ActiveSheet.Range["A1"].AddComment().Text = "*Add Comments";//Adding
comments to cells of particular range
book.SaveAs("Export.xlsx", ExcelSaveType.SaveAsXLS,
System.Web.HttpContext.Current.Response, ExcelDownloadType.Open);
}
}
```

The following screenshot displays the exported grid with comments added to cells

Copyright © 2001 - 2020 Syncfusion Inc.



Adding comments in exported Word document

We can add comments to the word document using the AppendComment method in the WComment class of the DocIO namespace. We can traverse through the required row/cell with the help of WTable class and thus can append the comment to the table cell.

RAZOR

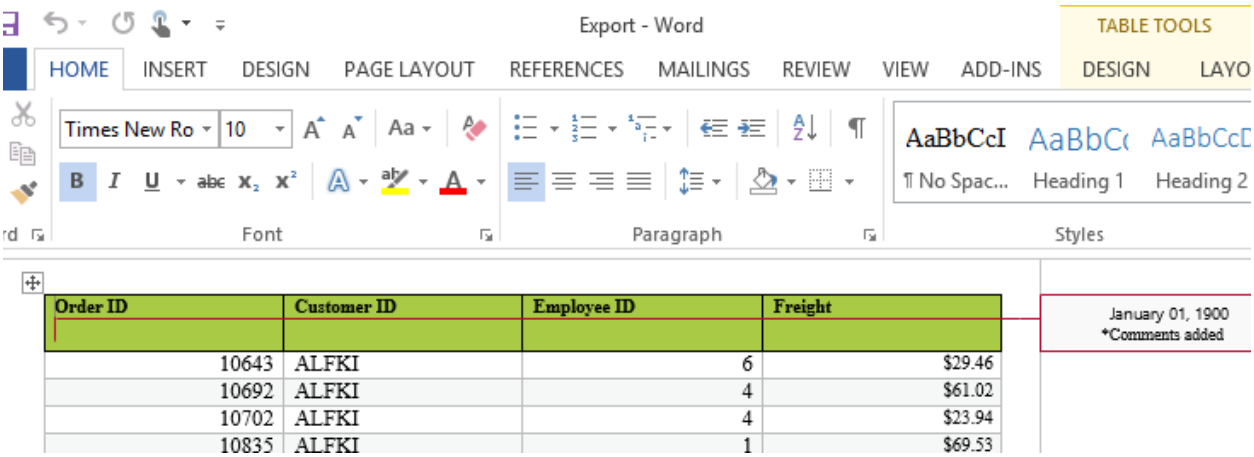
```
@(Html.EJ().Grid<OrdersView>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.ToolbarSettings(toolBar => toolBar.ShowToolbar().ToolbarItems(items =>
{
items.AddTool(ToolBarItems.WordExport);
}))
.AllowPaging()
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order
ID").TextAlign(TextAlign.Right).Add();
col.Field("CustomerID").HeaderText("Customer ID").Add();
col.Field("EmployeeID").HeaderText("Employee
ID").TextAlign(TextAlign.Right). Add();
col.Field("Freight").HeaderText("Freight").TextAlign(TextAlign.Right).Add();
}))
```

C#

```
public partial class GridController : Controller
{
public ActionResult ExportingGrid()
{
```

```
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
public void ExportToWord(string GridModel)
{
WordExport exp = new WordExport();
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
GridProperties gridProperty =
(GridProperties)Utils.DeserializeToModel(typeof(GridProperties), GridModel);
IWordDocument document = exp.Export(gridProperty, (IEnumerable)data,
"Export.docx", false, false, "flat-lime", true);
var table = document.Sections[0].Tables[0];
table.AddRow();//Add new row to the grid table
var para = table.Rows[0].Cells[0].AddParagraph().AppendComment("*Comments
added");
document.Save("Export.docx", FormatType.Docx,
System.Web.HttpContext.Current.Response, HttpContentDisposition.Attachment);
}
}
```

The following screenshot shows the exported grid with comments added to the document.



Adding comments in exported PDF document

We can add comments to a PDF documents using the annotation support provided in the PDF namespace. The annotation added can be of any format such as freeTextAnnotation, popUpAnnotation and LineAnnotation etc., based on the requirement we can add annotation which is available under Syncfusion.Pdf.Interactive namespace.

RAZOR

```
@(Html.EJ().Grid<OrdersView>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.ToolbarSettings(toolBar => toolBar.ShowToolbar().ToolbarItems(items =>
{
items.AddTool(ToolBarItems.PdfExport);
}))
.AllowPaging()
.Columns(col =>
{
```

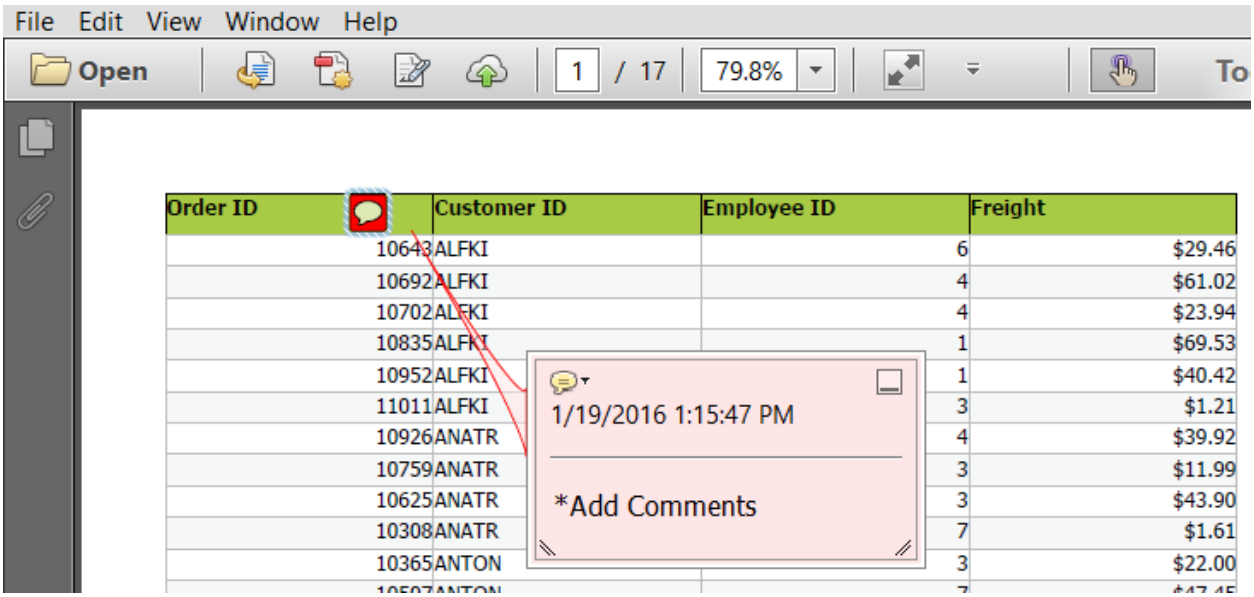
```
col.Field("OrderID").HeaderText("Order
ID").TextAlign(TextAlign.Right).Add();
col.Field("CustomerID").HeaderText("Customer ID").Add();
col.Field("EmployeeID").HeaderText("Employee
ID").TextAlign(TextAlign.Right). Add();
col.Field("Freight").HeaderText("Freight").TextAlign(TextAlign.Right).Add();
}))
```

C#

```
public partial class GridController : Controller
{
public ActionResult ExportingGrid()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
public void ExportToPdf(string GridModel)
{
PdfExport exp = new PdfExport();
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
GridProperties gridProperty =
(GridProperties)Utils.DeserializeToModel(typeof(GridProperties), GridModel);
PdfDocument document = exp.Export(gridProperty, (IEnumerable)data,
"Export.pdf", false, false, "flat-lime", true);
RectangleF rectangle = new RectangleF(120, 20, 20, 125);
//Creates a new pop-up annotation.
PdfPopupAnnotation popupAnnotation = new PdfPopupAnnotation(rectangle,
"*Comments added");
popupAnnotation.Border.Width = 2;
popupAnnotation.Border.HorizontalRadius = 10;
popupAnnotation.Border.VerticalRadius = 20;
//Sets the PDF pop-up icon.
popupAnnotation.Icon = PdfPopupIcon.Comment;
//Adds the annotation to page.
document.Pages[0].Annotations.Add(popupAnnotation);
document.Save("Export.pdf", Response, HttpReadType.Save);
}
}
```

The following screenshot displays the exported grid with comments added to cells.

Copyright © 2001 - 2020 Syncfusion Inc.



Adding header and footer in the exported file (Excel, Word or PDF)

We can add header and footer in the exported file while exporting the grid control.

Adding header and footer in Excel sheet

Using the Range Text property and SetValue method of the XlsIO IRange Class, we can add headers and footers in Excel sheet.

RAZOR

```
@(Html.EJ().Grid<OrdersView>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.ToolbarSettings(toolBar => toolBar.ShowToolbar().ToolbarItems(items =>
{
items.AddTool(ToolBarItems.ExcelExport);
}))
.AllowPaging()
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order
ID").TextAlign(TextAlign.Right).Add();
col.Field("CustomerID").HeaderText("Customer ID").Add();
col.Field("EmployeeID").HeaderText("Employee
ID").TextAlign(TextAlign.Right). Add();
col.Field("Freight").HeaderText("Freight").TextAlign(TextAlign.Right).Add();
}))
```

C#

```
public partial class GridController : Controller
{
public ActionResult ExportingGrid()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
public void ExportToExcel(string GridModel)
{
GridProperties gridProperty =
(GridProperties)Utils.DeserializeToModel(typeof(GridProperties), GridModel);
ExcelExport exp = new ExcelExport();
IEnumerable data = new NorthwindDataContext().OrdersViews.ToList();
IWorkbook book = exp.Export(gridProperty, (IEnumerable)data, "Export.xlsx",
ExcelVersion.Excel2010, false, false, "flat-lime", true);
book.ActiveSheet.InsertRow(1);
// Merging the sheet from Range A1 to D1 for adding title space
book.ActiveSheet.Range["A1:D1"].Merge();
//Adding the title using Text property
book.ActiveSheet.Range["A1"].Text = "Grid Order Data";
book.ActiveSheet.Range["A1"].CellStyle.HorizontalAlignment =
ExcelHAlign.HAlignCenter;//set text alignment
//Adding footer using SetValue method
book.ActiveSheet.SetValue(book.ActiveSheet.Rows.Length + 2,
book.ActiveSheet.Columns.Length - 3, "CopyRights");
book.SaveAs("Export.xlsx", ExcelSaveType.SaveAsXLS,
System.Web.HttpContext.Current.Response, ExcelDownloadType.Open);
}
}
```

Adding header and footer in exported Word document

We can add header and footer to the word document using the HeadersFooters property in the WHeadersFooters class of the DocIO namespace. We can create an instance of the IWParagraph class and append the header/footer text to it using the AppendText method.

RAZOR

```
@(Html.EJ().Grid<OrdersView>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.ToolbarSettings(toolBar => toolBar.ShowToolbar().ToolbarItems(items =>
{
items.AddTool(ToolBarItems.WordExport);
}))
.AllowPaging()
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order
ID").TextAlign(TextAlign.Right).Add();
col.Field("CustomerID").HeaderText("Customer ID").Add();
col.Field("EmployeeID").HeaderText("Employee
ID").TextAlign(TextAlign.Right). Add();
col.Field("Freight").HeaderText("Freight").TextAlign(TextAlign.Right).Add();
}))
```

C#

```
public partial class GridController : Controller
{
public ActionResult ExportingGrid()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.datasource = DataSource;
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
return View();
}
public void ExportToWord(string GridModel)
{
WordExport exp = new WordExport();
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
GridProperties gridProperty =
(GridProperties)Utils.DeserializeToModel(typeof(GridProperties), GridModel);
IWordDocument document = exp.Export(gridProperty, (IEnumerable)DataSource,
"Export.docx", false, false, "flat-lime", true);
IWParagraph para = new WParagraph(document);
//Add header to the word document
para = document.Sections[0].HeadersFooters.Header.AddParagraph();
//Insert the header text using AppendText method
para.AppendText("[Header]");
//Add footer to the word document
para = document.Sections[0].HeadersFooters.Footer.AddParagraph();
//Insert the footer text using AppendText method
para.AppendText("[Footer]");
//Adding Title to the Grid
var index =
document.LastSection.Body.ChildEntities.IndexOf(document.LastSection.Tables[
0]);
WParagraph para1 = new WParagraph(document);
para1.Text = "Grid Title";
document.LastSection.Body.ChildEntities.Insert(index, para1);
document.Save("Export.docx", FormatType.Docx,
System.Web.HttpContext.Current.Response, HttpContentDisposition.Attachment);
}
}
```

Adding header and footer in the exported PDF document

We can add header/footer to a PDF documents using the PdfPageTemplateElement class. The header and footer can contain any types of element including dynamic fields.

RAZOR

```
@(Html.EJ().Grid<OrdersView>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.ToolbarSettings(toolBar => toolBar.ShowToolbar().ToolbarItems(items =>
{
items.AddTool(ToolBarItems.PdfExport);
}))
.AllowPaging()
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order
ID").TextAlign(TextAlign.Right).Add();
col.Field("CustomerID").HeaderText("Customer ID").Add();
col.Field("EmployeeID").HeaderText("Employee
ID").TextAlign(TextAlign.Right). Add();
col.Field("Freight").HeaderText("Freight").TextAlign(TextAlign.Right).Add();
}))
```

C#

Copyright © 2001 - 2020 Syncfusion Inc.

```
public partial class GridController : Controller
{
public ActionResult ExportingGrid()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
public ActionResult ExportToPdf(string GridModel)
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
GridProperties gridProperty =
(GridProperties)Utils.DeserializeToModel(typeof(GridProperties), GridModel);
PdfExport exp = new PdfExport();
PdfDocument document = exp.Export(gridProperty, (IEnumerable)DataSource,
"Export.pdf", false, false, "flat-lime", true);
RectangleF rect = new RectangleF(0, 0, document.PageSettings.Width, 50);
//create a header pager template
PdfPageTemplateElement header = new PdfPageTemplateElement(rect);
//create a footer pager template
PdfPageTemplateElement footer = new PdfPageTemplateElement(rect);
Font f = new Font("Helvetica", 10, System.Drawing.FontStyle.Bold);
PdfFont font = new PdfTrueTypeFont(f, true);
header.Graphics.DrawString("Demo Report", font, PdfBrushes.Black, new
Point(250, 0)); //Add custom text to the Header
document.Template.Top = header; //Append custom template to the document
footer.Graphics.DrawString("CopyRights", font, PdfBrushes.Gray, new
Point(250, 0));//Add Custom text to footer
document.Template.Bottom = footer;//Add the footer template to document
document.Save(Server.MapPath("/Output/Export.pdf"));
return RedirectToAction("Index");
}
}
```

External search in grid

Using search method of grid, you can search the string in grid externally without using in-built toolbar search support. While using the search method it is necessary to set the AllowSearching property as true. The following code example explains the previous behavior.

RAZOR

```
<input type="text" id="search" class="e-ejinputtext" />
@(Html.EJ().Button("search")
.Text("Searching")
.ClientSideEvents(eve => { eve.Click("onSearching"); })
)
@(Html.EJ().Grid<OrdersView>("Grid")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.AllowPaging()
.AllowSearching()
.Columns(col =>
{
col.Field("OrderID").Add();
col.Field("CustomerID").Add();
col.Field("EmployeeID").Add();
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
col.Field("Freight").Add();
col.Field("ShipCity").Add();
col.Field("ShipCountry").Add();
})
)
```

JS

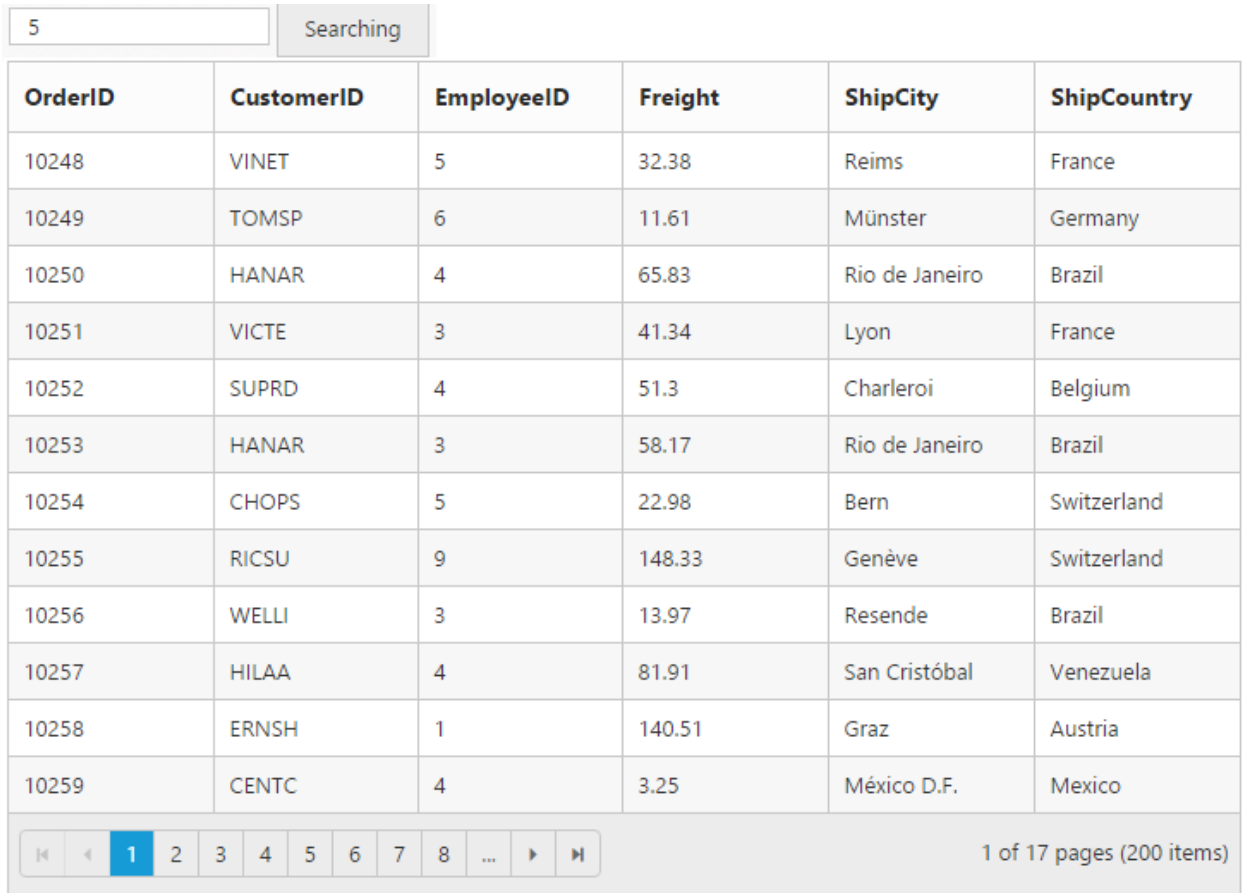
```
function onSearching(args) {
var obj = $("#Grid").ejGrid("instance");
var val = $("#search").val();
obj.search(val);
}
```

C#

```
namespace SyncfusionMvcApplication3.Controllers
{
public class HomeController : Controller
{
public ActionResult Index()
{
ViewBag.datasource = OrderRepository.GetAllRecords();
return View();
}
}
}
```

The following output is displayed as a result of the previous code example.

Copyright © 2001 - 2020 Syncfusion Inc.



Configure grid through the grid model properties

There comes a time when you want to set grid properties other than using grid builder i.e., in the Controller side. At the time you can pass GridProperties Model instance as a parameter to grid Helper.

We can set grid properties in server-side using the GridProperties class and use it in view page using grid Helper overload.

In addition to id parameter of grid helper we can also pass GridProperties Model as another parameter to grid helper.

The following code example shows you how to set grid properties such as AllowPaging, DataSource and Columns in Controller using GridProperties class.

RAZOR

```
@model Syncfusion.JavaScript.Models.GridProperties
@(Html.EJ().Grid<object>("FlatGrid",Model))
```

C#

```
namespace EJGrid.Controllers
{
public class HomeController : Controller
{
public ActionResult Index()
{
```

```
List<Column> cols = new List<Column>();
cols.Add(new Column() { Field = "OrderID" });
cols.Add(new Column() { Field = "EmployeeID" });
cols.Add(new Column() { Field = "ShipCity" });
cols.Add(new Column() { Field = "ShipCountry" });
cols.Add(new Column() { Field = "Freight" });
GridProperties prop = new GridProperties();
prop.DataSource = OrderRepository.GetAllRecords();
prop.Columns = cols;
prop.AllowPaging = true;
return View(prop);
}
}
}
```

The following output is displayed as a result of the previous code example.

Work with partial views

The grid can be rendered in either Unobtrusive or Non-unobtrusive mode.

In unobtrusive mode, to load grid from partial view via AJAX, in the success callback, the partial view should be parsed using the ej.widget.init method.

Note: The ej.widget.init method is available in ej.unobtrusive.min.js file.

Note: If the InitUnobtrusiveInScriptManager key is set in appSettings of web config then the Html.EJ().ScriptManager() should be placed in the partial view.

The following code example describes the previous behavior.

RAZOR

```
@(Html.EJ().Grid<OrdersView>("PartialGrid")
.Datasource((IEnumerable<OrdersView>)Model)
.AllowPaging()
.Columns(col =>
{
col.Field(o => o.OrderID).HeaderText("Order
ID").Width(70).TextAlign(TextAlign.Right).Add();
col.Field(o => o.EmployeeID).HeaderText("Employee
ID").Width(70).TextAlign(TextAlign.Right).Add();
col.Field(o => o.CustomerID).HeaderText("Customer ID").Width(70).Add();
col.Field(o =>
o.Freight).HeaderText("Freight").Width(70).TextAlign(TextAlign.Right).Add();
})
)
```

C#

```
namespace Grid.Controllers
{
public class HomeController : Controller
{
public ActionResult Index()
```

```
{
return View();
}
public ActionResult GetPartial()
{
var model = new NorthwindDataContext().OrdersViews.ToList();
return PartialView("_GridPartial", model);
}
}
}
```

HTML

```
<div id="target"></div>
```

JS

```
<script>
$(function(){
$.ajax({
url:'@Url.Action("GetPartial")',
success: function(doc){
$("#target").html(doc);
ej.widget.init($("#target"));
}
});
});
</script>
```

The following output is displayed as a result of the previous code example.

In non-unobtrusive mode, to load grid from partial view via AJAX, the ScriptManager HTML helper should be placed at the bottom of the partial view.

Note: The Html.EJ().ScriptManager() which is placed in the Layout page will not initiate control rendering in partial view hence every partial view should have their own ScriptManager.

The following code sample describes the previous behavior.

RAZOR

```
@(Html.EJ().Grid<OrdersView>("PartialGrid")
.Datasource((IEnumerable<OrdersView>)Model)
.AllowPaging()
.Columns(col =>
{
col.Field(o => o.OrderID).HeaderText("Order
ID").Width(70).TextAlign(TextAlign.Right).Add();
col.Field(o => o.EmployeeID).HeaderText("Employee
ID").Width(70).TextAlign(TextAlign.Right).Add();
col.Field(o => o.CustomerID).HeaderText("Customer ID").Width(70).Add();
col.Field(o =>
o.Freight).HeaderText("Freight").Width(70).TextAlign(TextAlign.Right).Add();
})
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
)
@(Html.EJ().ScriptManager())
```

C#

```
namespace Grid.Controllers
{
public class HomeController : Controller
{
public ActionResult Index()
{
return View();
}
public ActionResult GetPartial()
{
var model = new NorthwindDataContext().OrdersViews.ToList();
return PartialView("_GridPartial", model);
}
}
}
```

HTML

```
<div id="target"></div>
```

JS

```
<script>
$(function(){
$.ajax({
url:'@Url.Action("GetPartial")',
success: function(doc){
$("#target").html(doc);
}
});
});
</script>
```

The following output is displayed as a result of the previous code example.

Rendering the grid using grid properties in server-side

The GridProperties helps to render the grid control in server-side.

The following code example which will explain to render the grid control in server-side.

RAZOR

```
@(Html.EJ().Grid<object>("FlatGrid", Model))
```

C#

```
namespace Grid.Controllers
{
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
public class GridController : Controller
{
public ActionResult GridFeatures()
{
GridProperties grid = new GridProperties();
List<Column> colList = new List<Column>();
colList.Add(new Column() { Field = "OrderID", HeaderText="Order ID",
TextAlign = Syncfusion.JavaScript.TextAlign.Right, Width = 75 });
colList.Add(new Column() { Field = "CustomerID", HeaderText = "Customer ID",
Width = 80 });
colList.Add(new Column() { Field = "ShipName", HeaderText = "Ship Name",
Width = 100 });
colList.Add(new Column() { Field = "ShipCity", HeaderText = "Ship City",
Width = 100 });
colList.Add(new Column() { Field = "Freight", HeaderText = "Freight", Width
= 80, TextAlign = Syncfusion.JavaScript.TextAlign.Right });
grid.Columns = colList;
grid.AllowPaging = true;
grid.DataSource = OrderRepository.GetAllRecords().ToList();
return View(grid);
}
}
}
```

The following output is displayed as a result of the previous code example.

Order ID	Customer ID	Ship Name	Ship City	Freight
10248	VINET	Vins et alcools Chevalier	Reims	$32.380
10249	TOMSP	Toms Spezialitäten	Münster	$11.610
10250	HANAR	Hanari Carnes	Rio de Janeiro	$65.830
10251	VICTE	Victuailles en stock	Lyon	$41.340
10252	SUPRD	Suprêmes délices	Charleroi	$51.300

Export grid to target location without download prompt(Excel, Word or PDF)

In the Export method we have assigned the target location to save the exported file in the specified path. The target location is placed using the Server.MapPath.

The following code example shows how to save the exported files in a target location.

RAZOR

```
@(Html.EJ().Grid<EmployeeView>("MasterGrid")
.Datasource((IEnumerable<object>)ViewBag.DataSource)
.AllowPaging()
.ToolbarSettings(toolBar => toolBar.ShowToolbar().ToolbarItems(items =>
{
items.AddTool(ToolBarItems.ExcelExport);
items.AddTool(ToolBarItems.WordExport);
items.AddTool(ToolBarItems.PdfExport);
}))
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order
ID").TextAlign(TextAlign.Right).Add();
col.Field("CustomerID").HeaderText("Customer ID").Add();
col.Field("EmployeeID").HeaderText("Employee
ID").TextAlign(TextAlign.Right).Add();
col.Field("Freight").HeaderText("Freight").TextAlign(TextAlign.Right).Add();
})
)
```

C#

```
public ActionResult GridFeatures()
{
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
ViewBag.DataSource = DataSource;
return View();
}
public void ExportToExcel(string GridModel)
{
ExcelExport exp = new ExcelExport();
string targetFolder = Server.MapPath("") + "\\New folder\\";     // Set the
target folder using Server.MapPath
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
GridProperties obj =
(GridProperties)Syncfusion.JavaScript.Utils.DeserializeToModel(typeof(GridPr
operties), GridModel);
exp.Export(obj, DataSource, "Export.xlsx", ExcelVersion.Excel2010, false,
false, "flat-saffron", true, targetFolder);    //specify the path which
helps to save the excel file in local folder
}
public void ExportToWord(string GridModel)
{
WordExport exp = new WordExport();
string targetFolder = Server.MapPath("") + "\\New folder\\";   // Set the
target folder using Server.MapPath
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
GridProperties obj =
(GridProperties)Syncfusion.JavaScript.Utils.DeserializeToModel(typeof(GridPr
operties), GridModel);
exp.Export(obj, DataSource, "Export.docx", false, false, "flat-saffron",
true, targetFolder);   //specify the path which helps to save the excel file
in local folder
}
public void ExportToPdf(string GridModel)
{
PdfExport exp = new PdfExport();
string targetFolder = Server.MapPath("") + "\\New folder\\";    // Set the
target folder using Server.MapPath
var DataSource = new NorthwindDataContext().OrdersViews.ToList();
GridProperties obj =
(GridProperties)Syncfusion.JavaScript.Utils.DeserializeToModel(typeof(GridPr
operties), GridModel);
exp.Export(obj, DataSource, "Export.pdf", false, false, "flat-saffron",
true, targetFolder);     //specify the path which helps to save the excel
file in local folder
}
```

Hierarchy grid with different foreignKeyField in parent and child table

The QueryString property is used to filter the childGrid data based on value in parent grid data. But when the field name provided in the QueryString does not exists in Child grid, then the ForeignKeyField property is used to filter the childGrid data. If the foreign key column name differs for parent and child grid then use the ForeignKeyField property of grid.

The following code example explains the previous behavior.

RAZOR

```
@(Html.EJ().Grid<EmployeeView>("HierarchyGrid")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.Columns(col =>
{
col.Field("EmployeeID").HeaderText("Employee
ID").TextAlign(TextAlign.Right).Width(85).Add();
col.Field("FirstName").HeaderText("First Name").Width(100).Add();
col.Field("City").Width(100).Add();
col.Field("Country").Width(100).Add();
})
.ChildGrid(child =>
{
child.Datasource("http://js.syncfusion.com/demos/ejServices/Wcf/Northwind.sv
c/Orders")
.QueryString("FirstName")
.ForeignKeyField("CustomerName")
.AllowPaging()
.PageSettings(page => page.PageSize(5))
.Columns(col =>
{
```

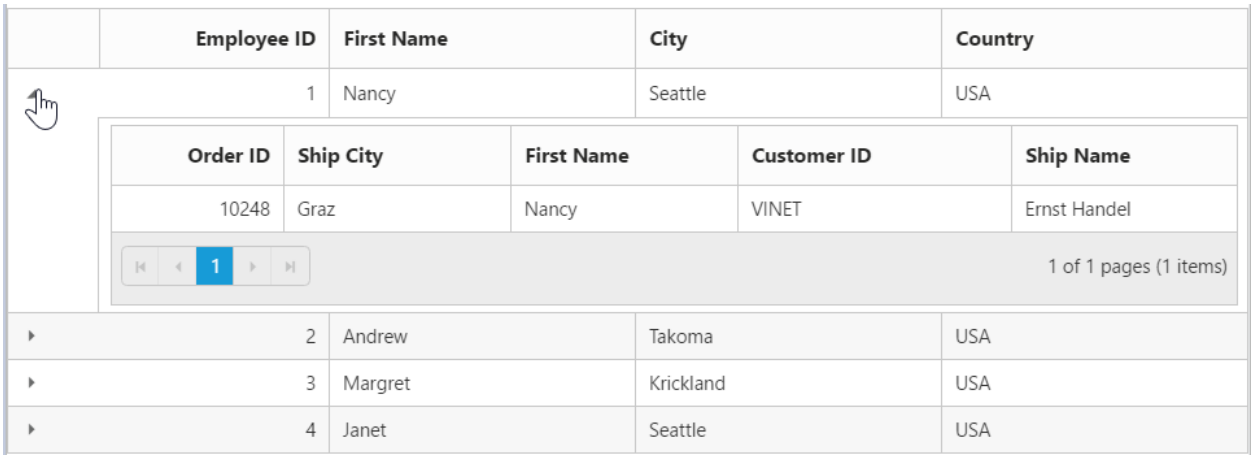
Copyright © 2001 - 2020 Syncfusion Inc.

```
col.Field("OrderID").HeaderText("Order
ID").TextAlign(TextAlign.Right).Width(75).Add();
col.Field("ShipCity").HeaderText("Ship City").Width(100).Add();
col.Field("CustomerName").HeaderText("First Name").Width(100).Add();
col.Field("CustomerID").HeaderText("Customer ID").Width(120).Add();
col.Field("ShipName").HeaderText("Ship Name").Width(100).Add();
});
})
)
```

C#

```
public partial class GridController : Controller
{
//
// GET: /HierarchyGrid/
public ActionResult HierarchyGrid()
{
var DataSource = new NorthwindDataContext().EmployeeViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
}
```

The following output is displayed as a result of the previous code example.



Display other Syncfusion controls in grid columns

We can display the other Syncfusion controls using the Template property of grid columns and TemplateRefresh event of ejGrid control.

RAZOR

```
@(Html.EJ().Grid<object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.AllowPaging()
.ClientSideEvents(event => event.TemplateRefresh("template"))
.Columns(col =>
{
col.HeaderText("Employee
Rating").Template("#columnTemplate").Width(100).Add();
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
col.Field("EmployeeID").HeaderText("Employee ID").Width(90).Add();
col.Field("FirstName").HeaderText("First Name").Width(90).Add();
col.Field("LastName").HeaderText("Last Name").Width(90).Add();
col.Field("Country").HeaderText("Country").Width(80).Add();
})
)
```

C#

```
namespace Grid.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource = new NorthwindDataContext().EmployeeViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

JS

```
<script type="text/x-jsrender" id="columnTemplate">
{{"{{"}}if EmployeeID<3{{}}}}
<input type="text" class="rating" value="3" />
{{"{{"}}else EmployeeID>2 && EmployeeID<5{{}}}}
<input type="text" class="rating" value="3" />
{{"{{"}}else EmployeeID>4{{}}}}
<input type="text" class="rating" value="5" />
{{"{{"}}/if{{}}}}
</script>
<script type="text/javascript">
function template(args) {
$(args.cell).find(".rating").ejRating({ allowReset: false });
}
</script>
```

The following output is displayed as a result of the previous code example.

Perform grid actions on external button click

CRUD operations

Using the addRecord method of grid, you can add a record to a grid externally without using in-built toolbar add support. While using the addRecord method it is necessary to set the AllowAdding property as true.

Using deleteRecord method of grid, you can delete a record to a grid externally without using in-built toolbar delete support. While using the deleteRecord method it is necessary to set the AllowDeleting property as true.

Using updateRecord method of grid, you can update a record to a grid externally without using in-built toolbar update support. While using the updateRecord method it is necessary to set the AllowEditing property as true.

Filtering

Using the filterColumn method of grid, you can filter the data in the grid externally without using in-built filter support. While using filterColumn method it is necessary to set AllowFiltering property as true.

Copyright © 2001 - 2020 Syncfusion Inc.

Grouping

Using the groupColumn and ungroupColumn method of grid, you can group/ungroup the grid externally without using in-built grouping support. While using the groupColumn and ungroupColumn method it is necessary to set the AllowGrouping property as true.

Sorting

Using the sortColumn method of grid, you can sort the grid externally without using in-built sorting support. While using the sortColumn method it is necessary to set the yAllowSorting property as true.

The following code example explains the previous behavior.

HTML

```
<table>
<tr>
<td>
<b>CRUD</b><br>@(Html.EJ().Button("AddRecord")
.Width("100px")
.ClientSideEvents(eve => { eve.Click("addRecord"); })
.Text("AddRecord")
)
@(Html.EJ().Button("UpdateRecord")
.Width("100px")
.ClientSideEvents(eve => { eve.Click("updateRecord"); })
.Text("UpdateRecord")
)
@(Html.EJ().Button("DeleteRecord")
.Width("100px")
.ClientSideEvents(eve => { eve.Click("deleteRecord"); })
.Text("DeleteRecord")
)
</td>
<td>
<b>Filtering</b><br><br>
@(Html.EJ().DropDownList("FilterColumnOne")
.TargetID("Order")
.Width("120px")
.WatermarkText("Select filter value one")
.SelectedIndex(0)
)
@(Html.EJ().DropDownList("FilterColumnTwo")
.TargetID("Employee")
.Width("120px")
.WatermarkText("Select filter value two")
.SelectedIndex(0)
)
@(Html.EJ().Button("filter")
.Width("100px")
.ClientSideEvents(eve => { eve.Click("Filter"); })
.Text("Filter")
)
@(Html.EJ().Button("ClearFilter")
.Width("100px")
.ClientSideEvents(eve => { eve.Click("clearFilter"); })
.Text("Clear")
)
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
</td>

.Width("100px")
.ClientSideEvents(eve => { eve.Click("Sort"); })
.Text("Clear")
)
</td>
</tr>
</table>
@(Html.EJ().Grid<object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.AllowGrouping()
.AllowFiltering()
.AllowPaging()
.AllowSorting()
.EditSettings(edit => { edit.AllowAdding().AllowDeleting().AllowEditing();
})
.ToolbarSettings(toolbar =>
{
toolbar.ShowToolbar().ToolbarItems(items =>
{
items.AddTool(ToolBarItems.Add);
items.AddTool(ToolBarItems.Edit);
items.AddTool(ToolBarItems.Delete);
items.AddTool(ToolBarItems.Update);
items.AddTool(ToolBarItems.Cancel);
});
})
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order
ID").IsPrimaryKey(true).TextAlign(TextAlign.Right).Width(150).Add();
col.Field("CustomerID").HeaderText("Customer ID").Width(200).Add();
col.Field("EmployeeID").HeaderText("Employee ID").Width(150).Add();
col.Field("Freight").HeaderText("Freight").TextAlign(TextAlign.Right).Width(
150).Format("{0:C}").Add();
col.Field("OrderDate").HeaderText("Order Date").Width(200).Add();
})
)
```

C#

```
public partial class GridController : Controller
{
//
```

```
// GET: /ExternalButton/
public ActionResult ExternalButton()
{
var DataSource = new NorthwindDataContext().EmployeeViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
}
```

JS

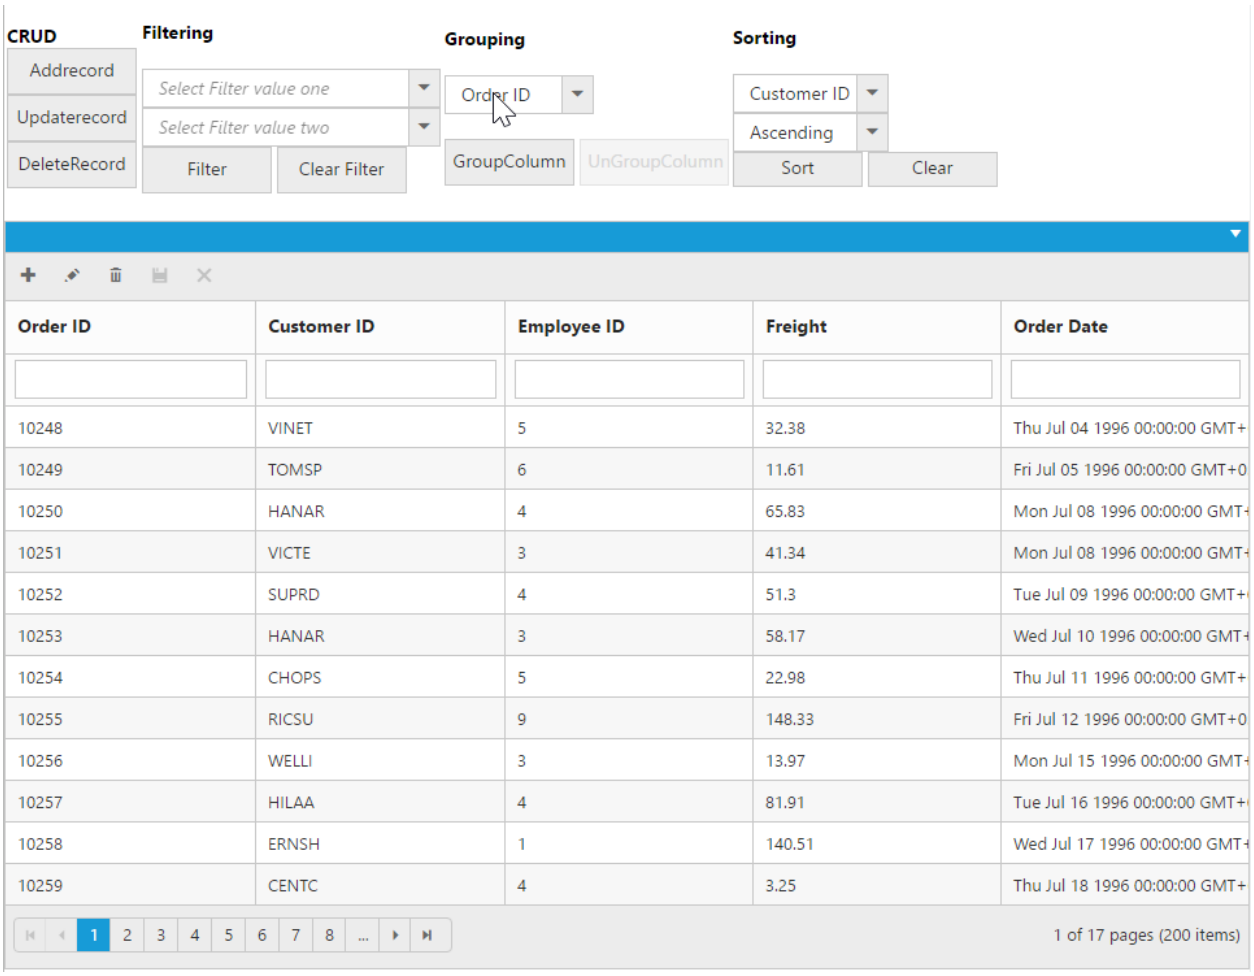
```
<script type="text/javascript">
function addRecord(){
var gridObj = $('#FlatGrid').data("ejGrid");
gridObj.addRecord({ "OrderID": 12333 });
}
function deleteRecord(){
var gridObj = $('#FlatGrid').data("ejGrid");
gridObj.deleteRecord("OrderID", { OrderID:
gridObj.model.dataSource[gridObj.model.selectedRowIndex].OrderID });
}
function updateRecord(){
var gridObj = $('#FlatGrid').data("ejGrid");
gridObj.updateRecord("OrderID", { OrderID: 10002, EmployeeID: 6 });
}
function Filter(args) {
var obj = $('#FlatGrid').data("ejGrid");
var one = $('#FilterColumnOne').data("ejDropDownList");
var two = $('#FilterColumnTwo').data("ejDropDownList");
var One = one.getValue();
var Two = two.getValue();
obj.filterColumn([{field:"OrderID",operator:"equal",value:One,predicate:"and
",
matchcase:true},{field:"EmployeeID",operator:"equal",value:Two,predicate:"an
d", matchcase:true}]);
}
function clearFilter(args) {
var gridObj = $("#FlatGrid").data("ejGrid");
gridObj.clearFiltering();
}
function Sort(args) {
var gridObj = $("#FlatGrid").data("ejGrid");
if (gridObj != undefined) {
gridObj.clearSorting();
if (this.element.attr('id').indexOf("doSorting") != -1) {
var name = $('#SortColumnName').data("ejDropDownList");
var direction = $('#Directions').data("ejDropDownList");
var columnName = name.getValue().replace(/\s*/g, "");
var sortDirection = direction.getValue().toLowerCase();
gridObj.sortColumn(columnName, sortDirection);
}
}
}
function clickToGroup(args) {
var gridObj = $("#FlatGrid").data("ejGrid");
var columnName = $("#GroupColumnName").ejDropDownList("getSelectedValue");
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
if (this.element.attr("id") == "groupColumn") {
gridObj.groupColumn(columnName);
$("#groupColumn").ejButton("disable");
$("#unGroupColumn").ejButton("enable");
}
else {
gridObj.ungroupColumn(columnName);
group = true;
$("#unGroupColumn").ejButton("disable");
$("#groupColumn").ejButton("enable");
}
}
function OnChange() {
var gridObj = $("#FlatGrid").data("ejGrid");
var columnName = $("#GroupColumnName").ejDropDownList("getSelectedValue");
if ($.inArray(columnName, gridObj.model.groupSettings.groupedColumns) != -1)
{
$("#unGroupColumn").ejButton("enable");
$("#groupColumn").ejButton("disable");
}
else {
$("#groupColumn").ejButton("enable");
$("#unGroupColumn").ejButton("disable");
}
}
</script>
```

The following output is displayed as a result of the previous code example.

Copyright © 2001 - 2020 Syncfusion Inc.



Getting Datasource of Grid in Sorted Order

Grid column can be sorted and after sorting, the datasource can be obtained in the same order using `sortBy` query and `executeLocal` method of DataManager.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Button("Sorting")
.Width("100px")
.ClientSideEvents(eve => { eve.Click("GetSortedData"); })
.Text("GetSortedData")
)
@(Html.EJ().Grid<object>("FlatGrid")
.Datasource((IEnumerable<object>)ViewBag.datasource)
.AllowPaging()
.AllowSorting()
.AllowMultiSorting()
.Columns(col =>
{
col.Field("OrderID").HeaderText("Order ID").Width(75).Add();
col.Field("CustomerID").HeaderText("Customer ID").Width(80).Add();
col.Field("EmployeeID").HeaderText("Employee ID").Width(75).Add();
col.Field("ShipCity").HeaderText("Verified").Width(110).Add();
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
})
```

C#

```
namespace Grid.Controllers
{
public class GridController : Controller
{
public ActionResult GridFeatures()
{
var DataSource = new NorthwindDataContext().EmployeeViews.ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

JS

```
<script type="text/javascript">
function GetSortedData(args) {
var obj = $("#FlatGrid").ejGrid("instance");
var Sort = obj.model.sortSettings.sortedColumns;
var query = ej.Query();
if(obj.model.sortSettings.sortedColumns.length){
for(var i=Sort.length-1;i>=0;i--){
query.sortBy(Sort[i].field, Sort[i].direction);
}
var SortedDatasource =
ej.DataManager(obj.model.dataSource).executeLocal(query);
}
}
</script>
```

Note: This solution is applicable only for local data.

GroupButton

Overview

The Group button control is a collection of buttons grouped together that allows you to select the items and perform action based on the item selected. It can be customized to behave either as RadioButtons or Checkboxes. You can add as many group button items as possible by connecting it to local or remote datasource.

You can customize the groupbutton items by using the spriteCSS, Image position properties available in Groupbutton.

Key Features

- Trendy Look: Rich Appearance with Theme Support
- RTL: Supports for Right to Left alignment of Groupbutton items.
- Text and Image: Supports both text and image as Groupbutton item content
- Built-in Icon: Supports the built-in icon libraries

Copyright © 2001 - 2020 Syncfusion Inc.

- Easy Customization: The customization of Groupbutton control to any form is made simple

Getting Started

This section provides details on how to create and customize Groupbutton control in an ASP.NET MVC application.

Dependencies

The following assemblies are needs to referenced to render a Groupbutton control in your application.

1. Syncfusion.EJ.dll
2. Syncfusion.EJ.MVC.dll

The script and CSS dependencies for rendering Groupbutton is given in the JS help document.

Create a simple GroupButton control

Create an ASP.NET MVC project and add necessary assemblies and script dependencies with the help of given Getting started document.

Add the below code in the view page to render a simple groupbutton control.

HTML

```
@Html.EJ().GroupButton("GroupButton").Items(item =>
{
item.Add().Text("Save");
item.Add().Text("Open");
item.Add().Text("Delete");
})
```

Run the project to get the following output

Behavior settings

Groupbutton provides options through which you can customize the default behavior of Groupbutton control.

Groupbutton Mode

The default behavior of Groupbutton is like Radiobutton, i.e., only one item can be selected at a time.

HTML

```
@Html.EJ().GroupButton("GroupButton").GroupButtonMode(GroupButtonMode.RadioB
utton).Items(item =>
{
item.Add().Text("Save");
item.Add().Text("Open");
item.Add().Text("Delete");
})
```

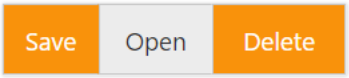
Copyright © 2001 - 2020 Syncfusion Inc.

RadioButton mode {:.caption}

To enable selection of one or more Groupbutton items at a time, you can set the Groupbutton mode to Checkbox. With this, you can toggle the each button's state to perform actions, since all the button will behave like individual buttons.

HTML

```
@Html.EJ().GroupButton("GroupButton").GroupButtonMode(GroupButtonMode.CheckB
ox).Items(item =>
{
item.Add().Text("Save");
item.Add().Text("Open");
item.Add().Text("Delete");
})
```



CheckBox mode {:.caption}

Easy Customization

The GroupButton wrapper and each GroupButton items can be easily customized according to your need using the options available in Groupbutton control.

Button Size

You can render the Groupbutton in different sizes by using the predefined size options for rendering a groupbutton with different sizes. Each size option has different height and width. Mainly it avoids the complexity in rendering groupbutton with complex CSS class.

Normal	Creates button with content size.
Mini	Creates button with Built-in mini size height, width specified.
Small	Creates button with Built-in small size height, width specified.
Medium	Creates button with Built-in medium size height, width specified.
Large	Creates button with Built-in large size height, width specified.

Apart from the above mentioned predefined size option, you can set your own width and height of GroupButton by using Height and Width property.

In the View page, add the following GroupButton elements to configure GroupButton for configure the size

HTML

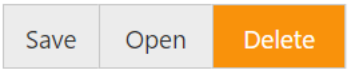
Copyright © 2001 - 2020 Syncfusion Inc.

```
<%--Set the different size options and custom size Groupbutton control as
follows--%>
@Html.EJ().GroupButton("GroupButton").Size(ButtonSize.Mini).Items(item =>
{
item.Add().Text("Save");
item.Add().Text("Open");
item.Add().Text("Delete");
})
```

Mini sized Groupbutton {:.caption}

HTML

```
<%--Set the different size options and custom size Groupbutton control as
follows--%>
@Html.EJ().GroupButton("GroupButton").Size(ButtonSize.Medium).Items(item =>
{
item.Add().Text("Save");
item.Add().Text("Open");
item.Add().Text("Delete");
})
```



Medium sized Groupbutton {:.caption}

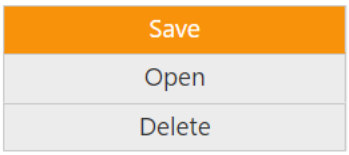
Orientation

Groupbutton element can be rendered either in vertical or horizontal orientation by means of the Orientation property available in GroupButton.

You can change the orientation of Groupbutton as given in the below code snippet.

HTML

```
@Html.EJ().GroupButton("GroupButton").Orientation(Orientation.Vertical).Item
s(item =>
{
item.Add().Text("Save");
item.Add().Text("Open");
item.Add().Text("Delete");
})
```



Copyright © 2001 - 2020 Syncfusion Inc.

DataSource

GroupButton can populate the groupbutton items based on datasource and by specifying the associated fields. You can bind data from both remote and local sources.

Refer the below table to know about the available fields

Field is a property that includes the object type. Fields are used to bind the data source and it includes following field members to make binding easier.

List of Field members

Name	Description
DataSource	Datasource receives Essential DataManager object and JSON object.
Id	Specifies the id to Groupbutton item
Text	Specifies the text of Groupbutton item
SpriteCssClass	Specifies the sprite CSS class to â€œLIâ€• item list
Url	Specifies the href attribute of "A" tag in item list
PrefixIcon	Specifies the PrefixIcon class for Groupbutton item list
SuffixIcon	Specifies the SuffixIcon class for Groupbutton item list
ImagePosition	Specifies the position of Image in Groupbutton item list
LinkAttribute	Specifies the link attribute to â€œAâ€• tag in item list
HtmlAttribute	Specifies the HTML attribute to â€œliâ€• tag in item list
ContentTemplate	Specifies the template content for customizing the Groupbutton items
Selected	Specifies initial selection state of GroupButton item
ContentType	Specifies Content type of Groupbutton Item. The possible values are 1. TextOnly 2. ImageOnly 3. ImageBoth 4. TextAndImage 5. ImageTextImage

Local data

To populate the Groupbutton items with the local data, map the field names mentioned in the above table with the property names.

1. Add the following code in your view page to render GroupButton with local data

ASPX-CS

```
// Add the following code in your CSHTML page.
```

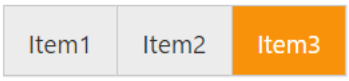
Copyright © 2001 - 2020 Syncfusion Inc.

```
@Html.EJ().GroupButton("groupbutton11").Datasource((IEnumerable<Groupbutton_
mvc.ButtonController.Groupbutton>)ViewBag.Model).GroupButtonFields(e =>
e.Text("text"))
```

C#

```
using System;
using System.Collections.Generic;
using System.Web.Mvc;
using Groupbutton_mvc.Models;
namespace Groupbutton_mvc
{
public class ButtonController: Controller
{
public class Groupbutton
{
public string text { get; set; }
public string id { get; set; }
}
public List<Groupbutton> model = new List<Groupbutton>();
public ActionResult ButtonFeatures()
{
model.Add(new Groupbutton { text = "Item1" });
model.Add(new Groupbutton { text = "Item2" });
model.Add(new Groupbutton { text = "Item3" });
ViewBag.Model = model;
return View();
}
}
}
```

The following screenshot displays the output of the above code.



Local data of GroupButton

RTL Support

In some cases, where you want to display the content in Right to Left direction, you can use RTL support by using the EnableRTL property. In RTL mode, when you have more than one content (image/text, image/image) in button, then these content are aligned in right to left format. With this property enabled, the Groupbutton items are rendered in reverse order.

In the view page, add the following Groupbutton to configure the Items with Right to left alignment

HTML

```
<%--Enable the alignment format for GroupButton control as follows--%>
@Html.EJ().GroupButton("GroupButton").EnableRTL(true).Items(item =>
{
item.Add().Text("Save");
item.Add().Text("Open");
item.Add().Text("Delete");
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
})
```

Here the items are rendered in the reverse order.

Miscellaneous

Text

You can display your own text for Button. By using the Text property, you can easily set text content for button. This text property overwrites the text that is provided on input button element.

In the view page, add the following button elements to configure Button with text

HTML

```
<%--Set the text for button control as follows--%>
@Html.EJ().GroupButton("GroupButton").Items(item =>
{
item.Add().Text("Save");
item.Add().Text("Open");
item.Add().Text("Delete");
})
```

Show Rounded Corner

Customizes the corners of Groupbutton control to be rendered with Rounded corners.

In the view page, add the following button elements to get rounded Button

HTML

```
<%--Enable the rounded corner for button control as follows--%>
@Html.EJ().GroupButton("GroupButton").ShowRoundedCorner(true).Items(item =>
{
item.Add().Text("Save");
item.Add().Text("Open");
item.Add().Text("Delete");
})
```

How to?

Render GroupButton from Code behind

GroupButton can be rendered from the code behind by initializing the required properties in controller and passing those properties via **ViewData** or **Model** to the client side.

The following code illustrates the initialization of GroupButton properties in the controller.

C#

```
//Namespace to get the JavaScript (GroupButton) component properties
using Syncfusion.JavaScript.Models;
namespace MvcApplication.Controllers
{
public class GroupButtonController : Controller
{
public class Groupbutton
{
public string text { get; set; }
public string id { get; set; }
}
public List<Groupbutton> model = new List<Groupbutton>();
// GET: GroupButton
public ActionResult GroupButtonFeatures()
{
model.Add(new Groupbutton { text = "Item1" });
model.Add(new Groupbutton { text = "Item2" });
model.Add(new Groupbutton { text = "Item3" });
//Initializing the GroupButton model
GroupButtonProperties BtnObj = new GroupButtonProperties();
//Initializing the datasource and other properties
BtnObj.ShowRoundedCorner=true;
BtnObj.DataSource = model;
BtnObj.GroupButtonFields.Text = "text";
//Passing GroupButton properties using the ViewData
ViewData["BtnModel"] = BtnObj;
return View();
}
}
}
```

Binding the GroupButton properties passed via **ViewData** from the controller in the client side as below.

ASPX-CS

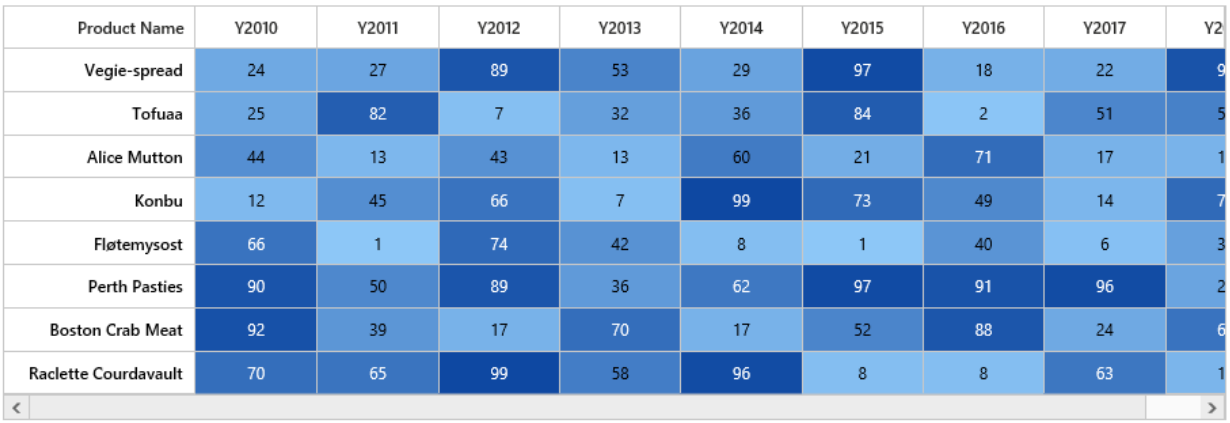
```
@{
Html.EJ().GroupButton("searchCustomer",(Syncfusion.JavaScript.Models.GroupBu
ttonProperties)ViewData["BtnModel"]).Render();
}
```

HeatMap

Overview

Essential HeatMap MVC represents tabular data values as gradient colors instead of numbers. Low and high values are different colors with different gradients.

Copyright © 2001 - 2020 Syncfusion Inc.



Product Name	Y2010	Y2011	Y2012	Y2013	Y2014	Y2015	Y2016	Y2017	Y2
Vegie-spread	24	27	89	53	29	97	18	22	9
Tofuaa	25	82	7	32	36	84	2	51	5
Alice Mutton	44	13	43	13	60	21	71	17	1
Konbu	12	45	66	7	99	73	49	14	7
Fløtemysost	66	1	74	42	8	1	40	6	3
Perth Pasties	90	50	89	36	62	97	91	96	2
Boston Crab Meat	92	39	17	70	17	52	88	24	6
Raclette Courdavault	70	65	99	58	96	8	8	63	1

Key features:

- 2 types of data source mapping (TableMapping, CellMapping)
- Color mapping
- Legend
- Virtualization

Getting Started

This section explains briefly about how to create a HeatMap in your application with ASP.NET MVC.

Initialize the HeatMap

1. Create Syncfusion ASP.NET MVC application. You can refer MVC Getting Started documentation to create new project and add necessary dll's and script files.
2. Add a HeatMap control in View file as like as follows.

RAZOR

```
<div>
@Html.EJ().HeatMap("heatmap", ViewData["HeatMapModel"] as
Syncfusion.JavaScript.DataVisualization.Models.HeatMapProperties)
</div>
```

Prepare and Populate data

Populate product information in a collection

C#

```
public ActionResult Default()
{
CellMapping CellMapping = new CellMapping();
CellMapping.Column = new PropertyMapping() { PropertyName = "ProductName",
DisplayName = "Product Name" };
CellMapping.Row = new PropertyMapping() { PropertyName = "Year", DisplayName
= "Year" };
CellMapping.Value = new PropertyMapping() { PropertyName = "Value" };
Collection columnMapping = new Collection();
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
columnMapping.Add(new HeaderMapping() { PropertyName = "Veggie-spread",
DisplayName = "Veggie-spread" });
columnMapping.Add(new HeaderMapping() { PropertyName = "Tofu", DisplayName =
"Tofu" });
columnMapping.Add(new HeaderMapping() { PropertyName = "Alice Mutton",
DisplayName = "Alice Mutton" });
columnMapping.Add(new HeaderMapping() { PropertyName = "Donut", DisplayName
= "Donut" });
columnMapping.Add(new HeaderMapping() { PropertyName = "Burger", DisplayName
= "Burger" });
columnMapping.Add(new HeaderMapping() { PropertyName = "Perth Pasties",
DisplayName = "Perth Pasties" });
CellMapping.ColumnMapping = columnMapping;
HeaderMapping headerMapping = new HeaderMapping() { PropertyName = "Year",
DisplayName = "Year", ColumnStyle = new ColumnStyle() { Width = 105,
TextAlign = HeatMapTextAlign.Right } };
CellMapping.HeaderMapping = headerMapping;
ViewData["HeatMapModel"] = Heatmap;
return View();
}
```

Map data into HeatMap

Now data is ready, next we need to configure data source and map rows and columns to visualize.

- Prepare `ItemsMapping` add it in resource.

C#

```
public ActionResult Default()
{
CellMapping CellMapping = new CellMapping();
CellMapping.Column = new PropertyMapping() { PropertyName = "ProductName",
DisplayName = "Product Name" };
CellMapping.Row = new PropertyMapping() { PropertyName = "Year", DisplayName
= "Year" };
CellMapping.Value = new PropertyMapping() { PropertyName = "Value" };
Collection columnMapping = new Collection();
columnMapping.Add(new HeaderMapping() { PropertyName = "Veggie-spread",
DisplayName = "Veggie-spread" });
columnMapping.Add(new HeaderMapping() { PropertyName = "Tofu", DisplayName =
"Tofu" });
columnMapping.Add(new HeaderMapping() { PropertyName = "Alice Mutton",
DisplayName = "Alice Mutton" });
columnMapping.Add(new HeaderMapping() { PropertyName = "Donut", DisplayName
= "Donut" });
columnMapping.Add(new HeaderMapping() { PropertyName = "Burger", DisplayName
= "Burger" });
columnMapping.Add(new HeaderMapping() { PropertyName = "Perth Pasties",
DisplayName = "Perth Pasties" });
CellMapping.ColumnMapping = columnMapping;
HeaderMapping headerMapping = new HeaderMapping() { PropertyName = "Year",
DisplayName = "Year", ColumnStyle = new ColumnStyle() { Width = 105,
TextAlign = HeatMapTextAlign.Right } };
CellMapping.HeaderMapping = headerMapping;
Heatmap.ItemsMapping = CellMapping;
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
ViewData["HeatMapModel"] = Heatmap;
return View();
}
```

- Set items source and mapping

C#

```
public ActionResult Default()
{
Heatmap.ItemsMapping = CellMapping;
ViewData["HeatMapModel"] = Heatmap;
return View();
}
public Collection GetCellSource()
{
Collection collection = new Collection();
string[] name = { "Veggie-spread", "Tofu", "Alice Mutton", "Donut",
"Burger", "Perth Pasties" };
Random random = new Random();
foreach (string item in name)
{
for (int i = 0; i < 6; i++)
{
double value = random.Next(0, random.Next(0, 100));
collection.Add(new SampleCellData() { ProductName = item, Year = "Y" + (2011
+ i), Value = value });
}
}
return collection;
}
```

Product Name	Y2010	Y2011	Y2012	Y2013	Y2014	Y2015	Y2016	Y2017
Vegie-spread	43	23	51	23	87	22	59	15
Tofuaa	50	92	28	18	58	26	81	99
Alice Mutton	15	81	56	35	53	14	47	35
Konbu	22	85	49	69	25	48	18	23
Fløtemysost	35	81	78	35	90	61	2	39
Perth Pasties	42	64	81	36	3	17	84	15
Boston Crab Meat	82	76	86	25	56	33	83	90
Raclette Courdavault	74	53	19	46	88	43	83	22

Color Mapping

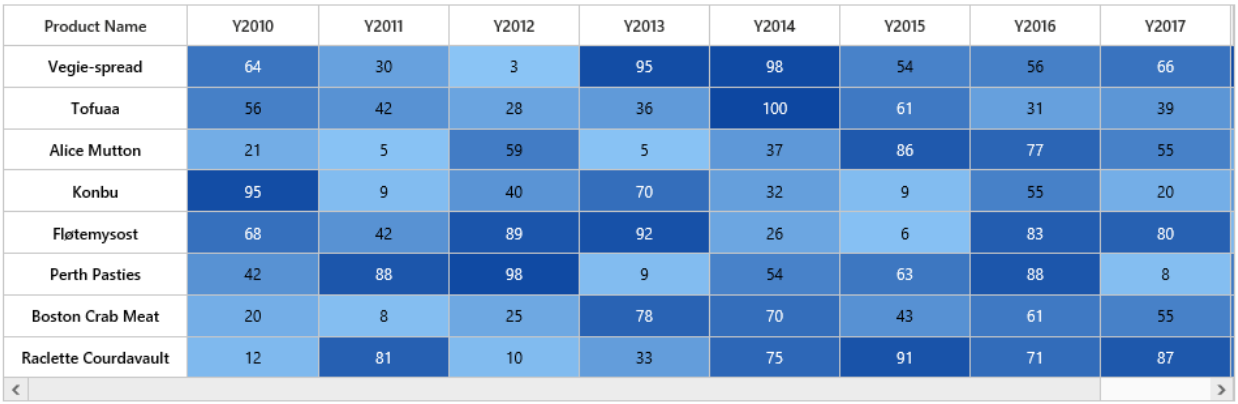
Next we can configure color range for these values using color mapping

- Configure items mapping based on items source.

C#

```
public ActionResult Default()
{
HeatMapProperties Heatmap = new HeatMapProperties();
List<HeatMapColorMapping> colorCollection = new List<HeatMapColorMapping>();
colorCollection.Add(new HeatMapColorMapping() { Color = "#8ec8f8", Label =
new HeatMapLabel() { Text = "0" }, Value = 0 });
colorCollection.Add(new HeatMapColorMapping() { Color = "#0d47a1", Label =
new HeatMapLabel() { Text = "100" }, Value = 100 });
Heatmap.ColorMappingCollection = colorCollection;
ViewData["HeatMapModel"] = Heatmap;
return View();
}
```

- This will show the grid data with color based on the range given.



Product Name	Y2010	Y2011	Y2012	Y2013	Y2014	Y2015	Y2016	Y2017
Vegie-spread	64	30	3	95	98	54	56	66
Tofuaa	56	42	28	36	100	61	31	39
Alice Mutton	21	5	59	5	37	86	77	55
Konbu	95	9	40	70	32	9	55	20
Fløtemysost	68	42	89	92	26	6	83	80
Perth Pasties	42	88	98	9	54	63	88	8
Boston Crab Meat	20	8	25	78	70	43	61	55
Raclette Courdavault	12	81	10	33	75	91	71	87

Legend

A legend control is used to represent range value in a gradient, create a legend with the same color mapping as shown below.

HTML

```
<div>
@Html.EJ().HeatMapLegend("heatmapLegend", ViewData["HeatMapLegendModel"] as
Syncfusion.JavaScript.DataVisualization.Models.HeatMapLegendProperties)
</div>
```

- Final code files looks like this.

C#

```
public ActionResult Default()
{
HeatMapProperties Heatmap = new HeatMapProperties();
List<HeatMapColorMapping> colorCollection = new List<HeatMapColorMapping>();
colorCollection.Add(new HeatMapColorMapping() { Color = "#8ec8f8", Label =
new HeatMapLabel() { Text = "0" }, Value = 0 });
colorCollection.Add(new HeatMapColorMapping() { Color = "#0d47a1", Label =
new HeatMapLabel() { Text = "100" }, Value = 100 });
Heatmap.ColorMappingCollection = colorCollection;
```

Copyright © 2001 - 2020 Syncfusion Inc.

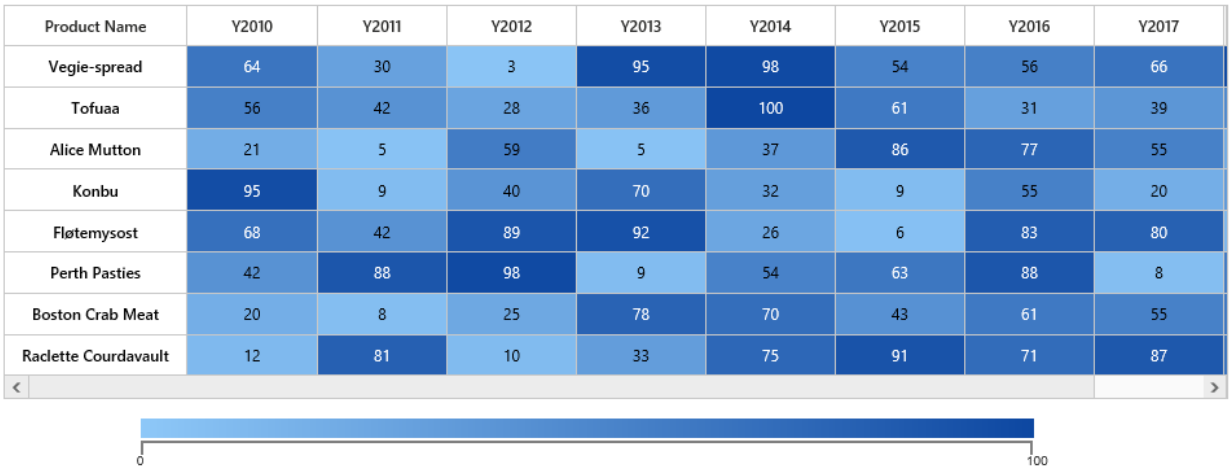
```
Heatmap.LegendCollection.Add("heatmapLegend");
Heatmap.Width = "830";
CellMapping CellMapping = new CellMapping();
CellMapping.Column = new PropertyMapping() { PropertyName = "ProductName",
DisplayName = "Product Name" };
CellMapping.Row = new PropertyMapping() { PropertyName = "Year", DisplayName
= "Year" };
CellMapping.Value = new PropertyMapping() { PropertyName = "Value" };
Collection columnMapping = new Collection();
columnMapping.Add(new HeaderMapping() { PropertyName = "Veggie-spread",
DisplayName = "Veggie-spread" });
columnMapping.Add(new HeaderMapping() { PropertyName = "Tofu", DisplayName =
"Tofu" });
columnMapping.Add(new HeaderMapping() { PropertyName = "Alice Mutton",
DisplayName = "Alice Mutton" });
columnMapping.Add(new HeaderMapping() { PropertyName = "Donut", DisplayName
= "Donut" });
columnMapping.Add(new HeaderMapping() { PropertyName = "Burger", DisplayName
= "Burger" });
columnMapping.Add(new HeaderMapping() { PropertyName = "Perth Pasties",
DisplayName = "Perth Pasties" });
CellMapping.ColumnMapping = columnMapping;
HeaderMapping headerMapping = new HeaderMapping() { PropertyName = "Year",
DisplayName = "Year", ColumnStyle = new ColumnStyle() { Width = 105,
TextAlign = HeatMapTextAlign.Right } };
CellMapping.HeaderMapping = headerMapping;
Heatmap.ItemsSource = GetCellSource();
Heatmap.ItemsMapping = CellMapping;
Heatmap.IsResponsive = true;
ViewData["HeatMapModel"] = Heatmap;
HeatMapLegendProperties legend = new HeatMapLegendProperties();
legend.ColorMappingCollection = colorCollection;
legend.Orientation = HeatMapLegendOrientation.Horizontal;
legend.LegendMode =
Syncfusion.JavaScript.DataVisualization.HeatMapEnums.HeatMapLegendMode.Gradi
ent;
legend.Height = "50px";
legend.Width = "75%";
legend.IsResponsive = true;
ViewData["HeatMapLegendModel"] = legend;
return View();
}
public Collection GetCellSource()
{
Collection collection = new Collection();
string[] name = { "Veggie-spread", "Tofu", "Alice Mutton", "Donut",
"Burger", "Perth Pasties" };
Random random = new Random();
foreach (string item in name)
{
for (int i = 0; i < 6; i++)
{
double value = random.Next(0, random.Next(0, 100));
collection.Add(new SampleCellData() { ProductName = item, Year = "Y" + (2011
+ i), Value = value });
}
}
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
return collection;
}
```

HTML

```
<div>
@Html.EJ().HeatMap("heatmap", ViewData["HeatMapModel"] as
Syncfusion.JavaScript.DataVisualization.Models.HeatMapProperties)
</div>
<div style="height: 15px; width: 100%;"></div>
<div>
@Html.EJ().HeatMapLegend("heatmapLegend", ViewData["HeatMapLegendModel"] as
Syncfusion.JavaScript.DataVisualization.Models.HeatMapLegendProperties)
</div>
```



Items Mapping

External data source can be mapped with HeatMap using ItemsMapping property. It supports 2 kind of data source.

- In TableMapping rows represents an objects in collection, columns represents numerical properties of that object.
- In CellMapping each cell represent an object in collection, this collection is grouped based on specific property to form as rows and columns.

Let us see the difference between two types of mapping. Following table represents two different data structure to represent the same HeatMap.

CellMapping	TableMapping
{% highlight c# %}public ActionResult Default(){ HeatMapProperties Heatmap = new HeatMapProperties(); CellMapping CellMapping = new CellMapping(); CellMapping.Column = new PropertyMapping() { PropertyName = "ProductName", DisplayName = "Product Name" };	{% highlight c# %}public ActionResult TableDataBinding(){ HeatMapProperties Heatmap = new HeatMapProperties(); TableMapping TableMapping = new TableMapping(); TableMapping.HeaderMapping = new HeaderMapping() { PropertyName =

Copyright © 2001 - 2020 Syncfusion Inc.

CellMapping.Row = new PropertyMapping() { PropertyName = "Year", DisplayName = "Year" }; CellMapping.Value = new PropertyMapping() { PropertyName = "Value" }; Collection columnMapping = new Collection(); columnMapping.Add(new HeaderMapping() { PropertyName = "Veggie-spread", DisplayName = "Veggie-spread" }); columnMapping.Add(new HeaderMapping() { PropertyName = "Tofu", DisplayName = "Tofu" }); columnMapping.Add(new HeaderMapping() { PropertyName = "Alice Mutton", DisplayName = "Alice Mutton" }); columnMapping.Add(new HeaderMapping() { PropertyName = "Donut", DisplayName = "Donut" }); columnMapping.Add(new HeaderMapping() { PropertyName = "Burger", DisplayName = "Burger" }); columnMapping.Add(new HeaderMapping() { PropertyName = "Perth Pasties", DisplayName = "Perth Pasties" }); CellMapping.ColumnMapping = columnMapping; HeaderMapping headerMapping = new HeaderMapping() { PropertyName = "Year", DisplayName = "Year", ColumnStyle = new ColumnStyle() { Width = 105, TextAlign = HeatMapTextAlign.Right } }; CellMapping.HeaderMapping = headerMapping; Heatmap.ItemsSource = GetCellSource(); Heatmap.ItemsMapping = CellMapping; ViewData["HeatMapModel"] = Heatmap; return View();}public Collection GetCellSource(){ Collection collection = new Collection(); string[] name = { "Veggie-spread", "Tofu", "Alice Mutton", "Donut", "Burger", "Perth Pasties" }; Random random = new Random(); foreach (string item in name) { for (int i = 0; i < 6; i++) { double value = random.Next(0, random.Next(0, 100)); collection.Add(new SampleCellData() { ProductName = item, Year = "Y" + (2011 + i), Value = value }); } } return collection;}{% endhighlight %}	"ProductName", DisplayName = "Product Name", ColumnStyle = new ColumnStyle() { Width = 140, TextAlign = HeatMapTextAlign.Right } }; TableMapping.ColumnMapping.Add(new HeaderMapping() { PropertyName = "Y2010", DisplayName = "Y2010" }); TableMapping.ColumnMapping.Add(new HeaderMapping() { PropertyName = "Y2011", DisplayName = "Y2011" }); TableMapping.ColumnMapping.Add(new HeaderMapping() { PropertyName = "Y2012", DisplayName = "Y2012" }); TableMapping.ColumnMapping.Add(new HeaderMapping() { PropertyName = "Y2013", DisplayName = "Y2013" }); TableMapping.ColumnMapping.Add(new HeaderMapping() { PropertyName = "Y2014", DisplayName = "Y2014" }); TableMapping.ColumnMapping.Add(new HeaderMapping() { PropertyName = "Y2015", DisplayName = "Y2015" }); Heatmap.ItemsMapping = TableMapping; Heatmap.ItemsSource = GetTableSource(); ViewData["HeatMapModel"] = Heatmap; return View(); }public Collection GetTableSource(){ Collection collection = new Collection(); Random random = new Random(); string[] rows = { "Veggie-spread", "Tofu", "Alice Mutton", "Donut", "Burger", "Perth Pasties", "Boston Crab Meat", "Racket Burger" }; for (int i = 0; i < 8; i++) { collection.Add(new SampleTableData() { ProductName = rows[i], Y2010 = random.Next(0, 100), Y2011 = random.Next(0, 100), Y2012 = random.Next(0, 100), Y2013 = random.Next(0, 100), Y2014 = random.Next(0, 100), Y2015 = random.Next(0, 100) }); } return collection;}{% endhighlight %}
Here, a single ProductInfo object represent a value for a particular product in a particular year	Here, a single ProductInfo object represents value for a particular product from year 2010 to 2015.

ProductName	2010	2011
Vegie-spread	64	56
Tofuaa	26	93
Alice Mutton	47	67
Konbu	67	36

ProductName	2010	2011
Vegie-spread	64	56
Tofuaa	26	93
Alice Mutton	47	67
Konbu	67	36

Color Mapping

Color mapping is used to indicate values as colors instead of numerical values. For example, if a HeatMap represents a data from 0 to 100. ColorMapping is used to specify a color for lower value and higher value. For any value between two values, a medium color will be automatically be chosen.

In color mapping, when white color is set to value 0 and red color is set for value 30, as shown below.

C#

```
public ActionResult Default()
{
HeatMapProperties Heatmap = new HeatMapProperties();
List<HeatMapColorMapping> colorCollection = new List<HeatMapColorMapping>();
colorCollection.Add(new HeatMapColorMapping() { Color = "#8ec8f8", Label =
new HeatMapLabel() { Text = "0" }, Value = 0 });
colorCollection.Add(new HeatMapColorMapping() { Color = "#0d47a1", Label =
new HeatMapLabel() { Text = "100" }, Value = 100 });
Heatmap.ColorMappingCollection = colorCollection;
ViewData["HeatMapModel"] = Heatmap;
return View();
}
```

Resultant HeatMap will be as shown below.

Product Name	Y2010	Y2011	Y2012	Y2013	Y2014	Y2015	Y2016	Y2017
Vegie-spread	84	65	55	80	13	100	41	96
Tofuaa	84	83	94	29	82	2	9	20
Alice Mutton	24	39	49	16	53	74	34	52
Konbu	57	1	95	47	39	39	98	52
Fløtemysost	13	40	57	71	27	22	42	19
Perth Pasties	30	70	38	78	5	27	45	63
Boston Crab Meat	56	52	60	7	74	68	45	100
Raclette Courdavault	90	2	58	90	80	94	30	77

Legend

Legend is a control used to summarize the range of colors in HeatMap. This gives visual guideline for mapping between value and color.

Copyright © 2001 - 2020 Syncfusion Inc.

Create Legend

Legend can be created with color mapping as shown below.

C#

```
public ActionResult TableDataBinding()
{
List<HeatMapColorMapping> colorCollection = new List<HeatMapColorMapping>();
colorCollection.Add(new HeatMapColorMapping() { Color = "#fe0002", Label =
new HeatMapLabel() { Text = "Poor" }, Value = 0 });
colorCollection.Add(new HeatMapColorMapping() { Color = "#ffff01", Label =
new HeatMapLabel() { Text = "Average" }, Value = 3 });
colorCollection.Add(new HeatMapColorMapping() { Color = "#13ab11", Label =
new HeatMapLabel() { Text = "Good" }, Value = 6 });
colorCollection.Add(new HeatMapColorMapping() { Color = "#005ba2", Label =
new HeatMapLabel() { Text = "Excellent" }, Value = 10 });
Heatmap.ColorMappingCollection = colorCollection;
HeatMapLegendProperties legend = new HeatMapLegendProperties();
legend.ColorMappingCollection = colorCollection;
legend.Orientation = HeatMapLegendOrientation.Horizontal;
legend.LegendMode = HeatMapLegendMode.Gradient;
legend.Height = "50px";
legend.Width = "75%";
ViewData["HeatMapLegendModel"] = legend;
return View();
}
```

Resultant legend will be like following image.

Legend Mode

There are two modes for Legend

- Gradient
- List

Gradient:

C#

```
public ActionResult TableDataBinding()
{
HeatMapLegendProperties legend = new HeatMapLegendProperties();
legend.Orientation = HeatMapLegendOrientation.Horizontal;
legend.LegendMode = HeatMapLegendMode.Gradient;
ViewData["HeatMapLegendModel"] = legend;
return View();
}
```

Copyright © 2001 - 2020 Syncfusion Inc.

List:

C#

```
public ActionResult TableDataBinding()
{
HeatMapLegendProperties legend = new HeatMapLegendProperties();
legend.Orientation = HeatMapLegendOrientation.Horizontal;
legend.LegendMode = HeatMapLegendMode.List;
ViewData["HeatMapLegendModel"] = legend;
return View();
}
```

Orientation

There are 2 types of Orientation, applicable for Gradient and List Mode

- Horizontal
- Vertical

Horizontal:

C#

```
public ActionResult TableDataBinding()
{
HeatMapLegendProperties legend = new HeatMapLegendProperties();
legend.Orientation = HeatMapLegendOrientation.Horizontal;
legend.LegendMode = HeatMapLegendMode.List;
ViewData["HeatMapLegendModel"] = legend;
return View();
}
```

Vertical:

C#

```
public ActionResult TableDataBinding()
{
HeatMapLegendProperties legend = new HeatMapLegendProperties();
legend.Orientation = HeatMapLegendOrientation.Vertical;
legend.LegendMode = HeatMapLegendMode.List;
ViewData["HeatMapLegendModel"] = legend;
return View();
}
```

Kanban Board

Overview

The Kanban control for ASP.NET MVC is an efficient way to visualize the workflow at each stage along its path to completion. The most important features available are Swim lane, filtering, and editing.

Some important features of the Kanban control are:

** DataSource - Bind the Kanban control with an array of JSON objects or ej.DataManager which support OData and remote web service binding. * Swim lane – Supports Swim lane grouping. Filters – Supports filtering based on user Query. Editing - Offers card editing, inserting, and deleting using Dialog. Card template - Offers to render the card based on user template. RTL support - Provides a full-fledged right-to-left mode which aligns content in the Kanban control from right to left. * Localization - Provides inherent support to localize the UI.*

Getting Started

This section explains briefly how to create a Kanban in your application with ASP.NET MVC and also explains about how to enable basic Kanban features like Swim lane, Filtering.

Create your first Kanban in MVC

The following steps explain creating first Kanban with an empty columns.

1. Create Syncfusion ASP.NET MVC application. You can refer MVC Getting Started documentation to create new project and add necessary dll's and script files. 2. Add a Kanban control in View file with an empty columns as like as follows. In Columns definition, the HeaderText property allows you to set text to column headers.

HTML

```
@(Html.EJ().Kanban("Kanban")
.Columns(col =>
{
col.HeaderText("Backlog").Add();
col.HeaderText("In Progress").Add();
col.HeaderText("Done").Add();
})
)
```

Copyright © 2001 - 2020 Syncfusion Inc.

Data Binding

You can bind the data to Kanban control by either locally or remotely. Assign the local data to DataSource property of Kanban control to bind local data.

RAZOR

```
@(Html.EJ().Kanban("Kanban")
.DataSource((IEnumerable<object>)ViewBag.datasource)
.Columns(col =>
{
col.HeaderText("Backlog").Add();
col.HeaderText("In Progress").Add();
col.HeaderText("Done").Add();
})
)
```

C#

```
public partial class KanbanController : Controller
{
List<Tasks> Task = new List<Tasks>();
// GET: /Kanban/
public ActionResult KanbanFeatures()
{
Task.Add(new Tasks(1, "Open", "Analyze the new requirements gathered from
the customer.", "Story", "Low", "Analyze,Customer", 3.5, "Andrew Fuller",
"../content/images/kanban/1.png", 1));
Task.Add(new Tasks(2, "InProgress", "Improve application performance",
"Improvement", "Normal", "Improvement", 6, "Andrew Fuller",
"../content/images/kanban/2.png", 1));
Task.Add(new Tasks(3, "Open", "Arrange a web meeting with the customer to
get new requirements.", "Others", "Critical", "Meeting", 5.5, "Janet",
"../content/images/kanban/3.png", 2));
Task.Add(new Tasks(4, "InProgress", "Fix the issues reported in the IE
browser.", "Bug", "Release Breaker", "IE", 2.5, "Janet",
"../content/images/kanban/3.png", 2));
Task.Add(new Tasks(5, "Testing", "Fix the issues reported by the customer.",
"Bug", "Low", "Customer", 3.5, "Andrew Fuller",
"../content/images/kanban/5.png", 1));
Task.Add(new Tasks(6, "Close", "Arrange a web meeting with the customer to
get the login page requirements.", "Others", "Low", "Meeting", 2, "Janet",
"../content/images/kanban/6.png", 1));
Task.Add(new Tasks(7, "Validate", "Validate new requirements",
"Improvement", "Low", "Validation", 1.5, "Janet",
"../content/images/kanban/7.png", 4));
Task.Add(new Tasks(8, "Close", "Login page validation", "Story", "Release
Breaker", "Validation,Fix", 2.5, "Andrew Fuller",
"../content/images/kanban/8.png", 2));
Task.Add(new Tasks(9, "Testing", "Fix the issues reported in Safari
browser.", "Bug", "Release Breaker", "Fix,Safari", 1.5, "Janet",
"../content/images/kanban/1.png", 2));
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
Task.Add(new Tasks(10, "Close", "Test the application in the IE browser.",
"Story", "Low", "Testing,IE", 5.5, "Andrew Fuller",
"../content/images/kanban/4.png", 3));
ViewBag.datasource = Task;
return View();
}
}
public class Tasks
{
public Tasks()
{
}
public Tasks(int Id, string Status, string Summary, string Type, string
Priority, string Tags, double Estimate, string Assignee, string Image, int
RankId)
{
this.Id = Id;
this.Status = Status;
this.Summary = Summary;
this.Type = Type;
this.Priority = Priority;
this.Tags = Tags;
this.Estimate = Estimate;
this.Assignee = Assignee;
this.Image = Image;
this.RankId = RankId;
}
public int Id { get; set; }
public string Status { get; set; }
public string Summary { get; set; }
public string Type { get; set; }
public string Priority { get; set; }
public string Tags { get; set; }
public double Estimate { get; set; }
public string Assignee { get; set; }
public string Image { get; set; }
public int RankId { get; set; }
}
```

Note: ODataAdaptor is the default adaptor used within DataManager. While binding to other web services, proper data adaptor needs to be set for adaptor option of DataManager.

Mapping Values

In order to display cards in Kanban control, you need to map the database fields to Kanban cards and columns. The required mapping field are listed as follows

- KeyField - Map the column name to use as Key values to columns.
- Columns - Map the corresponding Key values of KeyField column to each columns
- Content - Map the column name to use as content to cards in the Fields.
- PrimaryKey - Map the column name to use as Primary Key in Fields.

RAZOR

```
@(Html.EJ().Kanban("Kanban")
.DataSource((IEnumerable<object>)ViewBag.datasource)
.Columns(col =>
{
col.HeaderText("Backlog").Key("Open").Add();
col.HeaderText("In Progress").Key("InProgress").Add();
col.HeaderText("Done").Key("Close").Add();
})
.KeyField("Status")
.Fields(field =>
{
field.Color("Type")
.Content("Summary")
.PrimaryKey("Id");
})
)
```

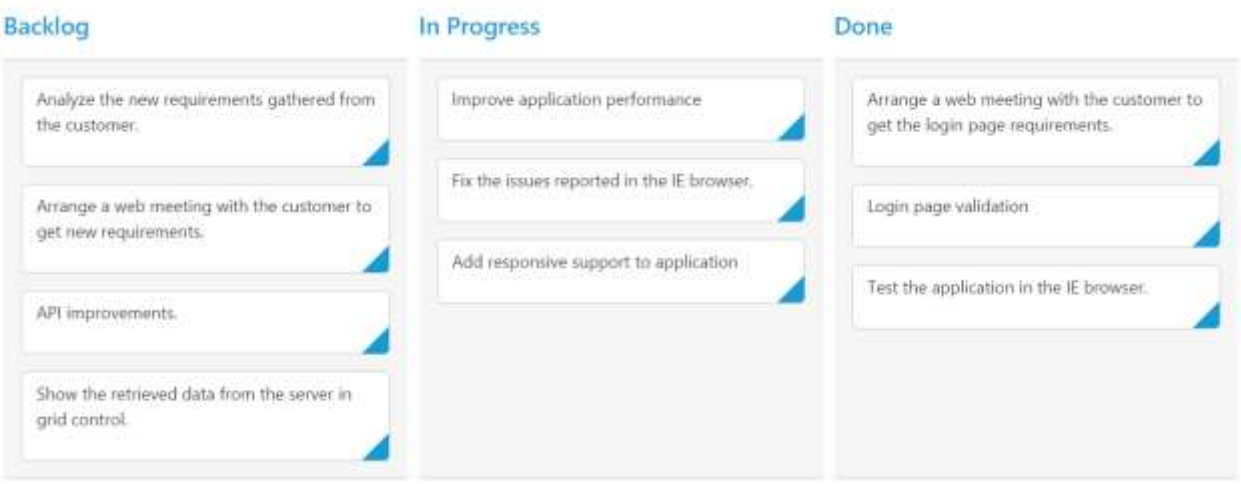
C#

```
public partial class KanbanController : Controller
{
List<Tasks> Task = new List<Tasks>();
// GET: /Kanban/
public ActionResult KanbanFeatures()
{
Task.Add(new Tasks(1, "Open", "Analyze the new requirements gathered from
the customer.", "Story", "Low", "Analyze,Customer", 3.5, "Andrew Fuller",
"../content/images/kanban/1.png", 1));
Task.Add(new Tasks(2, "InProgress", "Improve application performance",
"Improvement", "Normal", "Improvement", 6, "Andrew Fuller",
"../content/images/kanban/2.png", 1));
Task.Add(new Tasks(3, "Open", "Arrange a web meeting with the customer to
get new requirements.", "Others", "Critical", "Meeting", 5.5, "Janet",
"../content/images/kanban/3.png", 2));
Task.Add(new Tasks(4, "InProgress", "Fix the issues reported in the IE
browser.", "Bug", "Release Breaker", "IE", 2.5, "Janet",
"../content/images/kanban/3.png", 2));
Task.Add(new Tasks(5, "Testing", "Fix the issues reported by the customer.",
"Bug", "Low", "Customer", 3.5, "Andrew Fuller",
"../content/images/kanban/5.png", 1));
Task.Add(new Tasks(6, "Close", "Arrange a web meeting with the customer to
get the login page requirements.", "Others", "Low", "Meeting", 2, "Janet",
"../content/images/kanban/6.png", 1));
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
Task.Add(new Tasks(7, "Validate", "Validate new requirements",
"Improvement", "Low", "Validation", 1.5, "Janet",
"../content/images/kanban/7.png", 4));
Task.Add(new Tasks(8, "Close", "Login page validation", "Story", "Release
Breaker", "Validation,Fix", 2.5, "Andrew Fuller",
"../content/images/kanban/8.png", 2));
Task.Add(new Tasks(9, "Testing", "Fix the issues reported in Safari
browser.", "Bug", "Release Breaker", "Fix,Safari", 1.5, "Janet",
"../content/images/kanban/1.png", 2));
Task.Add(new Tasks(10, "Close", "Test the application in the IE browser.",
"Story", "Low", "Testing,IE", 5.5, "Andrew Fuller",
"../content/images/kanban/4.png", 3));
ViewBag.datasource = Task;
return View();
}
}
public class Tasks
{
public Tasks()
{
}
public Tasks(int Id, string Status, string Summary, string Type, string
Priority, string Tags, double Estimate, string Assignee, string Image, int
RankId)
{
this.Id = Id;
this.Status = Status;
this.Summary = Summary;
this.Type = Type;
this.Priority = Priority;
this.Tags = Tags;
this.Estimate = Estimate;
this.Assignee = Assignee;
this.Image = Image;
this.RankId = RankId;
}
public int Id { get; set; }
public string Status { get; set; }
public string Summary { get; set; }
public string Type { get; set; }
public string Priority { get; set; }
public string Tags { get; set; }
public double Estimate { get; set; }
public string Assignee { get; set; }
public string Image { get; set; }
public int RankId { get; set; }
}
```

Copyright © 2001 - 2020 Syncfusion Inc.



Note: PrimaryKey field is mandatory for "Drag and Drop","Selection" and "Editing" Features.

Enable Swimlane

Swimlane can be enabled by mapping the SwimlaneKey to appropriate column name in DataSource. This enables the grouping of the cards based on the mapped column values.

RAZOR

```
@(Html.EJ().Kanban("Kanban")
.DataSource((IEnumerable<object>)ViewBag.datasource)
.Columns(col =>
{
col.HeaderText("Backlog").Key("Open").Add();
col.HeaderText("In Progress").Key("InProgress").Add();
col.HeaderText("Done").Key("Close").Add();
})
.KeyField("Status")
.Fields(field =>
{
field.Color("Type")
.Content("Summary")
.SwimlaneKey("Assignee")
.PrimaryKey("Id");
})
)
```

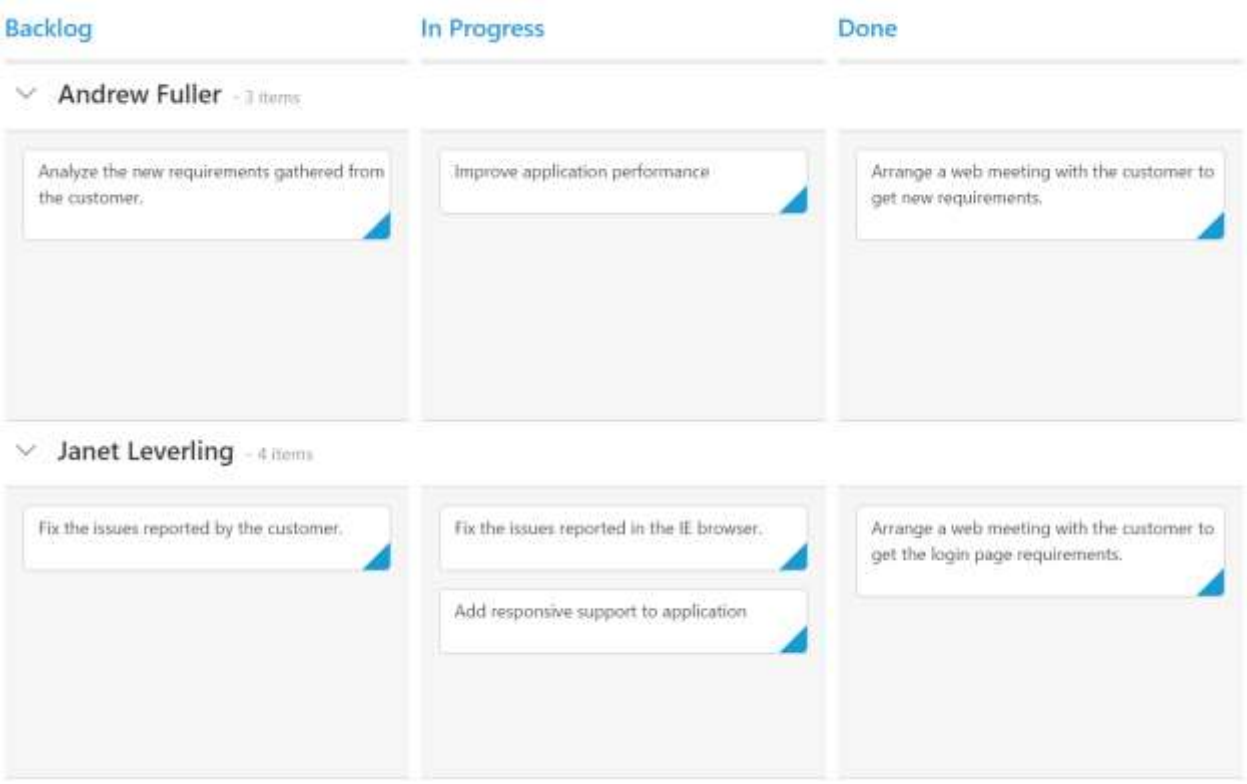
C#

```
public partial class KanbanController : Controller
{
List<Tasks> Task = new List<Tasks>();
// GET: /Kanban/
public ActionResult KanbanFeatures()
{
Task.Add(new Tasks(1, "Open", "Analyze the new requirements gathered from
the customer.", "Story", "Low", "Analyze,Customer", 3.5, "Andrew Fuller",
"../content/images/kanban/1.png", 1));
```

```
Task.Add(new Tasks(2, "InProgress", "Improve application performance",
"Improvement", "Normal", "Improvement", 6, "Andrew Fuller",
"../content/images/kanban/2.png", 1));
Task.Add(new Tasks(3, "Open", "Arrange a web meeting with the customer to
get new requirements.", "Others", "Critical", "Meeting", 5.5, "Janet",
"../content/images/kanban/3.png", 2));
Task.Add(new Tasks(4, "InProgress", "Fix the issues reported in the IE
browser.", "Bug", "Release Breaker", "IE", 2.5, "Janet",
"../content/images/kanban/3.png", 2));
Task.Add(new Tasks(5, "Testing", "Fix the issues reported by the customer.",
"Bug", "Low", "Customer", 3.5, "Andrew Fuller",
"../content/images/kanban/5.png", 1));
Task.Add(new Tasks(6, "Close", "Arrange a web meeting with the customer to
get the login page requirements.", "Others", "Low", "Meeting", 2, "Janet",
"../content/images/kanban/6.png", 1));
Task.Add(new Tasks(7, "Validate", "Validate new requirements",
"Improvement", "Low", "Validation", 1.5, "Janet",
"../content/images/kanban/7.png", 4));
Task.Add(new Tasks(8, "Close", "Login page validation", "Story", "Release
Breaker", "Validation,Fix", 2.5, "Andrew Fuller",
"../content/images/kanban/8.png", 2));
Task.Add(new Tasks(9, "Testing", "Fix the issues reported in Safari
browser.", "Bug", "Release Breaker", "Fix,Safari", 1.5, "Janet",
"../content/images/kanban/1.png", 2));
Task.Add(new Tasks(10, "Close", "Test the application in the IE browser.",
"Story", "Low", "Testing,IE", 5.5, "Andrew Fuller",
"../content/images/kanban/4.png", 3));
ViewBag.datasource = Task;
return View();
}
}
public class Tasks
{
public Tasks()
{
}
public Tasks(int Id, string Status, string Summary, string Type, string
Priority, string Tags, double Estimate, string Assignee, string Image, int
RankId)
{
this.Id = Id;
this.Status = Status;
this.Summary = Summary;
this.Type = Type;
this.Priority = Priority;
this.Tags = Tags;
this.Estimate = Estimate;
this.Assignee = Assignee;
this.Image = Image;
this.RankId = RankId;
}
public int Id { get; set; }
public string Status { get; set; }
public string Summary { get; set; }
public string Type { get; set; }
public string Priority { get; set; }
public string Tags { get; set; }
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
public double Estimate { get; set; }
public string Assignee { get; set; }
public string ImgUrl { get; set; }
public int RankId { get; set; }
}
```



Adding Filters

Filters allows to filter the collection of cards from DataSource which meets the predefined query in the filters collection. To enable filtering, define FilterSettings collection with display Text and ej.Query.

RAZOR

```
@(Html.EJ().Kanban("Kanban")
.DataSource((IEnumerable<object>)ViewBag.datasource)
.Columns(col =>
{
col.HeaderText("Backlog").Key("Open").Add();
col.HeaderText("In Progress").Key("InProgress").Add();
col.HeaderText("Done").Key("Close").Add();
})
.KeyField("Status")
.Fields(field =>
{
field.Color("Type")
.Content("Summary")
.SwimlaneKey("Assignee")
.PrimaryKey("Id");
})
.FilterSettings(filter =>
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
{
filter.Text("Janet Issues").Query("new ej.Query().where('Assignee', 'equal',
'Janet')").Description("Displays issues which matches the assignee as
'Janet").Add();
filter.Text("Closed Issues").Query("new ej.Query().where('Status', 'equal',
'Close')").Description("Display the issues of 'Testing'").Add();
})
)
```

C#

```
public partial class KanbanController : Controller
{
List<Tasks> Task = new List<Tasks>();
// GET: /Kanban/
public ActionResult KanbanFeatures()
{
Task.Add(new Tasks(1, "Open", "Analyze the new requirements gathered from
the customer.", "Story", "Low", "Analyze,Customer", 3.5, "Andrew Fuller",
"../content/images/kanban/1.png", 1));
Task.Add(new Tasks(2, "InProgress", "Improve application performance",
"Improvement", "Normal", "Improvement", 6, "Andrew Fuller",
"../content/images/kanban/2.png", 1));
Task.Add(new Tasks(3, "Open", "Arrange a web meeting with the customer to
get new requirements.", "Others", "Critical", "Meeting", 5.5, "Janet",
"../content/images/kanban/3.png", 2));
Task.Add(new Tasks(4, "InProgress", "Fix the issues reported in the IE
browser.", "Bug", "Release Breaker", "IE", 2.5, "Janet",
"../content/images/kanban/3.png", 2));
Task.Add(new Tasks(5, "Testing", "Fix the issues reported by the customer.",
"Bug", "Low", "Customer", 3.5, "Andrew Fuller",
"../content/images/kanban/5.png", 1));
Task.Add(new Tasks(6, "Close", "Arrange a web meeting with the customer to
get the login page requirements.", "Others", "Low", "Meeting", 2, "Janet",
"../content/images/kanban/6.png", 1));
Task.Add(new Tasks(7, "Validate", "Validate new requirements",
"Improvement", "Low", "Validation", 1.5, "Janet",
"../content/images/kanban/7.png", 4));
Task.Add(new Tasks(8, "Close", "Login page validation", "Story", "Release
Breaker", "Validation,Fix", 2.5, "Andrew Fuller",
"../content/images/kanban/8.png", 2));
Task.Add(new Tasks(9, "Testing", "Fix the issues reported in Safari
browser.", "Bug", "Release Breaker", "Fix,Safari", 1.5, "Janet",

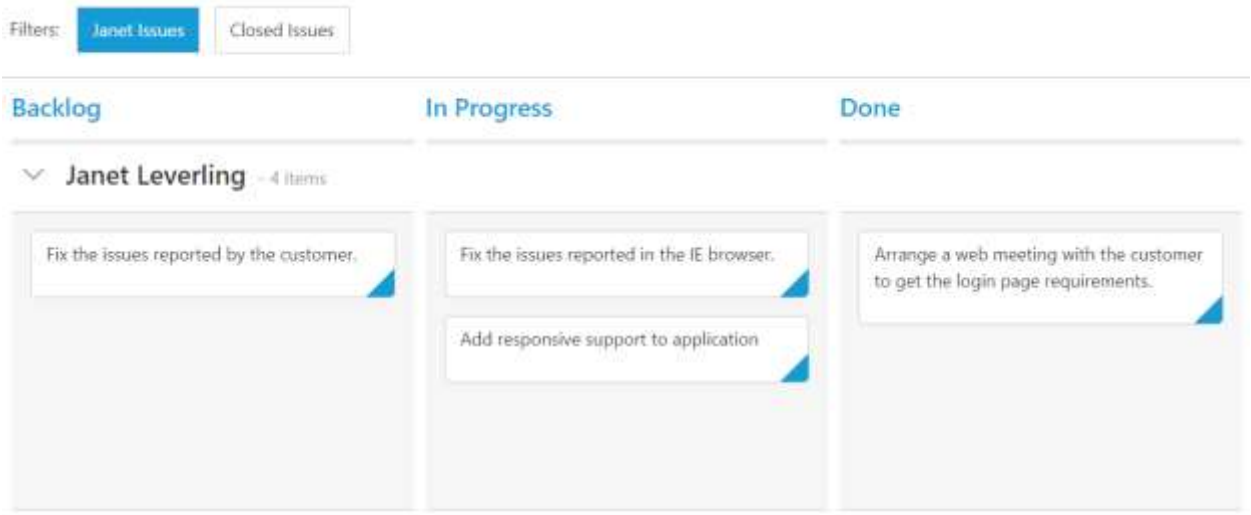
public string Type { get; set; }
public string Priority { get; set; }
public string Tags { get; set; }
public double Estimate { get; set; }
public string Assignee { get; set; }
public string ImgUrl { get; set; }
public int RankId { get; set; }
}
```



Columns

Column fields are present in the dataSource schema and it is rendering cards based its mapping column values.

Key Mapping

To render Kanban with simple cards, you need to map the dataSource fields to Kanban cards and Columns. The required mapping field are listed as follows

Mapping Fields	Description

KeyField	Map the column name to use as Key values to columns.
Columns.Key	Map the corresponding key values of KeyField column to each columns.
Columns.HeaderText	It represents the title for particular column
Fields.Content	Map the column name to use as content to cards.

Note: 1. If the column with KeyField is not in the dataSource and Key values specified will not available in column values, then the cards will not be rendered.

2. If the Fields.Content is not in the dataSource, then empty cards will be rendered.

The following code example describes the above behavior.

RAZOR

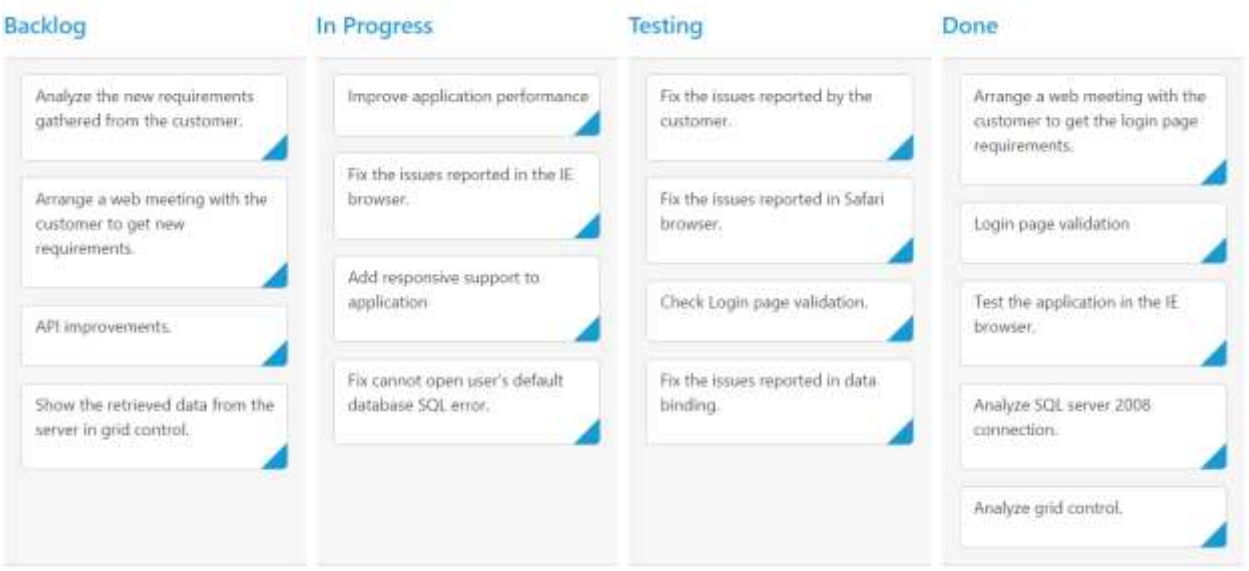
```
@(Html.EJ().Kanban("Kanban")
.DataSource((IEnumerable<object>)ViewBag.datasource)
.Columns(col =>
{
col.HeaderText("Backlog").Key("Open").Add();
col.HeaderText("In Progress").Key("InProgress").Add();
col.HeaderText("Testing").Key("Testing").Add();
col.HeaderText("Done").Key("Close").Add();
})
.KeyField("Status")
.Fields(field =>
{
field.Content("Summary");
})
)
```

C#

```
namespace MVCSampleBrowser
{
public partial class KanbanController : Controller
{
public ActionResult KanbanFeatures()
{
var DataSource = new NorthwindDataContext().Tasks.Take(30).ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.

Copyright © 2001 - 2020 Syncfusion Inc.



Multiple Key Mapping

You can map more than one datasource fields as Key values to show different key cards into single column. For e.g , you can map "Validate,In progress" keys under "In progress" column.

The following code example and screenshot which describes the above behavior.

RAZOR

```
@(Html.EJ().Kanban("Kanban")
.DataSource((IEnumerable<object>)ViewBag.datasource)
.Columns(col =>
{
col.HeaderText("Backlog").Key("Open").Add();
col.HeaderText("In Progress or Validate").Key("InProgress,Validate").Add();
col.HeaderText("Testing").Key("Testing").Add();
col.HeaderText("Done").Key("Close").Add();
})
.KeyField("Status")
.Fields(field =>
{
field.Content("Summary");
})
)
```

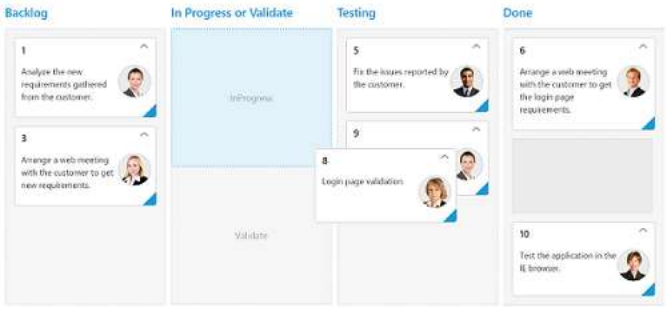
C#

```
namespace MVCSampleBrowser
{
public partial class KanbanController : Controller
{
public ActionResult KanbanFeatures()
{
var DataSource = new NorthwindDataContext().Tasks.Take(30).ToList();
ViewBag.datasource = DataSource;
return View();
}
}
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
}
```

The following output is displayed as a result of the above code example.



Headers

Header Template

The template design that applies on for the column header. To render template, set HeaderTemplate property of the Columns.

You can use JsRender syntax in the template. For more information about JsRender syntax, please refer the link.

The following code example describes the above behavior.

HTML

```
<!-- Column Template -->
<script id="column1" type="text/x-jsrender">
<span class="e-backlog e-icon"></span> Backlog
</script>
<div id="column4">
<span class="e-done e-icon"></span> Done
</div>
<div id='Kanban'></div>
```

RAZOR

```
@(Html.EJ().Kanban("Kanban")
.DataSource((IEnumerable<object>)ViewBag.datasource)
.Columns(col =>
{
col.HeaderText("Backlog").Key("Open").HeaderTemplate("#column1").Add();
col.HeaderText("In Progress").Key("InProgress").Add();
col.HeaderText("Testing").Key("Testing").Add();
col.HeaderText("Done").Key("Close").HeaderTemplate("#column4").Add();
})
.KeyField("Status")
.Fields(field =>
{
field.Content("Summary");
})
)
```

C#

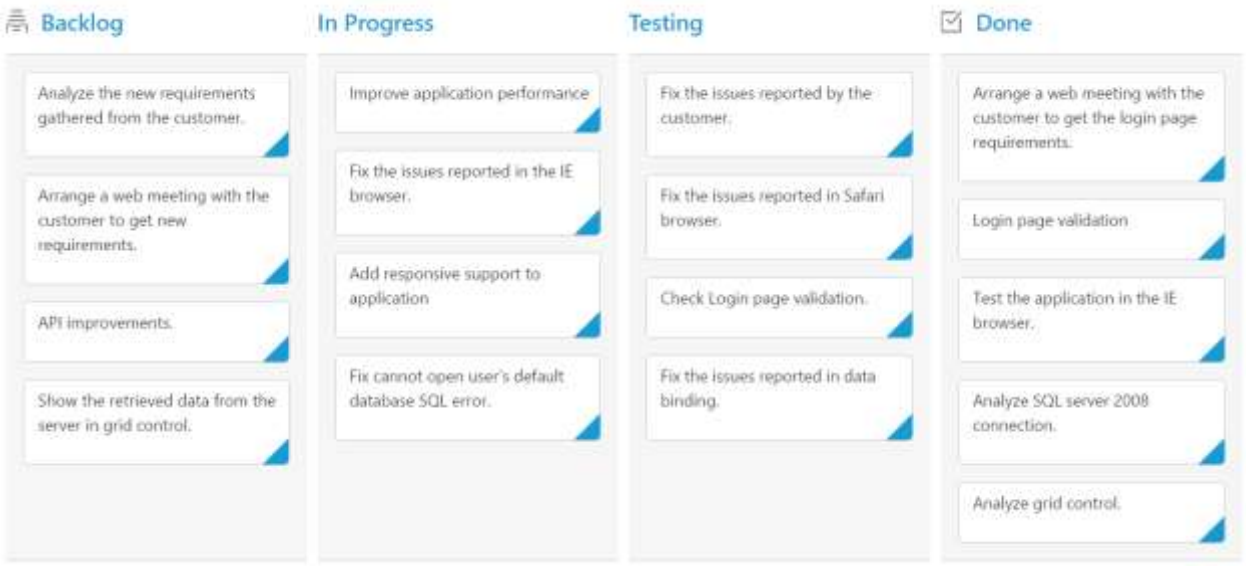
Copyright © 2001 - 2020 Syncfusion Inc.

```
namespace MVCSampleBrowser
{
public partial class KanbanController : Controller
{
public ActionResult KanbanFeatures()
{
var DataSource = new NorthwindDataContext().Tasks.Take(30).ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

CSS

```
/*CSS for Header template icon*/
.e-backlog,.e-done {
font-size: 16px;
padding-right: 5px;
display: inline-block;
}
.e-backlog:before {
content: "\e807";
}
.e-done:before {
content: "\e80a";
}
```

The following output is displayed as a result of the above code example.



Width

You can specify the width for particular column by setting Width property of Columns as in pixel (ex: 100) or in percentage (ex: 40%).

The following code example describes the above behavior.

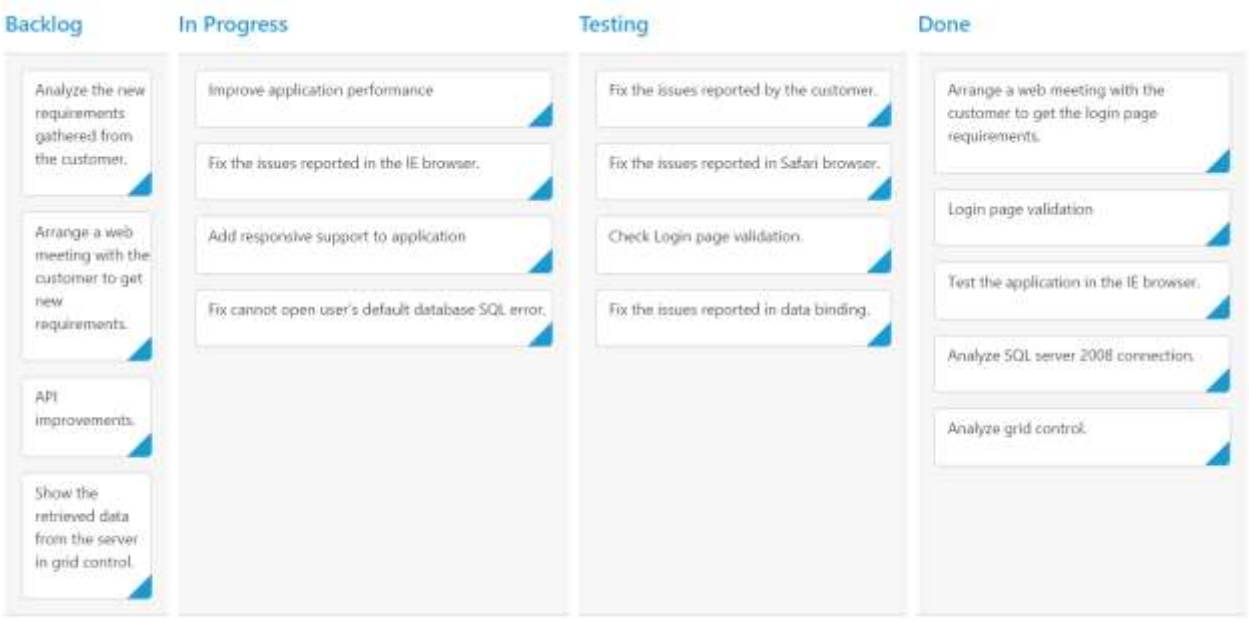
RAZOR

```
@(Html.EJ().Kanban("Kanban")
.DataSource((IEnumerable<object>)ViewBag.datasource)
.Columns(col =>
{
col.HeaderText("Backlog").Key("Open").Width(70).Add();
col.HeaderText("In Progress").Key("InProgress").Width("40%").Add();
col.HeaderText("Testing").Key("Testing").Width(90).Add();
col.HeaderText("Done").Key("Close").Width(90).Add();
})
.KeyField("Status")
.Fields(field =>
{
field.Content("Summary");
})
)
```

C#

```
namespace MVCSampleBrowser
{
public partial class KanbanController : Controller
{
public ActionResult KanbanFeatures()
{
var DataSource = new NorthwindDataContext().Tasks.Take(30).ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.



Copyright © 2001 - 2020 Syncfusion Inc.

Visibility

You can hide particular column in Kanban by setting Visible property of it as false.

The following code example describes the above behavior.

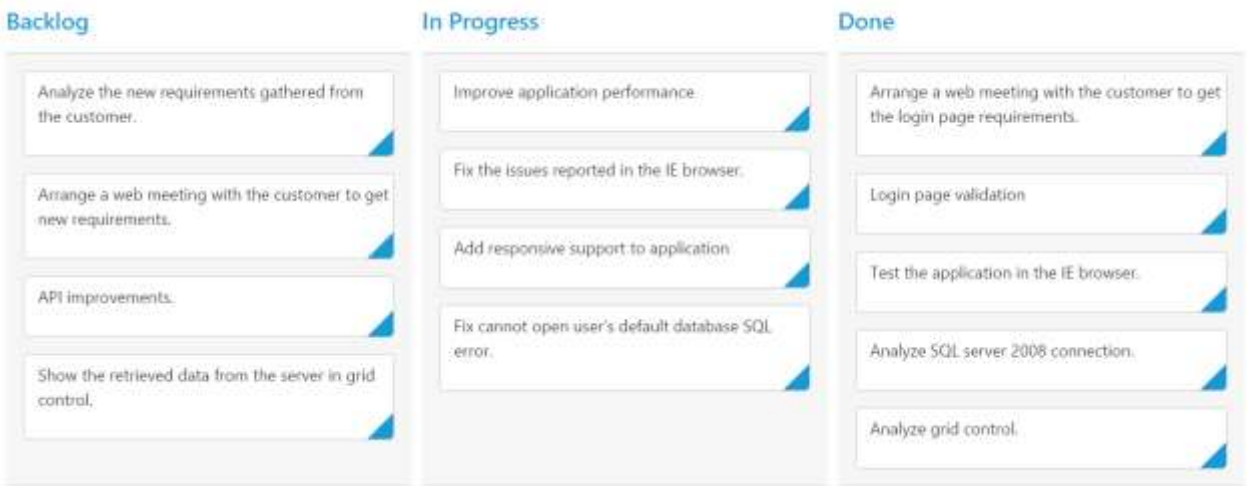
RAZOR

```
@(Html.EJ().Kanban("Kanban")
.DataSource((IEnumerable<object>)ViewBag.datasource)
.Columns(col =>
{
col.HeaderText("Backlog").Key("Open").Add();
col.HeaderText("In Progress").Key("InProgress").Add();
col.HeaderText("Testing").Key("Testing").Visible(false).Add();
col.HeaderText("Done").Key("Close").Add();
})
.KeyField("Status")
.Fields(field =>
{
field.Content("Summary");
})
)
```

C#

```
namespace MVCSampleBrowser
{
public partial class KanbanController : Controller
{
public ActionResult KanbanFeatures()
{
var DataSource = new NorthwindDataContext().Tasks.Take(30).ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.



Copyright © 2001 - 2020 Syncfusion Inc.

Toggle

You can set particular column collapsed state in Kanban by setting IsCollapsed property of it as true. You need to set AllowToggleColumn as true to use Expand/Collapse Column.

The following code example describes the above behavior.

RAZOR

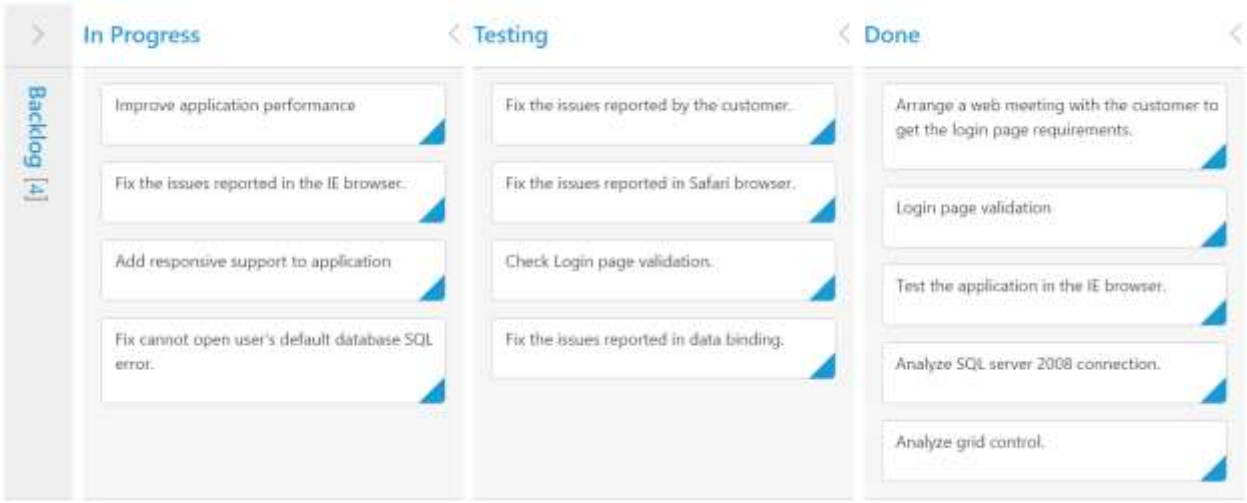
```
@(Html.EJ().Kanban("Kanban")
.DataSource((IEnumerable<object>)ViewBag.datasource)
.AllowToggleColumn(true)
.Columns(col =>
{
col.HeaderText("Backlog").Key("Open").IsCollapsed(true).Add();
col.HeaderText("In Progress").Key("InProgress").Add();
col.HeaderText("Testing").Key("Testing").Add();
col.HeaderText("Done").Key("Close").Add();
})
.KeyField("Status")
.Fields(field =>
{
field.Content("Summary");
field.PrimaryKey("Id");
})
```

C#

```
@(Html.EJ().Kanban("Kanban")
.DataSource((IEnumerable<object>)ViewBag.datasource)
.AllowToggleColumn(true)
.Columns(col =>
{
col.HeaderText("Backlog").Key("Open").IsCollapsed(true).Add();
col.HeaderText("In Progress").Key("InProgress").Add();
col.HeaderText("Testing").Key("Testing").Add();
col.HeaderText("Done").Key("Close").Add();
})
.KeyField("Status")
.Fields(field =>
{
field.Content("Summary");
field.PrimaryKey("Id");
})
```

The following output is displayed as a result of the above code example.

Copyright © 2001 - 2020 Syncfusion Inc.



Allow Dragging

You can enable and disable drag behavior to the cards in the Kanban columns using the AllowDrag property and the default value is true.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Kanban("Kanban")
.DataSource((IEnumerable<object>)ViewBag.datasource)
.Columns(col =>
{
col.HeaderText("Backlog").Key("Open").AllowDrag(false).Add();
col.HeaderText("In Progress").Key("InProgress").Add();
col.HeaderText("Done").Key("Close").Add();
})
.KeyField("Status")
.Fields(field =>
{
field.Content("Summary")
.Priority("RankId")
.PrimaryKey("Id");
})
)
```

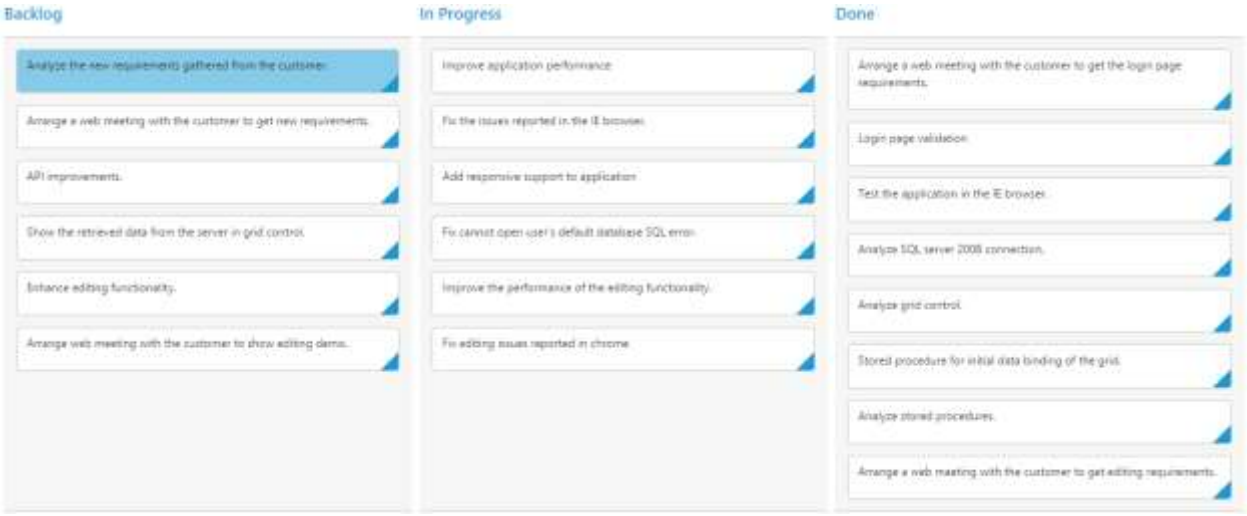
C#

```
namespace MVCSampleBrowser
{
public partial class KanbanController : Controller
{
//
// GET: /Kanban/
public ActionResult KanbanFeatures()
{
var DataSource = new NorthwindDataContext().Tasks.Take(30).ToList();
ViewBag.datasource = DataSource;
return View();
}
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
}
}
```

The following output is displayed as a result of the above code example.



Allow Dropping

You can enable and disable drop behavior to the cards in the Kanban columns using the AllowDrop property and the default value is true.

The following code example describes the above behavior.

RAZOR

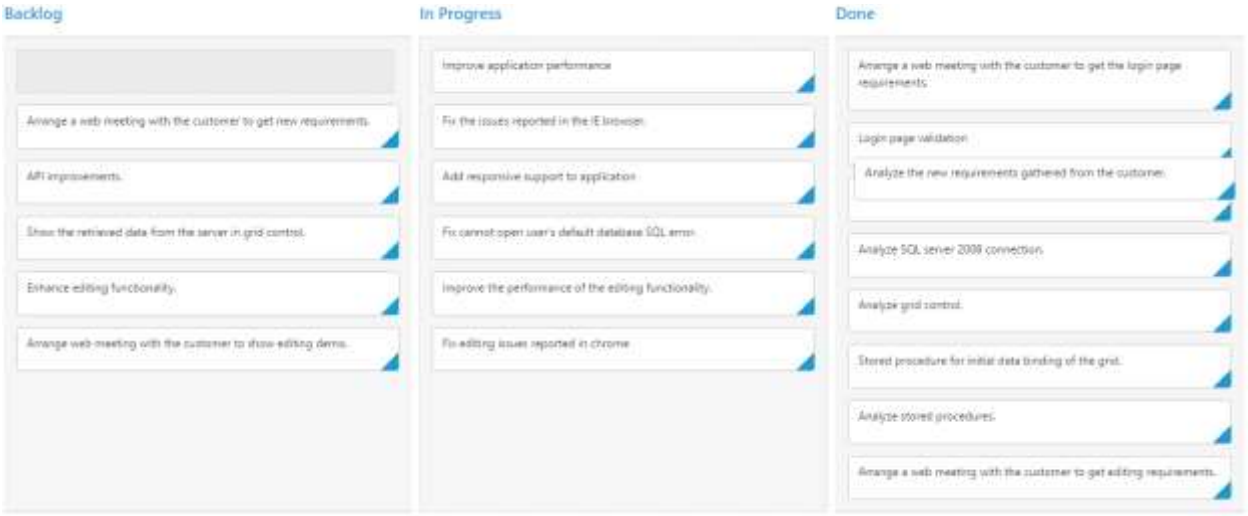
```
@(Html.EJ().Kanban("Kanban")
.DataSource((IEnumerable<object>)ViewBag.datasource)
.Columns(col =>
{
col.HeaderText("Backlog").Key("Open").Add();
col.HeaderText("In Progress").Key("InProgress").Add();
col.HeaderText("Done").Key("Close").AllowDrop(false).Add();
})
.KeyField("Status")
.Fields(field =>
{
field.Content("Summary")
.Priority("RankId")
.PrimaryKey("Id");
})
)
```

C#

```
namespace MVCSampleBrowser
{
public partial class KanbanController : Controller
{
//
// GET: /Kanban/
```

```
public ActionResult KanbanFeatures()
{
var DataSource = new NorthwindDataContext().Tasks.Take(30).ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.



Items Count

You can show total cards count in each column's header using the property EnableTotalCount and the default value is false.

The following code example describes the above behavior.

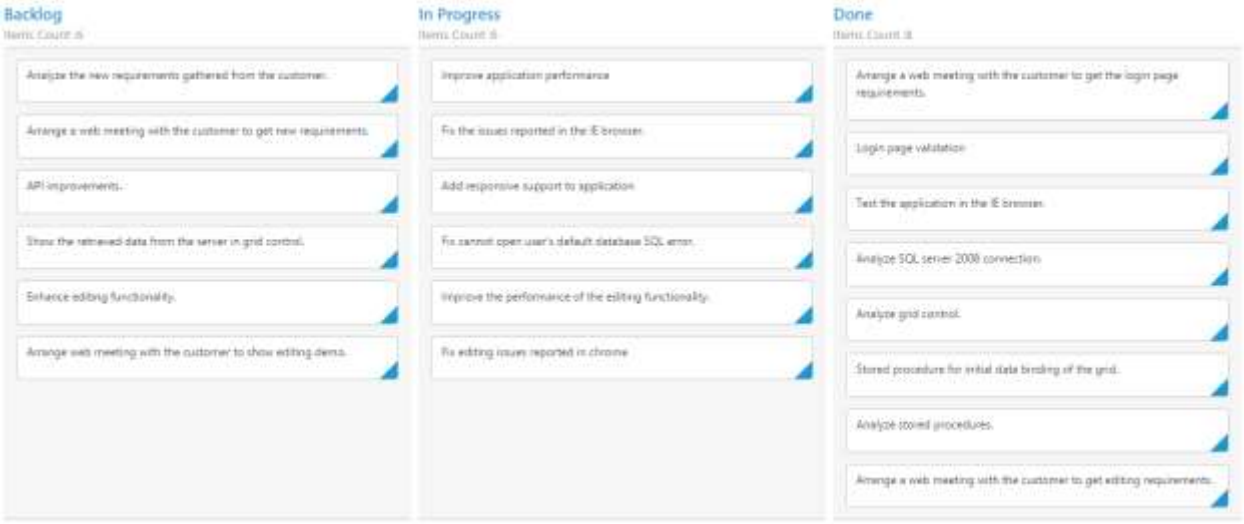
RAZOR

```
@(Html.EJ().Kanban("Kanban")
.DataSource((IEnumerable<object>)ViewBag.datasource)
.Columns(col =>
{
col.HeaderText("Backlog").Key("Open").Add();
col.HeaderText("In Progress").Key("InProgress").Add();
col.HeaderText("Done").Key("Close").Add();
})
.KeyField("Status")
.EnableTotalCount(true)
.Fields(field =>
{
field.Content("Summary")
.PrimaryKey("Id");
})
)
```

C#

```
namespace MVCSampleBrowser
{
public partial class KanbanController : Controller
{
//
// GET: /Kanban/
public ActionResult KanbanFeatures()
{
var DataSource = new NorthwindDataContext().Tasks.Take(30).ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.



Customize Items Count Text

You can customize the Items count text using the property TotalCount.Text.

The following code example describes the above behavior.

RAZOR

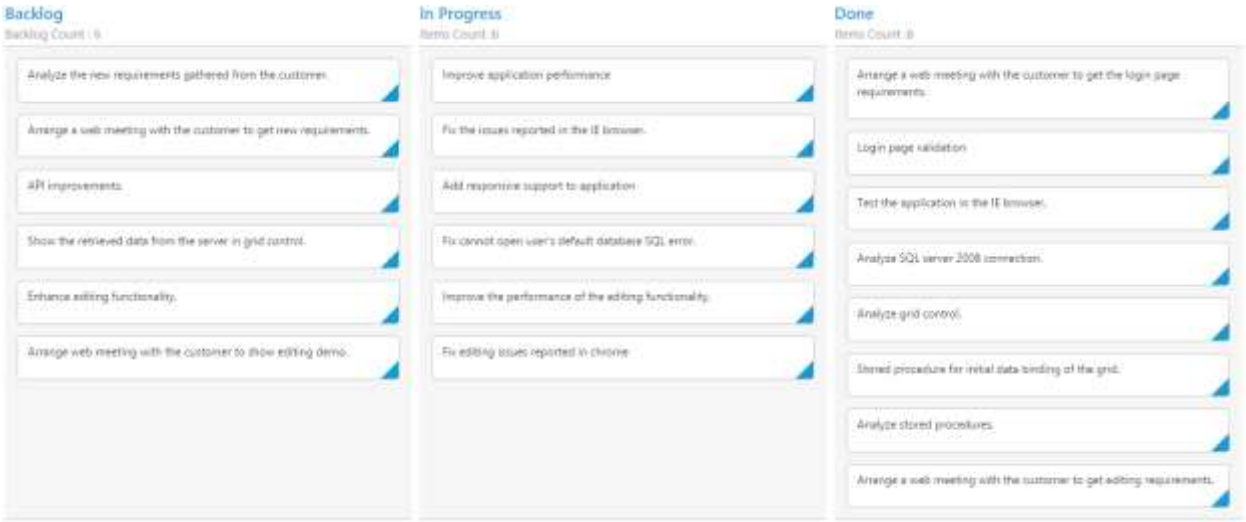
```
@(Html.EJ().Kanban("Kanban")
.DataSource((IEnumerable<object>)ViewBag.datasource)
.Columns(col =>
{
col.HeaderText("Backlog").Key("Open").TotalCount(
t => {
t.Text("Backlog Count");
}
).Add();
col.HeaderText("In Progress").Key("InProgress").Add();
col.HeaderText("Done").Key("Close").Add();
})
.KeyField("Status")
.EnableTotalCount(true)
.Fields(field =>
```

```
{
field.Content("Summary")
.PrimaryKey("Id");
})
)
```

C#

```
namespace MVCSampleBrowser
{
public partial class KanbanController : Controller
{
//
// GET: /Kanban/
public ActionResult KanbanFeatures()
{
var DataSource = new NorthwindDataContext().Tasks.Take(30).ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.



Display Empty Column

On binding empty data source to Kanban control, it displays "No cards to display" text. Using ShowColumnWhenEmpty property, we can render empty kanban columns. Set AllowEditing and AllowAdding property as true to add new data into the empty kanban column.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Kanban("Kanban")
.DataSource((IEnumerable<object>)ViewBag.datasource)
.ShowColumnWhenEmpty(true)
.Columns(col =>
```

Copyright © 2001 - 2020 Syncfusion Inc.

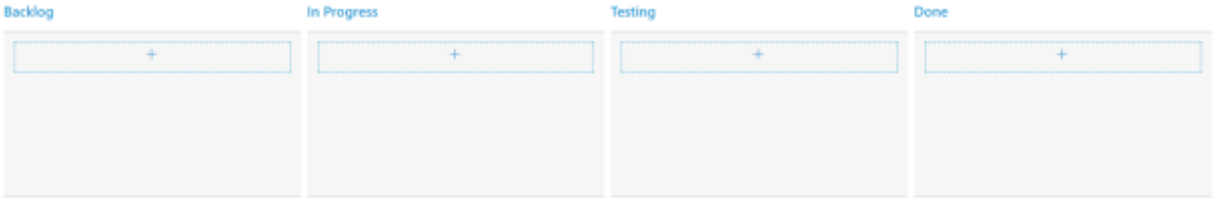
```
{
col.HeaderText("Backlog").Key("Open").Add();
col.HeaderText("In Progress").Key("InProgress").Add();
col.HeaderText("Testing").Key("Testing").Add();
col.HeaderText("Done").Key("Close").Add();
})
.KeyField("Status")
.Fields(field =>
{
field.Content("Summary")
.PrimaryKey("Id");
})
.EditSettings(edit =>
{
edit.AllowAdding(true)
.AllowEditing(true)
.EditItems(e =>
{
e.Field("Id").ValidationRules(rule => { rule.AddRule("required",
true).AddRule("number", true); }).Add();
e.Field("Status").Add();
e.Field("Assignee").Add();
e.Field("Estimate").EditType(KanbanEditingType.Numeric).NumericEditOptions(n
ew EditorProperties() { DecimalPlaces = 2 }).ValidationRules(rule => {
rule.AddRule("range", "[0,1000]"); }).Add();
e.Field("Summary").EditType(KanbanEditingType.TextArea).ValidationRules(rule
=> { rule.AddRule("required", true); }).Add();
}).EditMode(KanbanEditMode.Dialog);
})
)
```

C#

```
namespace MVCSampleBrowser
{
public partial class KanbanController : Controller
{
//
// GET: /Kanban/
public ActionResult KanbanFeatures()
{
var DataSource = new NorthwindDataContext().Tasks.Take(0).ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.

Copyright © 2001 - 2020 Syncfusion Inc.



Data Binding

Kanban DataSource property allows to bind datasource as the instance of one of the following types.

- Collection that implements IEnumerable or IEnumerable.
- REST Service URL as string.
- ORM components such as Entity Framework/Linq to SQL.

We can also bind the above type of data source by using lambda Expressions of Kanban DataSource Property.

In the following section, let us see on how to bind various data sources to Kanban using DataSource API.

IEnumerable

The Kanban can be bound with collection that implements IEnumerable interface. It can be assigned to Kanban DataSource property.

Note: When using DataSource builder, the IEnumerable data source can be passed as parameter either directly to the DataSource builder or to the JSON property of the DataSource builder.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Kanban("Kanban")
.DataSource((IEnumerable<Tasks>)ViewBag.datasource)
.Columns(col =>
{
col.HeaderText("Backlog").Key("Open").Add();
col.HeaderText("In Progress").Key("InProgress").Add();
col.HeaderText("Testing").Key("Testing").Add();
})
.KeyField("Status")
.Fields(field =>
{
field.Content("Summary");
})
)
```

C#

```
namespace MVCSampleBrowser
{
public partial class KanbanController : Controller
{
public ActionResult KanbanFeatures()
{
List<Tasks> Task = new List<Tasks>();
Task.Add(new Tasks(1, "Open", "Analyze the new requirements gathered from
the customer.", "Nancy"));
Task.Add(new Tasks(2, "InProgress", "Improve application performance",
"Andrew Fuller"));
Task.Add(new Tasks(3, "Open", "Arrange a web meeting with the customer to
get new requirements.","Janet"));
Task.Add(new Tasks(4, "InProgress", "Fix the issues reported in the IE
browser.", "Janet"));
Task.Add(new Tasks(5, "Testing", "Fix the issues reported by the
customer.","Steven walker"));
ViewBag.datasource = Task;
return View();
}
[Serializable]
public class Tasks
{
public Tasks()
{
}
public Tasks(int Id, string Status, string Summary, string Assignee)
{
this.Id = Id;
this.Status = Status;
this.Summary = Summary;
this.Assignee = Assignee;
}
public int Id { get; set; }
public string Status { get; set; }
public string Summary { get; set; }
public string Assignee { get; set; }
}
}
}
```

The following output is displayed as a result of the above code example.

Entity Framework

The collection of business objects generated from Entity Framework ORM can be used as Kanban data source. The Kanban can be used with Entity Framework using either code first technique or Database first technique.

The following code example describes the above behavior.

RAZOR

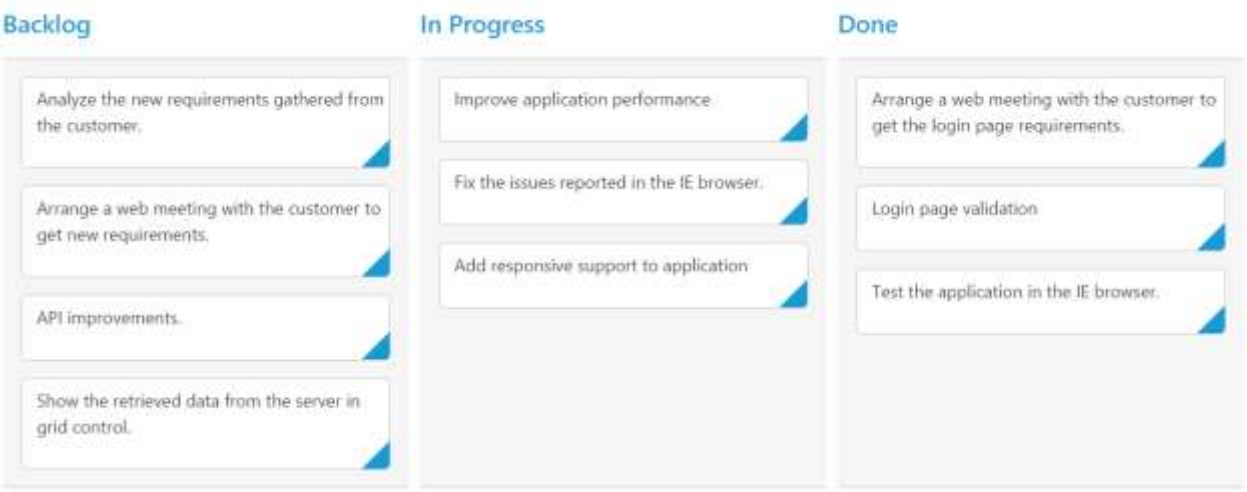
```
@(Html.EJ().Kanban("Kanban")
.DataSource((IEnumerable<object>)ViewBag.datasource)
.Columns(col =>
{
col.HeaderText("Backlog").Key("Open").Add();
col.HeaderText("In Progress").Key("InProgress").Add();
col.HeaderText("Done").Key("Close").Add();
})
.KeyField("Status")
.Fields(field =>
{
field.Content("Summary");
})
)
```

C#

```
namespace MVCSampleBrowser
{
public partial class KanbanController : Controller
{
public ActionResult KanbanFeatures()
{
var DataSource = new NorthwindDataContext().Tasks.Take(30).ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.

Copyright © 2001 - 2020 Syncfusion Inc.



LINQ to SQL

The LINQ to SQL can be used as the data source of the Kanban. And the Object Relation class which is used to map with Relational table.

The following code example describes the above behavior.

RAZOR

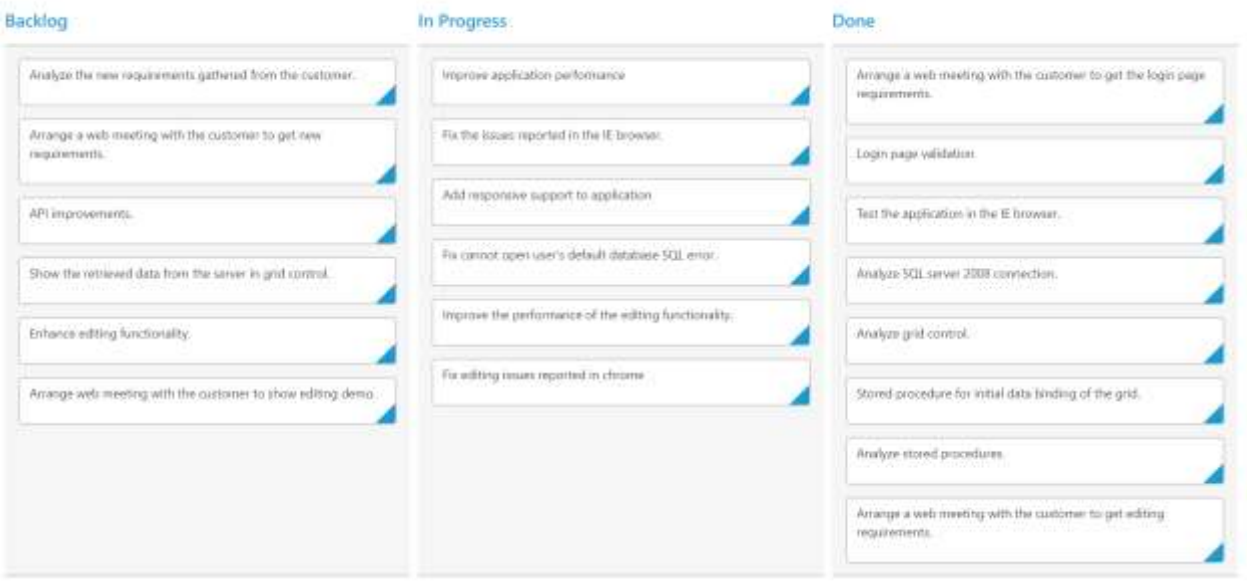
```
.DataSource((IEnumerable<object>)ViewBag.datasource)
.Columns(col =>
{
col.HeaderText("Backlog").Key("Open").Add();
col.HeaderText("In Progress").Key("InProgress").Add();
col.HeaderText("Done").Key("Close").Add();
})
.KeyField("Status")
.Fields(field =>
{
field.Content("Summary")
.PrimaryKey("Id");
})
)
```

C#

```
namespace MVCSampleBrowser
{
public partial class KanbanController : Controller
{
public ActionResult KanbanFeatures()
{
var DataSource = new NorthwindDataContext().Tasks.Take(30).ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.

Copyright © 2001 - 2020 Syncfusion Inc.



WCF DataService / OData Service

WCF Data Services is a component of the .NET Framework that enables you to create services that use the Open Data Protocol (OData) to expose and consume data over the Web or intranet by using the semantics of representational state transfer (REST).

To consume WCF DataService in Kanban control, provide the service link directly to the Kanban DataSource property.

We have an online OData Service http://mvc.syncfusion.com/Services/Northwnd.svc/Tasks created specifically for Syncfusion Controls

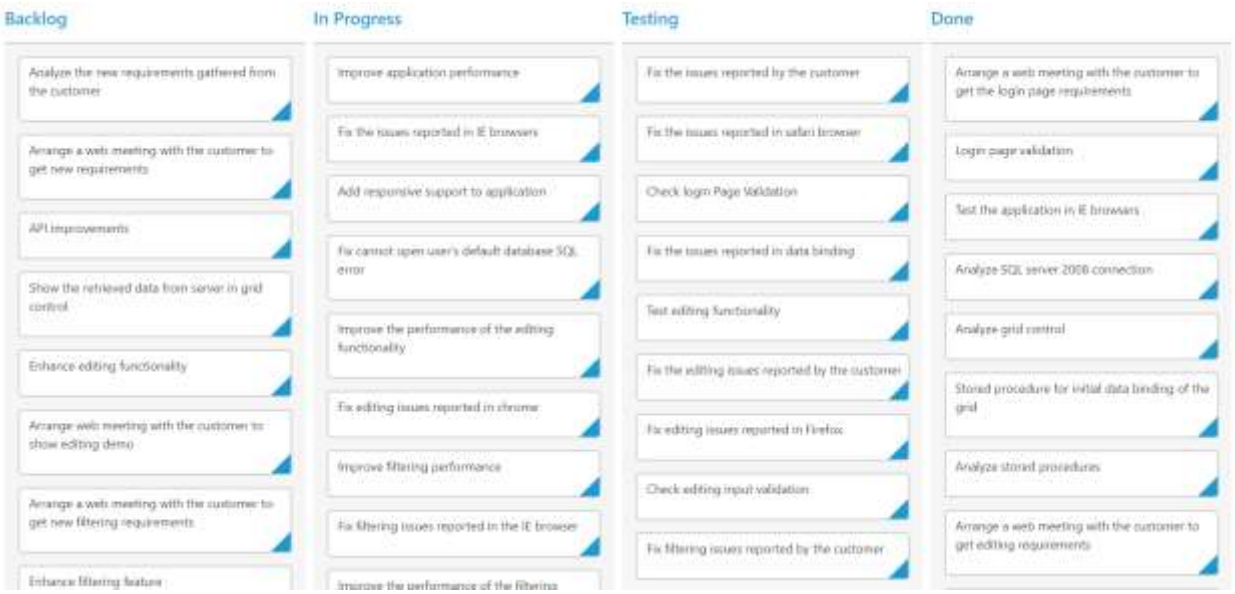
The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Kanban("Kanban")
.DataSource("http://mvc.syncfusion.com/Services/Northwnd.svc/Tasks")
.Columns(col =>
{
col.HeaderText("Backlog").Key("Open").Add();
col.HeaderText("In Progress").Key("InProgress").Add();
col.HeaderText("Done").Key("Close").Add();
})
.KeyField("Status")
.Fields(field =>
{
field.Content("Summary")
.PrimaryKey("Id");
})
)
```

The following output is displayed as a result of the above code example.

Copyright © 2001 - 2020 Syncfusion Inc.



ODataV4 Service

ODataV4Adaptor is used for consuming data from OData V4 Service. To consume OData V4 service, set the service link to the URL property of Kanban DataSource and set AdaptorType.ODataV4Adaptor to the Adaptor Property of Kanban DataSource.

Waring: ODL supports to parse the $search query option, however, Web API OData doesn't support it so far.

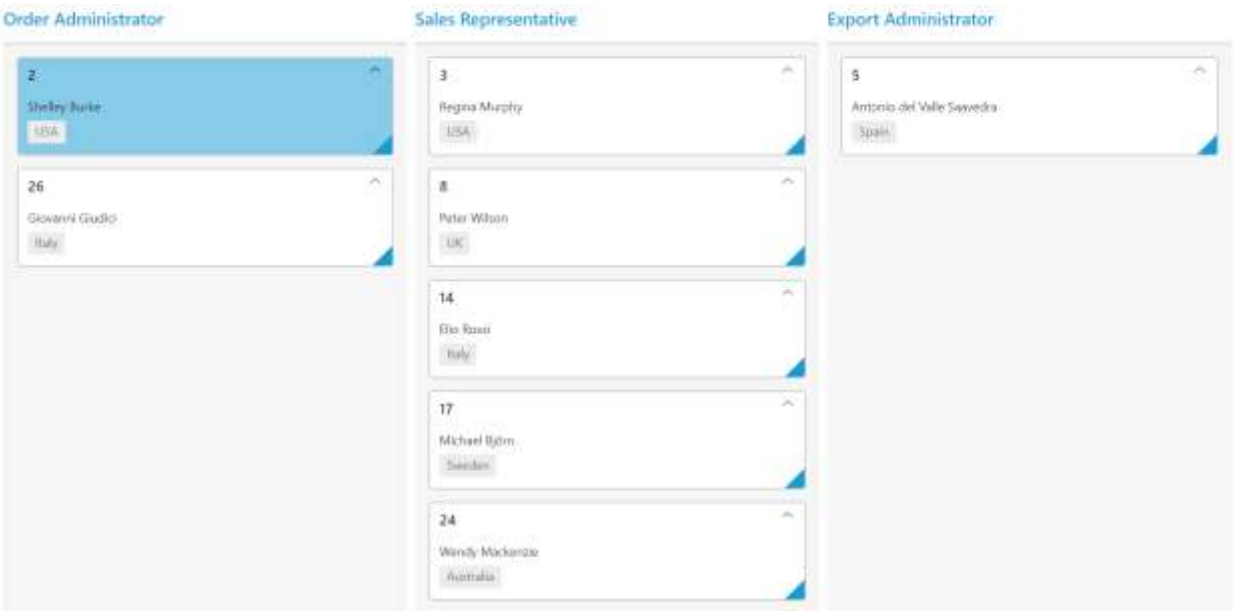
The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Kanban("Kanban")
.DataSource(data =>
data.URL("http://services.odata.org/v4/northwind/northwind.svc/Suppliers").A
daptor(AdaptorType.ODataV4Adaptor))
.Columns(col =>
{
col.HeaderText("Order Administrator ").Key("Order Administrator").Add();
col.HeaderText("Sales Representative").Key("Sales Representative").Add();
col.HeaderText("Export Administrator").Key("Export Administrator").Add();
})
.KeyField("ContactTitle")
.AllowTitle(true)
.Fields(field =>
{
field.Content("ContactName")
.Tag("Country")
.PrimaryKey("SupplierID");
})
)
```

The following output is displayed as a result of the above code example.

Copyright © 2001 - 2020 Syncfusion Inc.



WebAPI

Using ej.WebApiAdaptor, you can bind WebApi service data to Kanban. The data from WebApi service must be returned as object that has property Items with its value as dataSource and another property Count with its value as dataSource's total cards count.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Kanban("Kanban")
.DataSource(data =>
data.URL("/api/Orders").Adaptor(AdaptorType.WebApiAdaptor))
.Columns(col =>
{
col.HeaderText("Backlog").Key("Backlog ").Add();
col.HeaderText("In Progress").Key("InProgress ").Add();
col.HeaderText("Close").Key("Done ").Add();
})
.KeyField("Status")
.Fields(field =>
{
field.Content("Summary")
.PrimaryKey("Id");
})
)
```

C#

```
namespace MVCSampleBrowser.Controllers
{
public class OrdersController : ApiController
{
NorthwindDataContext db = new NorthwindDataContext();
public object Get()
{
```

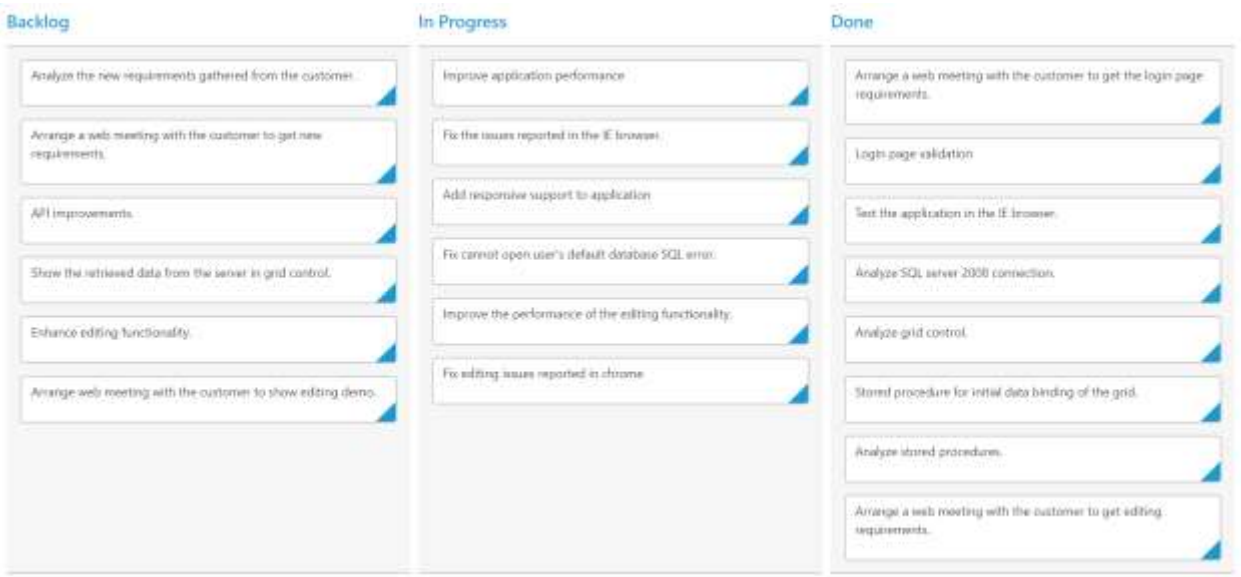
Copyright © 2001 - 2020 Syncfusion Inc.

```
var data = db.Tasks.Take(10).ToList();
return new
{
Items = data,
Count = data.Count()
};
}
}
}
```

Please refer the following link for common WebAPI creation.

http://www.asp.net/web-api/overview/getting-started-with-aspnet-web-api/tutorial-your-first-web-api

The following output is displayed as a result of the above code example.



URL Adaptor

You can use the UrlAdaptor of DataManager when binding DataSource from remote data. At initial load of Kanban, using URL property of DataManager, data are fetched from remote data and bound to Kanban. You can map CRUD operation in Kanban to Server-Side Controller action using the property CrudURL.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Kanban("Kanban")
.DataSource(data =>
data.URL("GetData").CrudURL("Crud").Adaptor(AdaptorType.UrlAdaptor))
.Columns(col =>
{
col.HeaderText("Backlog").Key("Open").ShowAddButton(true).Add();
col.HeaderText("In Progress").Key("InProgress").Add();
col.HeaderText("Done").Key("Close").Add();
})
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
.CustomToolbarItems(custom =>
{
custom.Template("#Delete").Add();
})
.EditSettings(edit =>
{
edit.AllowAdding(true)
.AllowEditing(true)
.EditItems(e =>
{
e.Field("Id").Add();
e.Field("Status").Add();
e.Field("Assignee").Add();
e.Field("Estimate").Add();
e.Field("Summary").Add();
}).EditMode(KanbanEditMode.Dialog);
})
.KeyField("Status")
.Fields(field =>
{
field.Content("Summary")
.PrimaryKey("Id")
.Priority("RankId");
})
.ClientSideEvents(eve => eve.ToolBarClick("toolbarClick"))
)
<script type="text/javascript">
function toolbarClick(args) {
if (args.itemName == "Delete" && this.element.find(".e-
kanbancard").hasClass("e-cardselection")) {
var selected = this.element.find(".e-cardselection");
this.KanbanEdit.deleteCard(selected.attr("id"));
}
}
</script>
<script id="Delete" type="text/template">
<a class="e-customdelete  e-icon" />
</script>
<style type="text/css" class="cssStyles">
.e-customdelete:before {
content: "\e800";
line-height: 26px;
min-height: 26px;
min-width: 14px;
display: inline-block;
}
</style>
```

Also when you use UrlAdaptor, you need to return the data as JSON and the JSON object must contain a properties result & count. The result holds the dataSource as its value and count holds the total cards count as its value.

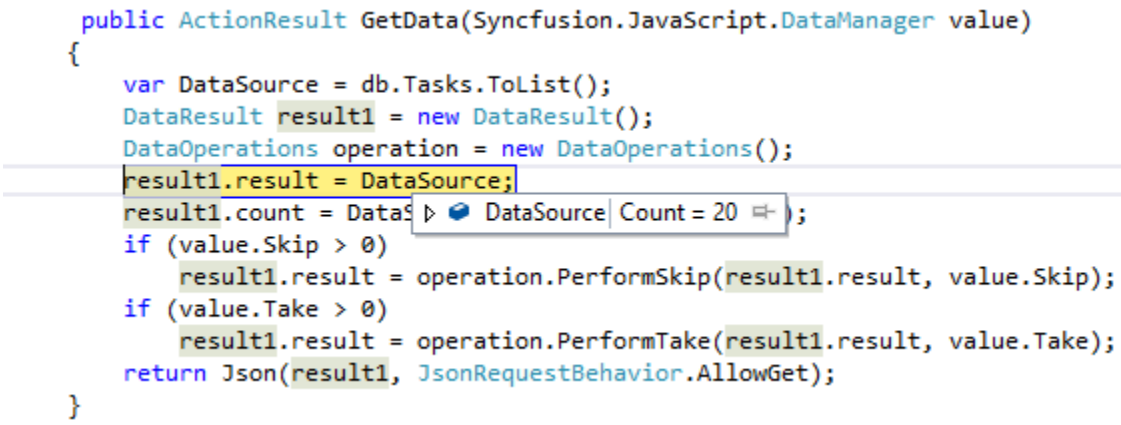
The following code example describes the above behavior.

C#

Copyright © 2001 - 2020 Syncfusion Inc.

```
public ActionResult GetData(Syncfusion.JavaScript.DataManager value)
{
var DataSource = db.Tasks.ToList();
DataResult result1 = new DataResult();
DataOperations operation = new DataOperations();
result1.result = DataSource;
result1.count = DataSource.AsQueryable().Count();
if (value.Skip > 0)
result1.result = operation.PerformSkip(result1.result, value.Skip);
if (value.Take > 0)
result1.result = operation.PerformTake(result1.result, value.Take);
return Json(result1, JsonRequestBehavior.AllowGet);
}
public class DataResult
{
public IEnumerable result { get; set; }
public int count { get; set; }
}
```

Please refer to the below screenshot.



Using DataOperations helper class you can perform Kanban action at server side. The in-built methods that we have provided in the DataOperations class are listed below.

1. PerformTake 2. PerformSelect 3. Execute

For more information about the Server-Side operation you can refer the below link.

Persisting Data in Server

Workflows

Workflows can be defined to set the flow of card moving between the Kanban column statuses and it is applicable to drag and drop and context menu features.

You can set Workflows as array of Objects which consists of Key and AllowedTransitions properties. The AllowedTransitions accepts more than one transition of the specific column key mentioned in Key property.

If a card is to be dragged to not allowed transition columns , then not supported warning symbol will be displayed for denoting the error.

The following code example describes the above Workflow functionality.

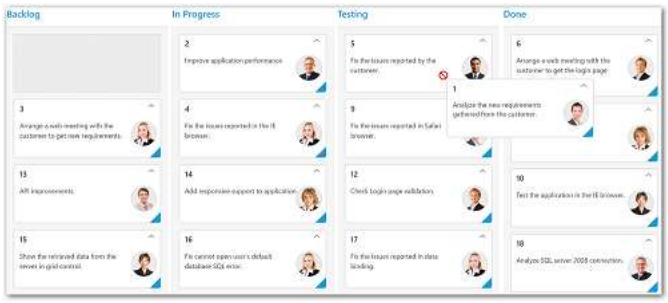
HTML

```
<div id='Kanban'></div>
```

JAVASCRIPT

```
@(Html.EJ().Kanban("Kanban")
.DataSource((IEnumerable<object>)ViewBag.datasource)
.Workflows(workflow =>
{
workflow.Key("Open").AllowedTransitions("InProgress").Add();
workflow.Key("InProgress").AllowedTransitions("Testing,Close").Add();
})
.Columns(col =>
{
col.HeaderText("Backlog").Key("Open").Add();
col.HeaderText("In Progress").Key("InProgress").Add();
col.HeaderText("Testing").Key("Testing").Add();
col.HeaderText("Done").Key("Close").Add();
})
.KeyField("Status")
.Fields(field =>
{
field.Content("Summary")
})
)
```

The following output is displayed as a result of the above code example.



Swim lanes

Swim lanes are a horizontal categorization of issues in the Kanban control which brings transparency to the workflow. This can be enabled by mapping the SwimlaneKey to appropriate column name in the DataSource.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Kanban("Kanban")
.DataSource((IEnumerable<object>)ViewBag.datasource)
.Columns(col =>
{
col.HeaderText("Backlog").Key("Open").Add();
col.HeaderText("In Progress").Key("InProgress").Add();
col.HeaderText("Done").Key("Close").Add();
```

Copyright © 2001 - 2020 Syncfusion Inc.

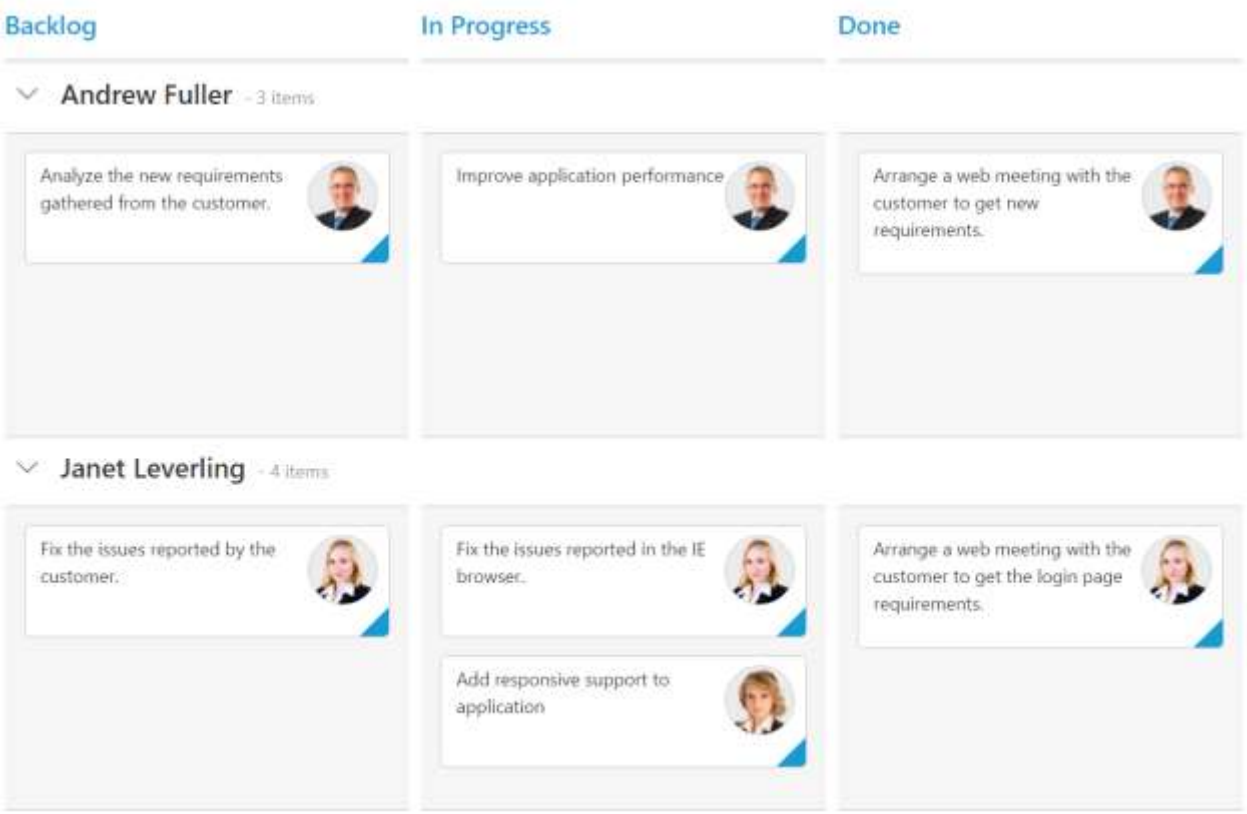
```
})
.KeyField("Status")
.Fields(field =>
{
field.Content("Summary")
.SwimlaneKey("Assignee")
.ImageUrl("Image")
.PrimaryKey("Id");
})
)
```

C#

```
namespace MVCSampleBrowser
{
public partial class KanbanController : Controller
{
//
// GET: /Kanban/
public ActionResult KanbanFeatures()
{
var DataSource = new NorthwindDataContext().Tasks.Take(30).ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.

Copyright © 2001 - 2020 Syncfusion Inc.



Customized swimlane header text

You can change the swimlane row header text using the swimlane Headers property. In this property, the text is changed using the Text property and the corresponding value is mapped into the Key property based on SwimlaneKey datasource mapping.

Refer to the following code example.

RAZOR

```
@(Html.EJ().Kanban("Kanban")
.DataSource((IEnumerable<object>)ViewBag.datasource)
.Columns(col =>
{
col.HeaderText("Backlog").Key("Open").Add();
col.HeaderText("In Progress").Key("InProgress").Add();
col.HeaderText("Done").Key("Close").Add();

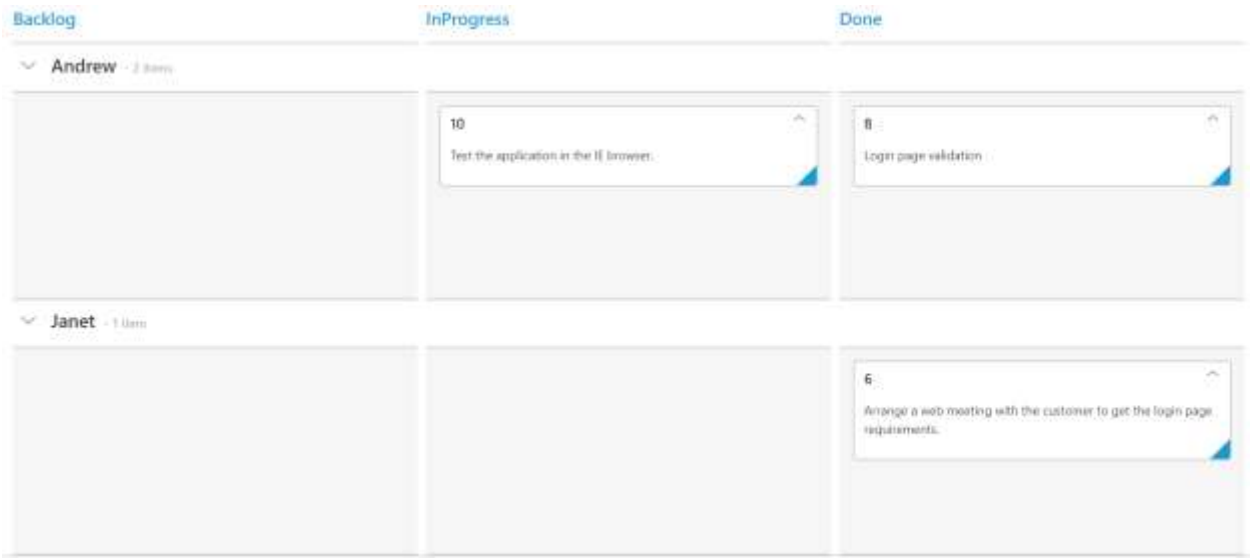
public string Image { get; set; }
public int RankId { get; set; }
}
```

The following output is displayed as a result of the above code example.



Empty swimlane row on Kanban board

You can create an empty swimlane row by enabling the ShowEmptySwimlane property based on swimlane headers Key value mapping. If no data is present, then the empty swimlane row is rendered on the Kanban board based on the specified swimlane headers Key.

Refer to the following code.

RAZOR

```
@(Html.EJ().Kanban("Kanban")
.DataSource((IEnumerable<object>)ViewBag.datasource)
.Columns(col =>
{
col.HeaderText("Backlog").Key("Open").Add();
col.HeaderText("In Progress").Key("InProgress").Add();
col.HeaderText("Done").Key("Close").Add();
})
.AllowTitle(true)
.KeyField("Status")
.Fields(field =>
{
field.Content("Summary")
.SwimlaneKey("Assignee")
.PrimaryKey("Id");
})
.SwimlaneSettings(swim =>
{
```

```
swim.ShowEmptySwimlane(true)
.Headers(header => {
header.Text("Andrew").Key("Andrew Fuller").Add();
header.Text("Janet").Key("Janet Leverling").Add();
});
})
)
```

C#

```
public partial class KanbanController : Controller
{
List<Tasks> Task = new List<Tasks>();
// GET: /Kanban/
public ActionResult KanbanFeatures()
{
Task.Add(new Tasks(8, "Close", "Login page validation", "Story", "Release
Breaker", "Validation,Fix", 2.5, "Andrew Fuller",
"../content/images/kanban/1.png", 2));
Task.Add(new Tasks(9, "Testing", "Fix the issues reported in Safari
browser.", "Bug", "Release Breaker", "Fix,Safari", 1.5, "Janet",
"../content/images/kanban/3.png", 2));
Task.Add(new Tasks(10, "InProgress", "Test the application in the IE
browser.", "Story", "Low", "Testing,IE", 5.5, "Andrew Fuller",
"../content/images/kanban/1.png", 3));
ViewBag.datasource = Task;
return View();
}
}

}
```

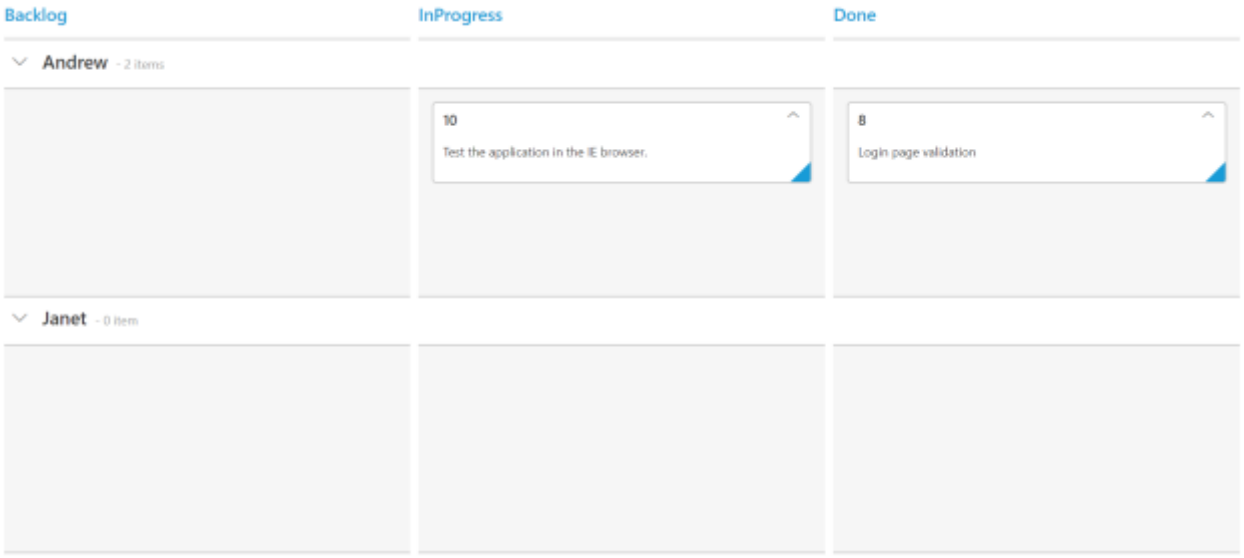
The following output is displayed as a result of the above code example.



Drag And Drop between swim lanes

You can set 'AllowDragAndDrop' property of 'SwimlaneSettings' as true to enable Drag and Drop between the swim lanes.

If a card is to be dragged in the same swim lane, only a droppable target cell is added to the dotted line border.If a card is dragged from one swim lane to another, all the Kanban cells will be added to the dotted line borders, except the dragged card cell.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Kanban("Kanban")
.DataSource((IEnumerable<object>)ViewBag.datasource)
.Columns(col =>
{
col.HeaderText("Backlog").Key("Open").Add();
col.HeaderText("In Progress").Key("InProgress").Add();
col.HeaderText("Done").Key("Close").Add();
})
.KeyField("Status")
.SwimlaneSettings(swimSettings =>
{
swimSettings.AllowDragAndDrop(true);
})
.Fields(field =>
{
field.Content("Summary")
.SwimlaneKey("Assignee")
.ImageUrl("Image")
```

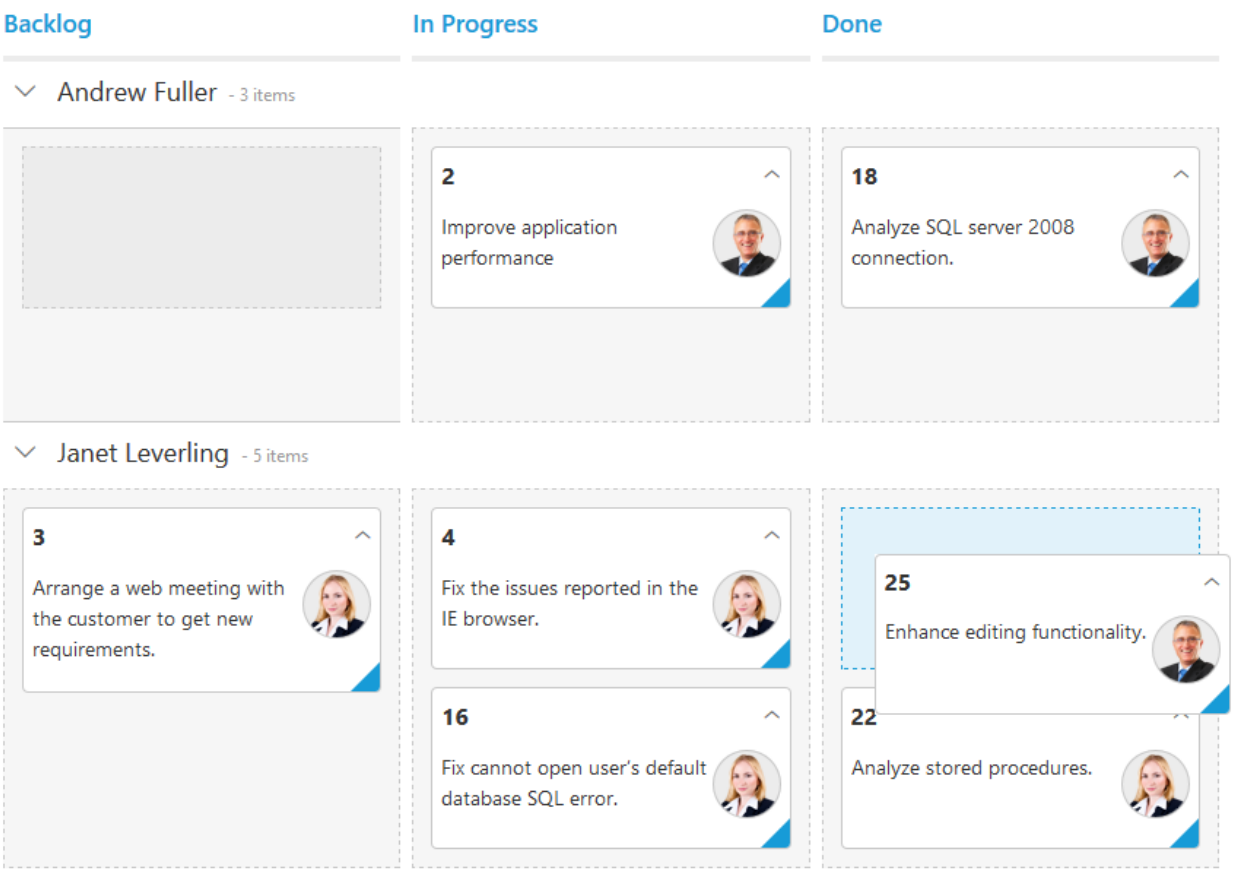
Copyright © 2001 - 2020 Syncfusion Inc.

```
.PrimaryKey("Id");
})
)
```

C#

```
namespace MVCSampleBrowser
{
public partial class KanbanController : Controller
{
// GET: /Kanban/
public ActionResult KanbanFeatures()
{
var DataSource = new NorthwindDataContext().Tasks.Take(30).ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.



Unassigned swim lane group

Unassigned swim lane feature provides option to group some common swim lane key values as separate swim lane group. You can enable and disable this behavior using the property Enable.

User can use default common key values or user defined key values.

Using default values Using user defined values

Note: By default, given common keys are grouped under the swim lane name Unassigned, user can customize the name using localization.

Using default values

By default, the swim lane keys of card which is having null, undefined, empty string ("") values will be grouped as unassigned category when Enable property is set as true.

Default values in the Keys collection are null, undefined, empty string ("").

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Kanban("Kanban")
.DataSource((IEnumerable<object>)ViewBag.datasource)
.Columns(col =>
{
col.HeaderText("Backlog").Key("Open").Add();
col.HeaderText("In Progress").Key("InProgress").Add();
col.HeaderText("Done").Key("Close").Add();
})
.KeyField("Status")
.Fields(field =>
{
field.Content("Summary")
.SwimlaneKey("Assignee")
.ImageUrl("Image")
.PrimaryKey("Id");
})
)
```

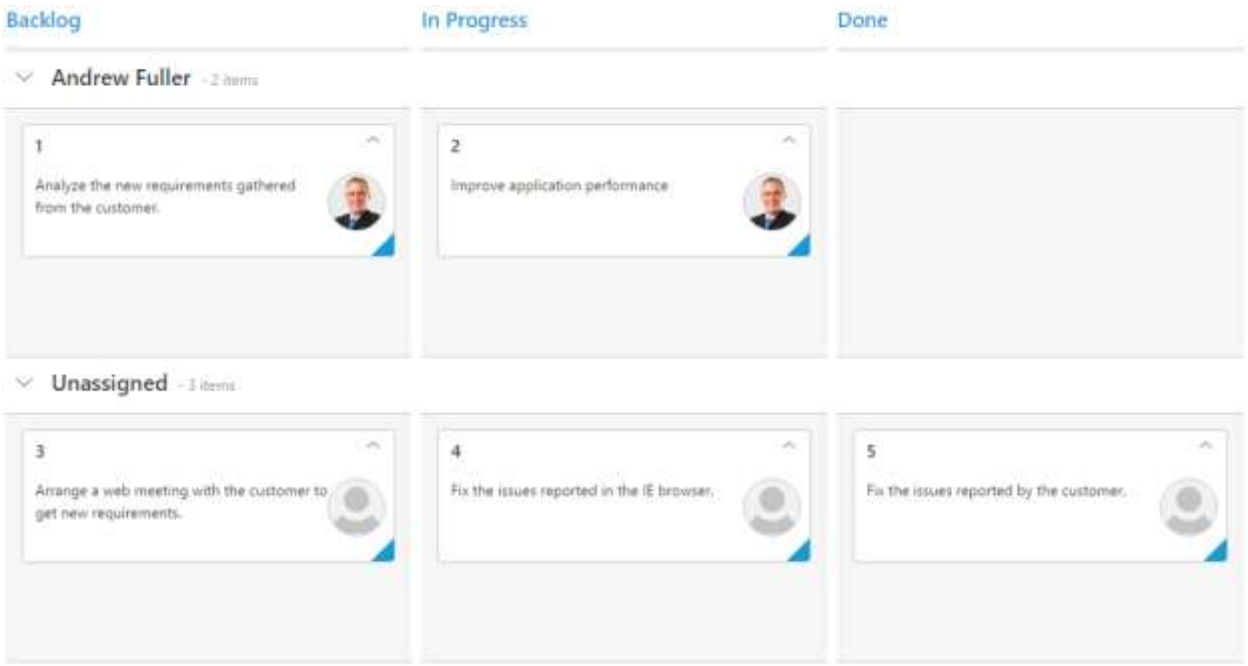
C#

```
namespace MVCSampleBrowser
{
public partial class KanbanController : Controller
{
//
// GET: /Kanban/
public ActionResult KanbanFeatures()
{
List<Tasks> Task = new List<Tasks>();
Task.Add(new Tasks(1, "Open", "Analyze the new requirements gathered from
the customer.", "Story", "Low", "Analyze,Customer", 3.5, "Andrew Fuller",
"../content/images/kanban/2.png", 1));
Task.Add(new Tasks(2, "InProgress", "Improve application performance",
"Improvement", "Normal", "Improvement", 6, "Andrew Fuller",
"../content/images/kanban/2.png", 1));
Task.Add(new Tasks(3, "Open", "Arrange a web meeting with the customer to
get new requirements.", "Others", "Critical", "Meeting", 5.5, "", "", 2));
Task.Add(new Tasks(4, "InProgress", "Fix the issues reported in the IE
browser.", "Bug", "Release Breaker", "IE", 2.5, null, "", 2));
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
Task.Add(new Tasks(5, "Close", "Fix the issues reported by the customer.",
"Bug", "Low", "Customer", 3.5, "", "", 1));
ViewBag.datasource = Task;
return View();
}
}
}
```

The output of the above code example.



Using user defined values

You can override default values for unassigned swim lane group using the property Keys.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Kanban("Kanban")
.DataSource((IEnumerable<object>)ViewBag.datasource)
.Columns(col =>
{
col.HeaderText("Backlog").Key("Open").Add();
col.HeaderText("In Progress").Key("InProgress").Add();
col.HeaderText("Done").Key("Close").Add();
})
.KeyField("Status")
.Fields(field =>
{
field.Content("Summary")
.SwimlaneKey("Assignee")
.ImageUrl("Image")
.PrimaryKey("Id");
})
.SwimlaneSettings(ss =>
```

Copyright © 2001 - 2020 Syncfusion Inc.

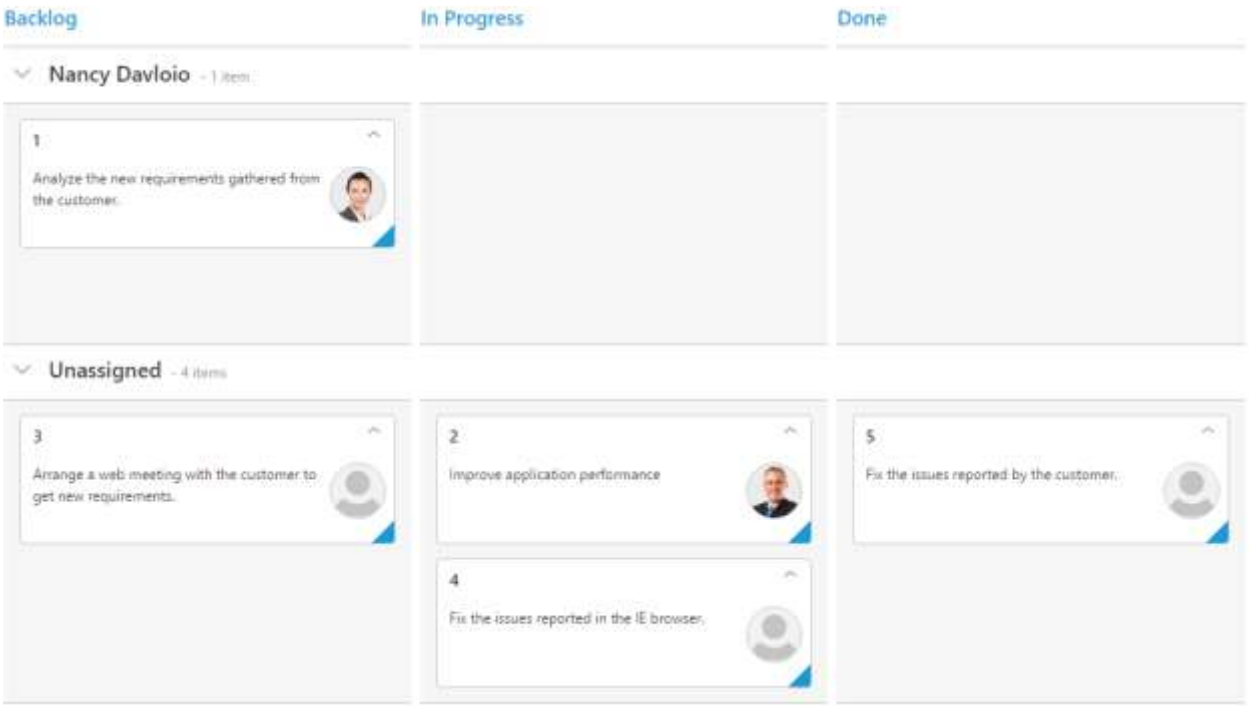
```
ss.UnassignedGroup(ug =>
ug.Keys(key =>
{
key.Add("Andrew Fuller");
key.Add("");
key.Add("null");
}
)
)
)
)
```

C#

```
namespace MVCSampleBrowser
{
public partial class KanbanController : Controller
{
//
// GET: /Kanban/
public ActionResult KanbanFeatures()
{
List<Tasks> Task = new List<Tasks>();
Task.Add(new Tasks(1, "Open", "Analyze the new requirements gathered from
the customer.", "Story", "Low", "Analyze,Customer", 3.5, "Nancy",
"../content/images/kanban/1.png", 1));
Task.Add(new Tasks(2, "InProgress", "Improve application performance",
"Improvement", "Normal", "Improvement", 6, "Andrew Fuller",
"../content/images/kanban/2.png", 1));
Task.Add(new Tasks(3, "Open", "Arrange a web meeting with the customer to
get new requirements.", "Others", "Critical", "Meeting", 5.5, "", "", 2));
Task.Add(new Tasks(4, "InProgress", "Fix the issues reported in the IE
browser.", "Bug", "Release Breaker", "IE", 2.5, null, "", 2));
Task.Add(new Tasks(5, "Close", "Fix the issues reported by the customer.",
"Bug", "Low", "Customer", 3.5, "", "", 1));
ViewBag.datasource = Task;
return View();
}
}
}
```

The output of the above code example.

Copyright © 2001 - 2020 Syncfusion Inc.



Drag and Drop

By default, AllowDragAndDrop is true. Cards can be transited from one column to another column, by dragging and dropping. And it has drop position indicator which enables easier positioning of cards

Note: It is not possible transit cards to other swim lanes through Drag and Drop.

Drag and Drop to external control

Kanban is now provided support to drag and drop cards to external controls, when AllowExternalDragAndDrop is set to true. Along with that you need to specify the ID of the component to which the card must be dropped in CardSettings property ExternalDropTarget.

Here, in order to drag and drop cards between two Kanban, enable the Kanban property AllowExternalDragAndDrop and specify the target Kanban ID in ExternalDropTarget.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Kanban("Kanban")
.DataSource((IEnumerable<object>)ViewBag.datasource)
.Columns(col =>
{
col.HeaderText("Open").Key("Open,InProgress").Add();
col.HeaderText("Done").Key("Testing,Close").Add();
})
.AllowTitle(true)
.KeyField("Status")
.AllowExternalDragAndDrop(true)
.CardSettings(card =>
{
card.ExternalDropTarget("#Kanban1");
})
.Fields(field =>
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
{
field.Content("Summary")
.PrimaryKey("Id");
})
)
@(Html.EJ().Kanban("Kanban1")
.DataSource((IEnumerable<object>)ViewBag.datasource1)
.Columns(col =>
{
col.HeaderText("Open").Key("Open,InProgress").Add();
col.HeaderText("Done").Key("Testing,Close").Add();
})
.AllowTitle(true)
.AllowExternalDragAndDrop(true)
.CardSettings(card =>
{
card.ExternalDropTarget("#Kanban");
})
.KeyField("Status")
.Fields(field =>
{
field.Content("Summary")
.PrimaryKey("Id");
})
)
```

C#

```
public partial class KanbanController : Controller
{

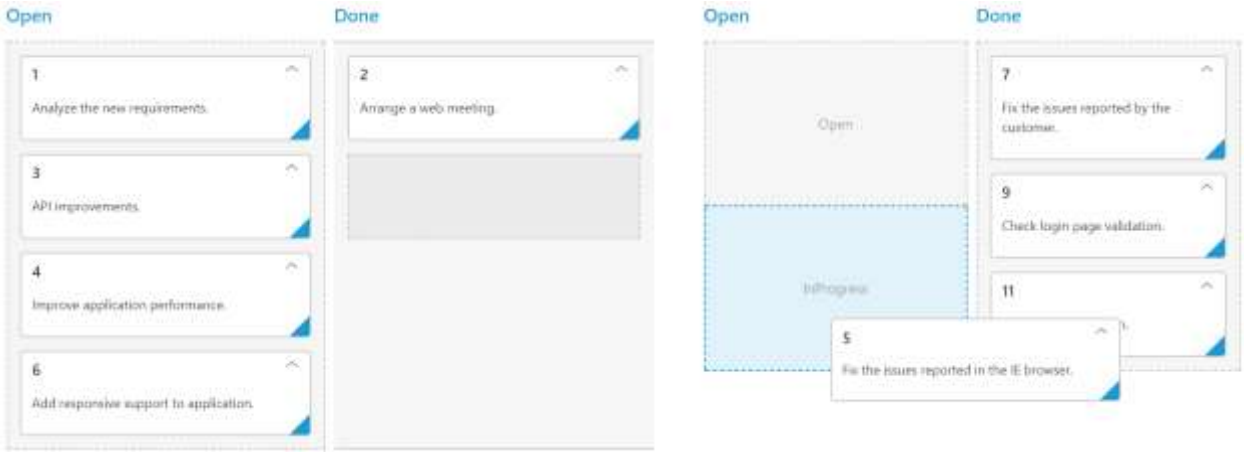
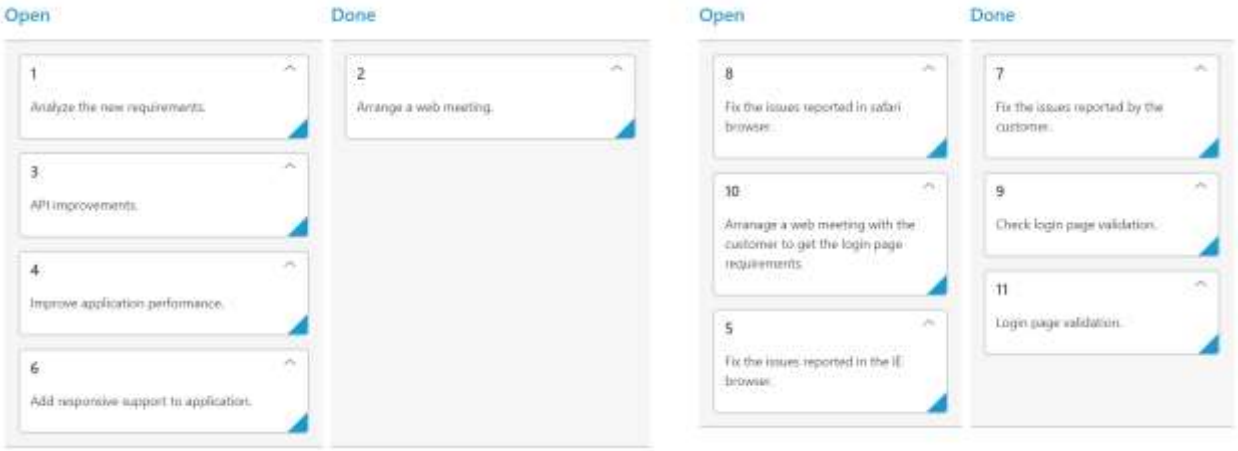
The following output is displayed before dropping Kanban cards.



The following output is displayed after dropping Kanban cards.



See Also

You can also drag and drop Kanban cards to any custom control. For instance, let it be a Grid control. Enable the Kanban property AllowExternalDragAndDrop and specify the target Grid element ID in ExternalDropTarget.

Note: The target control must have droppable feature to handle the card dropped from Kanban and customize it based on corresponding control.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Kanban("Kanban")
.DataSource((IEnumerable<object>)ViewBag.datasource)
.Columns(col =>
{
col.HeaderText("Open").Key("Open").Add();
col.HeaderText("In Progress").Key("InProgress").Add();
col.HeaderText("Done").Key("Close").Add();
})
.AllowTitle(true)
.KeyField("Status")
```

The following output is displayed after dropping the cards on Grid.

Cards

Customization

Cards can be customized with appropriate mapping fields from the database. The customizable mapping properties are listed as follows

Mapping Fields	Description
Content	Map the column name to use as content to cards.
Tag	Map the column name to use as tag. Multiple tags can be given with comma separated. E.g. "API","SQL, Database".
Color	Map the column name to use as colors to highlight cards left border.
ColorMapping	Map the colors to use with column values which is mapped with fields.color.
ImageUrl	Map the column name to use as image to cards.
PrimaryKey	Map the column name to use as primary key to cards.
PriorityKey	Map the column name to use as priority key to cards.

Copyright © 2001 - 2020 Syncfusion Inc.

Title	Map the column name to use as title to cards. Default title is primaryKey.
AllowTitle	Set as true to enable title for card.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Kanban("Kanban")
.DataSource((IEnumerable<object>)ViewBag.datasource)
.Columns(col =>
{
col.HeaderText("Backlog").Key("Open").Add();
col.HeaderText("In Progress").Key("InProgress").Add();
col.HeaderText("Done").Key("Close").Add();
})
.AllowTitle(true)
.AllowSelection(true)
.KeyField("Status")
.Fields(field =>
{
field.Color("Type")
.Content("Summary")
.ImageUrl("Image")
.Tag("Tags")
.Priority("RankId")
.PrimaryKey("Id");
})
.CardSettings(card=>
{
card.ColorMapping(color =>
{
color.Add("#cb2027", "Bug,Story")
.Add("#67ab47", "Improvement")
.Add("#fbae19", "Epic")
.Add("#6a5da8", "Others");
});
})
)
```

C#

```
namespace MVCSampleBrowser
{
public partial class KanbanController : Controller
{
//
// GET: /Kanban/
public ActionResult KanbanFeatures()
{
var DataSource = new NorthwindDataContext().Tasks.Take(30).ToList();
ViewBag.datasource = DataSource;
return View();
}
```

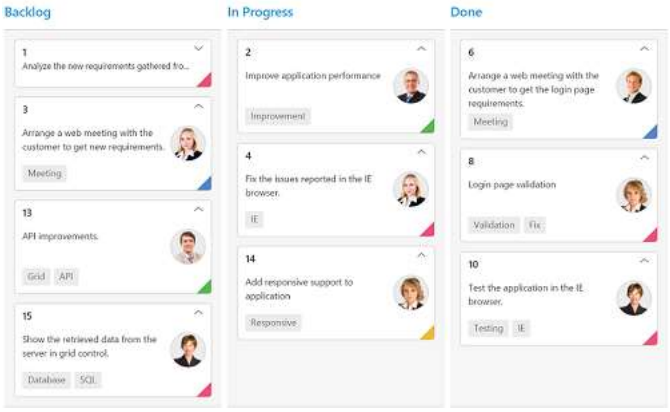
```
}
}
```

The following output is displayed as a result of the above code example.



Template

Templates are used to create custom card layout as per the user convenient. HTML templates can be specified in the `Template` property of the `CardSettings` as an ID of the template's HTML element.

You can use JsRender syntax in the template. For more information about JsRender syntax, please refer this link.

The following code example describes the above behavior.

HTML

```
<script id="template" type="text/x-jsrender">
<table>
<tr>
<td class="photo">
<img src="{{"{"}}:Priority{{}}}}.png">
</td>
<td class="details">
<table>
<colgroup>
<col width="30%">
<col width="70%">
</colgroup>
<tbody>
<tr>
<td class="CardHeader">   Name: </td>
<td>{{"{"}}:Assignee{{}}}}</td>
</tr>
<tr>
<td class="CardHeader">   Task: </td>
<td>{{"{"}}:Type{{}}}}</td>
</tr>
</tbody>
</table>
</td>
</tr>
</table>
```

```
</script>
```

CSS

```
<!--CSS for card template-->
<style>
.e-templatetable {
width: 100%;
}
.details > table {
margin-left: 2px;
border-collapse: separate;
border-spacing: 2px;
width: 100%;
}
.details td {
vertical-align: top;
}
.details {
padding: 8px 8px 10px 0;
}
.photo {
padding: 8px 6px 10px 6px;
text-align: center;
}
.CardHeader {
font-weight: bolder;
padding-right: 10px;
}
</style>
```

RAZOR

```
@(Html.EJ().Kanban("Kanban")
.DataSource((IEnumerable<object>)ViewBag.datasource)
.Columns(col =>
{
col.HeaderText("Backlog").Key("Open").Add();
col.HeaderText("In Progress").Key("InProgress").Add();
col.HeaderText("Done").Key("Close").Add();
})
.KeyField("Status")
.Fields(field =>
{
field.Color("Type")
.PrimaryKey("Id");
})
.CardSettings(card=>
{
card.ColorMapping(color =>
{
color.Add("#cb2027", "Bug,Story")
.Add("#67ab47", "Improvement")
.Add("#fbae19", "Epic")
.Add("#6a5da8", "Others");
});
```

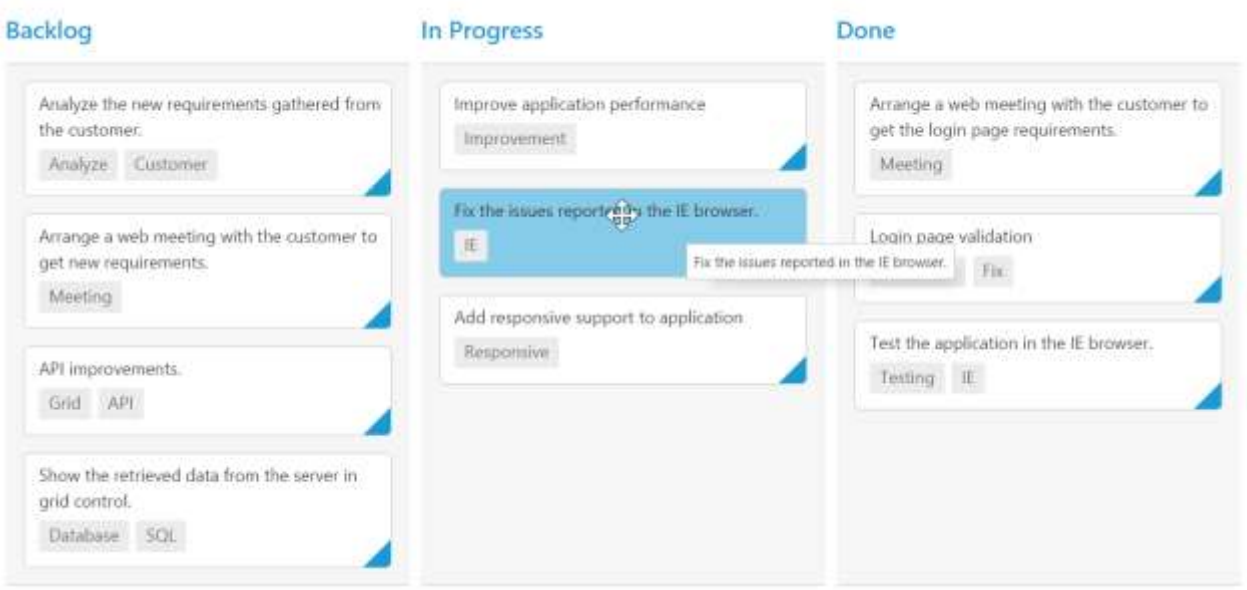
.Tag("Tags")
.PrimaryKey("Id");
})
)
```

C#

```
namespace MVCSampleBrowser
{
public partial class KanbanController : Controller
{
//
// GET: /Kanban/
public ActionResult KanbanFeatures()
{
var DataSource = new NorthwindDataContext().Tasks.Take(30).ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.



Template

By making use of template feature with tooltip, all the field names that are mapped from the dataSource can be accessed to define the Template tooltip for card. The TooltipSettings.Enable must be enabled first.

The following code example describes the tooltip template.

HTML

```
<script id="tooltipTemp" type="text/x-jsrender">
<div class='e-kanbantooltiptemplate'>
```

```
<table>
<tr>
<td class="photo">
<img src="{{"{{"}}:ImgUrl{{}}}}">
</td>
<td class="details">
<table>
<colgroup>
<col width="30%">
<col width="70%">
</colgroup>
<tbody>
<tr>
<td class="CardHeader">Assignee:</td>
<td>{{"{{"}}:Assignee{{}}}}</td>
</tr>
<tr>
<td class="CardHeader">Type:</td>
<td>{{"{{"}}:Type{{}}}}</td>
</tr>
<tr>
<td class="CardHeader">Estimate:</td>
<td>{{"{{"}}:Estimate{{}}}}</td>
</tr>
<tr>
<td class="CardHeader">Summary:</td>
<td>{{"{{"}}:Summary{{}}}}</td>
</tr>
</tbody>
</table>
</td>
</tr>
</table>
</div>
</script>
```

CSS

```
<!--toolTip template releated css -->
<style>
.details >table {
width: 100%;
margin-left:2px;
border-collapse: separate;
border-spacing: 1px;
}
.e-kanbantooltiptemplate {
width: 250px;
padding: 3px;
}
.e-kanbantooltiptemplate > table {
width: 100%;
}
.e-kanbantooltiptemplate td {
vertical-align: top;
}
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
td.details {
padding-left: 10px;
}
.CardHeader {
font-weight: bolder;
}
</style>
```

RAZOR

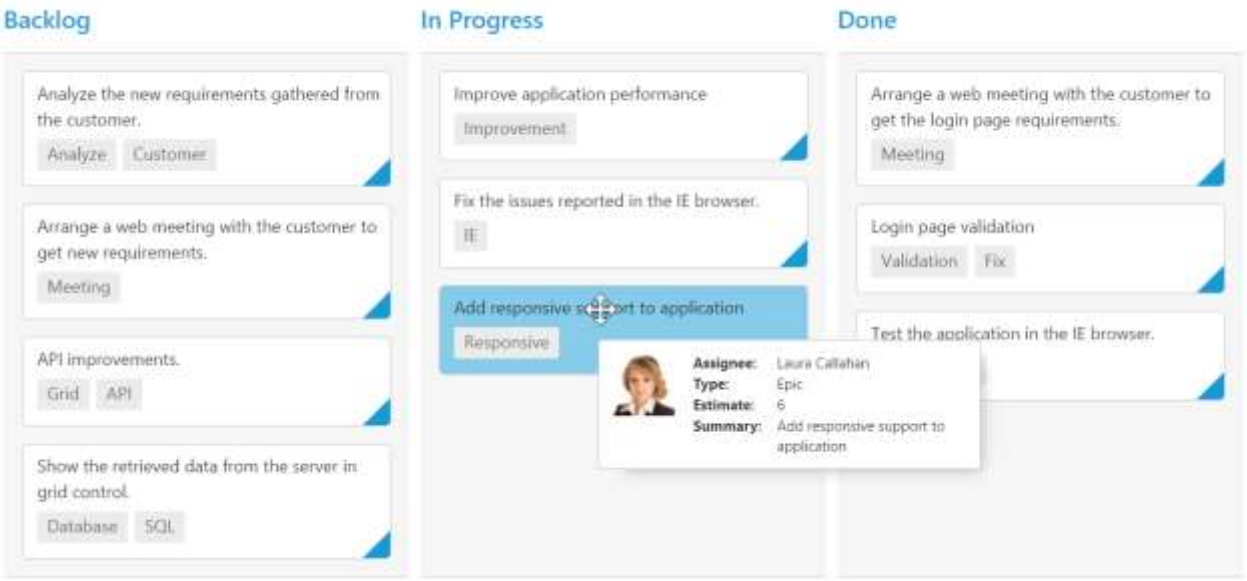
```
@(Html.EJ().Kanban("Kanban")
.DataSource((IEnumerable<object>)ViewBag.datasource)
.TooltipSettings(tooltip=>tooltip.Enable(true).Template("#tooltipTemp"))
.Columns(col =>
{
col.HeaderText("Backlog").Key("Open").Add();
col.HeaderText("In Progress").Key("InProgress").Add();
col.HeaderText("Done").Key("Close").Add();
})
.KeyField("Status")
.Fields(field =>
{
field.Content("Summary")
.Tag("Tags")
.PrimaryKey("Id");
})
)
```

C#

```
namespace MVCSampleBrowser
{
public partial class KanbanController : Controller
{
//
// GET: /Kanban/
public ActionResult KanbanFeatures()
{
var DataSource = new NorthwindDataContext().Tasks.Take(30).ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.

Copyright © 2001 - 2020 Syncfusion Inc.



Collapsible Cards

You can set particular cards collapsed state in Kanban by defining the CollapsibleCards property. Based on the CollapsibleCards object value, it maps the cards to the collapsible area.

You can set CollapsibleCards as object which consists of Field and Key properties. The Field property map the datasource field to be used in CollapsibleCards. The Key property map the specific column key to be in collapsed state.

Mapping Fields	Description
CollapsibleCards.Field	Map the collapsible card's field mapping.
CollapsibleCards.Key	Map the collapsible card's key mapping which is available in datasource value of field mapped in collapsibleCards.field.

Note: 1. If the CollapsibleCards with Field is in the dataSource and Key values specified will available in column values, then the cards will be rendered inside the collapsible card's division.

The following code example describes the collapsible cards.

RAZOR

```
@(Html.EJ().Kanban("Kanban")
.DataSource((IEnumerable<object>)ViewBag.datasource)
.Columns(col =>
{
col.HeaderText("Andrew").Key("Andrew Fuller").Add();
col.HeaderText("Janet").Key("Janet Leverling").Add();
col.HeaderText("Nancy").Key("Nancy Davloio").Add();
})
.AllowTitle(true)
.AllowSelection(false)
.KeyField("Assignee")
.Fields(field =>
```

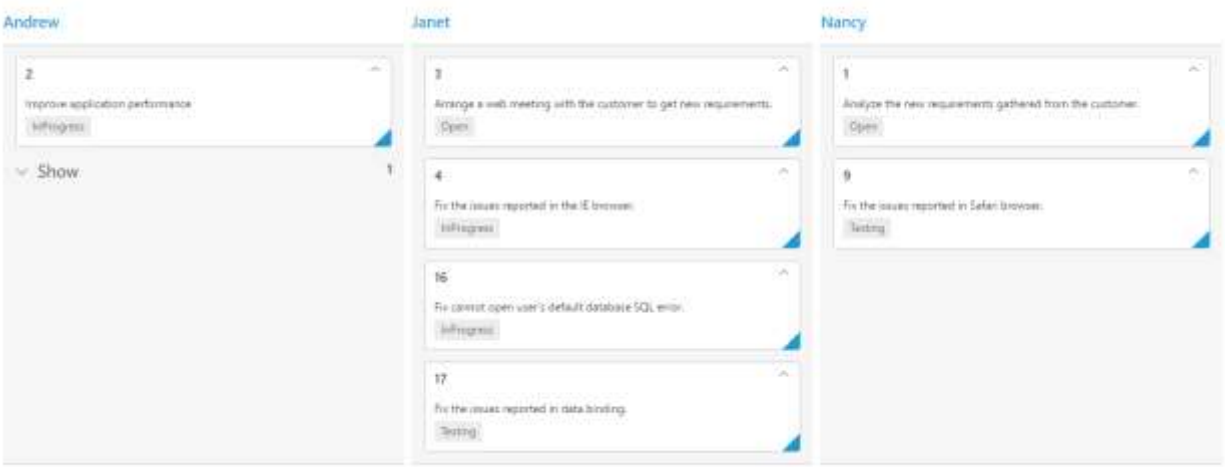
Copyright © 2001 - 2020 Syncfusion Inc.

```
{
field.PrimaryKey("Id");
field.Content("Summary");
field.Tag("Status");
field.CollapsibleCards(collapsibleCards =>
{
collapsibleCards.Field("Status").Key("Close");
});
})
)
```

C#

```
namespace MVCSampleBrowser
{
public partial class KanbanController : Controller
{
//
// GET: /Kanban/
public ActionResult KanbanFeatures()
{
var DataSource = new NorthwindDataContext().Tasks.Take(30).ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.



Prioritization of cards

Prioritizing cards is easy with drag-and-drop re-ordering that helps you to categorize most important work at the top. Cards can be categorized with priority by mapping specific database field into Priority property.

RankId defined in the dataSource which is consist priority of cards. The RankId will be changed while card ordering changes through Drag and Drop and Editing.

Copyright © 2001 - 2020 Syncfusion Inc.

The following code example describes the above behavior.

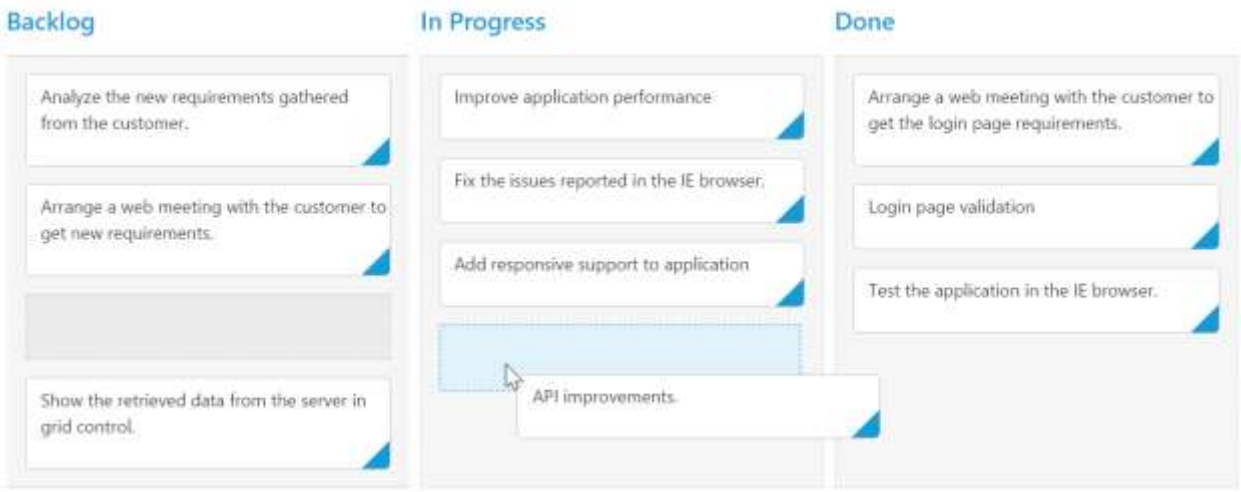
RAZOR

```
@(Html.EJ().Kanban("Kanban")
.DataSource((IEnumerable<object>)ViewBag.datasource)
.Columns(col =>
{
col.HeaderText("Backlog").Key("Open").Add();
col.HeaderText("In Progress").Key("InProgress").Add();
col.HeaderText("Done").Key("Close").Add();
})
.KeyField("Status")
.Fields(field =>
{
field.Content("Summary")
.Priority("RankId")
.PrimaryKey("Id");
})
)
```

C#

```
namespace MVCSampleBrowser
{
public partial class KanbanController : Controller
{
//
// GET: /Kanban/
public ActionResult KanbanFeatures()
{
var DataSource = new NorthwindDataContext().Tasks.Take(30).ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.



Copyright © 2001 - 2020 Syncfusion Inc.

Note: For Drag and Drop event handling, please refer this API.

Note: If the Priority property is not set in the Kanban fields, the cards are dropped based on the specifying JSON data orders in a particular column. If not set, drop the card in a particular position based on the previous card Priority value and the next card's Priority values will change dynamically.

Editing

The Kanban control has support for dynamic insertion, updating and deletion of cards.

Set AllowEditing and AllowAdding property as true to enable editing/inserting respectively. The primary key for the data source should be defined in PrimaryKey, for editing to work properly.

You can start the edit action by double clicking the particular card. Similarly, you can add new card to Kanban either by double clicking the particular cell or on an external button which is bound to call addCard method of Kanban.

Deletion of the card is possible by using deleteCard by passing primary key as attribute.

Note: In Kanban, the primary key column will be automatically set to read only while editing the card which is to avoid duplicate entry in the cards.

Configuring Edit Items

You need to configure the list of data source fields that are allowable in editing state using EditItems property. The Field property of EditItems needs to be mapped with data source fields.

You can map the data source field as title to edit form using Title property of Fields. By default, it's mapped with PrimaryKey.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Kanban("Kanban")
.DataSource((IEnumerable<object>)ViewBag.datasource)
.Columns(col =>
{
col.HeaderText("Backlog").Key("Open").Add();
col.HeaderText("In Progress").Key("InProgress").Add();
col.HeaderText("Done").Key("Close").Add();
})
.KeyField("Status")
.Fields(field =>
{
field.Content("Summary")
.PrimaryKey("Id");
})
.EditSettings(edit =>
{
edit.AllowAdding(true)
.AllowEditing(true)
.EditItems(e =>
{
e.Field("Id").Add();
e.Field("Status").EditType(KanbanEditingType.Dropdown).Add();
e.Field("Assignee").EditType(KanbanEditingType.Dropdown).Add();
e.Field("Estimate").EditType(KanbanEditingType.Numeric).NumericEditOptions(n
ew EditorProperties()
```

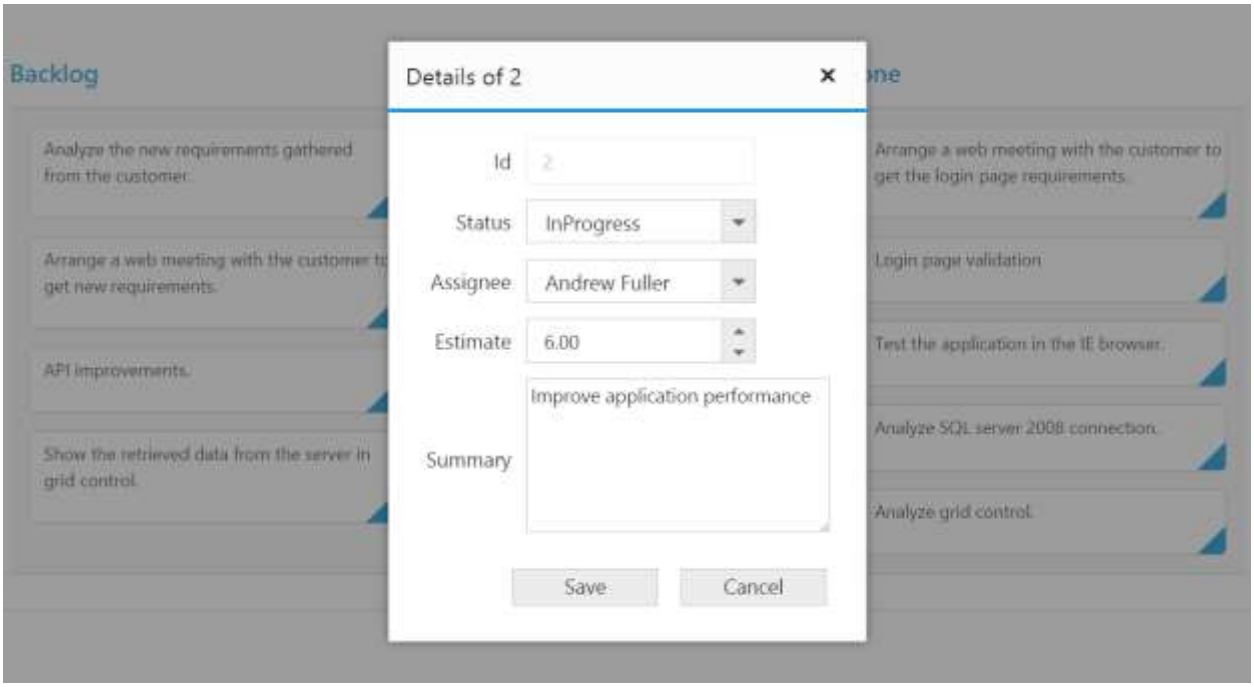
Copyright © 2001 - 2020 Syncfusion Inc.

```
{
DecimalPlaces = 2
}).Add();
e.Field("Summary").EditType(KanbanEditingType.TextArea).Add();
});
})
)
```

C#

```
namespace MVCSampleBrowser
{
public partial class KanbanController : Controller
{
//
// GET: /Kanban/
public ActionResult KanbanFeatures()
{
var DataSource = new NorthwindDataContext().Tasks.Take(30).ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.



Edit modes

Dialog

Set EditMode as Dialog to edit data using a dialog box, which displays the fields associated with the data card being edited. Default value is Dialog.

Note: For EditMode property you can assign either string value (“Dialog”) or enum value (ej.Kanban.EditMode.Dialog).

The following code example describes the above behavior.

RAZOR

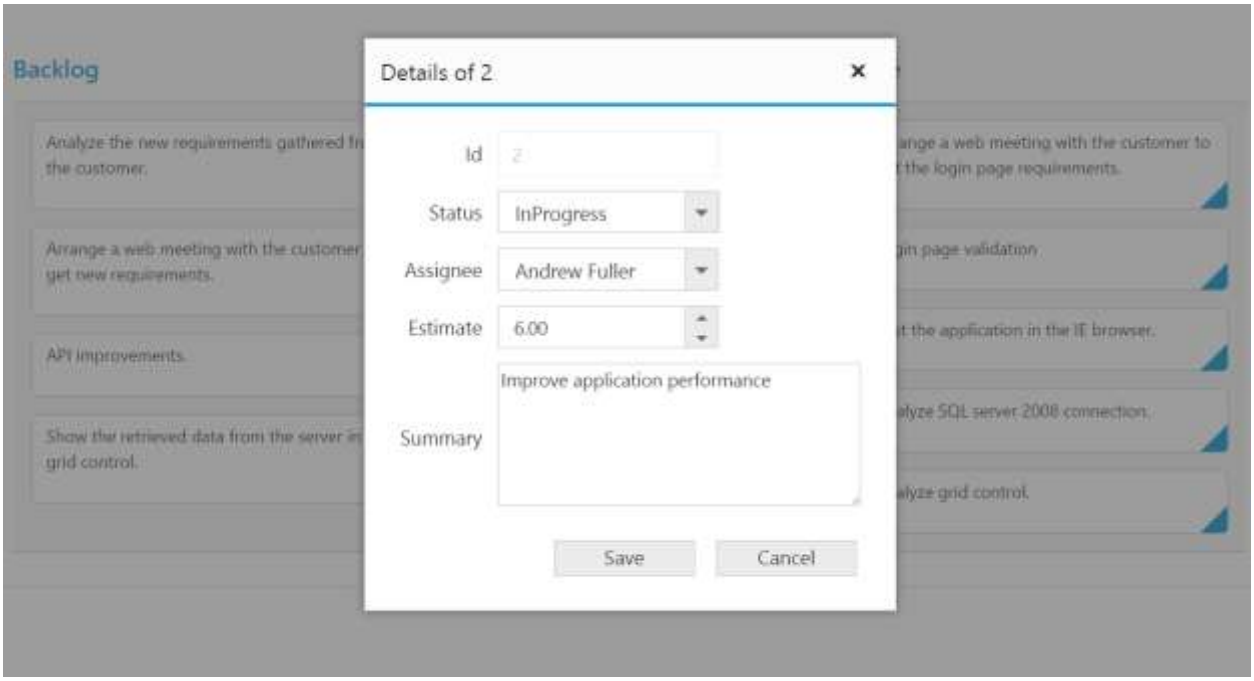
```
@(Html.EJ().Kanban("Kanban")
.DataSource((IEnumerable<object>)ViewBag.datasource)
.Columns(col =>
{
col.HeaderText("Backlog").Key("Open").Add();
col.HeaderText("In Progress").Key("InProgress").Add();
col.HeaderText("Done").Key("Close").Add();
})
.KeyField("Status")
.Fields(field =>
{
field.Content("Summary")
.PrimaryKey("Id");
})
.EditSettings(edit =>
{
edit.AllowAdding(true)
.AllowEditing(true)
.EditItems(e =>
{
e.Field("Id").Add();
e.Field("Status").EditType(KanbanEditingType.Dropdown).Add();
e.Field("Assignee").EditType(KanbanEditingType.Dropdown).Add();
e.Field("Estimate").EditType(KanbanEditingType.Numeric).NumericEditOptions(n
ew EditorProperties()
{
DecimalPlaces = 2
}).Add();
e.Field("Summary").EditType(KanbanEditingType.TextArea).Add();
});
})
)
```

C#

```
namespace MVCSampleBrowser
{
public partial class KanbanController : Controller
{
//
// GET: /Kanban/
public ActionResult KanbanFeatures()
{
var DataSource = new NorthwindDataContext().Tasks.Take(30).ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

Copyright © 2001 - 2020 Syncfusion Inc.

The following output is displayed as a result of the above code example.



Dialog Template Form

You can edit any of the fields pertaining to a single card of data and apply it to a template so that the same format is applied to all the other cards that you may edit later.

Using this template support, you can edit the fields that are not bound to EditItems.

To edit the cards using Dialog template form, set EditMode as DialogTemplate and specify the template id to DialogTemplate property of EditSettings.

Note: 1. value attribute is used to bind the corresponding field value while editing.

2. name attribute is used to get the changed field values while save the edited card.

3. For EditMode property you can assign enum value (KanbanEditMode.DialogTemplate).

The following code example describes the above behavior.

HTML

```
<script id="template" type="text/template">
<table cellspacing="10">
<tr>
<td style="text-align: right;">Id
</td>
<td style="text-align: left">
<input id="Id" name="Id" value="{{: Id}}" class="e-field e-ejinputtext valid
e-disable" style="text-align: right; width: 175px; height: 28px"
disabled="disabled" />
</td>
<td style="text-align: right;">Status
</td>
```

```
<td style="text-align: left">
<select id="Status" name="Status">
<option value="Close">Close</option>
<option value="InProgress">InProgress</option>
<option value="Open">Open</option>
</select>
</td>
</tr>
<tr>
<td style="text-align: right;">Estimate
</td>
<td style="text-align: left">
<input type="text" id="Estimate" name="Estimate" value="{{:Estimate}}" />
</td>
<td style="text-align: right;">Assignee
</td>
<td style="text-align: left">
<select id="Assignee" name="Assignee">
<option value="Nancy Davloio">Nancy</option>
<option value="Andrew Fuller">Andrew Fuller</option>
<option value="Janet Leverling">Janet</option>
<option value="Margaret hamilt">Margaret</option>
<option value="Steven walker">Steven walker</option>
<option value="Michael Suyama">Michael</option>
<option value="Robert King">Robert King</option>
<option value="Laura Callahan">Laura Callahan</option>
</select>
</td>
</tr>
</table>
</script>
```

RAZOR

```
@(Html.EJ().Kanban("Kanban")
.DataSource((IEnumerable<object>)ViewBag.datasource)
.ClientSideEvents(eve => eve.ActionComplete("complete"))
.Columns(col =>
{
col.HeaderText("Backlog").Key("Open").Add();
col.HeaderText("In Progress").Key("InProgress").Add();
col.HeaderText("Done").Key("Close").Add();
})
.KeyField("Status")
.Fields(field =>
{
field.Content("Summary")
.PrimaryKey("Id");
})
.EditSettings(edit =>
{
edit.AllowAdding(true)
.AllowEditing(true)
.EditMode(KanbanEditMode.DialogTemplate)
.DialogTemplate("#template");
})
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
)
```

C#

```
namespace MVCSampleBrowser
{
public partial class KanbanController : Controller
{
//
// GET: /Kanban/
public ActionResult KanbanFeatures()
{
var DataSource = new NorthwindDataContext().Tasks.Take(30).ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

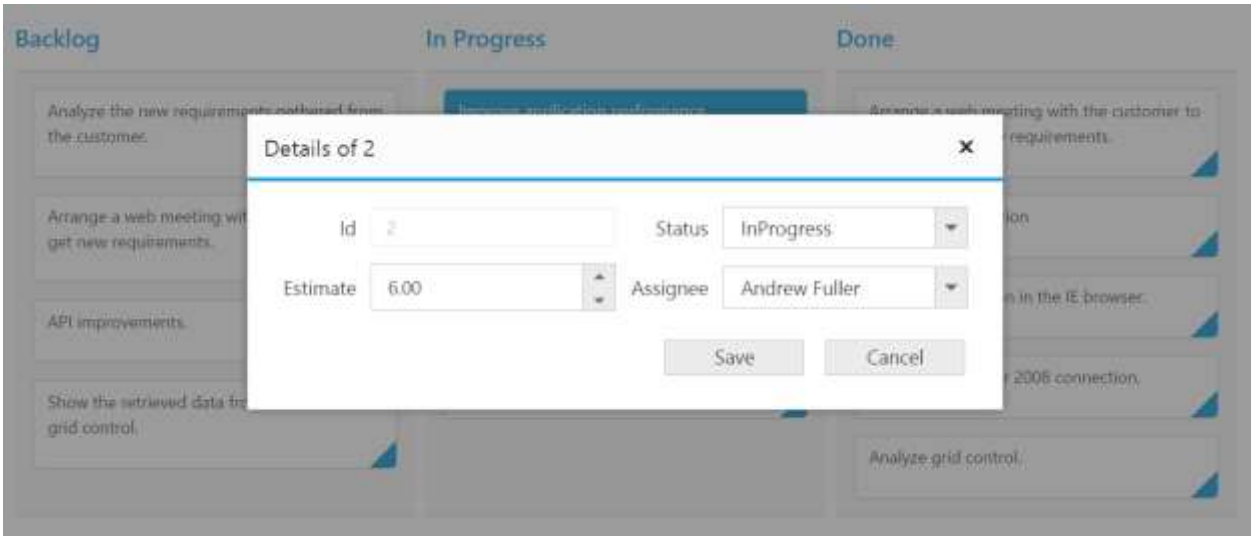
While using template, you can change the elements that are defined in the template, to appropriate Syncfusion JS controls based on the column type. This can be achieved by using ActionComplete event of Kanban. Please refer to following code snippets.

JAVASCRIPT

```
function complete(args) {
if ((args.requestType == "beginedit" || args.requestType == "add") &&
args.model.editSettings.editMode == "dialogtemplate") {
$("#Estimate").ejNumericTextbox({ value: parseFloat($("#Estimate").val()),
width: "175px", height: "34px", decimalPlaces: 2 });
$("#Assignee").ejDropDownList({ width: '175px' });
$("#Status").ejDropDownList({ width: '175px' });
$("#Priority").ejDropDownList({ width: '175px' });
if (args.requestType == "beginedit" || args.requestType == "add") {
$("#Assignee").ejDropDownList("setSelectedValue", args.data['Assignee']);
$("#Priority").ejDropDownList("setSelectedValue", args.data['Priority']);
$("#Status").ejDropDownList("setSelectedValue", args.data['Status']);
}
}
}
```

The following output is displayed as a result of the above code example.

Copyright © 2001 - 2020 Syncfusion Inc.



External Form

Set the EditMode as ExternalForm to open the edit form in outside kanban content.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Kanban("Kanban")
.DataSource((IEnumerable<object>)ViewBag.datasource)
.Columns(col =>
{
col.HeaderText("Backlog").Key("Open").Add();
col.HeaderText("In Progress").Key("InProgress").Add();
col.HeaderText("Done").Key("Close").Add();
})
.KeyField("Status")
.Fields(field =>
{
field.Content("Summary")
.PrimaryKey("Id");
})
.EditSettings(edit =>
{
edit.AllowAdding(true)
.AllowEditing(true)
.EditItems(e =>
{
e.Field("Id").Add();
e.Field("Status").EditType(KanbanEditingType.Dropdown).Add();
e.Field("Summary").EditType(KanbanEditingType.TextArea).Add();
}).EditMode(KanbanEditMode.ExternalForm);
})
)
```

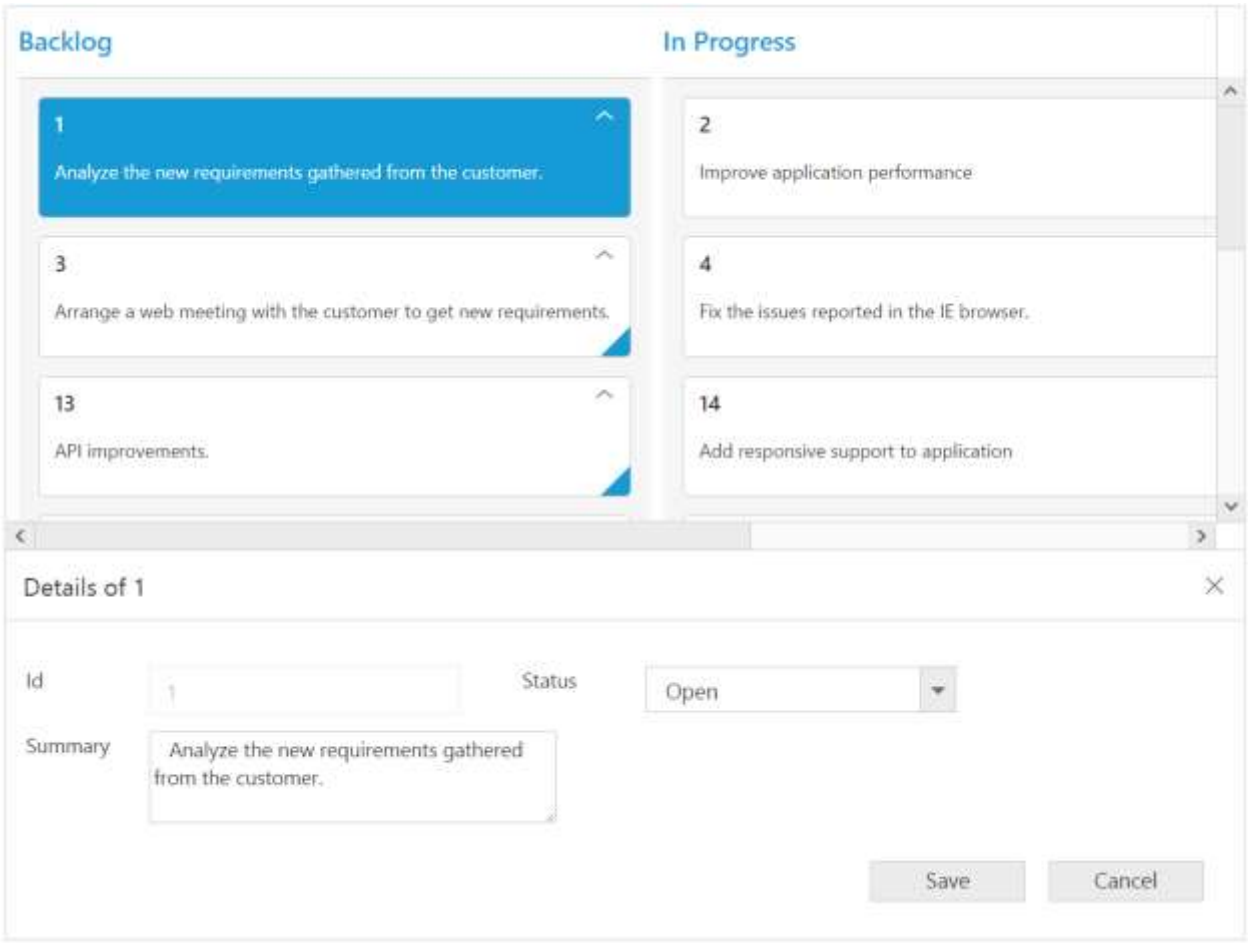
C#

```
namespace MVCSampleBrowser
{
public partial class KanbanController : Controller
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
{
// GET: /Kanban/
public ActionResult KanbanFeatures()
{
var DataSource = new NorthwindDataContext().Tasks.Take(30).ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.



Form Position:

Form Position can be customized by setting the FormPosition property of `EditSettings' as "right" or "bottom".

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Kanban("Kanban")
.DataSource((IEnumerable<object>)ViewBag.datasource)
.Columns(col =>
```

Copyright © 2001 - 2020 Syncfusion Inc.

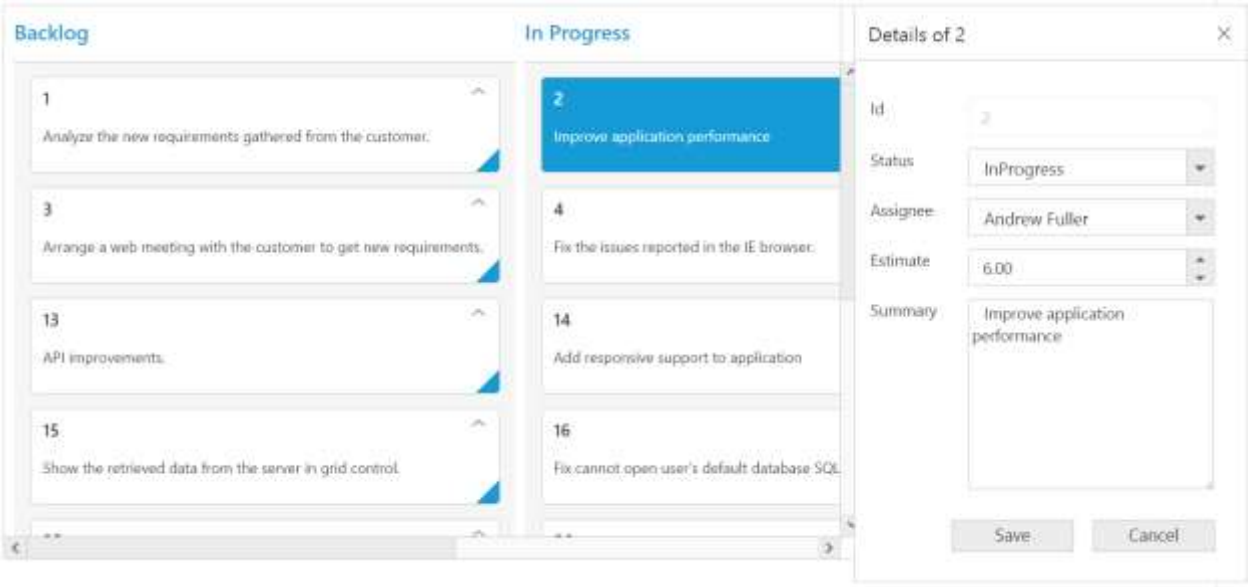
```
{
col.HeaderText("Backlog").Key("Open").Add();
col.HeaderText("In Progress").Key("InProgress").Add();
col.HeaderText("Done").Key("Close").Add();
})
.KeyField("Status")
.Fields(field =>
{
field.Content("Summary")
.PrimaryKey("Id");
})
.EditSettings(edit =>
{
edit.AllowAdding(true)
.AllowEditing(true)
.FormPosition(KanbanFormPosition.Right)
.EditItems(e =>
{
e.Field("Id").Add();
e.Field("Status").EditType(KanbanEditingType.Dropdown).Add();
e.Field("Assignee").EditType(KanbanEditingType.Dropdown).Add();
e.Field("Estimate").EditType(KanbanEditingType.Numeric).NumericEditOptions(n
ew EditorProperties()
{
DecimalPlaces = 2
}).Add();
e.Field("Summary").EditType(KanbanEditingType.TextArea).Add();
}).EditMode(KanbanEditMode.ExternalForm);
})
)
```

C#

```
namespace MVCSampleBrowser
{
public partial class KanbanController : Controller
{
// GET: /Kanban/
public ActionResult KanbanFeatures()
{
var DataSource = new NorthwindDataContext().Tasks.Take(30).ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.

Copyright © 2001 - 2020 Syncfusion Inc.



External Template Form

You can edit any of the fields pertaining to a single card of data and apply it to a template so that the same format is applied to all the other cards that you may edit later.

Using this template support, you can edit the fields that are not bound to Kanban Edit Items.

To edit the cards using External template form, set `EditMode` as `ExternalFormTemplate` and specify the template id to `ExternalFormTemplate` property of `EditSettings`.

While using template, you can change the elements that are defined in the template, to appropriate Syncfusion JS controls based on the column type. This can be achieved by using `ActionComplete` event of Kanban.

Note: 1. `value` attribute is used to bind the corresponding field value while editing.

2. `name` attribute is used to get the changed field values while save the edited card.

3. For `EditMode` property you can assign `enum` value (`KanbanEditMode.ExternalFormTemplate`).

The following code example describes the above behavior.

HTML

```
<script id="template" type="text/template">
<table cellspacing="10">
<tr>
<td style="text-align: right;">Id
</td>
<td style="text-align: left">
<input id="Id" name="Id" value="{{: Id}}" class="e-field e-ejinputtext valid
e-disable" style="text-align: right; width: 175px; height: 28px"
disabled="disabled" />
</td>
<td style="text-align: right;">Status
</td>
<td style="text-align: left">
<select id="Status" name="Status">
<option value="Close">Close</option>
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
<option value="InProgress">InProgress</option>
<option value="Open">Open</option>
</select>
</td>
</tr>
<tr>
<td style="text-align: right;">Assignee
</td>
<td style="text-align: left">
<select id="Assignee" name="Assignee">
<option value="Nancy">Nancy</option>
<option value="Andrew Fuller">Andrew Fuller</option>
<option value="Janet">Janet</option>
<option value="Margaret">Margaret</option>
<option value="Steven walker">Steven walker</option>
<option value="Michael">Michael</option>
<option value="Robert King">Robert King</option>
<option value="Laura Callahan">Laura Callahan</option>
</select>
</td>
</tr>
</table>
</script>
```

RAZOR

```
@(Html.EJ().Kanban("Kanban")
.DataSource((IEnumerable<object>)ViewBag.datasource)
.ClientSideEvents(eve => eve.ActionComplete("complete"))
.Columns(col =>
{
col.HeaderText("Backlog").Key("Open").Add();
col.HeaderText("In Progress").Key("InProgress").Add();
col.HeaderText("Done").Key("Close").Add();
})
.KeyField("Status")
.Fields(field =>
{
field.Content("Summary")
.PrimaryKey("Id");
})
.EditSettings(edit =>
{
edit.AllowAdding(true)
.AllowEditing(true)
.EditMode(KanbanEditMode.ExternalFormTemplate)
.ExternalFormTemplate("#template");
})
)
```

C#

```
namespace MVCSampleBrowser
{
public partial class KanbanController : Controller
{
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
// GET: /Kanban/
public ActionResult KanbanFeatures()
{
var DataSource = new NorthwindDataContext().Tasks.Take(30).ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

JAVASCRIPT

```
function complete(args) {
if ((args.requestType == "beginedit" || args.requestType == "add") &&
args.model.editSettings.editMode == "externalformtemplate") {
$("#Assignee").ejDropDownList({ width: '175px' });
$("#Status").ejDropDownList({ width: '175px' });
if (args.requestType == "beginedit" || args.requestType == "add") {
$("#Assignee").ejDropDownList("setSelectedValue", args.data['Assignee']);
$("#Status").ejDropDownList("setSelectedValue", args.data['Status']);
}
}
}
```

The following output is displayed as a result of the above code example.

Cell edit type and its params

The edit type of bound column can be customized using `EditType` property of `Columns`. The following Essential JavaScript controls are supported built-in by `EditType`. You can set the `EditType` based on specific data type of the column.

EditType	EditParams	Description	Example
Numeric	TextBoxes	control for integers, double, and decimal dataâ€™s	NumericEditOptions(new EditorProperties() { DecimalPlaces = 2 })
String	HTML Textbox	HTML Textbox	-
DatePicker	DatePicker	control for date data	DateEditOptions(new DatePickerProperties() { ButtonText="Now"})
DateTimePicker	DateTimePicker	control for date data-time data	DateTimeEditOptions(new DateTimePickerProperties() { Enabled=true})

Copyright © 2001 - 2020 Syncfusion Inc.

DropDown	DropDownList	control for list of data	DropdownEditOptions(new DropDownListProperties() { AllowGrouping=true})
RTE	RTE	control for customizing text in RTE format	RTEEditOptions(new RTEproperties() { EnableResize=true})
TextArea	HTML TextArea	Control for multi-line plain-text editing	

Note: 1. If EditType is not set, then by default it will display HTML textbox while editing a card.

2. For EditType property you can assign either string value (numericedit) or enum value (ej.Kanban.EditingType.Numeric).

The following code example describes the above behavior.

RAZOR

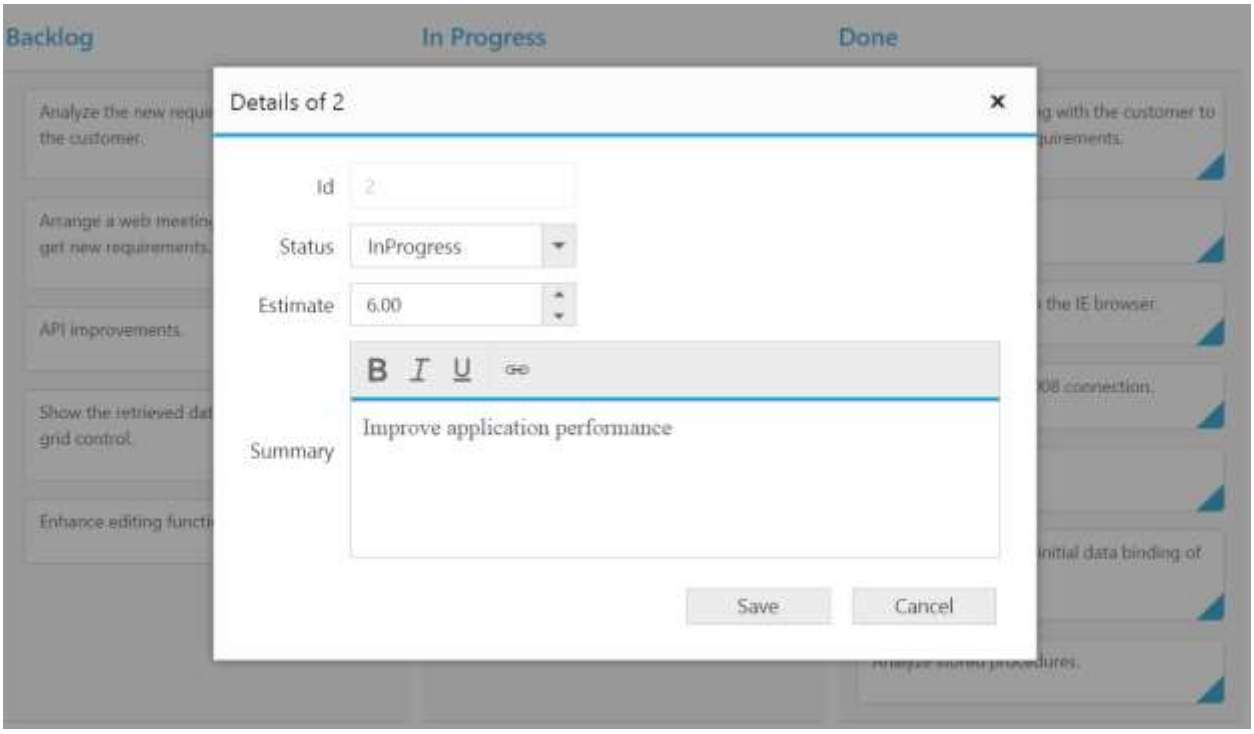
```
@(Html.EJ().Kanban("Kanban")
.DataSource((IEnumerable<object>)ViewBag.datasource)
.Columns(col =>
{
col.HeaderText("Backlog").Key("Open").Add();
col.HeaderText("In Progress").Key("InProgress").Add();
col.HeaderText("Done").Key("Close").Add();
})
.KeyField("Status")
.Fields(field =>
{
field.Content("Summary")
.PrimaryKey("Id");
})
.EditSettings(edit =>
{
edit.AllowAdding(true)
.AllowEditing(true)
.EditItems(e =>
{
e.Field("Id").Add();
e.Field("Status").EditType(KanbanEditingType.Dropdown).Add();
e.Field("Estimate").EditType(KanbanEditingType.Numeric).NumericEditOptions(n
ew EditorProperties()
{
DecimalPlaces = 2
}).Add();
e.Field("Summary").EditType(KanbanEditingType.RTE).RTEEditOptions(new
RTEproperties() { Height = "150",MinHeight="100"}).Add();
});
})
)
```

C#

Copyright © 2001 - 2020 Syncfusion Inc.

```
namespace MVCSampleBrowser
{
public partial class KanbanController : Controller
{
//
// GET: /Kanban/
public ActionResult KanbanFeatures()
{
var DataSource = new NorthwindDataContext().Tasks.Take(30).ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.



Column Validation

We can validate the value of the added or edited card cell before saving.

The below validation script files are needed when editing is enabled with validation.

1. jquery.validate.min.js 2. jquery.validate.unobtrusive.min.js

Note: If you enabled the unobtrusive option, then need to refer the jquery.validate.unobtrusive.min.js file in your application along with the other script.

jQuery Validation

You can set validation rules using ValidationRules property of Columns. The following are jQuery validation methods.

Copyright © 2001 - 2020 Syncfusion Inc.

List of jQuery validation methods

Rules	Description
required	Requires an element.
remote	Requests a resource to check the element for validity.
minlength	Requires the element to be of given minimum length.
maxlength	Requires the element to be of given maximum length.
rangelength	Requires the element to be in given value range.
min	The element requires a given minimum.
max	The element requires a given maximum.
range	Requires the element to be in a given value range.
email	The element requires a valid email.
url	The element requires a valid url.
date	Requires the element to be a date.
dateISO	The element requires an ISO date.
number	The element requires a decimal number.
digits	The element requires digits only.
creditcard	Requires the element to be a credit card number.
equalTo	Requires the element to be the same as another.

Kanban supports all the standard validation methods of jQuery, please refer the jQuery validation documentation link for more information.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Kanban("Kanban")
.DataSource((IEnumerable<object>)ViewBag.datasource)
.Columns(col =>
{
col.HeaderText("Backlog").Key("Open").Add();
col.HeaderText("In Progress").Key("InProgress").Add();
col.HeaderText("Done").Key("Close").Add();
})

Persisting data in server

Edited data can be persisted in database using RESTful web services.

All the CRUD operations in Kanban are done through DataManager. DataManager have an option to bind all the CRUD related data in server side. Please refer the link to know about the DataManager.

URL Adaptor

You can use the UrlAdaptor of DataManager when binding DataSource from remote data. At initial load of Kanban, using URL property of DataManager, data are fetched from remote data and bound to Kanban. You can map CRUD operation in Kanban to Server-Side Controller action using the property CrudURL.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Kanban("Kanban")
.DataSource(data =>
data.URL("GetData").CrudURL("Crud").Adaptor(AdaptorType.UrlAdaptor))
.Columns(col =>
{
col.HeaderText("Backlog").Key("Open").ShowAddButton(true).Add();
col.HeaderText("In Progress").Key("InProgress").Add();
col.HeaderText("Done").Key("Close").Add();
})
.CustomToolbarItems(custom =>
{
custom.Template("#Delete").Add();
})
.EditSettings(edit =>
{
edit.AllowAdding(true)
.AllowEditing(true)
.EditItems(e =>
{
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
e.Field("Id").Add();
e.Field("Status").Add();
e.Field("Assignee").Add();
e.Field("Estimate").Add();
e.Field("Summary").Add();
}).EditMode(KanbanEditMode.Dialog);
})
.KeyField("Status")
.Fields(field =>
{
field.Content("Summary")
.PrimaryKey("Id")
.Priority("RankId");
})
.ClientSideEvents(eve => eve.ToolBarClick("toolbarClick"))
)
<script type="text/javascript">
function toolbarClick(args) {
if (args.itemName == "Delete" && this.element.find(".e-
kanbancard").hasClass("e-cardselection")) {
var selected = this.element.find(".e-cardselection");
this.KanbanEdit.deleteCard(selected.attr("id"));
}
}
</script>
<script id="Delete" type="text/template">
<a class="e-customdelete  e-icon" />
</script>
<style type="text/css" class="cssStyles">
.e-customdelete:before {
content: "\e800";
line-height: 26px;
min-height: 26px;
min-width: 14px;
display: inline-block;
}
</style>
```

Also when you use UrlAdaptor, you need to return the data as JSON and the JSON object must contain a properties result & count. The result holds the dataSource as its value and count holds the total cards count as its value.

The following code example describes the above behavior.

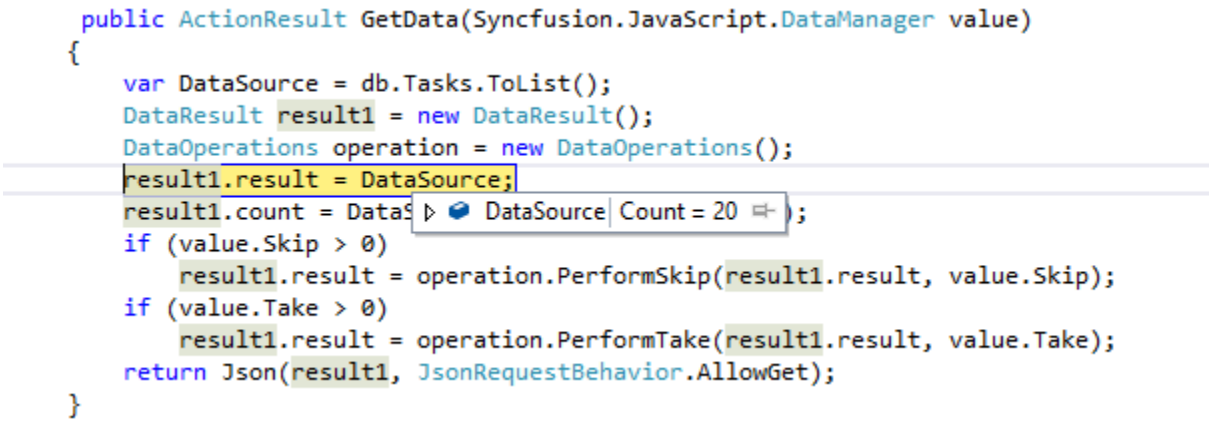
C#

```
public ActionResult GetData(Syncfusion.JavaScript.DataManager value)
{
var DataSource = db.Tasks.ToList();
DataResult result1 = new DataResult();
DataOperations operation = new DataOperations();
result1.result = DataSource;
result1.count = DataSource.AsQueryable().Count();
if (value.Skip > 0)
result1.result = operation.PerformSkip(result1.result, value.Skip);
if (value.Take > 0)
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
result1.result = operation.PerformTake(result1.result, value.Take);
return Json(result1, JsonRequestBehavior.AllowGet);
}
public class DataResult
{
public IEnumerable result { get; set; }
public int count { get; set; }
}
```

Please refer to the below screenshot.



Using DataOperations helper class you can perform Kanban action at server side. The in-built methods that we have provided in the DataOperations class are listed below.

1. PerformTake 2. PerformSelect 3. Execute

Accessing CRUD action request details in server side

The Server-Side function must be declared with the following parameter name for each editing functionality.

Parameters Table

Action	Parameter Name	Example
Update, Insert, Remove, Crud Update(Multiple cards data will be passed to the server when drag and drop enabled with priority.)	Changed values,Added values,Deleted value	public ActionResult Crud(List changed, List added, List deleted)

Insert Card

Using CrudURL property, you can specify the controller action mapping URL to perform insert operation at server side.

The following code example describes the above behavior.

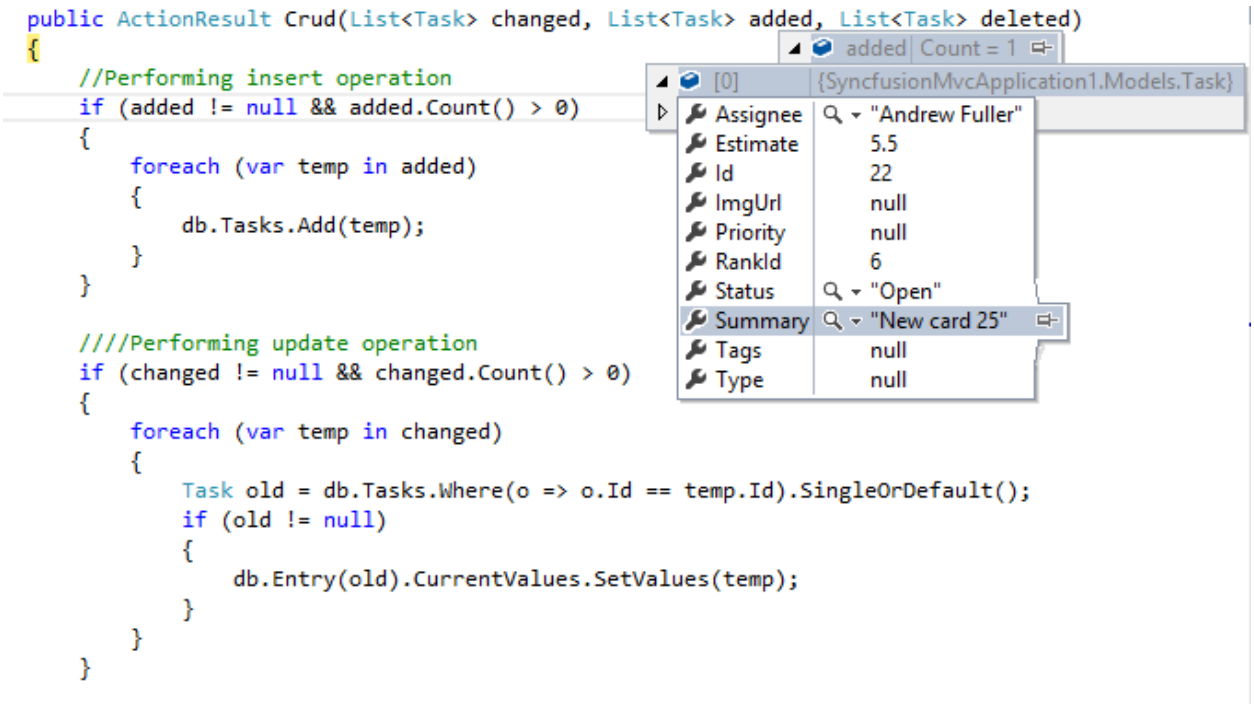
C#

```
public ActionResult Crud(List<Task> changed, List<Task> `added`, List<Task>
deleted)
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
{
// Insert card in the database.
if (added != null && added.Count() > 0)
{
foreach (var temp in added)
{
db.Tasks.Add(temp);
}
}
db.SaveChanges();
var data = db.Tasks.ToList();
return Json(data, JsonRequestBehavior.AllowGet);
}
```

The newly added card details are bound to the added parameter. Please refer the below image.



Update Card

Using CrudURL property, you can specify the controller action mapping URL to perform save/update operation at server side.

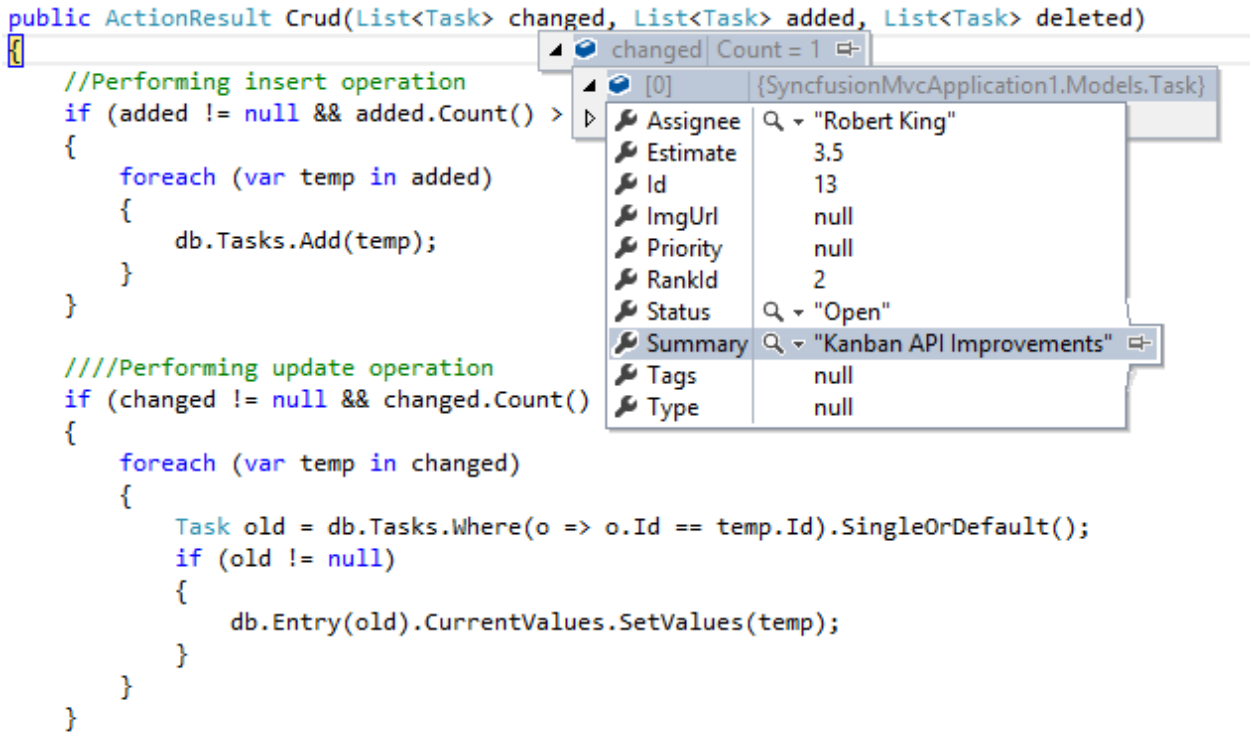
The following code example describes the above behavior.

C#

```
public ActionResult Crud(List<Task> `changed`, List<Task> added, List<Task>
deleted)
{
//Update card in the database.
if (changed != null && changed.Count() > 0)
{
foreach (var temp in changed)
{
Task old = db.Tasks.Where(o => o.Id == temp.Id).SingleOrDefault();
```

```
if (old != null)
{
db.Entry(old).CurrentValues.SetValues(temp);
}
}
}
db.SaveChanges();
var data = db.Tasks.ToList();
return Json(data, JsonRequestBehavior.AllowGet);
}
```

The updated card details are bound to the changed parameter. Please refer the below image.



Delete Card

Using CrudURL property, you can specify the controller action mapping URL to perform delete operation at server side.

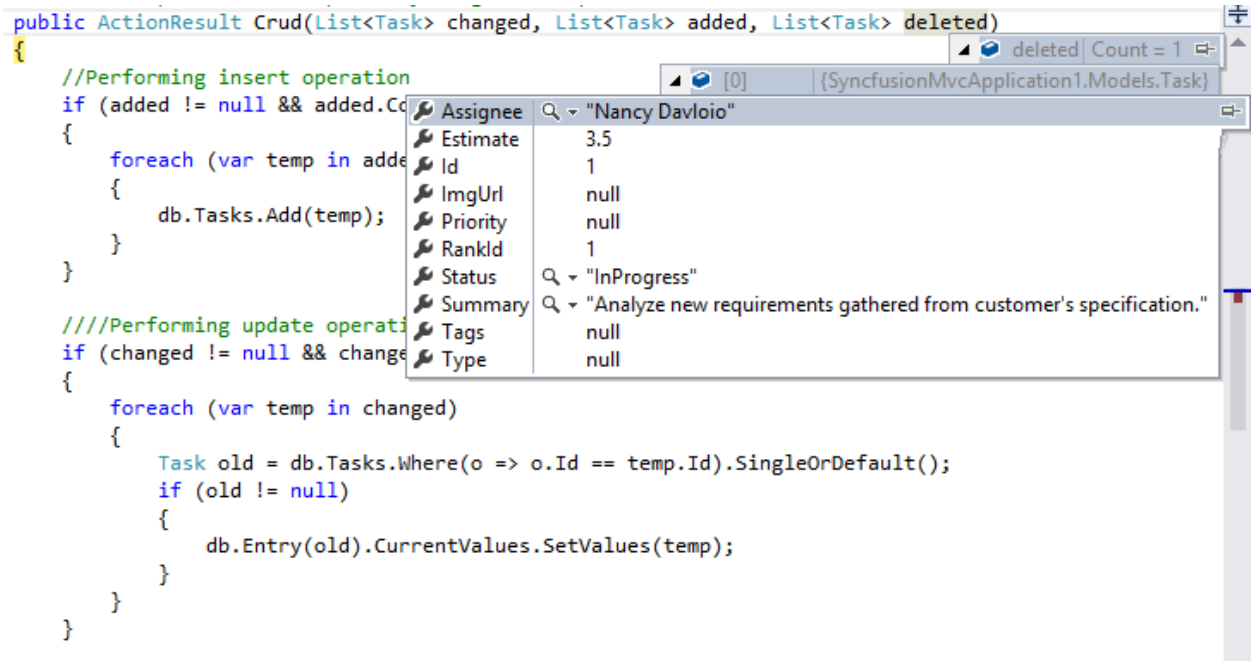
The following code example describes the above behavior.

C#

```
public ActionResult Crud(List<Task> changed, List<Task> added, List<Task>
deleted)
{
//Delete card in the database.
if (deleted != null && deleted.Count() > 0)
{
foreach (var temp in deleted)
{
db.Tasks.Remove(db.Tasks.Where(o => o.Id == temp.Id).SingleOrDefault());
}
```

```
}
db.SaveChanges();
var data = db.Tasks.ToList();
return Json(data, JsonRequestBehavior.AllowGet);
}
```

The deleted card details are bound to the deleted parameter. Please refer the below image.



Filtering

Filtering allows to filter the collection of cards from dataSource which meets the predefined query in the quick filters collection. To enable filtering, define FilterSettings collection with display Text and ej.Query.

You can also define display tip to describe filter definition to user using property Description. If the Description property is not defined, given Text will act as display tip.

We can also customize filter option through external button or customToolbarItems by using filterCards() method.

The following code example describes the above behavior.

RAZOR

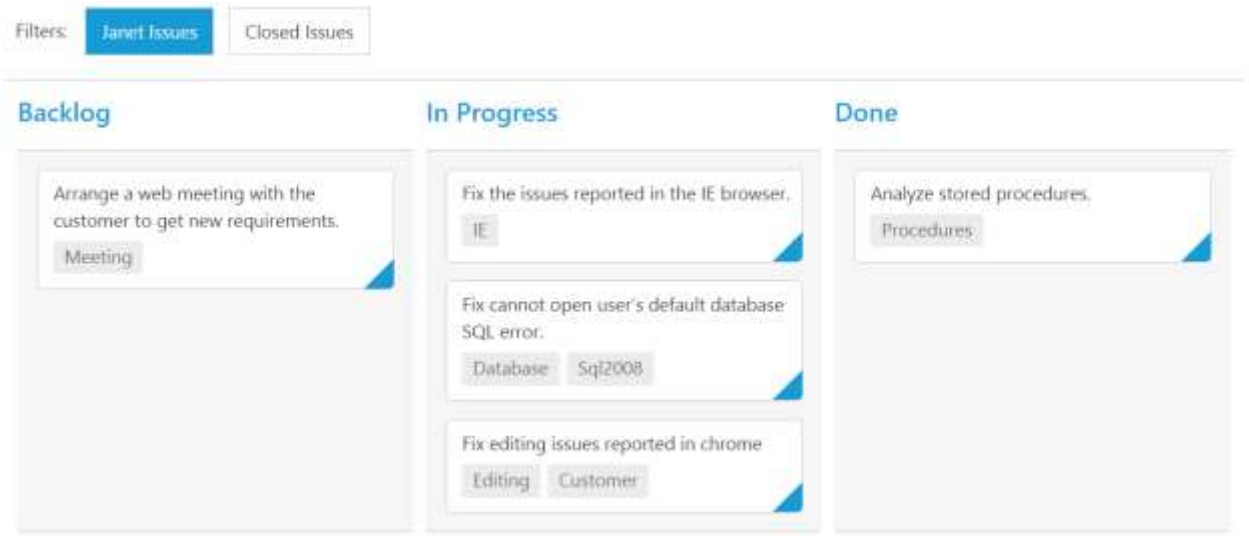
```
@(Html.EJ().Kanban("Kanban")
.DataSource((IEnumerable<object>)ViewBag.datasource)
.Columns(col =>
{
col.HeaderText("Backlog").Key("Open").Add();
col.HeaderText("In Progress").Key("InProgress").Add();
col.HeaderText("Done").Key("Close").Add();
})
.KeyField("Status")
.Fields(field =>
{
```

```
field.Content("Summary")
.Tag("Tags")
.PrimaryKey("Id");
})
.FilterSettings(filter =>
{
filter.Text("Janet Issues").Query("new ej.Query().where('Assignee', 'equal',
'Janet')").Description("Displays issues which matches the assignee as
'Janet").Add();
filter.Text("Closed  Issues").Query("new ej.Query().where('Status', 'equal',
'Close')").Description("Display the 'Closed' issues").Add();
})
)
```

C#

```
namespace MVCSampleBrowser
{
public partial class KanbanController : Controller
{
//
// GET: /Kanban/
public ActionResult KanbanFeatures()
{
var DataSource = new NorthwindDataContext().Tasks.Take(30).ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.



Scrolling

Scrolling can be enabled by setting AllowScrolling as true. The height and width can be set to Kanban by using the properties ScrollSettings.Height and ScrollSettings.Width respectively.

Copyright © 2001 - 2020 Syncfusion Inc.

Note: The height and width can be set in percentage and pixel. The default value for Height and Width in ScrollSettings is 0 and auto respectively.

Set width and height in pixel

To specify the ScrollSettings.Width and ScrollSettings.Height in pixel, by set the pixel value as integer.

The following code example describes the above behavior.

RAZOR

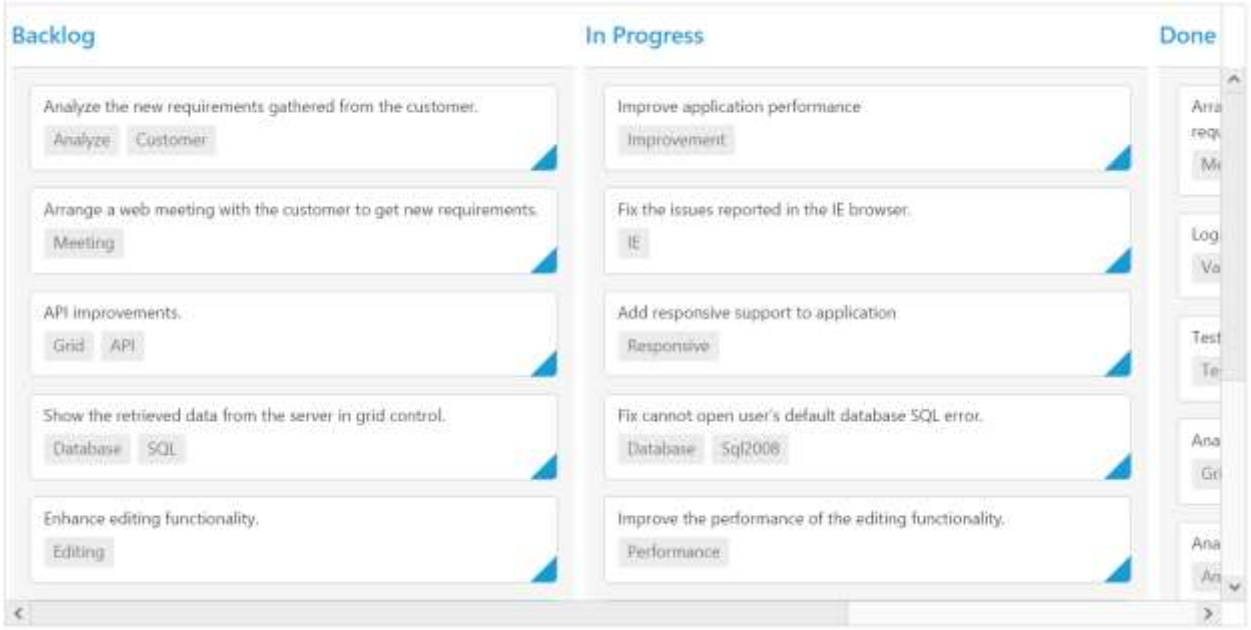
```
@(Html.EJ().Kanban("Kanban")
.DataSource((IEnumerable<object>)ViewBag.datasource)
.AllowScrolling(true)
.ScrollSettings(scroll=>scroll.Width(900).Height(450))
.Columns(col =>
{
col.HeaderText("Backlog").Key("Open").Add();
col.HeaderText("In Progress").Key("InProgress").Add();
col.HeaderText("Done").Key("Close").Add();
})
.KeyField("Status")
.Fields(field =>
{
field.Content("Summary")
.Tag("Tags")
.PrimaryKey("Id");
})
)
```

C#

```
namespace MVCSampleBrowser
{
public partial class KanbanController : Controller
{
//
// GET: /Kanban/
public ActionResult KanbanFeatures()
{
var DataSource = new NorthwindDataContext().Tasks.Take(30).ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.

Copyright © 2001 - 2020 Syncfusion Inc.



Set height and width in percentage

To specify the ScrollSettings.Width and ScrollSettings.Height in percentage, by set the percentage value as string.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Kanban("Kanban")
.DataSource((IEnumerable<object>)ViewBag.datasource)
.AllowScrolling(true)
.ScrollSettings(scroll => scroll.Width("70%").Height("70%"))
.Columns(col =>
{
col.HeaderText("Backlog").Key("Open").Add();
col.HeaderText("In Progress").Key("InProgress").Add();
col.HeaderText("Done").Key("Close").Add();
})
.KeyField("Status")
.Fields(field =>
{
field.Content("Summary")
.Tag("Tags")
.PrimaryKey("Id");
})
)
```

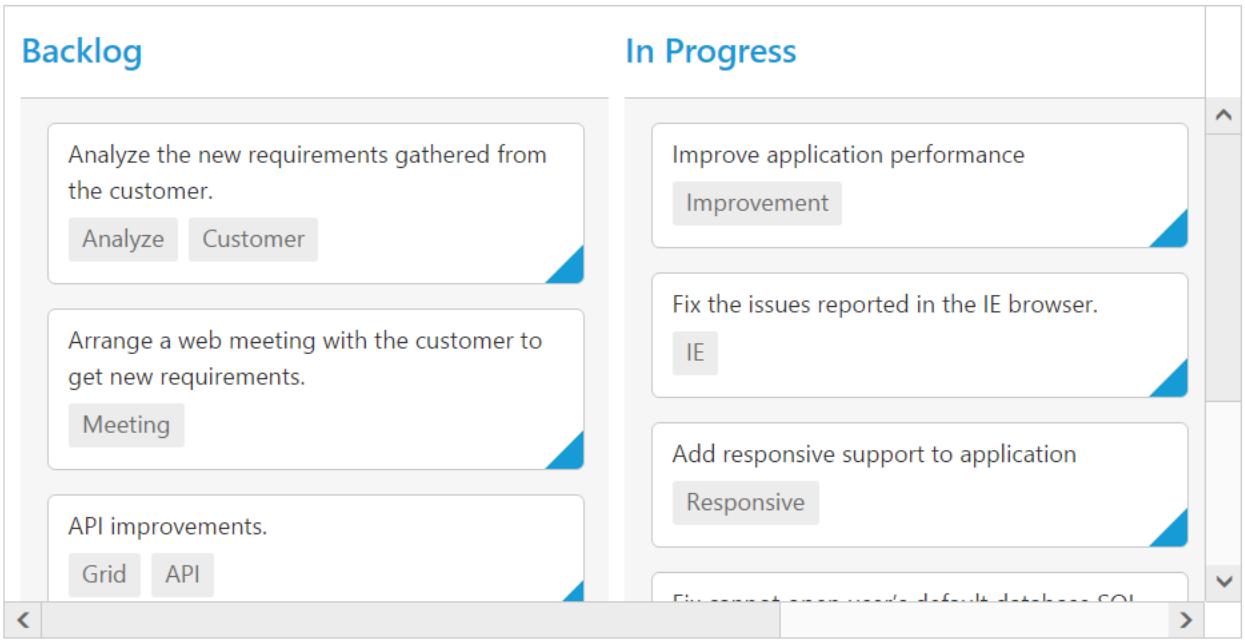
C#

```
namespace MVCSampleBrowser
{
public partial class KanbanController : Controller
{
//
// GET: /Kanban/
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
public ActionResult KanbanFeatures()
{
var DataSource = new NorthwindDataContext().Tasks.Take(30).ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.



Set width as auto

Specify Width property of ScrollSettings as auto, then the scrollbar is rendered only when the Kanban width exceeds the browser window width.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Kanban("Kanban")
.DataSource((IEnumerable<object>)ViewBag.datasource)
.AllowScrolling(true)
.ScrollSettings(scroll => scroll.Width("auto").Height("500"))
.Columns(col =>
{
col.HeaderText("Backlog").Key("Open").Add();
col.HeaderText("In Progress").Key("InProgress").Add();
col.HeaderText("Testing").Key("Testing").Add();
col.HeaderText("Done").Key("Close").Add();
})
.KeyField("Status")
.Fields(field =>
{
field.Content("Summary")
.Tag("Tags")
```

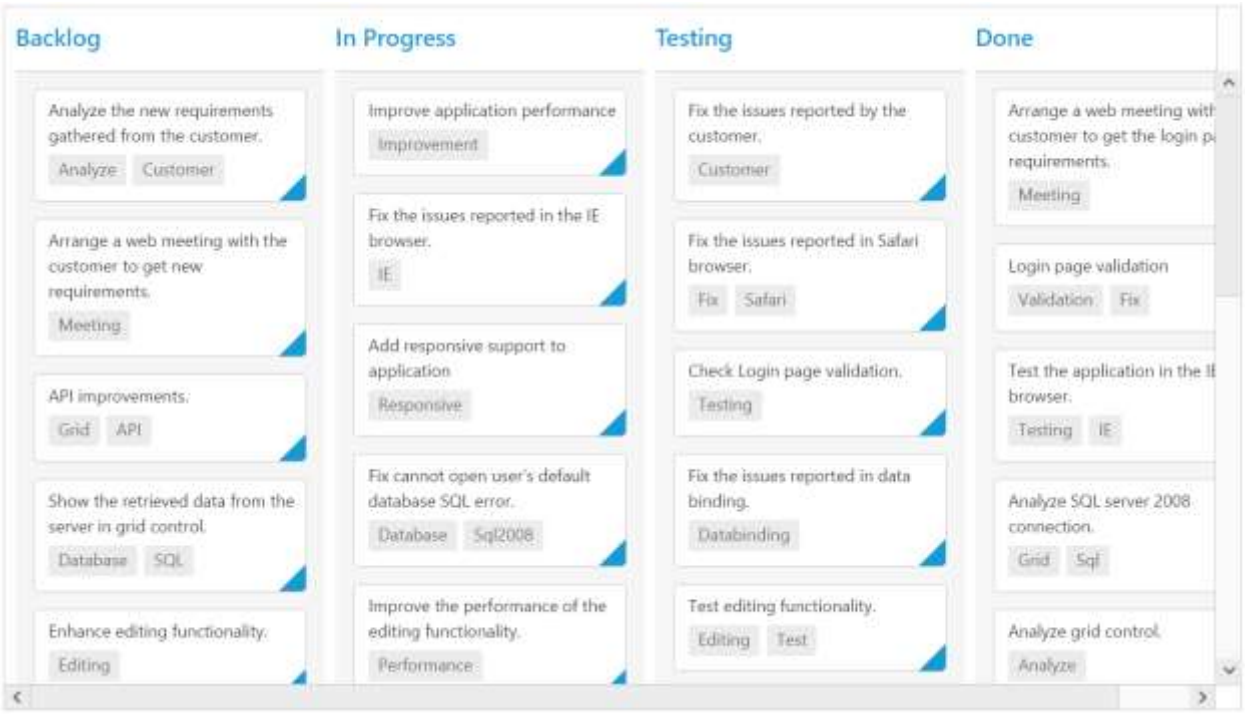
Copyright © 2001 - 2020 Syncfusion Inc.

```
.PrimaryKey("Id");
})
)
```

C#

```
namespace MVCSampleBrowser
{
public partial class KanbanController : Controller
{
//
// GET: /Kanban/
public ActionResult KanbanFeatures()
{
var DataSource = new NorthwindDataContext().Tasks.Take(30).ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.



Enabling freeze swim lane

Set AllowFreezeSwimlane as true. This enables scrolling with freezing of swim lane until you scroll to the next Swim lane, which helps user to aware of current swim lane target.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Kanban("Kanban")
```

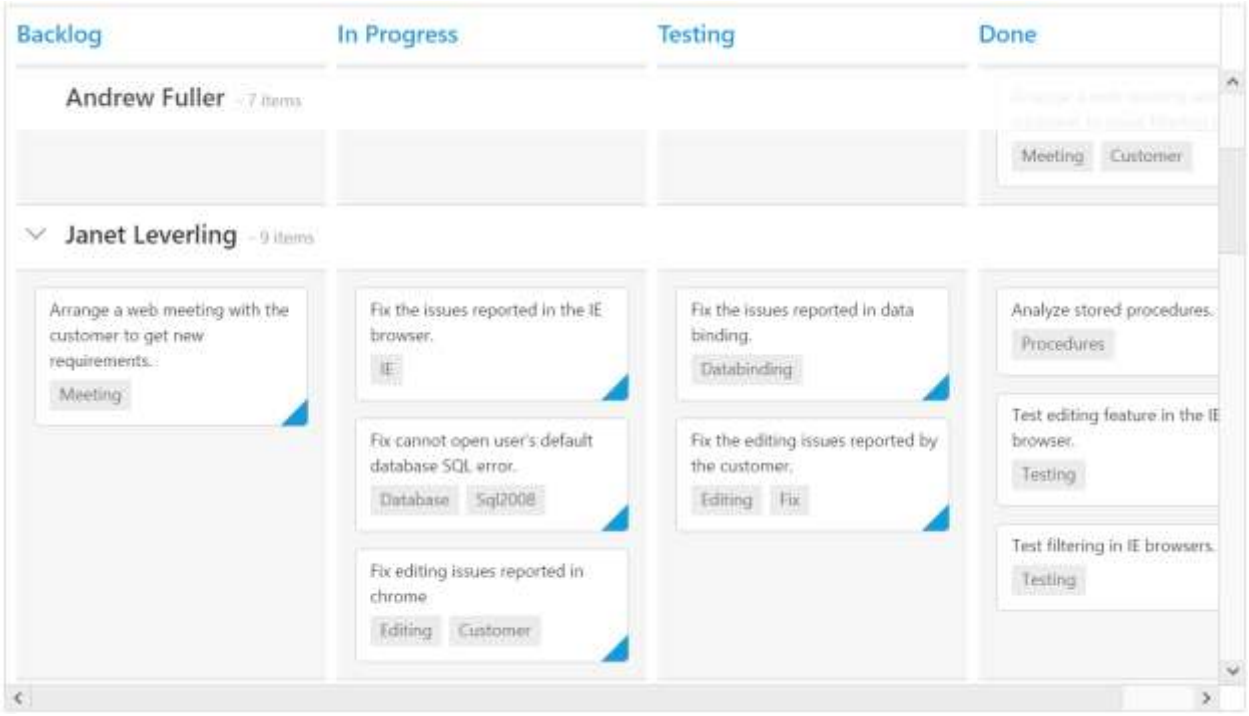
```
.DataSource((IEnumerable<object>)ViewBag.datasource)
.AllowScrolling(true)
.ScrollSettings(scroll =>
scroll.Width("auto").Height("500").AllowFreezeSwimlane(true))
.Columns(col =>
{
col.HeaderText("Backlog").Key("Open").Add();
col.HeaderText("In Progress").Key("InProgress").Add();
col.HeaderText("Testing").Key("Testing").Add();
col.HeaderText("Done").Key("Close").Add();
})
.KeyField("Status")
.Fields(field =>
{
field.Content("Summary")
.Tag("Tags")
.SwimlaneKey("Assignee")
.PrimaryKey("Id");
})
)
```

C#

```
namespace MVCSampleBrowser
{
public partial class KanbanController : Controller
{
//
// GET: /Kanban/
public ActionResult KanbanFeatures()
{
var DataSource = new NorthwindDataContext().Tasks.Take(30).ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.

Copyright © 2001 - 2020 Syncfusion Inc.



Note: AllowFreezeSwimlane is applicable when swim lane grouping enabled by setting SwimlaneKey.

Selection & Hovering

Selection provides an interactive support to highlight the card that you select. Selection can be done through simple Mouse down or Keyboard interaction. To enable selection, set AllowSelection as true.

You can see the mouse hovering effect on the corresponding cards using AllowHover property. By default selection and hovering is true.

Types of Selection

Two types of selections available in Kanban are,

1. Single 2. Multiple

Single Selection

To enable single selection by setting SelectionType property as single.

Multiple Selection

Multiple selections are an interactive support to select a group of cards in Kanban by mouse or keyboard interactions. To enable multiple selections by set SelectionType property as multiple.

You can select multiple random cards below key press.

Keys	Description
Ctrl + mouse left	To select multiple random cards.
Shift + mouse left	To continuous cards select.

To unselect selected cards, by press “Shift + mouse left” click on selected row.

Copyright © 2001 - 2020 Syncfusion Inc.

The following code example describes the above behavior.

RAZOR

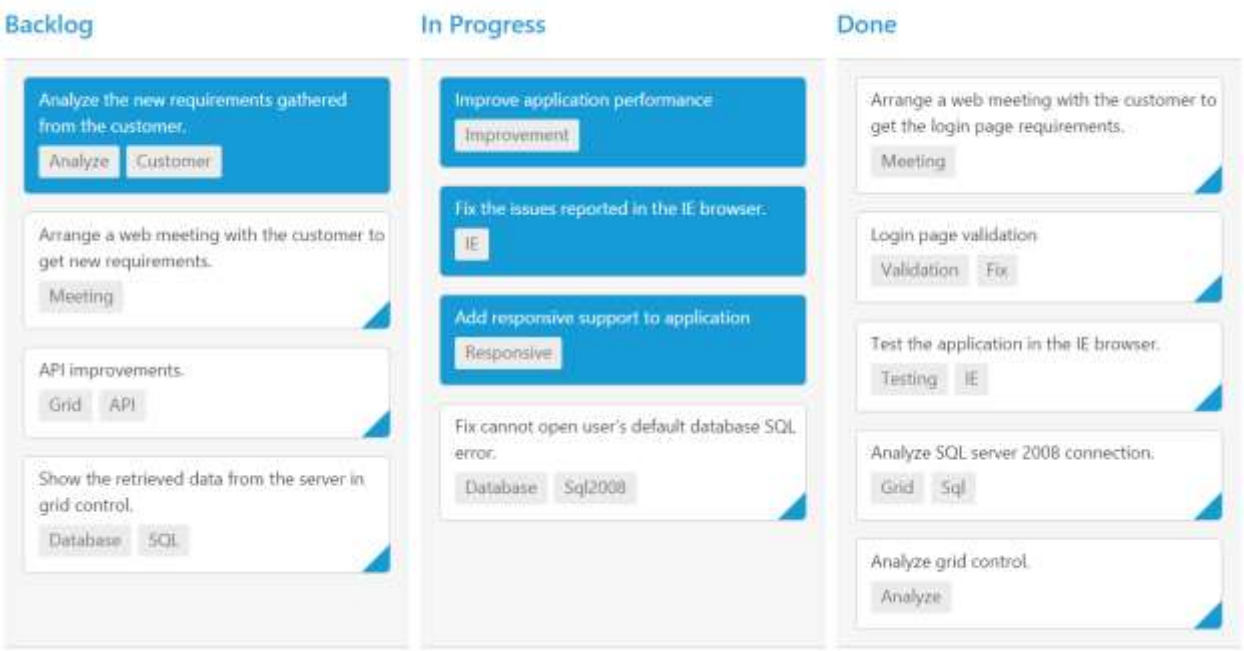
```
@(Html.EJ().Kanban("Kanban")
.DataSource((IEnumerable<object>)ViewBag.datasource)
.Columns(col =>
{
col.HeaderText("Backlog").Key("Open").Add();
col.HeaderText("In Progress").Key("InProgress").Add();
col.HeaderText("Done").Key("Close").Add();
})
.KeyField("Status")
.Fields(field =>
{
field.Content("Summary")
.Tag("Tags")
.PrimaryKey("Id");
})
.SelectionType(SelectionType.Multiple)
)
```

C#

```
namespace MVCSampleBrowser
{
public partial class KanbanController : Controller
{
//
// GET: /Kanban/
public ActionResult KanbanFeatures()
{
var DataSource = new NorthwindDataContext().Tasks.Take(30).ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.

Copyright © 2001 - 2020 Syncfusion Inc.



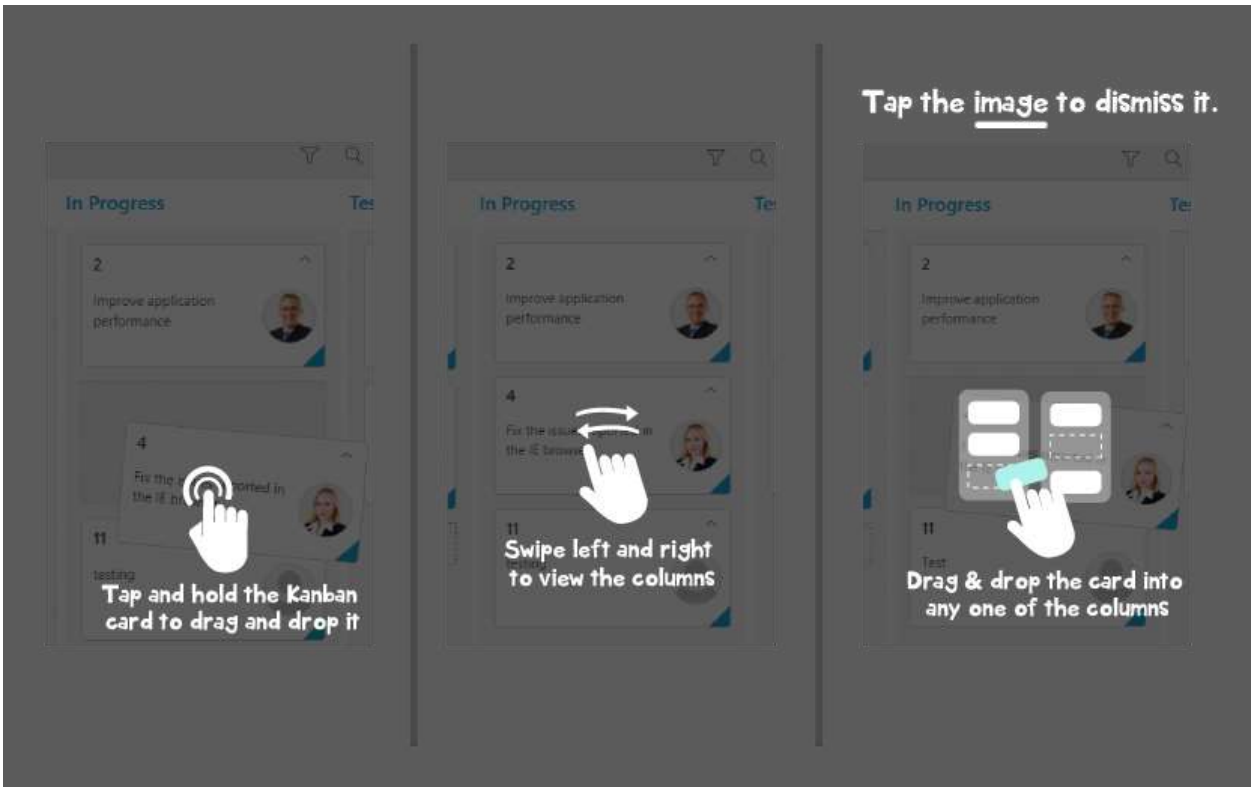
Responsive

The Kanban control has support for responsive behavior based on client browser's width and height. To enable responsive, IsResponsive property should be true.There are two modes of responsive layout is available in Kanban based on client width. They are.

- Mobile(<480px)
- Desktop(>480px)

You can check the image representation of touch actions from the below image.

Copyright © 2001 - 2020 Syncfusion Inc.



Mobile Layout

If client width is less than 480px, the Kanban will render in mobile mode. In which, you can see that kanban user interface is customized and redesigned for best view in small screens.To enable responsive, `IsResponsive` property should be true.

RAZOR

```
@(Html.EJ().Kanban("Kanban")
.DataSource((IEnumerable<object>)ViewBag.datasource)
.IsResponsive(true)
.AllowSelection(false)
.AllowKeyboardNavigation(true)
.AllowTitle(true)
.Columns(col =>
{
col.HeaderText("Backlog").Key("Open").ShowAddButton(true).Add();
col.HeaderText("In Progress").Key("InProgress").Add();
col.HeaderText("Testing").Key("Testing").Add();
col.HeaderText("Done").Key("Close").Add();
})
.KeyField("Status")
.EditSettings(edit =>
{
edit.AllowAdding(true)
.AllowEditing(true)
.EditItems(e =>
{
e.Field("Id").ValidationRules(rule => { rule.AddRule("required",
true).AddRule("number", true); }).Add();
e.Field("Status").EditType(KanbanEditingType.Dropdown).Add();
```

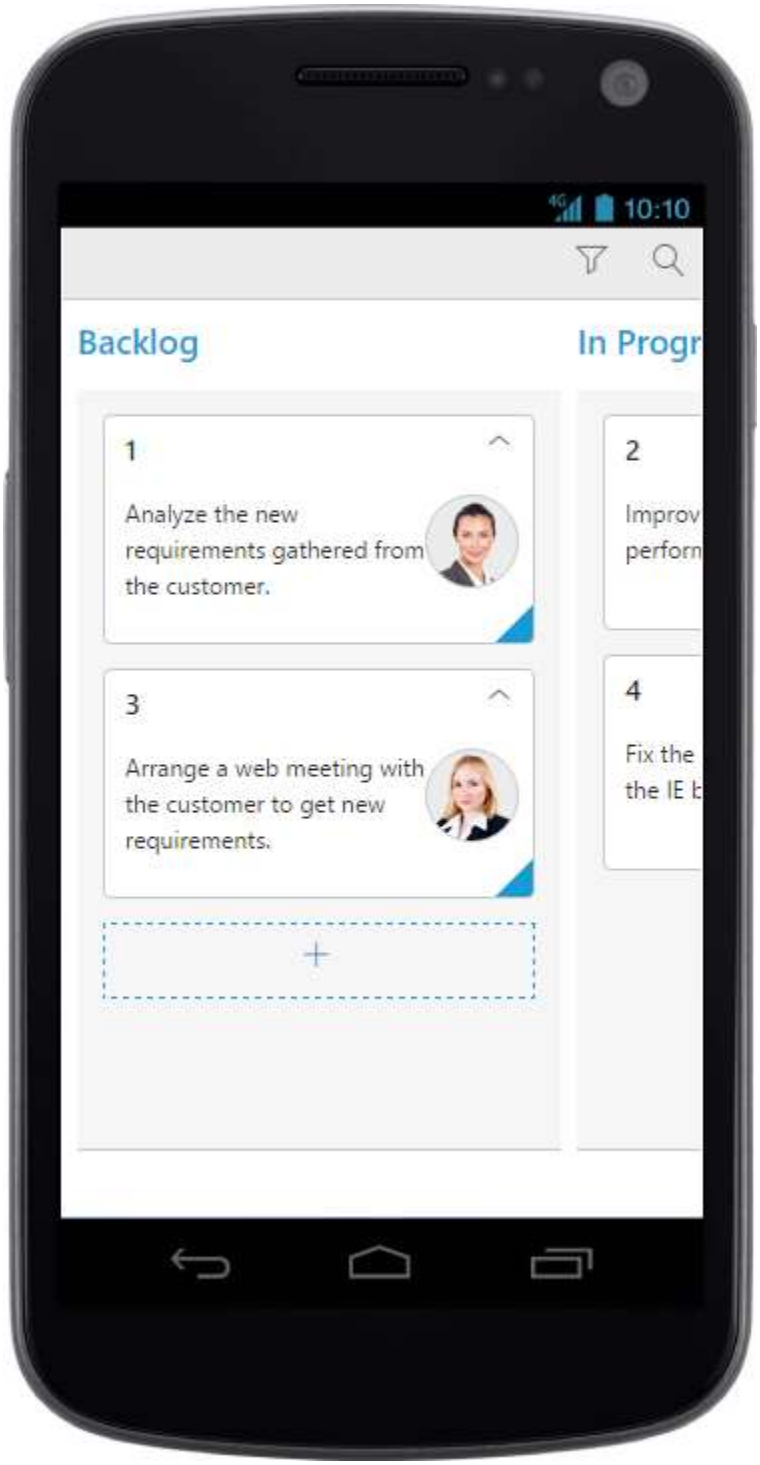
Copyright © 2001 - 2020 Syncfusion Inc.

```
e.Field("Assignee").EditType(KanbanEditingType.Dropdown).Add();
e.Field("Estimate").EditType(KanbanEditingType.Numeric).NumericEditOptions(n
ew EditorProperties() { DecimalPlaces = 2 }).ValidationRules(rule => {
rule.AddRule("range", "[0,1000]"); }).Add();
e.Field("Summary").EditType(KanbanEditingType.TextArea).ValidationRules(rule
=> { rule.AddRule("required", true); }).Add();
}).EditMode(KanbanEditMode.Dialog);
})
.AllowSearching(true)
.FilterSettings(filter =>
{
filter.Text("Janet Issues").Query("new ej.Query().where('Assignee', 'equal',
'Janet')").Description("Displays issues which matches the assignee as
'Janet").Add();
filter.Text("Testing Issues").Query("new ej.Query().where('Status', 'equal',
'Testing')").Description("Display the issues of 'Testing'").Add();
})
.Fields(field =>
{
field.Color("Type")
.PrimaryKey("Id")
.Content("Summary")
.ImageUrl("Image");
})
)
```

C#

```
namespace MVCSampleBrowser
{
public partial class KanbanController : Controller
{
//
// GET: /Kanban/
public ActionResult KanbanFeatures()
{
var DataSource = new NorthwindDataContext().Tasks.Take(30).ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

Copyright © 2001 - 2020 Syncfusion Inc.



Waring: IE8 and IE9 does not support responsive kanban. `ej.responsive.css` should be referred to display Responsive Kanban.

Kanban with Swim-lane

Width

By default, the Kanban is adaptable to its parent container. It can adjust its width of columns based on parent container width. You can also assign width of Columns in percentage.

The following code example describes the above behavior.

Copyright © 2001 - 2020 Syncfusion Inc.

RAZOR

```
@(Html.EJ().Kanban("Kanban")
.DataSource((IEnumerable<object>)ViewBag.datasource)
.IsResponsive(true)
.Columns(col =>
{
col.HeaderText("Backlog").Key("Open").Width(10).Add();
col.HeaderText("In Progress").Key("InProgress").Width(10).Add();
col.HeaderText("Done").Key("Close").Width(10).Add();
})
.KeyField("Status")
.Fields(field =>
{
field.Content("Summary")
.Tag("Tags")
.PrimaryKey("Id");
})
)
```

C#

```
namespace MVCSampleBrowser
{
public partial class KanbanController : Controller
{
//
// GET: /Kanban/
public ActionResult KanbanFeatures()
{
var DataSource = new NorthwindDataContext().Tasks.Take(30).ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

Note: AllowScrolling should be false while defining width in percentage.

Min Width

Min Width is used to maintain minimum width for the Kanban. If the Kanban width is less than MinWidth then the scrollbar will be displayed to maintain minimum width.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Kanban("Kanban")
.DataSource((IEnumerable<object>)ViewBag.datasource)
.IsResponsive(true)
.MinWidth(700)
.Columns(col =>
{
col.HeaderText("Backlog").Key("Open").Width(120).Add();
col.HeaderText("In Progress").Key("InProgress").Width(110).Add();
col.HeaderText("Done").Key("Close").Width(110).Add();
```

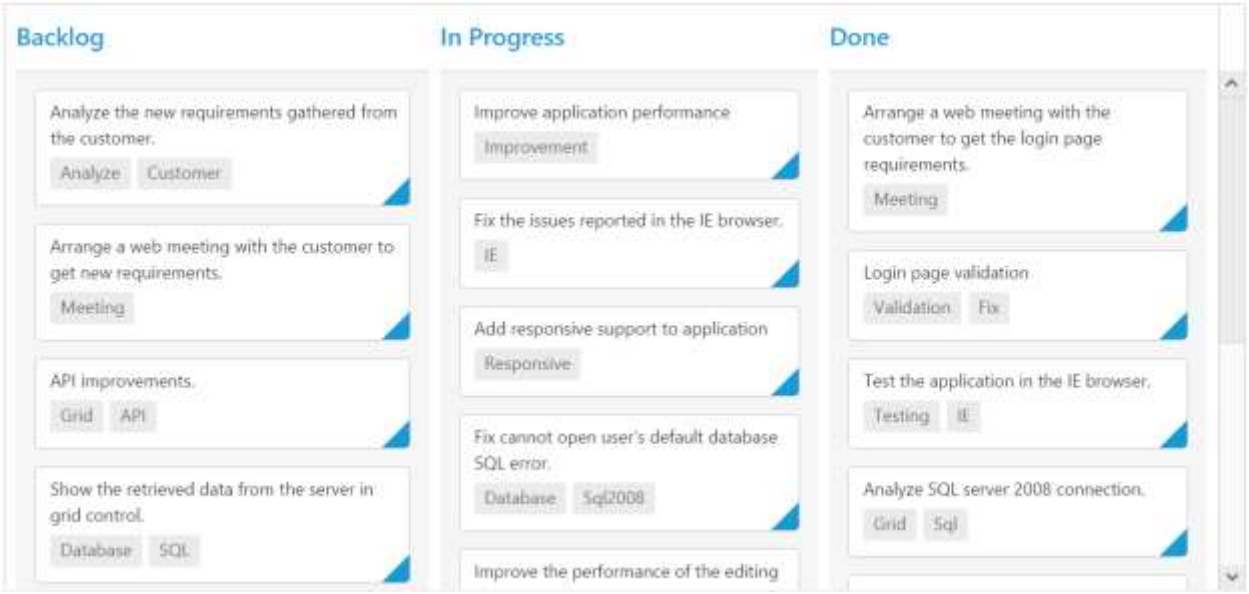
Copyright © 2001 - 2020 Syncfusion Inc.

```
})
.KeyField("Status")
.Fields(field =>
{
field.Content("Summary")
.Tag("Tags")
.PrimaryKey("Id");
})
)
```

C#

```
namespace MVCSampleBrowser
{
public partial class KanbanController : Controller
{
//
// GET: /Kanban/
public ActionResult KanbanFeatures()
{
var DataSource = new NorthwindDataContext().Tasks.Take(30).ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.



Stacked Headers

The stacked headers help you to group the logical columns in Kanban. It can be shown by setting ShowStackedHeader as true and by defining StackedHeaderRows.

Adding Stacked header columns

To stack columns in stacked header, you need to define `Column` property in `StackedHeaderColumns` with field names of visible columns.

The following code example describes the above behavior.

RAZOR

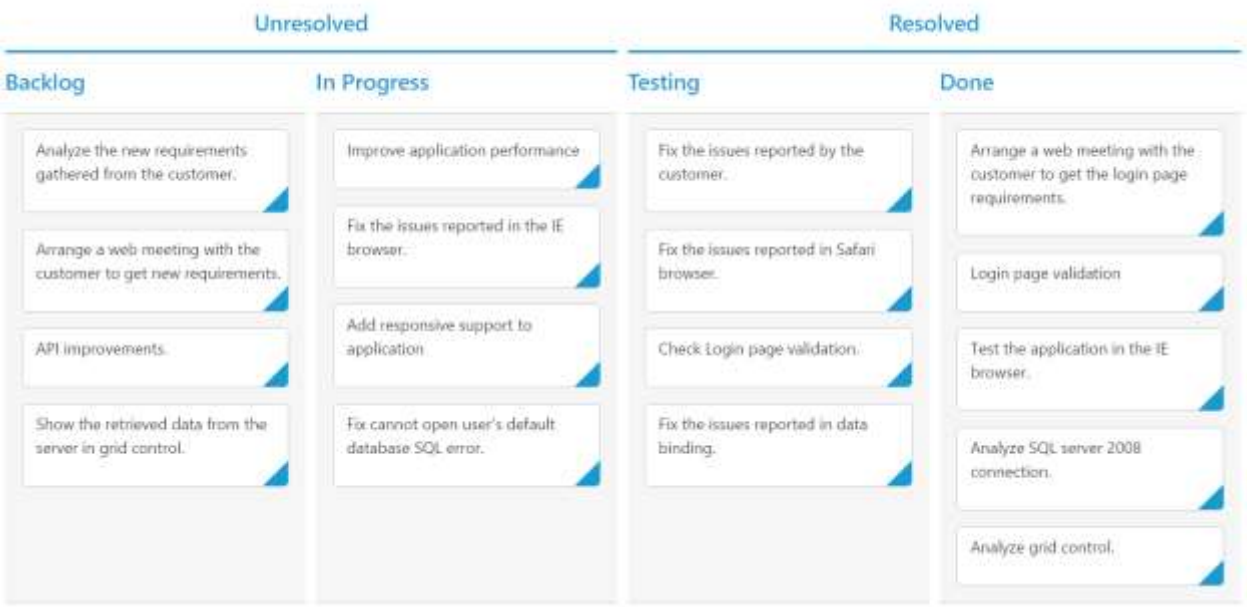
```
@(Html.EJ().Kanban("Kanban")
.DataSource((IEnumerable<object>)ViewBag.datasource)
.Columns(col =>
{
col.HeaderText("Backlog").Key("Open").Add();
col.HeaderText("In Progress").Key("InProgress").Add();
col.HeaderText("Testing").Key("Testing").Add();
col.HeaderText("Done").Key("Close").Add();
})
.KeyField("Status")
.Fields(field =>
{
field.Content("Summary")
.Tag("Tags")
.PrimaryKey("Id");
})
.StackedHeaderRows(rows =>
{
rows.StackedHeaderColumns(Columns =>
{
Columns.HeaderText("Unresolved").Column("Backlog,Validated,In
Progress").Add();
Columns.HeaderText("Resolved").Column("Testing,Done").Add();
}).Add();
})
)
```

C#

```
namespace MVCSampleBrowser
{
public partial class KanbanController : Controller
{
//
// GET: /Kanban/
public ActionResult KanbanFeatures()
{
var DataSource = new NorthwindDataContext().Tasks.Take(30).ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.

Copyright © 2001 - 2020 Syncfusion Inc.



Context Menu

Context menu is used to improve user action with Kanban using popup menu. It can be shown by defining ContextMenuSettings.Enable as true. Context menu has option to add default items in ContextMenuSettings.MenuItems and customized items in ContextMenuSettings.CustomMenuItems.

Default Context Menu items

Please find the below table for default context menu items and its actions.

Section	Context menu items	Action
Header	Hide Column	Hide the current column
	Visible Columns	Show the column if already hidden
Content	Add Card	Start Add new card
Card	Edit Card	Start Edit in current card
	Delete Card	Delete the current card
	Top of Row	Move the card to Top of Row
	Bottom of Row	Move the card to Bottom of Row
	Move Up	Move the card in Up direction
	Move Down	Move the card in Down direction
	Move Left	Move the card in Left direction
	Move Right	Move the card in Right direction
	Move to Swimlane	Move the card to Swim lane which is chosen from given list

Copyright © 2001 - 2020 Syncfusion Inc.

	Print Card	Print the specific card

The following code example describes the above behavior.

RAZOR

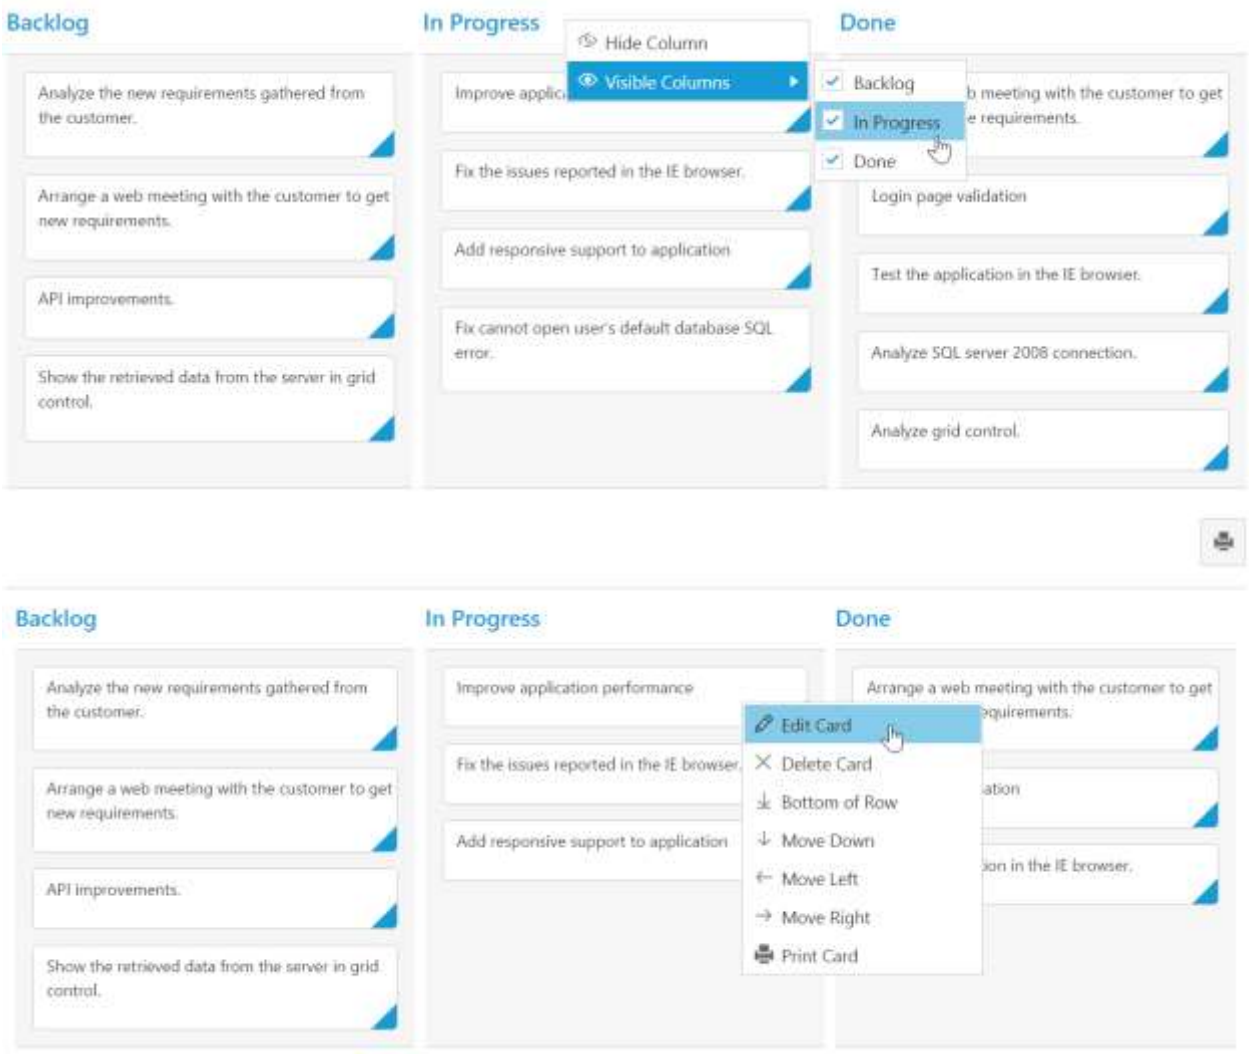
```
@(Html.EJ().Kanban("Kanban")
.DataSource((IEnumerable<object>)ViewBag.datasource)
.Columns(col =>
{
col.HeaderText("Backlog").Key("Open").Add();
col.HeaderText("In Progress").Key("InProgress").Add();
col.HeaderText("Done").Key("Close").Add();
})
.KeyField("Status")
.Fields(field =>
{
field.Content("Summary")
.Tag("Tags")
.PrimaryKey("Id");
})
.ContextMenuSettings(menu => menu.Enable(true))
)
```

C#

```
namespace MVCSampleBrowser
{
public partial class KanbanController : Controller
{
//
// GET: /Kanban/
public ActionResult KanbanFeatures()
{
var DataSource = new NorthwindDataContext().Tasks.Take(30).ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.

Copyright © 2001 - 2020 Syncfusion Inc.



Custom Context Menu

Custom context menu is used to create your own menu item and its action. To add customized context menu items, you need to use `ContextMenuSettings.CustomMenuItems` property and to bind required actions for this, use `ContextClick` event.

The following code example describes the above behavior.

RAZOR

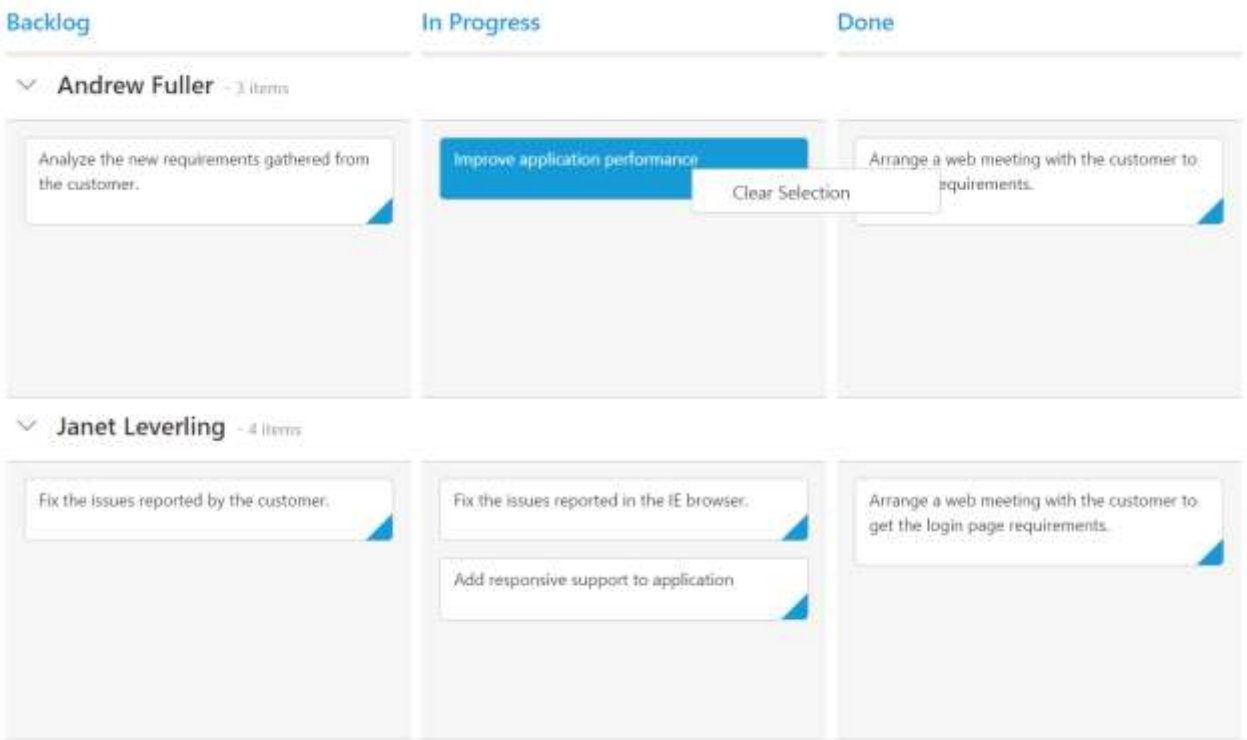
```
@(Html.EJ().Kanban("Kanban")
.DataSource((IEnumerable<object>)ViewBag.datasource)
.Columns(col =>
{
col.HeaderText("Backlog").Key("Open").Add();
col.HeaderText("In Progress").Key("InProgress").Add();
col.HeaderText("Done").Key("Close").Add();
})
.KeyField("Status")
.Fields(field =>
{
field.Content("Summary")
```

```
.Tag("Tags")
.SwimlaneKey("Assignee")
.PrimaryKey("Id");
})
.ContextMenuSettings(menu => menu.Enable(true) .MenuItems(item=>
item.Reset()).CustomMenuItems(custom => custom.Text("Clear
Selection").Target(ContextTarget.All).Add()))
)
```

C#

```
namespace MVCSampleBrowser
{
public partial class KanbanController : Controller
{
//
// GET: /Kanban/
public ActionResult KanbanFeatures()
{
var DataSource = new NorthwindDataContext().Tasks.Take(30).ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.



Sub Context Menu

Sub context menu is used to add customized sub menu to the custom context menu item. To add a sub context menu, you need to use ContextMenuSettings.subMenu property and to bind required actions for this, use ContextClick event.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Kanban("Kanban")
.DataSource((IEnumerable<object>)ViewBag.datasource)
.ClientSideEvents(eve => eve.ContextClick("click"))
.Columns(col =>
{
col.HeaderText("Backlog").Key("Open").Add();
col.HeaderText("In Progress").Key("InProgress").Add();
col.HeaderText("Done").Key("Close").Add();
})
.KeyField("Status")
.Fields(field =>
{
field.Content("Summary")
.Tag("Tags")
.SwimlaneKey("Assignee")
.PrimaryKey("Id");
})
.ContextMenuSettings(menu =>
menu.Enable(true).MenuItems(item=>item.Add()).CustomMenuItems(custom =>
{
custom.Text("Clear Selection").Target(ContextTarget.All).Add();
custom.Text("Move to
Column").Target(ContextTarget.All).Template("#template").Add();
}
))
)
```

C#

```
namespace MVCSampleBrowser
{
public partial class KanbanController : Controller
{
//
// GET: /Kanban/
public ActionResult KanbanFeatures()
{
var DataSource = new NorthwindDataContext().Tasks.Take(30).ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

HTML

```
<ul id="template">
```

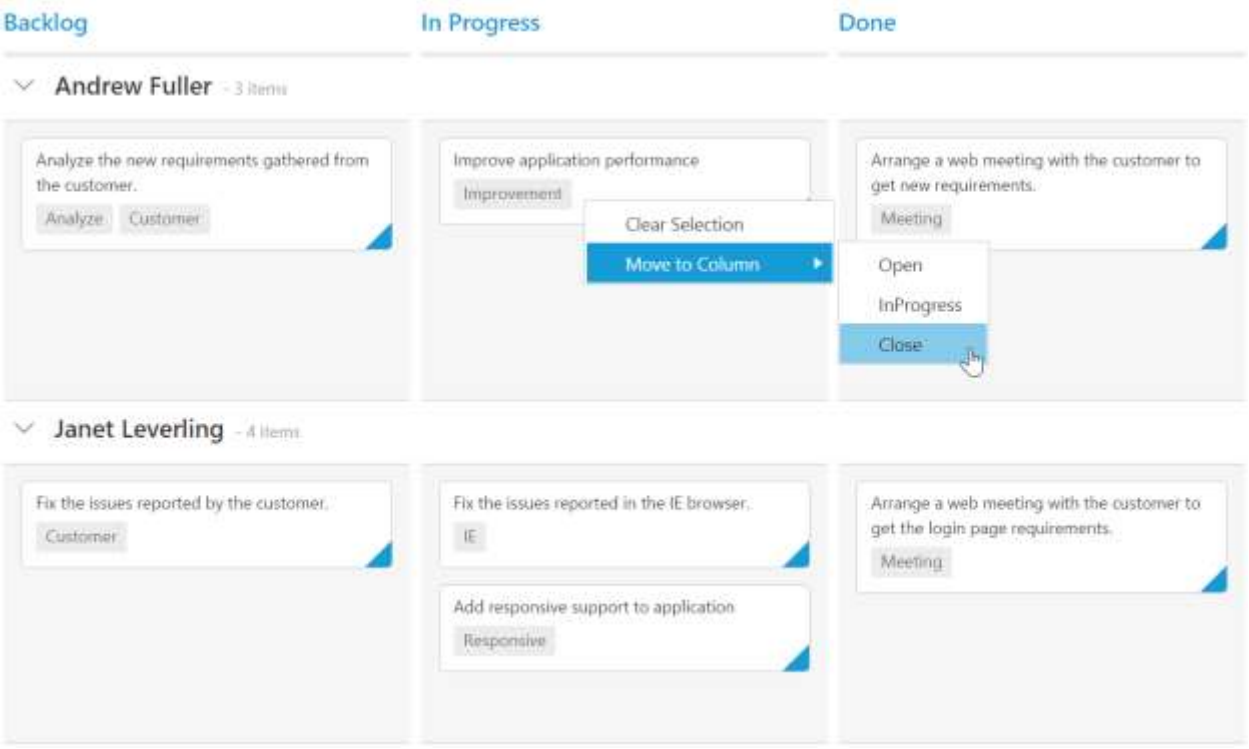
Copyright © 2001 - 2020 Syncfusion Inc.

```
<li><a>Open</a></li>
<li><a>InProgress</a></li>
<li><a>Close</a></li>
</ul>
```

JAVASCRIPT

```
function click(args)
{
if (args.text == "Clear Selection")
this.clearSelection();
}
```

The following output is displayed as a result of the above code example.



Print

Set 'AllowPrinting' as true, to enable Print icon in the Kanban toolbar. You can use 'print()' method from Kanban instance to print the Kanban.

The following code example describes the above behavior.

RAZOR

```
@(Html.EJ().Kanban("Kanban")
.DataSource((IEnumerable<object>)ViewBag.datasource)
.Columns(col =>
{
col.HeaderText("Backlog").Key("Open").Add();
col.HeaderText("In Progress").Key("InProgress").Add();
col.HeaderText("Done").Key("Close").Add();
})
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
.KeyField("Status")
.AllowTitle(true)
.AllowPrinting(true)
.Fields(field =>
{
field.Content("Summary")
.Tag("Tags")
.PrimaryKey("Id");
})
)
```

C#

```
namespace MVCSampleBrowser
{
public partial class KanbanController : Controller
{
// GET: /Kanban/
public ActionResult KanbanFeatures()
{
var DataSource = new NorthwindDataContext().Tasks.Take(30).ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.

Localization

All text in Kanban can be localized using ej.Kanban.Locale object. Please find the table with list of properties and its value in locale object.

Locale key words	Text
EmptyCard	No cards to display
SaveButton	Save
CancelButton	Cancel
EditFormTitle	Details of
AddFormTitle	Add New Card
SwimlaneCaptionFormat	"- {{:count}}{{if count == 1 }} item {{else}} items {{/if}}"
FilterSettings	Filters:
Min	Min
Max	Max
FilterOfText	Of
Cards	Cards

Copyright © 2001 - 2020 Syncfusion Inc.

ItemsCount	Items Count :
Unassigned	Unassigned
AddCard	Add Card
EditCard	Edit Card
DeleteCard	Delete Card
TopofRow	Top of Row
BottomofRow	Bottom of Row
MoveUp	Move Up
MoveDown	Move Down
MoveLeft	Move Left
MoveRight	Move Right
MovetoSwimlane	Move to Swimlane
HideColumn	Hide Column
VisibleColumns	Visible Columns
PrintCard	Print Card
Search	Search

The following code example describes the above behavior.

JAVASCRIPT

```
ej.Kanban.Locale["de-DE"] = {
EmptyCard: "Keine Karten angezeigt werden",
SaveButton: "Speichern",
CancelButton: "stornieren",
EditFormTitle: "Details von ",
AddFormTitle: "Neue Karte hinzufügen",
SwimlaneCaptionFormat: "- {{:count}}{{if count == 1 }} Artikel {{else}}
Artikel {{/if}}",
FilterSettings: "Filter:",
FilterOfText: "Von",
Max: "Max.",
Min: "Min.",
Cards: "Karten",
ItemsCount:"Artikel Graf :",
Unassigned:"Nicht zugewiesen",
};
```

RAZOR

```
@(Html.EJ().Kanban("Kanban")
```

Copyright © 2001 - 2020 Syncfusion Inc.

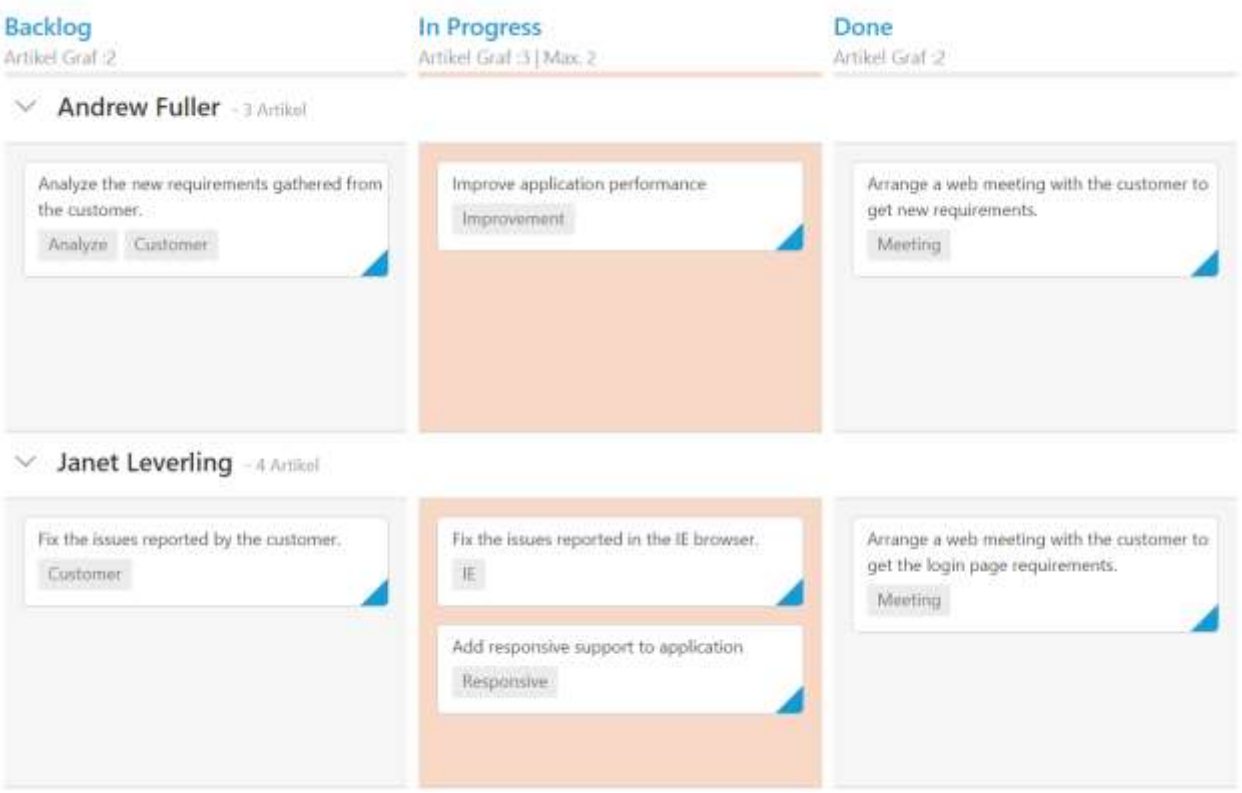
```
.DataSource((IEnumerable<object>)ViewBag.datasource)
.Locale("de-DE")
.EnableTotalCount(true)
.Columns(col =>
{
col.HeaderText("Backlog").Key("Open").Add();
col.HeaderText("In Progress").Key("InProgress").Constraints(con => {
con.Max(2); }).Add();
col.HeaderText("Done").Key("Close").Add();
})
.KeyField("Status")
.Fields(field =>
{
field.Content("Summary")
.Tag("Tags")
.SwimlaneKey("Assignee")
.PrimaryKey("Id");
})
)
```

C#

```
namespace MVCSampleBrowser
{
public partial class KanbanController : Controller
{
//
// GET: /Kanban/
public ActionResult KanbanFeatures()
{
var DataSource = new NorthwindDataContext().Tasks.Take(30).ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.

Copyright © 2001 - 2020 Syncfusion Inc.



Right to Left (RTL)

By default, Kanban render its text and layout from left to right. To customize Kanban's direction, you can change direction from LTR to RTL by using `EnableRTL` as true.

The following code example describes the above behavior.

JAVASCRIPT

```
ej.Kanban.Locale["ar-AE"] = {
EmptyCard: "لا بطاقات لعرض",
SaveButton: "حفظ",
CancelButton: "إلغاء",
EditFormTitle: "تفاصيل ",
AddFormTitle: "إضافة بطاقة جديدة",
SwimlaneCaptionFormat: "- {{:count}}{{if count == 1 }} بند {{else}} العناصر
{{/if}}",
FilterSettings: "مرشحات:",
FilterOfText: "من",
Max: "ماكس",
Min: "دقيقة",
Cards: " بطاقات",
ItemsCount: "عد العناصر:",
Unassigned: "غير معين",
};
```

RAZOR

```
@(Html.EJ().Kanban("Kanban")
.DataSource((IEnumerable<object>)ViewBag.datasource)
```

```
.Columns(col =>
{
col.HeaderText("تراكم الأعمال غير المنجزة").Key("Open").Add();
col.HeaderText("في تَقَدم").Key("InProgress").Constraints(con => { con.Max(2);
}).Add();
col.HeaderText("فعله").Key("Close").Add();
})
.AllowTitle(true)
.EnableRTL(true)
.Locale("ar-AE")
.KeyField("Status")
.Fields(field =>
{
field.Color("Type")
.Content("Summary")
.PrimaryKey("Id")
.SwimlaneKey("Assignee");
})
)
```

C#

```
namespace MVCSampleBrowser
{
public partial class KanbanController : Controller
{
//
// GET: /Kanban/
public ActionResult KanbanFeatures()
{
var DataSource = new NorthwindDataContext().Tasks.Take(30).ToList();
ViewBag.datasource = DataSource;
return View();
}
}
}
```

The following output is displayed as a result of the above code example.

Styling

List of classes and its purposes

To modify Kanban appearance, you need to override default CSS of Kanban. Please find the list of CSS classes and its corresponding section in Kanban. Also you have an option to create your own custom theme for all JavaScript controls using our Theme Studio

Section	CSS class	Purpose of CSS class
Root	e-kanban	This classes are in this root element (div) of Kanban control.
	e-js	
Header	e-kanbantoolbar	This class is added at div element of Kanban toolbar.
	e-kanbanheader	This is class is added in the root element of header element. In this class, You can override thin line between header and content of Kanban.
	e-table	This class is added at 'table' of Kanban header. This CSS class makes table width as 100 %.
	e-columnheader	This class is added at 'tr' of Kanban header.
	e-headercell	This class is added in 'th' element of Kanban header. You can override background color of header and border color
	e-headercelldiv	This class is add in div which present 'th' element in header. You recommend you to use e-headercelldiv to override skeleton of header.

Copyright © 2001 - 2020 Syncfusion Inc.

Body	e-kanbancontent	This class is added at root of body content. This is to override background color of body.
	e-table	This class is added to table of content. This CSS class makes table width as 100 %.
	e-swimlanerow	This class is added to all swim lane â€˜trâ€™s in Kanban.
	e-columnrow	This class is added to all next row of swimlane â€˜trâ€™s in Kanban
	e-rowcell	This class is added to all cells in Kanban. This is to override cells appearance and styling.
	e-cardselection	This class is added to card div element of Kanban. This is override selection.
	e-hover	This class adds to card of Kanban while hover cards.

Web Accessibility

Keyboard Navigation

Supported Keyboard Interactions keys with its description are tabulated as follows

Interaction Keys	Description
Alt + j	Focus the Kanban
Insert	Insert card in Kanban
Delete	Delete card in Kanban
F2	Edit card in Kanban
Enter	Save edited or added
Esc	Cancel add or edit state
Home	Go to first card
End	Go to last card
Up arrow	Move to up card selection
Down arrow	Move to down card selection
Right arrow	Move to right card selection
Left arrow	Move to left card selection
Ctrl + UpArrow	Collapse All swim lane groups
Ctrl + DownArrow	Expand All swim lane groups
Alt + UpArrow	Collapse selected swim lane
Alt + DownArrow	Expand selected swim lane

Copyright © 2001 - 2020 Syncfusion Inc.

Alt + LeftArrow	Collapse selected column
Alt + RightArrow	Expand selected column
Shift + UpArrow	Multi Selection by Up Arrow
Shift + DownArrow	Multi Selection by Down Arrow
Shift + LeftArrow	Multi Selection by Left Arrow
Shift + RightArrow	Multi Selection by Right Arrow

How to

Render Kanban from Code behind

Kanban can be rendered from the code behind by initializing the required properties in controller and passing those properties via **ViewData** or **Model** to the client side.

The following code illustrates the initialization of Kanban properties in the controller.

C#

```
//Namespace to get the JavaScript (Kanban) component properties
using Syncfusion.JavaScript.Models;
namespace MvcApplication.Controllers
{
public class KanbanController: Controller
{
public ActionResult KanbanFeatures()
{
// Initialize data for Kanban
List<Tasks> Task = new List<Tasks>();
Task.Add(new Tasks(1, "Open", "Analyze the new requirements gathered from
the customer.", "Story", "Low", "Analyze,Customer", 3.5, "Andrew Fuller",
"../content/images/kanban/1.png", 1));
Task.Add(new Tasks(2, "InProgress", "Improve application performance",
"Improvement", "Normal", "Improvement", 6, "Andrew Fuller",
"../content/images/kanban/2.png", 1));
Task.Add(new Tasks(3, "Open", "Arrange a web meeting with the customer to
get new requirements.", "Others", "Critical", "Meeting", 5.5, "Janet",
"../content/images/kanban/3.png", 2));
Task.Add(new Tasks(4, "InProgress", "Fix the issues reported in the IE
browser.", "Bug", "Release Breaker", "IE", 2.5, "Janet",
"../content/images/kanban/3.png", 2));
Task.Add(new Tasks(5, "Testing", "Fix the issues reported by the customer.",
"Bug", "Low", "Customer", 3.5, "Andrew Fuller",
"../content/images/kanban/5.png", 1));
//Initializing the kanban model
KanbanProperties kanbanObj = new KanbanProperties();
//Initializing the datasource and columns
kanbanObj.DataSource = Task;
kanbanObj.Columns.Add(new KanbanColumn() { HeaderText = "Backlog", Key = new
List<string> { "Open" } });
kanbanObj.Columns.Add(new KanbanColumn() { HeaderText = "In Progress", Key =
new List<string> { "InProgress" } });
```

```
kanbanObj.Columns.Add(new KanbanColumn() { HeaderText = "Done", Key = new
List<string> { "Close" } });
//Define the fields
kanbanObj.KeyField = "Status";
kanbanObj.Fields.Color = "Type";
kanbanObj.Fields.Content = "Summary";
kanbanObj.Fields.PrimaryKey = "Id";
//Passing kanban properties using the ViewData
ViewData["KanbanModel"] = kanbanObj;
return View();
}
}
}
```

Binding the Kanban properties passed via **ViewData** from the controller in the client side as below.

ASPX-CS

```
@{
Html.EJ().Kanban("Kanban",
(Syncfusion.JavaScript.Models.KanbanProperties)ViewData["KanbanModel"]).Rend
er();
}
```

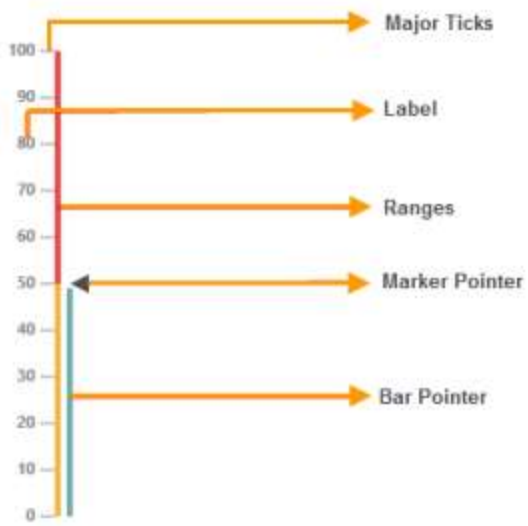
LinearGauge

Overview

The Gauge control for Essential Studio displays numerical information in the form of a scale that can be customized and oriented either vertically or horizontally. It comprises the following basic elements:

- Scales
- Pointers: bars and markers
- Ticks
- Labels
- Ranges

Copyright © 2001 - 2020 Syncfusion Inc.



Three basic scale designs available are : rectangle, rounded rectangle, and thermometer.

Key Features

- Interaction: Allows you to directly interact with pointers on a gauge.
- Indicators: Indicate the state of a gauge either active or inactive.
- Ranges: Highlight the range of values on a gauge.
- Pointers: Allows you to add multiple pointers like bar pointers and marker pointers to a gauge.
- Scale Direction: Allows you to set scales direction either horizontally or vertically.
- Animation: Supports animation effects for pointers.
- Custom Labels: Allows you to add custom label text on any part of a gauge.
- Scale Styles: Three basic styles of scales are supported: rectangle, rounded rectangle, and thermometer.

Getting Started

This section briefly explains on how to create a **Linear Gauge** control for your application.

- The ASP.NET MVC **Linear Gauge** provides support to display the **Linear Gauge** within your web page and allows you to customize it. This section encompasses the details on how to configure Linear Gauge.
- You will learn how to provide data for a **Linear Gauge** and display data in the required way. In addition, you will learn how to customize the default Linear Gauge appearance for your requirements.

Copyright © 2001 - 2020 Syncfusion Inc.

Create a Linear Gauge

ASP.NET MVC **Linear Gauge** widget basically renders with flexible APIs. You can easily create the Linear Gauge widget by the following steps.

1. First create an MVC Project and add necessary Dll's and scripts with the help of the given MVC-Getting Started Documentation.
2. Add the following code example to the corresponding view page to render **Linear Gauge**.

JS

```
@(Html.EJ().LinearGauge("thermoLinear"))
```

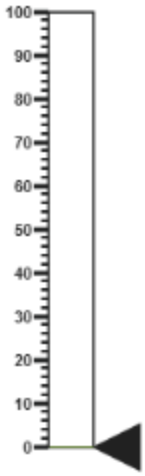
3. Add the following code example in the Controller page.

CSHARP

```
public ActionResult Default()
{
return View( );
}
```

Run the above code example to get a default **Linear Gauge** with default values as follows.

Copyright © 2001 - 2020 Syncfusion Inc.



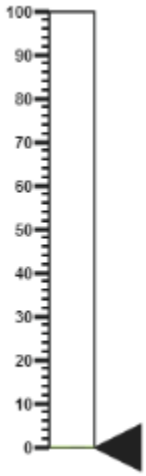
Set Height and Width values

Basic attributes of each canvas elements are height and width. You can set the height and width of the gauge using the following code example. It sets the height and width of the canvas image where the thermometer is to be rendered.

JS

```
@(Html.EJ().LinearGauge("thermoLinear")
.Height(550)
.Width(500))
```

Run the above code example and you will get the following gauge as similar to default. Here height and width of the canvas are set for given values.



Set Animation option and Label Color

- You can draw the Thermometer with some Label color to display the measurement value. For example give the labelColor as “#8c8c8c”.

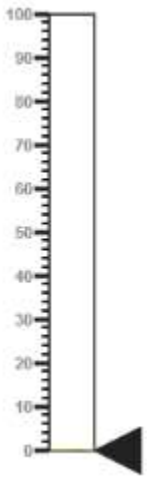
Copyright © 2001 - 2020 Syncfusion Inc.

- Set the EnableAnimation property as false to avoid animation on the pointers.

JS

```
@(Html.EJ().LinearGauge("thermoLinear")
.LabelColor("#8c8c8c")
.EnableAnimation(false)
.Height(550)
.Width(500))
```

Run the above code example and you will get the following gauge as the output.



Provide Scale Values

- The scale must have the appearance of a thermometer. By giving ScaleType as Thermometer, you can render a thermometer design.
- Minimum temperature can go up to -10 and maximum temperature can rise up to 110, so you can give minimum scale value as -10 and maximum value as 110.
- Set the location values such as vertical and horizontal position of the thermometer and give the thermometer height as Length.
- You can give the Minor Interval value as 5 to get the exact temperature on the patient.

JS

```
@(Html.EJ().LinearGauge("thermoLinear")
.LabelColor("#8c8c8c")
.EnableAnimation(false)
.Height(550)
.Width(500)
.Scales(s =>
{
s.Width(20)
.Type(ScaleType.Thermometer)
.BackgroundColor("transparent")
.Minimum(-10)
.Maximum(110).MinorIntervalValue(5)
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
.Length(335)
. Border(border=>border.Width(1))
.ShowCustomLabels(true)
.Position(loc => { loc.X(50).Y(18); })
//Add the pointers customization code here
//Add the labels customization code here
//Add the ticks customization code here
//Add the Custom labels customization code here
.Add();
}))
```

Run the above code example and you will get the following gauge as the output.

Add Pointers

In **Linear Gauge** the two types of pointers available are: Marker pointer and Bar pointer.

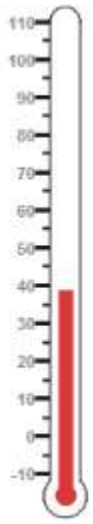
- **Marker pointer** is displayed as a pointer device that shows the actual values. But for your thermometer there is no need for the marker pointer. So you can hide the marker pointer by giving opacity as 0.
- **Bar pointer** acts as the mercury metal that shows the exact temperature of the patient. Set some of the basic properties of the Bar pointer such as Width, BarPointerDistanceFromScale, BarPointerValue and BarPointerBackgroundColor.

JS

```
@(Html.EJ().LinearGauge("thermoLinear")
.LabelColor("#8c8c8c")
.EnableAnimation(false)
.Height(550)
.Width(500)
.Scales(s =>
{
//Add the pointers customization code here
.MarkerPointers(mp => { mp.MarkerOpacity(0).Add(); })
```

```
.BarPointers(bar => {
bar.Width(10)
.BarPointerDistanceFromScale(0)
.BarPointerValue(37)
.BarPointerBackgroundColor("#DB3738").Add(); })
//Add the labels customization code here
//Add the ticks customization code here
//Add the Custom labels customization code here
.Add();
}))
```

Run the above code example to get the following gauge as your output.



Add Label Customization

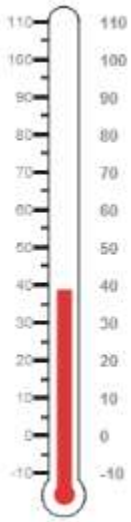
- For thermometer, you can display the label value on two sides, to get temperature in different scales. For that you can add two label values in an array.
- To display the value around the scales, labels are used. You can customize the label placement, font (including its style and family) and its distance from scale.

JS

```
@(Html.EJ().LinearGauge("thermoLinear")
.LabelColor("#8c8c8c")
.EnableAnimation(false)
.Height(550)
.Width(500)
.Scales(s =>
{
//Add the pointers customization code here
//Add the labels customization code here
.Labels(label =>
{
label.Placement(LabelPlacement.Near)
.Font(font => {
```

```
font.Size("10px")
.FontFamily("Segoe UI")
.FontStyle("normal");
}).Add();
label.Placement(LabelPlacement.Far)
.DistanceFromScale(distance=>distance.X(13)).Add();
})
//Add the ticks customization code here
//Add the Custom labels customization code here
.Add();
}))
```

Run the above code example and you will get the following gauge as output.



Add Tick Details

- Tick style has two values called major interval and minor interval. You can set major ticks widthand height greater than Minor ticks. And you can give TickColor, for better visibility in light backgrounds.
- Here four tick details are used for both sides having minor and major ticks. To display the tick value add the following code example.

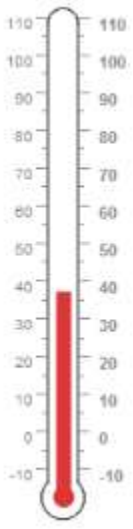
JS

```
@(Html.EJ().LinearGauge("thermoLinear")
.LabelColor("#8c8c8c")
.EnableAnimation(false)
.Height(550)
.Width(500)
.Scales(s =>
{
//Add the pointers customization code here
//Add the labels customization code here
//Add the ticks customization code here
.Ticks(tic =>
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
{
tic.Type(TickType.MajorInterval)
.Height(8)
.Width(1)
.Color("#8c8c8c")
.DistanceFromScale(distance=>distance.Y(4)).Add();
tic.Type(TickType.MinorInterval)
.Height(4)
.Width(1)
.Color("#8c8c8c")
.DistanceFromScale(distance=>distance.Y(4)).Add();
tic.Type(TickType.MajorInterval)
.Placement(TickPlacement.Far)
.Height(8)
.Width(1)
.Color("#8c8c8c")
.DistanceFromScale(distance=>distance.Y(4)).Add();
tic.Type(TickType.MinorInterval)
.Placement(TickPlacement.Far)
.Height(4)
.Width(1)
.Color("#8c8c8c")
.DistanceFromScale(distance=>distance.Y(4)).Add();
})
//Add the Custom labels customization code here
.Add();
}))
```

Run the above code example and you will get the following gauge as output.



Add Custom Label Details

- **Custom labels** are used to specify the texts in the gauge.
- It can be customized through various properties.
- In order to show custom labels, change the showIndicators property to **true**.

Copyright © 2001 - 2020 Syncfusion Inc.

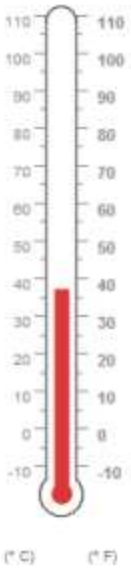
- Here you can use custom text to display three range descriptions.

JS

```
@(Html.EJ().LinearGauge("thermoLinear")
.LabelColor("#8c8c8c")
.EnableAnimation(false)
.Height(550)
.Width(500)
.Scales(s =>
{
//Add the pointers customization code here
//Add the labels customization code here
//Add the ticks customization code here
//Add the Custom labels customization code here
.CustomLabels(label => {
label.Value("(° C)")
.Position(loc => loc.X(44).Y(78))
.Font(f => {
f.FontStyle("bold")
.FontFamily("Segoe UI")
.Size("12px");
})
.Color("#666666").Add();
label.Value("(° F)")
.Position(loc => loc.X(56).Y(78))
.Font(f => {
f.FontStyle("bold")
.FontFamily("Segoe UI")
.Size("12px");
})
.Color("#666666").Add();
label.Position(loc => loc.X(51).Y(90))
.Font(f => {
f.FontStyle("bold")
.FontFamily("Segoe UI")
.Size("13px");
})
.Color("#666666").Add();
})
.Add();
}))
```

Run the above code example to get the following gauge as output.

Copyright © 2001 - 2020 Syncfusion Inc.



Change Scale from Degree to Fahrenheit

Add the function that converts the temperature in degree to Fahrenheit in the label, with an index value of 1.

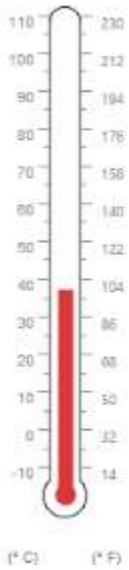
JS

```
@(Html.EJ().LinearGauge("thermoLinear")
.LabelColor("#8c8c8c")
.ClientSideEvents(event=>event.DrawLabels("DrawLabel"))
.EnableAnimation(false)
.Height(550)
.Width(500)
.Scales(s =>
{
s.Width(20)
.Type(ScaleTypes.Thermometer)
.BackgroundColor("transparent")
.Minimum(-10)
.Maximum(110).MinorIntervalValue(5)
.Length(335)
. Border(border=>border.Width(1))
.ShowCustomLabel(true)
.Position(loc => { loc.X(50).Y(18); }).Add();
//Add the pointers customization code here
//Add the labels customization code here
//Add the ticks customization code here
//Add the Custom labels customization code here
}))
<script>
function DrawLabel(args) {
if (args.label.index == 1) {
args.style.textValue = (args.label.value * (9 / 5)) + 32;
args.style.font = "Normal 10px Segoe UI";
}
}
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
</script>
```

Run the above code example and you will get the following gauge as output.



Add Custom Label for Current Value

Add the function that displays the current temperature value in the custom label.

JS

```
@(Html.EJ().LinearGauge("thermoLinear")
.LabelColor("#8c8c8c")
.ClientSideEvents(event=>event. DrawCustomLabel("DrawCustomLabel"))
.EnableAnimation(false)
.Height(550)
.Width(500)
.Scales(s =>
{
s.Width(20)
.Type(ScaleType.Thermometer)
.BackgroundColor("transparent")
.Minimum(-10)
.Maximum(110).MinorIntervalValue(5)
.Length(335)
.Border(border=>border.Width(1))
.ShowCustomLabel(true)
.Position(loc => { loc.X(50).Y(18); }).Add();
//Add the pointers customization code here
//Add the labels customization code here
//Add the ticks customization code here
//Add the Custom labels customization code here
}))
<script>
function DrawCustomLabel(args) {
if (args.customLabelIndex == 2) {
var temp = args.scaleElement.barPointers[0].value;
```

```
var value = (temp * (9 / 5)) + 32;
if (temp == -10) {
args.style.textValue = "Very Cold Weather" + "(" + value.toFixed(1) + "°
F)";
}
else if ((temp > -10 && temp < 0) || (temp > 0 && temp < 15)) {
args.style.textValue = "Cool Weather" + " (" + value.toFixed(1) + "° F)";
}
else if (temp == 0) {
args.style.textValue = "Freezing point of Water" + " (" + value.toFixed(1) +
"° F)";
}
else if (temp >= 15 && temp < 30) {
args.style.textValue = "Room Temperature" + " (" + value.toFixed(1) + "°
F)";
}
else if (temp == 30) {
args.style.textValue = "Beach Weather" + " (" + value.toFixed(1) + "° F)";
}
else if (temp == 37) {
args.style.textValue = "Body Temperature" + " (" + value.toFixed(1) + "°
F)";
}
else if (temp == 40) {
args.style.textValue = "Hot Bath Temperature" + " (" + value.toFixed(1) + "°
F)";
}
else if (temp > 40 && temp < 100) {
args.style.textValue = "Very Hot Temperature" + " (" + value.toFixed(1) + "°
F)";
}
else if (temp == 100) {
args.style.textValue = "Boiling point of Water" + " (" + value.toFixed(1) +
"° F)";
}
}
}
</script>
```

Copyright © 2001 - 2020 Syncfusion Inc.

Interaction and Animation

- **Linear Gauge** control contains **Interaction** feature. You can use this interaction feature to change the pointer values manually either by clicking or dragging the pointer over the Gauge. It dynamically changes the value of pointer when dragged. To Enable/Disable the user interaction you can use the `readOnly` Boolean property. The user interaction option is enabled when you set `readOnly` property as false. By default it holds the true value.
- **Linear Gauge** contains another attractive concept called **Animation**. The animation option enables the movement of the pointer from the minimum value to the current value. You can use animation option to change the pointer value dynamically. You can enable/ disable it using `enableAnimation` property. To enable animation set **enableAnimation** to 'true'.
- By default it holds the true value. You can control the speed of the pointer during animating using `animationSpeed`. It is a numerical value that holds the time in milliseconds. That is when setting value is 1000, it is considered as 1 second.

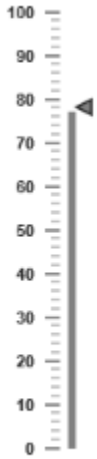
JS

```
@(Html.EJ().LinearGauge("LinearGauge1").Width(300).Height(500).Minimum(10).M
aximum(110)
.Value(78)
.EnableAnimation(true)
.AnimationSpeed(1000)
.ReadOnly(false)
//Adding scale collection
.Scales(scale => {
scale.Width(0).Border(border => border.Color("transparent").Width(0))
.ShowBarPointers(true)
//Adding marker pointer collection
.MarkerPointers(mp => { mp.Width(10).Length(10)
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
.MarkerBackgroundColor("Grey").MarkerDistanceFromScale(20).Add(); })
//Adding bar pointer collection
.BarPointers(bar =>
{
bar.Width(5).BarPointerDistanceFromScale(15)
.BarPointerBackgroundColor("Grey").Add();
})
//Adding tick collection
.Ticks(tic =>
{
tic.Type(TickType.MajorInterval).Width(2).Color("#8C8C8C")
.DistanceFromScale(distance => distance.X(7).Y(0)).Add();
tic.Type(TickType.MinorInterval).Width(1).Color("#8C8C8C")
.DistanceFromScale(distance => distance.X(7).Y(0)).Height(6).Add();
}).Add();
}))
```

Execute the above code to render the following output.



Scales

Scales are the basic functional block of the **Linear Gauge**. You can improve the appearance of scales by customizing it. The functional blocks of **Linear Gauge** are

- Marker Pointers
- Bar Pointer
- Labels
- Custom Labels
- Indicators
- Ticks
- Ranges

Copyright © 2001 - 2020 Syncfusion Inc.

Adding scale collection

Scale is the basic element of **Linear Gauge**. Scale collection is directly added to the gauge object. Refer the following code example to add scale collection in **Gauge** control.

JS

```
@(Html.EJ().LinearGauge("LinearGauge1")
.EnableAnimation(false)
//Adding frame object
.Frame(fr=>fr.BackgroundImageUrl("../images/gauge/Gauge_linear_light.png"))
//Adding scale collection
.Scales(scale => {
scale.Width(8).Position(position => position.X(20).Y(50))
.BackgroundColor("Grey")
.Border(border => border.Color("Grey").Width(0))
.ShowBarPointers(false).ShowMarkerPointers(true)
//Adding label collection
.Labels(label => { label.DistanceFromScale(distance =>
distance.X(50).Y(0)).Add(); })
//Adding marker pointer collection
.MarkerPointers(mp =>
{
mp.Width(20).Length(10).Type(MarkerType.Pentagon)
.Placement(PointerPlacement.Near)
.MarkerBackgroundColor("#FE8282")
.MarkerDistanceFromScale(20).Add();
})
//Adding ticks collection
.Ticks(tic =>
{
tic.Type(TickType.MajorInterval).Width(2).Color("#8C8C8C")
.DistanceFromScale(distance => distance.X(30).Y(0)).Add();
tic.Type(TickType.MinorInterval).Width(1).Height(6).Color("#8C8C8C")
.DistanceFromScale(distance => distance.X(30).Y(0)).Height(6).Add();
}).Add();
}))
```

Execute the above code to render the following output.

Copyright © 2001 - 2020 Syncfusion Inc.

Scale Customization

Colors and Border

- The **Scale** border is modified with **border** object. It has two border property, color and width are used to customize the border color of the scale and border width of the scale. Setting the background color improves the look and feel of the **Linear Gauge**. You can customize the background color of the scale using backgroundColor.
- Scales are used to enable or disable various properties such as showRanges, showIndicators, showCustomLabels, showLabels, showTicks, showBarPointers and showMarkerPointers. Enable/disable is done by setting the property into two states either "**true**" or "**false**". You can adjust the Opacity of the scale with opacity property.

JS

```
@(Html.EJ().LinearGauge("LinearGauge1")
.EnableAnimation(false)
//Adding frame object
.Frame(fr=>fr.BackgroundImageUrl("../images/gauge/Gauge_linear_light.png"))
//Adding scale collection
.Scales(scale => {
scale.Width(8).Position(position => position.X(20).Y(50))
.BackgroundColor("#FE8282")
.Border(border => border.Color("Red").Width(1))
.Opacity(0.5).ShadowOffset(10).Type(ScaleType.RoundedRectangle)
.ShowBarPointers(false).ShowMarkerPointers(true)
//Adding label collection
.Labels(label => { label.DistanceFromScale(distance =>
distance.X(50).Y(0)).Add(); })
//Adding marker pointer collection
.MarkerPointers(mp =>
{
mp.Width(20).Length(10).Type(MarkerType.Pentagon)
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
.Placement(PointerPlacement.Near)
.MarkerBackgroundColor("#C9E1E5")
.MarkerDistanceFromScale(20).Add();
})
//Adding ticks collection
.Ticks(tic =>
{
tic.Type(TickType.MajorInterval).Width(2).Color("#8C8C8C")
.DistanceFromScale(distance => distance.X(30).Y(0)).Add();
tic.Type(TickType.MinorInterval).Width(1).Height(6).Color("#8C8C8C")
.DistanceFromScale(distance => distance.X(30).Y(0)).Height(6).Add();
}).Add();
}))
```

Execute the above code to render the following output.

Appearance

- You can improve the appearance of **Linear Gauge** using various properties. You can set the interval values for the scale with major interval value and minor interval value properties and maximum and minimum value by minimum and maximum property. The width property is used to set the scale bar width.
- You can also adjust the Opacity of the scale with opacity property. The value for opacity lies between 0 and 1.**Linear Gauge** contains two scale directions, clockwise and counter clockwise. It can be set with direction property.

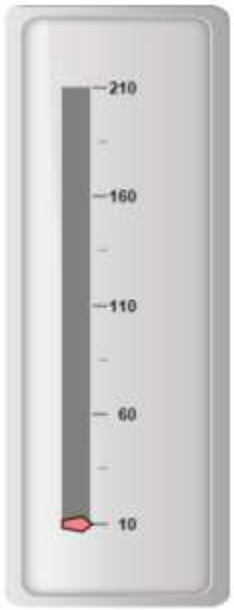
JS

```
@(Html.EJ().LinearGauge("LinearGauge1")
.EnableAnimation(false)
//Adding frame object
.Frame(fr=>fr.BackgroundImageUrl("../images/gauge/Gauge_linear_light.png"))
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
//Adding scale collection
.Scales(scale => {
scale.Width(18).Minimum(10)
.Maximum(210)
.MinorIntervalValue(25)
.MajorIntervalValue(50)
.Direction(Directions.CounterClockwise)
.Position(position => position.X(20).Y(50))
.BackgroundColor("Grey")
.Border(border => border.Color("Grey").Width(1))
.ShowBarPointers(false).ShowMarkerPointers(true)
//Adding label collection
.Labels(label => { label.DistanceFromScale(distance =>
distance.X(50).Y(0)).Add(); })
//Adding marker pointer collection
.MarkerPointers(mp =>
{
mp.Width(20).Length(10).Type(MarkerType.Pentagon)
.Placement(PointerPlacement.Near)
.MarkerBackgroundColor("#FE8282")
.MarkerDistanceFromScale(20).Add();
})
//Adding tick collection
.Ticks(tic =>
{
tic.Type(TickType.MajorInterval).Width(2).Color("#8C8C8C")
.DistanceFromScale(distance => distance.X(30).Y(0)).Add();
tic.Type(TickType.MinorInterval).Width(1).Height(6).Color("#8C8C8C")
.DistanceFromScale(distance => distance.X(30).Y(0)).Height(6).Add();
}).Add();
}))
```

Execute the above code to render the following output.



Copyright © 2001 - 2020 Syncfusion Inc.

Scale Types

Scale Type is an element which decides the appearance of the gauge. **Linear Gauge** contains three scale types such as,

- Rectangle
- Rounded Rectangle
- Thermometer

Rectangle

For rectangular scale type, the scale renders with rectangular structure. Refer the following code example.

JS

```
@(Html.EJ().LinearGauge("LinearGauge1")
.EnableAnimation(false)
//Adding frame object
.Frame(fr=>fr.BackgroundImageUrl("../images/gauge/Gauge_linear_light.png"))
//Adding scale collection
.Scales(scale => {
scale.Width(18).Length(300).Type(ScaleType.Rectangle)
.Position(position => position.X(54).Y(50))
.BackgroundColor("#C0B08E")
.Border(border => border.Color("#C0B08E").Width(1))
.ShowMarkerPointers(false)
//Adding tick collection
.Ticks(tic =>
{
tic.Type(TickType.MajorInterval).Width(2).Color("#206BA4")
.DistanceFromScale(distance => distance.X(-27).Y(0))
.Placement(TickPlacement.Far).Add();
tic.Type(TickType.MinorInterval).Width(1).Height(6).Color("#206BA4")
.DistanceFromScale(distance => distance.X(-27).Y(0)).Height(6)
.Placement(TickPlacement.Far).Add();
}).Add();
}))
```

Execute the above code to render the following output.

Copyright © 2001 - 2020 Syncfusion Inc.

Rounded Rectangle

For rounded rectangular scale type, the scale renders as rectangular structure but with constant radius rounded corner. Refer the following code example.

JS

```
@(Html.EJ().LinearGauge("LinearGauge1")
.EnableAnimation(false)
//Adding frame object
.Frame(fr=>fr.BackgroundImageUrl("../images/gauge/Gauge_linear_light.png"))
//Adding scale collection
.Scales(scale => {
scale.Width(8).Type(ScaleType.RoundedRectangle)
.Direction(Directions.Clockwise)
.Position(position => position.X(60).Y(50))
.BackgroundColor("#206BA4")
.Border(border => border.Color("#206BA4").Width(1))
//Adding label collection
.Labels(label => { label.DistanceFromScale(distance => distance.X(-
20).Y(0)).Add(); })
//Adding tick collection
.Ticks(tic =>
{
tic.Type(TickType.MajorInterval).Width(2).Color("#206BA4")
.DistanceFromScale(distance => distance.X(-27).Y(0))
.Placement(TickPlacement.Far).Add();
tic.Type(TickType.MinorInterval).Width(1).Height(6).Color("#206BA4")
.DistanceFromScale(distance => distance.X(-27).Y(0)).Height(6)
.Placement(TickPlacement.Far).Add();
}).Add();
}))
```

Execute the above code to render the following output.

Copyright © 2001 - 2020 Syncfusion Inc.

Thermometer

For thermometer scale type, the scale renders as thermometer structure with rounded bottom. Refer the following code example.

JS

```
@(Html.EJ().LinearGauge("LinearGauge1")
.EnableAnimation(false)
//Adding Frame object
.Frame(fr=>fr.BackgroundImageUrl("../images/gauge/Gauge_linear_light.png"))
//Adding scale collection
.Scales(scale => {
scale.Width(18).Length(300).Type(ScaleType.Thermometer)
.Position(position => position.X(54).Y(50))
.BackgroundColor("#C0B08E")
.Border(border => border.Color("#C0B08E").Width(1))
.ShowMarkerPointers(false).ShowBarPointers(false)
//Adding tick collection
.Ticks(tic =>
{
tic.Type(TickType.MajorInterval).Width(2).Color("#206BA4")
.DistanceFromScale(distance => distance.X(-27).Y(0))
.Placement(TickPlacement.Far).Add();
tic.Type(TickType.MinorInterval).Width(1).Height(6).Color("#206BA4")
.DistanceFromScale(distance => distance.X(-27).Y(0)).Height(6)
.Placement(TickPlacement.Far).Add();
}).Add();
}))
```

Execute the above code to render the following output.

Copyright © 2001 - 2020 Syncfusion Inc.

Adding multiple scales

You can set multiple scales for a single **Linear Gauge** control by using an array of scale objects. Each scale object is independent of each other. Refer the following code example to add multiple scale collection.

JS

```
@(Html.EJ().LinearGauge("LinearGauge1")
.EnableAnimation(false)
//Adding Frame object
.Frame(fr=>fr.BackgroundImageUrl("../images/gauge/Gauge_linear_light.png"))
//Adding Scale collection
.Scales(scale =>
//Adding Scale 1
{
scale.Width(8)
.Position(position => position.X(15).Y(50))
.BackgroundColor("Grey")
.Border(border => border.Color("Grey").Width(1))
.ShowMarkerPointers(true).ShowBarPointers(false)
.Labels(label => { label.DistanceFromScale(distance =>
distance.X(50).Y(0)).Add(); })
//Adding marker pointer collection
.MarkerPointers(mp => { mp.Type(MarkerType.Pentagon)
.Placement(PointerPlacement.Near).Width(20).Length(10)
.MarkerDistanceFromScale(20).MarkerBackgroundColor("#FE8282").Add(); })
//Adding tick collection
.Ticks(tic =>
{
tic.Type(TickType.MajorInterval).Width(2).Color("#8c8c8c")
.DistanceFromScale(distance => distance.X(30).Y(0)).Add();
tic.Type(TickType.MinorInterval).Width(1).Height(6).Color("#8c8c8c")
.DistanceFromScale(distance => distance.X(30).Y(0)).Height(6).Add();
}).Add();
//Adding Scale 2
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
scale.Width(8).Direction(Directions.Clockwise)
.Type(ScaleType.RoundedRectangle)
.Position(position => position.X(90).Y(50))
.BackgroundColor("#206BA4")
.Border(border => border.Color("#206BA4").Width(1))
.ShowMarkerPointers(false).ShowBarPointers(false).ShowLabels(false)
//Adding tick collection
.Ticks(tic =>
{
tic.Type(TickType.MajorInterval).Width(2).Color("#206BA4")
.DistanceFromScale(distance => distance.X(-27).Y(0))
.Placement(TickPlacement.Far).Add();
tic.Type(TickType.MinorInterval).Width(1).Height(6).Color("#206BA4")
.DistanceFromScale(distance => distance.X(-27).Y(0)).Height(6)
.Placement(TickPlacement.Far).Add();
}).Add();
//Adding Scale 3
scale.Width(18).Length(300)
.Position(position => position.X(54).Y(50))
.Type(ScaleType.Thermometer)
.BackgroundColor("#C0B08E")
.Border(border => border.Color("#C0B08E").Width(1))
.ShowMarkerPointers(false).ShowBarPointers(false)
.ShowLabels(false).ShowTicks(false)
.Add();
}))
```

Execute the above code to render the following output.

Marker Pointers

Marker Pointer value points out the actual value set in the **Linear Gauge**. You can set values for various pointer attributes such as value, type, length, width, border and color in pointer collection. You can also customize the pointers to improve the appearance of gauge.

Copyright © 2001 - 2020 Syncfusion Inc.

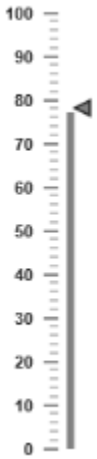
Adding marker pointer collection

You can add **Marker Pointer** collection directly to the scale object. To add pointer collection in a gauge control refer the following code example.

JS

```
@(Html.EJ().LinearGauge("LinearGauge1")
.Value(78)
//Adding Scale Collection
.Scales(scale => {
scale.Width(0).Border(border => border.Color("transparent").Width(0))
.ShowBarPointers(true)
//Adding marker pointer collection
.MarkerPointers(mp => { mp.Width(5).Length(10)
.MarkerBackgroundColor("Grey").MarkerDistanceFromScale(17).Add(); })
//Adding bar pointer collection
.BarPointers(bar =>
{
bar.Width(5)
.BarPointerBackgroundColor("Grey").BarPointerDistanceFromScale(15).Add();
})
//Adding tick collection
.Ticks(tic =>
{
tic.Type(TickType.MajorInterval).Width(2).Color("#8C8C8C")
.DistanceFromScale(distance => distance.X(7).Y(0)).Add();
tic.Type(TickType.MinorInterval).Width(1).Color("#8C8C8C")
.DistanceFromScale(distance => distance.X(7).Y(0)).Height(6).Add();
}).Add();
}))
```

Execute the above code to render the following output.



Add marker pointer value

The value property is the important element in the marker pointer collection which indicates the gauge value. Real purpose of the **Linear Gauge** is based on the pointer value. You can set the pointer value either directly during rendering the control or it can be achieved by public method.

Copyright © 2001 - 2020 Syncfusion Inc.

JS

```
@(Html.EJ().LinearGauge("LinearGauge1")
.EnableAnimation(false)
.Width(600).Height(150).Orientation(Orientation.Horizontal).LabelColor("Blac
k")
//Adding Frame object
.Frame(fr=>fr.BackgroundImageUrl("../Content/images/gauge/Gauge_linear_light
1.png"))
//Adding scale collection
.Scales(scale => {
scale.Width(30).BackgroundColor("#AEC75F").Border(border =>
border.Color("#AEC75F").Width(30))
.Direction(Directions.Clockwise).Type(ScaleType.RoundedRectangle)
//Adding marker pointer collection
.MarkerPointers(mp => { mp.Width(30).Length(30)
.MarkerBackgroundColor("#FE5C09").MarkerDistanceFromScale(20)
.Placement(PointerPlacement.Near).Value(67.5).Add(); })
//Adding label collection
.Labels(label => { label.Angle(90).DistanceFromScale(distance =>
distance.Y(100).X(0)).Add(); })
//Adding tick collection
.Ticks(tic =>
{
tic.Type(TickType.MajorInterval).Width(2).Color("#8C8C8C")
.DistanceFromScale(distance => distance.X(45).Y(0)).Add();
tic.Type(TickType.MinorInterval).Width(1).Color("#8C8C8C")
.DistanceFromScale(distance => distance.X(45).Y(0)).Height(6).Add();
}).Add();
}))
```

Execute the above code to render the following output.

Pointer Styles

Appearance

- Based on the value, the **pointer** points out the label value. You can set the pointer length and width using length and width property respectively. You can also adjust the opacity of the pointer using the opacity property which holds the value between 0 and 1. You can add the gradient effects to the pointer using gradient object.
- The marker pointer border is modified with the border object. It contains two border property namely color and width which are used to customize the border color of the scale and border width of the marker pointer. The background color can be customized with attribute backgroundColor.

Copyright © 2001 - 2020 Syncfusion Inc.

JS

```
@(Html.EJ().LinearGauge("LinearGauge1")
.EnableAnimation(false)
.Width(600).Height(150).Orientation(Orientation.Horizontal).LabelColor("Blac
k")
.EnableResize(true)
//Adding Frame object
.Frame(fr=>fr.BackgroundImageUrl("../Content/images/gauge/Gauge_linear_light
1.png"))
//Adding scale collection
.Scales(scale => {
scale.BackgroundColor("#AEC75F").Border(border =>
border.Color("#AEC75F").Width(30))
.Direction(Directions.Clockwise).Type(ScaleType.RoundedRectangle)
//Adding marker pointer collection
.MarkerPointers(mp => { mp.Width(30).Length(30).MarkerOpacity(0.4)
.MarkerBackgroundColor("#FCDD34").MarkerDistanceFromScale(20)
.Placement(PointerPlacement.Near).Value(67.5).Add(); })
//Adding label collection
.Labels(label => { label.Angle(90).DistanceFromScale(distance =>
distance.Y(100).X(0)).Add(); })
//Adding tick collection
.Ticks(tic =>
{
tic.Type(TickType.MajorInterval).Width(2).Color("#8C8C8C")
.DistanceFromScale(distance => distance.X(-1).Y(45)).Add();
tic.Type(TickType.MinorInterval).Width(1).Color("#8C8C8C")
.DistanceFromScale(distance => distance.X(-1).Y(45)).Height(6).Add();
}).Add();
}))
```

Execute the above code to render the following output.

Positioning the pointer

- You can position the Pointer with two properties, **distanceFromScale** and **placement**. The distanceFromScale property defines the distance between the scale and pointer.
- The Placement property is used to locate the pointer with respect to scale either inside or outside the scale or along the scale. It is an enumerable data type.

JS

```
@(Html.EJ().LinearGauge("LinearGauge1")
.EnableAnimation(false)
```

```
.Width(600).Height(150).Orientation(Orientation.Horizontal).LabelColor("Blac
k")
//Adding frame object
.Frame(fr=>fr.BackgroundImageUrl("../Content/images/gauge/Gauge_linear_light
1.png"))
//Adding scale collection
.Scales(scale => {
scale.Width(30).BackgroundColor("#AEC75F").Border(border =>
border.Color("#AEC75F").Width(30))
.Direction(Directions.Clockwise).Type(ScaleType.RoundedRectangle)
//Adding marker pointer collection
.MarkerPointers(mp => { mp.Width(30).Length(30).MarkerOpacity(0.4)
.MarkerBackgroundColor("#01A357").MarkerDistanceFromScale(60)
.Placement(PointerPlacement.Near).Value(55.5).Add(); })
//Adding label collection
.Labels(label => { label.Angle(90).DistanceFromScale(distance =>
distance.Y(100).X(0)).Add(); })
//Adding ticks collection
.Ticks(tic =>
{
tic.Type(TickType.MajorInterval).Width(2).Color("#8C8C8C")
.DistanceFromScale(distance => distance.X(-1).Y(45)).Add();
tic.Type(TickType.MinorInterval).Width(1).Color("#8C8C8C")
.DistanceFromScale(distance => distance.X(-1).Y(45)).Height(6).Add();
}).Add();
}))
```

Execute the above code to render the following output.

Types

It is possible to change the dimension of the marker pointer. Dimensions available for marker pointer are,

- Rectangle
- Triangle
- Ellipse
- Diamond
- Pentagon
- Circle
- Slider
- Pointer
- Wedge
- Trapezoid
- Rounded Rectangle

Copyright © 2001 - 2020 Syncfusion Inc.

Multiple Marker Pointers

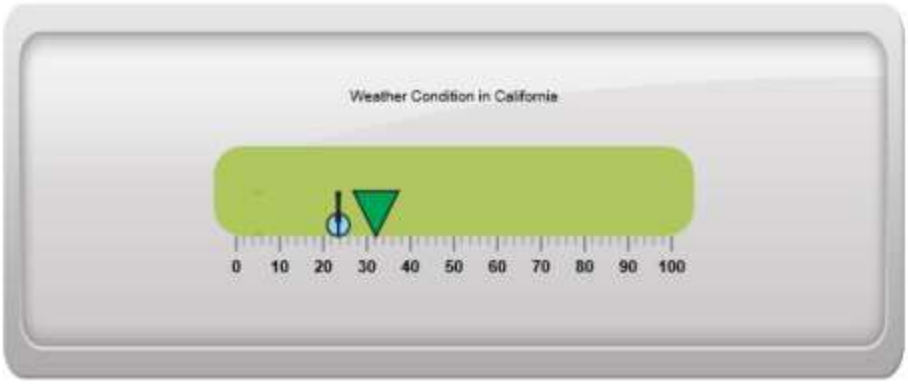
Linear Gauge can contain multiple pointers on it. You can use any combination and any number of pointers in a gauge. That is, a gauge can contain any number of marker pointer and any number of bar pointers. Refer the following code example containing multiple marker pointers.

JS

```
@(Html.EJ().LinearGauge("LinearGauge1")
.EnableAnimation(false).LabelColor("Black").EnableResize(true)
.Width(600).Theme(Themes.FlatLight).Height(250)
.Orientation(Orientation.Horizontal).LabelColor("Black")
//Adding frame object
.Frame(fr=>fr.BackgroundImageUrl("../Content/images/gauge/Gauge_linear_light
1.png"))
//Adding scale collection
.Scales(scale => {
scale.Width(30).BackgroundColor("#AEC75F")
.Border(border => border.Color("#AEC75F").Width(30))
.Direction(Directions.Clockwise)
.Type(ScaleType.RoundedRectangle).ShowCustomLabels(true)
//Adding marker pointer collection
.MarkerPointers(mp =>
{
//Adding marker pointer 1
mp.Width(30).Length(30)
.MarkerBackgroundColor("#01A357").MarkerDistanceFromScale(60)
.Placement(PointerPlacement.Near).Value(32.2).Add();
//Adding marker pointer 2
mp.Width(10).Length(30)
.MarkerBackgroundColor("#90DAFB").MarkerDistanceFromScale(60)
.Placement(PointerPlacement.Near).Value(23.7).Type(MarkerType.Circle).Add();
//Adding marker pointer 3
mp.Width(3).Length(30)
.MarkerBackgroundColor("#90DAFB").MarkerDistanceFromScale(60)
.Placement(PointerPlacement.Near).Value(23.7).Type(MarkerType.Star).Add();
})
//Adding label collection
.Labels(label => { label.Angle(90).DistanceFromScale(distance =>
distance.Y(100).X(0)).Add(); })
//Adding tick collection
.Ticks(tic =>
{
tic.Type(TickType.MajorInterval).Width(2).Color("#8C8C8C")
.DistanceFromScale(distance => distance.X(45).Y(0)).Add();
tic.Type(TickType.MinorInterval).Width(1).Color("#8C8C8C")
.DistanceFromScale(distance => distance.X(45).Y(0)).Height(6).Add();
})
//Adding custom label collection
.CustomLabels(cl => { cl.Value("Weather Condition in California")
.Position(position => position.X(52).Y(20)).Add();
})
.Add();
}))
```

Execute the above code to render the following output.

Copyright © 2001 - 2020 Syncfusion Inc.



Bar Pointers

Bar Pointer value points out the actual value set in the **Linear Gauge** as marker pointer. You can set the values of the various bar pointer attributes such as value, width, border and color in bar pointer collection. You can also customize the pointers to improve the appearance of gauge.

Adding bar pointer collection

You can add Bar Pointer collection directly to the scale object. Refer the following code example.

JS

```
@(Html.EJ().LinearGauge("LinearGauge1").EnableAnimation(false)
//Adding frame object
.Frame(fr=>fr.InnerWidth(8).OuterWidth(10)
.BackgroundImageUrl("../Content/images/gauge/Gauge_linear_light.png"))
.Value(78)
//Adding scale collection
.Scales(scale => {
scale.Width(0).Border(border => border.Color("transparent").Width(0))
.ShowBarPointers(true).ShowMarkerPointers(false)
//Adding bar pointer collection
.BarPointers(bar => {
bar.Width(5).BarPointerDistanceFromScale(15)
.BarPointerBackgroundColor("Grey").Add();
})
//Adding ticks collection
.Ticks(tic =>
{
tic.Type(TickType.MajorInterval).Width(2).Color("#8C8C8C")
.DistanceFromScale(distance => distance.X(7).Y(0)).Add();
tic.Type(TickType.MinorInterval).Width(1).Color("#8C8C8C")
.DistanceFromScale(distance => distance.X(7).Y(0)).Height(6).Add();
}).Add();
}))
```

Execute the above code to render the following output.

Copyright © 2001 - 2020 Syncfusion Inc.

Linear Gauge with bar pointer

Adding bar pointer value

Bar pointer value is also important element in the **Linear Gauge** as it indicates the gauge value. Real purpose of the **Linear Gauge** is based on the pointer value. You can set the bar pointer value either directly during rendering the control or it can be achieved by public method.

JS

```
@(Html.EJ().LinearGauge("LinearGauge1").EnableAnimation(false)
//Adding frame object
.Frame(fr=>fr.InnerWidth(8).OuterWidth(10)
.BackgroundImageUrl("../Content/images/gauge/Gauge_linear_light.png"))
//Adding scale object
.Scales(scale => {
scale.Width(0).Border(border => border.Color("transparent").Width(0))
.ShowBarPointers(true).ShowMarkerPointers(false)
//Adding bar pointer collection
.BarPointers(bar => {
bar.Width(5).BarPointerDistanceFromScale(15)
.BarPointerBackgroundColor("Grey").BarPointerValue(91).Add();
})
//Adding ticks collection
.Ticks(tic =>
{
tic.Type(TickType.MajorInterval).Width(2).Color("#8C8C8C")
.DistanceFromScale(distance => distance.X(7).Y(0)).Add();
tic.Type(TickType.MinorInterval).Width(1).Color("#8C8C8C")
.DistanceFromScale(distance => distance.X(7).Y(0)).Height(6).Add();
}).Add();
}))
```

Execute the above code to render the following output.

Copyright © 2001 - 2020 Syncfusion Inc.

Pointer Styles

Appearance

- Based on the value, the bar pointer points out the label value. You can set the bar pointer width using width property and you can also adjust the opacity of the pointer using opacity property that holds the value between 0 and 1. You can add the gradient effects to the pointer using gradient object.
- The marker pointer border is modified with the object border. It has two border property, color and width which are used to customize the border color of the scale and border width of the marker pointer. The background color can be customized with attribute backgroundColor.

JS

```
@(Html.EJ().LinearGauge("LinearGauge1").EnableAnimation(false)
//Adding frame object
.Frame(fr=>fr.InnerWidth(8).OuterWidth(10)
.BackgroundImageUrl("../Content/images/gauge/Gauge_linear_light.png"))
//Adding scale collection
.Scales(scale => {
scale.Width(0).Border(border => border.Color("transparent").Width(0))
.ShowBarPointers(true).ShowMarkerPointers(false)
//Adding bar pointer collection
.BarPointers(bar => {
bar.Width(10).BarPointerDistanceFromScale(15).BarPointerOpacity(0.7)
.BarPointerBackgroundColor("Red").BarPointerValue(91).Add();
})
//Adding tick collection
.Ticks(tic =>
{
tic.Type(TickType.MajorInterval).Width(2).Color("#8C8C8C")
.DistanceFromScale(distance => distance.X(7).Y(0)).Add();
tic.Type(TickType.MinorInterval).Width(1).Color("#8C8C8C")
.DistanceFromScale(distance => distance.X(7).Y(0)).Height(6).Add();
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
}).Add();
}))
```

Execute the above code to render the following output.

Positioning the pointer

- Bar pointer can be positioned with two properties such as **distanceFromScale** and **placement**. The distanceFromScale property defines the distance between the scale and pointer element.
- The placement property is used to locate the pointer with respect to scale either inside or outside the scale or along the scale. It is an enumerable data type.

JS

```
@(Html.EJ().LinearGauge("LinearGauge1").EnableAnimation(false)
//Adding frame object
.Frame(fr=>fr.InnerWidth(8).OuterWidth(10)
.BackgroundImageUrl("../Content/images/gauge/Gauge_linear_light.png"))
//Adding scale collection
.Scales(scale => {
scale.Width(0).Border(border => border.Color("transparent").Width(0))
.ShowBarPointers(true).ShowMarkerPointers(false)
//Adding bar pointer collection
.BarPointers(bar => {
bar.Width(10).BarPointerDistanceFromScale(40)
.BarPointerBackgroundColor("#8BABFF").BarPointerValue(91).Add();
})
//Adding ticks collection
.Ticks(tic =>
{
tic.Type(TickType.MajorInterval).Width(2).Color("#8C8C8C")
.DistanceFromScale(distance => distance.X(7).Y(0)).Add();
tic.Type(TickType.MinorInterval).Width(1).Color("#8C8C8C")
.DistanceFromScale(distance => distance.X(7).Y(0)).Height(6).Add();
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
}).Add();
}))
```

Execute the above code to render the following output.

Multiple Bar Pointers

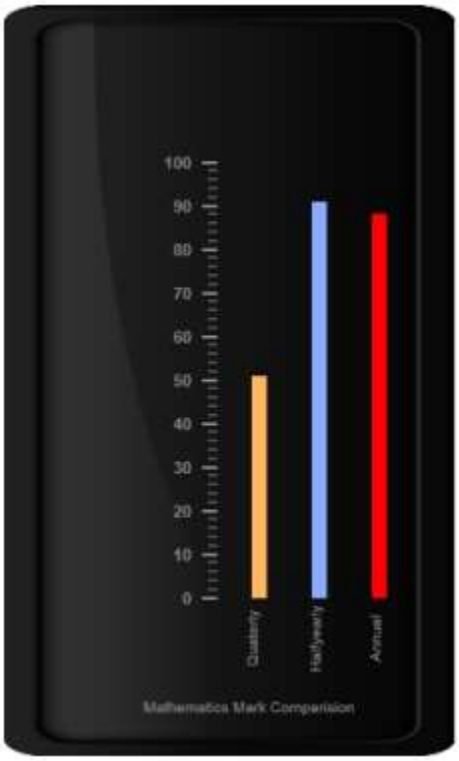
Linear Gauge can contain multiple bar pointers on it. You can use any combination and any number of pointers in a gauge. That is, a Gauge can contain any number of marker pointer and any number of bar pointers. Refer the following code example containing multiple bar pointers.

JS

```
@(Html.EJ().LinearGauge("LinearGauge1").EnableAnimation(false)
.Height(500).Width(300).LabelColor("Grey")
//Adding frame object
.Frame(fr=>fr.InnerWidth(8).OuterWidth(10)
.BackgroundImageUrl("../Content/images/gauge/Gauge_linear_dark1.png"))
//Adding scale collection
.Scales(scale => {
scale.Width(0).Border(border => border.Color("transparent").Width(0))
.ShowBarPointers(true).ShowMarkerPointers(false).ShowCustomLabels(true)
//Adding bar pointer collection
.BarPointers(bar =>
{
//Adding bar pointer 1
bar.Width(10).BarPointerDistanceFromScale(60)
.BarPointerBackgroundColor("#8BABFF").BarPointerValue(91).Add();
//Adding bar pointer 2
bar.Width(10).BarPointerDistanceFromScale(20)
.BarPointerBackgroundColor("#FDB761").BarPointerValue(51).Add();
//Adding bar pointer 3
bar.Width(10).BarPointerDistanceFromScale(100)
.BarPointerBackgroundColor("Red").BarPointerValue(88).Add();
})
//Adding tick collection
```

```
.Ticks(tic =>
{
tic.Type(TickType.MajorInterval).Width(2).Color("#8C8C8C")
.DistanceFromScale(distance => distance.X(7).Y(0)).Add();
tic.Type(TickType.MinorInterval).Width(1).Color("#8C8C8C")
.DistanceFromScale(distance => distance.X(7).Y(0)).Height(6).Add();
})
//Adding custom label collection
.CustomLabels(cl => {
cl.Value("Mathematics Mark Comparison").Position(position =>
position.X(55).Y(97)).Add();
cl.Value("Half yearly").Position(position =>
position.X(72).Y(87)).TextAngle(90).Add();
cl.Value("Quarterly").Position(position =>
position.X(56).Y(87)).TextAngle(90).Add();
cl.Value("Annual").Position(position =>
position.X(87).Y(87)).TextAngle(90).Add();
}).Add();
}))
```

Execute the above code to render the following output.



Labels

Labels are units that are used to display the values in the scales. You can customize Labels with the properties like angle, color, font, opacity, etc.

Adding label collection

Label collection can be directly added to the scale object. Refer the following code example to add label collection in a gauge.

Copyright © 2001 - 2020 Syncfusion Inc.

JS

```
@(Html.EJ().LinearGauge("LinearGauge1").EnableAnimation(false)
.Value(40)
//Adding frame object
.Frame(fr=>fr.InnerWidth(8).OuterWidth(10)
.BackgroundImageUrl("../Content/images/gauge/Gauge_linear_dark1.png"))
//Adding scale collection
.Scales(scale => {
scale.Width(0).Border(border => border.Color("transparent").Width(0))
.ShowBarPointers(true).ShowMarkerPointers(false).ShowCustomLabels(true)
//Adding bar pointer collection
.BarPointers(bar =>
{
bar.Width(10).BarPointerDistanceFromScale(13).Add();
})
//Adding label collection
.Labels(label => { label.TextColor("White").Add(); })
//Adding tick collection
.Ticks(tic =>
{
tic.Type(TickType.MajorInterval).Width(2).Color("#8C8C8C")
.DistanceFromScale(distance => distance.X(7).Y(0)).Add();
tic.Type(TickType.MinorInterval).Width(1).Color("#8C8C8C")
.DistanceFromScale(distance => distance.X(7).Y(0)).Height(6).Add();
}).Add();
}))
```

Execute the above code to render the following output.

Copyright © 2001 - 2020 Syncfusion Inc.

Label Customization

Appearance

- The attribute **angle** is used to display the labels in the specified angles and **color** attribute is used to display the labels in specified color. You can adjust the **opacity** of the label with the property opacity and the values of it lies between 0 and 1.The includeFirstValue is a special property by enabling this property, the first value of the label is not rendered.
- Font option is also available on the labels. The basic three properties of fonts such as size, family and style can be achieved by **size**, **fontStyle** and **fontFamily**. Labels are two types such as major and minor.Major type labels are for major interval values and minor type labels are for minor interval values.

JS

```
@(Html.EJ().LinearGauge("LinearGauge1").EnableAnimation(false)
.Value(40)
//Adding frame object
.Frame(fr=>fr.InnerWidth(8).OuterWidth(10)
.BackgroundImageUrl("../Content/images/gauge/Gauge_linear_light.png"))
//Adding scale collection
.Scales(scale => {
scale.Width(0).Border(border => border.Color("transparent").Width(0))
.ShowBarPointers(true).ShowMarkerPointers(false).ShowCustomLabels(true)
//Adding bar pointer collection
.BarPointers(bar =>
{
bar.Width(10).BarPointerDistanceFromScale(13).Add();
})
//Adding label collection
.Labels(label => { label.TextColor("Red").Angle(10).Opacity(0.5)
.Font(font=>font.Size("12px").FontStyle("Arial").FontFamily("Bold"))
.IncludeFirstValue(false).Add(); })
//Adding tick collection
.Ticks(tic =>
{
tic.Type(TickType.MajorInterval).Width(2).Color("#8C8C8C")
.DistanceFromScale(distance => distance.X(7).Y(0)).Add();
tic.Type(TickType.MinorInterval).Width(1).Color("#8C8C8C")
.DistanceFromScale(distance => distance.X(7).Y(0)).Height(6).Add();
}).Add();
}))
```

Execute the above code to render the following output.

Copyright © 2001 - 2020 Syncfusion Inc.

Unit text and Positioning

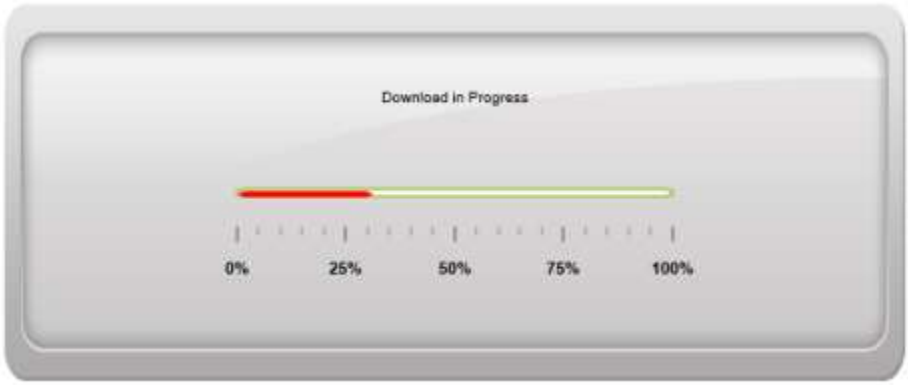
- The unitText property is used to add some text along with the labels. For example, in speedometer, you need to mention the units in kph. You can also add the unit text in front of the labels. To achieve this use the enumerable property unitTextPlacement.
- Labels can be positioned with the help of two properties such as **distanceFromScale** and **placement**. distanceFromScale property defines the distance between the scale and labels. Placement property is used to locate the labels with respect to scale either inside the scale or outside the scale or along the scale. It is an enumerable data type.

JS

```
@(Html.EJ().LinearGauge("LinearGauge1").EnableAnimation(false)
.Value(31).Width(600).Height(250).Theme(Themes.FlatLight).Orientation(Orient
ation.Horizontal)
.LabelColor("Black").EnableResize(true)
//Adding frame object
.Frame(fr=>fr.InnerWidth(8).OuterWidth(10)
.BackgroundImageUrl("../Content/images/gauge/Gauge_linear_light1.png"))
//Adding scale collection
.Scales(scale => {
scale.Width(5).Border(border =>
border.Color("#AEC75F").Width(2)).BackgroundColor("White")
.MajorIntervalValue(25).MinorIntervalValue(5)
.Type(ScaleType.RoundedRectangle).Direction(Directions.Clockwise)
.ShowBarPointers(true).ShowMarkerPointers(false).ShowCustomLabels(true)
//Adding bar pointer collection
.BarPointers(bar =>
{
bar.Width(4).BarPointerBackgroundColor("Red").Add();
})
//Adding label collection
.Labels(label => { label.Angle(90).DistanceFromScale(dc =>
```

```
dc.X(0).Y(60)).UnitText("%").Add(); })
//Adding tick collection
.Ticks(tic =>
{
tic.Type(TickType.MajorInterval).Width(2).Color("#8C8C8C")
.DistanceFromScale(distance => distance.X(25).Y(0)).Add();
tic.Type(TickType.MinorInterval).Width(1).Color("#8C8C8C")
.DistanceFromScale(distance => distance.X(25).Y(0)).Height(6).Add();
})
//Adding custom label collection
.CustomLabels(cl => { cl.Value("Download in Progress")
.Position(position => position.X(53).Y(20)).Add(); }).Add();
}))
```

Execute the above code to render the following output.



Ticks

Ticks are used to mark some values on the scale. Based on the tick's value you can set the labels on the required position.

Adding tick collection

Tick collection can be directly added to the scale object. Refer the following code example to add tick collection in a **Linear Gauge** control.

JS

```
@(Html.EJ().LinearGauge("LinearGauge1").EnableAnimation(false).Value(78)
//Adding frame object
.Frame(fr=>fr.InnerWidth(8).OuterWidth(10)
.BackgroundImageUrl("../Content/images/gauge/Gauge_linear_light.png"))
//Adding scale collection
.Scales(scale => {
scale.Width(5).Border(border =>
border.Color("Grey").Width(1)).BackgroundColor("transparent")
.Type(ScaleType.RoundedRectangle)
.ShowBarPointers(true)
//Adding bar pointer collection
.BarPointers(bar =>
{
bar.Width(5).BarPointerBackgroundColor("#95C7E0").Add();
bar.Width(6).BarPointerBackgroundColor("#EDC1D7")
.BarPointerDistanceFromScale(-15).BarPointerValue(30)
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
.BarPointerOpacity(0.7).Add();
})
//Adding marker pointer collection
.MarkerPointers(mp => { mp.Width(10).Length(10).Value(60).Add(); })
//Adding label collection
.Labels(label => { label.DistanceFromScale(distance => distance.X(-
25).Y(0)).Add(); })
//Adding tick collection
.Ticks(tic =>
{
tic.Type(TickType.MajorInterval).Width(2).Color("#8C8C8C")
.DistanceFromScale(distance => distance.X(-10).Y(0)).Add();
tic.Type(TickType.MinorInterval).Width(1).Color("#8C8C8C")
.DistanceFromScale(distance => distance.X(-10).Y(0)).Height(6).Add();
}).Add();
}))
```

Execute the above code to render the following output.

Tick Customization

Appearance

- Height and width of the ticks can be applied by using the properties height and width. You can customize ticks with the properties like angle, color, etc. angle attribute is used to display the labels in the specified angles and color attribute is used to display the labels in specified color.
- Ticks are two types such as major and minor. The opacity of the labels can be adjusted with the property opacity. The opacity values lies between 0 and 1.

JS

```
@(Html.EJ().LinearGauge("LinearGauge1").EnableAnimation(false).Value(78)
//Adding frame object
.Frame(fr=>fr.InnerWidth(8).OuterWidth(10)
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
.BackgroundImageUrl("../Content/images/gauge/Gauge_linear_light.png"))
//Adding scale object
.Scales(scale => {
scale.Width(5).Border(border =>
border.Color("Grey").Width(1)).BackgroundColor("transparent")
.Type(ScaleType.RoundedRectangle)
.ShowBarPointers(true)
//Adding bar pointer value
.BarPointers(bar =>
{
bar.Width(5).BarPointerBackgroundColor("#95C7E0").Add();
})
//Adding marker pointer collection
.MarkerPointers(mp => { mp.Width(10).Length(10).Value(60).Add(); })
//Adding label collection
.Labels(label => { label.DistanceFromScale(distance => distance.X(-
25).Y(0)).Add(); })
//Adding ticks collection
.Ticks(tic =>
{
tic.Type(TickType.MajorInterval).Width(2).Height(14).Angle(10).Color("Black"
)
.DistanceFromScale(distance =>
distance.X(-10).Y(0)).Placement(TickPlacement.Near).Add();
tic.Type(TickType.MinorInterval).Width(1).Height(10)
.Opacity(0.5).Color("Black").DistanceFromScale(distance =>
distance.X(-10).Y(0)).Placement(TickPlacement.Near).Height(6).Add();
}).Add();
}))
```

Execute the above code to render the following output.

Copyright © 2001 - 2020 Syncfusion Inc.

Types

Ticks are two types such as **majorInterval** and **minorInterval**. Major type ticks are for major interval values and minor type ticks are for minor interval values.

JS

```
@(Html.EJ().LinearGauge("LinearGauge1").EnableAnimation(false).Value(78)
//Adding frame object
.Frame(fr=>fr.InnerWidth(8).OuterWidth(10)
.BackgroundImageUrl("../Content/images/gauge/Gauge_linear_light.png"))
//Adding scale collection
.Scales(scale => {
scale.Width(5).Border(border =>
border.Color("Grey").Width(1)).BackgroundColor("transparent")
.Type(ScaleType.RoundedRectangle)
.ShowBarPointers(true)
//Adding bar pointer collection
.BarPointers(bar =>
{
bar.Width(5).BarPointerBackgroundColor("#95C7E0").Add();
})
//Adding marker pointer collection
.MarkerPointers(mp => { mp.Width(10).Length(10).Value(60).Add(); })
//Adding label collection
.Labels(label => { label.DistanceFromScale(distance => distance.X(-
25).Y(0)).Add(); })
//Adding ticks collection
.Ticks(tic =>
{
tic.Type(TickType.MajorInterval).Width(2).Height(14).Color("Black").Add();
tic.Type(TickType.MinorInterval).Add();
}).Add();
}))
```

Execute the above code to render the following output.

Copyright © 2001 - 2020 Syncfusion Inc.

Positioning the ticks

- You can position ticks with the help of two properties such as **distanceFromScale** and **placement**. The property distanceFromScale defines the distance between the scale and ticks.
- Placement property is used to locate the ticks with respect to scale either inside the scale or outside the scale or along the scale. It is an enumerable data type.

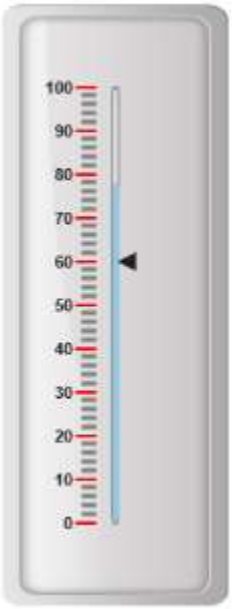
JS

```
@(Html.EJ().LinearGauge("LinearGauge1").EnableAnimation(false).Value(78)
//Adding frame collection
.Frame(fr=>fr.InnerWidth(8).OuterWidth(10)
.BackgroundImageUrl("../Content/images/gauge/Gauge_linear_light.png"))
//Adding scale collection
.Scales(scale => {
scale.Width(5).Border(border =>
border.Color("Grey").Width(1)).BackgroundColor("transparent")
.Type(ScaleType.RoundedRectangle)
.ShowBarPointers(true)
//Adding bar pointer collection
.BarPointers(bar =>
{
bar.Width(5).BarPointerBackgroundColor("#95C7E0").Add();
})
//Adding marker pointer collection
.MarkerPointers(mp => { mp.Width(10).Length(10).Value(60).Add(); })
//Adding label collection
.Labels(label => { label.DistanceFromScale(distance => distance.X(-
25).Y(0)).Add(); })
//Adding ticks collection
.Ticks(tic =>
{
tic.Type(TickType.MajorInterval).Width(2).Height(14).Color("Black")
.Placement(TickPlacement.Near).Color("Red")
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
.DistanceFromScale(distance=>distance.X(-10).Y(0)).Add();
tic.Type(TickType.MinorInterval).Color("Grey").Placement(TickPlacement.Near)
.DistanceFromScale(distance => distance.X(-10).Y(0)).Add();
}).Add();
}))
```

Execute the above code to render the following output.



Ranges

Ranges are used to specify or group the scale values. You can describe the values in the pointers using ranges.

Adding range collection

Range collection can be directly added to the scale object. Refer the following code example to add range collection in a **Linear Gauge** control.

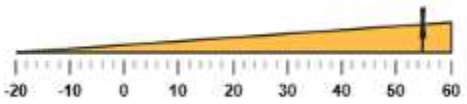
JS

```
@(Html.EJ().LinearGauge("LinearGauge1").EnableAnimation(false)
.Height(150).Width(600).Orientation(Orientation.Horizontal)
.LabelColor("Black").IsResponsive(true)
//Adding scale collection
.Scales(scale => {
scale.Width(0).BackgroundColor("transparent").Border(border =>
border.Color("transparent").Width(0)).ShowMarkerPointers(true)
.ShowBarPointers(false).ShowCustomLabels(true).Direction(Directions.Clockwis
e)
.ShowRanges(true).Minimum(-20).Maximum(60)
//Adding label collection
.Labels(label => { label.DistanceFromScale(distance =>
distance.X(0).Y(50)).Add(); })
//Adding tick collection
.Ticks(tic =>
{
tic.Type(TickType.MajorInterval).Width(2).Color("#8c8c8c")
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
.DistanceFromScale(distance => distance.X(25).Y(0)).Add();
tic.Type(TickType.MinorInterval).Color("#8c8c8c").Width(1)
.Height(6).DistanceFromScale(distance => distance.X(25).Y(0)).Add();
})
//Adding marker pointer collection
.MarkerPointers(mp =>
{
mp.Width(3).Length(30).MarkerBackgroundColor("#FE5C09")
.Type(MarkerType.Star).MarkerDistanceFromScale(20)
.Placement(PointerPlacement.Near).Value(55).Add();
})
//Adding range collection
.Ranges(range=>{
range.StartValue(-20).EndValue(60).StartWidth(0)
.EndWidth(20).RangeBackgroundColor("#FEBE48")
.Placement(RangePlacement.Near).DistanceFromScale(20).Add();
}).Add();
}))
```

Execute the above code to render the following output.



Range Customization

Appearance

The major attributes for ranges are **startValue** and **endValue**. The startValue defines the start position of the range and endValue defines the end position of the range. The startWidth and endWidth are used to specify the range width at the starting and ending position of the ranges.

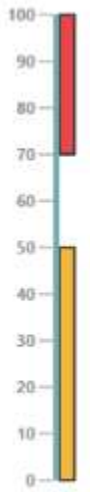
JS

```
@(Html.EJ().LinearGauge("LinearGauge1").Width(500)
.LabelColor("#8c8c8c")
//Adding scale collection
.Scales(scale => {
scale.Width(4).BackgroundColor("#10ADF5").ShowMarkerPointers(false)
.Border(border => border.Color("transparent").Width(0))
.ShowBarPointers(false).Length(310).ShowRanges(true)
//Adding label collection
.Labels(label => {
label.Font(font => font.Size("11px").FontStyle("Bold")
.FontFamily("Segoe UI")).Add(); })
//Adding ticks collection
.Ticks(tic =>
{
tic.Type(TickType.MajorInterval).Width(1).Color("#8c8c8c").Add();
})
//Adding range collection
.Ranges(range=>{
range.StartValue(0).EndValue(50).StartWidth(8)
.EndWidth(8).RangeBackgroundColor("#F6B53F").DistanceFromScale(5).Add();
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
range.StartValue(70).EndValue(100).StartWidth(8)
.EndWidth(8).RangeBackgroundColor("#E94649").DistanceFromScale(5).Add();
}).Add();
}))
```

Execute the above code to render the following output.



Colors and Border

- You can customize the ranges to improve the appearance of the **Gauge**. The range border is modified with the object called **border**. It has two border property such as color and width which are used to customize the border color of the ranges and border width of the ranges.
- You can set the background color to improve the look and feel of the **Linear Gauge**. For customizing the background color of the ranges, backgroundColor is used.You can add the gradient effects to the ranges by using gradient object.

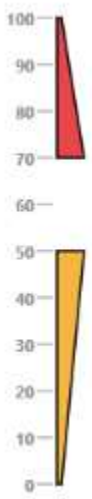
JS

```
@(Html.EJ().LinearGauge("LinearGauge1").Width(500)
.LabelColor("#8c8c8c")
//Adding scale collection
.Scales(scale => {
scale.Width(4).BackgroundColor("transparent").ShowMarkerPointers(false)
.Border(border => border.Color("transparent").Width(0))
.ShowBarPointers(false).Length(310).ShowRanges(true)
//Adding label collection
.Labels(label => {
label.Font(font => font.Size("11px").FontStyle("Bold")
.FontFamily("Segoe UI")).Add(); })
//Adding ticks collection
.Ticks(tic =>
{
tic.Type(TickType.MajorInterval).Width(1).Color("#8c8c8c").Add();
})
//Adding range collection
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
.Ranges(range=>{
range.StartValue(0).EndValue(50).StartWidth(18).Border(border =>
border.Color("Black").Width(2))
.EndWidth(3).RangeBackgroundColor("#F6B53F").DistanceFromScale(10).Add();
range.StartValue(70).EndValue(100).StartWidth(18).Border(border =>
border.Color("Black").Width(2))
.EndWidth(3).RangeBackgroundColor("#E94649").DistanceFromScale(10).Add();
}).Add();
}))
```

Execute the above code to render the following output.



Positioning the ranges

- You can position ranges using two properties such as **distanceFromScale** and **placement**. The distanceFromScale property defines the distance between the scale and range.
- Placement property is used to locate the pointer with respect to scale either inside the scale or outside the scale or along the scale. It is an enumerable data type.

JS

```
@(Html.EJ().LinearGauge("LinearGauge1").Width(500)
.LabelColor("#8c8c8c")
//Adding scale collection
.Scales(scale => {
scale.Width(4).BackgroundColor("transparent").ShowMarkerPointers(false)
.Border(border => border.Color("transparent").Width(0))
.ShowBarPointers(false).Length(310).ShowRanges(true)
//Adding label collection
.Labels(label => {
label.Font(font => font.Size("11px").FontStyle("Bold")
.FontFamily("Segoe UI")).Add(); })
//Adding Ticks collection
.Ticks(tic =>
{
tic.Type(TickType.MajorInterval).Width(1).Color("#8c8c8c").Add();
```

```
})
//Adding range collection
.Ranges(range=>{
range.StartValue(0).EndValue(50).StartWidth(18).Border(border=>
border.Color("Black").Width(2))
.EndWidth(3).RangeBackgroundColor("#F6B53F").DistanceFromScale(10)
.Placement(RangePlacement.Near).DistanceFromScale(-30).Add();
range.StartValue(70).EndValue(100).StartWidth(18).Border(border=>
border.Color("Black").Width(2))
.EndWidth(3).RangeBackgroundColor("#E94649").DistanceFromScale(10)
.Placement(RangePlacement.Near).DistanceFromScale(-30).Add();
}).Add();
}))
```

Execute the above code to render the following output.

Multiple Ranges

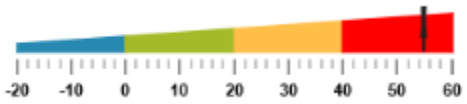
You can set multiple ranges by adding an array of range objects. Refer the following code example for multiple range functionality.

JS

```
@(Html.EJ().LinearGauge("LinearGauge1").EnableAnimation(false)
.Height(150).Width(600).Orientation(Orientation.Horizontal)
.LabelColor("Black").IsResponsive(true)
//Adding scale collection
.Scales(scale => {
scale.Width(0).BackgroundColor("transparent").Border(border=>
border.Color("transparent").Width(0)).ShowMarkerPointers(true)
.ShowBarPointers(false).ShowCustomLabels(true).Direction(Directions.Clockwis
e)
.ShowRanges(true).Minimum(-20).Maximum(60)
//Adding label collection
.Labels(label => { label.DistanceFromScale(dc => dc.X(0).Y(50)).Add(); })
//Adding ticks collection
.Ticks(tic =>
{
tic.Type(TickType.MajorInterval).Width(2).Color("#8c8c8c")
```

```
.DistanceFromScale(distance => distance.X(-1).Y(20)).Add();
tic.Type(TickType.MinorInterval).Color("#8c8c8c").Width(1)
.Height(6).DistanceFromScale(distance => distance.X(-1).Y(20)).Add();
})
//Adding marker pointer collection
.MarkerPointers(mp =>
{
mp.Width(3).Length(30).MarkerBackgroundColor("#FE5C09")
.Type(MarkerType.Star).MarkerDistanceFromScale(20)
.Placement(PointerPlacement.Near).Value(55).Add();
})
//Adding range collection
.Ranges(range=>{
range.StartValue(-20).EndValue(0).StartWidth(5)
.EndWidth(10).RangeBackgroundColor("#2788B1")
.Border(border => border.Color("#2788B1"))
.Placement(RangePlacement.Near).DistanceFromScale(20).Add();
range.StartValue(0).EndValue(20).StartWidth(10)
.EndWidth(15).RangeBackgroundColor("#A5BA28")
.Border(border => border.Color("#A5BA28"))
.Placement(RangePlacement.Near).DistanceFromScale(20).Add();
range.StartValue(20).EndValue(40).StartWidth(15)
.EndWidth(20).RangeBackgroundColor("#FEBE48")
.Border(border => border.Color("#FEBE48"))
.Placement(RangePlacement.Near).DistanceFromScale(20).Add();
range.StartValue(40).EndValue(60).StartWidth(20)
.EndWidth(25).RangeBackgroundColor("Red")
.Border(border => border.Color("Red"))
.Placement(RangePlacement.Near).DistanceFromScale(20).Add();
}).Add();
}))
```

Execute the above code to render the following output.



Custom labels

Custom labels are the text that can paste in any location of the **Linear Gauge**. It is used to define the purpose of the gauge.

Adding Custom label collection

Custom labels collection can be directly added to the scale object. Refer the following code to add custom labels collection in a **Linear Gauge** control.

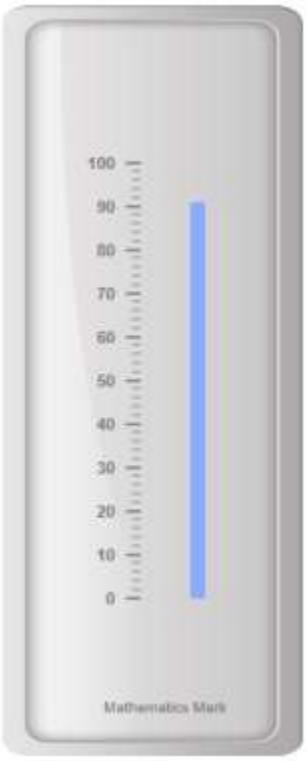
JS

```
@(Html.EJ().LinearGauge("LinearGauge1").EnableAnimation(false).LabelColor("G
rey")
//Adding frame object
.Frame(fr=>fr.InnerWidth(8).OuterWidth(10)
.BackgroundImageUrl("../Content/images/gauge/Gauge_linear_light.png"))
//Adding scale collection
.Scales(scale => {
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
scale.Width(0).Border(border=>border.Color("transparent").Width(0)).ShowMark
erPointers(false)
.ShowBarPointers(true).ShowCustomLabels(true)
.ShowBarPointers(true)
//Adding bar pointer collection
.BarPointers(bar =>
{
bar.Width(10).BarPointerBackgroundColor("#8BABFF")
.BarPointerValue(91).BarPointerDistanceFromScale(30).Add();
})
//Adding marker pointer collection
.MarkerPointers(mp => { mp.Width(10).Length(10).Value(60).Add(); })
//Adding label collection
.Labels(label => { label.DistanceFromScale(dc => dc.X(-25).Y(0)).Add(); })
//Adding ticks collection
.Ticks(tic =>
{
tic.Type(TickType.MajorInterval).Width(2).Color("#8c8c8c")
.DistanceFromScale(distance => distance.X(-7).Y(0)).Add();
tic.Type(TickType.MinorInterval).Color("#8c8c8c").Width(1)
.Height(6).DistanceFromScale(distance => distance.X(-7).Y(0)).Add();
})
//Adding custom label collection
.CustomLabels(cl => { cl.Value("Mathematics Mark").Position(position =>
position.X(55).Y(97)).Add(); }).Add();
}))
```

Execute the above code to render the following output.



Copyright © 2001 - 2020 Syncfusion Inc.

Basic Customization

Appearance

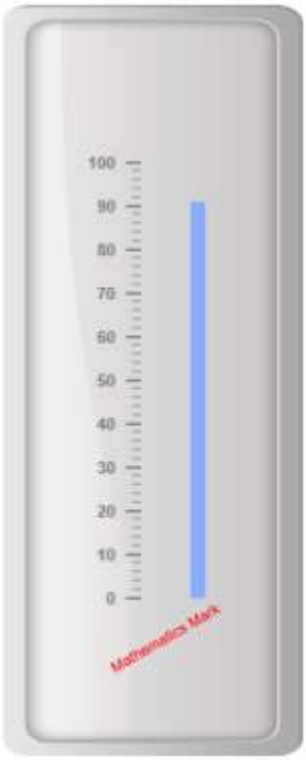
- You can customize custom labels using the properties like textAngle, color and font. The API **textAngle** is used to display the custom labels in the specified angles and **color** attribute is used to display the custom labels in specified color. You can use value attribute to set the text value in the custom labels.
- To display the custom labels, set showCustomLabels as 'true'. Font option is also available on the custom labels. The basic three properties of fonts such as size, family and style can be achieved by **size**, **fontStyle** and **fontFamily**. You can adjust the opacity of the label with the property opacity and the value of opacity lies between 0 and 1.

JS

```
@(Html.EJ().LinearGauge("LinearGauge1").EnableAnimation(false)
.Height(500).Width(200).LabelColor("Grey")
//Adding frame object
.Frame(fr=>fr.InnerWidth(8).OuterWidth(10)
.BackgroundImageUrl("../Content/images/gauge/Gauge_linear_light.png"))
//Adding scale collection
.Scales(scale => {
scale.Width(0).Border(border=>border.Color("transparent").Width(0)).ShowMark
erPointers(false)
.ShowBarPointers(true).ShowCustomLabels(true)
.ShowBarPointers(true)
//Adding bar pointer collection
.BarPointers(bar =>
{
bar.Width(10).BarPointerBackgroundColor("#8BABFF")
.BarPointerValue(91).BarPointerDistanceFromScale(30).Add();
})
//Adding marker pointer  collection
.MarkerPointers(mp => { mp.Width(10).Length(10).Value(60).Add(); })
//Adding label collection
.Labels(label => { label.DistanceFromScale(dc => dc.X(-25).Y(0)).Add(); })
//Adding ticks collection
.Ticks(tic =>
{
tic.Type(TickType.MajorInterval).Width(2).Color("#8c8c8c")
.DistanceFromScale(distance => distance.X(-7).Y(0)).Add();
tic.Type(TickType.MinorInterval).Color("#8c8c8c").Width(1)
.Height(6).DistanceFromScale(distance => distance.X(-7).Y(0)).Add();
})
//Adding custom label collection
.CustomLabels(cl => {
cl.Value("Mathematics Mark")
.TextAngle(30)
.CustomLabelOpacity(0.5)
.Color("Red")
.Position(position => position.X(55).Y(87)).Add();
}).Add();
}))
```

Copyright © 2001 - 2020 Syncfusion Inc.

Execute the above code to render the following output.



Locating the Custom Labels

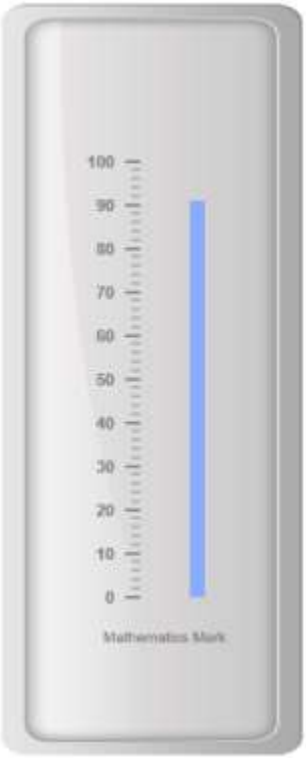
To set the location of the custom label in **Linear Gauge**, position property is used. You can position the custom labels in horizontal and vertical axis using X and Y axis respectively.

JS

```
@(Html.EJ().LinearGauge("LinearGauge1").EnableAnimation(false)
.Height(500).Width(200).LabelColor("Grey")
//Adding frame object
.Frame(fr=>fr.InnerWidth(8).OuterWidth(10)
.BackgroundImageUrl("../Content/images/gauge/Gauge_linear_light.png"))
//Adding scale collection
.Scales(scale => {
scale.Width(0).Border(border=>border.Color("transparent").Width(0)).ShowMark
erPointers(false)
.ShowBarPointers(true).ShowCustomLabels(true)
.ShowBarPointers(true)
//Adding bar pointer collection
.BarPointers(bar =>
{
bar.Width(10).BarPointerBackgroundColor("#8BABFF")
.BarPointerValue(91).BarPointerDistanceFromScale(30).Add();
})
//Adding marker pointer collection
.MarkerPointers(mp => { mp.Width(10).Length(10).Value(60).Add(); })
//Adding label collection
.Labels(label => { label.DistanceFromScale(dc => dc.X(-25).Y(0)).Add(); })
//Adding ticks collection
.Ticks(tic =>
```

```
{
tic.Type(TickType.MajorInterval).Width(2).Color("#8c8c8c")
.DistanceFromScale(distance => distance.X(-7).Y(0)).Add();
tic.Type(TickType.MinorInterval).Color("#8c8c8c").Width(1)
.Height(6).DistanceFromScale(distance => distance.X(-7).Y(0)).Add();
})
//Adding custom label collection
.CustomLabels(cl => {
cl.Value("Mathematics Mark")
.Position(position => position.X(55).Y(87)).Add();
}).Add();
}))
```

Execute the above code to render the following output.



Multiple Custom Labels

You can set multiple custom labels in a single **Linear Gauge** by adding an array of custom label objects. Refer the following code example for multiple custom label functionality.

JS

```
@(Html.EJ().LinearGauge("LinearGauge1").EnableAnimation(false)
.Height(500).Width(200).LabelColor("Grey")
//Adding frame object
.Frame(fr=>fr.InnerWidth(8).OuterWidth(10)
.BackgroundImageUrl("../Content/images/gauge/Gauge_linear_light.png"))
//Adding scale collection
.Scales(scale => {
scale.Width(0).Border(border=>border.Color("transparent").Width(0)).ShowMark
erPointers(false)
```

```
.ShowBarPointers(true).ShowCustomLabels(true)
.ShowBarPointers(true)
//Adding bar pointers
.BarPointers(bar =>
{
bar.Width(10).BarPointerBackgroundColor("#8BABFF")
.BarPointerValue(91).BarPointerDistanceFromScale(30).Add();
})
//Adding marker pointers
.MarkerPointers(mp => { mp.Width(10).Length(10).Value(60).Add(); })
//Adding label collection
.Labels(label => { label.DistanceFromScale(dc => dc.X(-25).Y(0)).Add(); })
//Adding ticks collection
.Ticks(tic =>
{
tic.Type(TickType.MajorInterval).Width(2).Color("#8c8c8c")
.DistanceFromScale(distance => distance.X(-7).Y(0)).Add();
tic.Type(TickType.MinorInterval).Color("#8c8c8c").Width(1)
.Height(6).DistanceFromScale(distance => distance.X(-7).Y(0)).Add();
})
//Adding custom labels
.CustomLabels(cl => {
//Adding custom label1
cl.Value("Mathematics Mark")
.Position(position => position.X(55).Y(87)).Color("Red").Add();
//Adding custom label 2
cl.Value("Marks in %")
.Position(position =>
position.X(15).Y(57)).Color("Red").TextAngle(90).Add();
}).Add();
}))
```

Execute the above code to render the following output.

Copyright © 2001 - 2020 Syncfusion Inc.

Indicators

Indicators simply indicates the current status of the pointer. Indicators are in several formats such as in shape format, textual format and image format.

Setting Dimension

- You can enable indicators by setting showIndicators to 'true' in scale collection. The height and width property for the indicators are used to specify the area allocated to the indicator for the width and height respectively.
- You can use the position collection to position the indicators along **X** and **Y** axis. X specifies horizontal position in indicators whereas Y specifies vertical position in indicators. Indicators are of several types such as, dimensions like circle, rectangle, rounded rectangle, text and image. By using the type property it can be applied. For image type **imageUrl** property is used.

JS

```
@(Html.EJ().LinearGauge("LinearGauge1").EnableAnimation(false).Value(78)
//Adding frame object
.Frame(frm=>frm.BackgroundImageUrl("../images/gauge/Gauge_linear_light.png")
)
//Adding scale collection
.Scales(s =>
{
s.Width(0).Maximum(300).MinorIntervalValue(5)
.BackgroundColor("transparent").MajorIntervalValue(30)
.Border(border=>border.Color("transparent").Width(0))
.ShowIndicators(true).ShowBarPointers(false)
.Length(310)
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
.Position(position => { position.X(51).Y(50); })
//Adding marker pointer collection
.MarkerPointers(mp =>
{ mp.Length(10).MarkerDistanceFromScale(12)
.Width(10).MarkerBackgroundColor("Grey").Add();
})
//Adding tick collection
.Ticks(tic =>
{
tic.Type(TickType.MajorInterval).Width(2).Color("#8c8c8c")
.DistanceFromScale(distance => distance.X(7).Y(0)).Add();
tic.Type(TickType.MinorInterval).Color("#8c8c8c").Width(1)
.Height(6).DistanceFromScale(distance => distance.X(7).Y(0)).Add();
})
//Adding indicator collection
.Indicators(indicator =>
{
indicator.Type(IndicatorType.Circle).Height(10)
.Width(10).Position(position => position.X(55).Y(100)).Add();
})
.Add();
}))
```

Execute the above code to render the following output.

State Ranges

State ranges are used to specify the indicator behavior in the certain region. `startValue` and `endValue` are used to set the range bound for the pointer. Whenever the pointer crosses the specified region, the indicator attributes are applied for the ranges.

JS

```
@(Html.EJ().LinearGauge("LinearGauge1").EnableAnimation(false).Value(78)
//Adding frame object
```

```
.Frame(frm=>frm.BackgroundImageUrl("../images/gauge/Gauge_linear_light.png")
)
//Adding scale collection
.Scales(s =>
{
s.Width(0).Maximum(300).MinorIntervalValue(5)
.BackgroundColor("transparent").MajorIntervalValue(30)
.Border(border=>border.Color("transparent").Width(0))
.ShowIndicators(true).ShowBarPointers(false)
.Length(310).ShowRanges(true)
.Position(position => { position.X(51).Y(50); })
//Adding marker pointer collection
.MarkerPointers(mp =>
{ mp.Length(10).MarkerDistanceFromScale(12)
.Width(10).MarkerBackgroundColor("Grey").Add();
})
//Adding ticks collection
.Ticks(tic =>
{
tic.Type(TickType.MajorInterval).Width(2).Color("#8c8c8c")
.DistanceFromScale(distance => distance.X(7).Y(0)).Add();
tic.Type(TickType.MinorInterval).Color("#8c8c8c").Width(1)
.Height(6).DistanceFromScale(distance => distance.X(7).Y(0)).Add();
})
//Adding indicator collection
.Indicators(indicator =>
{
indicator.Height(10).Width(10).Type(IndicatorType.Circle)
.Position(position => position.X(55).Y(100))
//Adding state range collection
.StateRanges(sr=>{
sr.StateRangeBackgroundColor("#02A258").StateRangeStartValue(0)
.StateRangeEndValue(200).StateRangeBorderColor("#02A258")
.Add();
sr.StateRangeBackgroundColor("Grey").StateRangeStartValue(200)
.StateRangeEndValue(300).StateRangeBorderColor("Grey")
.Add();
}).Add();
})
//Adding range collection
.Ranges(range =>
{
range.StartWidth(5).EndWidth(5).StartValue(0)
.EndValue(200).RangeBackgroundColor("#94C361")
.Border(border => border.Width(1).Color("#94C361")).Add();
range.StartWidth(5).EndWidth(5).StartValue(200)
.EndValue(250).RangeBackgroundColor("#F9CF67")
.Border(border => border.Width(1).Color("#F9CF67")).Add();
range.StartWidth(5).EndWidth(5).StartValue(250)
.EndValue(300).RangeBackgroundColor("#F89B83")
.Border(border => border.Width(1).Color("#F89B83")).Add();
})
.Add();
}))
```

Execute the above code to render the following output.

Copyright © 2001 - 2020 Syncfusion Inc.

Color and Appearance

The backgroundColor and borderColor sets the appearance behavior for the indicators. You can apply this only if it lies within the state ranges. Otherwise default behavior will be applied.

JS

```
@(Html.EJ().LinearGauge("LinearGauge1").EnableAnimation(false).Value(78)
//Adding frame object
.Frame(frm=>frm.BackgroundImageUrl("../images/gauge/Gauge_linear_light.png")
)
//Adding scale object
.Scales(s =>
{
s.Width(0).Maximum(300).MinorIntervalValue(5)
.BackgroundColor("transparent").MajorIntervalValue(30)
.Border(border=>border.Color("transparent").Width(0))
.ShowIndicators(true).ShowBarPointers(false)
.Length(310)
.Position(position => { position.X(51).Y(50); })
//Adding marker pointer collection
.MarkerPointers(mp =>
{ mp.Length(10).MarkerDistanceFromScale(12)
.Width(10).MarkerBackgroundColor("Grey").Add();
})
//Adding ticks collection
.Ticks(tic =>
{
tic.Type(TickType.MajorInterval).Width(2).Color("#8c8c8c")
.DistanceFromScale(distance => distance.X(7).Y(0)).Add();
tic.Type(TickType.MinorInterval).Color("#8c8c8c").Width(1)
.Height(6).DistanceFromScale(distance => distance.X(7).Y(0)).Add();
})
//Adding indicator collection
.Indicators(indicator =>
{
```

```
indicator.Type(IndicatorType.Circle).Height(10)
.Width(10).Position(position => position.X(55).Y(100))
.StateRanges(sr =>
{
sr.StateRangeEndValue(100)
.StateRangeStartValue(0)
.StateRangeBackgroundColor("#91B64E")
.StateRangeBorderColor("#91B64E").Add();
}).Add();
})
.Add();
}))
```

Execute the above code to render the following output.

Font options

The basic font options available for the textual type indicators in the **Linear Gauge** such as **Size**, **font style** and **font family** are achieved by the properties size, fontStyle and fontFamily.

JS

```
@(Html.EJ().LinearGauge("LinearGauge1").EnableAnimation(false).Value(78)
//Adding frame object
.Frame(frm=>frm.BackgroundImageUrl("../images/gauge/Gauge_linear_light.png")
)
//Adding scale collection
.Scales(s =>
{
s.Width(0).Maximum(300).MinorIntervalValue(5)
.BackgroundColor("transparent").MajorIntervalValue(30)
.Border(border=>border.Color("transparent").Width(0))
.ShowIndicators(true).ShowBarPointers(false)
.Length(310).ShowRanges(true)
.Position(position => { position.X(51).Y(50); })
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
//Adding marker pointer collection
.MarkerPointers(mp =>
{ mp.Length(10).MarkerDistanceFromScale(12)
.Width(10).MarkerBackgroundColor("Grey").Add();
})
//Adding tick collection
.Ticks(tic =>
{
tic.Type(TickType.MajorInterval).Width(2).Color("#8c8c8c")
.DistanceFromScale(distance => distance.X(7).Y(0)).Add();
tic.Type(TickType.MinorInterval).Color("#8c8c8c").Width(1)
.Height(6).DistanceFromScale(distance => distance.X(7).Y(0)).Add();
})
//Adding indicator collection
.Indicators(indicator =>
{
indicator.IndicatorFont(font=>
font.Size("12px").FontStyle("Bold").FontFamily("Arial"))
.Type(IndicatorType.text)
.IndicatorTextLocation(position => position.X(55).Y(100))
//Adding state range collection
.StateRanges(sr=>{
sr.StateRangeStartValue(0).StateRangeEndValue(200)
.StateRangeText("Safe").StateRangeTextColor("#94C361")
.Add();
sr.StateRangeStartValue(200).StateRangeEndValue(250)
.StateRangeText("Caution").StateRangeTextColor("#F9CF67")
.Add();
sr.StateRangeStartValue(250).StateRangeEndValue(300)
.StateRangeText("Danger").StateRangeTextColor("#F89B83")
.Add();
}).Add();
})
//Adding range collection
.Ranges(range =>
{
range.StartWidth(5).EndWidth(5).StartValue(0)
.EndValue(200).RangeBackgroundColor("#94C361")
.Border(border => border.Width(1).Color("#94C361")).Add();
range.StartWidth(5).EndWidth(5).StartValue(200)
.EndValue(250).RangeBackgroundColor("#F9CF67")
.Border(border => border.Width(1).Color("#F9CF67")).Add();
range.StartWidth(5).EndWidth(5).StartValue(250)
.EndValue(300).RangeBackgroundColor("#F89B83")
.Border(border => border.Width(1).Color("#F89B83")).Add();
})
.Add();
}))
```

Execute the above code to render the following output.

Copyright © 2001 - 2020 Syncfusion Inc.

Multiple Indicator

You can set multiple indicators in a single **Linear Gauge** by adding an array of indicator objects. Refer the following code example for multiple indicator functionality.

JS

```
@(Html.EJ().LinearGauge("LinearGauge1").EnableAnimation(false).Value(78)
//Adding frame object
.Frame(frm=>frm.BackgroundImageUrl("../images/gauge/Gauge_linear_light.png")
)
//Adding scale collection
.Scales(s =>
{
s.Width(0).Maximum(300).MinorIntervalValue(5)
.BackgroundColor("transparent").MajorIntervalValue(30)
.Border(border=>border.Color("transparent").Width(0))
.ShowIndicators(true).ShowBarPointers(false)
.Length(310).ShowRanges(true)
.Position(position => { position.X(51).Y(50); })
//Adding marker pointer collection
.MarkerPointers(mp =>
{ mp.Length(10).MarkerDistanceFromScale(12)
.Width(10).MarkerBackgroundColor("Grey").Add();
})
//Adding ticks collection
.Ticks(tic =>
{
tic.Type(TickType.MajorInterval).Width(2).Color("#8c8c8c")
.DistanceFromScale(distance =>distance.X(7).Y(0)).Add();
tic.Type(TickType.MinorInterval).Color("#8c8c8c").Width(1)
.Height(6).DistanceFromScale(distance => distance.X(7).Y(0)).Add();
})
//Adding ranges collection
.Ranges(range =>
```

```
{
range.StartWidth(5).EndWidth(5).StartValue(0)
.EndValue(200).RangeBackgroundColor("#94C361")
.Border(border => border.Width(1).Color("#94C361")).Add();
range.StartWidth(5).EndWidth(5).StartValue(200)
.EndValue(250).RangeBackgroundColor("#F9CF67")
.Border(border => border.Width(1).Color("#F9CF67")).Add();
range.StartWidth(5).EndWidth(5).StartValue(250)
.EndValue(300).RangeBackgroundColor("#F89B83")
.Border(border => border.Width(1).Color("#F89B83")).Add();
})
//Adding indicator collection
.Indicators(indicator =>
{
//Adding indicator 1
indicator.Height(10).Width(10)
.Type(IndicatorType.Circle)
.Position(position => position.X(35).Y(100))
.StateRanges(sr=>{
sr.StateRangeStartValue(0).StateRangeEndValue(200)
.StateRangeBackgroundColor("#02A258").StateRangeBorderColor("#02A258")
.Add();
sr.StateRangeStartValue(200).StateRangeEndValue(300)
.StateRangeBackgroundColor("Grey").StateRangeBorderColor("Grey")
.Add();
}).Add();
//Adding indicator 2
indicator.Height(10).Width(10)
.Type(IndicatorType.Circle)
.Position(position => position.X(75).Y(100))
.StateRanges(sr =>
{
sr.StateRangeStartValue(0).StateRangeEndValue(200)
.StateRangeBackgroundColor("Grey").StateRangeBorderColor("Grey")
.Add();
sr.StateRangeStartValue(200).StateRangeEndValue(300)
.StateRangeBackgroundColor("#02A258").StateRangeBorderColor("#02A258")
.Add();
}).Add();
})
.Add();
}))
```

Execute the above code to render the following output.

Copyright © 2001 - 2020 Syncfusion Inc.

Exporting

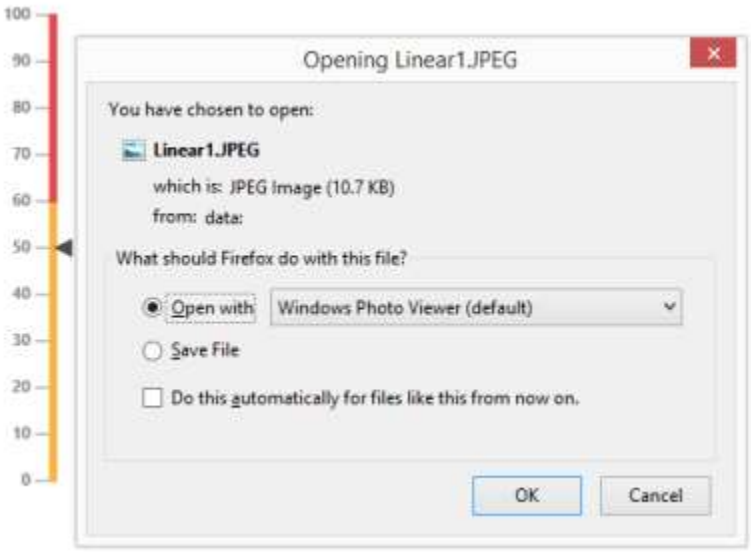
Linear Gauge has an exporting feature that converts **Gauge** control into image format and then export in client side. The method API `exportImage` is used to export the **LinearGauge**. It has two arguments such as **file name** and **file format** to specify the file name and file formats. For exporting refer the following code example.

JS

```
@(Html.EJ().LinearGauge("LinearGauge1").LabelColor("#8c8c8c").Width(500)
//Adding scale collection
.Scales(s =>
{
s.Width(4)
.BackgroundColor("transparent")
.Border(border=>border.Color("transparent").Width(0))
.ShowRanges(true)
.Length(310)
.Position(position => { position.X(51).Y(50); })
//Adding marker pointer collection
.MarkerPointers(mp =>
{ mp.Value(50).Length(10).MarkerDistanceFromScale(8)
.Width(10).MarkerBackgroundColor("#4D4D4D")
.Border(border=>border.Color("4D4D4D")).Add();
})
//Adding label collection
.Labels(label => {
label.Font(font => {
font.Size("11px").FontFamily("SegoeUI").FontStyle("bold");
}).DistanceFromScale(distance=>distance.X(-13)).Add();
})
//Adding bar pointer collection
.BarPointers(bar => {
bar.BarPointerValue(50)
.Width(4).BarPointerDistanceFromScale(8)
.BarPointerBackgroundColor("#6FAAB0").Add();
```

```
})
//Adding ticks collection
.Ticks(tic => {
tic.Type(TickType.MajorInterval)
.Width(1).Color("#8c8c8c").Add();
})
//Adding ranges collection
.Ranges(range =>
{
range.EndValue(60).StartValue(0).RangeBackgroundColor("#F6B53F")
.Border(border=>border.Color("#F6B53F"))
.StartWidth(4).EndWidth(4).Add();
range.EndValue(100).StartValue(60).RangeBackgroundColor("#E94649")
.Border(border=>border.Color("#E94649"))
.StartWidth(4).EndWidth(4).Add();
})
.Add();
}))
<script type="text/javascript">
$(function () {
$("#btnExportImage").ejButton({ width: "100px", click: "buttonClickEvent",
});
});
function buttonClickEvent() {
var FileName = $("#txtFileName").val();
var FileFormat = $("#ddlFileType").val();
$("#CoreExportLinearGauge").ejLinearGauge("exportImage", FileName,
FileFormat);
}
</script>
```

Execute the above code to render the following output.



Copyright © 2001 - 2020 Syncfusion Inc.

MVVM

AngularJS

Linear Gauge contains AngularJS support. It is possible to add object as well as array object in the **Linear Gauge**. The two way binding support is given to the pointer **value**, **minimum** scale value and **maximum** scale value.

Rendering the Linear gauge

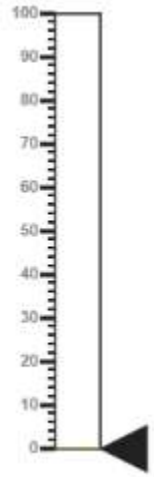
ej-LinearGauge is the control tag, where ej is tag prefix and **LinearGauge** is the control name.

Linear Gauge is rendered with the following code example.

ASPX-CS

```
<div ng-app="syncApp">
<div ng-controller="LinearGauge">
<ej-LinearGauge id="linearCore" e-readOnly="false" e-load="loadGaugeTheme"
e-enableAnimation="false" e-labelColor="#8c8c8c">
</ej-LinearGauge>
</div>
</div>
<script type="text/javascript">
<!—binding the value to the scope variables in application controller-->
angular.module('syncApp', ['ejangular'])
.controller('LinearGauge', function ($scope) {
$scope.value = 0;
});
</script>
```

Execute the above code to render the following output.



Adding Scale collection

Scale is an array object and the inner tag is used for it. You can extend the Object in the array collection such as, position with hyphen in the same tag.

Example: e-position-x and e-position-y.

ASPX-CS

Copyright © 2001 - 2020 Syncfusion Inc.

```
<!--To Render the Linear gauge-->
<ej-LinearGauge id="linearCore">
<!--Adding Scale collection to the Linear gauge-->
<e-scales>
<e-scale e-width="4" e-border-color="transparent" e-border-width="0"
e-showBarPointers="false" e-showRanges="true" e-length="310"
e-position-x="52" e-position-y="50" e-maximum="120">
</e-scale>
</e-scales>
</ej-LinearGauge>
```

Execute the above code to render the following output.

Adding Marker Pointer collection

Marker Pointer is an array object and the inner tag is used for it. You can extend the Object in the array collection such as, border with hyphen in the same tag.

Example: e-border-color.

ASPX-CS

```
<!--To Render the Linear gauge-->
<ej-LinearGauge id="linearCore">
<!--Adding Scale collection to the Linear gauge-->
<e-scales>
<e-scale>
<!--Adding marker pointer collection to the Scale collection-->
<e-markerPointers>
<e-markerPointer e-length="10" e-width="10" e-value="50"
e-backgrouundColor="#4D4D4D"
e-border-color="#4D4D4D">
</e-markerPointer>
</e-markerPointers>
</e-scale>
</e-scales>
</ej-LinearGauge>
```

Execute the above code to render the following output.

Copyright © 2001 - 2020 Syncfusion Inc.

Adding label collection

Label is also an array object and the inner tag is used for it. You can extend the Object in the array collection such as, font with hyphen in the same tag.

Example: e-font-size.

ASPX-CS

```
<!--To Render the Linear gauge-->
<ej-LinearGauge id="linearCore">
<!--Adding Scale collection to the Linear gauge-->
<e-scales>
<e-scale>
<!--Adding marker pointer collection to the Scale collection-->
<e-markerPointers>…</e-markerPointers>
<!--Adding label collection to the Scale collection-->
<e-labels>
<e-label  e-distanceFromScale-x="-10" e-distanceFromScale-y="0"
e-font-fontFamily="Segoe UI" e-font-fontStyle="bold"
e-font-size="11px">
</e-label>
</e-labels>
</e-scale>
</e-scales>
</ej-LinearGauge>
```

Execute the above code to render the following output.

Copyright © 2001 - 2020 Syncfusion Inc.

Adding Tick collection

Tick is an array object and the inner tag is used for it.

ASPX-CS

```
<!--To Render the Linear gauge-->
<ej-LinearGauge id="linearCore">
<!--Adding Scale collection to the Linear gauge-->
<e-scales>
<e-scale>
<!--Adding marker pointer collection to the Scale collection-->
<e-markerPointers>…</e-markerPointers>
<!--Adding label collection to the Scale collection-->
<e-labels>…</e-labels>
<!--Adding tick collection to the Scale collection-->
<e-ticks>
<e-tick e-type="majorinterval" e-width="2" e-color="#8c8c8c">
</e-tick>
</e-ticks>
</e-scale>
</e-scales>
</ej-LinearGauge>
```

Execute the above code to render the following output.

Copyright © 2001 - 2020 Syncfusion Inc.

Adding Range collection

Range is an array object and the inner tag is used for it. You can extend the Object in the array collection such as, border with hyphen in the same tag.

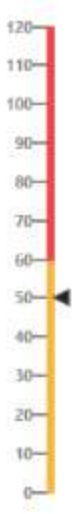
Example: e-border-color.

ASPX-CS

```
<!--To Render the Linear gauge-->
<ej-LinearGauge id="linearCore">
<!--Adding Scale collection to the Linear gauge-->
<e-scales>
<e-scale>
<!--Adding marker pointer collection to the Scale collection-->
<e-markerPointers>…</e-markerPointers>
<!--Adding label collection to the Scale collection-->
<e-labels>…</e-labels>
<!--Adding tick collection to the Scale collection-->
<e-ticks>…</e-ticks>
<!--Adding range collection to the Scale collection-->
<e-ranges>
<e-range e-startValue="0" e-endValue="60" e-startWidth="4"
e-endWidth="4" e-backgroundColor="#F6B53F"
e-border-color="#F6B53F">
</e-range>
<e-range e-startValue="60" e-endValue="120" e-startWidth="4"
e-endWidth="4" e-backgroundColor="#E94649"
e-border-color="#E94649">
</e-range>
</e-ranges>
</e-scale>
</e-scales>
</ej-LinearGauge>
```

Finally while running the above codes, the resultant gauge appears as follows.

Copyright © 2001 - 2020 Syncfusion Inc.



Two Way Binding

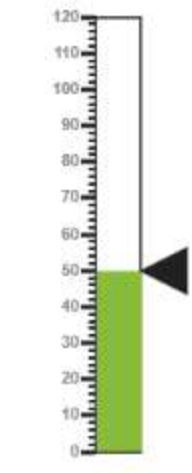
Linear Gauge support the two way binding for the property **value**, **minimum** and **maximum** as mentioned earlier. Following code example explains how to achieve the two way binding to the **Linear Gauge**.

ASPX-CS

```
<div ng-app="syncApp">
<div ng-controller="LinearGauge">
<div id="linearframe">
<ej-LinearGauge id="linearCore" e-value="nvalue" e-readOnly="false" e-
load="loadGaugeTheme" e-enableAnimation="false" e-labelColor="#8c8c8c">
</ej-LinearGauge>
</div>
<input type="text" id="txtMax" e-value="nvalue" ej-numerictextbox ng-
model="nvalue"  e-decimalplaces="2" e-showspinbutton="false"
Style="width:110px"/>
</div>
</div>
<script type="text/javascript">
<!—binding the value to the scope variables in application controller-->
angular.module('syncApp', ['ejangular'])
.controller('LinearGauge', function ($scope) {
$scope.value = 50;
});
</script>
```

Execute the above code to render the following output.

Copyright © 2001 - 2020 Syncfusion Inc.



50

KnockoutJS

- KnockoutJS support allows you to bind the HTML elements against any of the available data models.Two types of KnockoutJS binding is supported as of AngularJS,
- one-way binding
- two-way binding
- **One way binding** refers to the process of applying observable values to all the available properties of the **Linear Gauge** control, but the changes made in it does not reflect and trigger in turn to the observable collection. This kind of binding applies to all the properties of the Linear Gauge control.
- **Two-way binding** supports both the processes – it applies the observable values to the **Linear Gauge** properties as well as the changes made in it is also reflected back and triggered within the observable collections. Only few of the schedule properties support two-way binding and they are as follows
- value
- maximum
- minimum

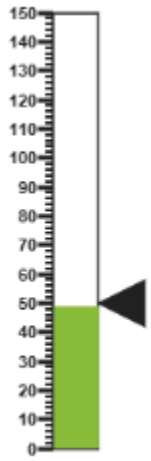
ASPX-CS

```
<div id="LinearGauge1"
data-bind="ejLinearGauge: {
value: sampleValue,
minimum: minimumValue,
maximum: maximumValue
}">
</div>
<script type="text/javascript">
$(function () {
window.viewModel = {
value: ko.observable(50),
minimum: ko.observable(0),
maximum: ko.observable(150)
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
};
$(function () {
ko.applyBindings(viewModel);
});
});
</script>
```

Execute the above code to render the following output.



Events

DrawBarPointers

Triggers while the bar pointer are being drawn on the gauge, you can use DrawBarPointers event.

ASPX-CS

```
@(Html.EJ().LinearGauge("container")
.DrawBarPointers("drawBarPointer")
)
function drawBarPointer(){
// Do Something
}
```

DrawCustomLabel

Triggers while the customLabel are being drawn on the gauge, you can use DrawCustomLabel event.

ASPX-CS

```
@(Html.EJ().LinearGauge("container")
.DrawCustomLabel("drawCustomLabel")
)
function drawCustomLabel(){
// Do Something
}
```

DrawIndicators

Triggers while the Indicator are being drawn on the gauge, you can use DrawIndicators event.

Copyright © 2001 - 2020 Syncfusion Inc.

ASPX-CS

```
@(Html.EJ().LinearGauge("container")
.DrawIndicators("drawIndicators")
)
function drawIndicators(){
// Do Something
}
```

DrawLabels

Triggers while the label are being drawn on the gauge, you can use DrawLabels event.

ASPX-CS

```
@(Html.EJ().LinearGauge("container")
.DrawLabels("drawLabels")
)
function drawLabels(){
// Do Something
}
```

DrawMarkerPointers

Triggers while the marker are being drawn on the gauge, you can use DrawMarkerPointers event.

ASPX-CS

```
@(Html.EJ().LinearGauge("container")
.DrawMarkerPointers("drawMarkerPointer")
)
function drawMarkerPointer(){
// Do Something
}
```

DrawRange

Triggers while the range are being drawn on the gauge, you can use DrawRange event.

ASPX-CS

```
@(Html.EJ().LinearGauge("container")
.DrawRange("drawRange")
)
function drawRange(){
// Do Something
}
```

DrawTicks

Triggers while the ticks are being drawn on the gauge, you can use DrawTicks event.

ASPX-CS

```
@(Html.EJ().LinearGauge("container")
.DrawTicks("drawTicks")
)
function drawTicks(){
// Do Something
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
}
```

Init

Triggers when the gauge is initialized, you can use Init event.

ASPX-CS

```
@(Html.EJ().LinearGauge("container")
.Init("init")
)
function init(){
// Do Something
}
```

Load

Triggers while the gauge start to Load, you can use Load event.

ASPX-CS

```
@(Html.EJ().LinearGauge("container")
.Load("load")
)
function load(){
// Do Something
}
```

MouseClick

Triggers when the left mouse button is clicked, you can use MouseClick event.

ASPX-CS

```
@(Html.EJ().LinearGauge("container")
.MouseClick("MouseClick")
)
function MouseClick(){
// Do Something
}
```

MouseClickMove

Triggers when clicking and dragging the mouse pointer over the gauge pointer, you can use MouseClickMove event.

ASPX-CS

```
@(Html.EJ().LinearGauge("container")
.MouseClickMove("MouseClickMove")
)
function MouseClickMove(){
// Do Something
}
```

MouseClickUp

Triggers when the mouse click is released, you can use MouseClickUp event.

Copyright © 2001 - 2020 Syncfusion Inc.

ASPX-CS

```
@(Html.EJ().LinearGauge("container")
.MouseClickUp("MouseClickUp")
)
function MouseClickUp(){
// Do Something
}
```

RenderComplete

Triggers while the rendering of the gauge completed, you can use RenderComplete event.

ASPX-CS

```
@(Html.EJ().LinearGauge("container")
.RenderComplete("RenderComplete")
)
function RenderComplete(){
// Do Something
}
```

DoubleClick

Triggers when the double click is released, you can use DoubleClick event.

ASPX-CS

```
@(Html.EJ().LinearGauge("container")
//double click event
.DoubleClick("onDoubleClick")
//...
)
function onDoubleClick(sender) {
// do something
}
```

RightClick

Triggers when the right click is released, you can use RightClick event.

ASPX-CS

```
@(Html.EJ().LinearGauge("container")
//right click event
.RightClick("onRightClick")
//...
)
function onRightClick(sender) {
// do something
}
```

Methods

destroy()

Destroy the linear gauge all events bound using this._on will be unbind automatically and bring the control to pre-init state.

Copyright © 2001 - 2020 Syncfusion Inc.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.destroy();
```

getBarDistanceFromScale()

To get bar distance from scale in number, you can use getBarDistanceFromScale method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.getBarDistanceFromScale();
```

getBarPointerValue()

To get Bar Pointer Value in number, you can use getBarPointerValuemethod.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.getBarPointerValue();
```

getBarWidth()

To get Bar Width in number, you can use getBarWidth method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.getBarWidth();
```

getCustomLabelAngle()

To get CustomLabel Angle in number, you can use getCustomLabelAngle method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.getCustomLabelAngle();
```

getCustomLabelValue()

To get CustomLabel Value in string, you can use getCustomLabelValue method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.getCustomLabelValue();
```

getLabelAngle()

To get Label Angle in number, you can use getLabelAngle method.

Copyright © 2001 - 2020 Syncfusion Inc.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.getLabelAngle();
```

getLabelPlacement()

To get LabelPlacement in number, you can use getLabelPlacement method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.getLabelPlacement();
```

getLabelStyle()

To get LabelStyle in number, you can use getLabelStyle method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.getLabelStyle();
```

getLabelXDistanceFromScale()

To get Label XDistance From Scale in number, you can use getLabelXDistanceFromScale method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.getLabelXDistanceFromScale();
```

getLabelYDistanceFromScale()

To get PointerValue in number, you can use getLabelXDistanceFromScale method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.getLabelYDistanceFromScale();
```

getMajorIntervalValue()

To get Major Interval Value in number, you can use getMajorIntervalValue method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.getMajorIntervalValue();
```

getMarkerStyle()

To get MarkerStyle in number, you can use getMarkerStyle method.

Copyright © 2001 - 2020 Syncfusion Inc.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.getMarkerStyle();
```

getMaximumValue()

To get Maximum Value in number, you can use getMaximumValue method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.getMaximumValue();
```

getMinimumValue()

To get PointerValue in number, you can use getMinimumValue method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.getMinimumValue();
```

getMinorIntervalValue()

To get Minor Interval Value in number, you can use getMinorIntervalValue method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.getMinorIntervalValue();
```

getPointerDistanceFromScale()

To get Pointer Distance From Scale in number, you can use getPointerDistanceFromScale method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.getPointerDistanceFromScale();
```

getPointerHeight()

To get PointerHeight in number, you can use getPointerHeight method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.getPointerHeight();
```

getPointerPlacement()

To get Pointer Placement in String, you can use getPointerPlacement method.

Copyright © 2001 - 2020 Syncfusion Inc.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.getPointerPlacement();
```

getPointerValue()

To get PointerValue in number, you can use getPointerValue method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.getPointerValue();
```

getPointerWidth()

To get PointerWidth in number, you can use getPointerWidth method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.getPointerWidth();
```

getRangeBorderWidth()

To get Range Border Width in number, you can use getRangeBorderWidth method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.getRangeBorderWidth();
```

getRangeDistanceFromScale()

To get Range Distance From Scale in number, you can use getRangeDistanceFromScale method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.getRangeDistanceFromScale();
```

getRangeEndValue()

To get Range End Value in number, you can use getRangeEndValue method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.getRangeEndValue();
```

getRangeEndWidth()

To get Range End Width in number, you can use getRangeEndWidth method.

Copyright © 2001 - 2020 Syncfusion Inc.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.getRangeEndWidth();
```

getRangePosition()

To get Range Position in number, you can use getRangePosition method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.getRangePosition();
```

getRangeStartValue()

To get Range Start Value in number, you can use getRangeStartValue method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.getRangeStartValue();
```

getRangeStartWidth()

To get Range Start Width in number, you can use getRangeStartWidth method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.getRangeStartWidth();
```

getScaleBarLength()

To get ScaleBarLength in number, you can use getScaleBarLength method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.getScaleBarLength();
```

getScaleBarSize()

To get Scale Bar Size in number, you can use getScaleBarSize method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.getScaleBarSize();
```

getScaleBorderWidth()

To get Scale Border Width in number, you can use getScaleBorderWidth method.

Copyright © 2001 - 2020 Syncfusion Inc.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.getScaleBorderWidth();
```

getScaleDirection()

To get Scale Direction in number, you can use getScaleDirection method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.getScaleDirection();
```

getScaleLocation()

To get Scale Location in object, you can use getScaleLocation method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.getScaleLocation();
```

getScaleStyle()

To get Scale Style in string, you can use getScaleStyle method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.getScaleStyle();
```

getTickAngle()

To get Tick Angle in number, you can use getTickAngle method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.getTickAngle();
```

getTickHeight()

To get Tick Height in number, you can use getTickHeight method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.getTickHeight();
```

getTickPlacement()

To get getTickPlacement in number, you can use getTickPlacement method.

Copyright © 2001 - 2020 Syncfusion Inc.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.getTickPlacement();
```

getTickStyle()

To get Tick Style in string, you can use getTickStyle method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.getTickStyle();
```

getTickWidth()

To get Tick Width in number, you can use getTickWidth method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.getBarDistanceFromScale();
```

getTickXDistanceFromScale()

To get get Tick XDistance From Scale in number, you can use getTickXDistanceFromScale method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.getTickWidth();
```

getTickYDistanceFromScale()

To get Tick YDistance From Scale in number, you can use getTickYDistanceFromScale method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.getTickYDistanceFromScale();
```

scales()

Specifies the scales, you can use scales method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.scales();
```

setBarDistanceFromScale()

To set setBarDistanceFromScale, you can use setBarDistanceFromScale method.

Copyright © 2001 - 2020 Syncfusion Inc.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.setBarDistanceFromScale();
```

setBarPointerValue()

To set setBarPointerValue, you can use setBarPointerValue method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.setBarPointerValue();
```

setBarWidth()

To set setBarWidth, you can use setBarWidth method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.setBarWidth();
```

setCustomLabelAngle()

To set setCustomLabelAngle, you can use setCustomLabelAngle method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.setCustomLabelAngle();
```

setCustomLabelValue()

To set setCustomLabelValue, you can use setCustomLabelValue method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.setCustomLabelValue();
```

setLabelAngle()

To set setLabelAngle, you can use setLabelAngle method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.setLabelAngle();
```

setLabelPlacement()

To set setLabelPlacement, you can use setLabelPlacement method.

Copyright © 2001 - 2020 Syncfusion Inc.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.setLabelPlacement();
```

setLabelStyle()

To set setLabelStyle, you can use setLabelStyle method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.setLabelStyle();
```

setLabelXDistanceFromScale()

To set setLabelXDistanceFromScale, you can use setLabelXDistanceFromScale method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.setLabelXDistanceFromScale();
```

setLabelYDistanceFromScale()

To set setLabelYDistanceFromScale, you can use setLabelYDistanceFromScale method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.setLabelYDistanceFromScale();
```

setMajorIntervalValue()

To set setMajorIntervalValue, you can use setMajorIntervalValue method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.setMajorIntervalValue();
```

setMarkerStyle()

To set setMarkerStyle, you can use setMarkerStyle method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.setMarkerStyle();
```

setMaximumValue()

To set setMaximumValue, you can use setMaximumValue method.

Copyright © 2001 - 2020 Syncfusion Inc.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.setMaximumValue();
```

setMinimumValue()

To set setMinimumValue, you can use setMinimumValue method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.setMinimumValue();
```

setMinorIntervalValue()

To set setMinorIntervalValue, you can use setMinorIntervalValue method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.setMinorIntervalValue();
```

setPointerDistanceFromScale()

To set setPointerDistanceFromScale, you can use setPointerDistanceFromScale method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.setPointerDistanceFromScale();
```

setPointerHeight()

To set PointerHeight, you can use setPointerHeight method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.setPointerHeight();
```

setPointerPlacement()

To set setPointerPlacement, you can use setPointerPlacement method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.setPointerPlacement();
```

setPointerValue()

To set PointerValue, you can use setPointerValue method.

Copyright © 2001 - 2020 Syncfusion Inc.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.setPointerValue();
```

setPointerWidth()

To set PointerWidth, you can use setPointerWidth method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.setPointerWidth();
```

setRangeBorderWidth()

To set setRangeBorderWidth, you can use setRangeBorderWidth method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.setRangeBorderWidth();
```

setRangeDistanceFromScale()

To set setRangeDistanceFromScale, you can use setRangeDistanceFromScale method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.setRangeDistanceFromScale();
```

setRangeEndValue()

To set setRangeEndValue, you can use setRangeEndValue method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.setRangeEndValue();
```

setRangeEndWidth()

To set setRangeEndWidth, you can use setRangeEndWidth method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.setRangeEndWidth();
```

setRangePosition()

To set setRangePosition, you can use setRangePosition method.

Copyright © 2001 - 2020 Syncfusion Inc.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.setRangePosition();
```

setRangeStartValue()

To set setRangeStartValue, you can use setRangeStartValue method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.setRangeStartValue();
```

setRangeStartWidth()

To set setRangeStartWidth, you can use setRangeStartWidth method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.setRangeStartWidth();
```

setScaleBarLength()

To set setScaleBarLength, you can use setScaleBarLength method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.setScaleBarLength();
```

setScaleBarSize()

To set setScaleBarSize, you can use setScaleBarSize method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.setScaleBarSize();
```

setScaleBorderWidth()

To set setScaleBorderWidth, you can use setScaleBorderWidth method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.setScaleBorderWidth();
```

setScaleDirection()

To set setScaleDirection, you can use setScaleDirection method.

Copyright © 2001 - 2020 Syncfusion Inc.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.setScaleDirection();
```

setScaleLocation()

To set setScaleLocation, you can use setScaleLocation method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.setScaleLocation();
```

setScaleStyle()

To set setScaleStyle, you can use setScaleStyle method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.setScaleStyle();
```

setTickAngle()

To set setTickAngle, you can use setTickAngle method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.setTickAngle();
```

setTickHeight()

To set setTickHeight, you can use setTickHeight method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.setTickHeight();
```

setTickPlacement()

To set setTickPlacement, you can use setTickPlacement method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.setTickPlacement();
```

setTickStyle()

To set setTickStyle, you can use setTickStyle method.

Copyright © 2001 - 2020 Syncfusion Inc.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.setTickStyle();
```

setTickWidth()

To set setTickWidth, you can use setTickWidth method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.setTickWidth();
```

setTickXDistanceFromScale()

To set setTickXDistanceFromScale, you can use setTickXDistanceFromScale method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.setTickXDistanceFromScale();
```

setTickYDistanceFromScale()

To set setTickYDistanceFromScale, you can use setTickYDistanceFromScale method.

ASPX-CS

```
@(Html.EJ().LinearGauge("LinearGauge1"))
var linear = $("#LinearGauge1").data("ejLinearGauge");
linear.setTickYDistanceFromScale();
```

ListBox

ListBox

The ListBox control provides a list of options and allows you to choose an item from the list. It includes several other HTML elements such as images, textboxes, check box, and radio buttons and so on. It also supports data binding, template options and multi-select options.

Key Features

- ListBox Customization: Supports customization of the ListBox height and width.
- Data binding: Supports data binding with JSON data and remote data.
- Themes: Essential ASP.NET MVC controls feature 12 built-in themes and also supports custom skin options for user-defined themes.
- Reorder: Moves a list item one-step up and one-step down, so that you are able to rearrange the list items inside ListBox control
- Cascading ListBoxes: To populate contents of the second ListBox based on the selection of first ListBox.
- Grouping: The ability to group list items according to their category.

Copyright © 2001 - 2020 Syncfusion Inc.

- Multi-Selection: The ability to select multiple items from the list using Ctrl and Shift key press.
- Template: Supports using templates to display list items.
- Keyboard navigation: Supports switching focus to the control and navigation through the list items with the key press.
- RTL: Supports displaying the ListBox with list items in direction from right to left.
- LoadOnDemand: Provides LoadOnDemand support for ListBox control, to load only specific set of List Data items.

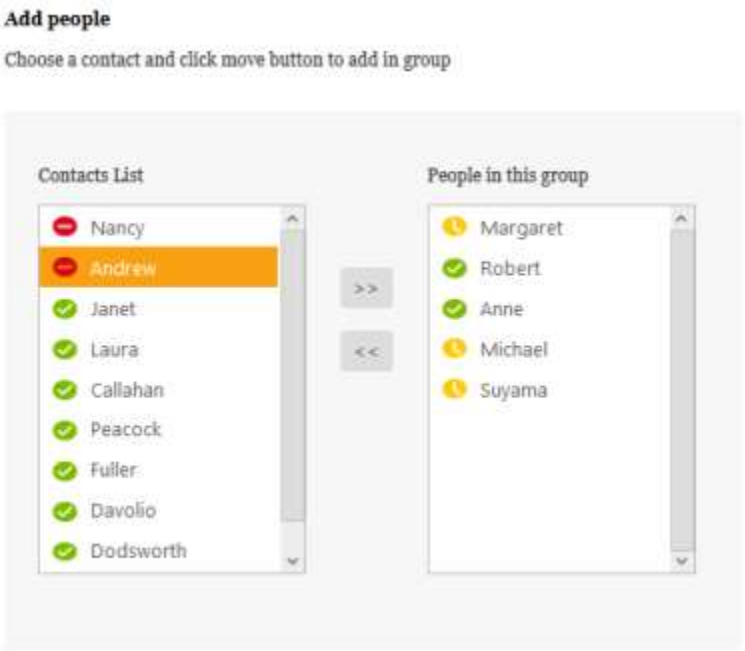
Getting Started

This section explains briefly on how to create a ListBox control in your ASP.NET MVC application.

Create your first ListBox in MVC

Here you can learn how to customize ListBox in Contact Selection tool. This allows you display the list of contacts, to select and move them to the next ListBox that has the selected items. The following example illustrates simulator of Group Creation tool like Skype messenger.

The following screenshot demonstrates the functionality of ListBox with Multi-Selection and Drag and Drop features.



Skype Group creation tool Simulator using ListBox

In the above screenshot, you can select a list item from the first ListBox widget. After you select the item, you can move the selected item to the second ListBox widget.

Create a ListBox Widget

EssentialASP.NET MVCListBox control renders with built-in features.

The following steps are used to create ListBox control.

1. You can create an MVC Project and add necessary assembly with the help of the given MVC-Getting Started Documentation.

2. Please add the below code in your layout._cshtml page to add necessary script and CSS files to render the ListBox control.

ASPX-CS

```
<head>

/script>
<script
src="http://cdn.syncfusion.com/js/assets/external/jquery.easing.1.3.min.js">
</script>
<script src="http://cdn.syncfusion.com/13.1.0.21/js/web/ej.web.all.min.js">
</script>
</head>
```

Create a CSHTML file in View page and add the following code sample to it.

3. Add the following code in your view page to render ListBox controls.

ASPX-CS

```
<div id="sample">
<h5>
<b>Add people</b></h5>
<p>
Choose a contact and click move button to add in group
</p>
<br />
<div id="control">
<div id="container1">
<p>
Contacts List</p>
@Html.EJ().ListBox("list1")
</div>
<div id="container2">
<p>
People in this group</p>
@Html.EJ().ListBox("list2")
</div>
</div>
</div>
```

4. Add the following style section for the ListBox controls alignment.

CSS

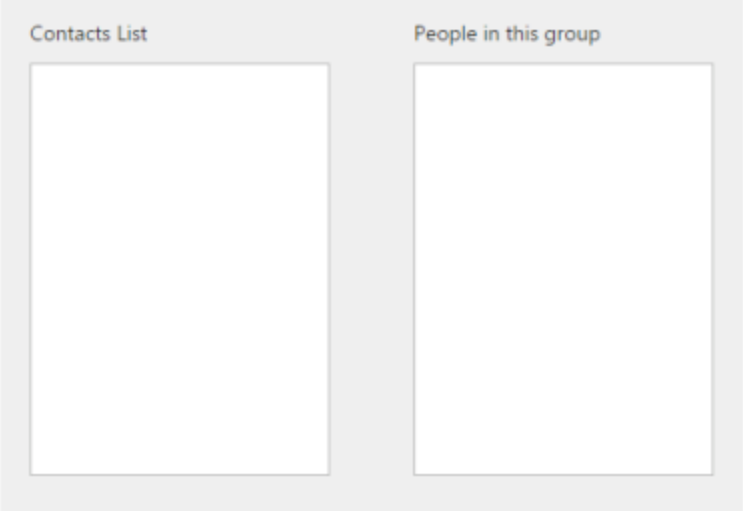
```
<style type="text/css" class="cssStyles">
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
#control
{
height: 350px;
width: 500px;
padding: 25px;
background-color: #f7f7f7;
display: flex;
}
#sample
{
height: 472px;
width: 600px;
}
#list2_container
{
float: right;
}
#list1_container
{
float: left;
}
.middle-buttons
{
padding: 91px 25px 25px 25px;
}
#container1, #container2
{
width: 200px;
}
img
{
padding-right: 10px;
padding-top: 3px;
width: 18px;
height: 15px;
}
#form1
{
padding: 25px;
}
</style>
```

5. Run this code to render an empty ListBox control.

Copyright © 2001 - 2020 Syncfusion Inc.



Render ListBox with element

Configure ListBox with Items

To populate items inside ListBox, you have to add list items inside <ul> as elements. The TargetID property is used to get the list items from the target. The Id of the ul that has the list items is given as the TargetID. Include the following <ul>, <li> elements in your sample.

HTML

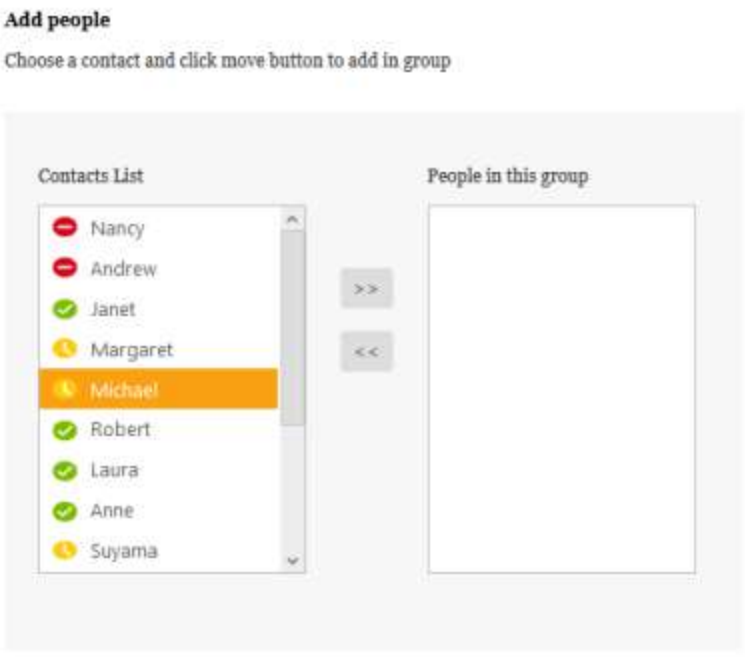
```
<div id="sample">
<h5>
<b>Add people</b></h5>
<p>
Choose a contact and click move button to add in group
</p>
<br />
<div id="control">
<div id="container1">
<p>
Contacts List</p>
@Html.EJ().ListBox("list1").TargetID("select")
<ul id="select">
<li>
<img src="~/images/listbox/busy.png" alt="Categorize" />
Nancy</li>
<li>
<img src="~/images/listbox/busy.png" alt="Done" />
Andrew</li>
<li>
<img src="~/images/listbox/avail.png" alt="Flag" />
Janet</li>
<li>
<img src="~/images/listbox/away.png" alt="Forward" />
Margaret</li>
<li>
<img src="~/images/listbox/away.png" alt="Move" />
Michael</li>
<li>
<img src="~/images/listbox/avail.png" alt="E-mail" />
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
Robert</li>
<li>
<img src="~/images/listbox/avail.png" alt="Meeting" />
Laura</li>
<li>
<img src="~/images/listbox/avail.png" alt="Reply" />
Anne</li>
<li>
<img src="~/images/listbox/away.png" alt="Move" />
Suyama</li>
<li>
<img src="~/images/listbox/avail.png" alt="E-mail" />
Callahan</li>
<li>
<img src="~/images/listbox/avail.png" alt="Meeting" />
Peacock</li>
<li>
<img src="~/images/listbox/avail.png" alt="Reply" />
Fuller</li>
<li>
<img src="~/images/listbox/avail.png" alt="Reply" />
Davolio</li>
<li>
<img src="~/images/listbox/avail.png" alt="Reply" />
Dodsworth</li>
<li>
<img src="~/images/listbox/avail.png" alt="Reply" />
Louis</li>
</ul>
</div>
<div class="middle-buttons">
@Html.EJ().Button("Add").Text(">>").ShowRoundedCorner(true).ClientSideEvents
(e => e.Click("add"))
<br />
<br />
@Html.EJ().Button("Remove").Text("<<").ShowRoundedCorner(true).ClientSideEve
nts(e => e.Click("remove"))
</div>
<div id="container2">
<p>
People in this group</p>
@Html.EJ().ListBox("list2")
<ul id="selectedItems">
</ul>
</div>
</div>
</div>
```

Run the above code to render ListBox with list items rendered inside ListBox. ListBox with Contact list items is shown as follows.

Copyright © 2001 - 2020 Syncfusion Inc.



ListBox with Contact list items

Enable Drag and Drop

You can drag an item from a ListBox and drop it in droppable element.To drag and drop a list item across controls or within a control, you have to set the AllowDrag and AllowDrop property as “true”.

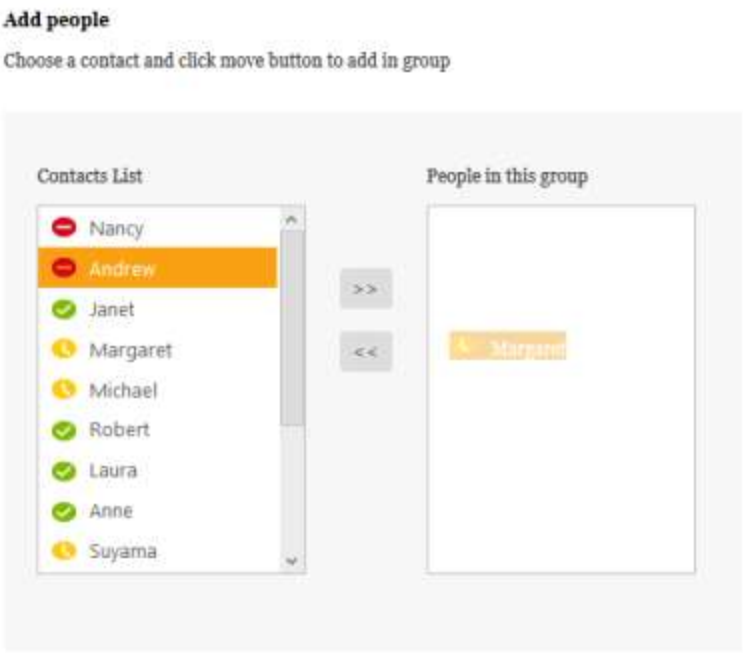
Please refer the below code snippet:

ASPX-CS

```
@Html.EJ().ListBox("list1").TargetID("select").AllowDrag(true).AllowDrop(tru
e)
@Html.EJ().ListBox("list2").AllowDrag(true).AllowDrop(true)
```

Run the above code example to render the following ListBox with Drag and drop feature. ListBox with Drag and Drop list items across control is as follows:

Copyright © 2001 - 2020 Syncfusion Inc.



ListBox with Drag and Drop list items

Enable Multiple Selection

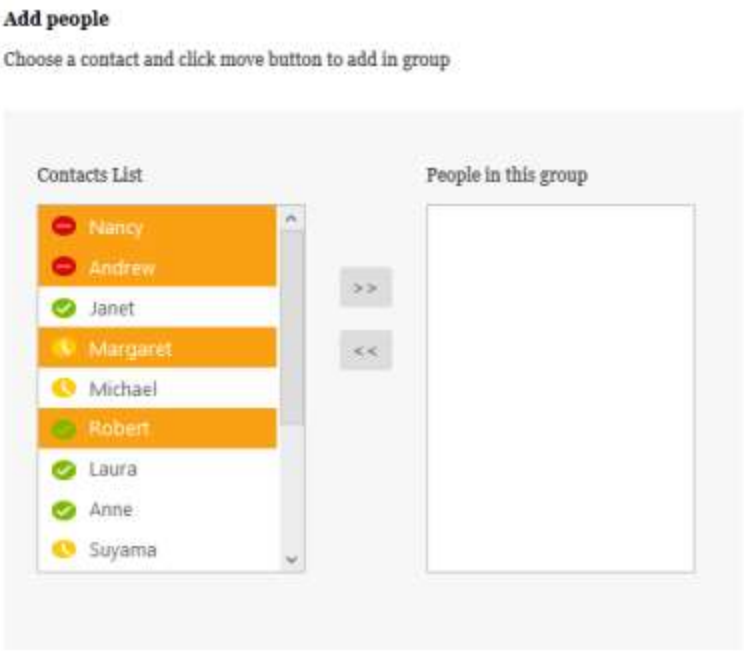
You can select multiple list items simultaneously in ListBox control, and move the multiple, selected items to the selection ListBox. To select multiple items in a ListBox, set the AllowMultiSelection property for the ListBox as “true”.

ASPX-CS

```
@Html.EJ().ListBox("list1").TargetID("select").AllowMultiSelection(true)
.AllowDragAndDrop(true)
```

Run the above code example to render the following ListBox with Multiple selection feature. ListBox control with Multiple Selection of list items is as follows.

Copyright © 2001 - 2020 Syncfusion Inc.



ListBox with Multiple Selection of list items

Add items to a Second ListBox

You have to move the selected list items to the second ListBox using AddItem(value) method and remove existing item in the first ListBox using RemoveItem() method.

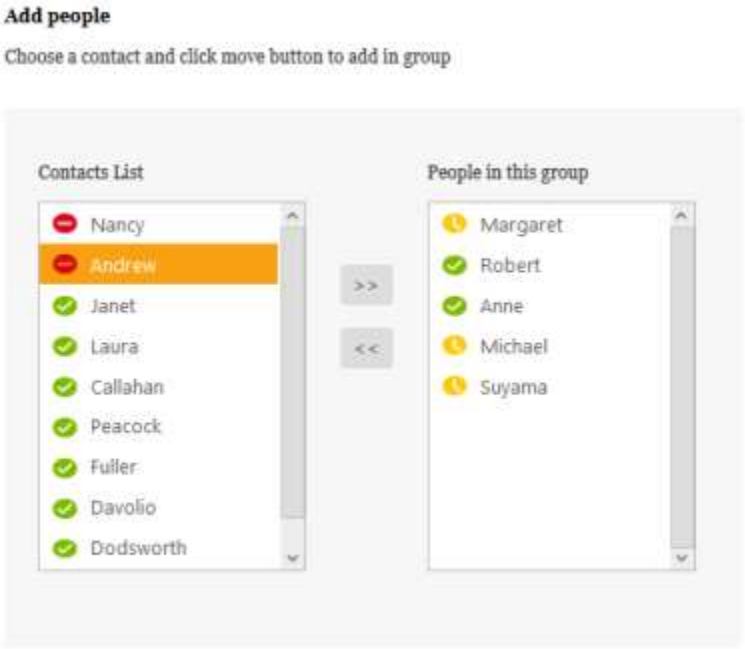
The following code sample explains how to add an item to a second ListBox.

JS

```
<script type="text/javascript">
function add(e)
{
var firstListBox = $('#list1').data("ejListBox");
var selectedItems = firstListBox.getSelectedItems();
var length = selectedItems.length;
for (i = 0; i < length; i++)
{
var value = $(selectedItems[i]).html();
selectedItems[i].remove();
var target = $('#list2').data("ejListBox");
target.addItem(value);
}
}
function remove(e)
{
var firstListBox = $('#list2').data("ejListBox");
var selectedItem = firstListBox.getSelectedItems();
var length = selectedItem.length;
for (i = 0; i < length; i++)
{
var value = $(selectedItem[i]).html();
selectedItem[i].remove();
var target = $('#list1').data("ejListBox");
```

```
target.addItem(value);
}
}
</script>
```

Run this code and you can see the output. Selected items from the first ListBox have been moved to second ListBox using AddItem() and RemoveItem() method and it is displayed in the following figure.



ListBox Selection moved to Second ListBox

Data-binding

The ListBox is populated with the node information taken from a data source. The ListBox supports binding data sources containing hierarchical data and supports Object data, Remote data, XML Data, SQL Data and LinqToSql Data, for retrieving data from a specified data source.

Data fields and configuration

The following sub-properties provides you a way to bind either the local or remote data to the ListBox control.

Property Table for ASP.NET MVC ListBox

Name	Description
Datasource	The data source contains the list of data for generating the ListBox items
Query	It specifies the query to retrieve the data from online server
ListBoxFields	It specifies the mapping fields for the data items of the ListBox
ID	It specifies the id of the tag
Text	It specifies the text content of the tag

Copyright © 2001 - 2020 Syncfusion Inc.

Value	It specifies the value of the tag
ImageUrl	Itâ€™s defines the imageURL for the image location
ImageAttributes	Itâ€™s defines the image attributes such as height, width, styles and so on
SpriteCssClass	It defines the sprite CSS for the image tag.
HtmlAttributes	It defines the HTML attributes such as id, class, styles for the item
Selected	It defines the tag value to be selected initially
ToolTipText	It specifies the Tooltip text of the tag
Category	It specifies the category of the tag
TableName	It defines the table name for tag value or display text while render with remote data

Local data

ListBox provides data binding support. Thus, you can bind the data from JSON Data source. To achieve this, map the corresponding fields with their column names.

And also, provide support to add and customize the list item by using appropriate data fields.

The following code explains you the details of data binding with ListBox.

1. Add the below code in your page to render the ListBox with local data.

ASPX-CS

```
// Add the following code in View page to configure ListBox widget
<div id="control">
<h5 class="ctrllabel">
Select a skill
</h5>
@Html.EJ().ListBox("listBoxSample").Width("240").Datasource((IEnumerable<Ski
llSet>)ViewBag.datasource).ListBoxFields(df=>
df.Text("text"))
</div>
```

CSHARP

```
// Add the following code to add list items in the controller page
public class SkillSet
{
public string text { get; set; }
}
public ActionResult Index()
{
List<SkillSet> skill = new List<SkillSet>();
skill.Add(new SkillSet { text = "ASP.NET" });
skill.Add(new SkillSet { text = "ActionScript" });
skill.Add(new SkillSet { text = "Basic" });
skill.Add(new SkillSet { text = "C++" });
skill.Add(new SkillSet { text = "C#" });
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
skill.Add(new SkillSet { text = "dBase" });
skill.Add(new SkillSet { text = "Delphi" });
skill.Add(new SkillSet { text = "ESPOL" });
skill.Add(new SkillSet { text = "F#" });
skill.Add(new SkillSet { text = "FoxPro" });
skill.Add(new SkillSet { text = "Java" });
skill.Add(new SkillSet { text = "J#" });
skill.Add(new SkillSet { text = "Lisp" });
skill.Add(new SkillSet { text = "Logo" });
skill.Add(new SkillSet { text = "PHP" });
ViewBag.datasource = skill;
return View();
}
```

2. Output of the above steps

Remote data

You can bind the data for the ListBox from remote that can fetch the data from remote web service. You can pass the query string to filter the data that helps to avoid the extensive properties look up by using Query options.

The following steps explains you the details of data binding from remote.

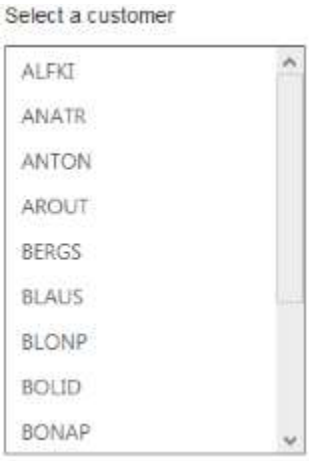
1. Add the below code in your page to render the ListBox with remote data

ASPX-CS

```
// Add the following code in View page to configure ListBox widget
<div class="control">
<div class="ctrllabel">
Select a customer
</div>
@Html.EJ().ListBox("listBoxSample").Datasource(listBoxDataSource =>
listBoxDataSource.URL("http://mvc.syncfusion.com/Services/Northwnd.svc/")).Q
uery("ej.Query().from('Customers').take(10)").ListBoxFields(f =>
f.Text("CustomerID"))
</div>
```

Copyright © 2001 - 2020 Syncfusion Inc.

2. Output of the above steps.



Behavior Settings

The following are some miscellaneous properties that helps you to change the behavior of ListBox control.

Target ID

You can append a list with ListBox by using TargetId property. Define a <ul>,< li> tag that you want to display on ListBox and then set the id of parent <ul> tag to TargetId property. And its data type is string.

The following steps explains you the configuration of TargetID property in ListBox.

1. Add the below code in your page to render the ListBox

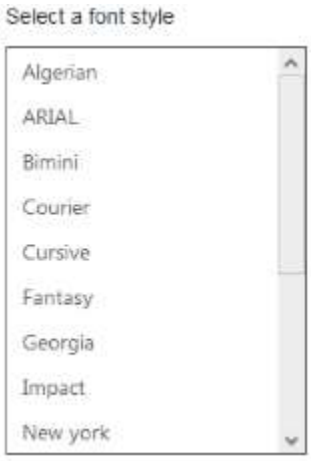
ASPX-CS

```
// Add the following code in View page to configure ListBox widget
<div id="control">
<h5 class="ctrllabel">
Select a font style
</h5>
@Html.EJ().ListBox("listboxSample").TargetID("targetList")
<ul id="targetList">
<li>Algerian</li>
<li>ARIAL</li>
<li>Bimini</li>
<li>Courier</li>
<li>Cursive</li>
<li>Fantasy</li>
<li>Georgia</li>
<li>Impact</li>
<li>New York</li>
<li>Sans-Serif</li>
<li>Scripts</li>
<li>Times</li>
<li>Times New Roman</li>
<li>Verdana</li>
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
<li>Western</li>
<li>ZapfEllipt BT</li>
</ul>
</div>
```

2. Output of the above steps.



Select the value by index

ListBox widget provides you support to select an item by mentioning the index of the item. The SelectedIndex property helps you to select the particular item from the list. Its date type is number.

The following steps explains you the configuration of SelectedIndex property in ListBox.

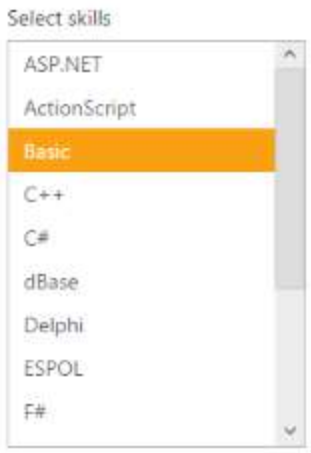
1. Add the below code in your page to render the ListBox

ASPX-CS

```
<div id="control">
<h5 class="ctrllabel">
Select a skill
</h5>
@Html.EJ().ListBox("listboxSample").Width("240").Datasource((IEnumerable<ug_
listbox.controllers.SkillSet>)ViewBag.datasource).ListBoxFields(df
=> df.Text("text")).SelectedIndex(2)
</div>
```

2. Output of the above steps.

Copyright © 2001 - 2020 Syncfusion Inc.



Enable or Disable the ListBox Widget

This features enables you to set the enable or disable options for ListBox by setting Boolean type value to Enabled property.

The following steps explains you the configuration of Enabled property in ListBox.

1. Add the below code in your view page to render the Disabled ListBox

ASPX-CS

```
// Add the following code in View page to configure ListBox widget
<div id="control">
<h5 class="ctrllabel">
Select a skill
</h5>
@Html.EJ().ListBox("listboxSample").Width("240").Datasource((IEnumerable<ug_
listbox.controllers.SkillSet>)ViewBag.datasource).ListBoxFields(df =>
df.Text("text")).Enabled(false)
</div>
```

CSHARP

```
// Add the following code to add list items in the controller page
public class SkillSet
{
public string text { get; set; }
}
public ActionResult Index()
{
List<SkillSet> skill = new List<SkillSet>();
skill.Add(new SkillSet { text = "ASP.NET" });
skill.Add(new SkillSet { text = "ActionScript" });
skill.Add(new SkillSet { text = "Basic" });
skill.Add(new SkillSet { text = "C++" });
skill.Add(new SkillSet { text = "C#" });
skill.Add(new SkillSet { text = "dBase" });
skill.Add(new SkillSet { text = "Delphi" });
skill.Add(new SkillSet { text = "ESPOL" });
skill.Add(new SkillSet { text = "F#" });
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
skill.Add(new SkillSet { text = "FoxPro" });
skill.Add(new SkillSet { text = "Java" });
skill.Add(new SkillSet { text = "J#" });
skill.Add(new SkillSet { text = "Lisp" });
skill.Add(new SkillSet { text = "Logo" });
skill.Add(new SkillSet { text = "PHP" });
ViewBag.datasource = skill;
return View();
}
```

2. Output of the above steps.

Persistence support

This features enables you to save current model value to browser cookies for state maintains. When you refresh the ListBox control page, it retains the model value apply from browser cookies. The date type of EnablePersistence is Boolean type.

The following steps explains you the configuration of EnablePersistence property in ListBox.

1. Add the below code in your view page to render the ListBox

ASPX-CS

```
// Add the following code in View page to configure ListBox widget
<div id="control">
<h5 class="ctrllabel">
Select a skill
</h5>
@Html.EJ().ListBox("listBoxSample").Width("240").Datasource((IEnumerable<ug_
listbox.controllers.SkillSet>)ViewBag.datasource).ListBoxFields(df =>
df.Text("text")) .EnablePersistence(true)
</div>
```

CSHARP

```
// Add the following code to add list items in the controller page
public class SkillSet
```

```
{
public string text { get; set; }
}
public ActionResult Index()
{
List<SkillSet> skill = new List<SkillSet>();
skill.Add(new SkillSet { text = "ASP.NET" });
skill.Add(new SkillSet { text = "ActionScript" });
skill.Add(new SkillSet { text = "Basic" });
skill.Add(new SkillSet { text = "C++" });
skill.Add(new SkillSet { text = "C#" });
skill.Add(new SkillSet { text = "dBase" });
skill.Add(new SkillSet { text = "Delphi" });
skill.Add(new SkillSet { text = "ESPOL" });
skill.Add(new SkillSet { text = "F#" });
skill.Add(new SkillSet { text = "FoxPro" });
skill.Add(new SkillSet { text = "Java" });
skill.Add(new SkillSet { text = "J#" });
skill.Add(new SkillSet { text = "Lisp" });
skill.Add(new SkillSet { text = "Logo" });
skill.Add(new SkillSet { text = "PHP" });
ViewBag.datasource = skill;
return View();
}
```

Multiple Selection

Allow multiple selection

ListBox widget allows you to select multiple values from the list Items using AllowMultiSelection property. You can select multiple list items along with Control key and Shift key press. To select multiple values we need to set AllowMultiSelection value to true.

Configuring multiple selection

The following steps explain you the configuration of the AllowMultiSelection for a ListBox.

1. Add the below code in your view page to render the ListBox

ASPX-CS

```
<div id="control">
<h5 class="ctrllabel">
Select a skill
</h5>
@{List<int> indexList = new List<int>();
indexList.Add(0);
indexList.Add(3);
}
@Html.EJ().ListBox("listBoxSample").Width("240").Datasource((IEnumerable<Ski
llSet>)ViewBag.datasource).ListBoxFields(df =>
df.Text("text")).SelectedItemList(indexList).AllowMultiSelection(true)
</div>
```

2. Output for ListBox control that provides multiple selection is as follows.

Copyright © 2001 - 2020 Syncfusion Inc.

Multiple selection through index

You can select the list of items from the ListBox using selectedItemList property. Its data type is array. To achieve this, you need to set true to AllowMultiSelection property in ListBox.

The following steps explains you the configuration of SelectedItemList property in ListBox

1. Add the below code in your view page to render the ListBox with allow multiple selection enabled.

ASPX-CS

```
// Add the following code in View page to configure ListBox widget
<div id="control">
<h5 class="ctrllabel">
Select a skill
</h5>
@{List<int> indexList = new List<int>();
indexList.Add(1);
indexList.Add(4);
}
@Html.EJ().ListBox("listBoxSample").Width("240").Datasource((IEnumerable<Ski
llSet>)ViewBag.datasource).ListBoxFields(df
=> df.Text("text")).SelectedIndices(indexList).AllowMultiSelection(true)
</div>
```

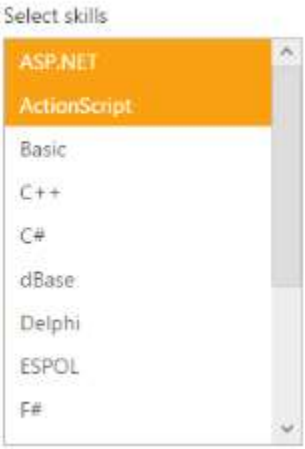
CSHARP

```
// Add the following code to add list items in the controller page
public class SkillSet
{
public string text { get; set; }
}
public ActionResult Index()
{
List<SkillSet> skill = new List<SkillSet>();
skill.Add(new SkillSet { text = "ASP.NET" });
skill.Add(new SkillSet { text = "ActionScript" });
skill.Add(new SkillSet { text = "Basic" });
skill.Add(new SkillSet { text = "C++" });
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
skill.Add(new SkillSet { text = "C#" });
skill.Add(new SkillSet { text = "dBase" });
skill.Add(new SkillSet { text = "Delphi" });
skill.Add(new SkillSet { text = "ESPOL" });
skill.Add(new SkillSet { text = "F#" });
skill.Add(new SkillSet { text = "FoxPro" });
skill.Add(new SkillSet { text = "Java" });
skill.Add(new SkillSet { text = "J#" });
skill.Add(new SkillSet { text = "Lisp" });
skill.Add(new SkillSet { text = "Logo" });
skill.Add(new SkillSet { text = "PHP" });
ViewBag.datasource = skill;
return View();
}
```

2. Output of the above steps.



Checkbox Support

Show Checkbox

You can enable the checkbox in the ListBox with this property. The data type of ShowCheckbox value is Boolean type. It maintains multiple selection and gets the checked items on its ListBox client side events.

Defining the Checkbox support

The following steps explains you the configuration of checkbox options in ListBox.

1. Add the below code in your view page to render the ListBox with checkbox

ASPX-CS

```
// Add the following code in View page to configure ListBox widget
<div id="control">
<h5 class="ctrllabel">
Select a skill
</h5>
@Html.EJ().ListBox("listBoxSample").Width("240").Datasource((IEnumerable<ug_
listbox.controllers.SkillSet>)ViewBag.datasource).ListBoxFields(df =>
df.Text("text")).ShowCheckbox(true)
```

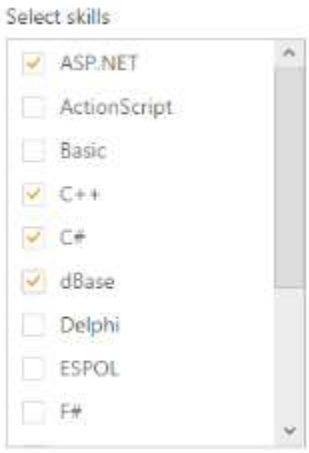
Copyright © 2001 - 2020 Syncfusion Inc.

```
</div>
```

CSHARP

```
// Add the following code to add list items in the controller page
public class SkillSet
{
public string text { get; set; }
}
public ActionResult Index()
{
List<SkillSet> skill = new List<SkillSet>();
skill.Add(new SkillSet { text = "ASP.NET" });
skill.Add(new SkillSet { text = "ActionScript" });
skill.Add(new SkillSet { text = "Basic" });
skill.Add(new SkillSet { text = "C++" });
skill.Add(new SkillSet { text = "C#" });
skill.Add(new SkillSet { text = "dBase" });
skill.Add(new SkillSet { text = "Delphi" });
skill.Add(new SkillSet { text = "ESPOL" });
skill.Add(new SkillSet { text = "F#" });
skill.Add(new SkillSet { text = "FoxPro" });
skill.Add(new SkillSet { text = "Java" });
skill.Add(new SkillSet { text = "J#" });
skill.Add(new SkillSet { text = "Lisp" });
skill.Add(new SkillSet { text = "Logo" });
skill.Add(new SkillSet { text = "PHP" });
ViewBag.datasource = skill;
return View();
}
```

2. Output of the above steps.



Check All

You can check all the check box in the list by using this property. The data type of CheckAll is Boolean type. To achieve this, set ShowCheckbox property as true.

Copyright © 2001 - 2020 Syncfusion Inc.

The following steps explains you the configuration of checkbox options in ListBox.

1. Add the below code in your view page to render the ListBox with all items checked initially.

ASPX-CS

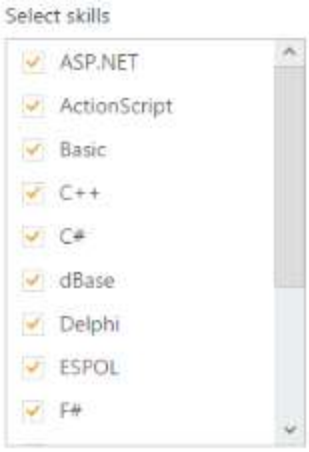
```
// Add the following code in View page to configure ListBox widget
<div id="control">
<h5 class="ctrllabel">
Select a skill
</h5>
@Html.EJ().ListBox("listBoxSample").Width("240").Datasource((IEnumerable<ug_
listbox.controllers.SkillSet>)ViewBag.datasource).ListBoxFields(df =>
df.Text("text")) .ShowCheckbox(true).CheckAll(true)
</div>
```

CSHARP

```
// Add the following code to add list items in the controller page
public class SkillSet
{
public string text { get; set; }
}
public ActionResult Index()
{
List<SkillSet> skill = new List<SkillSet>();
skill.Add(new SkillSet { text = "ASP.NET" });
skill.Add(new SkillSet { text = "ActionScript" });
skill.Add(new SkillSet { text = "Basic" });
skill.Add(new SkillSet { text = "C++" });
skill.Add(new SkillSet { text = "C#" });
skill.Add(new SkillSet { text = "dBase" });
skill.Add(new SkillSet { text = "Delphi" });
skill.Add(new SkillSet { text = "ESPOL" });
skill.Add(new SkillSet { text = "F#" });
skill.Add(new SkillSet { text = "FoxPro" });
skill.Add(new SkillSet { text = "Java" });
skill.Add(new SkillSet { text = "J#" });
skill.Add(new SkillSet { text = "Lisp" });
skill.Add(new SkillSet { text = "Logo" });
skill.Add(new SkillSet { text = "PHP" });
ViewBag.datasource = skill;
return View();
}
```

2. Output of the above steps.

Copyright © 2001 - 2020 Syncfusion Inc.



Uncheck All

You can uncheck all the check box in the list by using this property. The data type of UncheckAll is Boolean type. To achieve this, set ShowCheckbox property as true.

Appearance and Styling

Adjusting ListBox size

Width

ListBox widget provides you support to customize the dimensions of the ListBox. By using Width property you can set the width of the ListBox. Its data type is string.

Height

ListBox widget provides you support to customize the dimensions of the ListBox. By using Height property, you can set the height of the ListBox. Its data type is string.

Defining the ListBox size properties

The following steps explains you the configuration of Height & Width properties in ListBox.

1. Add the below code in your view page to render the ListBox with customized height and width

ASPX-CS

```
// Add the following code in View page to configure ListBox widget
<div id="control">
<h5 class="ctrllabel">
Select a skill
</h5>
@Html.EJ().ListBox("listBoxSample").Width("240").Height("302").Datasource((I
Enumerable<SkillSet>)ViewBag.datasource).ListBoxFields(df
=> df.Text("text"))
</div>
```

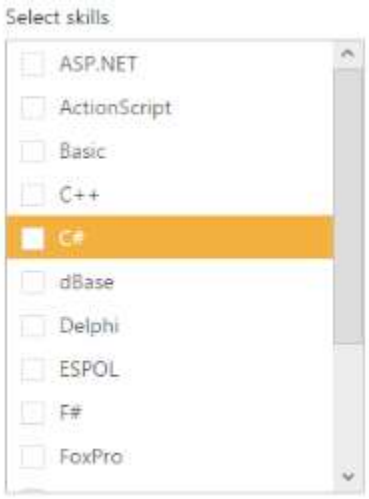
CSHARP

```
// Add the following code to add list items in the controller page
public class SkillSet
{
public string text { get; set; }
}
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
public ActionResult Index()
{
List<SkillSet> skill = new List<SkillSet>();
skill.Add(new SkillSet { text = "ASP.NET" });
skill.Add(new SkillSet { text = "ActionScript" });
skill.Add(new SkillSet { text = "Basic" });
skill.Add(new SkillSet { text = "C++" });
skill.Add(new SkillSet { text = "C#" });
skill.Add(new SkillSet { text = "dBase" });
skill.Add(new SkillSet { text = "Delphi" });
skill.Add(new SkillSet { text = "ESPOL" });
skill.Add(new SkillSet { text = "F#" });
skill.Add(new SkillSet { text = "FoxPro" });
skill.Add(new SkillSet { text = "Java" });
skill.Add(new SkillSet { text = "J#" });
skill.Add(new SkillSet { text = "Lisp" });
skill.Add(new SkillSet { text = "Logo" });
skill.Add(new SkillSet { text = "PHP" });
ViewBag.datasource = skill;
return View();
}
```

2. Output of the above steps



Enabling Rounded corner

ListBox widget provides you support to change the appearance of ListBox. By using showRoundedCorner you can create a rounded corner on the ListBox. Its data type is Boolean.

The following steps explains you the configuration of Rounded corner of the ListBox.

1. Add the below code in your view page to render the ListBox with rounded corners

ASPX-CS

```
// Add the following code in View page to configure ListBox widget
<div id="control">
<h5 class="ctrllabel">
```

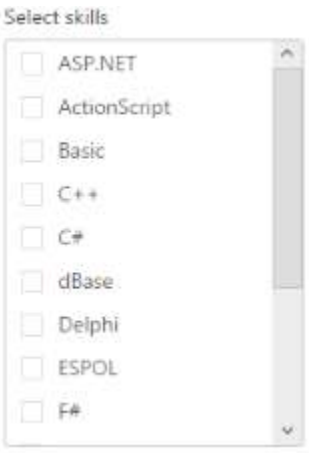
Copyright © 2001 - 2020 Syncfusion Inc.

```
Select a skill
</h5>
@Html.EJ().ListBox("listBoxSample").Width("240").Datasource((IEnumerable<Ski
llSet>)ViewBag.datasource).ListBoxFields(df =>
df.Text("text")).ShowRoundedCorner(true)
</div>
```

CSHARP

```
// Add the following code to add list items in the controller page
public class SkillSet
{
public string text { get; set; }
}
public ActionResult Index()
{
List<SkillSet> skill = new List<SkillSet>();
skill.Add(new SkillSet { text = "ASP.NET" });
skill.Add(new SkillSet { text = "ActionScript" });
skill.Add(new SkillSet { text = "Basic" });
skill.Add(new SkillSet { text = "C++" });
skill.Add(new SkillSet { text = "C#" });
skill.Add(new SkillSet { text = "dBase" });
skill.Add(new SkillSet { text = "Delphi" });
skill.Add(new SkillSet { text = "ESPOL" });
skill.Add(new SkillSet { text = "F#" });
skill.Add(new SkillSet { text = "FoxPro" });
skill.Add(new SkillSet { text = "Java" });
skill.Add(new SkillSet { text = "J#" });
skill.Add(new SkillSet { text = "Lisp" });
skill.Add(new SkillSet { text = "Logo" });
skill.Add(new SkillSet { text = "PHP" });
ViewBag.datasource = skill;
return View();
}
```

2. Output of the above steps.



Copyright © 2001 - 2020 Syncfusion Inc.

Sorting

We can change ListBox items rendering order either as ascending or descending, by using "SortOrder" property. By default SortOrder will be "None". Please use code as like in below,

This is example code position of the ListBox may change if your are apply styles as per your requirement.

1. Add the below code in your view page to render the ListBox with sorting option

ASPX-CS

```
//Add the following code in View page to configure ListBox widget
<div class="contents">
<span class="txt">Select skill</span>
@Html.EJ().ListBox("skillSet").Datasource((IEnumerable<SkillSet>)ViewBag.Dat
aSource1).SortOrder(SortOrder.None).ListBoxFields(df => df.Value("skill"))
</div>
```

CSHARP

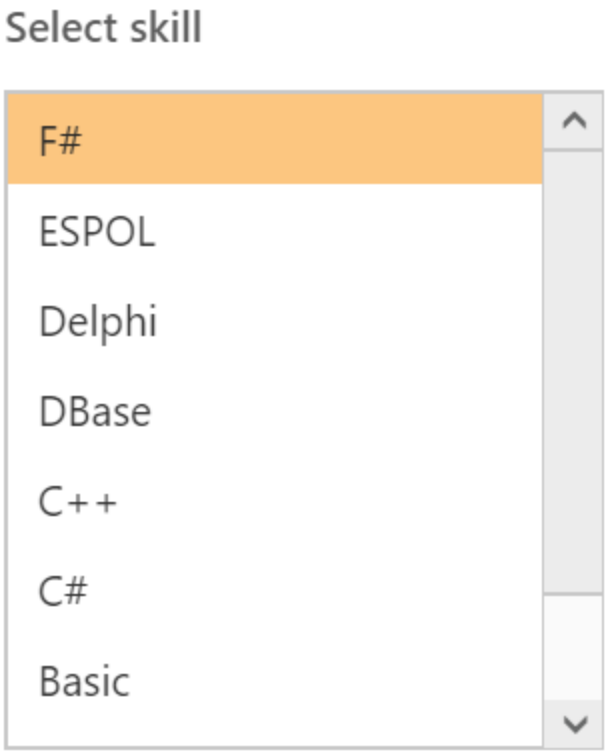
```
// Add the following code to add listbox items in the controller page
public partial class ListBoxController : Controller
{
List<SkillSet> veg1 = new List<SkillSet>();
List<GroupList> skills = new List<GroupList>();
// GET: /Sorting/
public ActionResult Sorting()
{
veg1.Add(new SkillSet { skill = "F#" });
veg1.Add(new SkillSet { skill = "ActionScript" });
veg1.Add(new SkillSet { skill = "Delphi" });
veg1.Add(new SkillSet { skill = "Basic" });
veg1.Add(new SkillSet { skill = "C++" });
veg1.Add(new SkillSet { skill = "ESPOL" });
veg1.Add(new SkillSet { skill = "C#" });
veg1.Add(new SkillSet { skill = "DBase" });
veg1.Add(new SkillSet { skill = "ASP.NET" });
ViewBag.DataSource1 = veg1;
return View();
}
}
```

CSHARP

```
public class SkillSet
{
public string skill { get; set; }
}
```

once you have included the above code your output will be shown as given,

Copyright © 2001 - 2020 Syncfusion Inc.



Theme

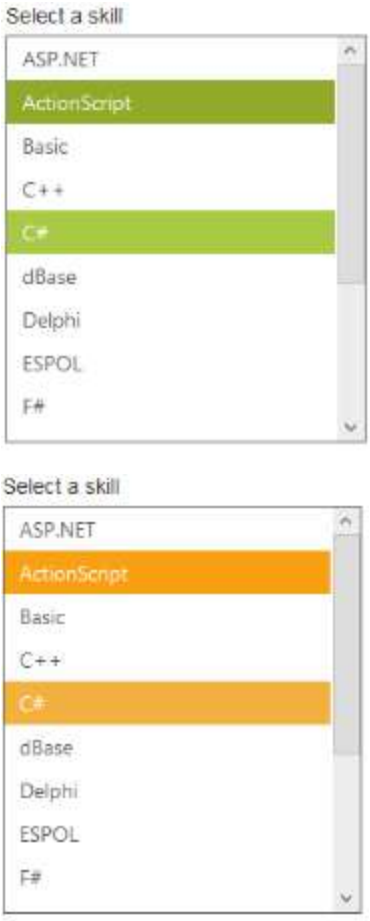
ListBox control's style and appearance can be controlled based on CSS classes. In order to apply styles to the ListBox control, you can refer to two files namely, ej.widgets.core.min.css and ej.theme.min.css. When you refer to the file ej.widgets.all.min.css, it is not necessary to include the files ej.widgets.core.min.css and ej.theme.min.css in your project, as ej.widgets.all.min.css is the combination of these two.

By default, there are 12 themes support available for ListBox control namely,

- default-theme
- flat-azure-dark
- fat-lime
- flat-lime-dark
- flat-saffron
- flat-saffron-dark
- gradient-azure
- gradient-azure-dark
- gradient-lime
- gradient-lime-dark
- gradient-saffron
- gradient-saffron-dark

The following screenshot illustrates the ListBox with Flat-lime and Flat-Saffron built-in themes.

Copyright © 2001 - 2020 Syncfusion Inc.



Custom class with ListBox

CSS class can be used to customize the ListBox control appearance. Define a CSS class as per your requirement and assign the class name to CssClass property. The data type of CssClass property is string.

Configuring the Custom CSS property

The following steps explains you the configuration of CssClass properties in ListBox.

1. Add the below code in your view page to render the ListBox with custom CSS class.

ASPX-CS

```
// Add the following code in View page to configure ListBox widget
<div id="control">
<h5 class="ctrllabel">
Select a skill
</h5>
@Html.EJ().ListBox("listBoxSample").Datasource((IEnumerable<ug_listbox.controllers.SkillSet>)
ViewBag.datasource).ListBoxFields(df => df.Text("text")) .CssClass("custom-class")
</div>
```

CSHARP

```
// Add the following code to add list items in the controller page
public class SkillSet
{
public string text { get; set; }
}
public ActionResult Index()
{
List<SkillSet> skill = new List<SkillSet>();
skill.Add(new SkillSet { text = "ASP.NET" });
skill.Add(new SkillSet { text = "ActionScript" });
skill.Add(new SkillSet { text = "Basic" });
skill.Add(new SkillSet { text = "C++" });
skill.Add(new SkillSet { text = "C#" });
skill.Add(new SkillSet { text = "dBase" });
skill.Add(new SkillSet { text = "Delphi" });
skill.Add(new SkillSet { text = "ESPOL" });
skill.Add(new SkillSet { text = "F#" });
skill.Add(new SkillSet { text = "FoxPro" });
skill.Add(new SkillSet { text = "Java" });
skill.Add(new SkillSet { text = "J#" });
skill.Add(new SkillSet { text = "Lisp" });
skill.Add(new SkillSet { text = "Logo" });
skill.Add(new SkillSet { text = "PHP" });
ViewBag.datasource = skill;
return View();
}
```

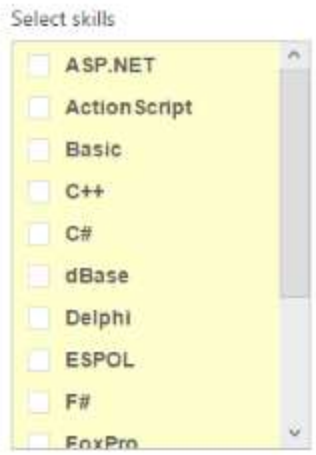
2. Configure the CSS styles to apply on ListBox.

CSS

```
<style>
.custom-class
{
background-color: #FFFFCC;
font-weight: bold;
font-family: sans-serif;
}
</style>
```

3. Output of the above steps.

Copyright © 2001 - 2020 Syncfusion Inc.



Tooltip Support

The following steps explains you the configuration of Tooltip properties in ListBox.

1. Add the below code in your page to render the ListBox with tooltip

ASPX-CS

```
// Add the following code in View page to configure ListBox widget
<div id="control">
<h5 class="ctrllabel">
Select a skill
</h5>
@Html.EJ().ListBox("listBoxSample").Datasource((IEnumerable<SkillSet>)ViewBa
g.datasource).ListBoxFields(df =>
df.Text("text").TooltipText("tooltip"))
</div>
```

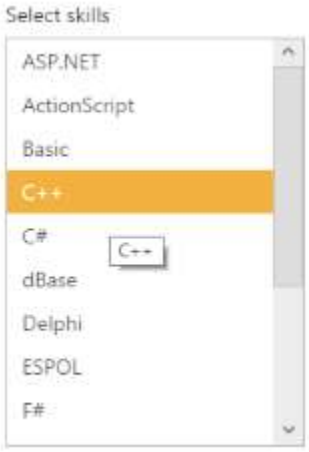
CSHARP

```
// Add the following code to add list items in the controller page
public class SkillSet
{
public string text { get; set; }
public string tooltip { get; set; }
}
public ActionResult Index()
{
List<SkillSet> skill = new List<SkillSet>();
skill.Add(new SkillSet { text = "ASP.NET", tooltip = "ASP.NET" });
skill.Add(new SkillSet { text = "ActionScript", tooltip = "ActionScript"});
skill.Add(new SkillSet { text = "Basic", tooltip = "Basic" });
skill.Add(new SkillSet { text = "C++", tooltip = "C++" });
skill.Add(new SkillSet { text = "C#", tooltip = "C#" });
skill.Add(new SkillSet { text = "dBase", tooltip = "dBase" });
skill.Add(new SkillSet { text = "Delphi", tooltip = "Delphi" });
skill.Add(new SkillSet { text = "ESPOL", tooltip = "ESPOL" });
skill.Add(new SkillSet { text = "F#", tooltip = "F#" });
skill.Add(new SkillSet { text = "FoxPro", tooltip = "FoxPro" });
skill.Add(new SkillSet { text = "Java", tooltip = "Java" });
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
skill.Add(new SkillSet { text = "J#", tooltip = "J#" });
skill.Add(new SkillSet { text = "Lisp", tooltip = "Lisp" });
skill.Add(new SkillSet { text = "Logo", tooltip = "Logo" });
skill.Add(new SkillSet { text = "PHP", tooltip = "PHP" });
ViewBag.datasource = skill;
return View();
}
```

2. Output of the above steps.



Cascading Support

Using cascade option, you can create a behavior of cascade between ListBox controls. For this, create a database with single field that is common between two ListBox data fields and then mention that column id in value field. With this, you can set second ListBox id in CascadeTo property in first ListBox.

In the following code example, in the first and second ListBox, "categoryId" is the common field.

The "categoryId" value of the selected item in the First Listbox that matches with "categoryId" value in the second Listbox, is retrieved and the item is loaded.

Note: In case the second ListBox is to be disabled, until the first one is selected, you can set enable property as false in second ListBox that enables automatically once the value is selected in first one.

You can add any number of cascading ListBox. For this, create a Datasource with single field value that is common between the two consecutive cascading ListBox and cascading is achieved based on that common field."

The following steps explains you the behavior of cascade ListBox.

1. Add the below code in your view page to render the ListBox with cascade option/

ASPX-CS

```
// Add the following code in View page to configure ListBox widget
<div class="controlitem">
<span class="txt">
Cascading Listbox
```

```
</span>
@Html.EJ().ListBox("groupsList").Datasource((IEnumerable<Groups>)ViewBag.dat
asource).ListBoxFields(df =>
df.Value("CategoryId")).CascadeTo("subcategoryList")
</div>
<div class="controlitem">
@Html.EJ().ListBox("subcategoryList").Datasource((IEnumerable<Category>)View
Bag.datasource1).ListBoxFields(df =>
df.Value("SubCategoryId")).CascadeTo("productList").Enabled(false)
</div>
<div class="controlitem">
@Html.EJ().ListBox("productList").Datasource((IEnumerable<SubCategory>)ViewB
ag.datasource2).ListBoxFields(df =>
df.Value("ProductId")).CascadeTo("subProductList").Enabled(false)
</div>
<div class="controlitem">
@Html.EJ().ListBox("subProductList").Datasource((IEnumerable<SubProduct>)Vie
wBag.datasource3).Enabled(false)
</div>
```

CSHARP

```
// Add the following code to add list items in the controller page
public partial class ListBoxController : Controller
{
List<Groups> group = new List<Groups>();
List<Category> firstLevel = new List<Category>();
List<SubCategory> secondLevel = new List<SubCategory>();
List<SubProduct> thirdLevel = new List<SubProduct>();
public ActionResult Cascading()
{
group.Add(new Groups { CategoryId = "a", Text = "Clothing" });
group.Add(new Groups { CategoryId = "b", Text = "Furniture" });
ViewBag.datasource = group;
//first level child
firstLevel.Add(new Category { SubCategoryId = 11, CategoryId = "a", Text =
"Women" });
firstLevel.Add(new Category { SubCategoryId = 12, CategoryId = "b", Text =
"Home furniture" });
firstLevel.Add(new Category { SubCategoryId = 13, CategoryId = "b", Text =
"Bedding" });
ViewBag.datasource1 = firstLevel;
//second level child
secondLevel.Add(new SubCategory { ProductId = 101, SubCategoryId = 11, Text
= "men shirts" });
secondLevel.Add(new SubCategory { ProductId = 102, SubCategoryId = 11, Text
= "men pants" });
secondLevel.Add(new SubCategory { ProductId = 103, SubCategoryId = 12, Text
= "women shirts" });
secondLevel.Add(new SubCategory { ProductId = 104, SubCategoryId = 12, Text
= "women pants" });
secondLevel.Add(new SubCategory { ProductId = 105, SubCategoryId = 13, Text
= "sofa" });
secondLevel.Add(new SubCategory { ProductId = 106, SubCategoryId = 13, Text
= "chairs" });
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
secondLevel.Add(new SubCategory { ProductId = 106, SubCategoryId = 14, Text
= "bedsheets" });
secondLevel.Add(new SubCategory { ProductId = 108, SubCategoryId = 14, Text
= "pillows" });
ViewBag.datasource2 = secondLevel;
//third level child
thirdLevel.Add(new SubProduct { ProductId = 101, Text = "red men shirts" });
thirdLevel.Add(new SubProduct { ProductId = 101, Text = "blue men shirts"
});
thirdLevel.Add(new SubProduct { ProductId = 102, Text = "red men pants" });
thirdLevel.Add(new SubProduct { ProductId = 102, Text = "blue men pants" });
thirdLevel.Add(new SubProduct { ProductId = 103, Text = "blue women shirts"
});
thirdLevel.Add(new SubProduct { ProductId = 103, Text = "red women shirts"
});
thirdLevel.Add(new SubProduct { ProductId = 104, Text = "red women pants"
});
thirdLevel.Add(new SubProduct { ProductId = 104, Text = "blue women pants"
});
thirdLevel.Add(new SubProduct { ProductId = 105, Text = "red sofa" });
thirdLevel.Add(new SubProduct { ProductId = 105, Text = "blue sofa" });
thirdLevel.Add(new SubProduct { ProductId = 106, Text = "red chairs" });
thirdLevel.Add(new SubProduct { ProductId = 106, Text = "blue chairs" });
thirdLevel.Add(new SubProduct { ProductId = 107, Text = "red bedsheets" });
thirdLevel.Add(new SubProduct { ProductId = 107, Text = "blue bedsheets" });
thirdLevel.Add(new SubProduct { ProductId = 108, Text = "red pillows" });
thirdLevel.Add(new SubProduct { ProductId = 108, Text = "blue pillows" });
ViewBag.datasource3 = thirdLevel;
return View();
}
}
```

CSHARP

```
public class Groups
{
public string Text { get; set; }
public string CategoryId { get; set; }
public class Category
{
public string Text { get; set; }
public string CategoryId { get; set; }
public int SubCategoryId { get; set; }
}
public class SubCategory
{
public string Text { get; set; }
public int ProductId { get; set; }
public int SubCategoryId { get; set; }
}
public class SubProduct
{
public string Text { get; set; }
public int ProductId { get; set; }
}
}
```

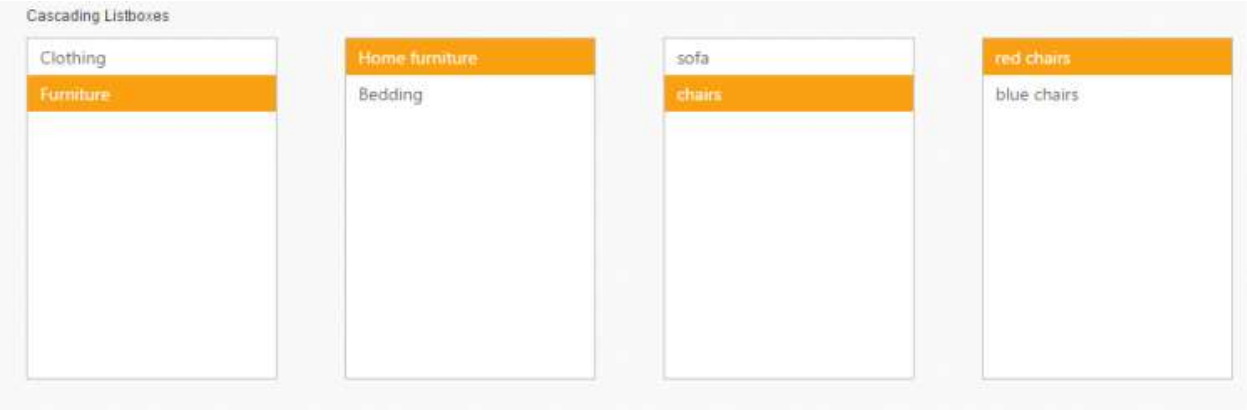
Copyright © 2001 - 2020 Syncfusion Inc.

2. Configure the styles as follows.

ASPX-CS

```
<style>
.controlitem {
margin-left: 50px;
display: inline-block;
}
</style>
```

3. Output of the above steps.



VirtualScrolling support

ListBox widget provides the VirtualScrolling support, when binding the remote data for the ListBox. It loads partially, only a set of data from remote server loaded initially, and imports data further upon loading. To enable VirtualScrolling support, set the EnableVirtualScrolling property as true. You can set ItemsCount that specifies number of items in the ListBox. You can load any number of items upon request with ItemRequest ClientSide Event.

The following steps explains you the behavior of VirtualScrolling support in ListBox.

1. Add the below code in your page to render the ListBox

ASPX-CS

```
// Add the following code in View page to configure ListBox widget
<div class="control">
<h5 class="ctrllabel">
Select Customer ID
</h5>
@Html.EJ().ListBox("customerList").Datasource(listBoxDatasource =>
listBoxDatasource.URL("http://mvc.syncfusion.com/Services/Northwnd.svc/")).Q
uery("ej.Query().from('Customers')").ListBoxFields(f =>
f.Text("CustomerID")).ItemsCount(91)
.AllowVirtualScrolling(true).ClientSideEvents(e =>
```

```
e.ActionBegin("itemRequested"))
</div>
```

JS

```
<script type="text/javascript">
function itemRequested(args) {
var target = $("#customerList").data("ejListBox");
//to load 20 items
target.model.query = ej.Query().from('Customers').range(args.start,
args.start + 20);
this.model.itemsCount = 20;
}
</script>
```

2. Output of the above steps.

Drag and Drop Support

ListBox widget provides the Drag and Drop support. A list item can be dragged from a ListBox control and can be dropped in any droppable element. To enable Drag and Drop support, set the AllowDrag and AllowDrop property as true. In control, enable the AllowDrag and AllowDrop property where you want to drop list Item.

The following steps explains you the behavior of template support with ListBox.

1. Add the below code in your page to render the ListBox

ASPX-CS

```
// Add the following code in View page to configure ListBox widget
<div class="control1">
<h5 class="ctrlLabel">
Drag and drop skills
</h5>
@Html.EJ().ListBox("listBoxSample").Datasource((IEnumerable<ug_listbox.contr
ollers.SkillSet>)ViewBag.datasource).ListBoxFields(df =>
df.Text("text")) .AllowDrag(true).AllowDrop(true)
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
</div>
<div class="control2">
@Html.EJ().ListBox("dragSample").AllowDrag(true).AllowDrop(true)
</div>
```

CSHARP

```
// Add the following code to add list items in the controller page
public class SkillSet
{
public string text { get; set; }
}
public ActionResult Index()
{
List<SkillSet> skill = new List<SkillSet>();
skill.Add(new SkillSet { text = "ASP.NET" });
skill.Add(new SkillSet { text = "ActionScript" });
skill.Add(new SkillSet { text = "Basic" });
skill.Add(new SkillSet { text = "C++" });
skill.Add(new SkillSet { text = "C#" });
skill.Add(new SkillSet { text = "dBase" });
skill.Add(new SkillSet { text = "Delphi" });
skill.Add(new SkillSet { text = "ESPOL" });
skill.Add(new SkillSet { text = "F#" });
skill.Add(new SkillSet { text = "FoxPro" });
skill.Add(new SkillSet { text = "Java" });
skill.Add(new SkillSet { text = "J#" });
skill.Add(new SkillSet { text = "Lisp" });
skill.Add(new SkillSet { text = "Logo" });
skill.Add(new SkillSet { text = "PHP" });
ViewBag.datasource = skill;
return View();
}
```

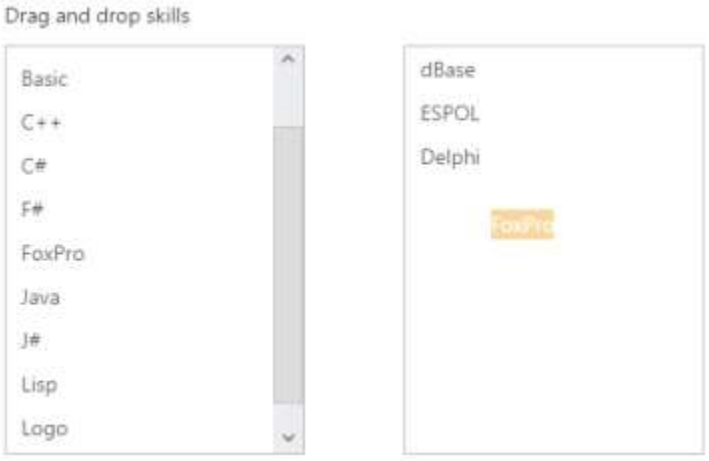
2. Add the following class in CSS.

ASPX-CS

```
<style type="text/css" class="cssStyles">
.control
{
margin-left: 20px;
}
.ctrlLabel
{
padding-bottom: 3px;
}
.control2
{
padding-left: 350px;
}
</style>
```

Copyright © 2001 - 2020 Syncfusion Inc.

3. Output of the above steps.



Template Support

ListBox widget provides the template support, when binding the data for the ListBox. For this behavior, set the common syntax /element in template property. You can add any HTML mark-up element inside the ListBox using this property.

The following steps explains you the behavior of template support with ListBox.

1. Add the below code in your view page to render the ListBox

Note: Images for this sample are available in 'installed location/images/Employee'

ASPX-CS

```
// Add the following code in View page to configure ListBox widget
<div class="control">
<div class="ctrllabel">
Template support
</div>
@Html.EJ().ListBox("listBoxSample").Datasource((IEnumerable<employeespecialists>)ViewBag.datasource).Height("238")
.Template("<img class='employee-image'
src='../../Content/images/Employees/${employee-image}.png' alt='employee'
height='50px' width='50px'/>
<div class='e-name'>
${text}
</div>
<div class='design'>
${design}
</div>
<div class='cont'>
${country}
</div>")
</div>
```

CSHARP

```
// Add the following code to add list items in the controller page
public class EmployeeSpecialists
{
public string text { get; set; }
public string employeeImg { get; set; }
public string design { get; set; }
public string country { get; set; }
}
public ActionResult Index()
{
List<EmployeeSpecialists> employeeList = new List<EmployeeSpecialists>();
employeeList.Add(new EmployeeSpecialists { text = "Erik Linden", employeeImg
= "3", design = "Representative", country = "England" });
employeeList.Add(new EmployeeSpecialists { text = "John Linden", employeeImg
= "6", design = "Representative", country = "Norway" });
employeeList.Add(new EmployeeSpecialists { text = "Louis", employeeImg =
"7", design = "Representative", country = "Australia" });
employeeList.Add(new EmployeeSpecialists { text = "Lawrence", employeeImg =
"8", design = "Representative", country = "India" });
ViewBag.datasource = employeeList;
return View();
}
```

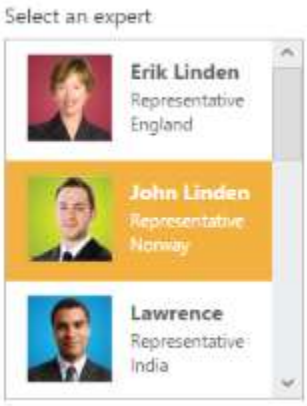
2. Customize the template in CSS.

CSS

```
<style>
.employee-image
{
margin: 0;
padding: 3px 10px 3px 3px;
border: 0 none;
width: 60px;
height: 60px;
float: left;
}
.e-name
{
font-weight: bold;
padding: 6px 3px 1px 3px;
}
.design, .cont
{
font-size: smaller;
padding: 3px 3px -1px 0px;
}
#selectExperts li
{
width: 200px;
height: 70px;
padding: 5px;
}
</style>
```

Copyright © 2001 - 2020 Syncfusion Inc.

3. Output of the above steps.



RTL Support

This feature supports to change the left-to-right alignment of the ListBox widget to right-to-left (RTL).

Defining the RTL property

The following steps explains you the configuration of enableRTL properties in ListBox.

1. Add the below code in your page to render the ListBox with right to left alignment

ASPX-CS

```
// Add the following code in View page to configure ListBox widget
<div id="control">
<h5 class="ctrllabel">
Select a skill
</h5>
@Html.EJ().ListBox("listBoxSample").Datasource((IEnumerable<ug_listbox.contr
ollers.skillSet>)ViewBag.datasource).ListBoxFields(df =>
df.Text("text")).EnableRTL(true)
</div>
```

CSHARP

```
// Add the following code to add list items in the controller page
public class skillSet
{
public string text { get; set; }
}
public ActionResult Index()
{
List<skillSet> skill = new List<skillSet>();
skill.Add(new skillSet { text = "ASP.NET" });
skill.Add(new skillSet { text = "ActionScript" });
skill.Add(new skillSet { text = "Basic" });
skill.Add(new skillSet { text = "C++" });
skill.Add(new skillSet { text = "C#" });
skill.Add(new skillSet { text = "dBase" });
skill.Add(new skillSet { text = "Delphi" });
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
skill.Add(new skillSet { text = "ESPOL" });
skill.Add(new skillSet { text = "F#" });
skill.Add(new skillSet { text = "FoxPro" });
skill.Add(new skillSet { text = "Java" });
skill.Add(new skillSet { text = "J#" });
skill.Add(new skillSet { text = "Lisp" });
skill.Add(new skillSet { text = "Logo" });
skill.Add(new skillSet { text = "PHP" });
ViewBag.datasource = skill;
return View();
}
```

2. Output of the above steps.

Keyboard interaction

You can use Keyboard shortcut keys as an alternative to the mouse on using ListBox widget. ListBox Widget allows you to perform all kind of actions using keyboard shortcuts.

Keyboard shortcut keys

Shortcut Key	Description
Access keyÂ + j	Focuses into the ListBox text box
Up	Moves to previous item in the ListBox
Down	Moves to next item in the ListBox
Enter	Selects the focused item
Left	Moves to previous item in the ListBox
Right	Moves to next item in the ListBox
Home	Navigates to the starting item
End	Navigates to the end item

Copyright © 2001 - 2020 Syncfusion Inc.

Configure keyboard interaction

The following steps explains you to enable keyboard interaction for a ListBox.

1. Add the below code in your page to render the ListBox

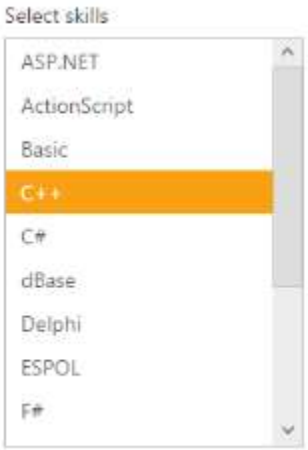
ASPX-CS

```
// Add the following code in View page to configure ListBox widget
<div id="control">
<h5 class="ctrllabel">
Select a skill
</h5>
@Html.EJ().ListBox("listBoxSample").Datasource((IEnumerable<ug_listbox.contr
ollers.skillset>)ViewBag.datasource).ListBoxFields(df
=> df.Text("text"))
</div>
```

JS

```
// Render ListBox control
<script type="text/javascript">
$(document).on("keydown", function (e) {
if (e.altKey && e.keyCode === 74) { // j- key code.
var target = $('#listBoxSample').data("ejListBox");
target.selectItemByIndex(1);
$("#listBoxSample_container").focus();
}
});
</script>
```

2. Run the sample, press Alt + J to focus in the ListBox widget that enables it and you can navigate using arrow keys.



Copyright © 2001 - 2020 Syncfusion Inc.

How to

Render ListBox from Code behind

ListBox can be rendered from the code behind by initializing the required properties in controller and passing those properties via **ViewData** or **Model** to the client side.

The following code illustrates the initialization of ListBox properties in the controller.

C#

```
//Namespace to get the JavaScript (Listbox) component properties
using Syncfusion.JavaScript.Models;
namespace MvcApplication.Controllers
{
public class ListBoxController: Controller
{
public ActionResult ListBoxFeatures()
{
// initialize data
List<Bikes> bike = new List<Bikes>();
bike.Add(new Bikes { id = "bk1", text = "Aachen RTR" });
bike.Add(new Bikes { id = "bk2", text = "CBR 150-R" });
bike.Add(new Bikes { id = "bk3", text = "CBZ Xtreme" });
bike.Add(new Bikes { id = "bk4", text = "Discover" });
bike.Add(new Bikes { id = "bk5", text = "Dazzler" });
bike.Add(new Bikes { id = "bk6", text = "Flame" });
bike.Add(new Bikes { id = "bk7", text = "Faze" });
bike.Add(new Bikes { id = "bk8", text = "FZ-S" });
bike.Add(new Bikes { id = "bk9", text = "Pulsar" });
bike.Add(new Bikes { id = "bk10", text = "Shine" });
bike.Add(new Bikes { id = "bk11", text = "R15" });
bike.Add(new Bikes { id = "bk12", text = "Unicorn" });
//Initializing the Listbox model
ListBoxProperties ListObj = new ListBoxProperties();
//Initializing the datasource and other properties
ListObj.DataSource = bike;
ListObj.ListBoxFields.Text = "text";
ListObj.ListBoxFields.Value = "id";
ListObj.AllowMultiSelection = true;
//Passing Listbox properties using the ViewData
ViewData["ListModel"] = ListObj;
return View();
}
}
}
```

Copyright © 2001 - 2020 Syncfusion Inc.

Binding the ListBox properties passed via

ViewData from the controller in the client side as below.

ASPX-CS

```
@{
Html.EJ().ListBox("bikeList", (Syncfusion.JavaScript.Models.
ListBoxProperties)ViewData["ListModel"]).Render();
}
```

ListView

ListView

The EssentialStudio for ASP.NET MVCListView widget builds interactive list view interface. This control allows you to select an item from a list-like interface and display a set of data items in different layouts or views. Lists are used for displaying data, data navigation, result lists, and data entry.

Key Features

- AJAX Load: Loads AJAX content in the ListView content.
- Data binding: Supports Data binding with JSON data and remote data.
- Template support: The ListView supports template content.
- Group List: The ListView supports group item list.
- Check List: The ListView supports check list.

Getting Started

This section explains briefly on how to create a ListView control in your application.

Create your first ListView in MVC

The Essential StudioListView widget builds an interactive list view interface. This control allows you to select an item from a list-like interface and provides the infrastructure to display a set of data items in different layouts or views. Lists display data, data navigation, result lists, and data entry.

List view Control

Copyright © 2001 - 2020 Syncfusion Inc.

The following steps guide you to add a ListView control in a MVC application.

Create a simple ListView

1. You can create a MVC Project and add necessary Dll's and Scripts with the help of the given MVC-Getting Started Documentation.
2. You need to add the class in the Models. Define the Class with key and text field. Then create a List of that class and add the data.

C#

```
public class ListData
{
public string texts { get; set; }
}
public static class ListDataModal
{
public static List<ListData> listTempSource = new List<ListData>();
public static List<ListData> setListDataSource()
{
listTempSource.Add(new ListData { texts = "Inbox" });
listTempSource.Add(new ListData { texts = "VIP" });
listTempSource.Add(new ListData { texts = "Drafts" });
listTempSource.Add(new ListData { texts = "Sent" });
listTempSource.Add(new ListData { texts = "Junk" });
listTempSource.Add(new ListData { texts = "Trash" });
listTempSource.Add(new ListData { texts = "All mails" });
listTempSource.Add(new ListData { texts = "Mail" });
return listTempSource;
}
}
```

In the controller page, you need to pass the model class to the corresponding view.

C#

```
public ActionResult Index()
{
return View(ListDataModal.setListDataSource());
}
```

In the View page, add ListView helper and map the Local data list to corresponding DataSource and ListviewFields. You need to refer the model class at the top of the page.

ASPX-CS

```
@model List<ApplicationName.Models.ListData>
@{
@Html.EJ().ListView("Listview").ShowHeader(false).Height(206).Width(400).Dat
aSource(Model).FieldSettings(f => { f.Text("texts"); });
}
```

Run the above code to render the following output.

Copyright © 2001 - 2020 Syncfusion Inc.

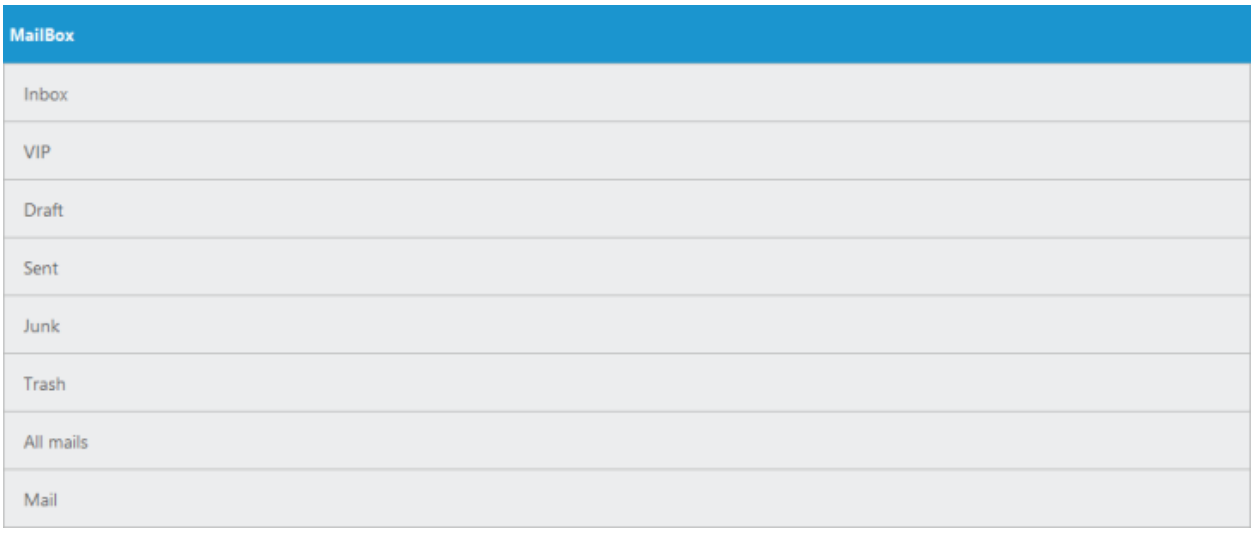
Add header

You can add a header for ListView using ShowHeader property. Refer to the following code example.

ASPX-CS

```
<!—Add Listview control with header -->
@model List<ApplicationName.Models.ListData>
@{
@Html.EJ().ListView("Listview").ShowHeader(true).HeaderTitle("Mailbox").Heig
ht(206).Width(400).DataSource(Model).FieldSettings(f => { f.Text("texts");
});
}
```

Run the above code to render the following output.



Copyright © 2001 - 2020 Syncfusion Inc.

Grouped List

First Level Group List

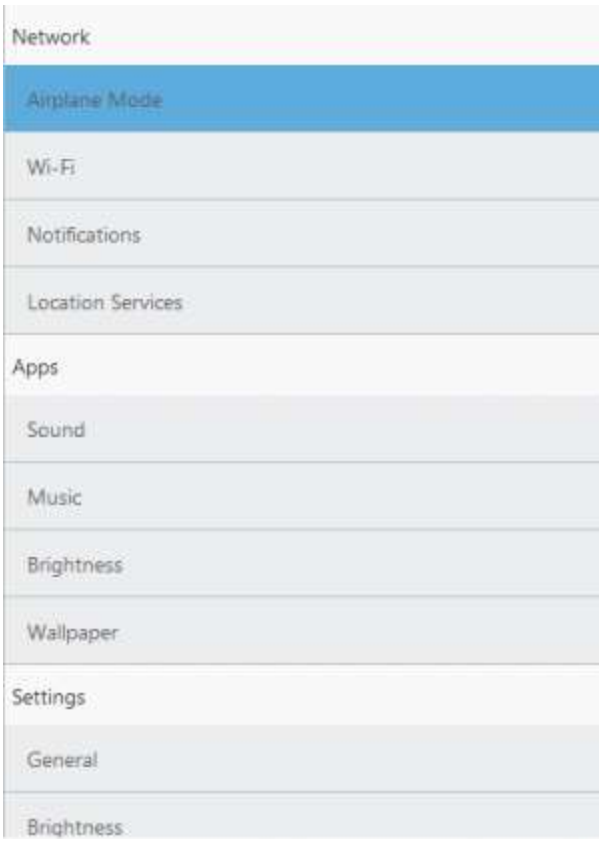
The ListView widget can make as grouped list by setting the “EnableGroupList” property as “true”. This groups the set of items listed under ul. You can identify the grouped items with the header title specified respectively.

Refer the following code example.

ASPX-CS

```
@Html.EJ().ListView("firstLevelGroupList").Width(400).EnableGroupList(true).
Groups(groupList =>
{
groupList.Add().Title("Network").Items(items =>
{
items.Add().Text("Airplane_Mode");
items.Add().Text("Wi-Fi");
items.Add().Text("Notifications");
items.Add().Text("Location_Services");
});
groupList.Add().Title("Apps").Items(items =>
{
items.Add().Text("Sound");
items.Add().Text("Brightness");
items.Add().Text("Wallpaper");
});
groupList.Add().Title("Settings").Items(items =>
{
items.Add().Text("General");
items.Add().Text("Brightness");
items.Add().Text("Wallpaper");
});
})
```

Copyright © 2001 - 2020 Syncfusion Inc.



First Level Group List

Nested Child Group List

While selecting a list item that is grouped, you can also render another set of list items. This is achieved by defining the desired child item list within the list containing ”PrimaryKeyValue”. This PrimaryKeyValue property relates the parent child for identifying its appropriate child when clicking on the parent list item.

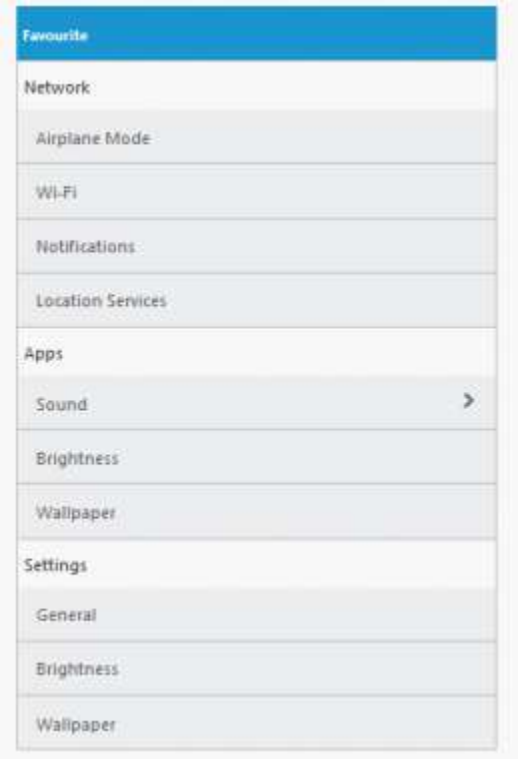
Refer the following code examples.

ASPX-CS

```
@Html.EJ().ListView("groupListSample").Width(400).ShowHeader(true).HeaderTit
le("Favorites").EnableGroupList(true).Groups(groupList =>
{
groupList.Add().Title("Network").Items(items =>
{
items.Add().Text("Airplane_Mode");
items.Add().Text("Wi-Fi");
items.Add().Text("Notifications");
items.Add().Text("Location_Services");
});
groupList.Add().Title("Apps").Items(items =>
{
items.Add().Text("Sound").PrimaryKey(1).Children(child =>
{
child.Add().Text("Ring Tone");
child.Add().Text("Message Tone");
child.Add().Text("Notification Tone");
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
});
items.Add().Text("Brightness");
items.Add().Text("Wallpaper");
});
groupList.Add().Title("Settings").Items(items =>
{
items.Add().Text("General");
items.Add().Text("Brightness");
items.Add().Text("Wallpaper");
});
})
```



Nested Child Group List

Selection

MultiSelection

ListView has a checklist feature that is used to select multiple list items at the same time in the ListView. For this, set EnableCheckMark to “true”.

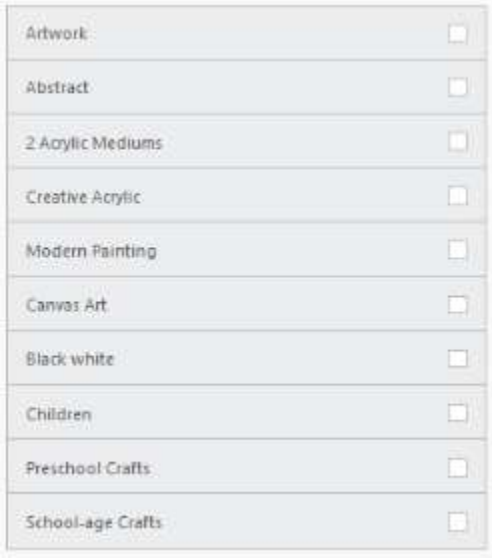
Refer the following code examples.

ASPX-CS

```
@Html.EJ().ListView("lb").EnableCheckMark(true).Width(400).Items(items =>
{
items.Add().Text("ArtWork");
items.Add().Text("Abstract");
items.Add().Text("2 Acrylic Mediums");
items.Add().Text("Creative Acrylic");
items.Add().Text("Modern Painting");
```

```
items.Add().Text("Canvas Art");
items.Add().Text("Black white");
items.Add().Text("Children");
items.Add().Text("Preschool Crafts");
items.Add().Text("School-age Crafts");
})
```

Screenshot:



Enable Check Mark

PreventSelection

When selecting a specific list item, it is highlighted with an active color. PreventSelection property is used to prevent this behavior by setting it to “true”.

Note: When the click or select action is completed, the highlight is undone automatically even when the property is set to “false”.

Refer the following code examples.

ASPX-CS

```
@Html.EJ().ListView("lb").Width(400).PreventSelection(true).Items(items =>
{
items.Add().Text("ArtWork");
items.Add().Text("Abstract");
items.Add().Text("2 Acrylic Mediums");
items.Add().Text("Creative Acrylic");
items.Add().Text("Modern Painting");
items.Add().Text("Canvas Art");
items.Add().Text("Black white");
items.Add().Text("Children");
items.Add().Text("Preschool Crafts");
items.Add().Text("School-age Crafts");
})
```

Copyright © 2001 - 2020 Syncfusion Inc.

PersistSelection

PersistSelection property is used to highlight the selected item in the ListView control even after touch end happens. By default, the active state is removed once the touch end happens.

Refer the following code examples.

ASPX-CS

```
@Html.EJ().ListView("lb").PersistSelection(true).Width(400).Items(items =>
{
items.Add().Text("ArtWork");
items.Add().Text("Abstract");
items.Add().Text("2 Acrylic Mediums");
items.Add().Text("Creative Acrylic");
items.Add().Text("Modern Painting");
items.Add().Text("Canvas Art");
items.Add().Text("Black white");
items.Add().Text("Children");
items.Add().Text("Preschool Crafts");
items.Add().Text("School-age Crafts");
})
```

Screenshot:

Persist Selection

Customize Header

In Listview, you can enable the built-in Header support. To show or hide the Header in ListView, use the ShowHeader property. By default, ListView is rendered with the Header. You can set the title for the Header by using the HeaderTitle property.

In some cases, for the purpose of navigation, you may want to show the Back button in ListView Header. To achieve this, ShowHeaderBackButton property is used. By default, ListView is not rendered with the header back button in parent page. To customize the text shown in ListViewHeaderBack button, the property HeaderBackButtonText is used.

Refer the following code example.

Copyright © 2001 - 2020 Syncfusion Inc.

ASPX-CS

```
@Html.EJ().ListView("lb").Width(400).ShowHeader(true).ShowHeaderBackButton(t
rue).HeaderBackButtonText("Menu").Items(items =>
{
items.Add().Text("ArtWork");
items.Add().Text("Abstract");
items.Add().Text("2 Acrylic Mediums");
items.Add().Text("Creative Acrylic");
items.Add().Text("Modern Painting");
items.Add().Text("Canvas Art");
items.Add().Text("Black white");
items.Add().Text("Children");
items.Add().Text("Preschool Crafts");
items.Add().Text("School-age Crafts");
})
```

Screenshot:

Customize Header

Data Binding

Local Data Binding

Essential Studio WebJS ListView provides support for Data Binding. Data Binding provides a simple and consistent way for applications to present and interact with data. Elements can be bounded to data from a variety of data sources. In local data binding, the data source is written inside the program. Then it is handled by the ListView control. DataSource is used to get the data source that holds the list items.

Please refer the following code examples.

Copyright © 2001 - 2020 Syncfusion Inc.

For MVC Wrapper example, you need to create model file for data-binding. Add the following model code to a CS file and save it as ListLocalData.cs.

C#

```
public class ListLocalData
{
public string text { get; set; }
}
public static class ListLocalDataModal
{
public static List<ListLocalData> listSource = new List<ListLocalData>();
public static List<ListLocalData> setListSource()
{
listSource.Add(new ListLocalData { text = "Hot Singles"});
listSource.Add(new ListLocalData { text = "Rising Artists"});
listSource.Add(new ListLocalData { text = "Live Music"});
listSource.Add(new ListLocalData { text = "Best of 2013 So Far"});
listSource.Add(new ListLocalData { text = "100 Albums - $5 Each"});
listSource.Add(new ListLocalData { text = "Hip-Hop and R&B Sale"});
listSource.Add(new ListLocalData { text = "CD Deals"});
listSource.Add(new ListLocalData { text = "Songs"});
listSource.Add(new ListLocalData { text = "Bestselling Albums"});
listSource.Add(new ListLocalData { text = "New Releases"});
listSource.Add(new ListLocalData { text = "Bestselling Songs"});
listSource.Add(new ListLocalData { text = "Rock"});
listSource.Add(new ListLocalData { text = "Gospel" });
listSource.Add(new ListLocalData { text = "Jazz"});
listSource.Add(new ListLocalData { text = "Music Trade-In"});
listSource.Add(new ListLocalData { text = "Redeem a Gift Card"});
listSource.Add(new ListLocalData { text = "Band T-Shirts"});
listSource.Add(new ListLocalData { text = "Mobile MVC"});
return listSource;
}
public static void clearSource()
{
listSource.Clear();
}
}
```

You have to modify the controller as the model is added to the sample. You can modify the controller as follows.

C#

```
public ActionResult LocalDataBinding()
{
ListLocalDataModal.clearSource();
return View(ListLocalDataModal.setListSource());
}
```

You can use the following code example to give you the exact output.

ASPX-CS

```
@model List<ListLocalData>
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
@{
@Html.EJ().ListView("localListView").Width(400).DataSource(Model)
}
```

Screenshot:

Local Data Binding

Remote Data Binding

Essential Studio Web MVC ListView provides support for **Remote Data Binding**.

OData

OData is a standardized protocol for creating and consuming data. You can provide the OData service URL directly to the Datasource URL property.

HTML

```
@(Html.EJ().ListView("ListView1").DataSource("http://js.syncfusion.com/ejservices/Wcf/Northwind.svc/").Query("ej.Query().from('Customers').take(10)").FieldSettings(listViewFieldSettings =>
listViewFieldSettings.Text("CustomerID")))
```

Run the code to get the following output

Copyright © 2001 - 2020 Syncfusion Inc.

OData Version 4

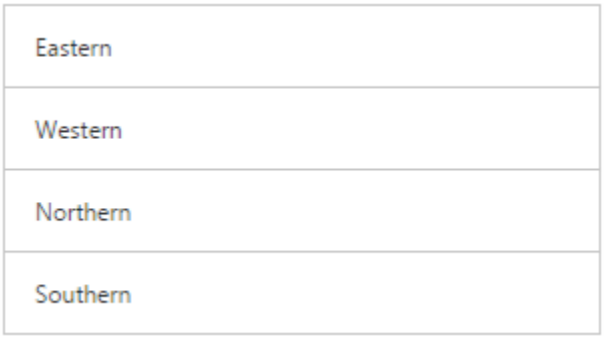
For OData Version 4 support ODataV4Adaptor should be used. By using URL property of Datasource, you can bind OData Version 4 Service link and specify Adaptor value as enum AdaptorType.ODataV4Adaptor.

For further details about OData service please refer the link.

HTML

```
@(Html.EJ().ListView("ListView1").DataSource("http://js.syncfusion.com/ejser
vices/Wcf/Northwind.svc/").Query("ej.Query().from('Customers').take(10)").Wi
dth(300).FieldSettings(listViewFieldSettings =>
listViewFieldSettings.Text("CustomerID")))
```

Run the code to get the following output.



Copyright © 2001 - 2020 Syncfusion Inc.

URL Adaptor

URL Adaptor of **DataManager** can be used when you are required to use remote service to retrieve data. It interacts with server-side for all **DataManager** Queries and **CRUD** operations.

Now, in the following code example the data is retrieved from **Controller**.

HTML

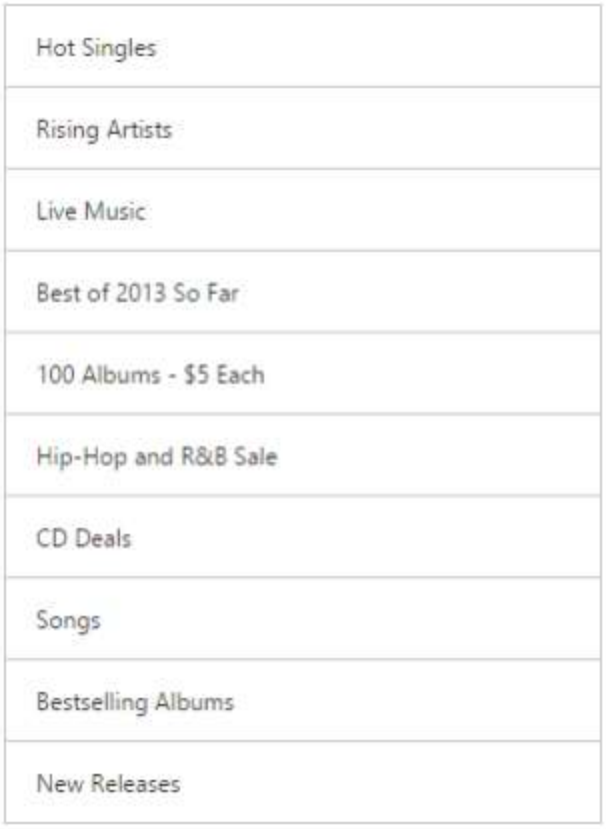
```
@(Html.EJ().ListView("ListView").DataSource(listViewDataSource =>
listViewDataSource.URL(Url.Action("DataSource",
"ListView")).Adaptor(AdaptorType.UrlAdaptor)).Query("ej.Query()").FieldSetti
ngs(listViewFieldSettings => listViewFieldSettings.Text("caption")))
```

C#

```
**Controller:**
public partial class ListviewController : Controller
{
public JsonResult DataSource()
{
IEnumerable Data = setListSource();
return Json(Data, JsonRequestBehavior.AllowGet);
}
public static List<ListLocalData> setListSource()
{
List<ListLocalData> listSource = new List<ListLocalData>();
listSource.Add(new ListLocalData { caption = "Hot Singles" });
listSource.Add(new ListLocalData { caption = "Rising Artists" });
listSource.Add(new ListLocalData { caption = "Live Music" });
listSource.Add(new ListLocalData { caption = "Best of 2013 So Far" });
listSource.Add(new ListLocalData { caption = "100 Albums - $5 Each" });
listSource.Add(new ListLocalData { caption = "Hip-Hop and R&B Sale" });
listSource.Add(new ListLocalData { caption = "CD Deals" });
listSource.Add(new ListLocalData { caption = "Songs" });
listSource.Add(new ListLocalData { caption = "Bestselling Albums" });
listSource.Add(new ListLocalData { caption = "New Releases" });
return listSource;
}
```

Run the code to get the following output

Copyright © 2001 - 2020 Syncfusion Inc.



WebAPI

WebApi Adaptor, extended from **ODataAdaptor**, of **DataManager** is used for retrieving data from WebApi service.ASP.NET Web API is a Framework for building HTTP services. You can retrieve data from ASP.NET Web API by using DataManager. Using WebApiAdaptor, you can bind WebApi service's data to ListView. The data from WebApi service must be returned as an object that has its value as data source and property "caption" with its value as dataSource's total records count.

HTML

```
@(Html.EJ().ListView("ListView").DataSource(listViewDataSource =>
listViewDataSource.URL(Url.Action("http://js.syncfusion.com/ejservices/Wcf/N
orthwind.svc/")).Adaptor(AdaptorType.WebApiAdaptor)).Query("ej.Query().from(
'Customers').take(10)").FieldSettings(listViewFieldSettings =>
listViewFieldSettings.Text("CompanyName")))
```

Run the code to get the following output.

Copyright © 2001 - 2020 Syncfusion Inc.

FieldSettings

The FieldSettings property is used to map the DataSource field with the list item fields. In addition to the list item specific properties, the following fields are available while mapping.

FieldSettings

Properties	Definition
ParentPrimaryKey	In DB, you can relate any child item to some other item. Set here is â€˜PrimaryKeyâ€™ for the parent item. Here â€˜ParentPrimaryKeyâ€™ defines the â€˜PrimaryKeyâ€™ of some parent item to identify its parent.
Attributes	In DB, you can define your desired class name or styles for the list item through the â€˜Attributesâ€™ field.

Please refer the following code examples.

ASPX-CS

```
@model List<FieldSettingsData>
@{
@Html.EJ().ListView("localListView").Width(400).ShowHeader(true).HeaderTitle
("Music World").DataBinding(true).DataSource(Model).FieldSettings(f =>
{
f.Text("texts").PrimaryKey("primaryKeys").ParentPrimaryKey("parentPrimaryKey
s").ChildHeaderTitle("Title").ChildHeaderBackButtonText("BackIconText");
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
});
}
```

Screenshots:

Field Settings

When you click on the parent item, it navigates to its corresponding child list item as follows.

Field Settings

Filtering

Filtering is one of the key features of ListView control. The Filtering option is added into the ListView control when the EnableFiltering property is set to “true”. This enables a simple interface to filter items from a large collection of ListView items.

Refer the following code examples.

ASPX-CS

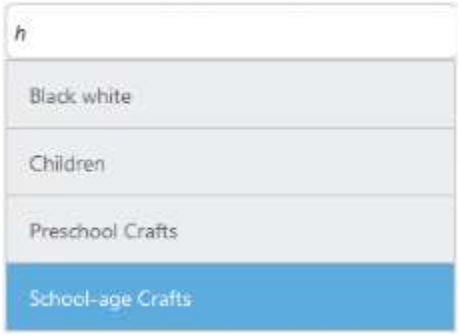
```
@Html.EJ().ListView("lb").Width(300).EnableFiltering(true).Items(items => {
items.Add().Text("ArtWork");
items.Add().Text("Abstract");
items.Add().Text("2 Acrylic Mediums");
items.Add().Text("Creative Acrylic");
items.Add().Text("Modern Painting");
items.Add().Text("Canvas Art");
items.Add().Text("Black white");
items.Add().Text("Children");
items.Add().Text("Preschool Crafts");
items.Add().Text("School-age Crafts");
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
})
```

Screenshot:

Enable Filtering



Enable Filtering

Dimensions

To customize the ListView dimensions, Width and Height properties are used.

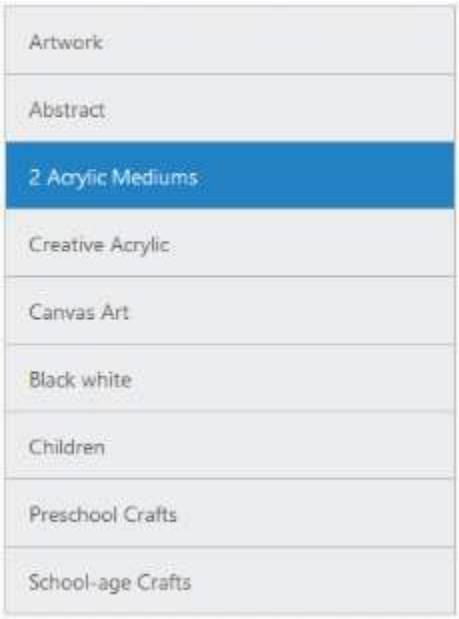
Refer to the following code examples.

ASPX-CS

```
@Html.EJMobile().ListView("lb").Height(600).Width(300).Items(items =>
{
items.Add().Text("ArtWork");
items.Add().Text("Abstract");
items.Add().Text("2 Acrylic Mediums");
items.Add().Text("Creative Acrylic");
```

```
items.Add().Text("Canvas Art");
items.Add().Text("Black white");
items.Add().Text("Children");
items.Add().Text("Preschool Crafts");
items.Add().Text("School-age Crafts");
})
```

Screenshot:



Height

Virtual Scrolling

We can load large data on demand using "AllowVirtualScrolling" property. By default, "AllowVirtualScrolling" set as boolean value of **“false”**. When it is set true, list items will be loaded on every scroll action. The number of items to be loaded per request can be specified using the “ItemRequestCount” property.By default “ItemRequestCount” value will be 5. We have provided two type of option for virtualScrolling,

Normal Mode

This mode allows you to load the list view data while scrolling i.e. each time the scroll bar is scrolled, it will send request to the server to load the data.

Continuous Mode

This mode allows you to load the list view data when the scrollbar reaches the end point. In this mode, we can specify the number of items to be loaded per request.

Please refer the following code examples.

ASPX-CS

```
@Html.EJ().ListView("localListView").Width(400).Height(300).DataSource(dataS
ource =>
dataSource.URL("http://js.syncfusion.com/ejservices/Wcf/Northwind.svc/").Cro
ssDomain(true)).Query("ej.Query().from('Customers')").FieldSettings(f =>
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
f.Text("CustomerID")).AllowVirtualScrolling(true).VirtualScrollMode(VirtualS
crollMode.Continuous).ItemRequestCount(8)
```

How To

Get the selected values on post back.

Single selection

Enable the property PersistSelection in order to use selection in ListView. Then use the getActiveItemText method take the selected active text through javascript and then pass it to the controller via AJAX.

HTML

```
@Html.EJ().ListView("localListView").Width(400).DataSource((IEnumerable<Cars
List>)ViewBag.datasource).FieldSettings(sf =>
sf.Text("text")).PersistSelection(true)
@Html.EJ().Button("button").ShowRoundedCorner(true).Text("Submit").ClientSid
eEvents(e => e.Click("click"))
<script>
function click(args) {
var text = $("#localListView").ejListView("getActiveItemText");
$.ajax({
type: "POST",
data: { value: text },
url: "/ListView/Features",
success: function (result) {
alert(result);
}
});
}
</script>
```

C#

```
[HttpPost]
public ActionResult Features(string value)
{
string val = value;
return Json(val, JsonRequestBehavior.AllowGet);
}
```

Multiple selection

Multiple items can be selected by using EnableCheckMark property. Hence we need to use the getCheckedItemsText method to take all the checked items and then pass it to the controller using javascript AJAX.

HTML

```
@Html.EJ().ListView("localListView").Width(400).DataSource((IEnumerable<Cars
List>)ViewBag.datasource).EnableCheckMark(true).FieldSettings(sf =>
sf.Text("text"))
@Html.EJ().Button("button").ShowRoundedCorner(true).Text("Submit").ClientSid
eEvents(e => e.Click("click"))
<script>
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
function click1(args) {
var text = $("#localListView").ejListView("getCheckedItemsText");
$.ajax({
type: "POST",
data: { value: text },
url: "/ListView/Features",
success: function (result) {
alert(result);
}
});
}
</script>
```

C#

```
[HttpPost]
public ActionResult Features(object value)
{
object val = value;
return Json(val, JsonRequestBehavior.AllowGet);
}
```

Render ListView from Code behind

ListView can be rendered from the code behind by initializing the required properties in controller and passing those properties via **ViewData** or **Model** to the client side

The following code illustrates the initialization of ListView properties in the controller.

C#

```
//Namespace to get the JavaScript (ListView) component properties
using Syncfusion.JavaScript.Models;
namespace MvcApplication.Controllers
{
public class ListViewController: Controller
{
public ActionResult ListviewFeatures()
{
//Initializing the Listbox model
ListViewProperties ListviewObj = new ListViewProperties();
//Initializing the data as items and other properties
ListViewProperties ListviewObj = new ListViewProperties();
ListviewObj.ShowHeader = false;
ListviewObj.Width = 200;
List<ListViewItem> obj = new List<ListViewItem>();
obj.Add(new ListViewItem() { Text = "Home" });
obj.Add(new ListViewItem() { Text = "Profile" });
obj.Add(new ListViewItem() { Text = "Photos" });
obj.Add(new ListViewItem() { Text = "Location" });
ListviewObj.Items = obj;
ListviewObj.EnableCheckMark = true;
//Passing Listview properties using the ViewData
ViewData["ListModel"] = ListObj;
return View();
}
}
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
}
```

Binding the ListView properties passed via **ViewData** from the controller in the client side as below.

ASPX-CS

```
@{
Html.EJ().ListView("Listview",
(Syncfusion.JavaScript.Models.ListViewProperties)ViewData["ListViewModel"]).
Render();
}
```

Maps

Maps

A Map is a graphical representation of geographical data. It is used to represent the statistical data of a particular geographical area on Earth. Using pan and zoom, the maps can be navigated. Maps supports enhanced data visualization with bubbles and labels using data bound to the map.

Use Case Scenarios

Some of the Maps control use case scenarios:

- To visualize weather data.
- To visualize geographical statistics information.
- To visualize the density or availability of resources in an area.
- To visualize political information.
- To visualize the layout of a building.

Key Features

- Layers - Map is maintained through Layers and it can accommodate one or more layers.
- Map Providers Support - Syncfusion Map support map providers such as OpenStreetMap that can be added to any layers in maps.
- GeoJSON Data Input - The GeoJSON standard allows you to plot your own shapes using customized data to your maps. You can obtain some of the GeoJSON standard shape information from GEOJSON format shapes that can be used as data input for maps.
- Map Elements Customization - Map contains a set of elements, including shapes, bubbles, markers, legend, labels and data items that can be visualized with customized appearance showing additional information on the map using bound data.
- User Interaction - Options like zooming, panning and map selection enables the effective interaction on map elements.

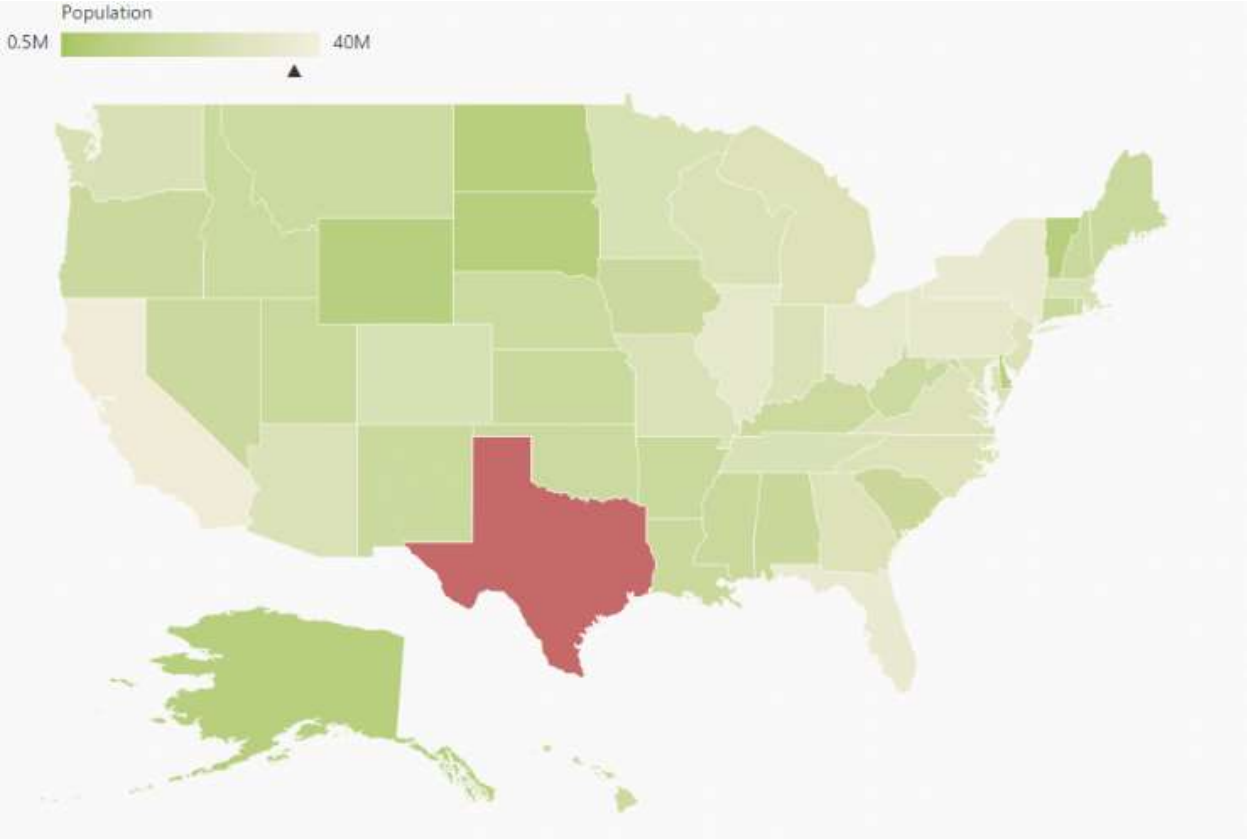
Getting Started

This section explains briefly about how to create Maps in your application with ASP.NET MVC.

Create your first Map in MVC

You can configure an Essential ASP.NET MVC Map with simple steps. In this example, you can learn how to configure USA population map with customized appearance and tooltip.

Copyright © 2001 - 2020 Syncfusion Inc.



Create a simple MVC Application

To begin, create a new ASP.NET MVC project Razor application. For creating a MVC Project and adding necessary Dll's and Scripts, refer MVC-Getting Started Documentation.

Preparing Shape Data

The Shape Data collection describing geographical shape information can be obtained from GEOJSON format shapes.

In this example, USA shape is used as shape data by utilizing the United States of America.json file in the following folder structure obtained from downloaded Maps_GeoJSON folder.

..\ Maps_GeoJSON\All Countries with States

You can store the United States of America.json file in App_Data folder as usa.json. Then read the complete contents in "usa.json" file and assign to new MapData object in "MapController.cs" in the following folder location,

~/Controller/MapController.cs

C#

```
public ActionResult Map()
{
ViewData["mapdata"] = GetUSMap();
return View();
}
public object GetUSMap()
{
```

```
string data =
System.IO.File.ReadAllText(Server.MapPath("~/App_Data/USA.json"));
JavaScriptSerializer ser = new JavaScriptSerializer();
ser.MaxJsonLength = int.MaxValue;
return new MapData(data);
}
```

Prepare Data Source

The dataSource is populated with USA population data inside the controller relative to shape data. For better understanding, “MapController.cs” is populated with data of USA Population in “MapController.cs”.

C#

```
public ActionResult Map()
{
ViewData["mapdata"] = GetUSMap();
ViewData["datasource"] = GetUSPopulationData();
return View();
}
public object GetUSMap()
{
string data =
System.IO.File.ReadAllText(Server.MapPath("~/App_Data/USA.json"));
JavaScriptSerializer ser = new JavaScriptSerializer();
ser.MaxJsonLength = int.MaxValue;
return new MapData(data);
}
public List<CountyPopulationData> GetUSPopulationData()
{
List<CountyPopulationData> populationData = new List<CountyPopulationData>
{
new CountyPopulationData(){ Name= "California", Population=38332521},
new CountyPopulationData(){ Name= "Texas", Population=26448193},
new CountyPopulationData(){ Name= "New York", Population=19651127},
new CountyPopulationData(){ Name= "Florida", Population=19552860},
new CountyPopulationData(){ Name= "Illinois", Population=12882135},
new CountyPopulationData(){ Name= "Pennsylvania", Population=12773801},
new CountyPopulationData(){ Name= "Ohio", Population=11570808},
new CountyPopulationData(){ Name= "Georgia", Population=9992167},
new CountyPopulationData(){ Name= "Michigan", Population=9895622},
new CountyPopulationData(){ Name= "North Carolina", Population=9848060},
new CountyPopulationData(){ Name= "New Jersey", Population=8899339},
new CountyPopulationData(){ Name= "Virginia", Population=8260405},
new CountyPopulationData(){ Name= "Washington", Population=6971406},
new CountyPopulationData(){ Name= "Massachusetts", Population=6692824},
new CountyPopulationData(){ Name= "Arizona", Population=6626624},
new CountyPopulationData(){ Name= "Indiana", Population=6570902},
new CountyPopulationData(){ Name= "Tennessee", Population=6495978},
new CountyPopulationData(){ Name= "Missouri", Population=6044171},
new CountyPopulationData(){ Name= "Maryland", Population=5928814},
new CountyPopulationData(){ Name= "Wisconsin", Population=5742713},
new CountyPopulationData(){ Name= "Minnesota", Population=5420380},
new CountyPopulationData(){ Name= "Colorado", Population=5268367},
new CountyPopulationData(){ Name= "Alabama", Population=4833722},
new CountyPopulationData(){ Name= "South Carolina", Population=4774839},
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
new CountyPopulationData(){ Name= "Louisiana", Population=4625470},
new CountyPopulationData(){ Name= "Kentucky", Population=4395295},
new CountyPopulationData(){ Name= "Oregon", Population=3930065},
new CountyPopulationData(){ Name= "Oklahoma", Population=3850568},
new CountyPopulationData(){ Name= "Puerto Rico", Population=3615086},
new CountyPopulationData(){ Name= "Connecticut", Population=3596080},
new CountyPopulationData(){ Name= "Iowa", Population=3090416},
new CountyPopulationData(){ Name= "Mississippi", Population=2991207},
new CountyPopulationData(){ Name= "Arkansas", Population=2959373},
new CountyPopulationData(){ Name= "Utah", Population=2900872},
new CountyPopulationData(){ Name= "Kansas", Population=2893957},
new CountyPopulationData(){ Name= "Nevada", Population=2790136},
new CountyPopulationData(){ Name= "New Mexico", Population=2085287},
new CountyPopulationData(){ Name= "Nebraska", Population=1868516},
new CountyPopulationData(){ Name= "West Virginia", Population=1854304},
new CountyPopulationData(){ Name= "Idaho", Population=1612136},
new CountyPopulationData(){ Name= "Hawaii", Population=1404054},
new CountyPopulationData(){ Name= "Maine", Population=1328302},
new CountyPopulationData(){ Name= "New Hampshire", Population=1323459},
new CountyPopulationData(){ Name= "Rhode Island", Population=1051511},
new CountyPopulationData(){ Name= "Montana", Population=1015165},
new CountyPopulationData(){ Name= "Delaware", Population=925749},
new CountyPopulationData(){ Name= "South Dakota", Population=844877},
new CountyPopulationData(){ Name= "Alaska", Population=735132},
new CountyPopulationData(){ Name= "North Dakota", Population=723393},
new CountyPopulationData(){ Name= "District of Columbia",
Population=646449},
new CountyPopulationData(){ Name= "Vermont", Population=626630},
new CountyPopulationData(){ Name= "Wyoming", Population=582658}
};
return populationData;
}
public class CountyPopulationData
{
public string name;
public string Name
{
get { return name; }
set { name = value; }
}
public double population;
public double Population
{
get { return population; }
set { population = value; }
}
}
```

You can refer to shape data and datasource as illustrated in the following “Map.cshtml”,

ASPX-CS

```
@{
var mapData = ViewData["mapdata"];
var dataSource = ViewData["datasource"];
}
```

Copyright © 2001 - 2020 Syncfusion Inc.

Initialize Map

- Create a tag and set the height and width to determine the map size.

ASPX-CS

```
<div style="width: 900px; height: 600px;"></div>
```

- Add the following code sample in “Map.cshtml” file, to create the Map control in the View page.

ASPX-CS

```
<div style="width:900px; height:600px;">
@(Html.EJ().Map("container")
.Layers(layer =>
{
layer.ShapeData(mapData).Add();
})
)
</div>
```

- The Final Map.cshtml file appears as follows.

ASPX-CS

```
@{
var mapData = ViewData["mapdata"];
var datasource = ViewData["datasource"];
}
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<script src="http://code.jquery.com/jquery-1.10.1.min.js"></script>
<script
src="http://cdn.syncfusion.com/13.1.0.21/js/ej.widgets.all.min.js"></script>
<script src="http://cdn.jsdelivr.net/jsrender/1.0pre35/jsrender.min.js"
type="text/javascript"></script>
<script
src="http://cdn.syncfusion.com/13.1.0.21/js/web/ej.unobtrusive.min.js"
type="text/javascript"></script>
@using Syncfusion.JavaScript.DataVisualization.Models
</head>
<body>
<div style="height:600px;width:900px;">
@(Html.EJ().Map("container")
.Layers(layer =>
{
layer.ShapeData(mapData).Add();
})
)
</div>
@(Html.EJ().ScriptManager())
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
</body>
</html>
```

The above code renders a map with default properties and shape input provided through data in layers.

Data Binding in Map

The following properties in shape layers is used for binding data in Maps control.

- DataSource
- ShapeDataPath
- ShapePropertyPath

DataSource

The DataSource property accepts collection values as input. For example, you can provide the list of objects as input.

Shape Data Path

The ShapeDataPath property is used to refer the data ID in DataSource. For example, population MapData contains data ids ‘Name’ and ‘Population’. The ShapeDataPath and ShapePropertyPath properties are related to each other (refer to ShapePropertyPath for more details).

Shape Property Path

The ShapePropertyPath property is similar to the ShapeDataPath that refers the column name in the Data property of shape layers to identify the shape. When the values of the ShapeDataPath property in

Copyright © 2001 - 2020 Syncfusion Inc.

the DataSource property and the value of ShapePropertyPath in the Data property match, then the associated object from the DataSource is bound to the corresponding shape.

ASPX-CS

```
@(Html.EJ().Map("container")
.Layers(layer =>
{
layer.ShapeData(mapData)
.ShapeDataPath("name")
.ShapePropertyPath("name")
.DataSource(datasource)
.Add();
})
)
```

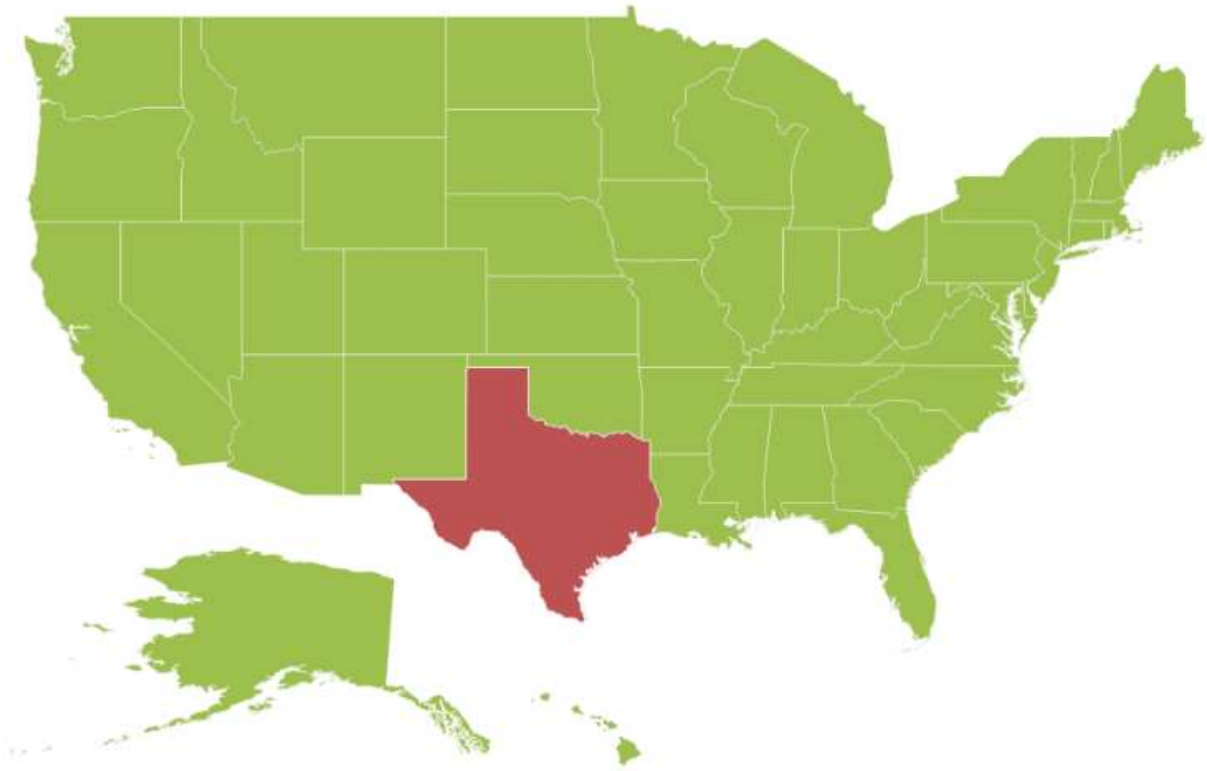
Customize Map Appearance

You can customize the shape's color by using Fill, Stroke and StrokeThickness properties in ShapeSettings.

ASPX-CS

```
@(Html.EJ().Map("container")
.Layers(layer =>
{
layer.ShapeData(mapData)
.ShapeDataPath("name")
.ShapePropertyPath("name")
.DataSource(datasource)
.EnableSelection(false)
.EnableMouseHover(true)
.ShapeSettings(ss  =>
{
ss.Fill("#9CBF4E")
.StrokeThickness(0.5)
.Stroke("White")
.HighlightStroke ("White")
.HighlightColor("#BC5353")
.HighlightBorderWidth(1);
})
.Add();
})
)
```

Copyright © 2001 - 2020 Syncfusion Inc.



Customizing Map Appearance by Range

The Range color mapping is used to differentiate the shape's fill based on its underlying value and color ranges. The From and To properties defines the value ranges and the GradientColors property defines the equivalent color ranges respective to their value ranges.

Note: The EnableGradient property value should be true to apply gradient colors for maps.

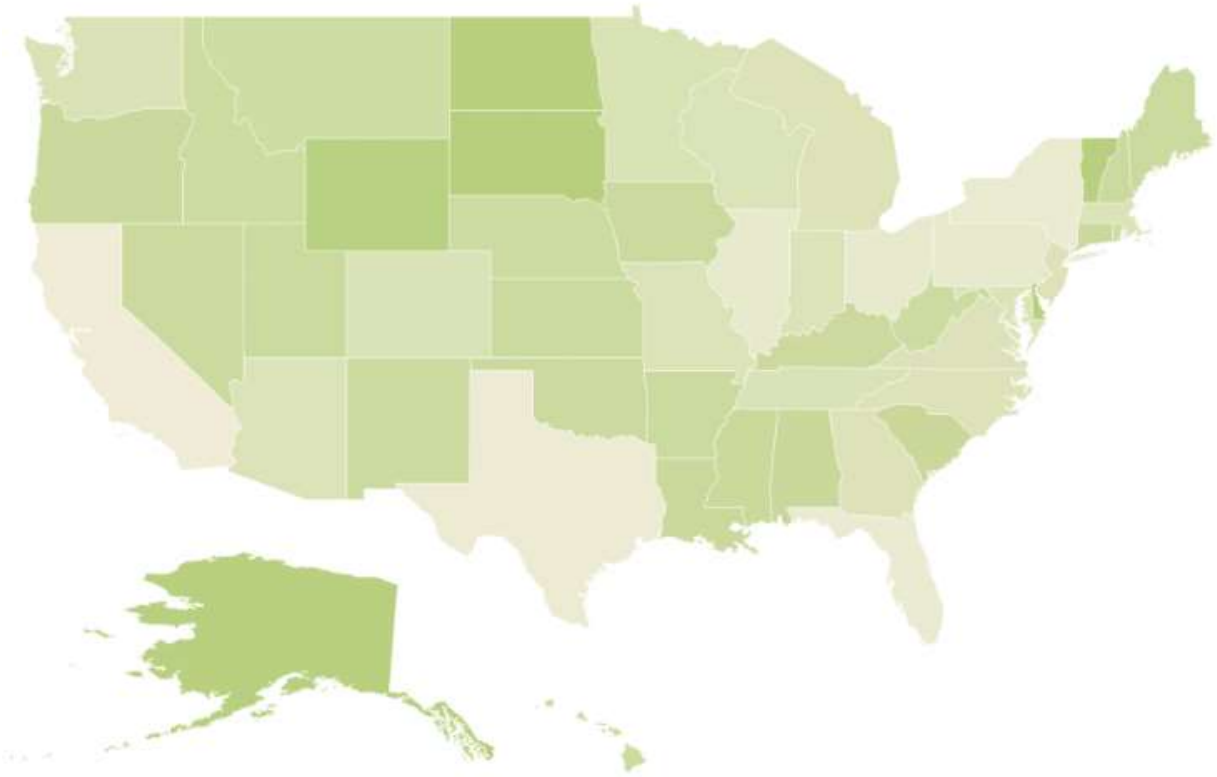
ASPX-CS

```
@(Html.EJ().Map("container")
.Layers(layer =>
{
layer.ShapeData(mapData)
.ShapeDataPath("name")
.ShapePropertyPath("name")
.DataSource(datasource)
.ShowMapItems(false)
.EnableSelection(false)
.EnableMouseHover(true)
.ShapeSettings(ss  =>
{
ss.Fill("#9CBF4E")
.StrokeThickness(0.5)
.Stroke("White")
.HighlightStroke("White")
.HighlightColor("#BC5353")
.HighlightBorderWidth(1)
.ValuePath("population")
.EnableGradient(true)
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
.RangeColorMappings(cm =>
{
cm.From(500000).To(1000000).GradientColors(new List<string> { "#9CBF4E",
"#B8CE7B" }).Add();
cm.From(1000001).To(5000000).GradientColors(new List<string> { "#B8CE7B",
"#CBD89A" }).Add();
cm.From(5000001).To(10000000).GradientColors(new List<string> { "#CBD89A",
"#DEE2B9" }).Add();
cm.From(10000001).To(40000000).GradientColors(new List<string> { "#DEE2B9",
"#F1ECD8" }).Add();
});
})
.Add();
})
)
```

The following screenshot illustrates a Map with gradient color property enable.



Enable Tooltip

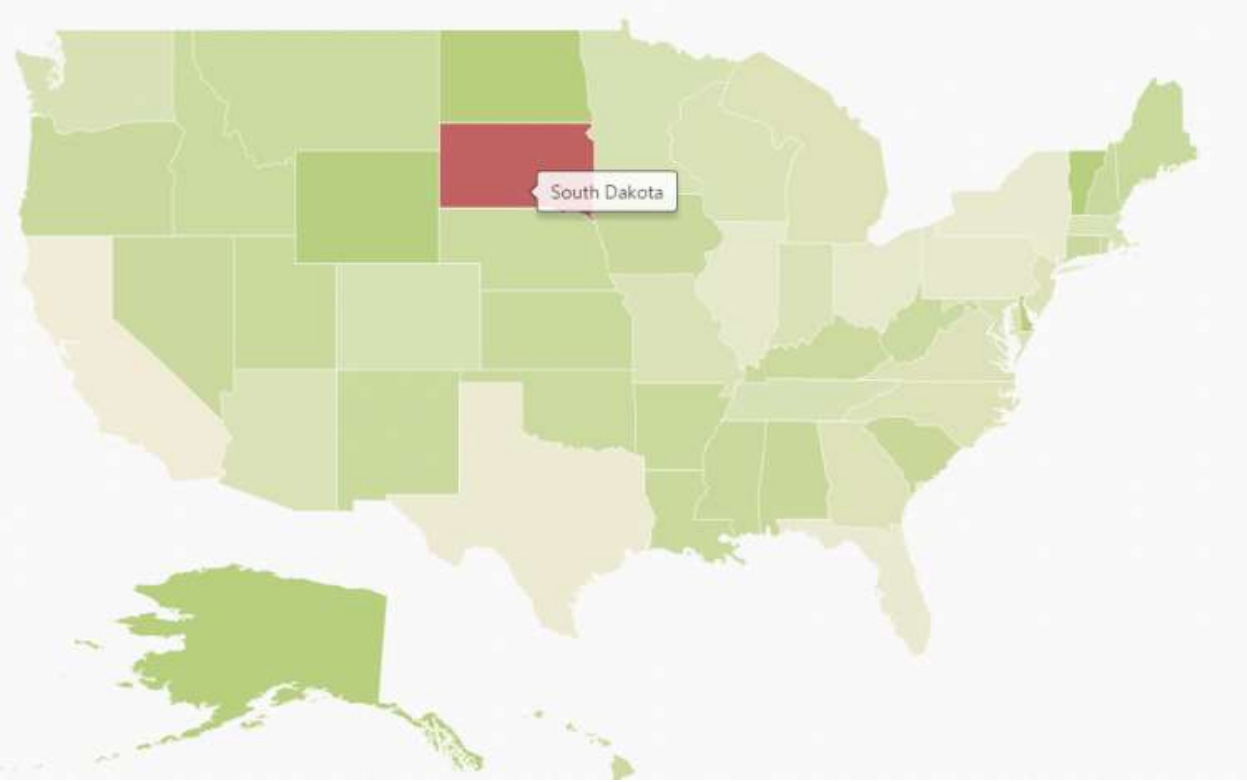
The tooltip is displayed only when ShowTooltip is set to ‘true’ in the shape layers. By default, it takes the property of the bound object that is referred in the ValuePath and displays its content on hovering the corresponding shape. The TooltipTemplate property is used for customizing the template for tooltip.

ASPX-CS

```
@(Html.EJ().Map("container")
```

```
.Layers(layer =>
{
layer.ShapeSettings(ss  =>
{
ss.ValuePath("name")
})
.ShowTooltip(true);
})
)
```

The following screenshot illustrates a map control displaying a Tooltip.



Legend

A Legend can be made visible by setting the ShowLegend property in LegendSetting.

Interactive Legend

The legends can be made interactive with an arrow mark indicating the exact range color in the legend, when the mouse hovers the corresponding shapes. You can enable this option by setting Mode property in LegendSettings value as 'Interactive'. The default value of Mode property is 'Default' to enable the normal legend.

Title

Use Title property to provide title for interactive legend.

Label

You can use LeftLabel and RightLabel property to provide left and right labels for interactive legend.

ASPX-CS

```
@(Html.EJ().Map("container")
.Layers(layer =>
{
layer.ShapeData(mapData)
.ShapeDataPath("name")
.ShapePropertyPath("name")
.DataSource(datasource)
.ShowMapItems(false)
.EnableSelection(false)
.EnableMouseHover(true)
.ShapeSettings(ss  =>
{
ss.Fill("#9CBF4E")
.StrokeThickness(0.5)
.Stroke("White")
.HighlightStroke("White")
.HighlightColor("#BC5353")
.HighlightBorderWidth(1)
.ValuePath("population")
.EnableGradient(true)
.RangeColorMappings(cm =>
{
cm.From(500000).To(1000000).GradientColors(new List<string> { "#9CBF4E",
"#B8CE7B" }).Add();
cm.From(1000001).To(5000000).GradientColors(new List<string> { "#B8CE7B",
"#CBD89A" }).Add();
cm.From(5000001).To(10000000).GradientColors(new List<string> { "#CBD89A",
"#DEE2B9" }).Add();
cm.From(10000001).To(40000000).GradientColors(new List<string> { "#DEE2B9",
"#F1ECD8" }).Add();
});
})
.LegendSettings(ml =>
{
ml.ShowLegend(true)
.Height(15)
.Width(150)
.Position(Syncfusion.JavaScript.DataVisualization.Models.DockPosition.Toplef
t)
.Type(Syncfusion.JavaScript.DataVisualization.Models.LegendType.Layers)
.Mode(Syncfusion.JavaScript.DataVisualization.Models.LegendMode.Interactive)
.Title("Population")
.LeftLabel("0.5 M")
.RightLabel("40 M");
})
.Add();
})
)
```

DockOnMap and Dock Position

dockOnMap determines whether the legend should be placed outside or inside the map bounds.

dockPosition determines the legend placement and it is valid only when dockOnMap is true.

Copyright © 2001 - 2020 Syncfusion Inc.

Icon

To get `icon` value for legend setting. You can set `iconHeight` and `iconWidth` property for legend settings.

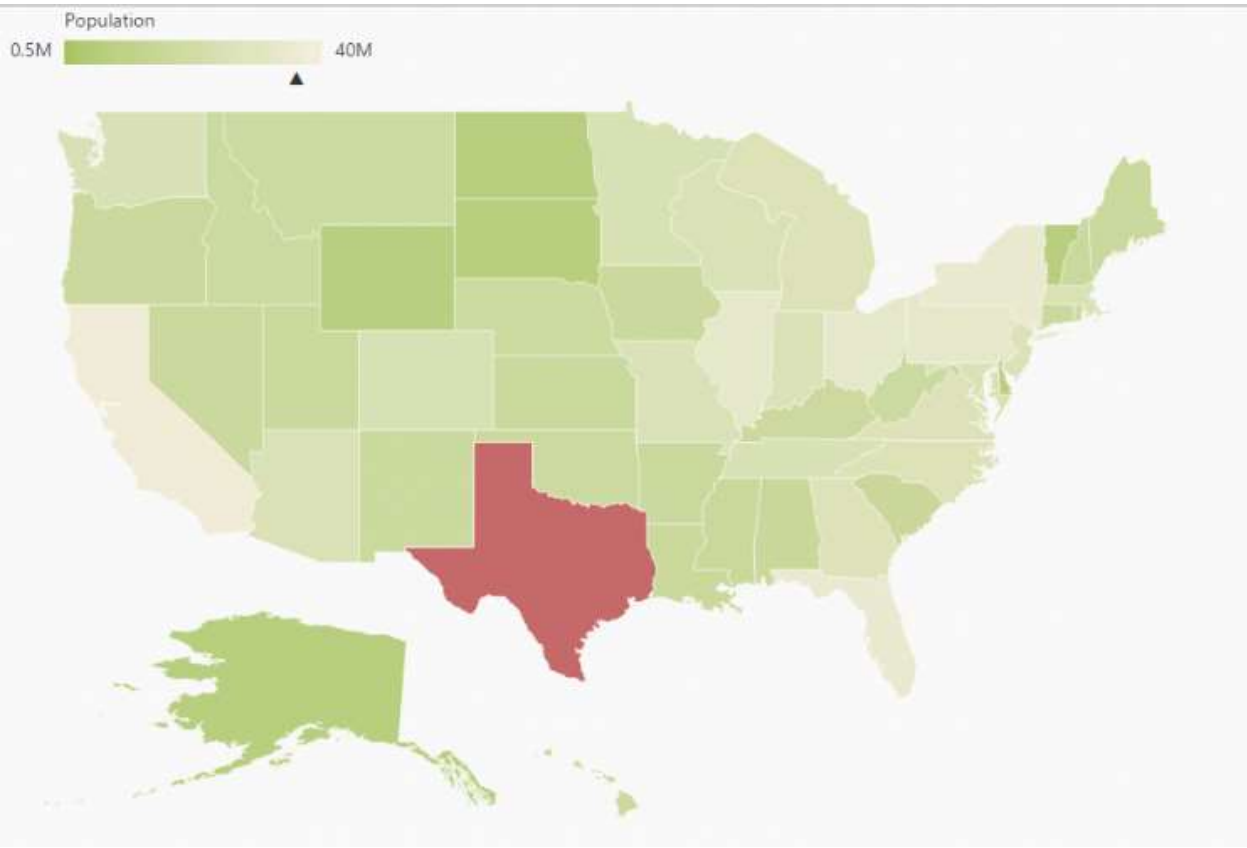
label Orientation

Set the orientation of legend labels by using `labelOrientation` property.

Show Labels

Enables or Disables the `showLabels`

The following screenshot illustrates a map displaying an interactive legend.



The complete code sample can be found here

Populate Data

In this section you can learn how to populate shape data for providing Data input to Map control and usage of DataSource property.

Shape Data

The Shape Data collection describing geographical shape information can be obtained from GEOJSON format shapes.

In this example, USA shape is used as shape data by utilizing the “United States of America.json” file in the following folder structure obtained from downloaded Maps_GeoJSON folder.

..\ Maps_GeoJSON\All Countries with States

Copyright © 2001 - 2020 Syncfusion Inc.

You can store the “United States of America.json” file in App_Data folder as “usa.json”. Then, read the complete contents in “usa.json” file and assign to new MapData object in “MapController.cs” in the following folder location,

~/Controller/MapController.cs

C#

```
public ActionResult Map()
{
ViewData["mapdata"] = GetUSMap();
return View();
}
public object GetUSMap()
{
string data =
System.IO.File.ReadAllText(Server.MapPath("~/App_Data/USA.json"));
JavaScriptSerializer ser = new JavaScriptSerializer();
ser.MaxJsonLength = int.MaxValue;
return new MapData(data);
}
```

Data Binding

The Maps control supports data binding with the DataSource property in the shape layers.

Properties

The following properties in shape layers is be used for binding data in Maps control,

- Data Source
- shapeDataPath
- shapePropertyPath

Data Source

The DataSource property accepts the collection values as input. For example, you can provide the list of objects as input.

Shape Data Path

The ShapeDataPath property is used to refer the data ID in DataSource. For example, population MapData contains data ids ‘Name’ and ‘Population’. The ShapeDataPath and the ShapePropertyPath properties are related to each other (refer to ShapePropertyPath for more details).

Shape Property Path

The ShapePropertyPath property is similar to the ShapeDataPath that refers to the column name in the Data property of shape layers to identify the shape. When the values of the ShapeDataPath property in the DataSource property and the value of ShapePropertyPath in the Data property match, then the associated object from the DataSource is bound to the corresponding shape.

The Datasource is populated with JSON data relative to shape data and stored in JSON object. The USA population as datasource is used for better understanding.

For better understanding, “MapController.cs” is populated with data of USA Population in “MapController.cs” and you can refer both shape data and datasource as illustrated in the following “Map.cshtml”,

Copyright © 2001 - 2020 Syncfusion Inc.

C#

```
public ActionResult Map()
{
ViewData["mapdata"] = GetUSMap();
ViewData["datasource"] = GetUSPopulationData();
return View();
}
public object GetUSMap()
{
string data =
System.IO.File.ReadAllText(Server.MapPath("~/App_Data/USA.json"));
JavaScriptSerializer ser = new JavaScriptSerializer();
ser.MaxJsonLength = int.MaxValue;
return new MapData(data);
}
public List<CountyPopulationData> GetUSPopulationData()
{
List<CountyPopulationData> populationData = new List<CountyPopulationData>
{
new CountyPopulationData(){ Name= "California", Population=38332521},
new CountyPopulationData(){ Name= "Texas", Population=26448193},
new CountyPopulationData(){ Name= "New York", Population=19651127},
new CountyPopulationData(){ Name= "Florida", Population=19552860},
new CountyPopulationData(){ Name= "Illinois", Population=12882135},
new CountyPopulationData(){ Name= "Pennsylvania", Population=12773801},
new CountyPopulationData(){ Name= "Ohio", Population=11570808},

new CountyPopulationData(){ Name= "Wisconsin", Population=5742713},
new CountyPopulationData(){ Name= "Minnesota", Population=5420380},
new CountyPopulationData(){ Name= "Colorado", Population=5268367},
new CountyPopulationData(){ Name= "Alabama", Population=4833722},
new CountyPopulationData(){ Name= "South Carolina", Population=4774839},
new CountyPopulationData(){ Name= "Louisiana", Population=4625470},
new CountyPopulationData(){ Name= "Kentucky", Population=4395295},
new CountyPopulationData(){ Name= "Oregon", Population=3930065},
new CountyPopulationData(){ Name= "Oklahoma", Population=3850568},
new CountyPopulationData(){ Name= "Puerto Rico", Population=3615086},
new CountyPopulationData(){ Name= "Connecticut", Population=3596080},
new CountyPopulationData(){ Name= "Iowa", Population=3090416},
new CountyPopulationData(){ Name= "Mississippi", Population=2991207},
new CountyPopulationData(){ Name= "Arkansas", Population=2959373},
new CountyPopulationData(){ Name= "Utah", Population=2900872},
new CountyPopulationData(){ Name= "Kansas", Population=2893957},
new CountyPopulationData(){ Name= "Nevada", Population=2790136},
new CountyPopulationData(){ Name= "New Mexico", Population=2085287},
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
new CountyPopulationData(){ Name= "Nebraska", Population=1868516},
new CountyPopulationData(){ Name= "West Virginia", Population=1854304},
new CountyPopulationData(){ Name= "Idaho", Population=1612136},
new CountyPopulationData(){ Name= "Hawaii", Population=1404054},
new CountyPopulationData(){ Name= "Maine", Population=1328302},
new CountyPopulationData(){ Name= "New Hampshire", Population=1323459},
new CountyPopulationData(){ Name= "Rhode Island", Population=1051511},
new CountyPopulationData(){ Name= "Montana", Population=1015165},
new CountyPopulationData(){ Name= "Delaware", Population=925749},
new CountyPopulationData(){ Name= "South Dakota", Population=844877},
new CountyPopulationData(){ Name= "Alaska", Population=735132},
new CountyPopulationData(){ Name= "North Dakota", Population=723393},
new CountyPopulationData(){ Name= "District of Columbia",
Population=646449},
new CountyPopulationData(){ Name= "Vermont", Population=626630},
new CountyPopulationData(){ Name= "Wyoming", Population=582658}
};
return populationData;
}
public class CountyPopulationData
{
public string name;
public string Name
{
get { return name; }
set { name = value; }
}
public double population;
public double Population
{
get { return population; }
set { population = value; }
}
}
```

ASPX-CS

```
@{
var mapData = ViewData["mapdata"];
var dataSource = ViewData["datasource"];
}
```

The JSON object “populationData” is used as DataSource in the following code example.

ASPX-CS

```
@(Html.EJ().Map("container")
.Layers(layer =>
{
layer.ShapeData(mapData)
.ShapeDataPath("name")
.ShapePropertyPath("name")
.DataSource(datasource)
.Add();
})
)
```

Copyright © 2001 - 2020 Syncfusion Inc.

Customization

Maps control supports color customization to determine the exact combination of colors for shapes displayed in Maps and tooltip support to display additional information of shape data.

Shapes Color Customization

The Map control highly supports the customization of the shape's color. The shape's color can be customized using the following ways:

- Using the Fill, Stroke and StrokeThickness properties.
- Color Mapping support.
- Color Palette support.

Shape Settings

The ShapeSettings defines the basic customization settings of shapes in the map.

The important property that makes an impact on shape colors is AutoFill. This AutoFill property is available in the shapeSettings.

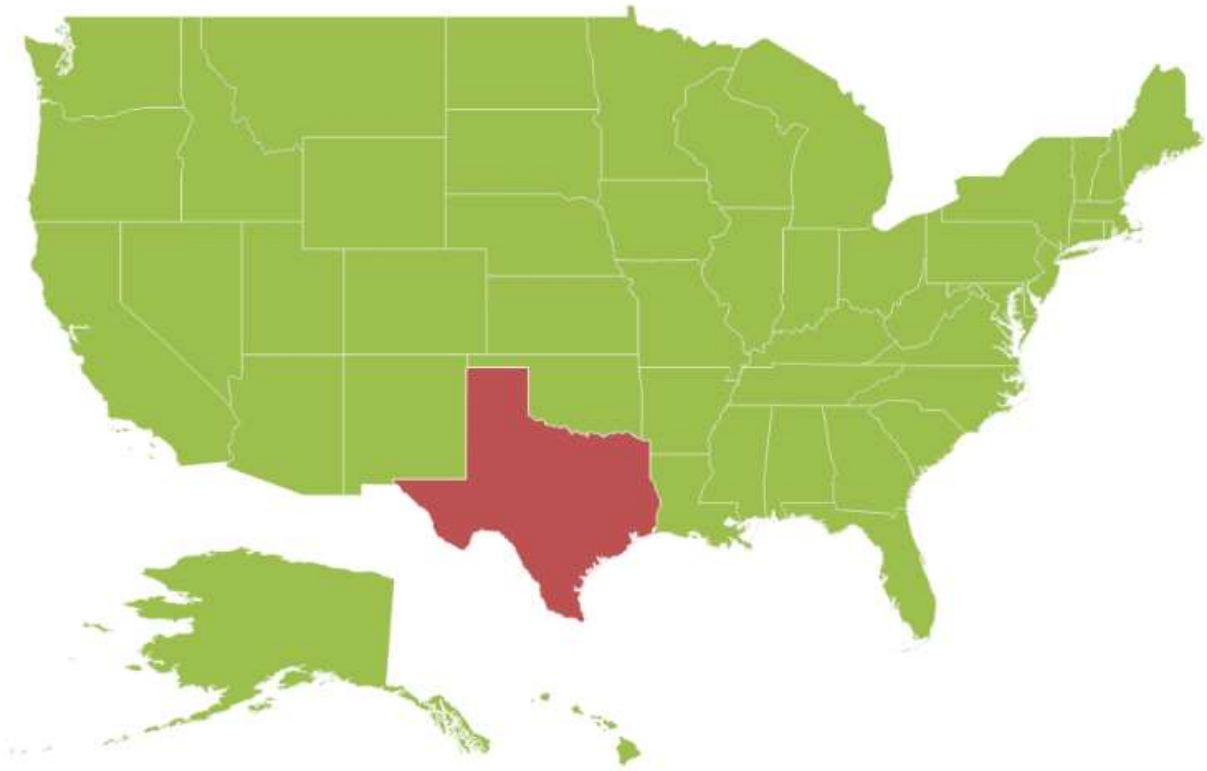
- Fill - It is used to set the fill color of the shapes in the map.
- Stroke - It is used to set the border color of the shape in the map.
- StrokeThickness - It is used to set the border thickness of the shape in the map.
- HighlightColor - It is used to set the mouse hover color for shapes in the map.
- HighlightBorderWidth - It is used to set the mouse hover border width for shapes in the map.
- SelectionColor - It is used to set the selection color for shapes in the map.

The above properties of ShapeSettings are applied only when AutoFill property value is false. By map, AutoFill property value is false.

ASPX-CS

```
@(Html.EJ().Map("container")
.Layers(layer =>
{
layer.ShapeData(mapData)
.EnableMouseHover(true)
.ShapeSettings(ss =>
{
ss.Fill("#9CBF4E")
.StrokeThickness(0.5)
.Stroke("White")
.HighlightStroke("White")
.HighlightColor("#BC5353")
.HighlightBorderWidth(1);
})
.Add();
})
)
```

Copyright © 2001 - 2020 Syncfusion Inc.



Color Mapping

The Color Mapping support enables the customization of shape colors based on the underlying value of shape received from bounded data.

- ColorValuePath - It renders the field value that is to be fetched from data for each shape used for determining the shape color.
- ValuePath - It renders the field value that is to be fetched from data for each shape. This support also provides a tree map-like impact on the map UI. The various types of Color Mapping supported in maps are listed as follows.
- RangeColorMapping - It is used to differentiate the shape's fill based on its underlying value and color ranges. The properties of Range color mapping are listed in the following table.

Property Table

Property	Type	Description
From	Double	Gets or sets start value
To	Double	Gets or sets end value
Color	Color	Gets or sets the colors to be applied for specific range value containing shapes when EnableGradient property value is false.
Label	String	Gets or sets the label for legend when Mode property value is â€˜defaultâ€™.

Copyright © 2001 - 2020 Syncfusion Inc.

GradientColors	Array	Gets or sets the start point and end point gradient colors to be applied for specific range value containing shapes when EnableGradient property value is set to true.

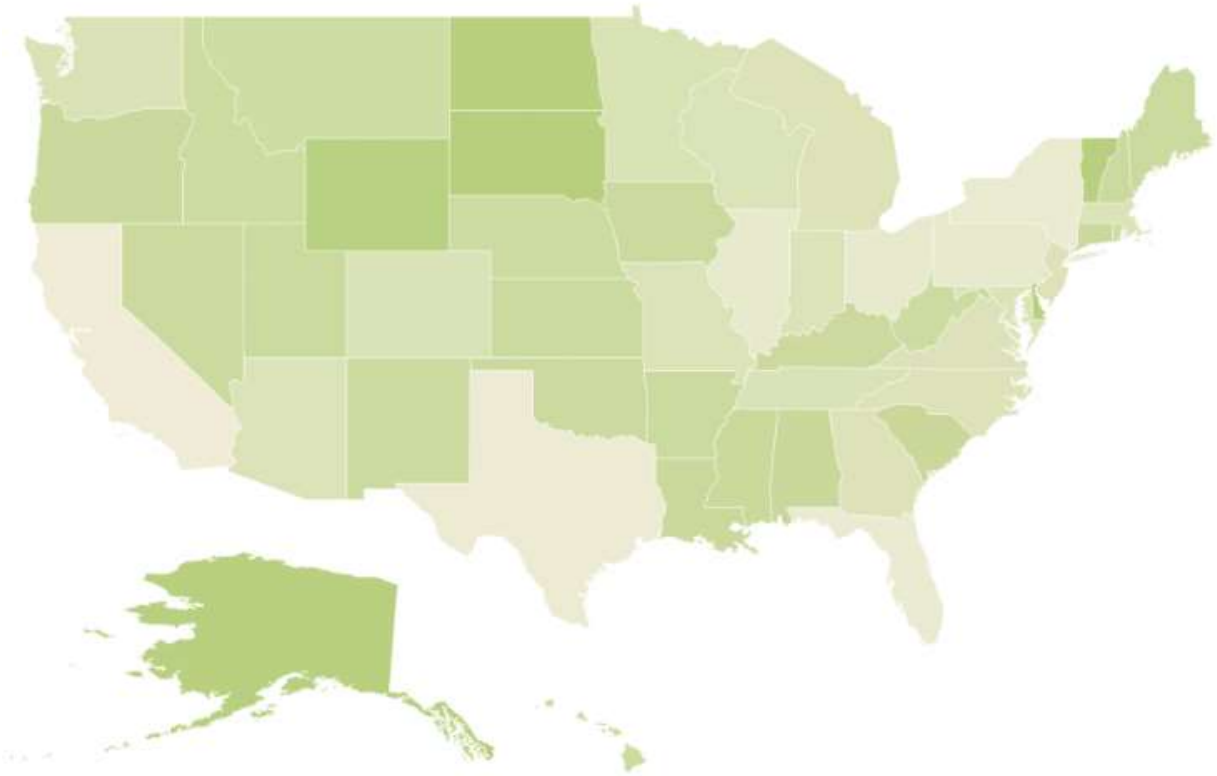
ASPX-CS

```
@(Html.EJ().Map("map")
.Layers(layer =>
{
layer.ShapeData(mapData)
.ShapeDataPath("name")
.ShapePropertyPath("name")
.DataSource(datasource)
.ShowMapItems(false)
.ShapeSettings(ss  =>
{
ss.Fill("#9CBF4E")
.StrokeThickness(0.1)
.Stroke("White")
.ValuePath("population")
.EnableGradient(true)
.RangeColorMappings(cm =>
{
cm.From(500000).To(1000000).GradientColors(new List<string> { "#9CBF4E",
"#B8CE7B" }).Add();
cm.From(1000001).To(5000000).GradientColors(new List<string> { "#B8CE7B",
"#CBD89A" }).Add();
cm.From(5000001).To(10000000).GradientColors(new List<string> { "#CBD89A",
"#DEE2B9" }).Add();
cm.From(10000001).To(40000000).GradientColors(new List<string> { "#DEE2B9",
"#F1ECD8" }).Add();
});
})
.Add();
})
)
```

When the underlying object value is 700000, then the Fill color of the corresponding shape is set between #9CBF4E and #B8CE7B.

When the underlying value is below any of the given sorted range or above the sorted range, then the Fill is set from Fill.

Copyright © 2001 - 2020 Syncfusion Inc.



- EqualColorMapping - The Equal color mapping is used to differentiate the shape's fill based on its underlying Value and Color. The properties of Equal color mapping is listed in the following table.

Property	Type	Description
Value	String	Gets or sets the value.
Color	String	Gets or sets the color for mapping.

In Equal color mapping, value property contains the values of the field set in ColorValuePath property of shape settings.

Here "MapController.cs" is populated with data of USA Election in "MapController.cs" to provide election data as input datasource.

C#

```
public ActionResult Map()
{
ViewData["datasource"] = GetElectionResults();
return View();
}
public List<ElectionData> GetElectionResults()
{
List<ElectionData> electionResults = new List<ElectionData>
```

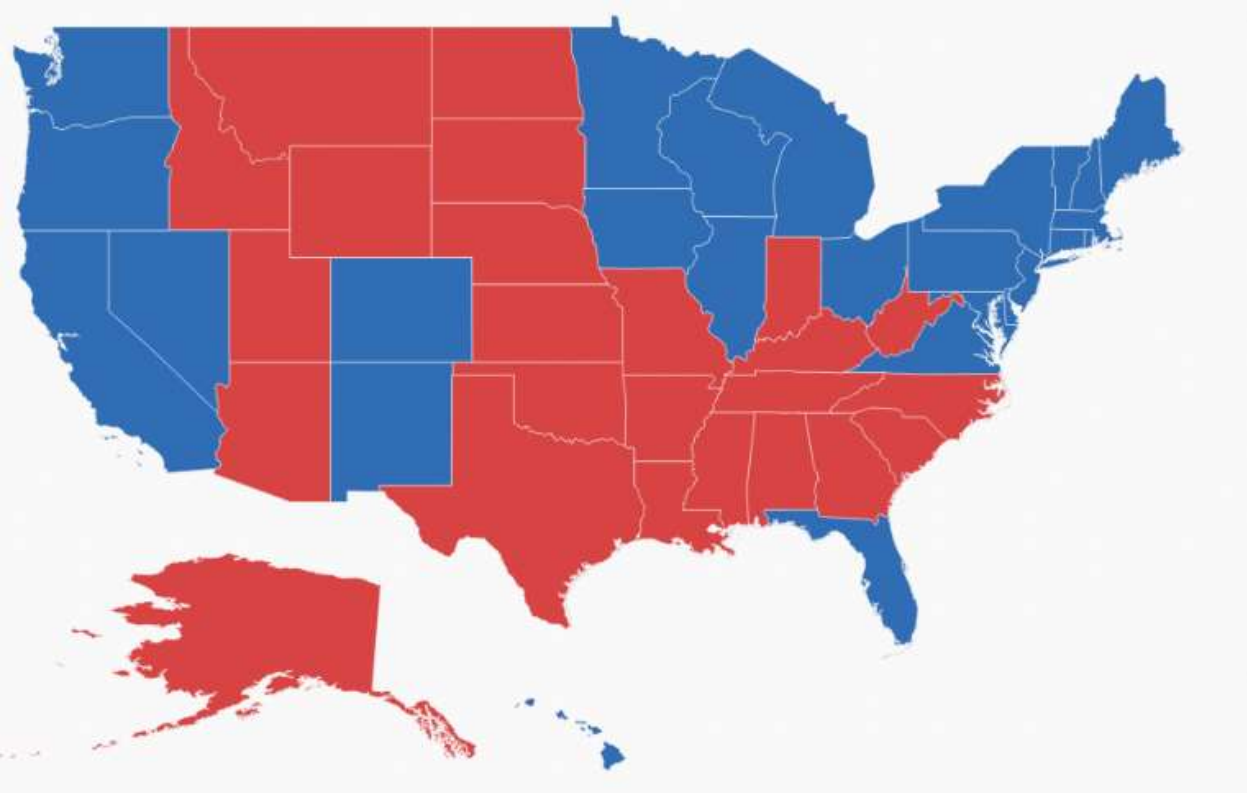
ASPX-CS

```
@(Html.EJ().Map("maps")
.Layers(layer =>
{
layer.ShapeData(mapData)
.ShapeDataPath("State")
.ShapePropertyPath("name")
.DataSource(datasource)
.ShapeSettings(shape =>
{
shape.StrokeThickness(0.5)
.AutoFill(false)
.Stroke("white")
.ValuePath("Electors")
.ColorValuePath("Candidate")
.EqualColorMappings(cm =>
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
{
cm.Value("Romney").Color("#D84444").Add();
cm.Value("Obama").Color("#316DB5").Add();
});
})
.Add();
})
)
```



Binding color from the datasource

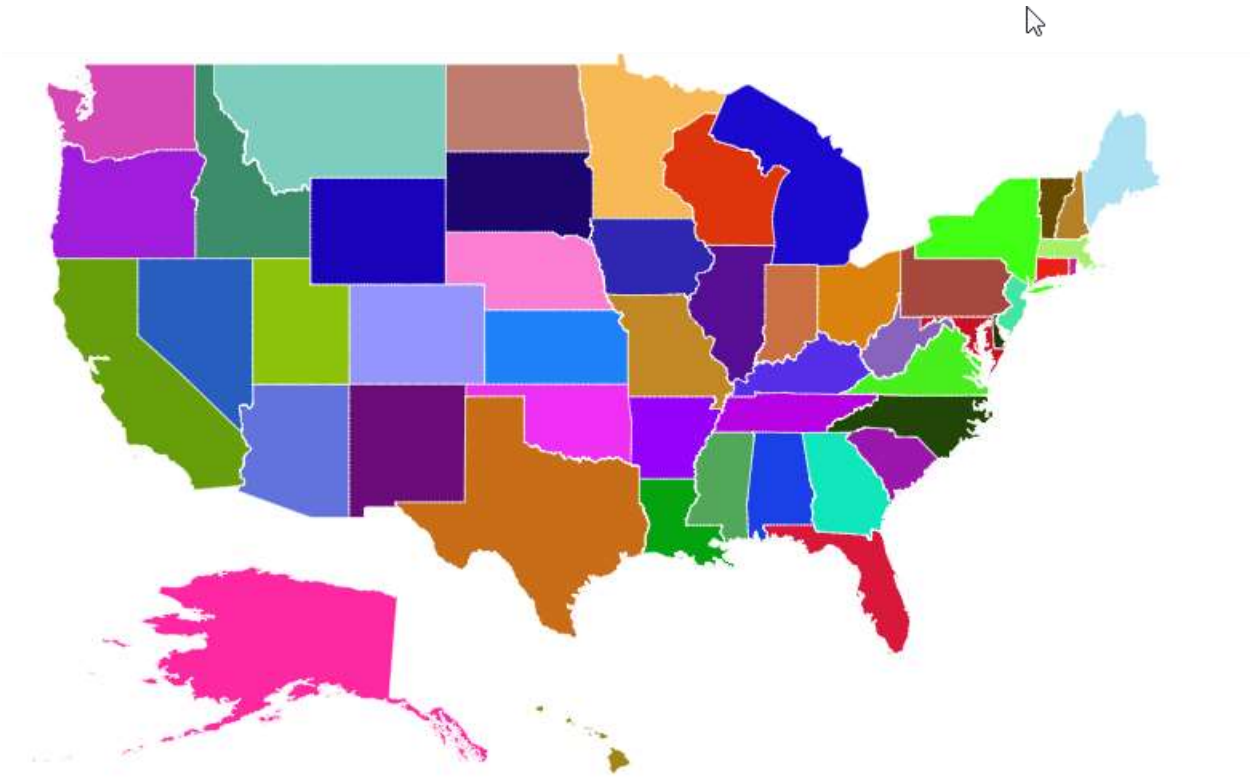
By using colorPath property, you can bind the specific field in the datasource to the map, and the shapes will be rendered based the color values available from the field you bind.

Note: While setting color for map by using colorPath property, do not set any other color mapping hence color mapping is having higher priority than colorPath.

ASPX-CS

```
@(Html.EJ().Map("maps")
.Layers(layer =>
{
layer.ShapeData(mapData)
.ShapeDataPath("State")
.ShapePropertyPath("name")
.DataSource(datasource)
.ShapeSettings(shape =>
{
shape.ColorPath("ShapeFill")
})
```

```
.Add();
})
)
```



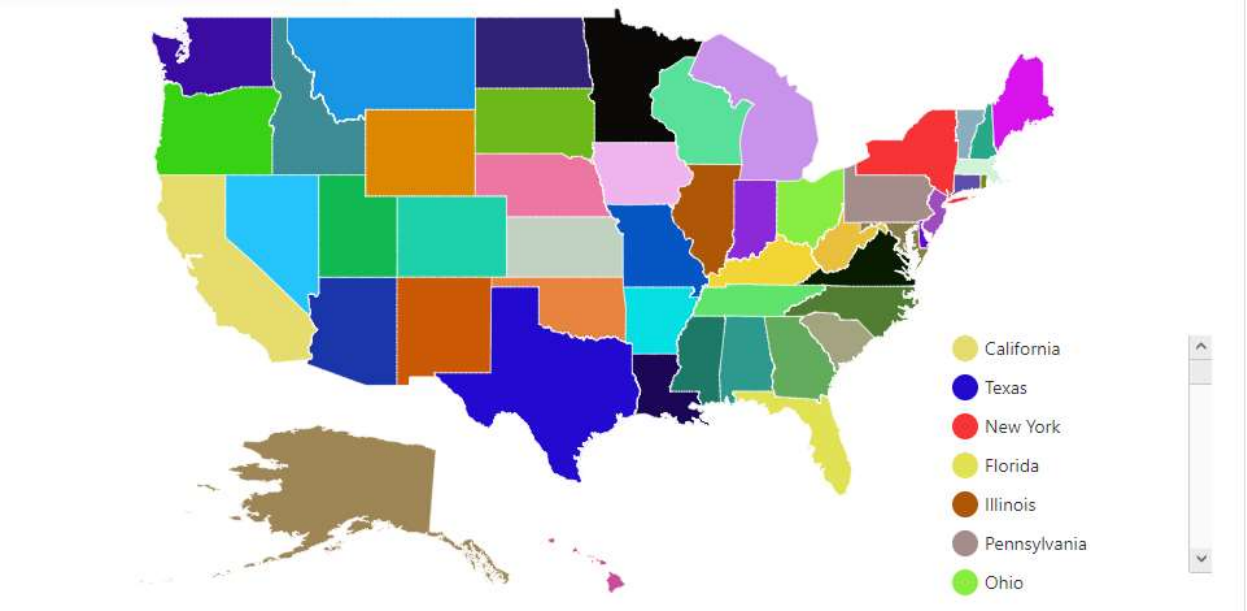
While binding color path for map, it is possible to render legend for each shape in the map. To achieve this, set the textPath for legend. textPath contains another field name in the datasource. As per the text, content in the field legend will be generated.

ASPX-CS

```
@(Html.EJ().Map("maps")
.Layers(layer =>
{
layer.ShapeData(mapData)
.ShapeDataPath("State")
.ShapePropertyPath("name")
.DataSource(datasource)
.ShapeSettings(shape =>
{
shape.ColorPath("ShapeFill")
})
.LegendSettings(legend =>
{
legend.ShowLegend(true)
.TextPath("name")
})
.Add();
})
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
)
```



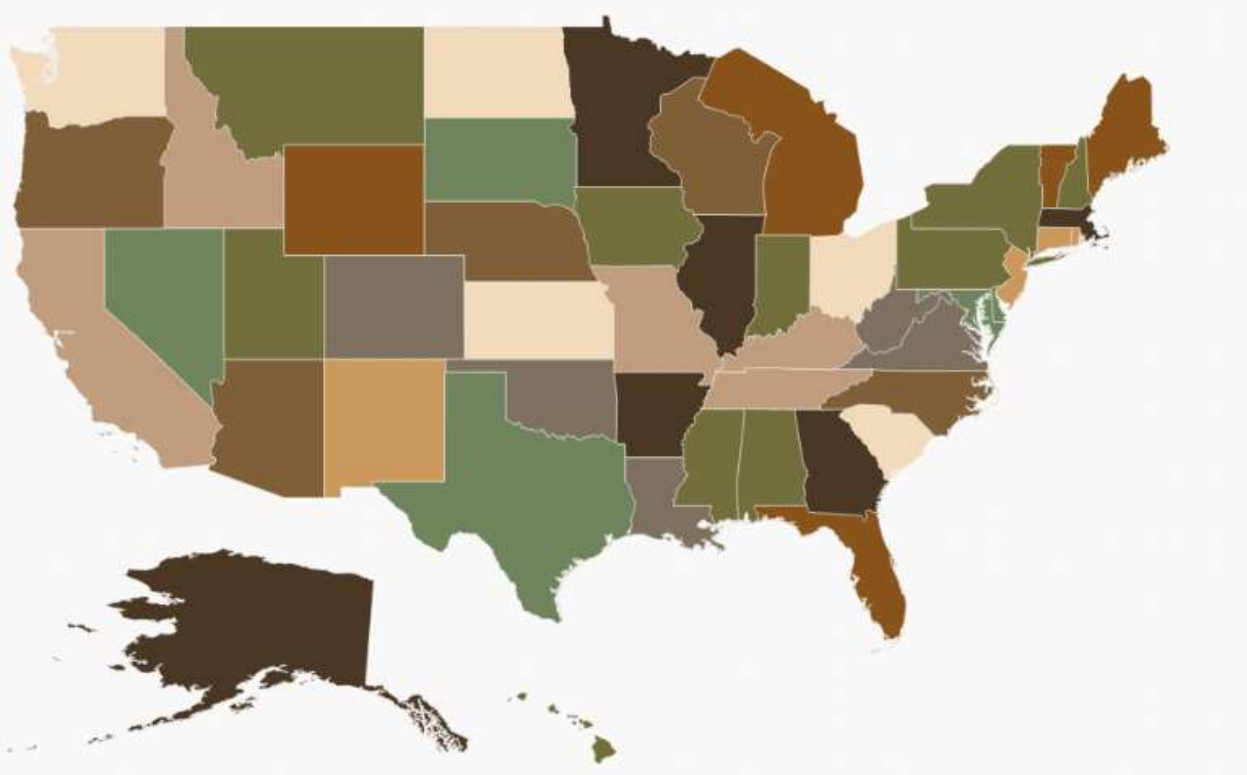
ColorPalette

AutoFill

When AutoFill property is set to true, shapes are filled with default colors from built-in palettes or custom palette.

ASPX-CS

```
@(Html.EJ().Map("maps")
.Layers(layer =>
{
layer.ShapeData(mapData)
.ShapeSettings(shape =>
{
shape.StrokeThickness(0.5)
.Stroke("white")
.AutoFill(true);
})
.Add();
})
)
```



ColorPalette

The ColorPalette property determines whether the auto fill colors are fetched from built-in color palettes or custom palette.

The ColorPalette property can be set with Palette1, Palette2, Palette3 and CustomPalette values where Palette1, Palette2 and Palette3 are built-in color palettes and default value for this property is “Palette1”.

The CustomPalette property is used to set an array of colors to be auto filled in shapes.

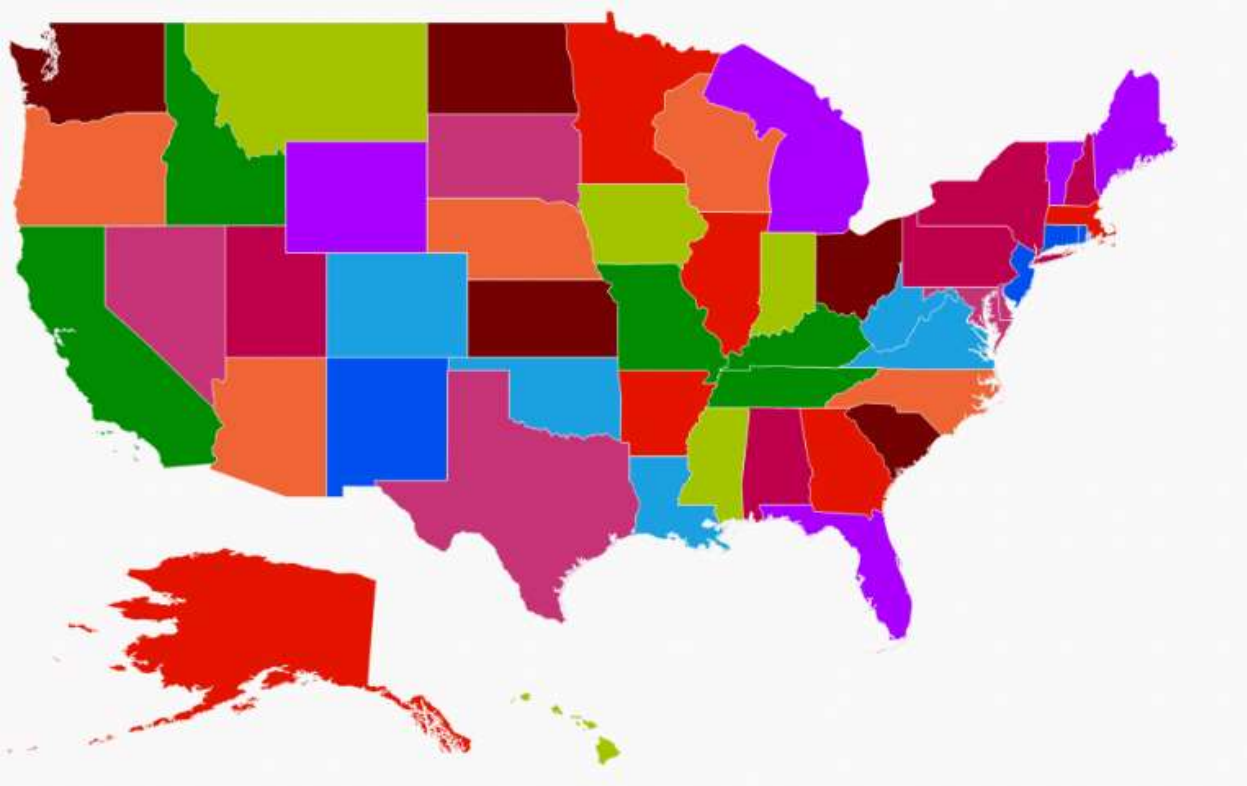
This property is enabled only when ColorPalette property value is set to “CustomPalette”.

ASPX-CS

```
@(Html.EJ().Map("container")
.Layers(layer =>
{
layer.ShapeData(mapData)
.ShapeSettings(shape =>
{
shape.ColorPalette(ColorPalette.CustomPalette)
.AutoFill(true)
.CustomPalette(new List<string>
{
"#E51400", "#A4C400", "#730202",
"#008B00", "#EF6535",
"#1BA0E2", "#C63477", "#0050EF",
"#BF004D", "#AA00FF"
});
})
.Add();
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
})
)
```



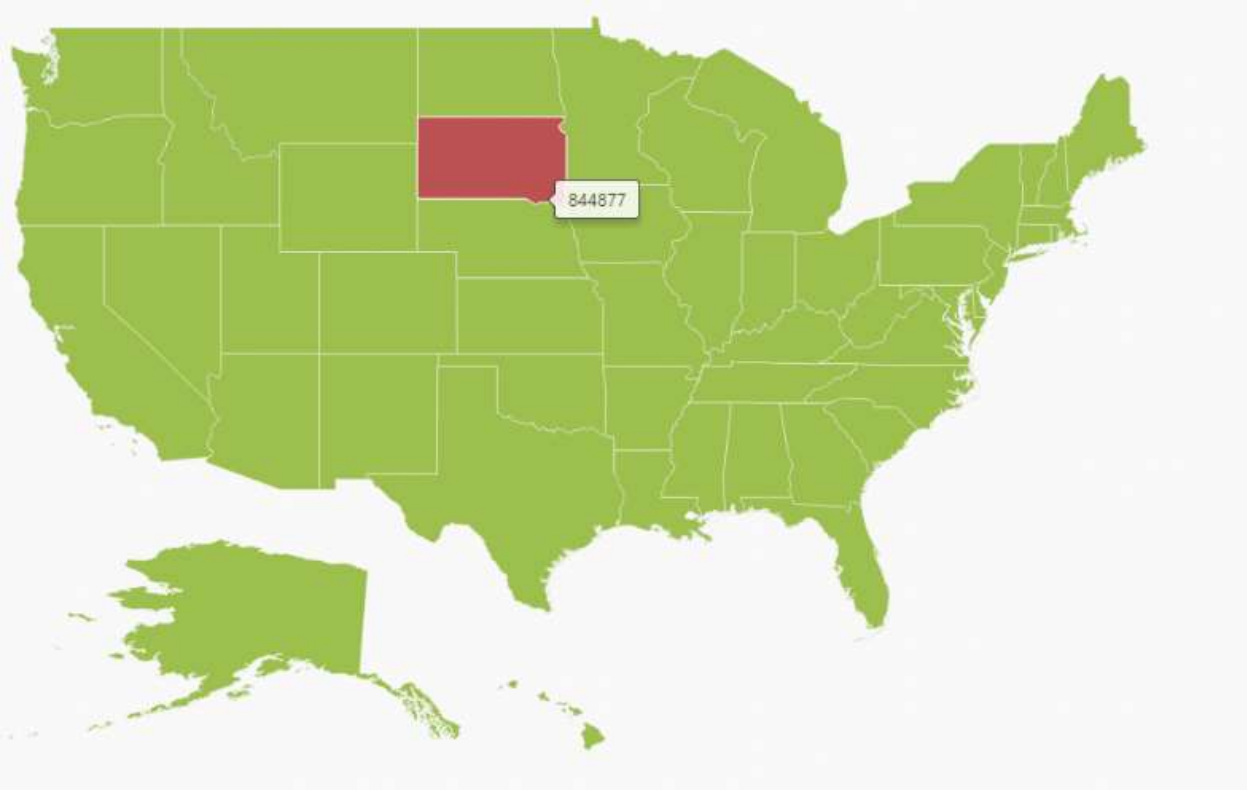
Tooltip

The tooltip is displayed only when you set ShowTooltip to “true” in the shape layers. By default, it takes the property of the bound object that is referred in the ValuePath and displays its content on hovering the corresponding shape.

ASPX-CS

```
@(Html.EJ().Map("container")
.Layers(layer =>
{
layer.ShapeData(mapData)
.ShapeSettings(shape=>
shape.ValuePath(“name”);
})
.ShowTooltip(true)
.Add();
})
)
```

Copyright © 2001 - 2020 Syncfusion Inc.



Tooltip Template

The ToolTipTemplate property is used for customizing the template for tooltip.

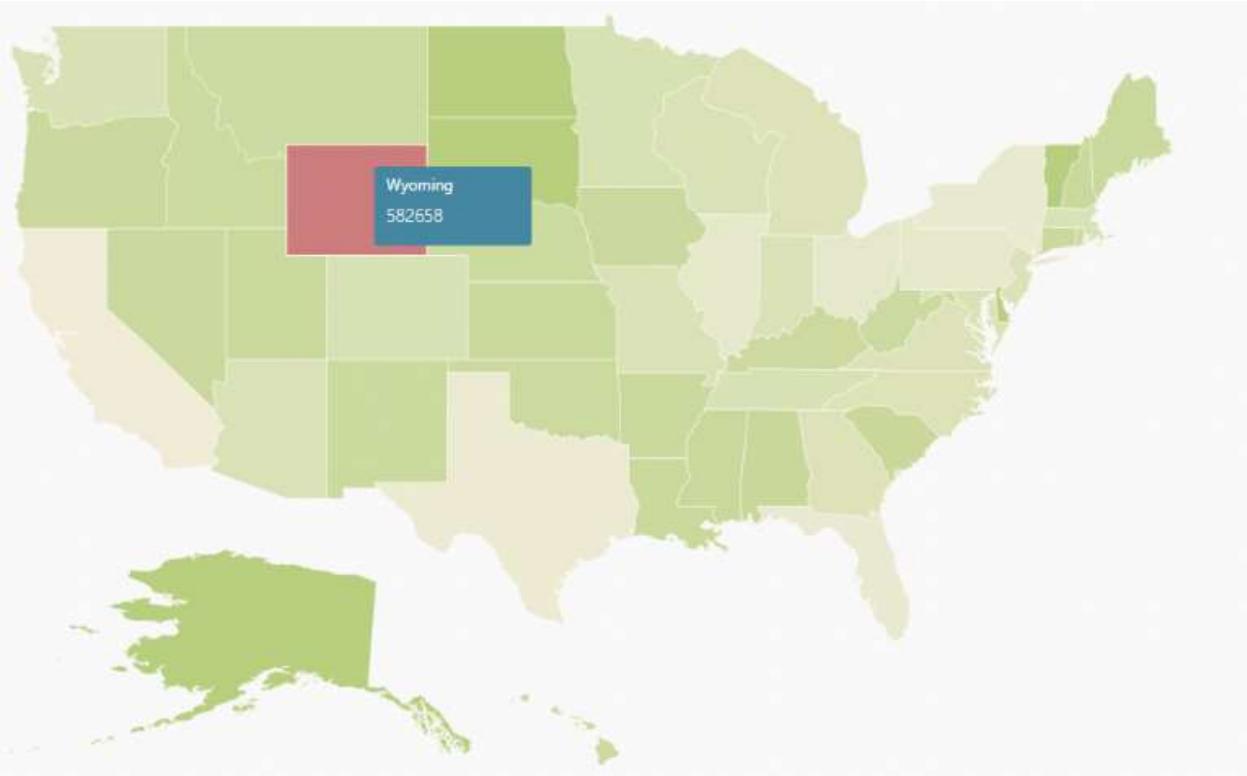
ASPX-CS

```
@(Html.EJ().Map("container")
.Layers(layer =>
{
layer.ShapeData(mapData)
.ShapeSettings(shape=>
{
shape.ValuePath("name");
});
.ShowTooltip(true)
.ToolTipTemplate("'myTooltip'")
.Add();
})
)
<div  id="myTooltip" style="display: none;">
<div >
<div style="height:40px;width:78px;background:#4586a0;border-radius:3px;">
<div style="margin-top:-20px;margin-left:9px;padding-top:3px">
<label style="margin-top:-20px;font-weight:normal;font-
size:12px;color:white;font-family:Segoe UI;">{{:name}}</label>
</div>
<div style="height:10px;"></div>
<div style="margin-top:-10px;margin-left:9px;">
<label style="margin-top:-10px;font-weight:normal;font-
size:14px;color:white;font-family:segoe ui light;">{{:population}}</label>
</div>
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
</div>
</div>
</div>
```

The following screenshot illustrates a map control displaying a Tooltip with template.



Customize map background

The Map background can be customized by using the background property of the Map.

ASPX-CS

```
@(Html.EJ().Map("container")
.Background("skyblue")
)
```

Base Map Index

Specifies the index of the map to determine the shape layer to be displayed, you can use baseMapIndex property and the default value is 0.

ASPX-CS

```
@(Html.EJ().Map("container")
.BaseMapIndex(0)
)
```

Center Position

Specify the centerPosition where map should be displayed

ASPX-CS

Copyright © 2001 - 2020 Syncfusion Inc.

```
@(Html.EJ().Map("container")
.CenterPosition([38.5000, -98])
)
```

Label Settings

The labelSettings defines the basic customization settings of labels in the map.

The below properties are used for labelSettings

- enableSmartLabel - enable or disable the enableSmartLabel property.
- labelLength - set the labelLength property.
- labelPath - set the labelPath property.
- showLabels - The property specifies whether to show labels or not
- smartLabelSize - set the smartLabelSize property.

ASPX-CS

```
@(Html.EJ().Map("container")
.LabelSettings(lb=>lb.EnableSmartLabels(false).LabelLength(2).ShowLabels(fal
se).SmartLabelSize(LabelSize.Fixed))
)
```

Map Elements

Map control contains a set of map elements, including shapes, bubbles, markers, legend, labels and data items that can be visualized with customized appearance showing additional information on the map using bound data.

Markers

Markers are notes that is used to leave some message on the map.

There are two ways to set marker for map.

- Using markers and marker template
- Adding marker objects to map.

Markers

The Markers property has a list of objects that contains the data for Annotation. You can visualize these data by using MarkerTemplate property.

C#

```
public ActionResult Map()
{
// ...
ViewData["Annotationdatasource"] = GetMarkers();
return View();
}
// ...
public List<MarkerData> GetMarkers()
{
List<MarkerData> markerData = new List<MarkerData>
{
```

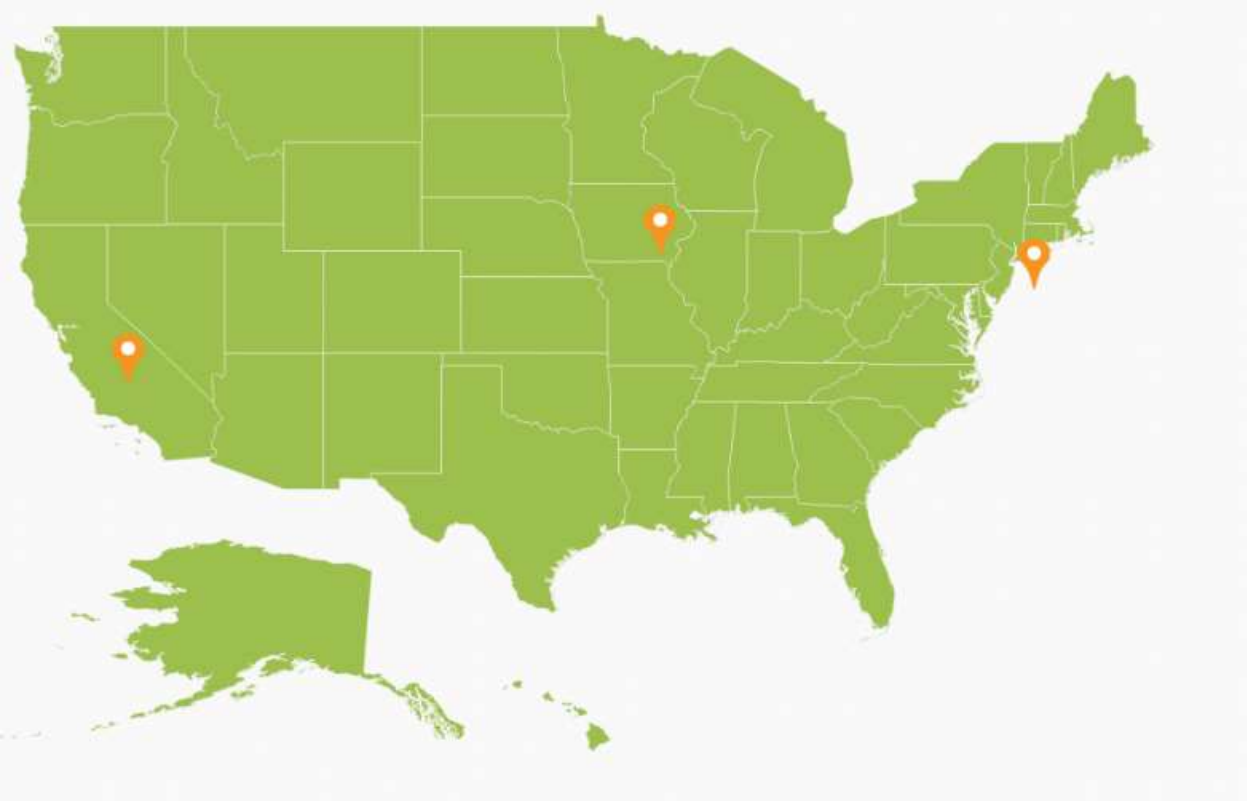
Copyright © 2001 - 2020 Syncfusion Inc.

```
new MarkerData {City = "California", Latitude = 37.0000, Longitude = -
120.0000 },
new MarkerData {City = "New York", Latitude = 40.7127, Longitude = -74.0059
},
new MarkerData {City = "Iowa", Latitude = 42, Longitude = -93}
};
return electionResults;
}
public class MarkerData
{
private double latitude;
public double Latitude
{
get { return latitude; }
set { latitude = value; }
}
public double longitude;
public double Longitude
{
get { return longitude; }
set { longitude = value; }
}
private string city;
public string City
{
get { return city; }
set { city = value; }
}
}
```

ASPX-CS

```
@(Html.EJ().Map("container")
.Layers(layer =>
{
.Markers(markers)
.MarkerTemplate("template")
})
)
<div  id="template" style="display: none;">
<div>
<svg height="100" width="100">
<circle cx="20" cy="20" r="10" stroke="black" stroke-width="1" fill="red" />
</svg>
</div>
</div>
```

Copyright © 2001 - 2020 Syncfusion Inc.



Adding Marker objects to map

Without Datasource, n number of markers can be added to shape layers with Markers property. Each marker object contains the following list of properties.

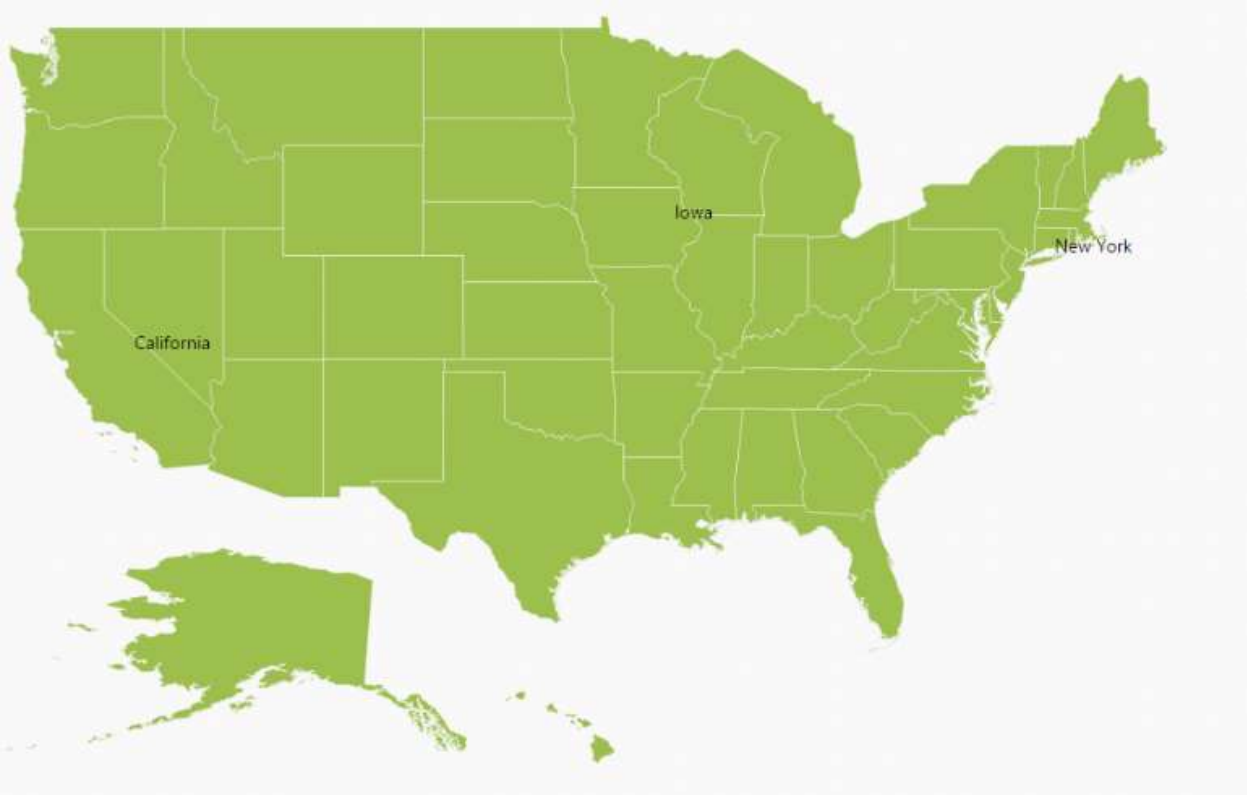
- Label - Text that displays some information about the annotation in text format.
- Latitude - Latitude point determine the Y-axis position of annotation.
- Longitude - Longitude point determine the X-axis position of annotation.

ASPX-CS

```
@(Html.EJ().Map("container")
.Layers(layer =>
{
layer.EnableMouseHover(true)
.ShapeData(mapData)
.ShapeSettings(ss =>
{
ss.Fill("#9CBF4E")
.StrokeThickness(0.5)
.Stroke("White")
.HighlightStroke("White")
.HighlightColor("#BC5353")
.HighlightBorderWidth(1);
})
.Markers(an =>
{
an.Label("California")
.Latitude(37)
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
.Longitude(-120).Add();
an.Label("New York")
.Latitude(40.7127)
.Longitude(-74.0059).Add();
an.Label("Iowa")
.Latitude(42)
.Longitude(-93).Add();
})
.Add();
})
)
```



Bubbles

Bubbles in the Maps control represent the underlying data values of the map. Bubbles are scattered throughout the map shapes that contain bound values.

Bubbles are included when data binding and the BubbleSettings is set to the shape layers.

Properties

Property	Type	Description
MaxValue	String	Get or sets the maximum height and width of the bubble.
MinValue	String	Gets or sets the minimum height and width of the bubble.

ColorValuePath	String	Get or sets the field value that is to be fetched from data for each bubble used for determining the bubble color.
ValuePath	String	Gets or sets the field value that is to be fetched from data for each bubble.
ColorMappings	Collection of RangeColorMapping	Gets or sets the tree map colors.
Color	String	Gets or sets the fill color for bubbles.
ShowTooltip	Boolean	Enable or disable the tooltip for bubbles.
TooltipTemplate	String	Gets or sets the tooltip template for bubbles.

Add Bubbles to a Map

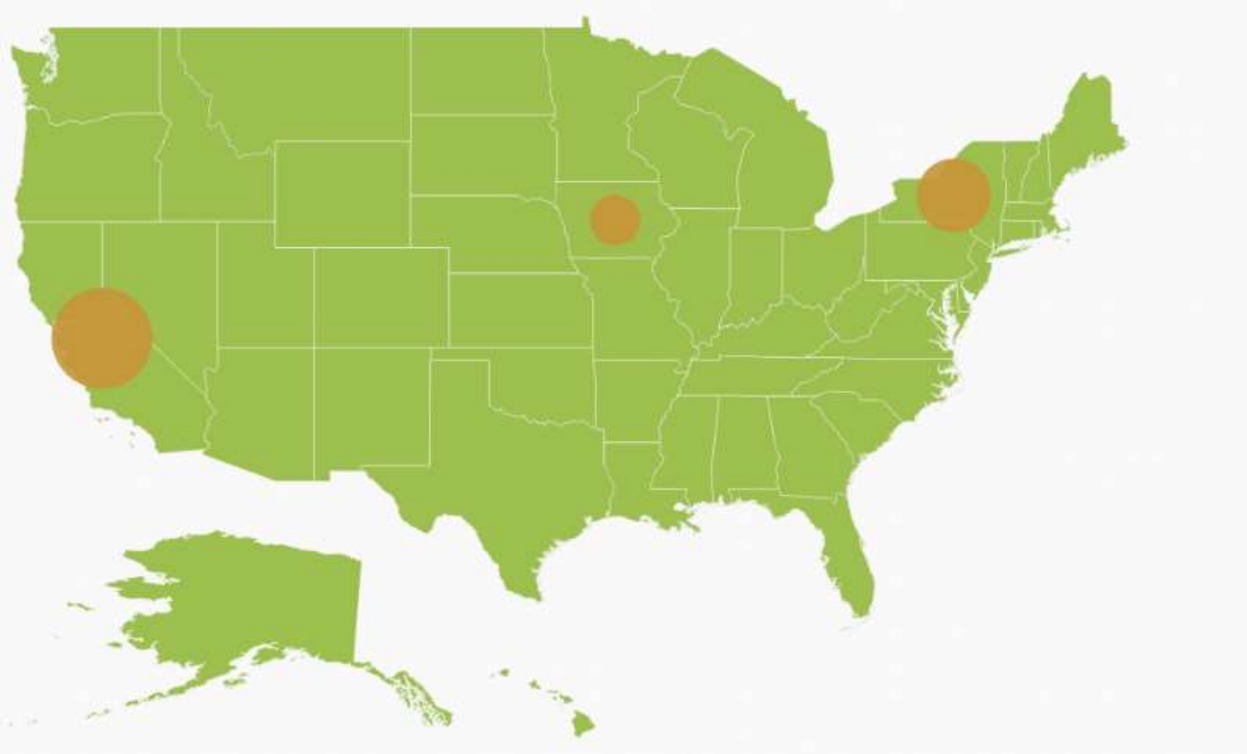
To add bubbles to a map, the bubble marker setting is added to the shape file layer. Create the Model and ViewModel as illustrated in the Data Binding topic and add the following code. Also set the `MaxValue`, `MinValue`, and `ValuePath` properties as illustrated in the following code sample.

Note: Tooltip and Color Mappings for bubble is to be set as similar to tooltip and color mappings set in layers and ShapeSettings. For more details, refer Tooltip and Color Mappings section.

ASPX-CS

```
@(Html.EJ().Map("container")
.Layers(layer =>
{
layer.EnableMouseHover(true)
.ShapeData(mapData)
.DataSource(population_data)
.ShapeSettings(ss =>
{
ss.Fill("#9CBF4E")
.StrokeThickness(0.5)
.Stroke("White");
})
.BubbleSettings(bs =>
{
bs.ValuePath("Population ")
.ShowBubble(true)
.MinValue(20)
.MaxValue(40)
.Color("#C99639");
})
.Add();
})
)
```

Copyright © 2001 - 2020 Syncfusion Inc.



Add bubbles to the map

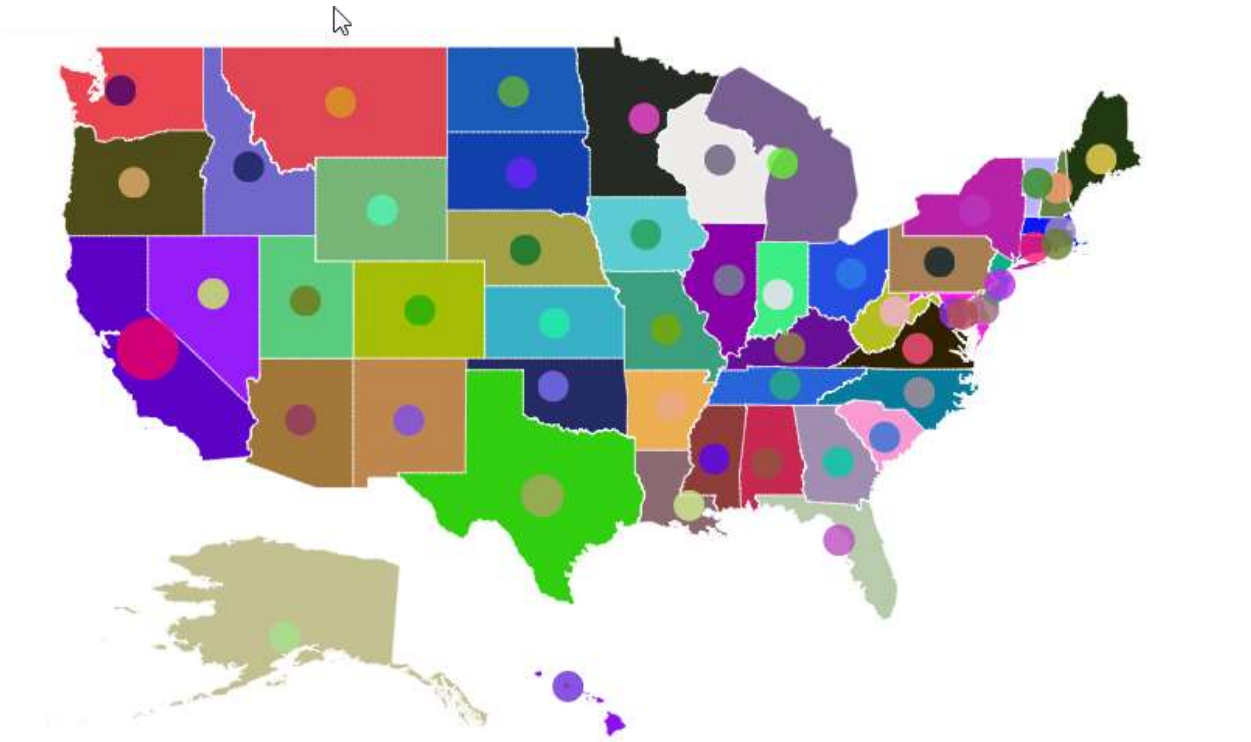
You can set color for each bubble by using `ColorPath` property in bubble settings.

Note: While settings color for bubbles by using `ColorPath`, do not set any other color mapping hence color mapping is having higher priority than `colorPath`.

ASPX-CS

```
@(Html.EJ().Map("container")
.Layers(layer =>
{
layer.EnableMouseHover(true)
.ShapeData(mapData)
.DataSource(population_data)
.ShapeSettings(ss =>
{
ss.ColorPath("ShapeFill")
})
.BubbleSettings(bs =>
{
bs.ValuePath("Population ")
.ShowBubble(true)
.MinValue(20)
.MaxValue(40)
.ColorPath("fill");
})
.Add();
})
)
```

Copyright © 2001 - 2020 Syncfusion Inc.



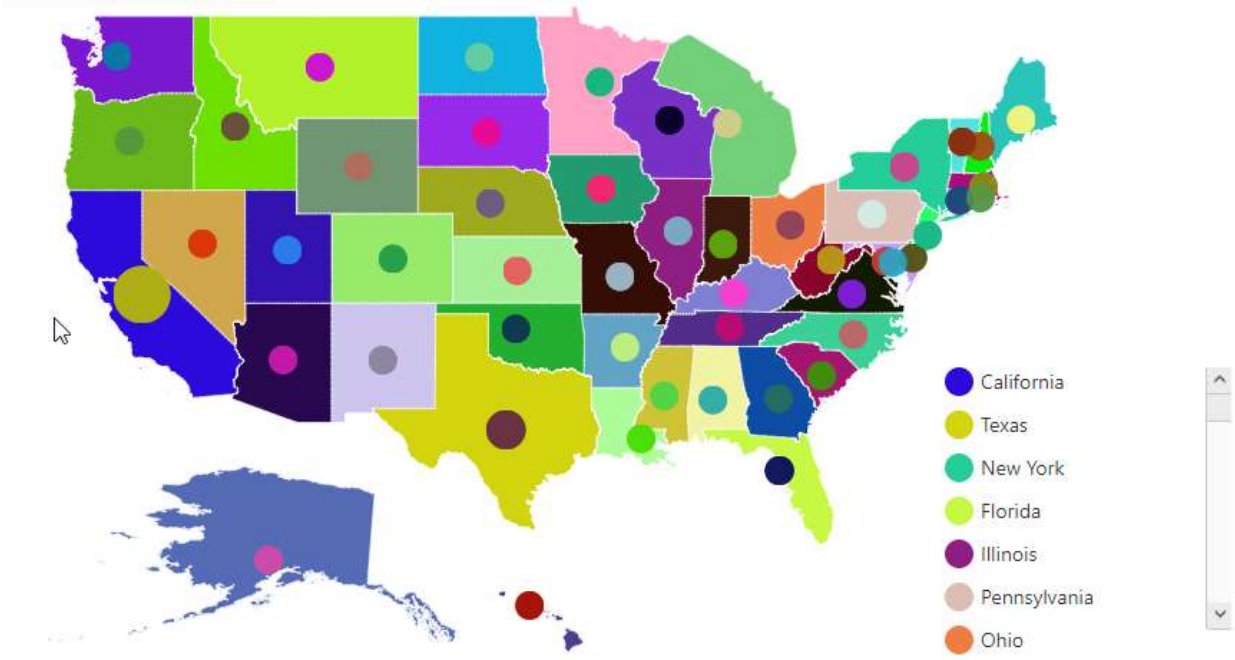
While binding colorPath for bubbles, it is possible to render the legend for each bubble. To achieve this, set the textPath for legend. textPath contains another field name in the datasource. As per the text, content in the field legend will be generated.

ASPX-CS

```
@(Html.EJ().Map("container")
.Layers(layer =>
{
layer.EnableMouseHover(true)
.ShapeData(mapData)
.DataSource(population_data)
.ShapeSettings(ss =>
{
ss.ColorPath("ShapeFill")
})
.BubbleSettings(bs =>
{
bs.ValuePath("Population ")
.ShowBubble(true)
.MinValue(20)
.MaxValue(40)
.ColorPath("fill");
})
.LegendSettings(bs =>
{
ls.ShowLegend(true)
.TextPath("name");
})
.Add();
})
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
)
```



Legend

A legend is a key used on a map, contains swatches of symbols with descriptions. It provides valuable information for interpreting what the map is displaying you, and can be represented in various colors, shapes or other identifiers based on the data. It gives a breakdown of what each symbol represents throughout the map.

Visibility of Legend

The Legends can be made visible by setting the `ShowLegend` property of legendSettings.

Positioning of Legend

The legend can be positioned in two ways.

- Absolute Position.
- Dock Position.

Absolute Position

Based on the margin values of X and Y-axes, the Map legends can be positioned with the support of `PositionX` and `PositionY` properties available in `LegendSettings`. For positioning the legend based on margins corresponding to a map, `Position` value is set as '*None*'.

Dock Position

The map legends can be positioned in following locations within the container.

- TopLeft
- TopCenter
- TopRight
- CenterLeft

Copyright © 2001 - 2020 Syncfusion Inc.

- Center
- CenterRight
- BottomLeft
- BottomRight
- BottomCenter
- BottomRight
- None

You can set this option by using Position property in LegendSettings.

Legend Size

The map legend size can be modified using Height and Width properties in LegendSettings.

Legend for Shapes

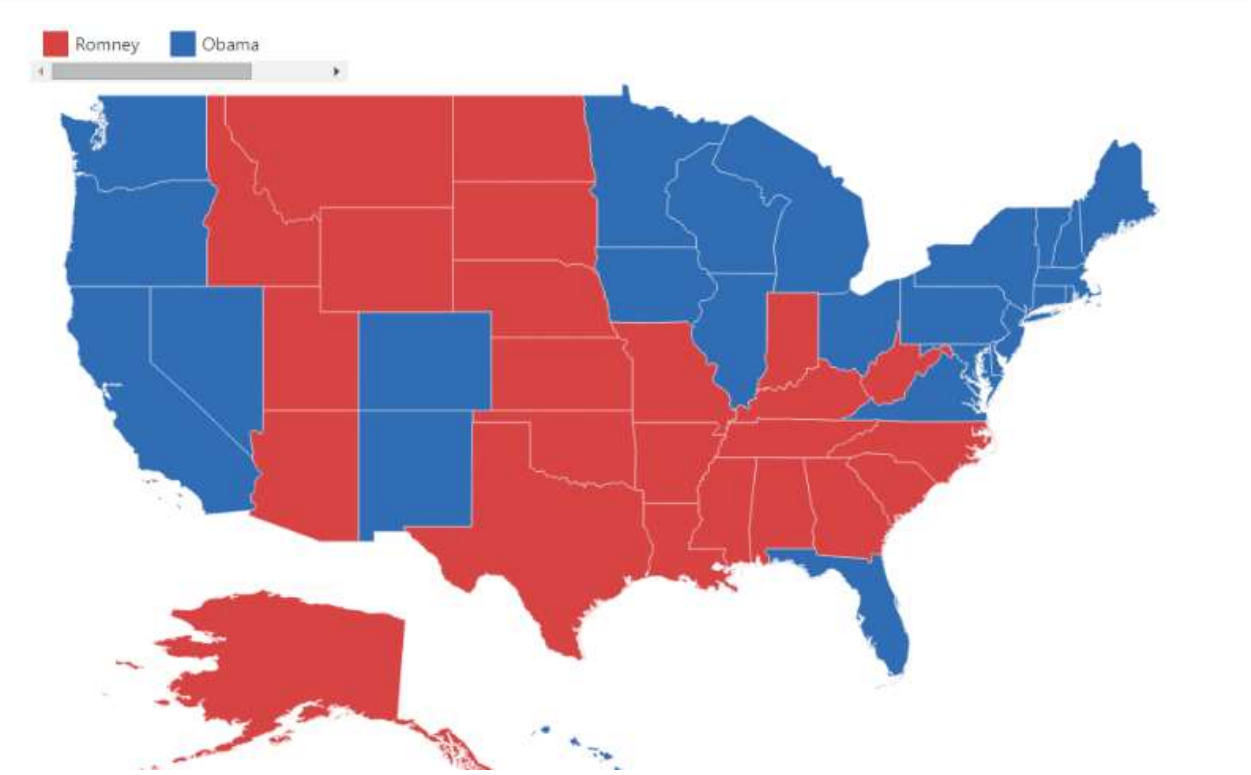
The Layer shape type legends can be generated for each color mappings in shape settings.

Note: Here, Equal Color Mapping code sample for shapeSettings with color mappings is referred.

ASPX-CS

```
@(Html.EJ().Map("container")
.Layers(layer =>
{
layer.LegendSettings(ml =>
{
ml .ShowLegend(true)
.Height(20)
.Width(60)
.PositionX(80)
.PositionY(90);
})
})
)
```

Copyright © 2001 - 2020 Syncfusion Inc.



Interactive Legend

The legends can be made interactive with an arrow mark indicating the exact range color in the legend when the mouse hovers over the corresponding shapes. You can enable this option by setting Mode property in LegendSettings value as “Interactive” and default value of Mode property is “Default” to enable the normal legend.

Title for Interactive Legend

You can provide the title for interactive legend by using Title property in LegendSettings.

Label for Interactive Legend

You can provide the left and right labels to interactive legend by using LeftLabel and RightLabel properties in LegendSettings.

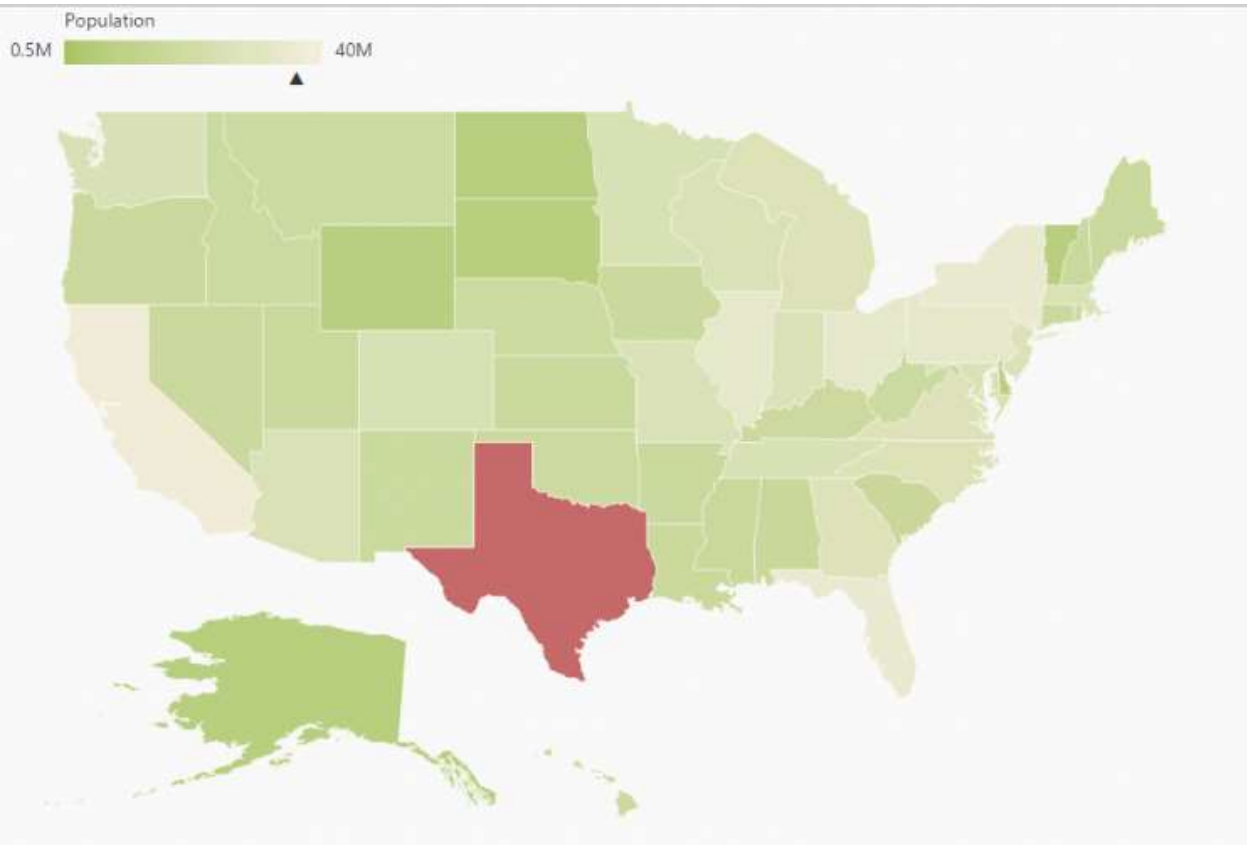
Note: Here, Range Color Mapping code snippet for shapeSettings with color mappings is referred.

ASPX-CS

```
@(Html.EJ().Map("container")
.Layers(layer =>
{
.LegendSettings(ml =>
{
ml.ShowLegend(true)
.Height(15)
.Width(150)
.Position(Syncfusion.JavaScript.DataVisualization.Models.DockPosition.Topleft)
.Mode(Syncfusion.JavaScript.DataVisualization.Models.LegendMode.Interactive)
.Title("Population")
.LeftLabel("0.5 M")
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
.RightLabel("40 M");
})
})
)
```



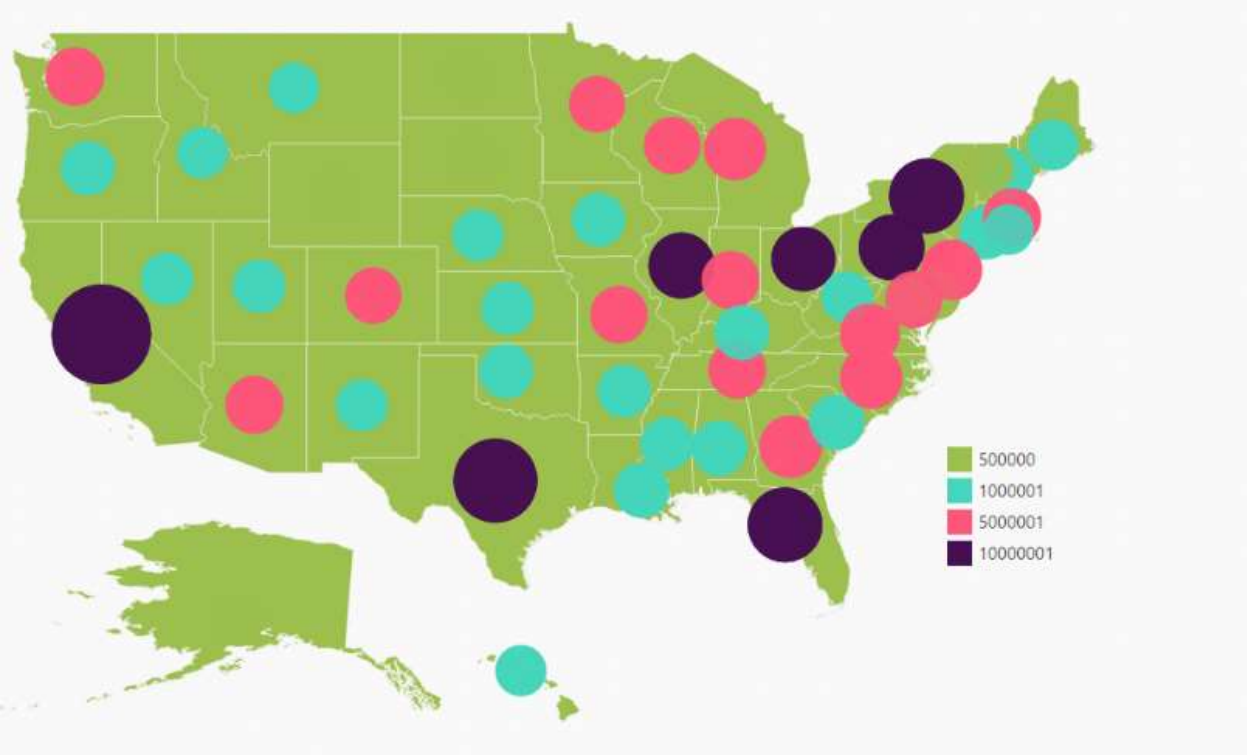
Bubble Legend

A bubble legend feature is used to provide the key (legend) for another map element bubble. You can activate the Bubble legend by setting the enum Type in LegendSettings as "*Bubble*" and this enables you to easily identify what value a particular bubble is representing.

ASPX-CS

```
@(Html.EJ().Map("container")
.Layers(layer =>
{
.LegendSettings(ml =>
{
ml.ShowLegend(true)
.Height(15)
.Width(150)
.Type(Syncfusion.JavaScript.DataVisualization.Models.LegendType.Bubbles)
.Title("Population");
})
.BubbleSettings( b1 =>
{
b1.ShowBubble(true)
.ValuePath(population)
```

```
.MinValue(20),
.MaxValue(40)
.RangeColorMappings(cm =>
{
cm.From(500000).To(1000000).GradientColors(new List<string> { "#9CBF4E",
"#B8CE7B" }).Range(10688).Add();
cm.From(1000001).To(5000000).GradientColors(new List<string> { "#B8CE7B",
"#CBD89A" }).Range(19390).Add();
cm.From(5000001).To(10000000).GradientColors(new List<string> { "#CBD89A",
"#DEE2B9" }).Range(18718).Add();
cm.From(10000001).To(40000000).GradientColors(new List<string> { "#DEE2B9",
"#F1ECD8" }).Range(30716).Add();
});
})
})
)
```



User Interaction

Options like zooming, panning and map selection enable the effective interaction on Map elements.

Map Selection

Each shape in the Map can be selected and deselected during interaction with shapes.

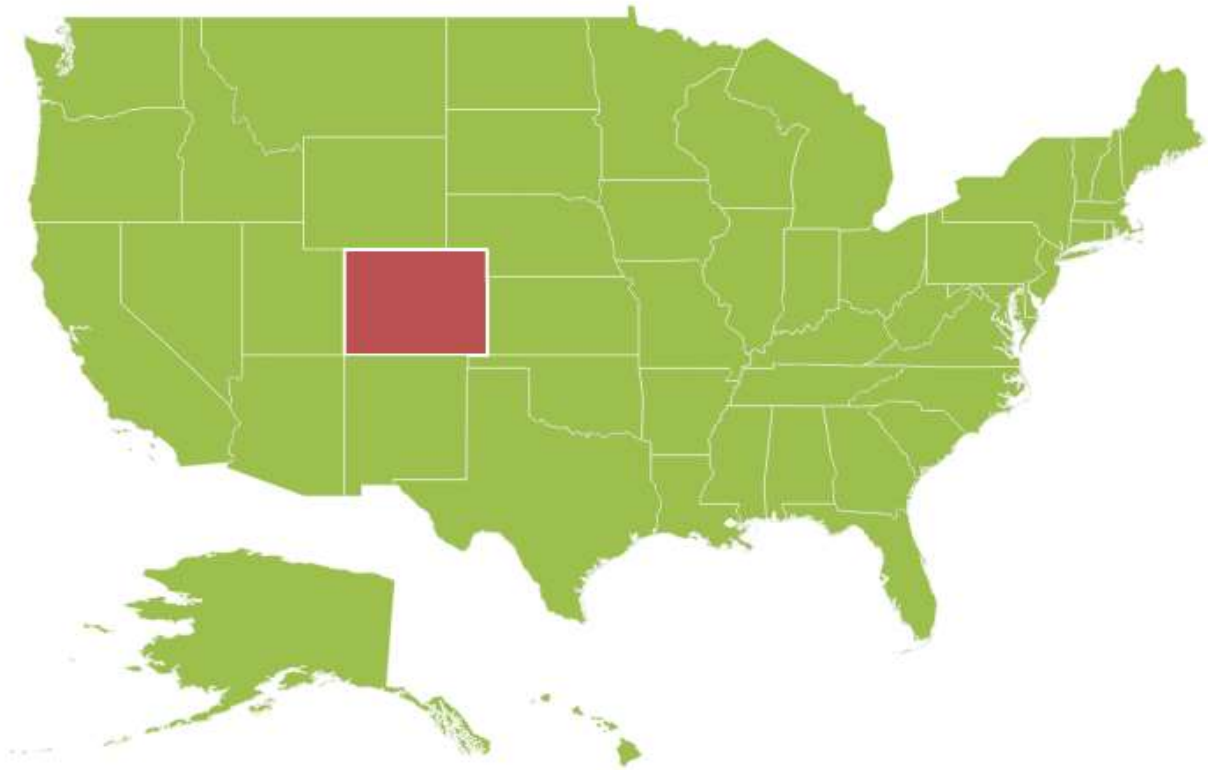
The SelectionColor property is used to get or set the selected shape color. The SelectionStroke and SelectionStrokeWidth properties are used to customize the selected shape border.

You can select the shape by tapping the shape. The single selection is enabled by the EnableSelection property of shape layer. When EnableSelection is set to false, the shapes cannot be selected.

ASPX-CS

Copyright © 2001 - 2020 Syncfusion Inc.

```
@(Html.EJ().Map("maps")
.Layers(layer =>
{
layer.ShapeData(mapData)
.ShapeSettings(shape =>
{
shape.StrokeThickness(0.5)
.Fill("#9CBF4E")
.Stroke("white")
.SelectionColor("#BC5353")
.SelectionStrokeWidth(2)
.SelectionStroke("white");
})
.EnableSelection(true)
.Add();
})
)
```



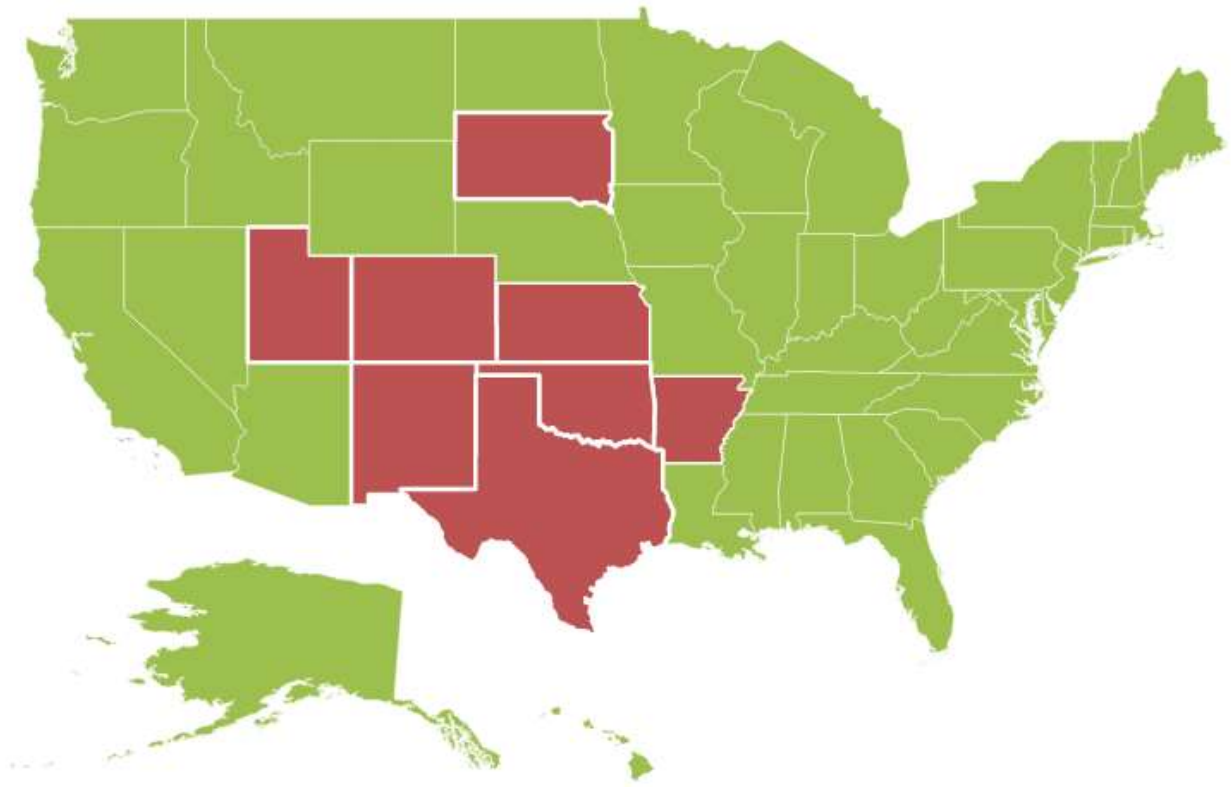
MultiSelection

This feature enables you to select multiple Map shapes on mouse taps accompanied by "Ctrl" key press. For this feature to get enabled, set the property selectionMode as "*multiple*" along with enableSelection property.

JS

```
@(Html.EJ().Map("maps")
.Layers(layer =>
{
```

```
layer.ShapeData(mapData)
// ...
.EnableSelection(true)
.SelectionMode(Multiple)
// ...
.Add();
})
)
```



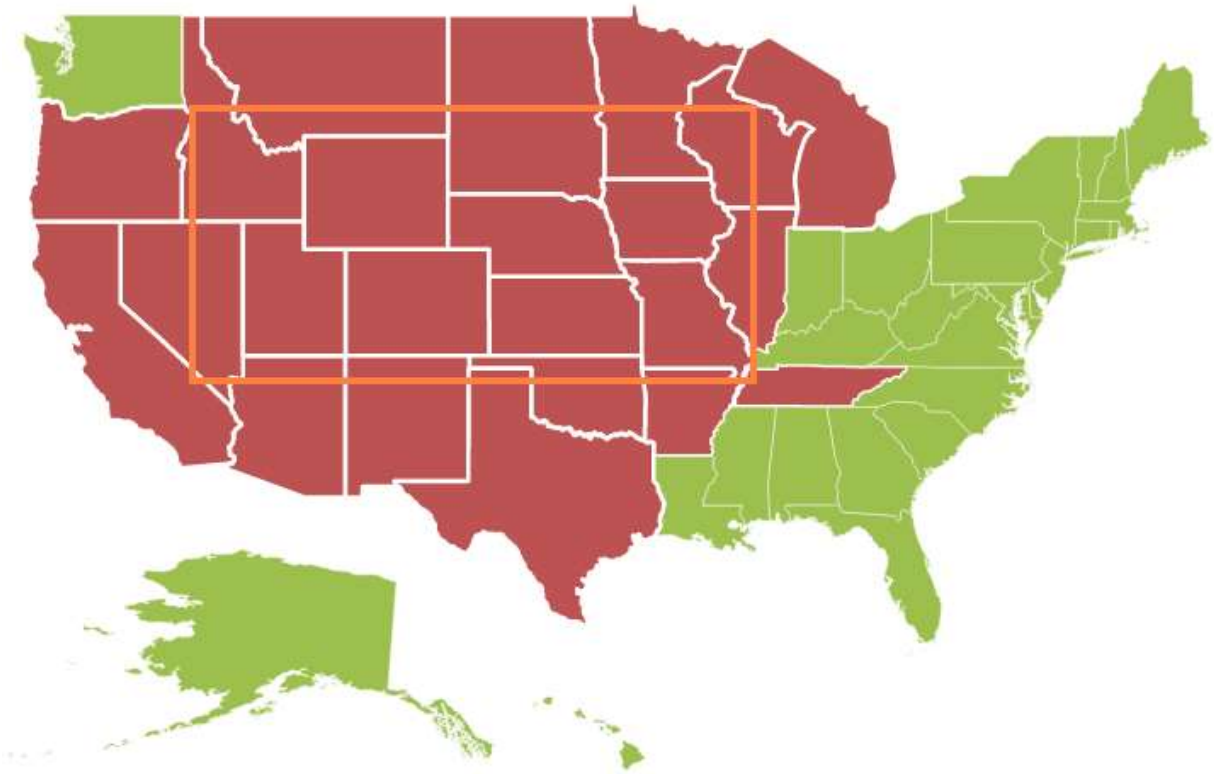
Dragging On Selection

This feature enables you to select the shapes by dragging over the shapes. While dragging over the shapes, a rectangle is generated and the shapes that come within the rectangle is selected.

You can enable this feature by setting the property DraggingOnSelection in the Layers to "*true*".

JS

```
@(Html.EJ().Map("maps")
.Layers(layer =>
{
layer
// ...
.DraggingOnSelection(true)
// ...
.Add();
})
)
```



Zooming

The zooming feature enables you to zoom in and out of the Map to show in-depth information. It is controlled by the Level property of the Map. When the zoom level of the Map control is increased, the Map is zoomed in. When the zoom level is decreased, then the Map is zoomed out.

Properties

The following properties are related to the zooming feature of the Maps control:

- Level
- EnableZoom
- MinValue
- MaxValue

Level

The Level property determines the Map's scale size when zooming. The default value of Level is 1.

Note: The level cannot be less than 1.

EnableZoom

The EnableZoom property enables or disables the zooming feature.

MinValue

The MinValue property is used to set the minimum zoom level of the Map.

MaxValue

The MaxValue property is used to set the maximum zoom level of the Map.

ASPX-CS

Copyright © 2001 - 2020 Syncfusion Inc.

```
@(Html.EJ().Map("maps")
.Layers(layer =>
{
layer.ShapeData(mapData)
.Add();
})
.ZoomSettings(zoom=>
{
zoom.EnableZoom(true)
.MinValue(1)
.MaxValue(20)
.Level(1);
})
)
```

Factor

Specifies the zoom factor for map zoom value, you can use factor property.

ASPX-CS

```
@(Html.EJ().Map("maps")
.Layers(layer =>
{
layer.ShapeData(mapData)
.Add();
})
.ZoomSettings(zoom=>
{
zoom.EnableZoom(true)
.Factor(1)
})
)
```

Additional Options to Zoom the Map

Maps can be zoomed by using the following options also,

- Zoom method.
- Mouse scroll.
- Mouse double tap.
- Shape selection
- Position

By using Zoom method

You can zoom the Maps by using Zoom method. The Zoom method contains parameter zoom value. The Map can be zoomed or scaled based on zoom value parameter.

ASPX-CS

```
$("#map").ejMap("zoom", 2);
```

Copyright © 2001 - 2020 Syncfusion Inc.

By using mouse scroll

You can zoom the Map with mouse events by using mouse scroll. When the mouse is scrolled up, the Map is zoomed in and when the mouse is scrolled down, the Map is zoomed out.

By using mouse double tap

When the map is double-tapped by using mouse, the zoom in operation is performed.

By using Shape Selection

Map shape is zoomed to the whole map area on the shape selected. Animation can be applied for that zooming with the EnableAnimation property as true.

You can enable this feature by setting EnableZoomOnSelection property value as '*true*'.

When EnableZoomOnSelection property is set to true, then zooming of the Map control is muted on double click.

ASPX-CS

```
@(Html.EJ().Map("maps")
.ZoomSettings(zoom=>
{
zoom.EnableZoomOnSelection(true);
})
)
```

Positioning

Depending on the latitude and longitude, you can zoom the Map to the exact position. All locations are considered as latitude and longitude values and the exact location is considered as Map coordinates.

The NavigateTo is a method defined that allows you to zoom the Map control to the given location. This method contains three attributes as follows.

Copyright © 2001 - 2020 Syncfusion Inc.

Attribute Table

Attribute	Type	Description
Latitude	Double	Latitude point of the position
Longitude	Double	Longitude point of the position
Level	Double	Zoom level of the map

JS

```
<script type="text/javascript">
function buttonClick()
{
$("#map").ejMap("navigateTo", 13, 80, 5);
}
</script>
```

Panning

The panning feature enables the Map navigation. The `EnablePan` property is used to enable or disable the panning support.

ASPX-CS

```
@(Html.EJ().Map("maps")
.EnablePan(true)
)
```

Mouse Wheel Zoom

You can zoom the Map with mouse by using mouse wheel. When the mouse is wheeled, the Map is zoomed in.

You can enable this feature by setting `EnableMouseWheelZoom` property value as '*true*'.

ASPX-CS

```
@(Html.EJ().Map("maps")
.ZoomSettings(zoom=>
{
zoom.EnableMouseWheelZoom(true);
})
)
```

Navigation Control

Navigation control is built-in with Maps control. With Navigation control, Maps can be panned in any direction and zoomed. It is possible to show or hide the NavigationControl by `EnableNavigation` property.

Copyright © 2001 - 2020 Syncfusion Inc.

ASPX-CS

```
@(Html.EJ().Map("maps")
.NavigationControl(navigation =>
{
navigation.EnableNavigation(true);
})
)
```

Zoom with Navigation Control

With Navigation control, the Maps can be zoomed. When you click the ZoomIn button, the Map is zoomed in and when you click the ZoomOut button, the Map is zoomed out.

Panning with Navigation Control

Maps can be panned with Pan buttons (TopPan button, RightPan button, BottomPan button, and LeftPan button). When you click a particular Pan button, the Map is panned on the respective directions.

Navigation Control Positions

The Navigation control can be positioned in two ways.

- Absolute Position
- Dock Position

Absolute Position

Based on the margin values of X and Y-axes, the navigation control can be positioned with the help of the X and Y properties available in AbsolutePosition. For positioning the navigation control based on margins corresponding to a Map, DockPosition value is set as '*None*'.

Dock Position

The navigation control can be positioned in following locations within the container.

Copyright © 2001 - 2020 Syncfusion Inc.

- TopLeft
- TopCenter
- TopRight
- CenterLeft
- Center
- CenterRight
- BottomLeft
- BottomRight
- BottomCenter
- BottomRight
- None

You can set this option by using the DockPosition property in NavigationControl.

Orientation

Set the orientation value for navigation control.

Name	Description
horizontal	specifies the horizontal position
vertical	specifies the vertical position

Content

Specifies the navigation control template for map, you can use content property.

ASPX-CS

```
@(Html.EJ().Map("maps")
.NavigationControl(navigation =>
{
navigation.EnableNavigation(true)
.Orientation(Orientation.Vertical)
.AbsolutePosition(new ShapePoint(5, 12))
.DockPosition(Syncfusion.JavaScript.
DataVisualization.Models.DockPosition.None);
})
)
```

Animation

Animation is enabled or disabled using enable animation property.

ASPX-CS

```
@(Html.EJ().Map("maps")
.EnableAnimation(true)
)
```

Enable Layer Change Animation

Enables or Disables the animation for layer change in map, you can use enableLayerChangeAnimation property and the default value is false.

Copyright © 2001 - 2020 Syncfusion Inc.

ASPX-CS

```
@(Html.EJ().Map("maps")
.EnableLayerChangeAnimation(true)
)
```

Responsiveness during browser resize

Map is made responsive when resizing the browser by using isResponsive property.

ASPX-CS

```
@(Html.EJ().Map("maps")
.IsResponsive(true)
)
```

Layers

Map is maintained through Layers and it can accommodate one or more layers.

Multilayer

The Multilayer support allows you to load multiple shape files in a single container, enabling maps to display more information.

Adding Multiple Layers in the Map

The shape layers is the core layer of the map. The multiple layers can be added in the shape Layers as SubShapeFileLayers within the shape Layers.

SubLayer

The subLayer is the collection of shape Layers.

In this example, World Map shape is used as shape data by utilizing the "WorldMap.json" file in the following folder structure obtained from downloaded Maps_GeoJSON folder.

..\ Maps_GeoJSON\

Here "MapController.cs" is populated with data of World Map in "MapController.cs".

~/Controller/MapController.cs

C#

```
public ActionResult Map()
{
ViewData["world_map"] = GetWorldMap();
}
public object GetWorldMap ()
{
string data =
System.IO.File.ReadAllText(Server.MapPath("~/App_Data/WorldMap.json"));
JavaScriptSerializer ser = new JavaScriptSerializer();
ser.MaxJsonLength = int.MaxValue;
return new MapData(data);
}
```

Refer both USA data and world map data as illustrated in the following "Map.cshtml".

Copyright © 2001 - 2020 Syncfusion Inc.

ASPX-CS

```
@{
var mapData = ViewData["mapdata"];
var world_map = ViewData["world_map"];
}
@(Html.EJ().Map("maps")
.Layers(layer =>
{
layer.ShapeData(world_map)
.ShapeSettings(ss =>
{
ss.Fill("#9CBF4E")
.StrokeThickness(0.5)
.Stroke("White");
})
.SubLayer(sublayer =>
{
sublayer.ShapeData(mapData)
.ShapeSettings(ss =>
{
ss.Fill("orange")
.StrokeThickness(1)
.Stroke("White");
})
.Add();
})
.Add();
})
)
```

Copyright © 2001 - 2020 Syncfusion Inc.

Map Providers

Map control support map providers such as OpenStreetMap that can be added to any layers in maps.

Open Street Map

OpenStreetMap is a map of the entire world. The OpenStreetMap allows you to view, edit and use geographical data in a collaborative way from any place on the Earth.

Enable OSM

You can enable this feature by setting the LayerType property value as "OSM".

ASPX-CS

```
@(Html.EJ().Map("map")
.Layers(layer =>
{
layer.LayerType(Syncfusion.JavaScript.DataVisualization.Models.LayerType.OSM
)
.UrlTemplate("http://a.tile.openstreetmap.org/level/tileX/tileY.png”);
})
)
```

URL Template

The UrlTemplate property determines the format of tile map. You can specify the template for the tile layer.

Bing Map

Bing Map is a key feature in accessing the external geospatial imagery services for deep-zoom satellite view.

Enable Bing Maps

You can enable this feature by defining the LayerType as “Bing”.

ASPX-CS

```
@(Html.EJ().Map("map")
.Layers(layer =>
{
layer.LayerType(Syncfusion.JavaScript.DataVisualization.Models.LayerType.Bin
g)
.Key("// ...bingMapKey”).Add();
})
)
```

Key

The bing Map Key is provided as input to this key property. The Bing Map key can be obtained from http://www.microsoft.com/maps/create-a-bing-maps-key.aspx.

Copyright © 2001 - 2020 Syncfusion Inc.

AngularJS Support

AngularJS is a JavaScript framework added to a HTML page with a <script> tag. It extends HTML attributes with directives and binds data to HTML with expressions. AngularJS directives allow you to specify custom and reusable HTML tags that moderate the behavior of certain elements.

Angular binding uses directives to plug its action into the page. Directives, all prefaced with ng-, are placed in HTML attributes. To know more about Angular binding refer to: http://help.syncfusion.com/aspnetmvc/maps/angularjs-support

Apply the plugin and property assigning the Map element through the directive that starts with the letter “e-“. The following code illustrates how to bind data to the Map component through Angular support.

ASPX-CS

```
//References to be added for AngularJS support.
<script src="@Url.Content("~/Scripts/angular.min.js")"></script>
<script
src="@Url.Content("~/Scripts/ej/ej.widget.angular.min.js")"></script>
<script src="@Url.Content("~/Scripts/MapsData/USA.js")"></script>
//Initializes Map
<div ng-app="SyncApp">
<div ng-controller="MapController">
<div id="map" style="height: inherit; min-height: 356px;" ej-map e-
zoomsettings- enablezoom="enableZoom">
<div e-layers>
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
<div e-layer e-shapedata="shapeData" e-shapesettings-fill="fill" e-
shapesettings-strokethickness="strokeThickness" e-shapesettings-
stroke="stroke">
</div>
</div>
</div>
Shape Color:  <input type="text" id="Text11" ng-model="nfill" style="width:
110px">
<div>
</div>
angular.module('SyncApp', ['ejangular'])
.controller('MapController', function ($scope)
{
$scope.enableZoom = true,
$scope.shapeData = usMap;
$scope.fill = "#9CBF4E";
$scope.strokeThickness = "0.5";
$scope.stroke = "white";
});
```

RTL

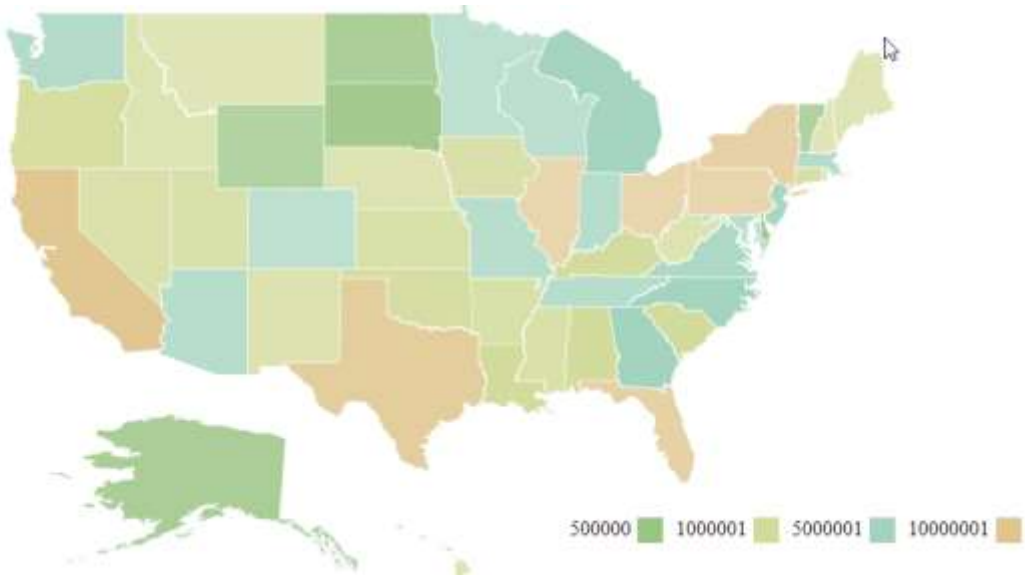
Right-to-Left or RTL describes the ability of application to handle and responds you to communicate with a right-to-left language, such as Arabic or Japanese. enableRTL property is used to change the rendering format to “Right-to-Left”. By default, legend and tooltip will be rendered as “Left-to-Right” in Maps.

ASPX-CS

```
@(Html.EJ().Map("maps")
.EnableRTL(true)
)
```

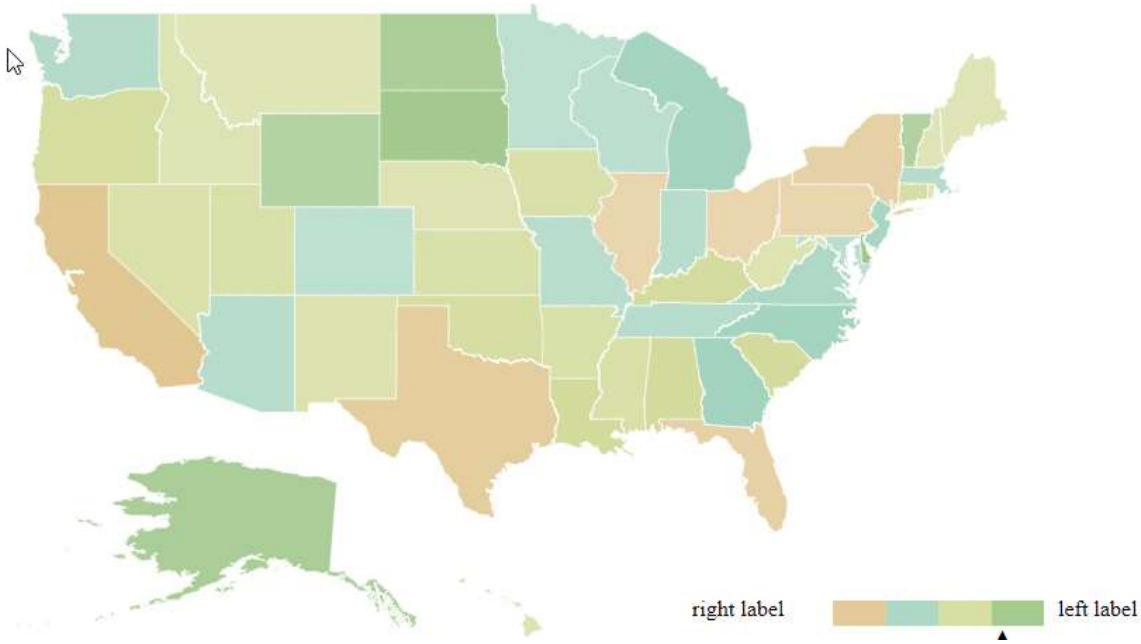
In default legend, after setting EnableRTL is set as true, legend text will be rendered first, and then legend icon will be rendered.

Copyright © 2001 - 2020 Syncfusion Inc.



Interactive legend

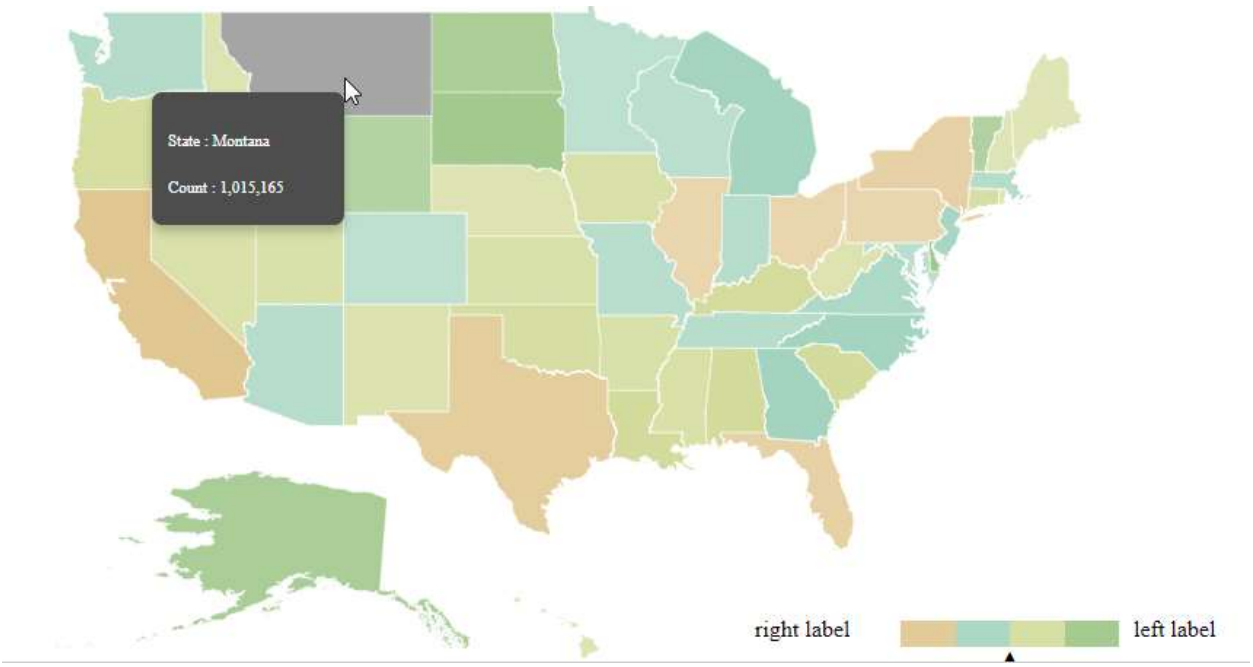
If EnableRTL is set as true, then whole interactive legend will be rendered from right-to-left, which means left label will be rendered at right side, and right label will be rendered at left side. Also, navigation arrow position will be changed to right side.



Tooltip

If EnableRTL is set as true, tooltip will be rendered at the left side of the mouse cursor.

Copyright © 2001 - 2020 Syncfusion Inc.



Methods

navigateTo(latitude, longitude, level)

Method for navigating to specific shape based on latitude, longitude and zoom level, you can use navigateTo method.

ASPX-CS

```
@(Html.EJ().Map("Map1"))
```

JS

```
var map = $("#Map1").data("ejMap");
map.navigateTo();
```

pan(direction)

Method to perform map panning, you can use pan method.

ASPX-CS

```
@(Html.EJ().Map("Map1"))
```

JS

```
var map = $("#Map1").data("ejMap");
map.pan();
```

refresh()

Method to reload the map, you can use refresh method.

ASPX-CS

```
@(Html.EJ().Map("Map1"))
```

Copyright © 2001 - 2020 Syncfusion Inc.

JS

```
var map = $("#Map1").data("ejMap");
map.refresh();
```

refreshLayers()

Method to reload the shapeLayers with updated values, you can use refreshLayers method.

ASPX-CS

```
@(Html.EJ().Map("Map1"))
```

JS

```
var map = $("#Map1").data("ejMap");
map.refreshLayers();
```

refreshNavigationControl(navigation)

Method to reload the navigation control with updated values, you can use refreshNavigationControl method.

ASPX-CS

```
@(Html.EJ().Map("Map1"))
```

JS

```
var map = $("#Map1").data("ejMap");
map.refreshNavigationControl();
```

zoom(level, isAnimate)

Method to perform map zooming, you can use zoom method.

ASPX-CS

```
@(Html.EJ().Map("Map1"))
```

JS

```
var map = $("#Map1").data("ejMap");
map.zoom();
```

Events

MarkerSelected

Triggered on selecting the map markers, you can use MarkerSelected event.

ASPX-CS

```
@(Html.EJ().Map("container")
.MarkerSelected("MarkerSelected")
)
```

Copyright © 2001 - 2020 Syncfusion Inc.

JS

```
function MarkerSelected(){
// Do Something
}
```

Mouseleave

Triggers while leaving the hovered map shape, you can use Mouseleave event.

ASPX-CS

```
@(Html.EJ().Map("container")
.Mouseleave("MouseLeave")
)
```

JS

```
function MouseLeave(){
// Do Something
}
```

Mouseover

Triggers while hovering the map shape, you can use mouseover event.

ASPX-CS

```
@(Html.EJ().Map("container")
.Mouseover("MouseOver")
)
```

JS

```
function MouseOver(){
// Do Something
}
```

OnRenderComplete

Triggers once map render completed, you can use OnRenderComplete event.

ASPX-CS

```
@(Html.EJ().Map("container")
.OnRenderComplete("RenderComplete")
)
```

JS

```
function RenderComplete(){
// Do Something
}
```

Copyright © 2001 - 2020 Syncfusion Inc.

Panned

Triggers when map panning ends, you can use Panned event.

ASPX-CS

```
@(Html.EJ().Map("container")
.Panned("Panned")
)
```

JS

```
function Panned(){
// Do Something
}
```

ShapeSelected

Triggered on selecting the map shapes, you can use ShapeSelected event.

ASPX-CS

```
@(Html.EJ().Map("container")
.ShapeSelected("ShapeSelected")
)
```

JS

```
function ShapeSelected(){
// Do Something
}
```

ZoomedIn

Triggered when map is zoomed-in, you can use ZoomedIn event.

ASPX-CS

```
@(Html.EJ().Map("container")
.ZoomedIn("ZoomedIn")
)
```

JS

```
function ZoomedIn(){
// Do Something
}
```

ZoomedOut

Triggers when map is zoomed out, you can use ZoomedOut event.

ASPX-CS

```
@(Html.EJ().Map("container")
.ZoomedOut("ZoomedOut")
)
```

Copyright © 2001 - 2020 Syncfusion Inc.

JS

```
function ZoomedOut(){
// Do Something
}
```

ShapeRendering

The ShapeRendering event is triggered while rendering each shape in the map.

ASPX-CS

```
@(Html.EJ().Map("container")
.ShapeRendering("shape")
)
```

JS

```
function shape(){
// Do Something
}
```

BubbleRendering

The BubbleRendering event is triggered while rendering each bubble in the map.

ASPX-CS

```
@(Html.EJ().Map("container")
.BubbleRendering("bubble")
)
```

JS

```
function bubble(){
// Do Something
}
```

LegendItemRendering

The LegendItemRendering event is triggered before rendering each legend in the map.

ASPX-CS

```
@(Html.EJ().Map("container")
.LegendItemRendering("legend")
)
```

JS

```
function legend(){
// Do Something
}
```

Click

Triggers while clicking on the layers of the map, you can use Click event.

Copyright © 2001 - 2020 Syncfusion Inc.

ASPX-CS

```
@(Html.EJ().Map("container")
.Click("click")
)
```

JS

```
function click(){
// Do Something
}
```

DoubleClick

Triggers while double clicking on the layers of the map, you can use DoubleClick event.

ASPX-CS

```
@(Html.EJ().Map("container")
.DoubleClick("doubleClick")
)
```

JS

```
function doubleClick(){
// Do Something
}
```

RightClick

Triggers while right clicking on the layers of the map, you can use RightClick event.

ASPX-CS

```
@(Html.EJ().Map("container")
.RightClick("rightClick")
)
```

JS

```
function rightClick(){
// Do Something
}
```

Load

Triggers before loading the map, you can use Load event.

ASPX-CS

```
@(Html.EJ().Map("container")
.Load("load")
)
```

JS

Copyright © 2001 - 2020 Syncfusion Inc.

```
function load(){
// Do Something
}
```

MaskEdit

MaskEdit

The MaskEdit control provides an easy and reliable way of collecting user input and displaying standard data in a specific format. Some common uses of the MaskEdit control are IP address editors, phone number editors, and Social Security number editors.

Key Features

- Mask: The format where the value should be entered in the text box can be set using this property.
- Input Mode: This feature allows the MaskEdit text box to act as an input text box or password text box.
- Watermark Text:The MaskEdit text box supports watermarking. A watermark is background text that appears in the text box without interfering with user text entry or the readability of the text entered. It can be used to display a ready instruction or other important information for the user. It appears automatically before the text is entered and disappears once the user begins entering text.
- Theme: Essential ASP.NET MVC controls feature 12 built-in themes: six flat themes and six with gradient effects. They also support custom skin options for user-defined themes.

Getting Started

This section explains you briefly on how to create a MaskEdit control in your ASP.NET MVC application.

Create your first MaskEdit Widget in MVC

ASP.NET MVC MaskEdit control allows you to set the type and format of the input mask that is used in the textbox and also the number of place holders. Using the following guidelines, you can create MaskEdit control for a real-time payment application.

The following screenshot illustrates the functionality of a MaskEdit. Using MaskEdit control textbox, you can enter only the assigned text format and no other formats. The input mask prevents you from entering invalid characters into the control. In this application, MobileNumber textbox has a mask value.

MaskEdit

In the above screenshot, you can type only numbers and it does not allow text format.

Create a MaskEdit control

ASP.NET MVC MaskEdit control renders built-in features like text masking, number masking and flexible APIs. You can easily create the MaskEdit control using simple HTML helper class as follows:

Copyright © 2001 - 2020 Syncfusion Inc.

1. Create an MVC Project and add necessary assemblies, styles and scripts to it. Refer MVC-Getting Started.
2. Add the following code to the corresponding view page to render MaskEdit.

ASPX-CS

```
<div class="frame">
<div class="control">
<table class="editors">
<tbody>
<tr>
<td>
<label>
Kilometers</label>
</td>
<td>
@Html.EJ().NumericTextbox("numeric").Value("1000")
</td>
</tr>
<tr>
<td>
<label>
Service Tax</label>
</td>
<td>
@Html.EJ().PercentageTextbox("percent").Value("100")
</td>
</tr>
<tr>
<td>
<label>
Fare</label>
</td>
<td>
@Html.EJ().CurrencyTextbox("currency").Value("50")
</td>
</tr>
<tr>
<td>
<label>
Mobile No</label>
</td>
<td>
@*creating MaskEdit control*@
@Html.EJ().MaskEdit("maskedit").MaskFormat("99-999-
99999").InputMode(InputMode.Text)
</td>
</tr>
</tbody>
</table>
<div class="pay-bill">
@Html.EJ().Button("btn").Size(ButtonSize.Small).Text("PayBill")
</div>
</div>
</div>
```

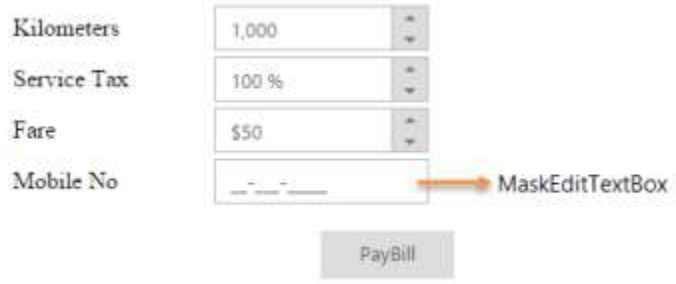
Copyright © 2001 - 2020 Syncfusion Inc.

3. Add the following styles to show MaskEdit and place it in a particular position.

CSS

```
<style>
.frame
{
width: 300px;
}
.editors
{
max-width: 400px;
}
.control .pay-bill
{
margin-left: 208px;
margin-top: 15px;
}
.editors label
{
display: block;
width: 130px;
}
.control
{
margin-top: 10px;
}
.ctrl-label
{
padding-bottom: 3px;
}
</style>
```

Execute the above code example to render the following output.



MaskEdit

Set Mask value to Mobile Number textbox

In this section, you can learn how to set mask value for MobileNumber textbox. To achieve this, set the mask value in the MaskEdit control to the desired values.

@Html.EJ().MaskEdit("maskedit").MaskFormat("99-999-99999").InputMode(InputMode.Text)

Copyright © 2001 - 2020 Syncfusion Inc.

Create a MaskEdit control for Product Key Validation

Create a MaskEdit

You can easily create the MaskEdit control using simple HTML helper class as follows.

1. Create a MVC Project and add necessary assemblies and scripts to it.

Refer MVC-Getting Started.

2. Add the following code to the corresponding view page to render MaskEdit.

ASPX-CS

```
<div class="frame">
<div class="control">
<table class="editors">
<tbody>
<tr>
<td>
<label>
Product Key</label>
</td>
<td>
@Html.EJ().MaskEdit("maskedit").MaskFormat("aaaa-aaaa-aaaa-
aaaa").InputMode(InputMode.Text) @*creating MaskEdit control for product key
validation*@                          </td>
</tr>
</tbody>
</table>
<div class="product-key">
@Html.EJ().Button("btn").Size(ButtonSize.Small).Text("Submit")
</div>
</div>
</div>
```

3. Add the following styles to show the MaskEdit, and place it in a particular position.

CSS

```
<style>
.frame
{
width: 300px;
}
.editors
{
max-width: 400px;
}
.control .product-key
{
margin-left: 208px;
margin-top: 15px;
}
.editors label
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
{
display: block;
width: 130px;
}
.control
{
margin-top: 10px;
}
.control-label
{
padding-bottom: 3px;
}
</style>
```

4. Run the above code example to render the following output.

Product Key

Set Mask value to Product key textbox

You can set mask value for Product key textbox by setting the desired values to the MaskEdit control.

ASPX-CS

```
@Html.EJ().MaskEdit("maskedit").MaskFormat("aaaa-aaaa-aaaa-
aaaa").InputMode(InputMode.Text)
```

Behavior Settings

Persistence Support

MaskEditTextBox provides state maintenance support. You can maintain the previous changes made in the control after a page loads.

Configure Persistence Support

In the View page add MaskEditTextBox helper, and configure the EnablePersistence property as follows.

ASPX-CS

```
@Html.EJ().MaskEdit("mask").MaskFormat("99-999-
99999").EnablePersistence(true)
```

Output of MaskEditTextBox with EnablePersistence is as follows.

MaskEditTextBox at initial load

Copyright © 2001 - 2020 Syncfusion Inc.

MaskEditTextBox after changing the value and after page refresh

Enabled or Disabled

MaskEditTextBox has an option to enable or disable its element. You can set the Enabled property as “false” to enable the Textbox controls.

Configure Enabled or Disabled

In the View page add MaskEditTextBox helper, and configure the Enabled property.

ASPX-CS

```
@Html.EJ().MaskEdit("mask").Enabled(false).MaskFormat("99-999-99999")
```

Output when Enabled is “true” and when Enabled is “false”.

Textboxes with enabled as true

Textboxes with enabled as false

Adjusting Textbox Size

MaskEditTextBox size can be modified by using the Height and Width properties. You can customize the size of Textbox by using these properties.

Configure Height and Width

MaskEditTextBox size can be modified by using the Height and Width properties.

ASPX-CS

```
@Html.EJ().MaskEdit("mask").MaskFormat("99-999-
99999").Width("100").Height("50")
```

Output of MaskEditTextBox after setting “Height” and “Width” is as follows.

MaskEditTextBox with height and width

Define Value

The value of MaskEditTextBox can be assigned by using the Value property. The default value for Value property is null. Specify the name attribute value for the mask edit textbox.

You can get the raw value of **MaskEdit** without literals and prompt characters by using the get_StrippedValue method.

Also you get the value of **MaskEdit** with the masked format by using the get_UnstrippedValue method.

Copyright © 2001 - 2020 Syncfusion Inc.

Configure Value

In the View page add MaskEditTextBox helper, and configure the Value property

ASPX-CS

```
@Html.EJ().MaskEdit("mask").MaskFormat("99-999-99999").Value("1234567890")
```

Output of MaskEditTextBox with the value property is as follows.

MaskEditTextBox with value

Read Only Support

MaskEditTextBox supports read only option. When you enable the ReadOnly property to the control, the value cannot be changed in the MaskEditTextBox. You can set the ReadOnly property as “true” to enable this option.

Configure Read Only

In the View page add MaskEditTextBox helper, and configure the ReadOnly property.

ASPX-CS

```
@Html.EJ().MaskEdit("mask").MaskFormat("99-999-
99999").Value("123456").ReadOnly(true)
```

Output of MaskEditTextBox when ReadOnly is “true” is as follows. MaskEditTextBox values cannot be edited or changed.

MaskEditTextBox with readOnly

Error Visibility

The MaskEditTextBox has an option that shows the error value with red colored text. It is used to validate the Mask Edit value. You can set the ShowError property as “true” to enable this option.

Configure Error Visibility

In the View page use the corresponding Textbox helper for rendering Textbox controls.

ASPX-CS

```
@* Add the following code in your view page to render Textbox controls.*@
@Html.EJ().MaskEdit("mask").MaskFormat("99-999-
99999").Value("123456").ShowError(true)
```

Output for MaskEditTextBox when ShowError is “true” is as follows.

Textbox with showError

Copyright © 2001 - 2020 Syncfusion Inc.

Textbox without error

Mask Edit Properties

Custom Character

The MaskEdit allows you to use the custom character option. The specified character is allowed to enter in the Mask Edit Textbox by using the CustomCharacter property.

Hide Prompt On Leave

The MaskEditTextBox provides the option to hide the prompt when you focus out from the control. The mask prompt is visible when you focus again to the control. The default value of HidePromptOnLeave is false.

Input Mode

The MaskEdit supports two type of inputs such as text and password that have been assigned by using the enum values ej.InputMode.Text and ej.InputMode.Password. The default value for InputMode is text in MaskEdit.

Mask Format

The MaskEdit provides the option to define the MaskFormat to the value. The default value for MaskFormat property is empty string.

The following steps explain the implementation of MaskEdit Properties.

In the View page use the corresponding Textbox helper for rendering MaskEdit control.

ASPX-CS

```
@* Add the following code in your view page to render Textbox controls.*@
@{Html.EJ().MaskEdit("mask")
.MaskFormat("99-999-CCCC").CustomCharacter("r").
HidePromptOnLeave(true).InputMode(InputMode.Text).Render();}
```

The output for MaskEditTextBox with its properties is as follows.

MaskEdit with MaskFormat

MaskEdit with HidePromptOnLeave

MaskEdit with prompt focus

Copyright © 2001 - 2020 Syncfusion Inc.

MaskEdit with InputMode text

MaskEdit with CustomCharacter

Appearance

Theme

The MaskEditTextBox control's style and appearance can be controlled based on CSS classes. In order to apply styles to the Textbox control, you need to refer 2 files namely, ej.widgets.core.min.css and ej.theme.min.css. If the file ej.widgets.all.min.css is referred, then it is not necessary to include the files ej.widgets.core.min.css and ej.theme.min.css in your project, as ej.widgets.all.min.css is the combination of these two.

By default, there are 12 themes support available for Textbox control namely:

- default-theme
- flat-azure-dark
- fat-lime
- flat-lime-dark
- flat-saffron
- flat-saffron-dark
- gradient-azure
- gradient-azure-dark
- gradient-lime
- gradient-lime-dark
- gradient-saffron
- gradient-saffron-dark

CSS Class

The CSS can be customized by using the CssClass in the MaskEditTextBox. You can customize the MaskEditTextBox with CssClass property to appear like your desired control.

Configure CSS Class

1. In the View page add MaskEditTextBox helper, and configure the CssClass property.

ASPX-CS

```
@Html.EJ().MaskEdit("mask").MaskFormat("99-999-
99999").Value("123456").CssClass("customCss")
```

2. Customize the CSS properties in custom CSS class.

CSS

```
<style>
.customCss .e-box
{
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
border-color: #9d241b;
}
.customCss .e-input
{
background-color: #f6db8d;
}
.customCss .e-select
{
background-color: #ecf6ac;
border-color: #3c36e7;
}
</style>
```

The output for MaskEditTextBox after applying CssClass is as follows.

Textboxes with cssClass

Rounded Corner Support

MaskEditTextBox provides you with rounded corner support whose appearance is different from normal textbox controls.

Configure Rounded Corner Support

In the View page add MaskEditTextBox helper, and configure the ShowRoundedCorner property.

ASPX-CS

```
@Html.EJ().MaskEdit("mask").Value("123456").ShowRoundedCorner(true)
```

Output of MaskEditTextBox when ShowRoundedCorner is “true”.

Textboxes with showRoundedCorner

Water Mark Text Support

The Textboxes provide water mark text support. You can display the initial value in the control by water mark.

Configure Water Mark Text

In the View page use the corresponding Textbox helper for rendering Textbox controls.

ASPX-CS

```
@Html.EJ().MaskEdit("mask").MaskFormat("99-999-
99999").WatermarkText("MaskEdit")
```

Output of MaskEditTextBox when ShowRoundedCorner is “true”.

MaskEditTextBox with watermark text

Copyright © 2001 - 2020 Syncfusion Inc.

Text Alignment Support

The MaskEditTextBox provides text alignment support that allows you to set the alignment of text in the control by using the TextAlign property.

Configure Text Alignment

In the View page use the corresponding MaskEdit helper for rendering MaskEdit control.

ASPX-CS

```
@Html.EJ().MaskEdit("mask").MaskFormat("99-999-
99999").Value("12345677").TextAlign(TextAlign.Right)
```

The output for Textboxes when TextAlign is set to “right”.

MaskEditTextBox with textAlign

HTML Attributes Support

The MaskEditTextBox provides support for adding HTML attributes to the component. ‘HtmlAttributes’ property is used to add HTML attributes like, id, class etc.. to the components. We need to use IDictionary<string,object> to specify the HTML attributes.

Configure HTMLAttributes property

1. In the View page add MaskEditTextBox helper, and configure the HtmlAttributes property. Here we have added the Access key attribute. While pressing the “AccessKey” and “J” keys, MaskEditTextBox will gain focus.

ASPX-CS

```
@{IDictionary<string, object> maskAttribute = new Dictionary<string,
object>();
maskAttribute.Add("accesskey", "j");
}
@Html.EJ().MaskEdit("mask").MaskFormat("99-999-
99999").HtmlAttributes(maskAttribute)
```

2. Add the following JavaScript code to focus the MaskEditTextBox

JS

```
<script type="text/javascript">
$(function ()
{
$(document).on("keydown", function (e)
{
if (e.altKey && e.keyCode === 74)
{ // j- key code.
$("#mask").focus();
}
});
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
});
</script>
```

The output for MaskEditTextBox after configuring the HtmlAttributes property

MaskEditTextBox with focus

Globalization Support in MaskEdit

We have provided the globalization support in **MaskEdit** control. Our **MaskEdit** control mainly rendered based on the **maskFormat** property, so we have provided the globalization support based on the maskFormat literals. We have given this globalization support option on below maskFormat literals in **MaskEdit** control. You can change the globalization by using the locale property. The default value for **locale** property is 'en-US' in **MaskEdit** control.

Formats	Description
$	Currency symbol value will be changed based on the corresponding culture.
.	Decimal Separator value will be changed based on the corresponding culture.
,	Thousand Separator will be changed based on the corresponding culture.

To know more about EJ globalize support, please refer the below link

https://help.syncfusion.com/aspnetmvc/globalization

The following example describes the way to use localization in MaskEdit.

Refer the below German culture file in head section of HTML page after the reference of **ej.web.all.min.js** file.

JAVASCRIPT

```
<script src="http://cdn.syncfusion.com/{{ site.releaseversion
}}/js/i18n/ej.culture.de-DE.min.js"></script>
```

ASPX-CS

```
<label for="mask">Mask Edit</label>
@(Html.EJ().MaskEdit("maskedit").InputMode(InputMode.Text).MaskFormat("$999,
999.99").Width("100%").Locale("de-DE"))
```

Output of MaskEdit with localization.

MaskEdit with de-DE locale

MaskEdit with default (en-US) locale

Menu

Menu

The Menu control supports displaying a Menu created from list items. The Menu is based on a hierarchy of Parent and Child elements where the Child items are rendered as sub-menu items.

Key Features

- UL/LI template: Requires UL and LI list of items as input.
- Orientation: Vertical and horizontal orientation support.
- Context menu: A Menu that is displayed wherever you right-click on the page or on the control.
- Keyboard shortcuts: Allows easy access to Menu items through shortcut keys.
- Data binding: Supports data binding Menu items as remote or local data.
- Theme: Essential ASP.NET MVC controls feature 12 built-in themes, six flat and six with gradient effects, and also supports custom skin options for user-defined themes.
- Keyboard navigation: You can interact with the Menu control using the keyboard.
- RTL support: This feature allows text in Menu items to be displayed from right to left.
- Center Menu: This feature allows you to center-align root Menu items.
- Separators and open-on-click support.

Getting Started

This section explains briefly about how to create a Menu control in your application with ASP.NET MVC

Create Syncfusion Menu in MVC

The Essential ASP.NET MVC Menu control supports displaying a Menu out of list items. The Menu is based on parent and child elements hierarchy, where the child items are rendered as the sub-menu items .The Menu control can also render with local and remote data source. The following section explains you on how to customize the Menu control for a website.

The following screenshot illustrates the appearance of Syncfusion’s website Menu.

Copyright © 2001 - 2020 Syncfusion Inc.

Syncfusion Menu

The Menu items in the above screenshot allow you to navigate through multiple menus in a page and select an item. It has a hierarchical structure with sub menus.

Create a Menu

Essential ASP.NET MVC Menu widget basically renders with built-in features like keyboard navigation, show and hides Menu items with animations and flexible API's. Refer the following guidelines to render Menu control with Local data source value.

1. You can create a MVC Project and add the necessary Dll's and scripts using the MVC-Getting Started Documentation.
2. Add the below code in your view page to add the necessary CSS and script files

ASPX-CS

```
<head>
<link href="http://cdn.syncfusion.com/13.1.0.21/js/web/flat-
azure/ej.web.all.min.css" rel="stylesheet" />
<!--Scripts-->
<script src="http://cdn.syncfusion.com/js/assets/external/jquery-
1.10.2.min.js"></script>
<script
src="http://cdn.syncfusion.com/js/assets/external/jquery.easing.1.3.min.j
s"></script>
<script
src="http://cdn.syncfusion.com/13.1.0.21/js/web/ej.web.all.min.js">
</script>
</head>
```

3. Add the following code example to the corresponding view page for Menu rendering.

ASPX-CS

```
@Html.EJ().Menu("SyncfusionProducts")
```

4. Execute the above code to render Empty Menu bar.

Essential ASP.NET MVC Menu without menu item

Configure Parent Menu items

Each Menu consists of a list of Menu items with list of sub level Menu item. Refer the following guidelines to initialize the root level elements of Menu control with Remote data source value. RootLevelItems data service is created to define the root level Menu items, sub items and InnerItems data services to initialize the sub level and inner sub levels and both can be referred from the following service location. In Menu Widgets mention the RootLevelItem Data Source in the Datasource property.

Copyright © 2001 - 2020 Syncfusion Inc.

Elements's properties like Id, Text, URL, and Parent Id can be defined using our menu fields and it explained briefly under the concept and features of Menu control.

http://js.syncfusion.com/demos/ejServices/Wcf/Northwind.svc/

To navigate the clicked Menu item to a specific URL, define the navigation URL to each Menu item.

Initialize the Menu with data source value as follows.

ASPX-CS

```
@Html.EJ().Menu("syncfusionProducts").Items(items =>
{
items.Add().Url("#").Id("Products").Text("Products");
items.Add().Url("").Text("Support");
items.Add().Url("").Id("Purchase").Text("Purchase");
items.Add().Url("").Id("Downloads").Text("Downloads");
items.Add().Id("Resources").Url("").Text("Resources");
items.Add().Url("").Id("Company").Text("Company");
})
```

Execute the above code to display the Root level Menu items.

Essential ASP.NET MVC Menu without sub menu item

Initialize sub-level Menu items

Each Menu items consist of list of sub level Menu items. Refer the following guidelines to initialize the sub level items of Menu control. The ParentId field property maps root level Menu item to its sub level Menu item. In Menu Widgets mention the RootLevelItems and SubLevelItems Data Source in the Datasource property. The Child field property is used to define sub level Menu items of parent Menu item.

The following code example explains the initialization of first level sub menu items of Menu control.

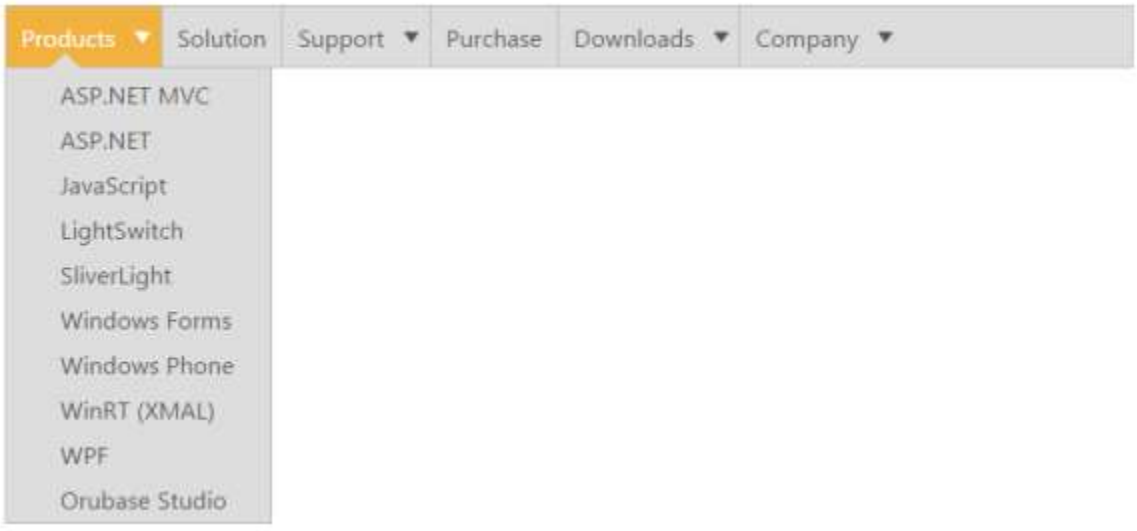
ASPX-CS

```
@Html.EJ().Menu("syncfusionProducts").Items(items =>
{
items.Add().Url("#").Id("Products").Text("Products").Children(child =>
{
child.Add().Url("").Text("ASP.NET");
child.Add().Url("").Text("ASP.NET MVC");
child.Add().Url("").Text("Mobile MVC");
child.Add().Url("").Text("Silverlight");
child.Add().Url("").Text("Windows Forms");
child.Add().Url("").Text("Windows Phone");
child.Add().Url("").Text("WinRT (XMAL)");
child.Add().Url("").Text("WPF");
child.Add().Url("").Text("Orubase Studio");
child.Add().Url("").Text("Metro Studio");
child.Add().Url("").Text("What's New");
});
items.Add().Url("").Text("Support").Children(child =>
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
{
child.Add().Url("").Text("Direct-Trac Support");
child.Add().Url("").Text("Community Forums");
child.Add().Url("").Text("Knowledge Base");
child.Add().Url("").Text("Online Documentation");
child.Add().Url("").Text("Services");
});
items.Add().Url("").Id("Purchase").Text("Purchase");
items.Add().Url("").Id("Downloads").Text("Downloads").Children(child =>
{
child.Add().Url("").Text("Evaluation");
child.Add().Url("").Text("Free E-Books");
child.Add().Url("").Text("Metro Studio");
child.Add().Url("").Text("Latest Version");
child.Add().Url("").Text("Version History");
});
items.Add().Id("Resources").Url("").Text("Resources").Children(child =>
{
child.Add().Url("").Text("Technology Resource Portal");
child.Add().Url("").Text("Case Studies");
child.Add().Url("").Text("Boucher & DataSheet");
child.Add().Url("").Text("FAQ");
});
items.Add().Url("").Id("Company").Text("Company").Children(child =>
{
child.Add().Url("").Text("About Us");
child.Add().Url("").Text("Company Blog");
child.Add().Url("").Text("Technical Blog");
child.Add().Url("").Text("Newsletter");
child.Add().Url("").Text("Partners");
child.Add().Url("").Text("Locations");
child.Add().Url("").Text("Contact Us");
child.Add().Url("").Text("Careers");
});
})
```

Execute the above code to render the following output.



Copyright © 2001 - 2020 Syncfusion Inc.

Essential ASP.NET MVC Menu with sub menu item

Define multiple level Menu items

You can render sub menu item to multiple level in Menu control. In Menu Widgets, mention the InnerItems Data Source in the Datasource property. The Child field property is used to define the sub level Menu item of parent Menu. Specify the ParentId value to render sub level Menu item for the Menu item. Each Level Menu item have Child field to define the child level Menu item.

The following code example explains the initialization of multiple level sub menu items.

ASPX-CS

```
@Html.EJ().Menu("syncfusionProducts").Items(items =>
{
items.Add().Url("#").Id("Products").Text("Products").Children(child =>
{
child.Add().Url("").Text("ASP.NET");
child.Add().Url("").Text("ASP.NET MVC");
child.Add().Url("").Text("Mobile MVC");
child.Add().Url("").Text("Silverlight");
child.Add().Url("").Text("Windows Forms");
child.Add().Url("").Text("Windows Phone");
child.Add().Url("").Text("WinRT (XMAL)");
child.Add().Url("").Text("WPF");
child.Add().Url("").Text("Orubase Studio");
child.Add().Url("").Text("Metro Studio");
child.Add().Url("").Text("What's New").Children(child1 =>
{
child1.Add().Url("").Text("ASP.NET");
child1.Add().Url("").Text("WPF");
child1.Add().Url("").Text("Silverlight");
child1.Add().Url("").Text("Windows Forms");
child1.Add().Url("").Text("Windows Phone");
child1.Add().Url("").Text("ASP.NET MVC");
child1.Add().Url("").Text("ASP.NET");
});
});
items.Add().Url("").Text("Support").Children(child =>
{
child.Add().Url("").Text("Direct-Trac Support");
child.Add().Url("").Text("Community Forums");
child.Add().Url("").Text("Knowledge Base");
child.Add().Url("").Text("Online Documentation");
child.Add().Url("").Text("Services").Children(child1 =>
{
child1.Add().Url("").Text("Consulting");
child1.Add().Url("").Text("Training");
});
});
items.Add().Url("").Id("Purchase").Text("Purchase");
items.Add().Url("").Id("Downloads").Text("Downloads").Children(child =>
{
child.Add().Url("").Text("Evaluation");
child.Add().Url("").Text("Free E-Books");
child.Add().Url("").Text("Metro Studio");
child.Add().Url("").Text("Latest Version");
child.Add().Url("").Text("Version History");
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
});
items.Add().Id("Resources").Url("").Text("Resources").Children(child =>
{
child.Add().Url("").Text("Technology Resource Portal").Children(child1 =>
{
child1.Add().Url("").Text("E-Books");
child1.Add().Url("").Text("White Papers");
});
child.Add().Url("").Text("Case Studies");
child.Add().Url("").Text("Boucher & DataSheet");
child.Add().Url("").Text("FAQ");
});
items.Add().Url("").Id("Company").Text("Company").Children(child =>
{
child.Add().Url("").Text("About Us").Children(child1 =>
{
child1.Add().Url("").Text("More About Us");
child1.Add().Url("").Text("Management");
child1.Add().Url("").Text("News & Events");
child1.Add().Url("").Text("Customer Quotes");
child1.Add().Url("").Text("Customer Lists");
child1.Add().Url("").Text("Case Studies");
child1.Add().Url("").Text("Awards");
child1.Add().Url("").Text("Media Kit");
});
child.Add().Url("").Text("Company Blog");
child.Add().Url("").Text("Technical Blog");
child.Add().Url("").Text("Newsletter");
child.Add().Url("").Text("Partners").Children(child1 =>
{
child1.Add().Url("").Text("Technology Partners");
child1.Add().Url("").Text("Training Partners");
child1.Add().Url("").Text("Consulting Partners");
});
child.Add().Url("").Text("Locations").Children(child1 =>
{
child1.Add().Url("").Text("RDU");
child1.Add().Url("").Text("Chennai");
});
child.Add().Url("").Text("Contact Us");
child.Add().Url("").Text("Careers");
});
})
```

Execute the above code to render the multiple sub menus in a hierarchy

Copyright © 2001 - 2020 Syncfusion Inc.

Essential ASP.NET MVC Menu with multiple level sub menu item

Orientation

It gets or sets the direction in which the Menu control renders and specifies the orientation of the normal menu. According to the orientation property the Menu control renders in horizontal or vertical.

Horizontal Menu

Horizontal orientation displays the menu items horizontally and it is the default orientation behavior of Menu control.

The following steps explains you the details on rendering the Menu control.

1. Add the below code in your view page to render the horizontal menu

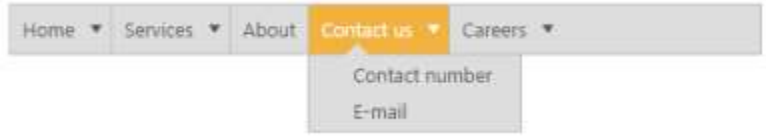
ASPX-CS

```
// In the CSHTML page, add the following code to configure Menu control.
<div class="imgframe">
@Html.EJ().Menu("menuControl").Items(items =>
{
items.Add().Id("Home").Text("Home").Children(child =>
{
child.Add().Text("Foundation");
child.Add().Text("Launch");
child.Add().Text("About").Children(child1 =>
{
child1.Add().Text("Company");
child1.Add().Text("Location");
});
});
items.Add().Text("Services").Children(child =>
{
child.Add().Text("Consulting");
child.Add().Text("Outsourcing");
});
items.Add().Text("About");
items.Add().Id("Contact").Text("Contact Us").Children(child =>
{
child.Add().Text("Contact number");
child.Add().Text("E-mail");
});
items.Add().Id("Careers").Text("Careers").Children(child =>
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
{
child.Add().Text("Position").Children(child1 =>
{
child1.Add().Text("Developer");
child1.Add().Text("Manager");
});
child.Add().Text("Apply online");
});
}).Width("500")
</div>
```

The following screenshot displays the output of the above code.



Horizontal Menu

Vertical Menu

You can also render Menu control in vertical direction using orientation.To set the vertical orientation of Menu control, replace the following script in the above sample code example.

1. Add the following code in your view page to render vertical menu

ASPX-CS

```
// Add the following code in the CSHTML page.
<div class="imgframe">
@Html.EJ().Menu("menuControl").Items(items =>
{
items.Add().Id("Home").Text("Home").Children(child =>
{
child.Add().Text("Foundation");
child.Add().Text("Launch");
child.Add().Text("About").Children(child1 =>
{
child1.Add().Text("Company");
child1.Add().Text("Location");
});
});
items.Add().Text("Services").Children(child =>
{
child.Add().Text("Consulting");
child.Add().Text("Outsourcing");
});
items.Add().Text("About");
items.Add().Id("Contact").Text("Contact Us").Children(child =>
{
child.Add().Text("Contact number");
child.Add().Text("E-mail");
});
items.Add().Id("Careers").Text("Careers").Children(child =>
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
{
child.Add().Text("Position").Children(child1 =>
{
child1.Add().Text("Developer");
child1.Add().Text("Manager");
});
child.Add().Text("Apply online");
});
}).Width("200").Orientation(Orientation.Vertical)
</div>
```

The following screen shot displays the output of the above code.

Vertical Menu

Data binding

Data binding enables you to synchronize the elements with different sources of data. You can bind data using two ways, Local data and remote data.

Field Members

Field is a property that includes the object type. Fields are used to bind the data source and it includes following field members to make binding easier.

List of Field members

Name	Description
DataSource	Datasource receives Essential DataManager object and JSON object.
Query	It receives query to retrieve data from the table (query is same as SQL). Example: ej.Query().from("Categories").select("CategoryID,CategoryName").take(3);
TableName	It receives table name to execute query on the corresponding table
Id	Specifies the id to menu items list
ParentId	Specifies the parent id of the table.
Text	Specifies the text of menu items list
SpriteCssClass	Specifies the sprite CSS class to â€œLIâ€• item list
LinkAttribute	Specifies the link attribute to â€œAâ€• tag in item list
ImageAttribute	Specifies the image attribute to â€œIMGâ€• tag inside items list
HtmlAttribute	Specifies the HTML attributes to â€œLIâ€• item list

Copyright © 2001 - 2020 Syncfusion Inc.

ImageUrl	Specifies the image URL to â€œIMGâ€• tag inside item list.

Local data

To define the local data to the Menu control, map the user-defined JSON data names with its appropriate dataSource column names.

1. Add the following code in your view page to render menu with local data

ASPX-CS

```
// Add the following code in your CSHTML page.
@Html.EJ().Menu("menu").MenuFields(f =>
f.Datasource((IEnumerable<Check.Controllers.CheckController.MenuJson>)Vie
wBag.datasource)
.Id("id").Text("text").ParentId("parent"))
```

C#

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Web;
using System.Web.Mvc;
namespace Check.Controllers
{
public class CheckController : Controller
{
public class MenuJson
{
public string text { get; set; }
public int id { get; set; }
public string parent { get; set; }
}
List<MenuJson> menu = new List<MenuJson>();
public ActionResult DataBindingJson()
{
menu.Add(new MenuJson { id = 1, text = "Group A", parent = null });
menu.Add(new MenuJson { id = 2, text = "Group B", parent = null });
menu.Add(new MenuJson { id = 3, text = "Group C", parent = null });
menu.Add(new MenuJson { id = 4, text = "Group D", parent = null });
menu.Add(new MenuJson { id = 5, text = "Group E", parent = null });
menu.Add(new MenuJson { id = 11, parent = "1", text = "Algeria" });
menu.Add(new MenuJson { id = 12, parent = "1", text = "Armenia" });
menu.Add(new MenuJson { id = 13, parent = "1", text = "Bangladesh" });
menu.Add(new MenuJson { id = 14, parent = "1", text = "Cuba" });
menu.Add(new MenuJson { id = 15, parent = "2", text = "Denmark" });
menu.Add(new MenuJson { id = 16, parent = "2", text = "Egypt" });
menu.Add(new MenuJson { id = 17, parent = "3", text = "Finland" });
menu.Add(new MenuJson { id = 18, parent = "3", text = "India" });
menu.Add(new MenuJson { id = 19, parent = "3", text = "Malaysia" });
menu.Add(new MenuJson { id = 20, parent = "4", text = "New Zealand" });
menu.Add(new MenuJson { id = 21, parent = "4", text = "Norway" });
menu.Add(new MenuJson { id = 22, parent = "4", text = "Romania" });
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
menu.Add(new MenuJson { id = 23, parent = "5", text = "Singapore" });
menu.Add(new MenuJson { id = 24, parent = "5", text = "Thailand" });
menu.Add(new MenuJson { id = 25, parent = "5", text = "Ukraine" });
menu.Add(new MenuJson { id = 26, parent = "11", text = "First Place" });
menu.Add(new MenuJson { id = 27, parent = "12", text = "Second Place" });
menu.Add(new MenuJson { id = 28, parent = "13", text = "Third place" });
menu.Add(new MenuJson { id = 29, parent = "14", text = "Fourth Place" });
menu.Add(new MenuJson { id = 30, parent = "15", text = "First Place" });
menu.Add(new MenuJson { id = 31, parent = "16", text = "Second Place" });
menu.Add(new MenuJson { id = 32, parent = "17", text = "Third Place" });
menu.Add(new MenuJson { id = 33, parent = "18", text = "First Place" });
menu.Add(new MenuJson { id = 34, parent = "19", text = "Second Place" });
menu.Add(new MenuJson { id = 36, parent = "21", text = "Second Place" });
menu.Add(new MenuJson { id = 37, parent = "22", text = "Third place" });
menu.Add(new MenuJson { id = 39, parent = "24", text = "First Place" });
menu.Add(new MenuJson { id = 40, parent = "25", text = "Second Place" });
ViewBag.datasource = menu;
return View();
}
}
}
```

The following screenshot displays the output of the above code.

Local data of Menu

Remote data

The Menu control also provides support for Remote data binding. Here the remote data is placed in Web service and you can render the menu items from the web service using Service URL. The data is in JSON format.

DataManager is used to manage relational data in JavaScript. DataManager uses two different classes, ej.DataManager for processing, and ej.Query for serving data. ej.DataManager communicates with data source and ej.Query generates data queries that are to be read by DataManager. To know more about DataManager and Query refer the following link location.

http://help.syncfusion.com/aspnetmvc/menu/data-binding

In the following example, http://mvc.syncfusion.com/Services/Northwnd.svc/ is used as the URL. This acts as web service that is located in the Syncfusion server. The web service with the name Northwnd.svc is used here.

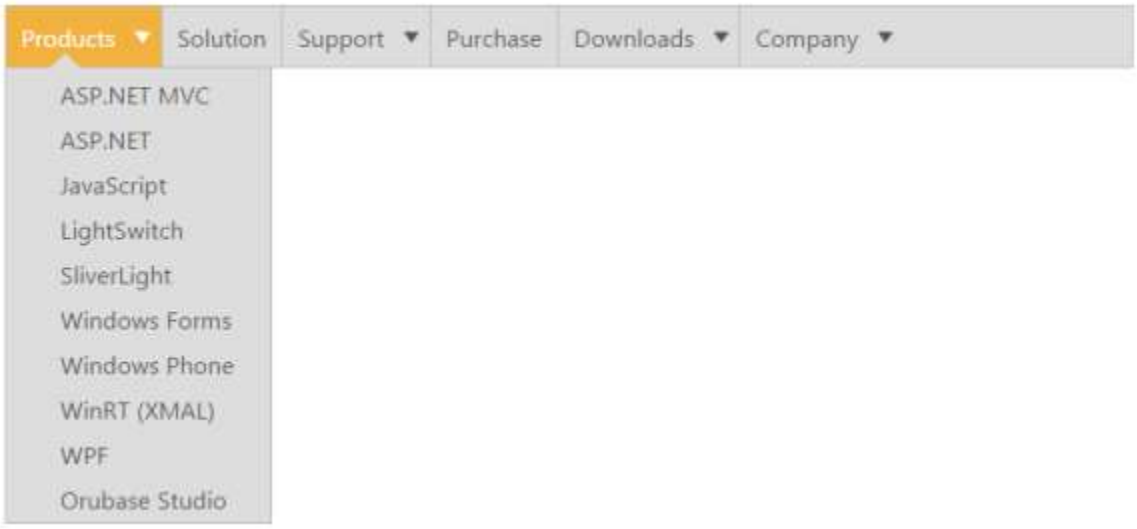
1. Add the following code in your View page to render the menu with remote data

ASPX-CS

Copyright © 2001 - 2020 Syncfusion Inc.

```
@Html.EJ().Menu("SyncfusionProducts").Width("600px").MenuFields(f =>
f.Datasource(d =>
d.URL("http://mvc.syncfusion.com/UGOdataServices/Northwnd.svc/")).Query("
ej.Query().from('RootLevelItems')").Id("InfoID").Text("InfoText").Child(m
enuChild =>
menuChild.Datasource(dataSource =>
dataSource.URL("http://mvc.syncfusion.com/UGOdataServices/Northwnd.svc/")
)
.TableName("SubItems").Id("SubItemID").ParentId("InfoID").Text("SubItemte
xt").Child(subMenuChild =>
subMenuChild.Datasource(dataSource =>
dataSource.URL("http://mvc.syncfusion.com/UGOdataServices/Northwnd.svc/")
).TableName("InnerItems").Id("InnerSubItemID").ParentId("SubItemID").Text
("InnerSubItemtext"))))
```

The following screenshot displays the output of the above code.



Remote data of Menu

Icons and navigation

Icons are the images that is displayed in the Menu control. To specify the menu with icons you can use SpriteCssClass property to display the icons.

1. Add the following code in your View page.

ASPX-CS

```
// Add the following code in your CSHTML page
@Html.EJ().Menu("menu").MenuFields(f =>
f.Datasource((IEnumerable<Check.Controllers.CheckController.icons>)ViewBa
g.datasource).Id("id").Text("text").ParentId("parent").SpriteCssClass("sp
rite"))
```

CSHARP

```
// In the controller page add the code
```

```
using System;using System.Collections.Generic;
using System.Linq;using System.Web;
using System.Web.Mvc;using Check.Models;
namespace Check.Controllers
{
public class CheckController : Controller
{
public class icons
{
public string text { get; set; }
public string sprite { get; set; }
public int id { get; set; }
public string parent { get; set; }
}
List<icons> menu = new List<icons>();
public ActionResult DataBindingJson()
{
menu.Add(new icons { id = 1, text = "Group A", parent = null });
menu.Add(new icons { id = 2, text = "Group B", parent = null });
menu.Add(new icons { id = 3, text = "Group C", parent = null });
menu.Add(new icons { id = 4, text = "Group D", parent = null });
menu.Add(new icons { id = 5, text = "Group E", parent = null });
menu.Add(new icons { id = 11, parent = "1", text = "Algeria", sprite =
"flag-dz" });
menu.Add(new icons { id = 12, parent = "1", text = "Armenia", sprite =
"flag-am" });
menu.Add(new icons { id = 13, parent = "1", text = "Bangladesh", sprite =
"flag-bangladesh" });
menu.Add(new icons { id = 14, parent = "1", text = "Cuba", sprite =
"flag-cu" });
menu.Add(new icons { id = 15, parent = "2", text = "Denmark", sprite =
"flag-denmark" });
menu.Add(new icons { id = 16, parent = "2", text = "Egypt", sprite =
"flag-eg" });
menu.Add(new icons { id = 17, parent = "3", text = "Finland", sprite =
"flag-fi" });
menu.Add(new icons { id = 18, parent = "3", text = "India", sprite =
"flag-in" });
menu.Add(new icons { id = 19, parent = "3", text = "Malaysia", sprite =
"flag-my" });
menu.Add(new icons { id = 20, parent = "4", text = "New Zealand", sprite
= "flag-new-zealand" });
menu.Add(new icons { id = 21, parent = "4", text = "Norway", sprite =
"flag-no" });
menu.Add(new icons { id = 22, parent = "4", text = "Romania", sprite =
"flag-ro" });
menu.Add(new icons { id = 23, parent = "5", text = "Singapore", sprite =
"flag-singapore" });
menu.Add(new icons { id = 24, parent = "5", text = "Thailand", sprite =
"flag-th" });
menu.Add(new icons { id = 25, parent = "5", text = "Ukraine", sprite =
"flag-ukraine" });
menu.Add(new icons { id = 26, parent = "11", text = "First Place" });
menu.Add(new icons { id = 27, parent = "12", text = "Second Place" });
menu.Add(new icons { id = 28, parent = "13", text = "Third place" });
menu.Add(new icons { id = 29, parent = "14", text = "Fourth Place" });
menu.Add(new icons { id = 30, parent = "15", text = "First Place" });
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
menu.Add(new icons { id = 31, parent = "16", text = "Second Place" });
menu.Add(new icons { id = 32, parent = "17", text = "Third Place" });
menu.Add(new icons { id = 33, parent = "18", text = "First Place" });
menu.Add(new icons { id = 34, parent = "19", text = "Second Place" });
menu.Add(new icons { id = 35, parent = "20", text = "First Place" });
menu.Add(new icons { id = 36, parent = "21", text = "Second Place" });
menu.Add(new icons { id = 37, parent = "22", text = "Third place" });
menu.Add(new icons { id = 38, parent = "23", text = "Third Place" });
menu.Add(new icons { id = 39, parent = "24", text = "First Place" });
menu.Add(new icons { id = 40, parent = "25", text = "Second Place" });
ViewBag.datasource = menu;
return View();
}
}
}
```

2. Add the following code in your style section.

CSS

```
<style type="text/css">
#menu
{
margin-left: 50px;
}
.e-menu li > ul > li > a
{
padding: 3px 24px 3px 35px;
}
[class^="mail-"],
[class*="mail-"]
{
background-image: url("../images/spriteimage.png");
height: 18px;
left: 2px;
top: 4px;
width: 24px;
}
.mail-dz { background-position: -68px -15px;     }
.mail-am { background-position: 91px -45px;      }
.mail-bangladesh { background-position: -98px 0;         }
.mail-cu { background-position: -607px -221px;   }
.mail-denmark { background-position: -67px -15px;     }
.mail-eg { background-position: 600px -15px;     }
.mail-fi { background-position: 12441px 12458px; }
.mail-in { background-position: -307px -103px;   }
.mail-my { background-position: 240px -102px;    }
.mail-new-zealand { background-position: -100px -45px;     }
.mail-no { background-position: -69px -45px;     }
.mail-pl { background-position: -129px -45px;    }
.mail-ca { background-position: -1345px -387px;  }
.mail-cn { background-position: -427px -42px;    }
.mail-ee { background-position: -706px -15px;    }
.mail-es { background-position: -1157px -43px    }
</style>
```

Copyright © 2001 - 2020 Syncfusion Inc.

The following screenshot displays the output for the above code.

Menu with Icons

Navigation

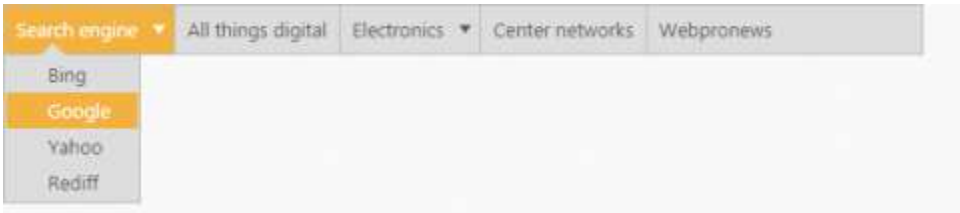
Navigation in Menu control is the default usage to navigate into the other web page. You can navigate to another page in menu item by providing link to the menu items. Navigation in Menu control can be achieved by placing “href” path to the anchor tag. Use the following code sample for navigating in Menu control.

1. Add the following code in your View page.

ASPX-CS

```
// Add the following code in your CSHTML page.
<div class="imgframe">
@Html.EJ().Menu("link").Items(items =>
{
items.Add().Url("#").Id("search").Text("Search engine").Children(child =>
{
child.Add().Url("http://www.bing.com/").Text("Bing");
child.Add().Url("https://www.google.co.in/").Text("Google");
child.Add().Url("https://in.yahoo.com/").Text("Yahoo");
child.Add().Url("http://www.rediff.com/").Text("Rediff");
});
items.Add().Url("http://allthingsd.com/").Text("All things digital");
items.Add().Url("").Text("Electronics").Children(child =>
{
child.Add().Url("http://www.engadget.com/").Text("Engadget");
child.Add().Url("http://www.electronista.com/").Text("Electronista");
child.Add().Url("http://www.gearlog.com/").Text("Gearlog");
});
items.Add().Url("http://www.centernetworks.com/").Text("Center
networks");
items.Add().Url("http://www.webpronews.com/").Text("Web pronews");
}).Width("500")
</div>
```

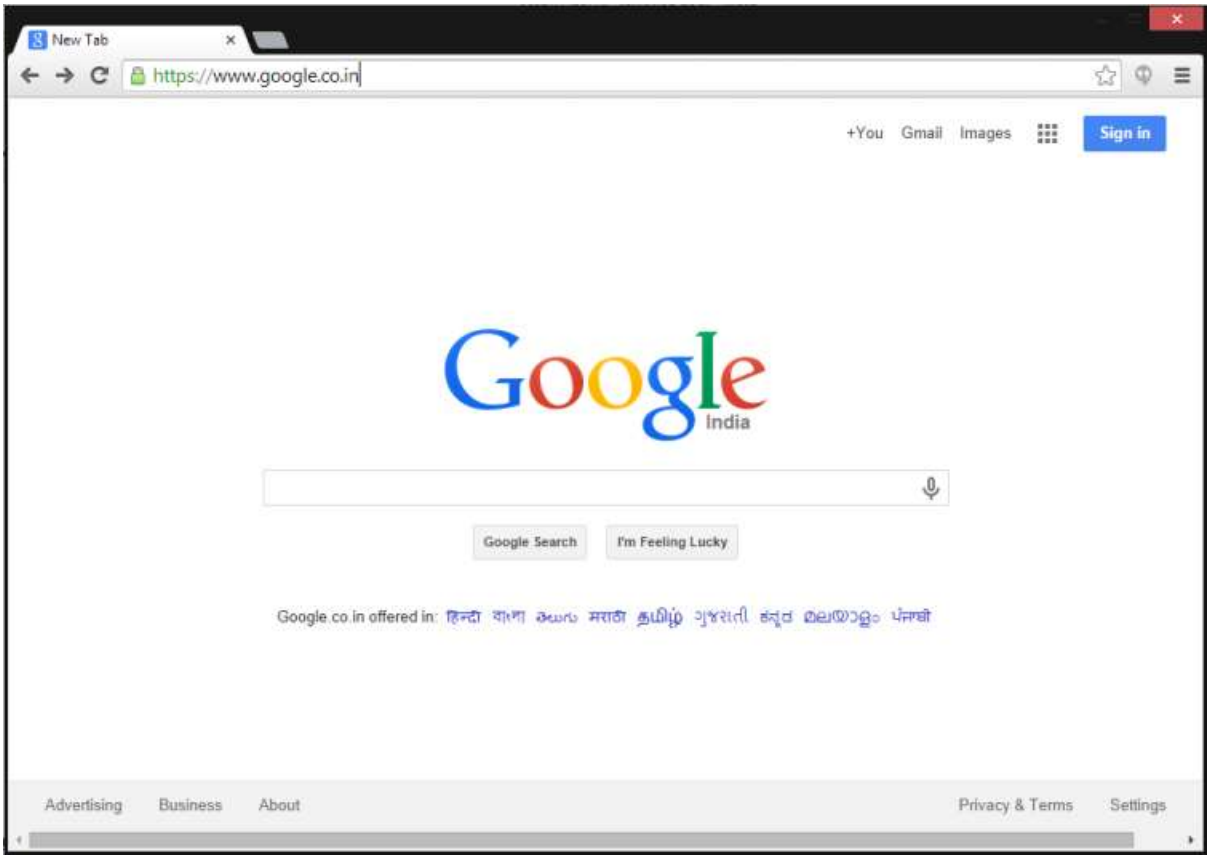
The following screenshot displays the output for the above code example.



Copyright © 2001 - 2020 Syncfusion Inc.

Navigation of Menu

When you click on “Google” that is present under “Search engine”, it navigates to the link that you specified in the sample code. Then the output is as follows.



After navigating to a menu item

Customizing the Submenu direction

You can customize the direction to open the sub menu items using SubMenuDirection property. SubMenuDirection accepts the type as string or enum and value as “Left” and “Right”.

In the following example, the Sub menus opens in the Left side of the menu.

1. Add the following code in your View page.

ASPX-CS

```
// Add the following code in your CSHTML page.
<div class="imgframe">
@Html.EJ().Menu("syncfusionProducts").Items(items =>
{
items.Add().Id("Products").Text("Products").Children(child =>
{
child.Add().Text("ASP.NET");
child.Add().Text("ASP.NET MVC");
child.Add().Text("Mobile MVC");
child.Add().Text("Silverlight");
child.Add().Text("Windows Forms");
```

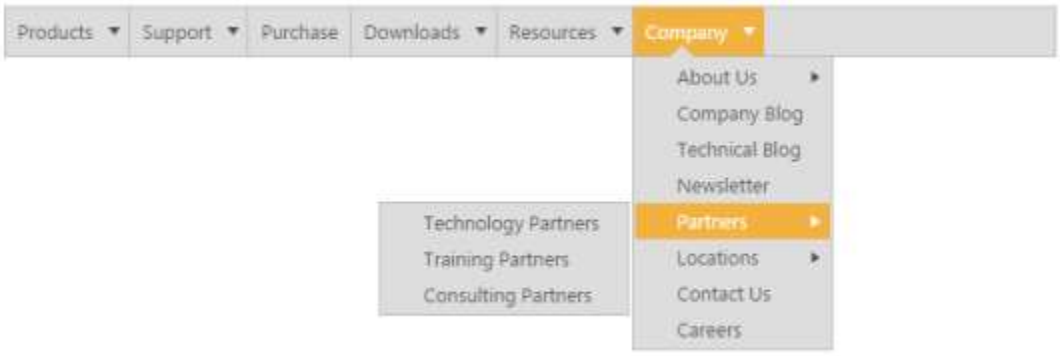
Copyright © 2001 - 2020 Syncfusion Inc.

```
child.Add().Text("Windows Phone");
child.Add().Text("WinRT (XMAL)");
child.Add().Text("WPF");
child.Add().Text("Orubase Studio");
child.Add().Text("Metro Studio");
child.Add().Text("What's New").Children(child1 =>
{
child1.Add().Text("ASP.NET");
child1.Add().Text("WPF");
child1.Add().Text("Silverlight");
child1.Add().Text("Windows Forms");
child1.Add().Text("Windows Phone");
child1.Add().Text("ASP.NET MVC");
child1.Add().Text("ASP.NET");
});
});
items.Add().Text("Support").Children(child =>
{
child.Add().Text("Direct-Trac Support");
child.Add().Text("Community Forums");
child.Add().Text("Knowledge Base");
child.Add().Text("Online Documentation");
child.Add().Text("Services").Children(child1 =>
{
child1.Add().Text("Consulting");
child1.Add().Text("Training");
});
});
items.Add().Id("Purchase").Text("Purchase");
items.Add().Id("Downloads").Text("Downloads").Children(child =>
{
child.Add().Text("Evaluation");
child.Add().Text("Free E-Books");
child.Add().Text("Metro Studio");
child.Add().Text("Latest Version");
child.Add().Text("Version History");
});
items.Add().Id("Resources").Text("Resources").Children(child =>
{
child.Add().Text("Technology Resource Portal").Children(child1 =>
{
child1.Add().Text("E-Books");
child1.Add().Text("White Papers");
});
child.Add().Text("Case Studies");
child.Add().Text("Boucher's & Data sheets");
child.Add().Text("FAQ");
});
items.Add().Id("Company").Text("Company").Children(child =>
{
child.Add().Text("About Us").Children(child1 =>
{
child1.Add().Text("More About Us");
child1.Add().Text("Management");
child1.Add().Text("News & Events");
child1.Add().Text("Customer Quotes");
child1.Add().Text("Customer Lists");
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
child1.Add().Text("Case Studies");
child1.Add().Text("Awards");
child1.Add().Text("Media Kit");
});
child.Add().Text("Company Blog");
child.Add().Text("Technical Blog");
child.Add().Text("Newsletter");
child.Add().Text("Partners").Children(child1 =>
{
child1.Add().Text("Technology Partners");
child1.Add().Text("Training Partners");
child1.Add().Text("Consulting Partners");
});
child.Add().Text("Locations").Children(child1 =>
{
child1.Add().Text("RDU");
child1.Add().Text("Chennai");
});
child.Add().Text("Contact Us");
child.Add().Text("Careers");
});
}).Width("600").SubMenuDirection(Direction.Left)
</div>
```

The output for the above code example is as follows.



Customizing Submenu Direction

You can even achieve auto positioning for Context Menu. Use the following code sample for context menu in order to open the submenu items of context menu in left side.

1. Add the following code in your View page.

ASPX-CS

```
// Add the following code in your CSHTML page.
<div id="target" class="textarea">
HTML is written in the form of HTML elements consisting of tags enclosed
in angle
brackets (like <html> ),within the web page content. HTML tags most
commonly
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
come in pairs like and ,although some tags, known as empty elements, are
unpaired,
for example <img>. The purpose of a web browser is to read HTML documents
and compose them into visible or audible web pages. The browser does not
display
the HTML tags, but uses the tags to interpret the content of the page.
</div>
@Html.EJ().Menu("file").Items(items =>
{
items.Add().Text("Cut").Children(child =>
{
child.Add().Text("Cut Particular");
child.Add().Text("Cut Fully");
});
items.Add().Text("Copy");
items.Add().Text("Paste");
items.Add().Text("Comments");
items.Add().Text("Links");
items.Add().Text("Clear Formatting");
}).MenuType(MenuType.ContextMenu).OpenOnClick(true).ContextMenuTarget("#t
arget").SubMenuDirection(Direction.Left)
```

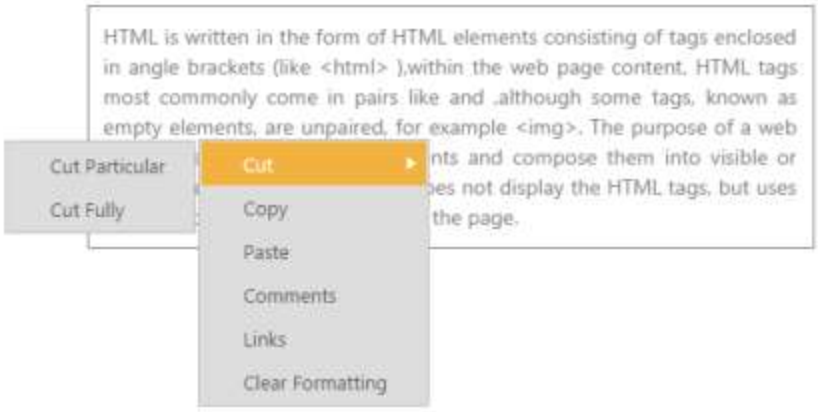
2. Add the following code in your style section.

CSS

```
<style type="text/css">
.textarea
{
border: 1px solid;
padding: 10px;
position: relative;
text-align: justify;
width: 463px;
color: gray;
margin: 0 auto;
}
</style>
```

The output for the above code example is as follows.

Copyright © 2001 - 2020 Syncfusion Inc.



Customizing Submenu direction in Context Menu

Look and feel

Essential JavaScript controls feature 12 built-in themes, six flat and gradient effects, and also supports custom skin options for user-defined themes.

12 themes support available for Menu control namely, *default-theme* flat-azure-dark *flat-lime* flat-lime-dark *flat-saffron* flat-saffron-dark *gradient-azure* gradient-azure-dark *gradient-lime* gradient-lime-dark *gradient-saffron* gradient-saffron-dark

CssClass

Menu control also customizes its appearance using user-defined CSS and custom skin options (colors and backgrounds). To apply custom themes you can use the “CssClass” property. “CssClass” property sets the root class for Menu control theme.

Using this CssClass you can override the existing styles under the theme style sheet. The theme stylesheet applies theme-specific styles like colors and backgrounds. In the following sample the value of “CssClass” property is set as “Purple-dark”. Purple-dark is added as root class to Menu control at the runtime. From this root class you can customize the Menu control theme.

1. Add the following code in your View page.

ASPX-CS

```
// Add the following code in your CSHTML page.
<div class="imgframe">
@Html.EJ().Menu("menu").Items(items =>
{
items.Add().Id("Home").Text("Home").Children(child =>
{
child.Add().Text("Foundation");
child.Add().Text("Launch");
child.Add().Text("About").Children(child1 =>
{
child1.Add().Text("Company");
child1.Add().Text("Location");
});
});
items.Add().Text("Services").Children(child =>
{
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
child.Add().Text("Consulting");
child.Add().Text("Outsourcing");
});
items.Add().Text("About");
items.Add().Id("Contact").Text("Contact Us").Children(child =>
{
child.Add().Text("Contact number");
child.Add().Text("E-mail");
});
items.Add().Id("Careers").Text("Careers").Children(child =>
{
child.Add().Text("Position").Children(child1 =>
{
child1.Add().Text("Developer");
child1.Add().Text("Manager");
});
child.Add().Text("Apply online");
});
}).Width("500").CssClass("Purple-dark")
</div>
```

2. Add the following code in your style section.

CSS

```
<style type="text/css" class="cssStyles">
.Purple-dark .e-menu,.e-menu.e-horizontal .e-list > ul {
background: pink;
}
.Purple-dark .e-menu.e-horizontal .e-list > a {
color: blue;
}
</style>
```

Following screenshot displays the output of the above code.

Look and feel of a Menu

Background Template

Menu control also provides support for template support. Normally Menu control can be created by using UL and LI tags in the preferred way. But in template supporting, you can customize the appearance of sub menu items rendering.

Initialize the Template Menu as illustrated in the following code example.

1. Add the following code in your View page.

ASPX-CS

```
// Add the following code in your CSHTML page.
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
@Html.EJ().Menu("template").Items(items =>
{
items.Add().Text("Books").Children(child =>
{
child.Add().ContentTemplate(@<div class="temp temp1">
<span>BOOKS</span>
<ul>
<li><a>New Releases</a></li>
<li><a>Bestsellers</a></li>
<li><a>Upcoming</a></li>
<li><a>Box Sets</a></li>
</ul>
<ul>
<li><a>HTML Basics</a></li>
<li><a>JavaScript</a></li>
<li><a>jQuery</a></li>
<li><a>PHP Basics</a></li>
</ul>
</div>);
});
items.Add().Text("Cameras").Children(child =>
{
child.Add().ContentTemplate(@<div class="temp temp2">
<span>CAMERAS</span>
<ul>
<li><a>Point & Shoots</a></li>
<li><a>Digital SLR</a></li>
<li><a>Camcorders</a></li>
<li><a>Bestsellers</a></li>
</ul>
<ul>
<li><a>Still Camera</a></li>
<li><a>Digital Camera</a></li>
<li><a>Video Camera</a></li>
<li><a>Virtual Camera</a></li>
</ul>
</div>);
});
items.Add().Text("Movies").Children(child =>
{
child.Add().ContentTemplate(@<div class="temp temp3">
<span>MOVIES</span>
<ul>
<li><a>Genobili Actions</a></li>
<li><a>Jackie Rocks</a></li>
<li><a>Men In Blue</a></li>
<li><a>Human vs Alien</a></li>
</ul>
<ul>
<li><a>Million Dreams</a></li>
<li><a>Kung-fu</a></li>
</ul>
</div>);
});
items.Add().Text("Musics").Children(child =>
{
child.Add().ContentTemplate(@<div class="temp temp4">
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
<span>MUSICS</span>
<ul>
<li><a>New Releases</a></li>
<li><a>Bestsellers</a></li>
<li><a>Devotional</a></li>
<li><a>Sufi & Ghazal</a></li>
</ul>
<ul>
<li><a>Pop songs</a></li>
<li><a>Rock Music</a></li>
</ul>
</div>);
});
items.Add().Text("Gaming").Children(child =>
{
child.Add().ContentTemplate(@<div class="temp temp5">
<span>GAMING</span>
<ul>
<li><a>Upcoming</a></li>
<li><a>PC</a></li>
<li><a>PS Vista</a></li>
<li><a>PS3</a></li>
<li><a>XBox</a></li>
<li><a>Consoles</a></li>
</ul>
<ul>
<li><a>FIFA 2999</a></li>
<li><a>NBA Actions</a></li>
<li><a>Crick Champions</a></li>
<li><a>Carom legend</a></li>
</ul>
</div>);
});
})
```

2. Add the following code in your style section.

CSS

```
<style type="text/css">
.temp
{
height: 237px;
width: 375px;
font-family: segoe UI;
cursor: default;
background-size: 100% 100%;
}
.temp span
{
color: red;
float: left;
font-size: 20px;
left: 20px;
position: relative;
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
top: 25px;
width: 100px;
}
.temp ul
{
float: left;
font-size: 14px;
left: -79px;
list-style-type: none;
margin: 0;
padding: 0;
position: relative;
top: 50px;
width: 128px;
}
.temp ul li
{
font-size: 13px;
}
.temp ul li a
{
text-decoration: underline;
cursor: pointer;
color: #000;
}
.temp1
{
background-image: url("1.jpg");
}
.temp2
{
background-image: url("2.jpg");
}
.temp3
{
background-image: url("3.jpg");
}
.temp4
{
background-image: url("4.jpg");
}
.e-menu.e-horizontal li > ul, .e-menu.e-horizontal li > ul > li:hover
{
background-color: #fff;
}
.e-menu.e-horizontal > li > ul:after
{
border-color: transparent transparent #fff;
}
</style>
```

Execute the above code to render the following output.

Template

Context Menu

A context menu is a type of menu in a graphical user interface (GUI) that appears when you perform right click operation. In this Menu control you can use a context menu by specifying the type of menu as ContextMenu. A context also provides support for nested level of menu items.

Before you use the context menu, provide the target area for it.

In the following example, a context menu for the division containing text is created. In this, when you perform right click operation, the following menu appears with open, edit, etc.

1. Add the following code in your View page.

ASPX-CS

```
// Add the following code in your CSHTML page.
<div id="target" class="textarea">
HTML is written in the form of HTML elements consisting of tags enclosed
in angle
brackets (like <html> ),within the web page content. HTML tags most
commonly
come in pairs like and ,although some tags, known as empty elements, are
unpaired,
for example <img>. The purpose of a web browser is to read HTML documents
and compose them into visible or audible web pages. The browser does not
display
the HTML tags, but uses the tags to interpret the content of the page.
</div>
@Html.EJ().Menu("file").Items(items =>
{
items.Add().Text("Open").Children(child =>
{
child.Add().Text("Open with notepad");
child.Add().Text("Open with notepad++");
});
items.Add().Text("Edit");
items.Add().Text("Save");
items.Add().Text("Save as");
items.Add().Text("Print");
```

Copyright © 2001 - 2020 Syncfusion Inc.

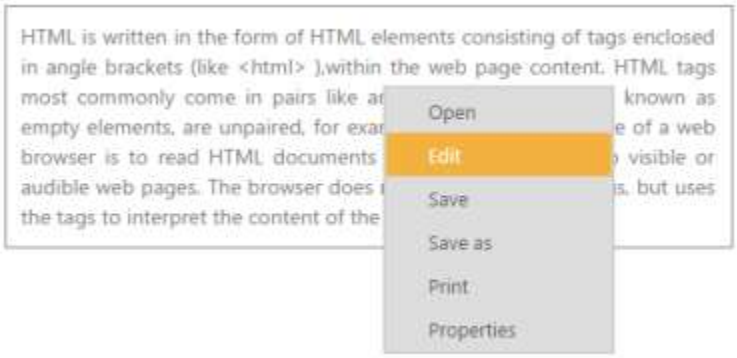
```
items.Add().Text("Properties");
}).MenuType(MenuType.ContextMenu).OpenOnClick(true).ContextMenuTarget("#t
arget")
```

2. Add the following code in your style section.

CSS

```
<style type="text/css">
.textarea
{
border: 1px solid;
padding: 10px;
position: relative;
text-align: justify;
width: 463px;
color: gray;
margin: 0 auto;
}
</style>
```

The following screen shot displays the output of the above code.



Context Menu

You can hide and show the context menu using the following methods.

HideContextMenu

Hides the context Menu control. Add the following script code in the sample in order to hide the context menu.

JS

```
<script type="text/javascript">
jQuery(function ($)
{
$("#menu").ejMenu({
width: 500,
});
//initialize the menu object
var menuObj = $("#menu").data("ejMenu");
```

```
//To enable Menu item using item id
menuObj.hideContextMenu();
});
</script>
```

ShowContextMenu

Shows the context menu control. Add the following script code in the sample in order to show the context menu.

JS

```
<script type="text/javascript">
jQuery(function ($)
{
$("#menu").ejMenu({
width: 500,
});
//initialize the menu object
var menuObj = $("#menu").data("ejMenu");
//To enable Menu item using item id
menuObj.showContextMenu();
});
</script>
```

Center Menu

You can align the Menu items to center by setting “EnableCenterAlign” property as true. “EnableCenterAlign” property accepts Boolean value. By default, its value is false. When set to true, then the root menu items is aligned in center.

1. Add the following code in your view section.

ASPX-CS

```
// Add the following code in CSHTML section.
<div class="imgframe">
@Html.EJ().Menu("menu").Items(items =>
{
items.Add().Id("Home").Text("Home").Children(child =>
{
child.Add().Text("Foundation");
child.Add().Text("Launch");
child.Add().Text("About").Children(child1 =>
{
child1.Add().Text("Company");
child1.Add().Text("Location");
});
});
items.Add().Text("Services").Children(child =>
{
child.Add().Text("Consulting");
child.Add().Text("Outsourcing");
});
items.Add().Text("About");
items.Add().Id("Contact").Text("Contact Us").Children(child =>
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
{
child.Add().Text("Contact number");
child.Add().Text("E-mail");
});
items.Add().Id("Careers").Text("Careers").Children(child =>
{
child.Add().Text("Position").Children(child1 =>
{
child1.Add().Text("Developer");
child1.Add().Text("Manager");
});
child.Add().Text("Apply online");
});
}).Width("500").EnableCenterAlign(true)</div>
```

The following screenshot displays the output of the above code.

Center Menu

RTL Support

The EnableRTL option allows the Menu control to display it in the right to left direction. By default, this option is set to “false” in the Menu control.

1. The following code depicts you on how to enable the rtl property of the Menu control.

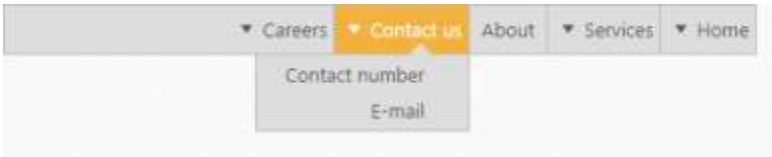
ASPX-CS

```
// The following code example depicts how to enable the rtl property of
the Menu control.
<div class="imgframe">
@Html.EJ().Menu("menuControl").Items(items =>
{
items.Add().Id("Home").Text("Home").Children(child =>
{
child.Add().Text("Foundation");
child.Add().Text("Launch");
child.Add().Text("About").Children(child1 =>
{
child1.Add().Text("Company");
child1.Add().Text("Location");
});
});
items.Add().Text("Services").Children(child =>
{
child.Add().Text("Consulting");
child.Add().Text("Outsourcing");
});
items.Add().Text("About");
items.Add().Id("Contact").Text("Contact Us").Children(child =>
{
child.Add().Text("Contact number");
child.Add().Text("E-mail");
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
});
items.Add().Id("Careers").Text("Careers").Children(child =>
{
child.Add().Text("Position").Children(child1 =>
{
child1.Add().Text("Developer");
child1.Add().Text("Manager");
});
child.Add().Text("Apply online");
});
}).Width("500").EnableRTL(true)
</div>
```

Following screenshot displays the output for the above code.



RTL Support

Separators

Separators can be added to menu items to display a horizontal bars between menu items. Separators are similar to borders and cannot be selected.**enableSeparator** is the property that is used to display the separators in the Menu control. It accepts Boolean type value. Its default value is true.

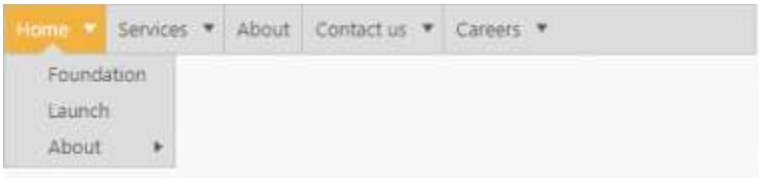
1. Add the following code in your view page.

ASPX-CS

```
// Add the following code in the CSHTML page.
<div class="imgframe">
Html.EJ().Menu("menuControl").Items(items =>
{
items.Add().Id("Home").Text("Home").Children(child =>
{
child.Add().Text("Foundation");
child.Add().Text("Launch");
child.Add().Text("About").Children(child1 =>
{
child1.Add().Text("Company");
child1.Add().Text("Location");
});
});
items.Add().Text("Services").Children(child =>
{
child.Add().Text("Consulting");
child.Add().Text("Outsourcing");
});
items.Add().Text("About");
items.Add().Id("Contact").Text("Contact Us").Children(child =>
{
child.Add().Text("Contact number");
```

```
child.Add().Text("E-mail");
});
items.Add().Id("Careers").Text("Careers").Children(child =>
{
child.Add().Text("Position").Children(child1 =>
{
child1.Add().Text("Developer");
child1.Add().Text("Manager");
});
child.Add().Text("Apply online");
});
}).Width("500").EnableSeparator(true)
</div>
```

The following screenshot displays the output for the above code sample.



Menu with Separators

2. Add the following code in your view page to display the Menu control without separator by setting EnableSeparator as false.

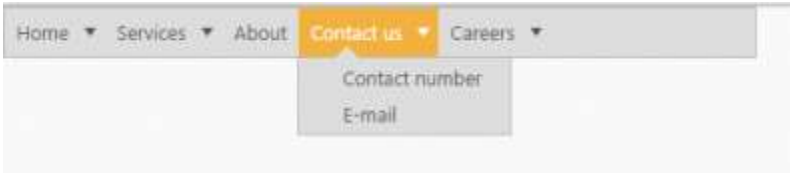
ASPX-CS

```
<div class="imgframe">
@Html.EJ().Menu("menuControl").Items(items =>
{
items.Add().Id("Home").Text("Home").Children(child =>
{
child.Add().Text("Foundation");
child.Add().Text("Launch");
child.Add().Text("About").Children(child1 =>
{
child1.Add().Text("Company");
child1.Add().Text("Location");
});
});
items.Add().Text("Services").Children(child =>
{
child.Add().Text("Consulting");
child.Add().Text("Outsourcing");
});
items.Add().Text("About");
items.Add().Id("Contact").Text("Contact Us").Children(child =>
{
child.Add().Text("Contact number");
child.Add().Text("E-mail");
});
items.Add().Id("Careers").Text("Careers").Children(child =>
{
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
child.Add().Text("Position").Children(child1 =>
{
child1.Add().Text("Developer");
child1.Add().Text("Manager");
});
child.Add().Text("Apply online");
});
}).Width("500").EnableSeparator(false)
</div>
```

The following screenshot displays the output for the above code.



Menu without Separators

Responsive Layout

Responsive Layout is aimed at crafting sites to provide an optimal viewing experience—easy reading and navigation with a minimum of resizing, panning, and scrolling—across a wide range of devices (from mobile phones to desktop computer monitors). In order to get responsive layout, you can add ej.responsive.css file in this sample. CDN link for the responsive CSS file is as follows.

http://cdn.syncfusion.com/13.1.0.21/js/web/responsive-css/ej.responsive.css

Note: Refer to the ej.responsive.css file after the ej.widgets.all.min.css file

Add the above CSS link in the code sample.

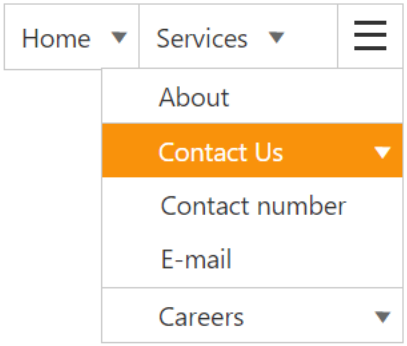
1. Add the following code in your View page.

ASPX-CS

```
// Add the following code in your CSHTML page.
<div class="imgframe">
@Html.EJ().Menu("menuControl").Items(items =>
{
items.Add().Id("Home").Text("Home").Children(child =>
{
child.Add().Text("Foundation");
child.Add().Text("Launch");
child.Add().Text("About").Children(child1 =>
{
child1.Add().Text("Company");
child1.Add().Text("Location");
});
});
items.Add().Text("Services").Children(child =>
{
child.Add().Text("Consulting");
child.Add().Text("Outsourcing");
});
```

```
items.Add().Text("About");
items.Add().Id("Contact").Text("Contact Us").Children(child =>
{
child.Add().Text("Contact number");
child.Add().Text("E-mail");
});
items.Add().Id("Careers").Text("Careers").Children(child =>
{
child.Add().Text("Position").Children(child1 =>
{
child1.Add().Text("Developer");
child1.Add().Text("Manager");
});
child.Add().Text("Apply online");
});
}).Width("200")
</div>
```

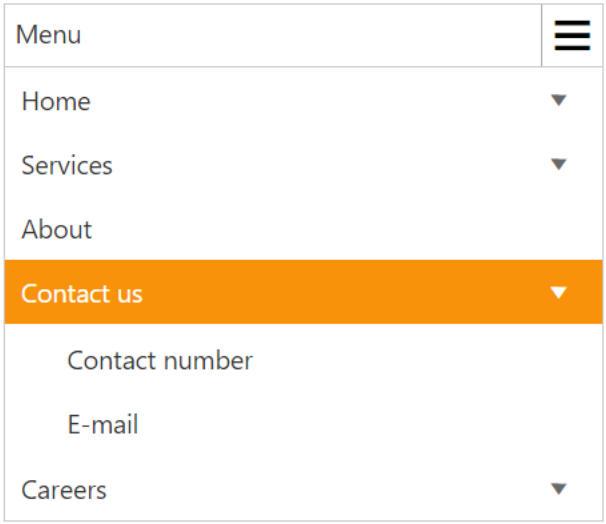
The following screenshot displays the output for the above code.



Menu with responsive layout

Responsive in Mobile or Tablet:

Menu will be displayed in mobile or Tablet as shown in the below image:



Copyright © 2001 - 2020 Syncfusion Inc.

Note: Window width below 767px is considered as Mobile or Tablet mode in our menu.

Keyboard Navigation

The Menu control also provides support for keyboard navigation. In the Menu control, it is possible to control the entire menu control items by using the provided shortcut keys.

The various keyboard shortcuts available within the Menu control are discussed in the following table,

List of keyboard shortcut keys

Keys	Usage
Esc	Closes the opened Menu control.
Enter	Selects the focused item.
Up/left/down/right arrow keys	Navigates up or previous item.
Down	Navigates down or next item.
Left	Navigates to previous group.
Right	Navigates to next group.

1. Add the following code for Keyboard navigation in your Menu control.

ASPX-CS

```
// Add the following code for Keyboard navigation in our Menu control.
<div class="imgframe">
@Html.EJ().Menu("keyboard").Items(items =>
{
items.Add().Id("Home").Text("Home").Children(child =>
{
child.Add().Text("Foundation");
child.Add().Text("Launch");
child.Add().Text("About").Children(child1 =>
{
child1.Add().Text("Company");
child1.Add().Text("Location");
});
});
items.Add().Text("Services").Children(child =>
{
child.Add().Text("Consulting");
child.Add().Text("Outsourcing");
});
items.Add().Text("About");
items.Add().Id("Contact").Text("Contact Us").Children(child =>
{
child.Add().Text("Contact number");
child.Add().Text("E-mail");
});
items.Add().Id("Careers").Text("Careers").Children(child =>
{
```

Copyright © 2001 - 2020 Syncfusion Inc.

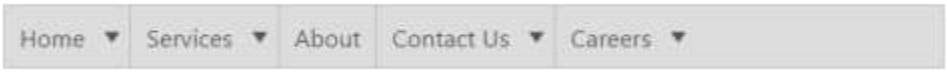
```
child.Add().Text("Position").Children(child1 =>
{
child1.Add().Text("Developer");
child1.Add().Text("Manager");
});
child.Add().Text("Apply online");
});
}).Width("500")
</div>
// Add the following code in your <script> section.
<script type="text/javascript">
jQuery(function ($)
{
//Control focus key
$(document).on("keydown", function (e)
{
if (e.altKey && e.keyCode === 74)
{
// j- key code.
$("#keyboard").focus();
}
});
});
</script>
```

2. Add the following code in your style section.

CSS

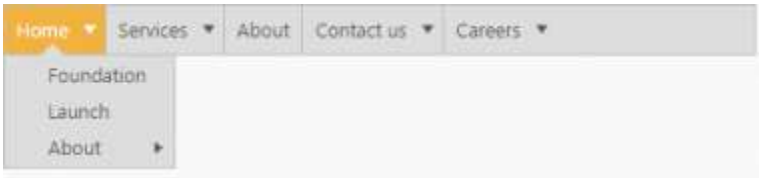
```
<style type="text/css">
#keyboard
{
margin-left: 50px;
}
</style>
```

Following screenshot displays the output of the above code.



Accessibility

When you press alt+j, the first item of the Menu control only gets focused as displayed in the following screenshot.



Keyboard Navigation

Similarly you can access the Menu control using keyboard itself.

Miscellaneous

Height

Specifies the height of the root menu. You can customize the height of the Menu control by using Height property.

1. You can specify the height of the Menu control using helper as follows.

ASPX-CS

```
// You can specify the height of the Menu control in the CSHTML page as follows.
<div class="imgframe">
@Html.EJ().Menu("menu").Items(items =>
{
items.Add().Id("Home").Text("Home").Children(child =>
{
child.Add().Text("Foundation");
child.Add().Text("Launch");
child.Add().Text("About").Children(child1 =>
{
child1.Add().Text("Company");
child1.Add().Text("Location");
});
});
items.Add().Text("Services").Children(child =>
{
child.Add().Text("Consulting");
child.Add().Text("Outsourcing");
});
items.Add().Text("About");
items.Add().Id("Contact").Text("Contact Us").Children(child =>
{
child.Add().Text("Contact number");
child.Add().Text("E-mail");
});
items.Add().Id("Careers").Text("Careers").Children(child =>
{
child.Add().Text("Position").Children(child1 =>
{
child1.Add().Text("Developer");
child1.Add().Text("Manager");
});
child.Add().Text("Apply online");
});
}).Height("50")
</div>
```

Width

Specifies the width of the main menu. You can customize the width of the Menu control by using Width property.

Copyright © 2001 - 2020 Syncfusion Inc.

1. You can specify the width of the Menu control using helper as follows.

ASPX-CS

```
// You can specify the width of the Menu control in the CSHTML page as
follows.
<div class="imgframe">
@Html.EJ().Menu("menu").Items(items =>
{
items.Add().Id("Home").Text("Home").Children(child =>
{
child.Add().Text("Foundation");
child.Add().Text("Launch");
child.Add().Text("About").Children(child1 =>
{
child1.Add().Text("Company");
child1.Add().Text("Location");
});
});
items.Add().Text("Services").Children(child =>
{
child.Add().Text("Consulting");
child.Add().Text("Outsourcing");
});
items.Add().Text("About");
items.Add().Id("Contact").Text("Contact Us").Children(child =>
{
child.Add().Text("Contact number");
child.Add().Text("E-mail");
});
items.Add().Id("Careers").Text("Careers").Children(child =>
{
child.Add().Text("Position").Children(child1 =>
{
child1.Add().Text("Developer");
child1.Add().Text("Manager");
});
child.Add().Text("Apply online");
});
}).Width("700")
</div>
```

Open on click

Specifies the sub menu items to be show or open only on click. It accepts the Boolean value. Its default value is false. If we set “OpenOnClick” property to true then the submenu items will open only on click. By default the submenu will open when we hover on menu items.

1. Add the following code in your view page to render the menu.

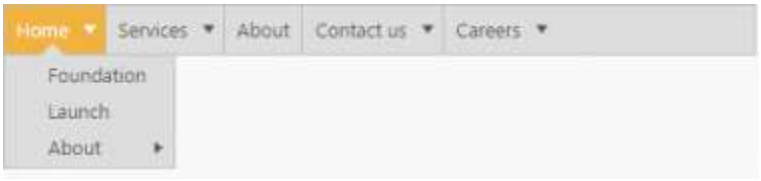
ASPX-CS

```
// Add the following code in the CSHTML page.
<div class="imgframe">
@Html.EJ().Menu("menu").Items(items =>
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
{
items.Add().Id("Home").Text("Home").Children(child =>
{
child.Add().Text("Foundation");
child.Add().Text("Launch");
child.Add().Text("About").Children(child1 =>
{
child1.Add().Text("Company");
child1.Add().Text("Location");
});
});
items.Add().Text("Services").Children(child =>
{
child.Add().Text("Consulting");
child.Add().Text("Outsourcing");
});
items.Add().Text("About");
items.Add().Id("Contact").Text("Contact Us").Children(child =>
{
child.Add().Text("Contact number");
child.Add().Text("E-mail");
});
items.Add().Id("Careers").Text("Careers").Children(child =>
{
child.Add().Text("Position").Children(child1 =>
{
child1.Add().Text("Developer");
child1.Add().Text("Manager");
});
child.Add().Text("Apply online");
});
}).Width("500").OpenOnClick(true)
</div>
```

Output screenshot for the above code example is as follows.



Sub menu items to open on click

Animation

Animation type is used to enable or disable the Animation when hover or click on menu items. Its value type is string. It accepts two values such as “none” and “default”. Support to disable the Animation Type when hover or click on menu items is none. Support to enable the Animation Type when hover or click on menu items is default.

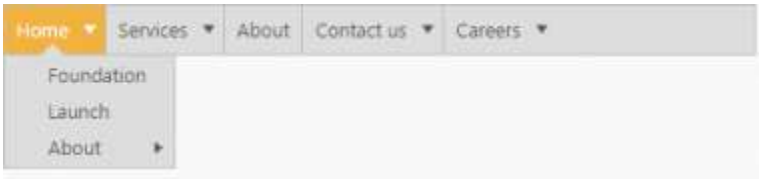
1. Add the following code in your view page to render the menu.

ASPX-CS

```
// Add the following code in the CSHTML page.
```

```
<div class="imgframe">
@Html.EJ().Menu("menu").Items(items =>
{
items.Add().Id("Home").Text("Home").Children(child =>
{
child.Add().Text("Foundation");
child.Add().Text("Launch");
child.Add().Text("About").Children(child1 =>
{
child1.Add().Text("Company");
child1.Add().Text("Location");
});
});
items.Add().Text("Services").Children(child =>
{
child.Add().Text("Consulting");
child.Add().Text("Outsourcing");
});
items.Add().Text("About");
items.Add().Id("Contact").Text("Contact Us").Children(child =>
{
child.Add().Text("Contact number");
child.Add().Text("E-mail");
});
items.Add().Id("Careers").Text("Careers").Children(child =>
{
child.Add().Text("Position").Children(child1 =>
{
child1.Add().Text("Developer");
child1.Add().Text("Manager");
});
child.Add().Text("Apply online");
});
}).Width("500").AnimationType(AnimationType.Default)
</div>
```

Output screenshot for the above code sample is as follows.



Animation

Title text

Specifies the title to the responsive menu. You can provide title to the Menu control by using TitleText property.

1. You can specify the title of the Menu control using helper as follows.

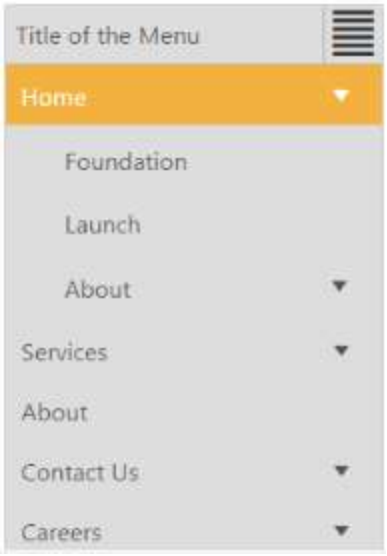
ASPX-CS

Copyright © 2001 - 2020 Syncfusion Inc.

```
// You can specify the title of the Menu control in the CSHTML page as
follows.
<div class="imgframe">
@Html.EJ().Menu("menu").Items(items =>
{
items.Add().Id("Home").Text("Home").Children(child =>
{
child.Add().Text("Foundation");
child.Add().Text("Launch");
child.Add().Text("About").Children(child1 =>
{
child1.Add().Text("Company");
child1.Add().Text("Location");
});
});
items.Add().Text("Services").Children(child =>
{
child.Add().Text("Consulting");
child.Add().Text("Outsourcing");
});
items.Add().Text("About");
items.Add().Id("Contact").Text("Contact Us").Children(child =>
{
child.Add().Text("Contact number");
child.Add().Text("E-mail");
});
items.Add().Id("Careers").Text("Careers").Children(child =>
{
child.Add().Text("Position").Children(child1 =>
{
child1.Add().Text("Developer");
child1.Add().Text("Manager");
});
child.Add().Text("Apply online");
});
}).Width("500").TitleText("Title of the Menu")
</div>
```

The following screenshot displays the output of the above code.

Copyright © 2001 - 2020 Syncfusion Inc.



Title text for Responsive Layout

Show root level arrows

Specifies the main menu item arrows to display only when it contains child menu items. You can use “ShowRootLevelArrows” property to display the arrows of main menu items only when it contains child menu items. This property accepts Boolean value. Its default value is true.

1. Add the following code in your view page to render the menu with root level arrows

ASPX-CS

```
// Add the following code in the CSHTML page.
<div class="imgframe">
@Html.EJ().Menu("menu").Items(items =>
{
items.Add().Id("Home").Text("Home").Children(child =>
{
child.Add().Text("Foundation");
child.Add().Text("Launch");
child.Add().Text("About").Children(child1 =>
{
child1.Add().Text("Company");
child1.Add().Text("Location");
});
});
items.Add().Text("Services").Children(child =>
{
child.Add().Text("Consulting");
child.Add().Text("Outsourcing");
});
items.Add().Text("About");
items.Add().Id("Contact").Text("Contact Us").Children(child =>
{
child.Add().Text("Contact number");
child.Add().Text("E-mail");
});
items.Add().Id("Careers").Text("Careers").Children(child =>
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
{
child.Add().Text("Position").Children(child1 =>
{
child1.Add().Text("Developer");
child1.Add().Text("Manager");
});
child.Add().Text("Apply online");
});
}).Width("500").ShowRootLevelArrows(false)
</div>
```

The following screenshot displays the output of the above code.

Show root level arrows

Show sub level arrows

Specifies the sub menu items arrows to display only when it contains child menu items. You can use “ShowSubLevelArrows” property to show the arrows of sub menu items only when it contains child menu items. This property accepts Boolean value. Its default value is true.

1. Add the following code in your view page to render the menu with sub level arrows

ASPX-CS

```
// Add the following code in the CSHTML page.
<div class="imgframe">
@Html.EJ().Menu("menu").Items(items =>
{
items.Add().Id("Home").Text("Home").Children(child =>
{
child.Add().Text("Foundation");
child.Add().Text("Launch");
child.Add().Text("About").Children(child1 =>
{
child1.Add().Text("Company");
child1.Add().Text("Location");
});
});
items.Add().Text("Services").Children(child =>
{
child.Add().Text("Consulting");
child.Add().Text("Outsourcing");
});
items.Add().Text("About");
items.Add().Id("Contact").Text("Contact Us").Children(child =>
{
child.Add().Text("Contact number");
child.Add().Text("E-mail");
```

```
});
items.Add().Id("Careers").Text("Careers").Children(child =>
{
child.Add().Text("Position").Children(child1 =>
{
child1.Add().Text("Developer");
child1.Add().Text("Manager");
});
child.Add().Text("Apply online");
});
}).Width("500").ShowSubLevelArrows(false)
</div>
```

The following screenshot displays the output of the above code.

Show sub level arrows

How To

Render Menu from code behind

Menu can be rendered from the code behind by initializing the required properties in controller and passing those properties via ViewData or Model to the client side

The following code illustrates the rendering of Menu using Menu properties from code behind.

RAZOR

```
@{
Html.EJ().Menu("Menu",
(Syncfusion.JavaScript.Models.MenuProperties)ViewData["Menu"]).Render();
}
```

C#

```
public ActionResult Index()
{
List<MenuBaseItem> obj = new List<MenuBaseItem>();
obj.Add(new MenuBaseItem() { Text="Products"});
obj.Add(new MenuBaseItem() { Text = "Support" });
obj.Add(new MenuBaseItem() { Text = "Downloads" });
obj.Add(new MenuBaseItem() { Text = "Purchase" });
obj.Add(new MenuBaseItem() { Text = "Resources" });
obj.Add(new MenuBaseItem() { Text = "Company" });
MenuProperties menu = new MenuProperties();
menu.Items = obj;
menu.Width = "150";
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
menu.Orientation = Syncfusion.JavaScript.Orientation.Vertical;
ViewData["Menu"] = menu;
return View();
}
```

NavigationDrawer

Overview

EssentialMVCNavigation Drawer is a sliding panel that displays the list of navigation options on demand. That is, by default, it is not visible but you can display it onto the left/right side of the screen by swiping or by clicking with desired target icon.

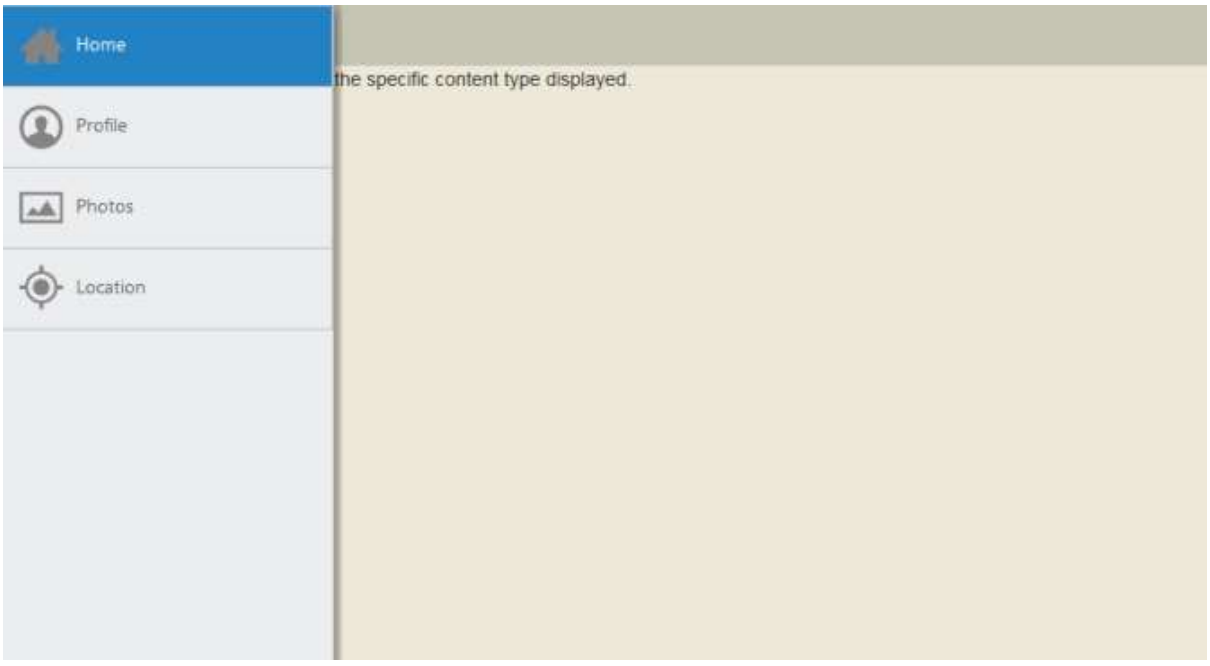
Key Features

- Direction: Specifies the rendering direction for the Navigation Drawer. That is, you can display it from right or left side of the page.
- Type: Specifies the transition type of Navigation Drawer.
- Consider SubPage: Specifies whether the Navigation Drawer to be rendered inside the closest subpage or not.
- Position: Specifies the position of the Navigation Drawer. It can be fixed or relative to the page.

Getting Started

Create your first Navigation Drawer control in MVC

In this section, you can learn how to create a simple navigation drawer.



Create Navigation Drawer Widget

The following steps guide you in adding a Navigation Drawer control for a web application that displays a list of items such as home, profile, photos and location where you can navigate to desired page by clicking on the option available in the drawer.

Copyright © 2001 - 2020 Syncfusion Inc.

You can create an MVC Project and add the necessary assemblies, styles and scripts to it. Refer to the MVC-Getting Started.

To add a Navigation Drawer control, call NavigationDrawer helper. You can display the navigational item as a list by using ListView. This is achieved by creating the ListView inside the content template. You can set the text for list items by using Text property. You can paste the following code in corresponding view page.

ASPX-CS

```
@Html.EJ().NavigationDrawer("navigationPane").Width(300).ContentTemplate(
@<div>
@Html.EJ().ListView("list").ShowHeader(false).Width(300).Items(items =>
{
items.Add().Text("Home");
items.Add().Text("Profile");
items.Add().Text("Photos");
items.Add().Text("Location");
});
</div>)
```

Create the target element as follows to display the drawer by clicking target icon.

ASPX-CS

```
<div class="navigation">
<div id="target" class="icon-target"> Drawer</div>
</div>
```

To set the target icon image from sprite and to position the target icon properly use the following code example.

CSS

```
<style>
[class*="icon-"]
{
background-image:
url("http://js.syncfusion.com/ug/web/content/drawer/sprite.png");
}
.icon-target
{
background-position: 0 -331px;
font-size: 34px;
height: 48px;
position: absolute;
text-indent: 50px;
top: -3px;
width: 48px;
z-index: 3;
}
.navigation
{
background: none repeat scroll 0 0 #C4C4B4;
color: #fff;
height: 45px;
```

Copyright © 2001 - 2020 Syncfusion Inc.

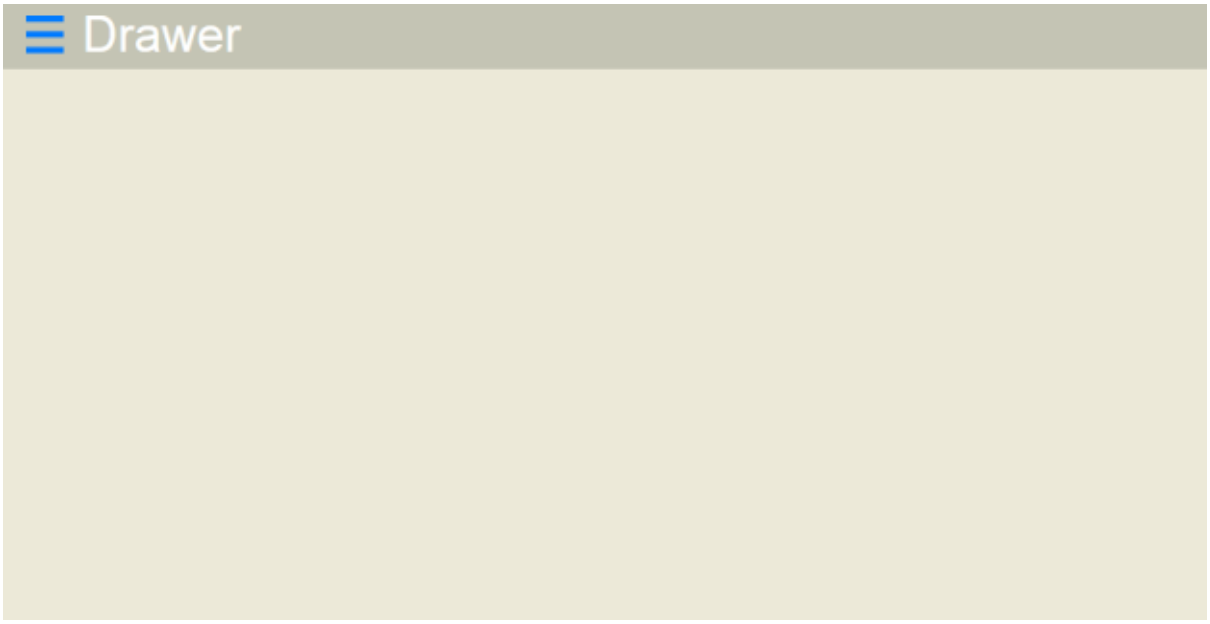
```
padding-left: 5px;
width: 100%;
}
body
{
background: none repeat scroll 0 0 #ece9d8;
}
</style>
```

Set the TargetId property as follows.

ASPX-CS

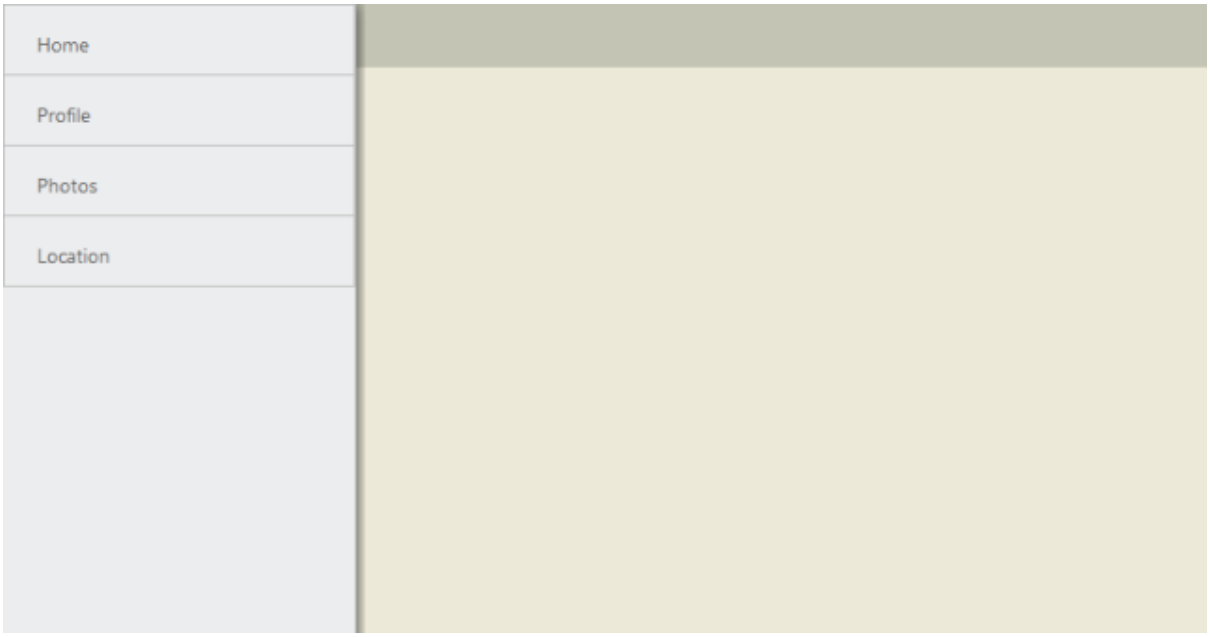
```
@Html.EJ().NavigationDrawer("navigationPane").Width(300).TargetId("target
").ContentTemplate(@<div>
@Html.EJ().ListView("list").ShowHeader(false).Width(300).Items(items =>
{
items.Add().Text("Home");
items.Add().Text("Profile");
items.Add().Text("Photos");
items.Add().Text("Location");
});
</div>)
```

Run the application to render the following output.



You can display the drawer either by clicking on the target icon or by swiping from left on the page. Refer to the following screenshot.

Copyright © 2001 - 2020 Syncfusion Inc.



You can set the images for Navigation Drawer by using the ImageClass property as follows.

ASPX-CS

```
@Html.EJ().NavigationDrawer("navigationPane").Width(300).TargetId("target
").ContentTemplate(@<div>
@Html.EJ().ListView("list").ShowHeader(false).Width(300).Items(items =>
{
items.Add().Text("Home").ImageClass("e-icon e-home");
items.Add().Text("Profile").ImageClass("e-icon e-profile");
items.Add().Text("Photos").ImageClass("e-icon e-photo");
items.Add().Text("Location").ImageClass("e-icon e-location");
});
</div>)
```

You can define the image classes specified for the list items as follows.

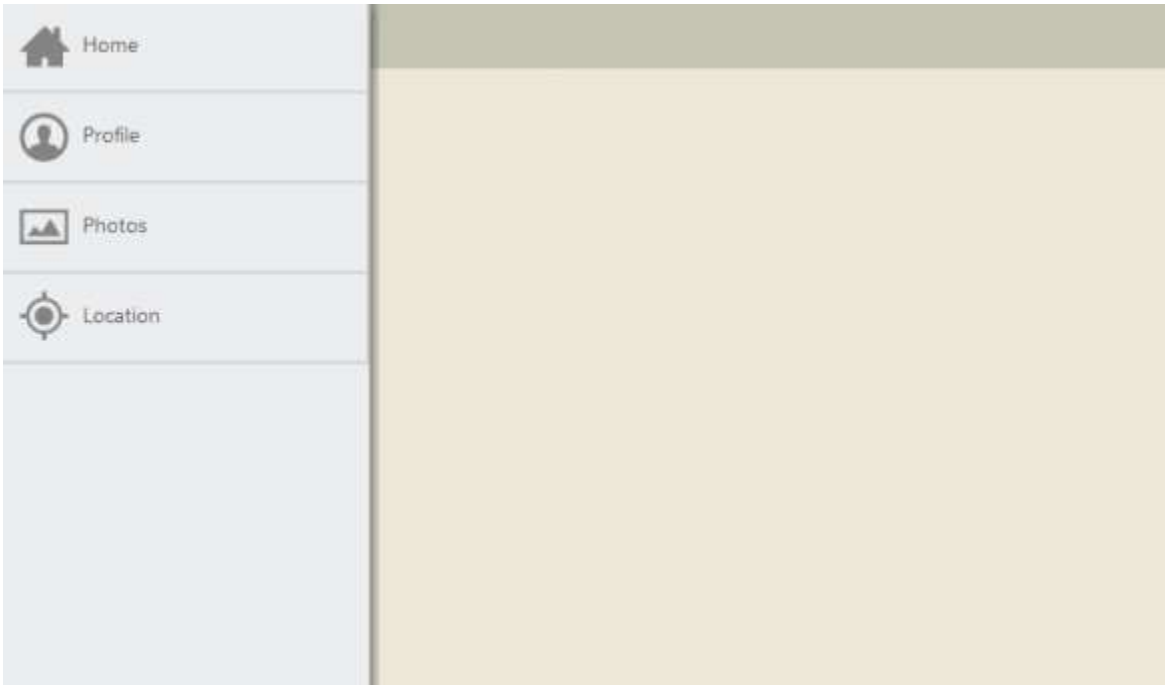
CSS

```
<style>
@font-face {
font-family: 'ej-font';
src: url('../../common-images/tools/icons.eot');
src: url('../../common-images/tools/icons.eot') format('embedded-
opentype'), url('../../common-images/tools/icons.woff')
format('woff'),url('../../common-images/tools/icons.woff')
format('woff'), url('../../common-images/tools/icons.ttf')
format('truetype'), url('../../common-images/tools/icons.svg')
format('svg');
font-weight: normal;
font-style: normal;
}
.e-home:before {
font-family: "ej-font";
content: "\e900";
}
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
.e-profile:before {
font-family: "ej-font";
content: "\e901";
}
.e-photo:before {
font-family: "ej-font";
content: "\e903";
}
.e-location:before {
font-family: "ej-font";
content: "\e905";
}
.e-people:before {
font-family: "ej-font";
content: "\e902";
}
.e-communities:before {
font-family: "ej-font";
content: "\e904";
}
.e-home, .e-profile, .e-people, .e-photo, .e-communities, .e-location {
font-size: 24px;
color: black;
}
</style>
```

Run the application to render the following output.



Create corresponding content elements for each options in the navigation list as follows.

ASPX-CS

```
<!-- Home Page Content-->
<div id="Home">
```

```
The Home screen allows you to choose the specific content type displayed.
</div>
<!-- Profile Page Content-->
<div id="Profile" style="display: none">
The Profile page content is displayed.
</div>
<!-- Photos Page Content-->
<div id="Photos" style="display: none">
The Photos page content is displayed.
</div>
<!-- Location Page Content-->
<div id="Location" style="display: none">
The Location page content is displayed.
</div>
</div>
```

You can load the desired content for the navigation items by updating the content through MouseDown handler of ListView. You can define the handler and pass the method name with MouseDown attribute through listViewSettings. Also to know which item's content is being loaded in the page, make the list selection to persist in the drawer by setting persistSelection as true. Refer to the following code example.

ASPX-CS

```
@Html.EJ().NavigationDrawer("navigationPane").Width(300).TargetId("target
").ContentTemplate(@<div>
@Html.EJ().ListView("list").ShowHeader(false).ClientSideEvents(click =>
click.MouseDown("slideMenuClick")).PersistSelection(true).Width(300).Item
s(items =>
{
items.Add().Text("Home").ImageClass("e-icon e-home");
items.Add().Text("Profile").ImageClass("e-icon e-profile");
items.Add().Text("Photos").ImageClass("e-icon e-photo");
items.Add().Text("Location").ImageClass("e-icon e-location");
});
</div>)
```

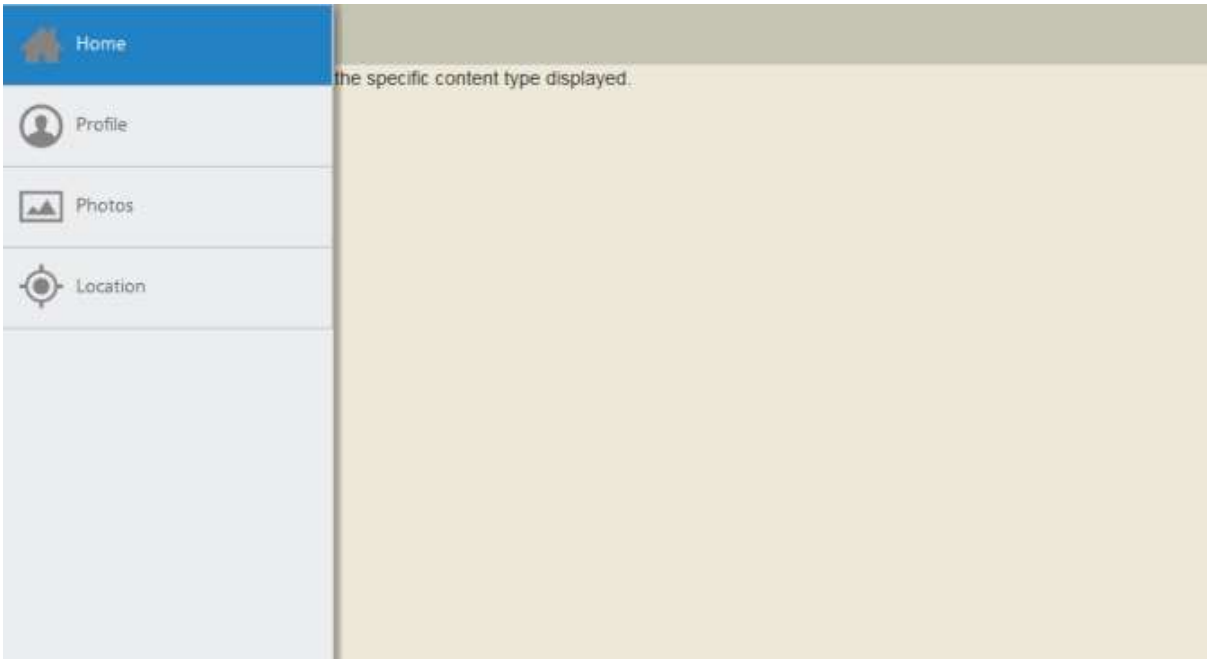
In the mouse down handler, you can hide the other content and display the respective selected item's content.

JS

```
<script type="text/javascript">
function slideMenuClick(e)
{
$('#Home, #Profile, #Photos, #Location').hide(); //Hiding all other
contents
$('#' + e.text).show(); //Displaying the content based on the text of
item selected
$("#navigationPane").ejNavigationDrawer("close");
}
</script>
```

Run the application to render the following output.

Copyright © 2001 - 2020 Syncfusion Inc.



Customize Direction

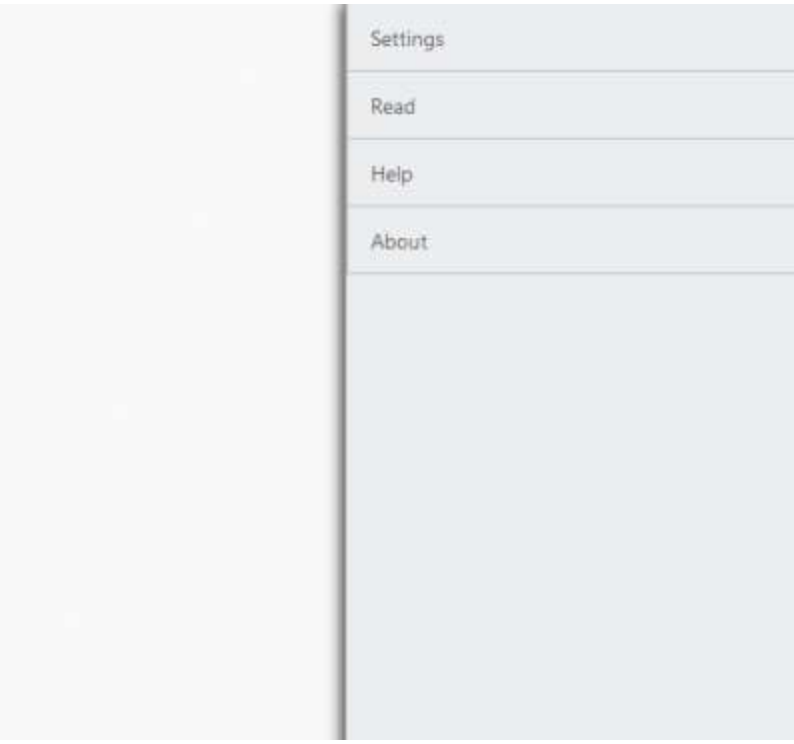
By using this property, you can set the drawer to be open from right to left direction or left to right direction. The possible direction values are Right, Left and the default value is Left. Refer to the following code example.

ASPX-CS

```
@Html.EJ().NavigationDrawer("navigationPane").Width(300).Direction(Naviga
tionDrawerDirection.Right).ContentTemplate(@<div>
@Html.EJ().ListView("list").Width(300).Items(items =>
{
items.Add().Text("Home");
items.Add().Text("Profile");
items.Add().Text("Photos");
items.Add().Text("Location");
})
</div>)
```

The following screenshot displays the output by swiping from right to left at the right side end of the screen.

Copyright © 2001 - 2020 Syncfusion Inc.



Customize Position

Position property is used to specify the position whether it is in fixed or relative to the page. When you set a normal value to position property, it appears within the container. Otherwise, it appears in the whole body .The possible position values are fixed and normal. The Default value is normal.

ASPX-CS

```
@Html.EJ().NavigationDrawer("navigationPane").Width(300).Position(Navigat
ionDrawerPosition.Fixed).ContentTemplate(@<div>
@Html.EJ().ListView("list").Width(300).Items(items =>
{
items.Add().Text("Home");
items.Add().Text("Profile");
items.Add().Text("Photos");
items.Add().Text("Location");
})
</div>)
```

The following screenshot illustrates the output by swiping from left to right at the left end of the screen.

Copyright © 2001 - 2020 Syncfusion Inc.

TargetId

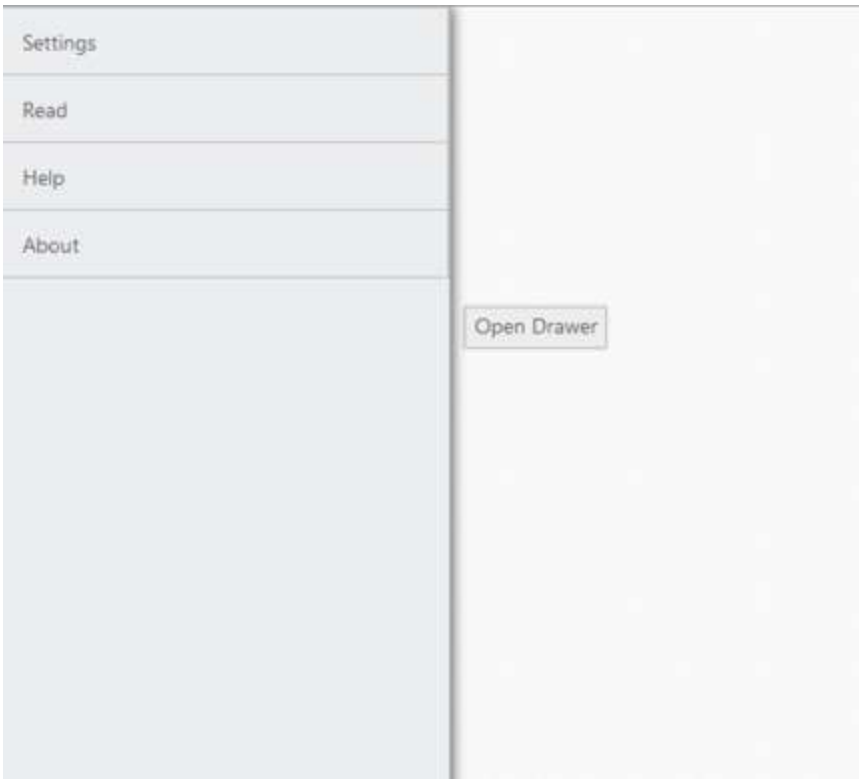
This property is used to define the target Id for Navigation Drawer. The drawer opens while you click on the specified target element.

ASPX-CS

```
@{
@Html.EJ().Button("drawerTarget").Text("Open Drawer")
@Html.EJ().NavigationDrawer("navigationPane").Width(300).TargetId("drawer
Target").ContentTemplate(@<div>
@Html.EJ().ListView("list").Width(300).Items(items =>
{
items.Add().Text("Home");
items.Add().Text("Profile");
items.Add().Text("Photos");
items.Add().Text("Location");
})
</div>)
}
<style>
#drawerTarget {
top: 200px;
left: 600px;
position: absolute;
}
</style>
```

The following screenshots illustrates the output.

Copyright © 2001 - 2020 Syncfusion Inc.



Animations

You can set the transition type of the Navigation Drawer by using type property. The possible transition types are slide and overlay.

- Slide - both navigation panel and content page slides towards left/right direction to view the navigation panel items.
- Overlay - Only the navigation panel slides over the content page to view the navigation panel items. That is, part of the content page is hidden under navigation panel.

Copyright © 2001 - 2020 Syncfusion Inc.

Note: Transition slide type works only with fixed position.

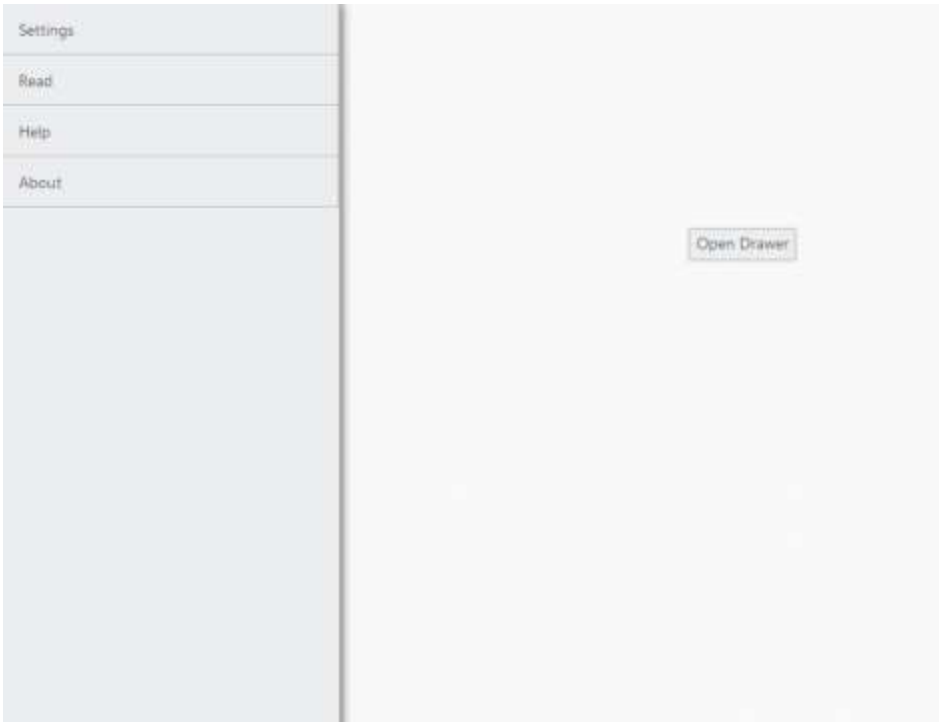
The default value is Overlay.

ASPX-CS

```
@{
@Html.EJ().Button("drawerTarget").Text("Open Drawer")
@Html.EJ().NavigationDrawer("navigationPane").Width(300).Type(NavigationD
rawerType.Slide).TargetId("drawerTarget").Position(NavigationDrawerPositi
on.Fixed).ContentTemplate(@<div>
@Html.EJ().ListView("list").Width(300).Items(items =>
{
items.Add().Text("Home");
items.Add().Text("Profile");
items.Add().Text("Photos");
items.Add().Text("Location");
})
</div>)
}
<style>
#drawerTarget
{
top: 200px;
left: 600px;
position: absolute;
}
</style>
<script>
$("#drawerTarget").click(function () {
$("#navigationPane").ejNavigationDrawer("open");
});
</script>
```

The following screenshot illustrates the output.

Copyright © 2001 - 2020 Syncfusion Inc.



How To

Render NavigationDrawer from Code behind

NavigationDrawer can be rendered from the code behind by initializing the required properties in controller and passing those properties via **ViewData** or **Model** to the client side

The following code illustrates the initialization of NavigationDrawer properties in the controller.

C#

```
//Namespace to get the JavaScript (NavigationDrawer) component properties
using Syncfusion.JavaScript.Models;
namespace MvcApplication.Controllers
{
public class NavigationController: Controller
{
public ActionResult NavigationDrawer()
{
//Initializing the NavigationDrawer model
NavigationDrawerProperties NavigationObj = new
NavigationDrawerProperties();
//Initializing the NavigationDrawer content template other properties
NavigationObj.ContentTemplate = new
MvcTemplate<NavigationDrawerProperties>
{
RazorViewTemplate = (data) =>
{
return "<div id='listview'><ul><li data-ej-text='Home'></li><li data-ej-
text='Profile'></li><li data-ej-text='Photos'></li><li data-ej-
text='Location'></li></ul></div>";
}
};
NavigationObj.Width = 300;
NavigationObj.TargetId = "target";
//Passing NavigationDrawer properties using the ViewData
ViewData["NavigationModel"] = NavigationObj;
return View();
}
}
}
```

Binding the NavigationDrawer properties passed via **ViewData** from the controller in the client side as below.

ASPX-CS

```
<div class="navigation">
<div id="target" class="drawericon e-icon"> Drawer</div>
</div>
@{
Html.EJ().NavigationDrawer("navigationPane",
(Syncfusion.JavaScript.Models.NavigationDrawerProperties)ViewData["Naviga
tionModel"]).Render();
}
<script>
//render listview
$(function () {
$("#listview").ejListView();
});
</script>
<style>
.drawericon {
background-position: center center;
background-repeat: no-repeat;
height: 45px;
width: 32px;
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
background-size: 100% 100%;
padding-right: 10px;
}
.drawer icon:before {
content: "\e76b";
font-size: 24px;
height: 26px;
line-height: 24px;
}
body {
background: none repeat scroll 0 0 #ece9d8;
}
</style>
```

NumericTextBox

NumericTextBox

Essential ASP.NET MVC NumericTextBox is used to display only numeric values. It has Spin buttons to increase or decrease the values in the Text Box.

Key Features

- Min and Max Values—Specifies value range for the textbox.
- Spin Buttons—Enable you to increase or decrease the current value in the textbox.
- Step Value—Enables you to increment or decrement the current value by step value.
- Globalization— EJ MVC NumericTextBox has globalization support. It use ej.globalize.js file to globalize the number format, and parse numbers according to the culture.
- Keyboard Navigation—You can interact with NumericTextBox by using keyboard.
- RTL Support—Support for right to left alignment of textbox input.
- Decimal Values—You can configure the textbox to accept decimal values.
- Themes—NumericTextBox consist of 17 built-in themes, and also support custom skins for creating user-defined themes.

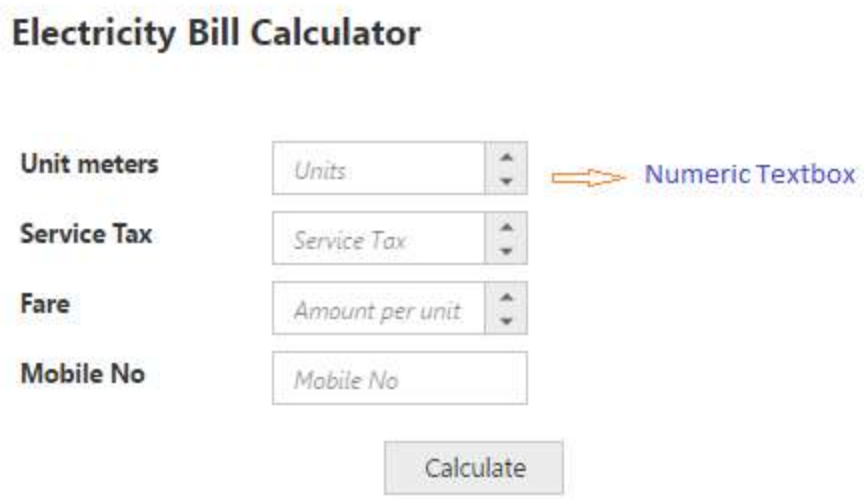
Getting Started

This section explains briefly about how to create a EJMVC NumericTextBox in ASP.NET MVC platform.

Create your first NumericTextBox in MVC

From the following steps you can learn how to create and use NumericTextBox in your application. Here we have showcased, a small Electric bill calculator application using EJMVC Editors widgets.The Essential ASP.NET MVC Editors control includes Numeric, Percentage, Currency and MaskEdit textbox controls. This will guide you to use the wide range of Editors functionalities to complete this application.

Copyright © 2001 - 2020 Syncfusion Inc.



Create Editors

ASP.NET MVC Editors renders built-in features like keyboard navigation, min and max range and flexible API's.

1. Create a MVC Project and add necessary Dll's and Scripts. Refer MVC-Getting Started.
2. Add necessary helper elements to render the Editor components.

ASPX-CS

```
<div class="editors">
<div class="element-text" style="">Electricity Bill Calculator</div>
<br />
<table class="editors">
<tbody>
<tr>
<td>
<label>Unit meters</label>
</td>
<td>    @* NumericTextBox creation with watermark text *@
@Html.EJ().NumericTextbox("numeric").WatermarkText("Units")
</td>
</tr>
<tr>
<td>
<label>Service Tax</label>
</td>
<td>     @* PercentageTextBox creation with watermark text *@
@Html.EJ().PercentageTextbox("percent").WatermarkText("Tax")
</td>
</tr>
<tr>
<td>
<label>Fare</label>
</td>
<td>    @* CurrencyTextBox creation with watermark text *@
@Html.EJ().CurrencyTextbox("currency").WatermarkText("Amount per unit")
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
</td>
</tr>
<tr>
<td>
<label>Mobile No</label>
</td>
<td>    @* MaskEditTextBox creation with watermark text *@
@Html.EJ().MaskEdit("maskedit").WatermarkText("Phone number")
</td>
</tr>
</tbody></table>
<div class="pay-bill">
@Html.EJ().Button("btn").Size(ButtonSize.Small).Text("Calculate")
</div>
</div>
```

3. The following styles are added to arrange the Editors.

CSS

```
<style type="text/css" class="cssStyles">
.element-text
{
display: inline-block;

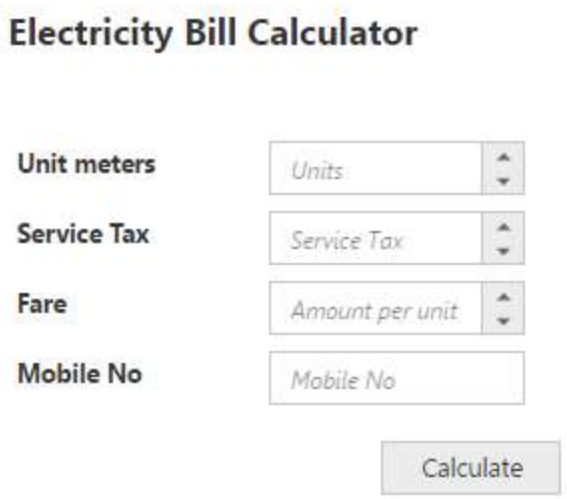
width: 130px;
}
</style>
```

4. Execute the code to render Editors as follows

Copyright © 2001 - 2020 Syncfusion Inc.



NumericTextBox with watermark text

Set MinValue, MaxValue and value in NumericTextBox

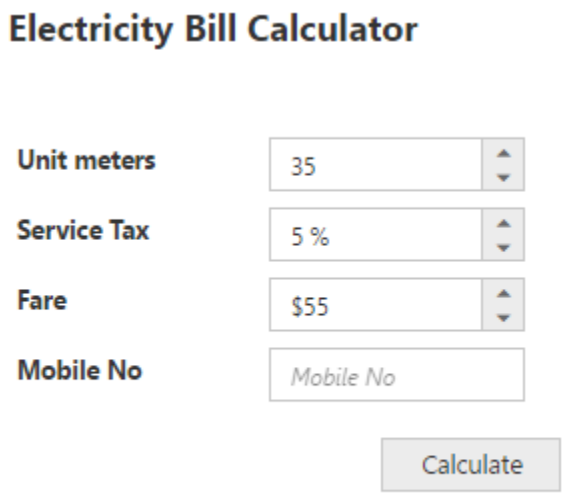
You can set the “MinValue”,“MaxValue” and “Value” in Numeric, Percentage and Currency text boxes for maintaining the range in Editors widgets. In this scenario, you have to enter the values between the default ranges and enter the phone number in the MaskEdit widget by using the ”MaskFormat” property. By using DecimalPlaces property for CurrencyTextBox you can get decimal values. The following code example illustrates how to achieve this.

ASPX-CS

```
<div class="editors">
<div class="element-text" style="">Electricity Bill Calculator</div>
<br />
<table class="editors">
<tbody>
<tr>
<td>
<label>Unit meters</label>
</td>
<td>
@Html.EJ().NumericTextbox("numeric").WatermarkText("Units").MinValue(1).M
axValue(10000).Value("70")
</td>
</tr>
<tr>
<td>
<label>Service Tax</label>
</td>
<td>
@Html.EJ().PercentageTextbox("percent").WatermarkText("Tax").MinValue(5).
MaxValue(100).Value("15")
</td>
</tr>
<tr>
<td>
<label>Fare</label>
```

```
</td>
<td>
@Html.EJ().CurrencyTextbox("currency").WatermarkText("Amount per
unit").MinValue(0.00).MaxValue(100000.00).Value("350.00").DecimalPlaces(2
)
</td>
</tr>
<tr>
<td>
<label>Mobile No</label>
</td>
<td>
@Html.EJ().MaskEdit("maskedit").WatermarkText("Phone
number").MaskFormat("99-999-99999").Value("9090909090")
</td>
</tr>
</tbody>
</table>
<div class="pay-bill">
@Html.EJ().Button("btn").Size(ButtonSize.Small).Text("Calculate")
</div>
</div>
```

The following screenshot illustrates the output of the above code examples.



Setting the Strict Mode Option

You can set the “StrictMode” option to restrict entering values defined outside the range. The following code example illustrates how to set strict mode option.

ASPX-CS

```
<div class="editors">
<div class="element-text" style="">ElectricityBill Calculator</div><br />
<table class="editors">
<tbody>
<tr>
```

```
<td>
<label>Unit meters</label>
</td>
<td>
@Html.EJ().NumericTextbox("numeric").WatermarkText("Units").MinValue(1).M
axValue(10000).Value("70").EnableStrictMode(true)
</td>
</tr>
<tr>
<td>
<label>Service Tax</label>
</td>
<td>
@Html.EJ().PercentageTextbox("percent").WatermarkText("Tax").MinValue(5).
MaxValue(100).Value("15")
</td>
</tr>
<tr>
<td>
<label>Fare</label>
</td>
<td>
@Html.EJ().CurrencyTextbox("currency").WatermarkText("Amount per
unit").MinValue(0.00).MaxValue(100000.00).Value("350.00").DecimalPlaces(2
)
</td>
</tr>
<tr>
<td>
<label>Mobile No</label>
</td>
<td>
@Html.EJ().MaskEdit("maskedit").WatermarkText("Phone
number").MaskFormat("99-999-99999").Value("9090909090")
</td>
</tr>
</tbody>
</table>
<div class="pay-bill">
@Html.EJ().Button("btn").Size(ButtonSize.Small).Text("Calculate")
</div>
</div>
```

Run the above code example and you can see that it restricts entering a value exceeding the MinValue and MaxValue range mentioned in the Numeric textbox.

Set Calculation process with NumericTextBox Widgets

You can use events to calculate the total and displays the value. You can achieve this with the help of Click event in the button widget. The calculation steps are written in the call back function of Click event button.

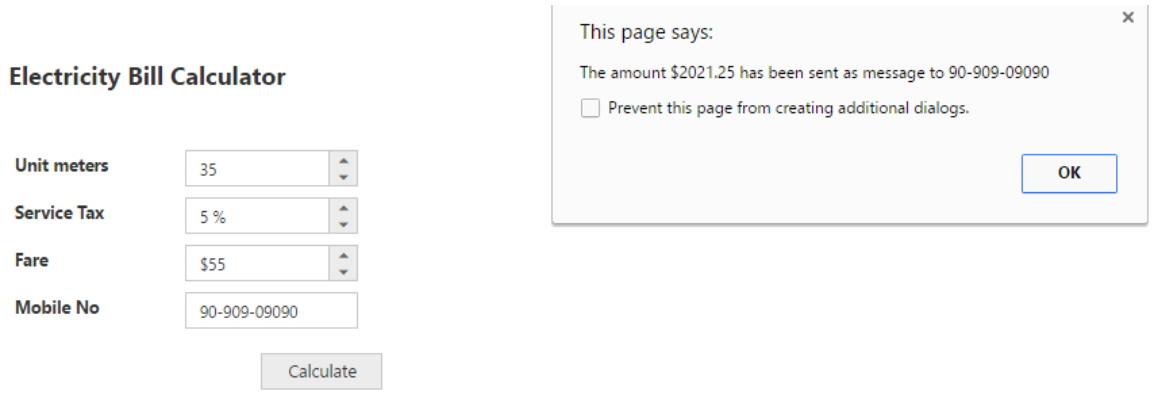
To customize the button, you can set the ContentType as TextAndImage to include the icon before the text and add the ClientSideEvents for click event.

ASPX-CS

Copyright © 2001 - 2020 Syncfusion Inc.

```
<div class="editors">
@* Refer the table format for textboxes customization *@
<div class="pay-bill">
@Html.EJ().Button("btn").Size(ButtonSize.Small).Text("Calculate").ClientS
ideEvents(c=>c.Click("calculateBill"))
</div>
</div>
<script type="text/javascript">
function calculateBill()
{
// Declares Necessary variable creation
var unitMeter, serviceTax, amountPerKm;
unitMeter = $("#numeric").data("ejNumericTextbox");// Object of Numeric
serviceTax = $("#percent").data("ejPercentageTextbox");// Object of
Percentage
amountPerKm = $("#currency").data("ejCurrencyTextbox"); // Object of
Currency
mobileNumber = $("#maskedit").data("ejMaskEdit"); // Object of MaskEdit
// This is used to calculate the Net amount
var netAmount = unitMeter.model.value * amountPerKm.model.value;
// This is used to calculate the service tax amount
var sTax = (netAmount * serviceTax.model.value) / 100;
// This shows the calculated amount for the units
alert("The amount $" + (netAmount + sTax) + " has been sent as message to
" + mobileNumber.model.value + ".");
}
</script>
```

Run the above code sample, fill the required Textbox fields and click the Calculate button. The values are displayed and an alert message is shown. The following screen shot illustrates the final output of the Electricity bill calculator.



Behavior Settings

Decimal Places

DecimalPlaces property specifies number of values allowed after the decimal point.The default value of DecimalPlaces property is 0 i.e., by default you cannot specify decimal value in NumericTextBox. We need to add this property to allow decimal values. To set the DecimalPlaces to “-1”, that allows the decimals without any limit in NumericTextBox control.

Copyright © 2001 - 2020 Syncfusion Inc.

Configure Decimal Places

In the View page add NumericTextBox helper, and configure the DecimalPlaces property as shown below.

ASPX-CS

```
@Html.EJ().NumericTextbox("numeric").DecimalPlaces(3).Value("333")
```

The output is as follows.

Persistence Support

NumericTextBox provides state maintenance support. You can maintain the previous changes made in the control after a page loads.

Configure Persistence Support

In the View page add NumericTextBox helper, and configure the EnablePersistence property as shown below.

ASPX-CS

```
@Html.EJ().NumericTextbox("numeric").Value("11").EnablePersistence(true)
```

Output of NumericTextBox with EnablePersistence is as follows.

Strict Mode Support

NumericTextBox allows you to use the strict mode option by setting the EnableStrictMode property. You can set the MinValue and MaxValue to the controls to enable strict mode functionality. Default value of this property is false. When the textbox value exceeds the MaxValue, it restricts the exceeded value and returns the MaxValue. Likewise when the textbox value goes below MinValue, it restricts the new value and returns the MinValue. When this property is enabled, it will not restrict the specified value and an error class is added to indicate wrong value is provided to the textbox.

Configure Strict Mode Support

In the View page add NumericTextBox helper, and configure the EnableStrictMode property.

ASPX-CS

```
@Html.EJ().NumericTextbox("numeric").MinValue(-
3).MaxValue(5).Value("10").EnableStrictMode(true)
```

Output when EnableStrictMode is “true” is as follows.

Copyright © 2001 - 2020 Syncfusion Inc.

Enabled or Disabled

NumericTextBox has an option to enable or disable its element. You can set the Enabled property as “false” to enable the Textbox controls.

Also you can enable/disable the **NumericTextBox** by using enable and disable methods.

Configure Enabled or Disabled

In the View page add NumericTextBox helper, and configure the Enabled property.

ASPX-CS

```
@Html.EJ().NumericTextbox("numeric").Value("1").Enabled(false)
```

Output when Enabled is “true” and when Enabled is “false”.

Adjusting Textbox Size

NumericTextBox size can be modified by using the Height and Width properties.

Configure Height and Width

In the View page add NumericTextBox helper, and configure the Height and Width property.

ASPX-CS

```
@Html.EJ().NumericTextbox("numeric").Width("100").Height("50").Value("1")
```

Output of NumericTextBox after setting “Height” and “Width” is as follows.

Increment Step

The IncrementStep property is used to increase or decrease the amount of value in the Numeric textbox.

Configure Increment Step

In the View page add NumericTextBox helper, and configure the IncrementStep property.

ASPX-CS

```
@Html.EJ().NumericTextbox("numeric").IncrementStep(2).Value("1")
```

Output of Numeric textbox with IncrementStep is as follows.

Copyright © 2001 - 2020 Syncfusion Inc.

Define Name

When you have placed the NumericTextBox in a form, the Name property is used to send the field value at form submission. The default value of the Name property is null.

Configure Name

In the View page add NumericTextBox helper, and configure the Name property.

ASPX-CS

```
@Html.EJ().NumericTextbox("numeric").Name("Numeric")
```

Define Value

The value of NumericTextBox can be assigned by using the Value property. The default value for Value property is null.

You can get the value of **NumericTextBox** by using getValue method.

Configure Value

In the View page add NumericTextBox helper, and configure the Value property.

ASPX-CS

```
@Html.EJ().NumericTextbox("numeric").Value("12")
```

Output of NumericTextBox with the value property is as follows.

Define MaxValue and MinValue

MaxValue

The maximum limit value can be assigned to the NumericTextBox by using the MaxValue property. The default value of MaxValue property is 1.7976931348623157e+308.

MinValue

The minimum limit value can be assigned to the NumericTextBox by using the MinValue property. The default value of MinValue property is -1.7976931348623157e+308.

Configure MaxValue and MinValue

In the View page add NumericTextBox helper, and configure the MinValue and MaxValue property. .

ASPX-CS

```
@Html.EJ().NumericTextbox("numeric").Value("2").MinValue(-1).MaxValue(2)
```

Output of NumericTextBox with MaxValue and MinValue is as follows.

Copyright © 2001 - 2020 Syncfusion Inc.

Read Only Support

NumericTextBox supports read only option. When you enable the ReadOnly property to the control, the value cannot be changed in the NumericTextBox. You can set the ReadOnly property as “true” to enable this option.

Configure Read Only

In the View page add NumericTextBox helper, and configure the ReadOnly property.

ASPX-CS

```
@Html.EJ().NumericTextbox("numeric").Value("1").ReadOnly(true)
```

Output of NumericTextBox when ReadOnly is “true” is as follows. NumericTextBox values cannot be edited or changed.

Appearance

Theme

NumericTextBox control’s style and appearance can be controlled based on CSS classes. In order to apply styles you need to refer 2 files namely, ej.widgets.core.min.css and ej.theme.min.css. If the file ej.web.all.min.css is referred, then it is not necessary to include the files ej.widgets.core.min.css and ej.theme.min.css in your project, as ej.web.all.min.css is the combination of these two.

By default, there are 17 themes support available namely:

- bootstrap
- flat-azure
- flat-azure-dark
- fat-lime
- flat-lime-dark
- flat-saffron
- flat-saffron-dark
- gradient-azure
- gradient-azure-dark
- gradient-lime
- gradient-lime-dark
- gradient-saffron
- gradient-saffron-dark
- high-contrast-01
- high-contrast-02
- material
- office-365

CSS Class

The CSS can be customized by using the CssClass in the NumericTextBox. You can customize the NumericTextBox with CssClass property to appear like your desired control.

Configure CSS Class

In the View page add NumericTextBox helper, and configure the CssClass property.

Copyright © 2001 - 2020 Syncfusion Inc.

ASPX-CS

```
@Html.EJ().NumericTextbox("numeric").Value("1").CssClass("customCss")
```

1. Customize the CSS properties in custom CSS class.

CSS

```
<style>
.customCss .e-box {
border-color: #9d241b;
}
.customCss .e-input {
background-color: #f6db8d;
}
.customCss .e-select {
background-color: #ecf6ac;
border-color: #3c36e7;
}
</style>
```

Output of NumericTextBox after applying CssClass is as follows.

Rounded Corner Support

NumericTextBox provides you with rounded corner support whose appearance is different from normal textbox controls.

Configure Rounded Corner Support

In the View page add NumericTextBox helper, and configure the ShowRoundedCorner property.

ASPX-CS

```
@Html.EJ().NumericTextbox("numeric").Value("1").ShowRoundedCorner(true)
```

Output of NumericTextBox when ShowRoundedCorner is “true”.

Spin Button Support

NumericTextBox provides you the option as to whether to display the spin button in the widget or remove it from the control by using showSpinButton property.

Configure Spin Button

In the View page add NumericTextBox helper, and configure the ShowSpinButton property.

ASPX-CS

```
@Html.EJ().NumericTextbox("numeric").Value("1").ShowSpinButton(false)
```

Output of NumericTextBox when ShowSpinButton is “false”.

Copyright © 2001 - 2020 Syncfusion Inc.

Water Mark Text Support

The NumericTextBox provide water mark text support. You can display the initial value in the control by water mark.

Configure Water Mark Text

In the View page add NumericTextBox helper, and configure the ShowSpinButton property.

ASPX-CS

```
@Html.EJ().NumericTextbox("numeric").WatermarkText("Numeric")
```

Output of NumericTextBox after applying WaterMarkText is as follows.

Globalization Support

Globalization is language support based on the culture in **NumericTextBox** . You can achieve the **Globalization** using "**locale"** property in **NumericTextBox** .

The widget provides multi-language support using globalization. You can customize the NumericTextBox with your own language style by using this feature. You can change the globalization by using the **locale** property. The default value for **locale** property is **en-US** in NumericTextBox control.

More than 350 culture specific files are available to localize the value. To know more about EJ globalize support, please refer the below link

http://help.syncfusion.com/js/localization

Note: All the culture-specific script files are available within the below specified location, once you have installed Essential Studio in your machine, therefore it is not necessary to download these files explicitly.

'(installed location)\Syncfusion\Essential Studio\{{ site.releaseversion }}\JavaScript\assets\scripts\i18n'
For example, If you have installed the Essential Studio package within C:\Program Files (x86), then navigate to the below location, C:\Program Files (x86)\Syncfusion\Essential Studio\{{ site.releaseversion }}\JavaScript\assets\scripts\i18n

Refer the below German culture file in head section of HTML page after the reference of **ej.web.all.min.js** file.

JAVASCRIPT

```
<script src="http://cdn.syncfusion.com/{{ site.releaseversion
}}/js/i18n/ej.culture.de-DE.min.js"></script>
```

You can dynamically change the language based on their culture.

Configure Localization

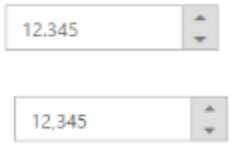
The following example describes the way to use localization in NumericTextBox.

Copyright © 2001 - 2020 Syncfusion Inc.

ASPX-CS

```
@Html.EJ().NumericTextbox("numeric").Value("12345").Locale("de-DE")
```

Output of NumericTextBox with localization.



RTL Support

NumericTextBox provides RTL (Right-To-Left) support. The alignment of NumericTextBox can be changed from Left-To-Right into Right-To-Left.

Enable RTL

In the View page add NumericTextBox helper, and configure the EnableRTL property.

ASPX-CS

```
@Html.EJ().NumericTextbox("numeric").Value("11").EnableRTL(true)
```

Output of NumericTextBox when EnableRTL is “true” is as follows.

NumericTextBox with enableRTL

Keyboard Interaction

With the keyboard navigation enabled in the NumericTextBox control, it is possible to control the actions with the provided shortcut keys. Almost all the NumericTextBox functionality that are done through mouse can be controlled with shortcut keys.

The various keyboard shortcuts available within the NumericTextBox control are discussed in the following table.

Keyboard Shortcuts

Shortcut Key	Description
Access key + j	Focuses the control
Up	Increments the value
Down	Decrements the value
Tab	Focus the next element

Configuring Keyboard Navigation

The following steps explain the implementation of keyboard interaction in NumericTextBox.

In the View page add NumericTextBox helper. Set the access key property to the NumericTextBox for focusing the control while key is pressed. We need to use ‘HtmlAttributes’ property to add the ”access

Copyright © 2001 - 2020 Syncfusion Inc.

key" attribute to the Editor elements. 'HtmlAttributes' property is used to add HTML attributes like, id, class etc.. to the components. We need to use IDictionary<string,object> to specify the HTML attributes.

ASPX-CS

```
@{IDictionary<string, object> numericAttribute = new Dictionary<string,
object>();
numericAttribute.Add("accesskey", "j");
}
@Html.EJ().NumericTextbox("numeric").Name("numeric").Value("11").HtmlAttr
ibutes(numericAttribute)
```

Run the above example and press Access key + j key to focus the NumericTextBox widget. Perform provided functionality by using keyboard shortcuts.

How To

Use Normal Textboxes as Syncfusion textboxes

In an application or a web page, you may use normal textboxes along with other Syncfusion components, since there is no separate EJHelpers for textboxes.

So, you may want to make a normal textbox to look like Syncfusion textbox in order to achieve uniform look and appearance in your web page.

This can be achieved by adding **"e-textbox"** class to the HTML helpers.

By adding this class, the textbox will have standard look and appearance as other components for all the themes supported by Syncfusion.

ASPX-CS

```
@Html.TextBox("textbox", "This is a normal Textbox", new { @class = "e-
textbox"})
```

Textbox will be rendered as shown below

Normal textbox as Syncfusion textbox

Pager

Overview

The **Essential ASP.NET MVC Pager** control allows you to navigate between the pages available in a record. Pager has features like pageSizeList an option to have multiple choices of page size value of pager control and has showGoToPage text box to navigate to any required page from the current page. The Essential ASP.NET MVC Pager control also has theme support.

Key Features

- **Trendy Look:** Rich Appearance with Theme Support.
- **RTL:** Supports for Right to Left alignment.
- **Responsive Support:** Pager control will be responsive respective to the layout.
- **Localization:** Supports localization to different cultures.

Getting Started

This section briefly explains about how to create a **Pager** control in your application with ASP.NET MVC.

Adding scroller control in your MVC application

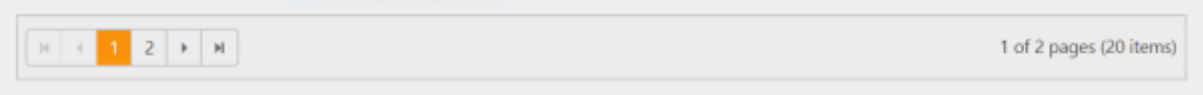
1. Create an MVC Project and add required assemblies, scripts and styles to it referring MVC-Getting-Started Documentation. 2. The Essential ASP.NET MVC Pager control based on total records count, page size and page count values. Add the following code example to the corresponding view pages to render the Pager control in your MVC application.

TotalRecordsCount: totalRecordsCount defines the total number of records which is bounded as a single data.

JAVASCRIPT

```
@Html.EJ().Pager("pager").TotalRecordsCount(20)
```

Run the above sample to get the below output.



PageSize: pageSize value defines the number of records to be displayed per page. The default value for the pageSize API is 12.

Note: The page count value changes with change in the pageSize value.

JAVASCRIPT

```
@Html.EJ().Pager("pager").TotalRecordsCount(20).PageSize(1)
```

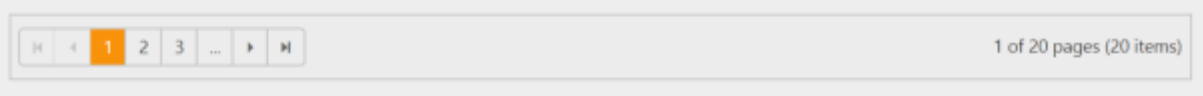
Run the above sample to get the below output.

PageCount: pageCount value defines the number of pages to be displayed in the pager control for navigation. The default value for pageCount is 10 and value will be updated based on totalRecordsCount and pageSize values.

JAVASCRIPT

```
@Html.EJ().Pager("pager").TotalRecordsCount(20).PageSize(1).PageCount(3)
```

Run the above sample to get the below output.



Copyright © 2001 - 2020 Syncfusion Inc.

Behavior Settings

Page Size List

The **PageSizeList** property of the pager control allows an option to have multiple options of page size values.By defining pageSizeList, a dropdown will render in a pager with given values along with the current pageSize as selected value in dropdown.

Selected value in a dropdown will be set to pageSize API and pager will refresh based on this new pageSize.

JAVASCRIPT

```
@{List<int> pageSizeList = new List<int>();
pageSizeList.Add(1);
pageSizeList.Add(2);
pageSizeList.Add(3);
}
<div class="control">
@Html.EJ().Pager("pager").TotalRecordsCount(20).PageSize(1).PageSizeList(
pageSizeList).PageCount(3)
</div>
```

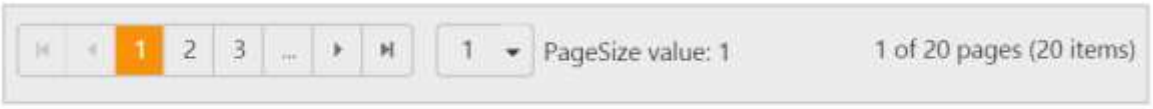
Page Size Message

The **PageSizeMessage** property allows to show a message along with the dropdown when **pageSizeList** API of pager control is defined. In the below sample, the **PageSizeMessage** of pager displays the current **pageSize** value of the pager control and will also be updated whenever the pageSize value is changed by selecting a value from the dropdown.

JAVASCRIPT

```
<div class="control">
@Html.EJ().Pager("pager").TotalRecordsCount(20).PageSize(1).PageCount(3).
PageSizeMessage("PageSize value: 1").ClientSideEvents(eve => {
eve.PageSizeSelected("pageSizeInfo");
</div>
<script>
function pageSizeInfo(e) {
var a = $("#pager").ejPager("instance");
a.option("pageSizeMessage", "PageSize value: " + e.pageSize);
}
</script>
```

Copyright © 2001 - 2020 Syncfusion Inc.

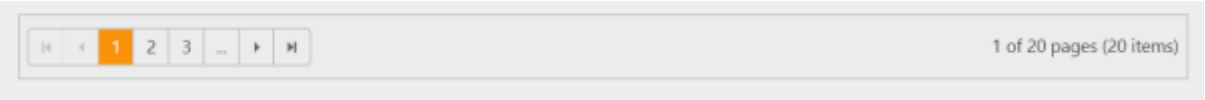


Responsive

The pager control has responsive support such that control also fit with mobile resolutions. By enabling **isResponsive** API, you can make the pager control responsive. While resizing the browser window, the inner elements in the pager control will adjust automatically to equalize the size. By default, **isResponsive** API value is false.

JAVASCRIPT

```
@Html.EJ().Pager("pager").PageCount(3).PageSize(1).CurrentPage(1).IsRespo
nsive(true).TotalRecordsCount(20)
```

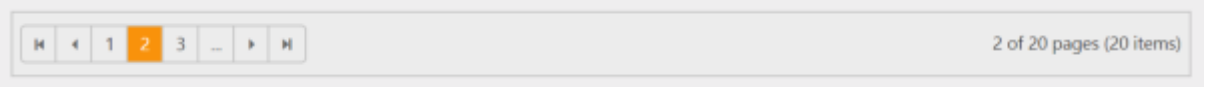


Current Page

The **CurrentPage** value of the pager determines which page to be displayed currently. The default value of the **currentPage** API is 1

JAVASCRIPT

```
@Html.EJ().Pager("pager").PageSize(1).PageCount(3).CurrentPage(2).TotalRe
cordsCount(20)
```



Enable/Disable

You can enable or disable pager control by using **Enabled** property. Setting enabled API value as false will disable the user interaction with the pager control.

JAVASCRIPT

```
@Html.EJ().Pager("pager").PageSize(1).PageCount(3).Enabled(false).TotalRe
cordsCount(20)
```

Customization

Show Go To Page

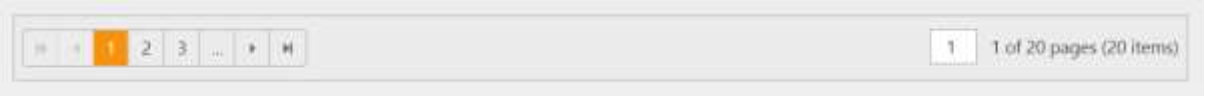
The **ShowGoToPage** property of pager renders a textbox within the pager element.

JAVASCRIPT

```
@Html.EJ().Pager("pager").PageSize(1).PageCount(3).ShowGoToPage(true).Tot
alRecordsCount(20)
```

Copyright © 2001 - 2020 Syncfusion Inc.

Run the above code to get the below output.



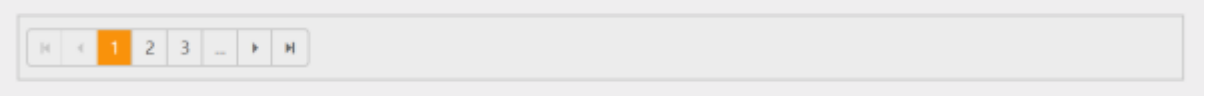
Show Page Info

The **ShowPageInfo** property of the pager control determines whether to show the page related information like total records count, total pages, current page in a pager.

JAVASCRIPT

```
@Html.EJ().Pager("pager").PageSize(1).PageCount(3).ShowPageInfo(false).To
talRecordsCount(20)
```

Run the above code to get the below output.



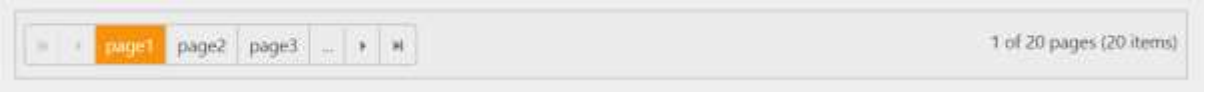
Custom Text

The **CustomText** property of pager allows to add the custom text along with numeric values in the pager numeric elements that are used for navigation in pager control.

JAVASCRIPT

```
@Html.EJ().Pager("pager").PageSize(1).PageCount(3).CustomText("page").Tot
alRecordsCount(20)
```

Run the above code to get the below output.



External Message

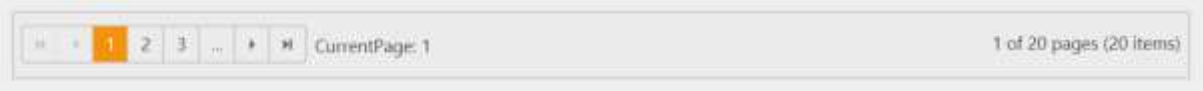
The pager control also allows to define a external message using externalMessage API to display an additional information. To use external message, we need to enable it using enableExternalMessage API. In the sample below, the externalMessage of pager is used to show the current active page of the pager control. Whenever the current page value of the pager changes, the externalMessage will be updated with the current page value.

JAVASCRIPT

```
<div class="control">
@Html.EJ().Pager("pager").PageSize(1).PageCount(3).EnableExternalMessage(
true).ExternalMessage("CurrentPage
:1").TotalRecordsCount(20).ClientSideEvents(eve => {
eve.Change("onChange"); })
</div>
<script type="text/javascript">
function onChange(e) {
var a = $("#pager").ejPager("instance");
a.option("externalMessage", "CurrentPage: " + e.currentPage);
```

```
}
</script>
```

Run the above code to get the below output.



Custom CSS

Pager control allows you to customize the appearance using user defined CSS and custom skin options such as colors and backgrounds. To apply custom themes, we can make use of cssClass property. Using cssClass property, we can override the existing theme styles. In the following sample, value for cssClass property is set as customCss and this root class is used to customize the pager control theme.

JAVASCRIPT

```
<div class="control">
@Html.EJ().Pager("pager").PageSize(1).PageCount(3).TotalRecordsCount(20).
CssClass("customCss")
</div>
```

Defining custom class.

HTML

```
<style>
.e-pager.customCss .e-link.e-currentitem{
background:lightblue;
}
.e-pager.customCss .e-numericitem, .e-pager.customCss .e-pagermsg{
font-family:monospace;
}
.e-pager.customCss .e-pagercontainer,.e-pager.customCss .e-link ,.e-
pager.customCss .e-icon {
background-color: rgba(33,33,33,0.35);
}
.e-pager.customCss {
color:white;
background-color: rgba(33,33,33,0.30);
}
.e-pager.customCss :hover {
color:white
}
.e-pager.customCss .e-hover.e-numericitem, .e-pager.customCss .e-hover.e-
icon{
background-color:rgba(173,216,230,0.30);
}
.e-pager.customCss .e-hover.e-icon.e-disable {
background-color: rgba(33,33,33,0.35);
}
.e-pager.customCss .e-icon, .e-pager.customCss .e-numericitem{
color:white;
border-right-color: #777;
}
</style>
```

Copyright © 2001 - 2020 Syncfusion Inc.

Run the above code to get the below output.

Localization

Pager has been provided with built in localization support with different culture.

Setting different culture to control

We can set different culture to **Pager** control using **Locale** API. While we change the culture of the control from default culture (English), the pager information text will be change accordingly. You can get the localized text by specifying the localized text file in your application and should be referred after ej.web.all.min.js file reference.

<script src="http://cdn.syncfusion.com/{{ site.releaseversion }}/js/l10n/ej.localetexts.es-ES.min.js"></script>

Also, you can set localizes text of your as shown below code snippet.

JAVASCRIPT

```
ej.Pager.Locale["es-ES"] = {
pagerInfo: "{0} de {1} páginas ({2} artículos)",
firstPageTooltip: "Ir a la primera página",
lastPageTooltip: "Ir a la última página",
nextPageTooltip: "Ir a la página siguiente",
previousPageTooltip: "Ir a la página anterior",
nextPagerTooltip: "Ir al siguiente Pager",
previousPagerTooltip: "Ir a Pager anterior"
};
ej.Pager.Locale["de-DE"] = {
pagerInfo: "{0} von {1} Seiten ({2} Beiträge)",
firstPageTooltip: "Zur ersten Seite",
lastPageTooltip: "Zur letzten Seite",
nextPageTooltip: "Zur nächsten Seite",
previousPageTooltip: "Zurück zur letzten Seite",
nextPagerTooltip: "Zum nächsten Pager",
previousPagerTooltip: "Zum vorherigen Pager"
};
```

How to?

Render Pager from Code behind

Pager can be rendered from the code behind by initializing the required properties in controller and passing those properties via **ViewData** or **Model** to the client side.

The following code illustrates the initialization of Pager properties in the controller.

C#

```
//Namespace to get the JavaScript (Pager) component properties
using Syncfusion.JavaScript.Models;
namespace MvcApplication.Controllers
{
public class PagerController : Controller
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
{
// GET: Pager
public ActionResult PagerFeatures()
{
//Initializing the Pager model
PagerProperties PagerObj = new PagerProperties();
//Initializing the datasource and other properties
PagerObj.TotalRecordsCount = 20;
PagerObj.PageSize = 1;
//Passing Pager properties using the ViewData
ViewData["PagerModel"] = PagerObj;
return View();
}
}
}
```

Binding the Pager properties passed via **ViewData** from the controller in the client side as below.

ASPX-CS

```
@{
Html.EJ().Pager("searchCustomer",(Syncfusion.JavaScript.Models.PagerPrope
rties)ViewData["PagerModel"]).Render();
}
```

PivotChart

Overview

The **PivotChart** control for **Essential ASP.NET MVC** is a lightweight control that reads both **OLAP** and **Relational** datasource and visualizes it in graphical format with the ability to drill up and down.

Key Features

The key features of the **PivotChart** control is listed as follows:

- **Data source** - Supports OLAP data binding with Microsoft SQL Server Analysis Services (SSAS), XML/A data sources and Relational data sources.
- **Series** - A collection of series items that contain the actual data points is displayed on the chart.
- **Legend** - A color code that helps to differentiate between chart items. A legend also has labels beside each color to indicate that it applies to information from Series 1, Series 2, and so on.
- **Drill support** - Enables you to navigate to the inner levels in the row axis.
- **Tooltip** - Displays data point values of respective chart series on mouse hover.
- **Zooming and scrolling** – Enables you to zoom into an area of the chart so the data can be viewed with more clarity.

Getting Started

Getting Started

Important

Starting with v16.2.0.x, if you refer to Syncfusion assemblies from trial setup or from the NuGet feed, include a license key in your projects. Refer to this link to learn about registering Syncfusion license key in your ASP.NET Core application to use our components.

Copyright © 2001 - 2020 Syncfusion Inc.

Creating a simple application with PivotChart and Relational datasource (Client Mode)

This section covers the information that you need to know to populate a simple PivotChart with Relational data completely on the client-side.

Project Initialization

Create a new **ASP.NET MVC Web Application** using Visual Studio IDE and name the project as **"PivotChartDemo"**.

Select the View engine as **'Razor'** and Project template as **'Internet Application'** and finally click **OK** button to create an application.

Now add the following dependency libraries as references into your MVC Web Application. In order to add them to your application, right-click on **References** in Solution Explorer and select Add Reference. Now in the **Reference Manager** dialog, under **Assemblies > Extension**, the following Syncfusion libraries will be found.

- Syncfusion.EJ
- Syncfusion.EJ.Export
- Syncfusion.EJ.Pivot
- Syncfusion.EJ.MVC

The version of Syncfusion libraries based on .NET Framework and MVC version are classified below. For example, version is illustrated as,

MVC Version	MVC Version of Syncfusion assembly	Base Version of Syncfusion assembly	System.Web.Mvc	System.Web.WebPages
MVC3	{{ site.mvc3releaseversion }}	{{ site.35esreleaseversion }}	3.0	1.0
MVC4	{{ site.mvc4releaseversion }}	{{ site.40esreleaseversion }}	4.0	2.0
MVC5	{{ site.mvc5releaseversion }}	{{ site.45esreleaseversion }}	5.0	3.0

Register the referred assemblies in Web.config files available inside Views folder and also at the root of the application.

XML

```
<compilation debug="true" targetFramework="4.0">
<assemblies>
……
……
<add assembly="Syncfusion.EJ, Version= {{ site.40esreleaseversion }},
Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.EJ.Pivot, Version= {{ site.40esreleaseversion
}}, Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
<add assembly="Syncfusion.EJ.Export, Version= {{ site.40esreleaseversion
}}, Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.EJ.Mvc, Version= {{ site.40esreleaseversion }},
Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
</assemblies>
</compilation>
```

Register the required namespaces in Web.config files available inside Views folder and also at the root of the application

XML

```
<namespaces>
……
……
<add namespace="Syncfusion.MVC.EJ" />
<add namespace="Syncfusion.JavaScript" />
</namespaces>
```

Note: Registering assemblies and namespaces earlier helps to include the control in view page with the help of intellisense.

Set the **UnobtrusiveJavaScriptEnabled** property to false under **appSettings** tag in Web.config file at the root folder.

XML

```
<configuration>
……
……
<appSettings>
……
……
<add key="UnobtrusiveJavaScriptEnabled" value="false" />
</appSettings>
</configuration>
```

Scripts and CSS Initialization

The scripts and style sheets that are mandatorily required to render PivotChart control in an MVC Web Application are mentioned in an appropriate order below:

1. ej.web.all.min.css
2. jQuery-3.0.0.min.js
3. ej.web.all.min.js

Click here here to know more about scripts and style sheets available online (CDN Link).

Scripts and style sheets are referred under the <head> tag in **_Layout.cshtml** file which is found inside **Views > Shared folder.**

ASPX-CS

```
<head>
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
<link href="http://cdn.syncfusion.com/{{ site.releaseversion
}}/js/web/flat-azure/ej.web.all.min.css" rel="stylesheet" type="text/css"
/>
<script src="http://cdn.syncfusion.com/js/assets/external/jquery-
3.0.0.min.js" type="text/javascript"></script>
<script src="http://cdn.syncfusion.com/{{ site.releaseversion
}}/js/web/ej.web.all.min.js" type="text/javascript"></script>
</head>
```

The script manager is initialized immediately after the RenderBody() function call in **_Layout.cshtml** file in-order to generate control related scripts.

ASPX-CS

```
<body>
……
……
@RenderBody()
@(Html.EJ().ScriptManager())
</body>
```

Initialize PivotChart

Before initializing, empty the contents of Index.cshtml file under Views > Home folder and add the following codes.

ASPX-CS

```
@using Syncfusion.JavaScript;
@Html.EJ().Pivot().PivotChart("PivotChart1")
<style>
#PivotChart1 {
width:950px;
height:460px;
}
</style>
```

Populate PivotChart With Data

Let us now see how to populate the PivotChart control using a sample JSON data as shown below.

ASPX-CS

```
@Html.EJ().Pivot().PivotChart("PivotChart1").ClientSideEvents(clientSideE
vents => clientSideEvents.Load("onLoad"))
<script type="text/javascript">
function onLoad(args) {
args.model.dataSource.data = [
{ Amount: 100, Country: "Canada", Product: "Bike" },
{ Amount: 200, Country: "Germany", Product: "Van" },
{ Amount: 300, Country: "Germany", Product: "Car" },
{ Amount: 150, Country: "United Kingdom", Product: "Bike" },
{ Amount: 200, Country: "Canada", Product: "Car" }
]
}
</script>
<style>
```

Copyright © 2001 - 2020 Syncfusion Inc.

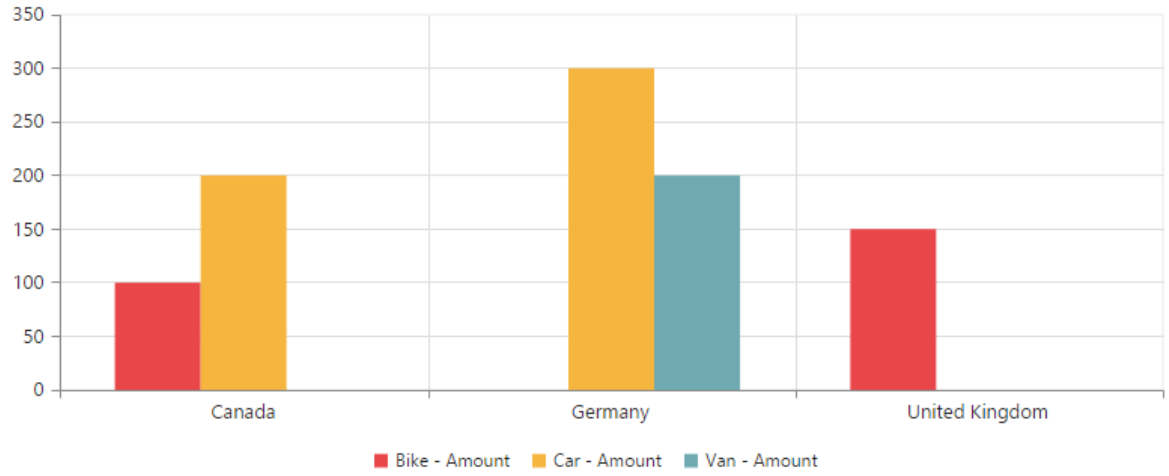
```
#PivotChart1 {
width:950px;
height:460px;
}
</style>
```

The JSON data is set to the **“data”** property present inside the **“dataSource”** object. **“dataSource”** object allows us to set both datasource as well as the fields that needs to be displayed in the row, column, value and filter section of the PivotChart control.

ASPX-CS

```
@Html.EJ().Pivot().PivotChart("PivotChart1").ClientSideEvents(clientSideE
vents => clientSideEvents.Load("onLoad")).DataSource(dataSource =>
dataSource.Rows(rows => {
rows.FieldName("Country").FieldCaption("Country").Add();}).Columns(column
s => { columns.FieldName("Product").FieldCaption("Product").Add();
}).Values(values => {
values.FieldName("Amount").Add();})).Size(size=>size.Height("460px").Widt
h("950px"))
```

The above code will generate a simple PivotChart with sales amount over products in different regions.



Apply Sorting

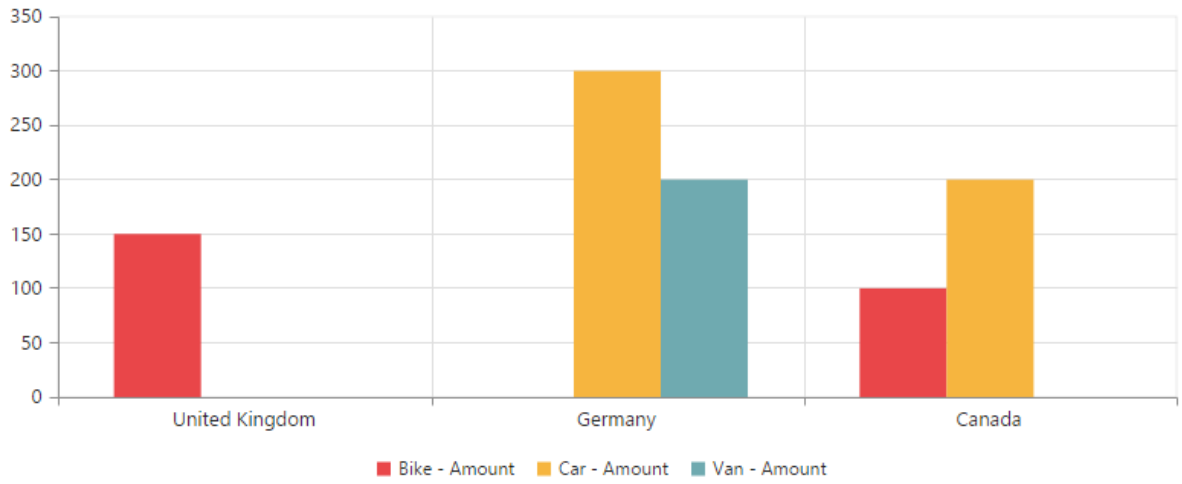
You can sort a field either to ascending or descending order using the "sortOrder" property. Sorting is applicable only for Row and Column fields.

Note: By default, fields are arranged in ascending order.

ASPX-CS

```
@Html.EJ().Pivot().PivotChart("PivotChart1").ClientSideEvents(clientSideE
vents => clientSideEvents.Load("onLoad")).DataSource(dataSource =>
dataSource
.Rows(rows => {
rows.FieldName("Country").FieldCaption("Country").SortOrder(SortOrder.Des
cending).Add();})
```

```
.Columns(columns => {
columns.FieldName("Product").FieldCaption("Product").Add(); })
.Values(values => {
values.FieldName("Amount").Add();})).Size(size=>size.Height("460px").Widt
h("950px"))
```



Apply Filtering

Filtering option allows you to specify a set of values that either need to be displayed or hidden. Also filtering option is applicable only for Row, Column and Filter areas.

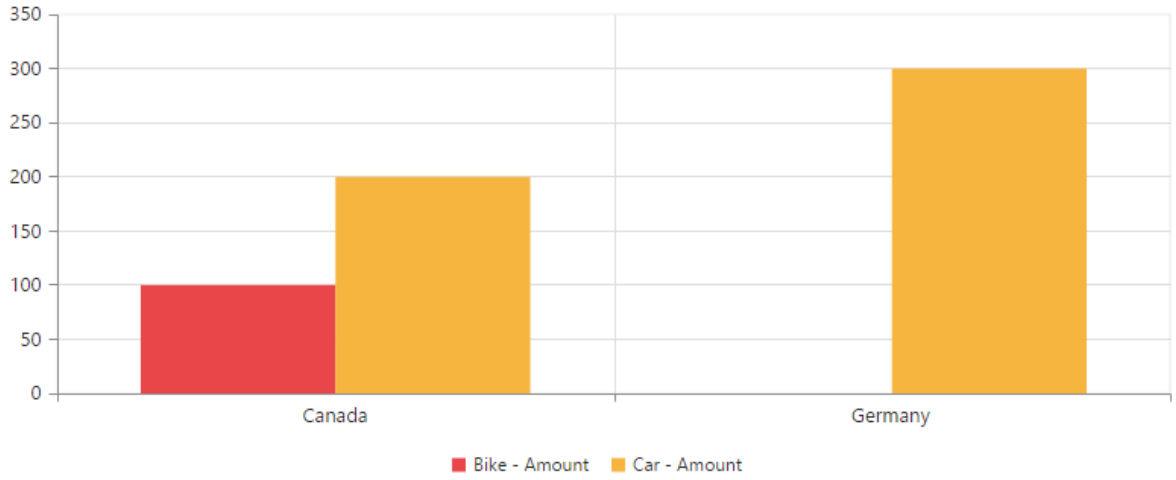
"FilterItems" object allow us to apply filtering to the fields using the following properties:

- FilterType - indicates whether the values should be included or excluded.
- Values - contains an array of values that needs to be included or excluded within the particular field.

ASPX-CS

```
@Html.EJ().Pivot().PivotChart("PivotChart1").ClientSideEvents(clientSideE
vents => clientSideEvents.Load("onLoad")).DataSource(dataSource =>
dataSource.Rows(rows => {
rows.FieldName("Country").FieldCaption("Country").FilterItems(filter => {
filter.FilterType(PivotFilterType.Exclude).Values(value => {
value.Add("United Kingdom"); }); }).Add(); }).Columns(columns => {
columns.FieldName("Product").FieldCaption("Product").Add();
}).Values(values => { values.FieldName("Amount").Add();
})).Size(size=>size.Height("460px").Width("950px"))
```

Copyright © 2001 - 2020 Syncfusion Inc.



Creating a simple application with PivotChart and Relational datasource (Server Mode)

This section covers the information required to create a simple PivotChart bound to Relational datasource.

Note: ASP.NET MVC Web Application will contain a service that transfers data to server-side, processes and returns back to client-side for control rendering and re-rendering. The service utilized for communication could be either WCF or WebAPI based on user requirement.

Project Initialization

Create a new **ASP.NET MVC Web Application** using Visual Studio IDE and name the project as **"PivotChartDemo"**.

Select the View engine as **'Razor'** and Project template as **'Internet Application'** and finally click **OK** button to create an application.

Now add the following dependency libraries as references into your MVC Web Application. In order to add them to your application, right-click on **References** in Solution Explorer and select Add Reference. Now in the **Reference Manager** dialog, under **Assemblies > Extension**, the following Syncfusion libraries will be found.

Note: If you have installed any version of Essential Studio, then the location of Syncfusion libraries is [system drive:\Program Files (x86)\Syncfusion\Essential Studio\{{ site.releaseversion }}\Assemblies].

- Syncfusion.Compression.Base
- Syncfusion.Linq.Base
- Syncfusion.Olap.Base
- Syncfusion.PivotAnalysis.Base
- Syncfusion.XlsIO.Base
- Syncfusion.Pdf.Base
- Syncfusion.DocIO.Base
- Syncfusion.EJ
- Syncfusion.EJ.Export
- Syncfusion.EJ.Pivot
- Syncfusion.EJ.MVC

Copyright © 2001 - 2020 Syncfusion Inc.

The version of Syncfusion libraries based on .NET Framework and MVC version are classified below. For example, version is illustrated as,

MVC Version	MVC Version of Syncfusion assembly	Base Version of Syncfusion assembly	System.Web.Mvc	System.Web.WebPages
MVC3	{{ site.mvc3releaseversion }}	{{ site.35esreleaseversion }}	3.0	1.0
MVC4	{{ site.mvc4releaseversion }}	{{ site.40esreleaseversion }}	4.0	2.0
MVC5	{{ site.mvc5releaseversion }}	{{ site.45esreleaseversion }}	5.0	3.0

Register the referenced assemblies in Web.config files available inside Views folder and also at the root of the application.

XML

```
<compilation debug="true" targetFramework="4.0">
<assemblies>
……
……
<add assembly="Syncfusion.EJ, Version= {{ site.40esreleaseversion }},
Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.EJ.Pivot, Version= {{ site.40esreleaseversion
}}, Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.EJ.Export, Version= {{ site.40esreleaseversion
}}, Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.EJ.Mvc, Version= {{ site.40esreleaseversion }},
Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
</assemblies>
</compilation>
```

Register the required namespaces in Web.config files available inside Views folder and also at the root of the application

XML

```
<namespaces>
……
……
<add namespace="Syncfusion.MVC.EJ" />
<add namespace="Syncfusion.JavaScript" />
</namespaces>
```

Note: Registering assemblies and namespaces earlier helps to include the control in view page with the help of intellisense.

Copyright © 2001 - 2020 Syncfusion Inc.

Set the **UnobtrusiveJavaScriptEnabled** property to false under **appSettings** tag in Web.config file at the root folder.

XML

```
<configuration>
……
……
<appSettings>
……
……
<add key="UnobtrusiveJavaScriptEnabled" value="false" />
</appSettings>
</configuration>
```

Scripts and CSS Initialization

The scripts and style sheets that are mandatorily required to render PivotChart control in a MVC Web Application are mentioned in an appropriate order below:

1. ej.web.all.min.css
2. jQuery-3.0.0.min.js
3. ej.web.all.min.js

Click here here to know more about scripts and style sheets available online (CDN Link).

Scripts and style sheets are referred under the <head> tag in **_Layout.cshtml** file which is found inside **Views > Shared folder.**

ASPX-CS

```
<head>
<link href="http://cdn.syncfusion.com/{{ site.releaseversion
}}/js/web/flat-azure/ej.web.all.min.css" rel="stylesheet" type="text/css"
/>
<script src="http://cdn.syncfusion.com/js/assets/external/jquery-
3.0.0.min.js" type="text/javascript"></script>
<script src="http://cdn.syncfusion.com/{{ site.releaseversion
}}/js/web/ej.web.all.min.js" type="text/javascript"></script>
</head>
```

The script manager is initialized immediately after the RenderBody() function call in **_Layout.cshtml** file in-order to generate control related scripts.

ASPX-CS

```
<body>
//....
//....
@RenderBody()
@(Html.EJ().ScriptManager())
</body>
```

Copyright © 2001 - 2020 Syncfusion Inc.

Control Initialization

Before initializing, empty the contents of **Index.cshtml** file under **Views > Home** folder and add the following codes. Register the namespaces at the top of the page and then add the control.

ASPX-CS

```
@using Syncfusion.JavaScript;
@Html.EJ().Pivot().PivotChart("PivotChart1").Url(Url.Content("/Relational
")).Size(size=>size.Width("950px").Height("460px"))
<style>
#PivotChart1 {
width:950px;
height:460px;
}
</style>
```

The **"Url"** property in PivotChart control points the service endpoint, where data are processed and fetched in the form of JSON. The services used in PivotChart control as endpoint are WCF and WebAPI.

Note: The above "Index.cshtml" contains WebAPI URL, which is "/Relational". If WCF service is used as endpoint, the URL would look like "/RelationalService.svc".

WebAPI

Adding a WebAPI Controller

To add a WebAPI controller in an existing MVC Web Application, right-click on the project in Solution Explorer and select **Add > New Item**. In the **Add New Item** window, select **WebAPI Controller Class** and name it as **"RelationalController.cs"**, click **Add**.

Now, WebAPI controller is added to the application successfully with the file **"RelationalController.cs"**.

Note: While adding WebAPI Controller Class, name it with the suffix 'Controller' which is mandatory. For example, in this demo the controller is named as "RelationalController".

Next, remove all the existing methods such as "Get", "Post", "Put" and "Delete" present inside RelationalController.cs file.

C#

```
namespace PivotChartDemo
{
public class RelationalController: ApiController
{
}
}
```

Adding the List of Namespaces

The following are the list of namespaces to be added on top of the main class inside RelationalController.cs file.

C#

```
using Syncfusion.JavaScript;
using Syncfusion.PivotAnalysis.Base;
namespace PivotChartDemo
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
{
public class RelationalController : ApiController
{
}
}
```

Datasource Initialization

A simple collection is provided as a datasource for the PivotChart in this demo section. This datasource is placed inside a separate class “ProductSales” in RelationalController.cs file. Refer to the following code example.

C#

```
namespace PivotChartDemo {
//....
//....
internal class ProductSales
{
public string Product
{
get;
set;
}
public string Date
{
get;
set;
}
public string Country
{
get;
set;
}
public string State
{
get;
set;
}
public int Quantity
{
get;
set;
}
public double Amount
{
get;
set;
}
public static ProductSalesCollection GetSalesData()
{
/// Geography
string[] countries = new string[] { "Australia", "Canada", "France",
"Germany", "United Kingdom", "United States" };
string[] ausStates = new string[] { "New South Wales", "Queensland",
"South Australia", "Tasmania", "Victoria" };
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
string[] canadaStates = new string[] { "Alberta", "British Columbia",
"Brunswick", "Manitoba", "Ontario", "Quebec" };
string[] franceStates = new string[] { "Charente-Maritime", "Essonne",
"Garonne (Haute)", "Gers" };
string[] germanyStates = new string[] { "Bayern", "Brandenburg",
"Hamburg", "Hessen", "Nordrhein-Westfalen", "Saarland" };
string[] ukStates = new string[] { "England" };
string[] ussStates = new string[] { "New York", "North Carolina",
"Alabama", "California", "Colorado", "New Mexico", "South Carolina" };
/// Time
string[] dates = new string[] { "FY 2005", "FY 2006", "FY 2007", "FY
2008", "FY 2009" };
/// Products
string[] products = new string[] { "Bike", "Van", "Car" };
Random r = new Random(123345345);
int numberOfRecords = 2000;
ProductSalesCollection listOfProductSales = new ProductSalesCollection();
for (int i = 0; i < numberOfRecords; i++)
{
ProductSales sales = new ProductSales();
sales.Country = countries[r.Next(1, countries.GetLength(0))];
sales.Quantity = r.Next(1, 12);
/// 1 percent discount for 1 quantity
double discount = (30000 * sales.Quantity) *
(double.Parse(sales.Quantity.ToString()) / 100);
sales.Amount = (30000 * sales.Quantity) - discount;
sales.Date = dates[r.Next(r.Next(dates.GetLength(0) + 1))];
sales.Product = products[r.Next(r.Next(products.GetLength(0) + 1))];
switch (sales.Product)
{
case "Car":
{
sales.Date = "FY 2005";
break;
}
}
switch (sales.Country)
{
case "Australia":
{
sales.State = ausStates[r.Next(ausStates.GetLength(0))];
break;
}
case "Canada":
{
sales.State = canadaStates[r.Next(canadaStates.GetLength(0))];
break;
}
case "France":
{
sales.State = franceStates[r.Next(franceStates.GetLength(0))];
break;
}
case "Germany":
{
sales.State = germanyStates[r.Next(germanyStates.GetLength(0))];
break;
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
}
case "United Kingdom":
{
sales.State = ukStates[r.Next(ukStates.GetLength(0))];
break;
}
case "United States":
{
sales.State = ussStates[r.Next(ussStates.GetLength(0))];
break;
}
}
listOfProductSales.Add(sales);
}
return listOfProductSales;
}
public override string ToString()
{
return string.Format("{0}-{1}-{2}", this.Country, this.State,
this.Product);
}
public class ProductSalesCollection : List<ProductSales> { }
}
}
```

Service methods in WebAPI Controller

Define the service methods inside RelationalController class, found inside RelationalController.cs file, created while adding WebAPI Controller Class to the Application.

C#

```
namespace PivotChartDemo {
public class RelationalController: ApiController {
PivotChart pivotChart = new PivotChart();
[System.Web.Http.ActionName("InitializeChart")]
[System.Web.Http.HttpPost]
public Dictionary<string, object> InitializeChart(Dictionary<string,
object> jsonResult)
{
this.BindData();
return pivotChart.GetJsonData(jsonResult["action"].ToString(),
ProductSales.GetSalesData());
}
[System.Web.Http.ActionName("DrillChart")]
[System.Web.Http.HttpPost]
public Dictionary<string, object> DrillChart(Dictionary<string, object>
jsonResult)
{
this.BindData();
return pivotChart.GetJsonData(jsonResult["action"].ToString(),
ProductSales.GetSalesData(), jsonResult["drilledSeries"].ToString());
}
private void BindData()
{
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
this.pivotChart.PivotEngine.PivotRows.Add(new PivotItem {
FieldMappingName = "Country", FieldHeader = "Country", TotalHeader =
"Total" });
this.pivotChart.PivotEngine.PivotRows.Add(new PivotItem {
FieldMappingName = "State", FieldHeader = "State", TotalHeader = "Total"
});
this.pivotChart.PivotEngine.PivotColumns.Add(new PivotItem {
FieldMappingName = "Product", FieldHeader = "Product", TotalHeader =
"Total" });
this.pivotChart.PivotEngine.PivotCalculations.Add(new
PivotComputationInfo { CalculationName = "Amount", Description =
"Amount", FieldHeader = "Amount", FieldName = "Amount", Format = "C",
SummaryType = Syncfusion.PivotAnalysis.Base.SummaryType.DoubleTotalSum
});
}
}
.....
..... // Datasource initialization
.....
}
```

Configure routing in WebAPIConfig Class

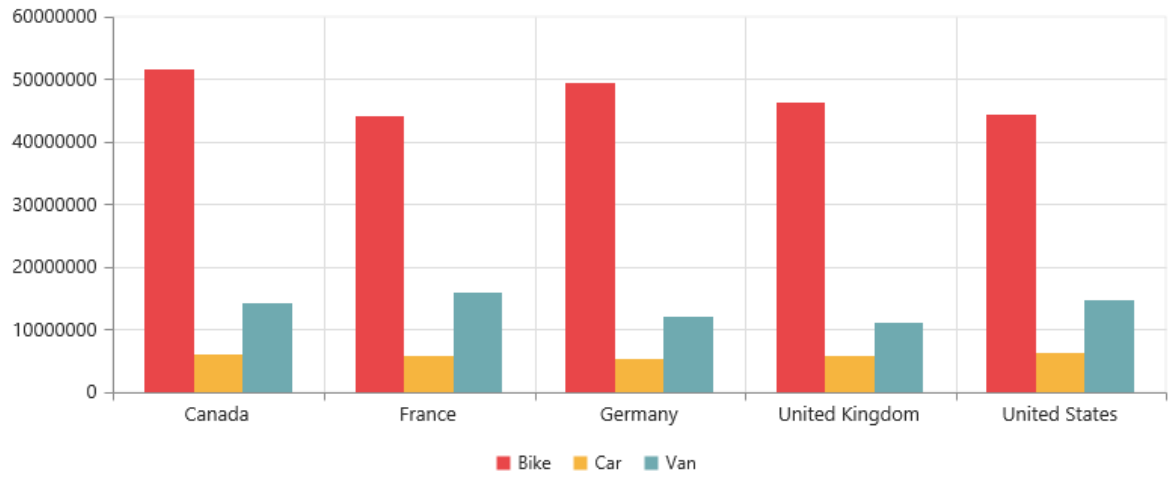
Open the WebAPIConfig.cs file found in **App_Start** folder. Then routing could be configured as shown in the following code example.

C#

```
public static class WebApiConfig
{
public static void Register(HttpConfiguration config)
{
config.Routes.MapHttpRoute(
name: "DefaultApi",
routeTemplate: "{controller}/{action}/{id}",
defaults: new { id = RouteParameter.Optional }
);
}
}
```

Now, **PivotChart** will be rendered with amount over a set of products across different customer geographic locations.

Copyright © 2001 - 2020 Syncfusion Inc.



WCF

This section demonstrates the utilization of WCF service as endpoint binding Relational datasource to a simple PivotChart. For more details on this topic, click here.

Getting Started

Important

Starting with v16.2.0.x, if you refer to Syncfusion assemblies from trial setup or from the NuGet feed, include a license key in your projects. Refer to this link to learn about registering Syncfusion license key in your ASP.NET Core application to use our components.

Creating a simple application with PivotChart and OLAP datasource (Client Mode)

This section covers the information required to populate a simple PivotChart with OLAP data completely on the client-side.

Project Initialization

Create a new **ASP.NET MVC Web Application** using Visual Studio IDE and name the project as **"PivotChartDemo"**.

Select the View engine as **'Razor'** and Project template as **'Internet Application'** and finally click **OK** button to create an application.

Now add the following dependency libraries as references into your MVC Web Application. In order to add them to your application, right-click on **References** in Solution Explorer and select Add Reference. Now in the **Reference Manager** dialog, under **Assemblies > Extension**, the following Syncfusion libraries will be found.

- Syncfusion.EJ
- Syncfusion.EJ.Export
- Syncfusion.EJ.Pivot
- Syncfusion.EJ.MVC

The version of Syncfusion libraries based on .NET Framework and MVC version are classified below. For example, version is illustrated as,

Copyright © 2001 - 2020 Syncfusion Inc.

MVC Version	MVC Version of Syncfusion assembly	Base Version of Syncfusion assembly	System.Web.Mvc	System.Web.WebPages
MVC3	{{ site.mvc3releaseversion }}	{{ site.35esreleaseversion }}	3.0	1.0
MVC4	{{ site.mvc4releaseversion }}	{{ site.40esreleaseversion }}	4.0	2.0
MVC5	{{ site.mvc5releaseversion }}	{{ site.45esreleaseversion }}	5.0	3.0

Register the referred assemblies in Web.config files available inside Views folder and also at the root of the application.

XML

```
<compilation debug="true" targetFramework="4.0">
<assemblies>
……
……
<add assembly="Syncfusion.EJ, Version= {{ site.40esreleaseversion }},
Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.EJ.Pivot, Version= {{ site.40esreleaseversion
}}, Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.EJ.Export, Version= {{ site.40esreleaseversion
}}, Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.EJ.Mvc, Version= {{ site.40esreleaseversion }},
Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
</assemblies>
</compilation>
```

Register the required namespaces in Web.config files available inside Views folder and also at the root of the application

XML

```
<namespaces>
……
……
<add namespace="Syncfusion.MVC.EJ" />
<add namespace="Syncfusion.JavaScript" />
</namespaces>
```

Note: Registering assemblies and namespaces earlier helps to include the control in view page with the help of intellisense.

Set the **UnobtrusiveJavaScriptEnabled** property to false under **appSettings** tag in Web.config file at the root folder.

Copyright © 2001 - 2020 Syncfusion Inc.

XML

```
<configuration>
……
……
<appSettings>
……
……
<add key="UnobtrusiveJavaScriptEnabled" value="false" />
</appSettings>
</configuration>
```

Scripts and CSS Initialization

The scripts and style sheets that are mandatorily required to render PivotChart control in a MVC Web Application are mentioned in an appropriate order below:

1. ej.web.all.min.css
2. jQuery-3.0.0.min.js
3. ej.web.all.min.js

Click here here to know more about scripts and style sheets available online (CDN Link).

Scripts and style sheets are referred under the <head> tag in **_Layout.cshtml** file which is found inside **Views > Shared folder.**

ASPX-CS

```
<head>
<link href="http://cdn.syncfusion.com/{{ site.releaseversion
}}/js/web/flat-azure/ej.web.all.min.css" rel="stylesheet" type="text/css"
/>
<script src="http://cdn.syncfusion.com/js/assets/external/jquery-
3.0.0.min.js" type="text/javascript"></script>
<script src="http://cdn.syncfusion.com/{{ site.releaseversion
}}/js/web/ej.web.all.min.js" type="text/javascript"></script>
</head>
```

The script manager is initialized immediately after the RenderBody() function call in **_Layout.cshtml** file in-order to generate control related scripts.

ASPX-CS

```
<body>
……
……
@RenderBody()
@(Html.EJ().ScriptManager())
</body>
```

Initialize PivotChart

Before initializing, empty the contents of Index.cshtml file under Views > Home folder and add the following codes.

ASPX-CS

Copyright © 2001 - 2020 Syncfusion Inc.

```
@using Syncfusion.JavaScript;
@Html.EJ().Pivot().PivotChart("PivotChart1")
<style>
#PivotChart1 {
width:950px;
height:460px;
}
</style>
```

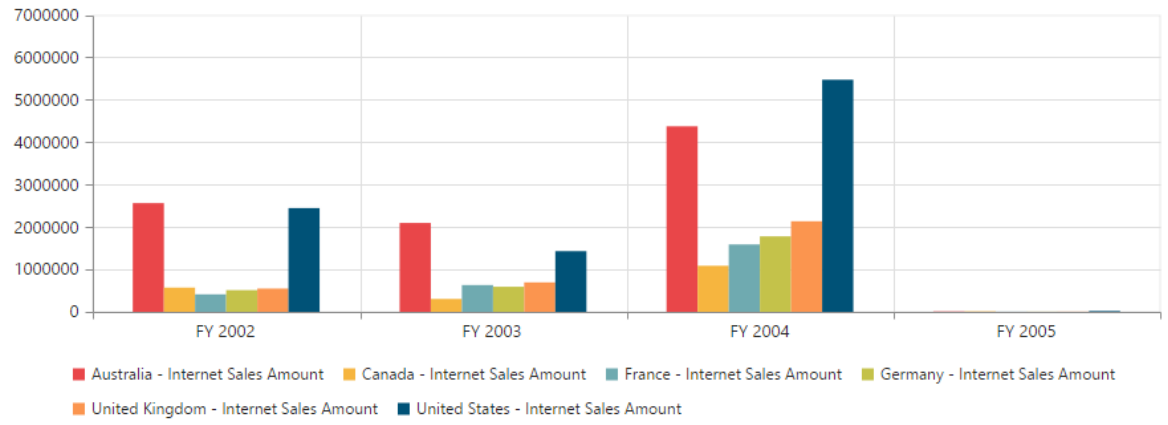
Populate PivotChart With DataSource

Initializes the OLAP datasource for PivotChart control as shown below.

HTML

```
@Html.EJ().Pivot().PivotChart("PivotChart1").DataSource(dataSource =>
dataSource.Rows(rows=>{rows.FieldName("[Date].[Fiscal]").Add();}).Columns
(columns=>{columns.FieldName("[Customer].[Customer
Geography]").Add();}).Values(values => { values.Measures(measures => {
measures.FieldName("[Measures].[Internet Sales Amount]").Add();
}).Axis(AxisName.Column).Add();}).Data("https://bi.syncfusion.com/olap/ms
mdpump.dll").Catalog("Adventure Works DW 2008 SE").Cube("Adventure
Works")).Size(size=>size.Height("460px").Width("950px"))
```

The above code will generate a simple PivotChart with "Fiscal" field in Row, "Customer Geography" field in Column and "Internet Sales Amount" field in Value section.



Creating a simple application with PivotChart and OLAP datasource (Server Mode)

This section covers the information required to create a simple PivotChart bound to OLAP datasource from server-side.

Note: ASP.NET MVC Web Application will contain a service that transfers data to server-side, processes and returns back to client-side for control rendering and re-rendering. The service utilized for communication could be either WCF or WebAPI based on user requirement.

Project Initialization

Create a new **ASP.NET MVC Web Application** using Visual Studio IDE and name the project as **"PivotChartDemo"**.

Copyright © 2001 - 2020 Syncfusion Inc.

Select the View engine as **'Razor'** and Project template as **'Internet Application'** and finally click **OK** button to create an application.

Now add the following dependency libraries as references into your MVC Web Application. In order to add them to your application, right-click on **References** in Solution Explorer and select **Add Reference**. Now in the **Reference Manager** dialog, under **Assemblies > Extension**, the following Syncfusion libraries will be found.

Note: If you have installed any version of SQL Server Analysis Service (SSAS) or Microsoft ADOMD.NET utility, then the location of Microsoft.AnalysisServices.AdomdClient library is [system drive:\Program Files (x86)\Microsoft.NET\ADOMD.NET]. And if you have installed any version of Essential Studio, then the location of Syncfusion libraries is [system drive:\Program Files (x86)\Syncfusion\Essential Studio\{{ site.releaseversion }}\Assemblies].

- Microsoft.AnalysisServices.AdomdClient
- Syncfusion.Compression.Base
- Syncfusion.Linq.Base
- Syncfusion.Olap.Base
- Syncfusion.PivotAnalysis.Base
- Syncfusion.XlsIO.Base
- Syncfusion.Pdf.Base
- Syncfusion.DocIO.Base
- Syncfusion.EJ
- Syncfusion.EJ.Export
- Syncfusion.EJ.Pivot
- Syncfusion.EJ.MVC

The version of Syncfusion libraries based on .NET Framework and MVC version are classified below. For example, version is illustrated as,

MVC Version	MVC Version of Syncfusion assembly	Base Version of Syncfusion assembly	System.Web.Mvc	System.Web.WebPages
MVC3	{{ site.mvc3releaseversion }}	{{ site.35esreleaseversion }}	3.0	1.0
MVC4	{{ site.mvc4releaseversion }}	{{ site.40esreleaseversion }}	4.0	2.0
MVC5	{{ site.mvc5releaseversion }}	{{ site.45esreleaseversion }}	5.0	3.0

Register the referred assemblies in Web.config files available inside Views folder and also at the root of the application.

XML

Copyright © 2001 - 2020 Syncfusion Inc.

```
<compilation debug="true" targetFramework="4.0">
<assemblies>
……
……
<add assembly="Syncfusion.EJ, Version= {{ site.40esreleaseversion }},
Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.EJ.Pivot, Version= {{ site.40esreleaseversion
}}, Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.EJ.Export, Version= {{ site.40esreleaseversion
}}, Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.EJ.Mvc, Version= {{ site.40esreleaseversion }},
Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
</assemblies>
</compilation>
```

Register the required namespaces in Web.config files available inside Views folder and also at the root of the application

XML

```
<namespaces>
……
……
<add namespace="Syncfusion.MVC.EJ" />
<add namespace="Syncfusion.JavaScript" />
</namespaces>
```

Note: Registering assemblies and namespaces earlier helps to include the control in view page with the help of intellisense.

Set the **UnobtrusiveJavaScriptEnabled** property to false under **appSettings** tag in Web.config file at the root folder.

XML

```
<configuration>
……
……
<appSettings>
……
……
<add key="UnobtrusiveJavaScriptEnabled" value="false" />
</appSettings>
</configuration>
```

Scripts and CSS Initialization

The scripts and style sheets that are mandatorily required to render PivotChart control in a MVC Web Application are mentioned in an appropriate order below:

1. ej.web.all.min.css
2. jQuery-3.0.0.min.js
3. ej.web.all.min.js

Copyright © 2001 - 2020 Syncfusion Inc.

Click here here to know more about scripts and style sheets available online (CDN Link).

Scripts and style sheets are referred under the **head** tag in **_Layout.cshtml** file which is found inside **Views > Shared folder.**

HTML

```
<head>
<link href="http://cdn.syncfusion.com/{{ site.releaseversion
}}/js/web/flat-azure/ej.web.all.min.css" rel="stylesheet" type="text/css"
/>
<script src="http://cdn.syncfusion.com/js/assets/external/jquery-
3.0.0.min.js" type="text/javascript"></script>
<script src="http://cdn.syncfusion.com/{{ site.releaseversion
}}/js/web/ej.web.all.min.js" type="text/javascript"></script>
</head>
```

The script manager is initialized immediately after the RenderBody() function call in **_Layout.cshtml** file in-order to generate control related scripts.

HTML

```
<body>
……
……
@RenderBody()
@(Html.EJ().ScriptManager())
</body>
```

Control Initialization

Before initializing, empty the contents of **Index.cshtml** file under **Views > Home** folder and add the following codes. Register the namespaces at the top of the page and then add the control.

HTML

```
@using Syncfusion.JavaScript;
@Html.EJ().Pivot().PivotChart("PivotChart1").Url(Url.Content("/Olap")).Si
ze(size=>size.Height("460px").Width("950px"))
<style>
#PivotChart1 {
width:950px;
height:460px;
}
</style>
```

The **“Url”** property in PivotChart control points the service endpoint, where data are processed and fetched in the form of JSON. The services used in PivotChart control as endpoint are WCF and WebAPI.

Note: The above "Index.cshtml" contains WebAPI URL, which is "/Olap". If WCF service is used as endpoint, the URL would look like "/OlapService.svc".

WebAPI

Adding a WebAPI Controller

Copyright © 2001 - 2020 Syncfusion Inc.

To add a WebAPI controller in your existing Web Application, right-click on the project in Solution Explorer and select **Add > New Item.** In the **Add New Item** window, select **WebAPI Controller Class** and name it as “OlapController.cs”, click **Add.**

Now WebAPI controller is added into your application successfully which in-turn comprise of the following file. The utilization of this file will be explained in the following sections.

- OlapController.cs

Note: While adding WebAPI Controller Class, name it with the suffix “Controller” that is mandatory. For example, in demo the controller is named as “OlapController”.

Next, remove all the existing methods such as “Get”, “Post”, “Put” and “Delete” present inside OlapController.cs file.

C#

```
namespace PivotChartDemo
{
public class OlapController : ApiController
{
}
}
```

List of Namespaces

Following are the list of namespaces to be added on top of the main class inside OlapController.cs file.

C#

```
using Syncfusion.Olap.Manager;
using Syncfusion.Olap.Reports;
using Syncfusion.JavaScript;
namespace PivotChartDemo
{
public class OlapController : ApiController
{
}
}
```

Datasource Initialization

Now, the connection string to connect OLAP Cube and PivotChart instances are created immediately inside the main class in OlapController.cs file.

C#

```
namespace PivotChartDemo
{
public class OlapController : ApiController
{
string connectionString = "Data
Source=https://bi.syncfusion.com/olap/msmdpump.dll; Initial
Catalog=Adventure Works DW 2008 SE;";
PivotChart pivotChart = new PivotChart();
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
//Other codes
}
}
```

Service methods in WebAPI Controller

Now you need to define the service methods inside OlapController class, found inside OlapController.cs file, created while adding WebAPI Controller Class to your Web Application.

C#

```
namespace PivotChartDemo
{
public class OlapController : ApiController
{
string connectionString = "Data
Source=https://bi.syncfusion.com/olap/msmdpump.dll; Initial
Catalog=Adventure Works DW 2008 SE;";
PivotChart pivotChart = new PivotChart();
[System.Web.Http.ActionName("InitializeChart")]
[System.Web.Http.HttpPost]
public Dictionary<string, object> InitializeChart(Dictionary<string,
object> jsonResult)
{
OlapDataManager DataManager = new OlapDataManager(connectionString);
DataManager.SetCurrentReport(CreateOlapReport());
return pivotChart.GetJsonData(jsonResult["action"].ToString(),
DataManager);
}
[System.Web.Http.ActionName("DrillChart")]
[System.Web.Http.HttpPost]
public Dictionary<string, object> DrillChart(Dictionary<string, object>
jsonResult)
{
OlapDataManager DataManager = new OlapDataManager(connectionString);
DataManager.SetCurrentReport(Syncfusion.JavaScript.Olap.Utils.Deserialize
OlapReport(jsonResult["olapReport"].ToString()));
return pivotChart.GetJsonData(jsonResult["action"].ToString(),
DataManager, jsonResult["drilledSeries"].ToString());
}
private OlapReport CreateOlapReport()
{
OlapReport olapReport = new OlapReport();
olapReport.Name = "Default Report";
olapReport.CurrentCubeName = "Adventure Works";
DimensionElement dimensionElementColumn = new DimensionElement();
//Specifying the Name for the Dimension Element
dimensionElementColumn.Name = "Customer";
dimensionElementColumn.AddLevel("Customer Geography", "Country");
MeasureElements measureElementColumn = new MeasureElements();
//Specifying the Name for the Measure Element
measureElementColumn.Elements.Add(new MeasureElement { Name = "Customer
Count" });
DimensionElement dimensionElementRow = new DimensionElement();
//Specifying the Dimension Name
dimensionElementRow.Name = "Date";
```

```
dimensionElementRow.AddLevel("Fiscal", "Fiscal Year");
///Adding Row Members
olapReport.SeriesElements.Add(dimensionElementRow);
///Adding Column Members
olapReport.CategoricalElements.Add(dimensionElementColumn);
///Adding Measure Element
olapReport.CategoricalElements.Add(measureElementColumn);
return olapReport;
}
}
}
```

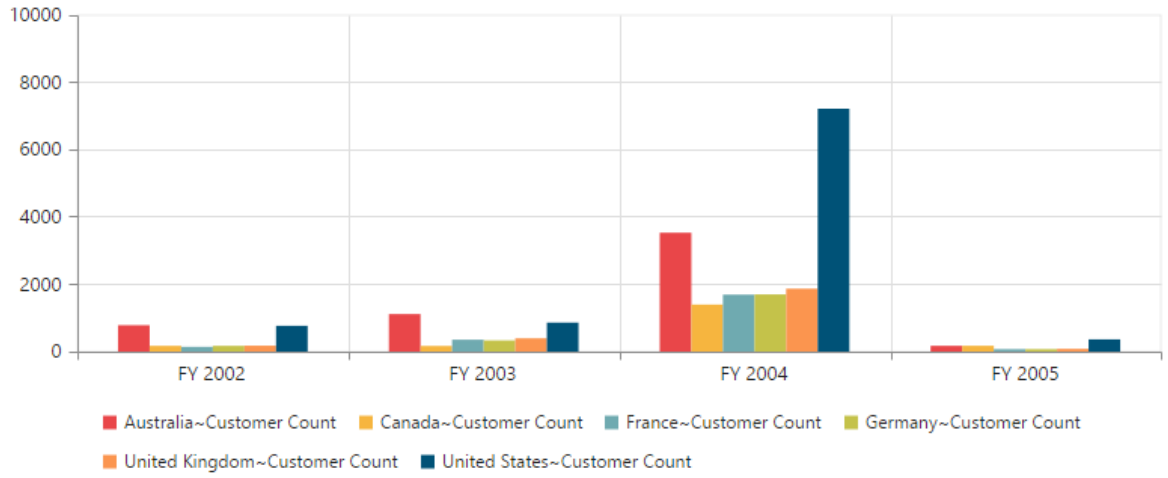
Configure routing in WebAPIConfig Class

Open the WebAPIConfig.cs file found in **App_Start** folder. Then routing could be configured as shown in the following code example.

C#

```
public static class WebApiConfig
{
public static void Register(HttpConfiguration config)
{
config.Routes.MapHttpRoute(
name: "DefaultApi",
routeTemplate: "{controller}/{action}/{id}",
defaults: new { id = RouteParameter.Optional }
);
}
}
```

Now, **PivotChart** is rendered with customer count over a period of fiscal years across different customer geographic locations.



WCF

This section demonstrates the utilization of WCF service as endpoint binding OLAP datasource to a simple PivotChart. For more details on this topic, click here.

Data Binding

Data Binding

Binding PivotChart to Collection

This section demonstrates binding of a collection to the PivotChart control as datasource. For more information on this datasource refer to the following links.

When you are using WebAPI controller, refer to the “Datasource Initialization” section under the following link.

If you are using WCF Service, refer the "Datasource Initialization" section below.

WCF

Adding a WCF Service

To add a WCF service in an existing MVC Application, right-click on the project in Solution Explorer and select **Add > New Item**. In the **Add New Item** window, select WCF Service and name it as RelationalService.svc, click **Add.**

Now, WCF service is added into the application successfully that comprises of the following files. The utilization of these files is explained in the immediate sections

- RelationalService.svc
- RelationalService.svc.cs
- IRelationalService.cs

Configuring WCF Service Class

Remove the “DoWork” method present inside both RelationalService.svc.cs and IRelationalService.cs files. Next, add “AspNetCompatibilityRequirements” attribute on top of main class present inside RelationalService.svc.cs and set **“RequirementsMode”** value to **“Allowed”**.

C#

```
namespace PivotChartDemo
{
[AspNetCompatibilityRequirements(RequirementsMode =
AspNetCompatibilityRequirementsMode.Allowed)]
public class RelationalService : IRelationalService
{
}
}
```

List of Dependency Libraries

Next you need to add the below mentioned dependency libraries into your Web Application. These libraries could be found in GAC (Global Assembly Cache) as well.

To add them to your Web Application, right-click on **References** in Solution Explorer and select **Add Reference**. Now in the **Reference Manager** dialog, under **Assemblies > Extension**, the following Syncfusion libraries are found.

Note: If you have installed any version of Essential Studio, then the location of Syncfusion libraries is [system drive:\Program Files (x86)\Syncfusion\Essential Studio\{{ site.releaseversion }}\Assemblies].

Copyright © 2001 - 2020 Syncfusion Inc.

- Syncfusion.Compression.Base
- Syncfusion.Linq.Base
- Syncfusion.Olap.Base
- Syncfusion.PivotAnalysis.Base
- Syncfusion.XlsIO.Base
- Syncfusion.Pdf.Base
- Syncfusion.DocIO.Base
- Syncfusion.EJ
- Syncfusion.EJ.Export
- Syncfusion.EJ.Pivot
- Syncfusion.EJ.MVC

List of Namespaces

Following are the list of namespaces to be added on top of the main class inside RelationalService.svc.cs file.

C#

```
using System.ServiceModel.Activation;
using Syncfusion.JavaScript;
using Syncfusion.PivotAnalysis.Base;
namespace PivotChartDemo
{
[AspNetCompatibilityRequirements(RequirementsMode =
AspNetCompatibilityRequirementsMode.Allowed)]
public class RelationalService : IRelationalService
{
}
}
```

Datasource Initialization

A simple collection is provided as a datasource for our PivotChart in this demo section. This datasource is placed inside a separate class named “ProductSales” in RelationalService.svc.cs file. Refer to the following code example.

C#

```
namespace PivotChartDemo
{
[AspNetCompatibilityRequirements(RequirementsMode =
AspNetCompatibilityRequirementsMode.Allowed)]
public class RelationalService : IRelationalService
{
//....
//....
}
internal class ProductSales
{
public string Product { get; set; }
public string Date { get; set; }
public string Country { get; set; }
public string State { get; set; }
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
public int Quantity { get; set; }
public double Amount { get; set; }
public static ProductSalesCollection GetSalesData()
{
/// Geography
string[] countries = new string[] { "Australia", "Canada", "France",
"Germany", "United Kingdom", "United States" };
string[] ausStates = new string[] { "New South Wales", "Queensland",
"South Australia", "Tasmania", "Victoria" };
string[] canadaStates = new string[] { "Alberta", "British Columbia",
"Brunswick", "Manitoba", "Ontario", "Quebec" };
string[] franceStates = new string[] { "Charente-Maritime", "Essonne",
"Garonne (Haute)", "Gers", };
string[] germanyStates = new string[] { "Bayern", "Brandenburg",
"Hamburg", "Hessen", "Nordrhein-Westfalen", "Saarland" };
string[] ukStates = new string[] { "England" };
string[] ussStates = new string[] { "New York", "North Carolina",
"Alabama", "California", "Colorado", "New Mexico", "South Carolina" };
/// Time
string[] dates = new string[] { "FY 2005", "FY 2006", "FY 2007", "FY
2008", "FY 2009" };
/// Products
string[] products = new string[] { "Bike", "Van", "Car" };
Random r = new Random(123345345);
int numberOfRecords = 2000;
ProductSalesCollection listOfProductSales = new ProductSalesCollection();
for (int i = 0; i < numberOfRecords; i++)
{
ProductSales sales = new ProductSales();
sales.Country = countries[r.Next(1, countries.GetLength(0))];
sales.Quantity = r.Next(1, 12);
/// 1 percent discount for 1 quantity
double discount = (30000 * sales.Quantity) *
(double.Parse(sales.Quantity.ToString()) / 100);
sales.Amount = (30000 * sales.Quantity) - discount;
sales.Date = dates[r.Next(r.Next(dates.GetLength(0) + 1))];
sales.Product = products[r.Next(r.Next(products.GetLength(0) + 1))];
switch (sales.Product)
{
case "Car":
{
sales.Date = "FY 2005";
break;
}
}
switch (sales.Country)
{
case "Australia":
{
sales.State = ausStates[r.Next(ausStates.GetLength(0))];
break;
}
case "Canada":
{
sales.State = canadaStates[r.Next(canadaStates.GetLength(0))];
break;
}
```

```
case "France":
{
sales.State = franceStates[r.Next(franceStates.GetLength(0))];
break;
}
case "Germany":
{
sales.State = germanyStates[r.Next(germanyStates.GetLength(0))];
break;
}
case "United Kingdom":
{
sales.State = ukStates[r.Next(ukStates.GetLength(0))];
break;
}
case "United States":
{
sales.State = ussStates[r.Next(ussStates.GetLength(0))];
break;
}
}
listOfProductSales.Add(sales);
}
return listOfProductSales;
}
public override string ToString()
{
return string.Format("{0}-{1}-{2}", this.Country, this.State,
this.Product);
}
public class ProductSalesCollection : List<ProductSales>
{
}
}
}
```

Service methods in WCF Service

First, you need to define the service methods inside IRelationalService interface, found in IRelationalService.cs file, created while adding WCF service to your Web Application.

C#

```
namespace PivotChartDemo
{
[ServiceContract]
public interface IRelationalService
{
[OperationContract]
Dictionary<string, object> InitializeChart(string action, string
currentReport, string customObject);
[OperationContract]
Dictionary<string, object> DrillChart(string action, string
drilledSeries);
}
}
```

Copyright © 2001 - 2020 Syncfusion Inc.

Secondly, you need to elaborate the service methods inside the main class, found in RelationalService.svc.cs file.

C#

```
namespace PivotChartDemo
{
[AspNetCompatibilityRequirements(RequirementsMode =
AspNetCompatibilityRequirementsMode.Allowed)]
public class RelationalService : IRelationalService
{
PivotChart pivotChart = new PivotChart();
public Dictionary<string, object> InitializeChart(string action, string
currentReport, string customObject)
{
this.BindData();
return pivotChart.GetJsonData(action, ProductSales.GetSalesData());
}
public Dictionary<string, object> DrillChart(string action, string
drilledSeries)
{
this.BindData();
return pivotChart.GetJsonData(action, ProductSales.GetSalesData(),
drilledSeries);
}
private void BindData()
{
this.pivotChart.PivotEngine.PivotRows.Add(new PivotItem {
FieldMappingName = "Country", FieldHeader = "Country", TotalHeader =
"Total" });
this.pivotChart.PivotEngine.PivotRows.Add(new PivotItem {
FieldMappingName = "State", FieldHeader = "State", TotalHeader = "Total"
});
this.pivotChart.PivotEngine.PivotRows.Add(new PivotItem {
FieldMappingName = "Date", FieldHeader = "Date", TotalHeader = "Total"
});
this.pivotChart.PivotEngine.PivotColumns.Add(new PivotItem {
FieldMappingName = "Product", FieldHeader = "Product", TotalHeader =
"Total" });
this.pivotChart.PivotEngine.PivotCalculations.Add(new
PivotComputationInfo { CalculationName = "Amount", Description =
"Amount", FieldHeader = "Amount", FieldName = "Amount", Format = "C",
SummaryType = Syncfusion.PivotAnalysis.Base.SummaryType.DoubleTotalSum
});
}
}
.....
..... // Datasource initialization
.....
}
```

Configuring Web Configuration File

Copyright © 2001 - 2020 Syncfusion Inc.

You can expose services through the properties such as binding, contract and address by using an endpoint.

1. Contract: This property indicates that the contract of the endpoint is exposing. Here you are referring to IRelationalService contract and hence it is PivotChartDemo.IRelationalService.
2. Binding: In your application, you use webHttpBinding to post and receive the requests and responses between the client-end and the service.
3. behaviorConfiguration: This property contains the name of the behavior to be used in the endpoint.

The endpointBehaviors are illustrated as follows.

XML

```
<system.serviceModel>
……
……
<services>
<service name="PivotChartDemo.RelationalService">
<endpoint address=""
behaviorConfiguration="PivotChartDemo.RelationalServiceAspNetAjaxBehavior
"
binding="webHttpBinding" contract="PivotChartDemo.IRelationalService" />
</service>
</services>
</system.serviceModel>
```

The endpointBehaviors contain all the behaviors for an endpoint. You can link each endpoint to the respective behavior only by using this name property.

XML

```
<system.serviceModel>
<behaviors>
<endpointBehaviors>
<behavior name="PivotChartDemo.RelationalServiceAspNetAjaxBehavior">
<enableWebScript />
</behavior>
</endpointBehaviors>
</behaviors>
……
……
</system.serviceModel>
```

Note: In this example, **“PivotChartDemo”** indicates the name and root namespace of the Web Application created in Visual Studio IDE and **“RelationalService”** indicates the name of the WCF service created.

Configuring routing file

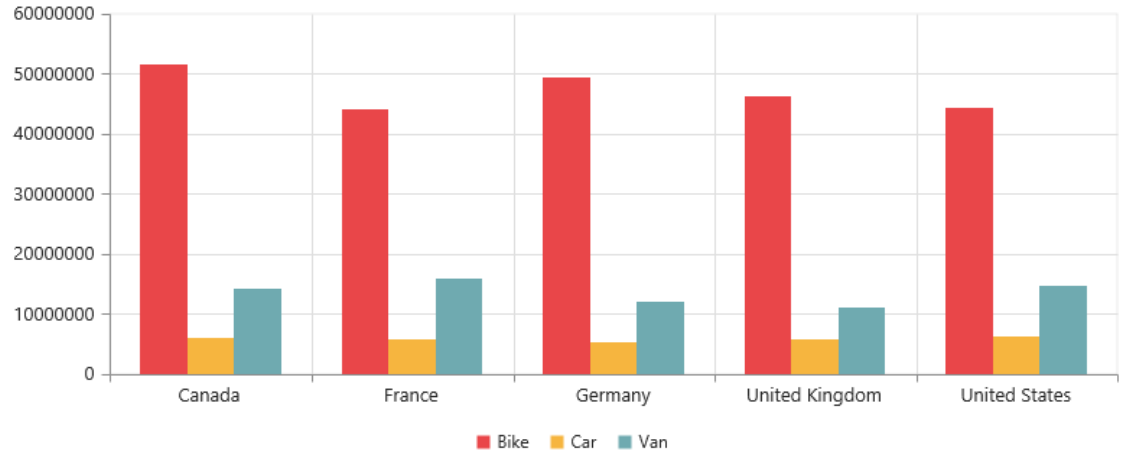
Routing configuration needs to be done in RouteConfig.cs file found under **AppStart** folder. The configuration would allow picking appropriate WCF service without any issues.

C#

Copyright © 2001 - 2020 Syncfusion Inc.

```
public static void RegisterRoutes(RouteCollection routes) {
routes.IgnoreRoute("{resource}.axd/{*pathInfo}");
routes.IgnoreRoute("{resource}.svc/{*pathInfo}");
routes.IgnoreRoute("{resource}.svc");
routes.MapRoute(
name: "Default",
url: "{controller}/{action}/{id}",
defaults: new { controller = "Home", action = "Index", id =
UrlParameter.Optional }
);
}
```

Now, **PivotChart** will be rendered as shown in the below figure.



DataBinding

Binding PivotChart to Offline Cube

To connect an OLAP Cube available in local machine, set the physical path of the Cube in the connection string. The following code example illustrates the same.

C#

```
string connectionString = @"DataSource = system
drive:\OfflineCube\Adventure_Works_Ext.cub; Provider = MSOLAP;";
OlapDataManager DataManager = new OlapDataManager(connectionString);
```

Binding PivotChart to Cube in local SQL Server

To connect an OLAP Cube available in SQL Server Analysis Service in local machine, set the server name and database name in the connection string. When you have any credentials to connect your Cube, then set the “User ID” and “Password” attributes accordingly. The following code example illustrates the same.

C#

```
string connectionString = "Data source=localhost; Initial
Catalog=Adventure Works DW;";
OlapDataManager DataManager = new OlapDataManager(connectionString);
```

Copyright © 2001 - 2020 Syncfusion Inc.

Binding PivotChart to Cube in online SQL Server

To connect an OLAP Cube available in SQL Server Analysis Service in online server through **XML/A**, set the host server link and database name in the connection string. When you have any credentials to connect your Cube, then set the “User ID” and “Password” attributes accordingly. The following code example illustrates the same.

C#

```
string connectionString = "Data
Source=https://bi.syncfusion.com/olap/msmdpump.dll; Initial
Catalog=Adventure Works DW 2008 SE;";
OlapDataManager DataManager = new OlapDataManager(connectionString);
```

Binding PivotChart to Cube in online Mondrian Server

To connect an OLAP Cube available in Mondrian Server through **XML/A**, set the host server link and database name in the connection string. When you have any credentials to connect your Cube, then set the “User ID” and “Password” attributes accordingly. The following code example illustrates the same.

C#

```
string connectionString = @"Data Source =
https://localhost:8080/mondrian/xmla; Initial Catalog =FoodMart;";
OlapDataManager DataManager = new OlapDataManager(connectionString);
DataManager.DataProvider.ProviderName =
Syncfusion.Olap.DataProvider.Providers.Mondrian;
```

Binding PivotChart to Cube in online ActivePivot Server

To connect an OLAP Cube available in ActivePivot Server through **XML/A**, set the host server link and database name in the connection string. When you have any credentials to connect your Cube, then set the “User ID” and “Password” attributes accordingly. The following code example illustrates the same.

C#

```
string connectionString = @"Data Source =
https://localhost:8080/cva_s/xmla; Initial Catalog = CVAS;";
OlapDataManager DataManager = new OlapDataManager(connectionString);
DataManager.DataProvider.ProviderName=Syncfusion.Olap.DataProvider.Provid
ers.ActivePivot;
```

WCF

Adding a WCF Service

To add a WCF service in an existing web application, right-click on the project in Solution Explorer and select **Add > New Item**. In the **Add New Item** window, select WCF Service and name it as **“OlapService.svc”**, click **Add**.

Now WCF service is added into your application successfully which in-turn comprise of the following files. The utilization of these files will be explained in the immediate sections.

- OlapService.svc
- OlapService.svc.cs
- IOlapService.cs

Copyright © 2001 - 2020 Syncfusion Inc.

Configuring WCF Service Class

Remove the “DoWork” method present inside both OlapService.svc.cs and IOlapService.cs files. Next, add “AspNetCompatibilityRequirements” attribute on top of main class present inside OlapService.svc.cs and set “RequirementsMode” value to “Allowed”.

C#

```
namespace PivotChartDemo
{
[AspNetCompatibilityRequirements(RequirementsMode =
AspNetCompatibilityRequirementsMode.Allowed)]
public class OlapService : IOlapService
{
}
}
```

List of Dependency Libraries

Next you need to add the below mentioned dependency libraries into your Web Application. These libraries could be found in GAC (Global Assembly Cache) as well.

To add them to your Web Application, right-click on **References** in Solution Explorer and select **Add Reference**. Now in the **Reference Manager** dialog, under **Assemblies > Extension**, the following Syncfusion libraries are found.

Note: If you have installed any version of SQL Server Analysis Service (SSAS) or Microsoft ADOMD.NET utility, then the location of Microsoft.AnalysisServices.AdomdClient library is [system drive:\Program Files (x86)\Microsoft.NET\ADOMD.NET]. And if you have installed any version of Essential Studio, then the location of Syncfusion libraries is [system drive:\Program Files (x86)\Syncfusion\Essential Studio\{{ site.releaseversion }}\Assemblies].

- Microsoft.AnalysisServices.AdomdClient
- Syncfusion.Compression.Base
- Syncfusion.Linq.Base
- Syncfusion.Olap.Base
- Syncfusion.PivotAnalysis.Base
- Syncfusion.XlsIO.Base
- Syncfusion.Pdf.Base
- Syncfusion.DocIO.Base
- Syncfusion.EJ
- Syncfusion.EJ.Export
- Syncfusion.EJ.Pivot
- Syncfusion.EJ.MVC

List of Namespaces

Following are the list of namespaces to be added on top of the main class inside OlapService.svc.cs file.

C#

```
using System.ServiceModel.Activation;
using Syncfusion.Olap.Manager;
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
using Syncfusion.Olap.Reports;
using Syncfusion.JavaScript;
using System.Collections.Generic;
namespace PivotChartDemo
{
[AspNetCompatibilityRequirements(RequirementsMode =
AspNetCompatibilityRequirementsMode.Allowed)]
public class OlapService : IOlapService
{
}
}
```

Datasource Initialization

Now the connection string to connect OLAP Cube and PivotChart instances are created immediately inside the main class in OlapService.svc.cs file.

C#

```
namespace PivotChartDemo
{
[AspNetCompatibilityRequirements(RequirementsMode =
AspNetCompatibilityRequirementsMode.Allowed)]
public class OlapService : IOlapService
{
PivotChart pivotChart = new PivotChart();
string connectionString = "Data
Source=https://bi.syncfusion.com/olap/msmdpump.dll; Initial
Catalog=Adventure Works DW 2008 SE;";
//Other codes
}
}
```

Service methods in WCF Service

First, you need to define the service methods inside IOlapService interface, found in IOlapService.cs file, created while adding WCF Service to your Web Application.

C#

```
namespace PivotChartDemo
{
[ServiceContract]
public interface IOlapService
{
[OperationContract]
Dictionary<string, object> InitializeChart(string action, string
customObject);
[OperationContract]
Dictionary<string, object> DrillChart(string action, string
drilledSeries, string olapReport, string customObject);
}
}
```

Copyright © 2001 - 2020 Syncfusion Inc.

Secondly, you need to elaborate the service methods inside the main class, found in OlapService.svc.cs file

C#

```
namespace PivotChartDemo
{
[AspNetCompatibilityRequirements(RequirementsMode =
AspNetCompatibilityRequirementsMode.Allowed)]
public class OlapService : IOlapService
{
PivotChart pivotChart = new PivotChart();
string connectionString = "Data
Source=https://bi.syncfusion.com/olap/msmdpump.dll; Initial
Catalog=Adventure Works DW 2008 SE;";
public Dictionary<string, object> InitializeChart(string action, string

Configuring Web Configuration File

You can expose services through the properties such as binding, contract and address by using an endpoint.

- Contract: This property indicates that the contract of the endpoint is exposing. Here you are referring to **IOlapService** contract and hence it is **PivotChartDemo.IOlapService**.
- Binding: In your application, you use **webHttpBinding** to post and receive the requests and responses between the client-end and the service.
- behaviorConfiguration: This property contains the name of the behavior to be used in the endpoint.

The endpointBehaviors are illustrated as follows.

XML

```
<system.serviceModel>
……
……
<services>
<service name="PivotChartDemo.OlapService">
<endpoint address=""
behaviorConfiguration="PivotChartDemo.OlapServiceAspNetAjaxBehavior"
binding="webHttpBinding" contract="PivotChartDemo.IOlapService" />
</service>
</services>
</system.serviceModel>
```

The endpointBehaviors contain all the behaviors for an endpoint. You can link each endpoint to the respective behavior only by using this name property.

XML

```
<system.serviceModel>
<behaviors>
<endpointBehaviors>
<behavior name="PivotChartDemo.OlapServiceAspNetAjaxBehavior">
<enableWebScript />
</behavior>
</endpointBehaviors>
</behaviors>
……
……
</system.serviceModel>
```

Configuring routing file

Routing configuration needs to be done in RouteConfig.cs file found under **AppStart** folder. The configuration would allow picking appropriate WCF service without any issues.

C#

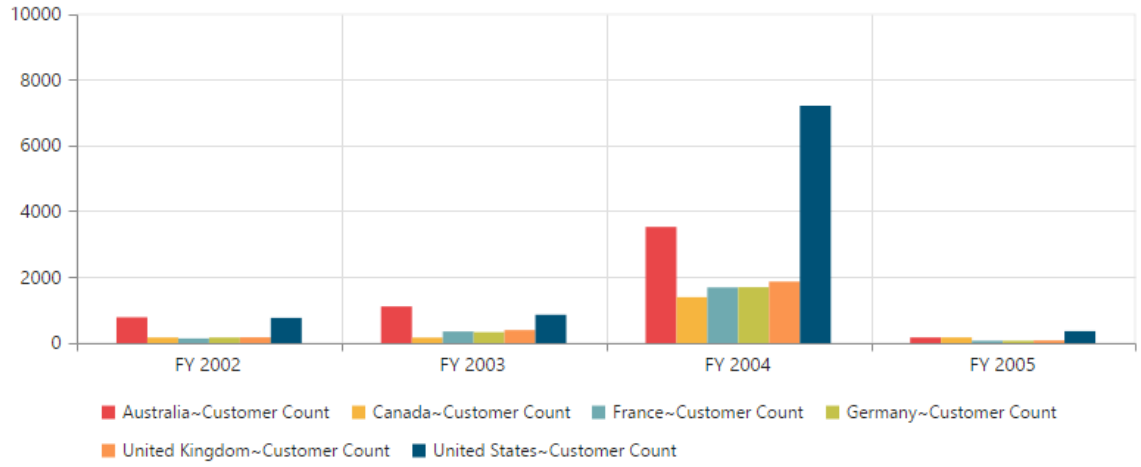
```
public static void RegisterRoutes(RouteCollection routes) {
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
routes.IgnoreRoute("{resource}.axd/{*pathInfo}");
routes.IgnoreRoute("{resource}.svc/{*pathInfo}");
routes.IgnoreRoute("{resource}.svc");
routes.MapRoute(
name: "Default",
url: "{controller}/{action}/{id}",
defaults: new { controller = "Home", action = "Index", id =
UrlParameter.Optional }
);
}
```

Note: In this example, “PivotChartDemo” indicates the name and root namespace of the Web Application created in Visual Studio IDE and “OlapService” indicates the name of the WCF service created.

Now, PivotChart is rendered with Customer Count over a period of fiscal years across different customer geographic locations.



Dimensions

Set size in percentage

You can customize the PivotChart dimension by setting the width and height of the control in percentage.

ASPX-CS

```
//Set size to Chart container
@Html.EJ().Pivot().PivotChart("PivotChart1").Url(Url.Content("/Relational
ChartService.svc")).Size(size => size.Height("80%").Width("80%"))
<style>
#PivotChart1 {
width:100%;
height:450px;
}
</style>
```

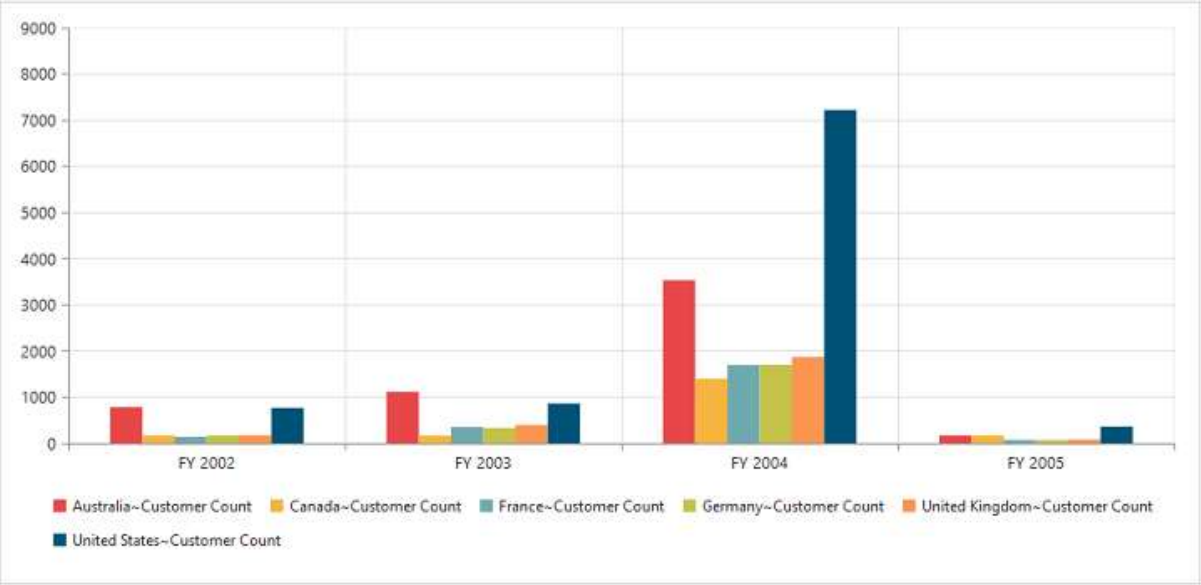
Copyright © 2001 - 2020 Syncfusion Inc.

Set size in pixels

You can customize the PivotChart dimension by setting the width and height of the control in pixels.

ASPX-CS

```
//Set size to Chart container
@Html.EJ().Pivot().PivotChart("PivotChart1").Url(Url.Content("/Relational
ChartService.svc")).Size(size => size.Height("460px").Width("950px"))
<style>
#PivotChart1 {
width:950px;
height:460px;
}
</style>
```



Responsive

PivotChart control supports responsive rendering based on the target device (desktop & tablet) resolution. It supports resolution upto 1024x600. You can enable responsiveness in PivotChart by setting IsResponsive property to true.

ASPX-CS

```
//Enable responsiveness to change the Chart size dynamically.
@Html.EJ().Pivot().PivotChart("PivotChart1").Url(Url.Content("/Relational
ChartService.svc")).Size(size =>
size.Height("460px").Width("950px")).IsResponsive(true)
<style>
#PivotChart1 {
min-height: 275px;
min-width: 525px;
height: 460px;
width: 100%;
}
</style>
```

Copyright © 2001 - 2020 Syncfusion Inc.

Chart Types

Essential **PivotChart MVC** supports 18 different types of chart as follows:

- Column
- Stacking Column
- Bar
- Stacking Bar
- Pie
- Pyramid
- Funnel

Copyright © 2001 - 2020 Syncfusion Inc.

- Line
- Step Line
- Spline
- Area
- Step Area
- Spline Area
- Stacking Area
- Doughnut
- Scatter
- Bubble
- WaterFall

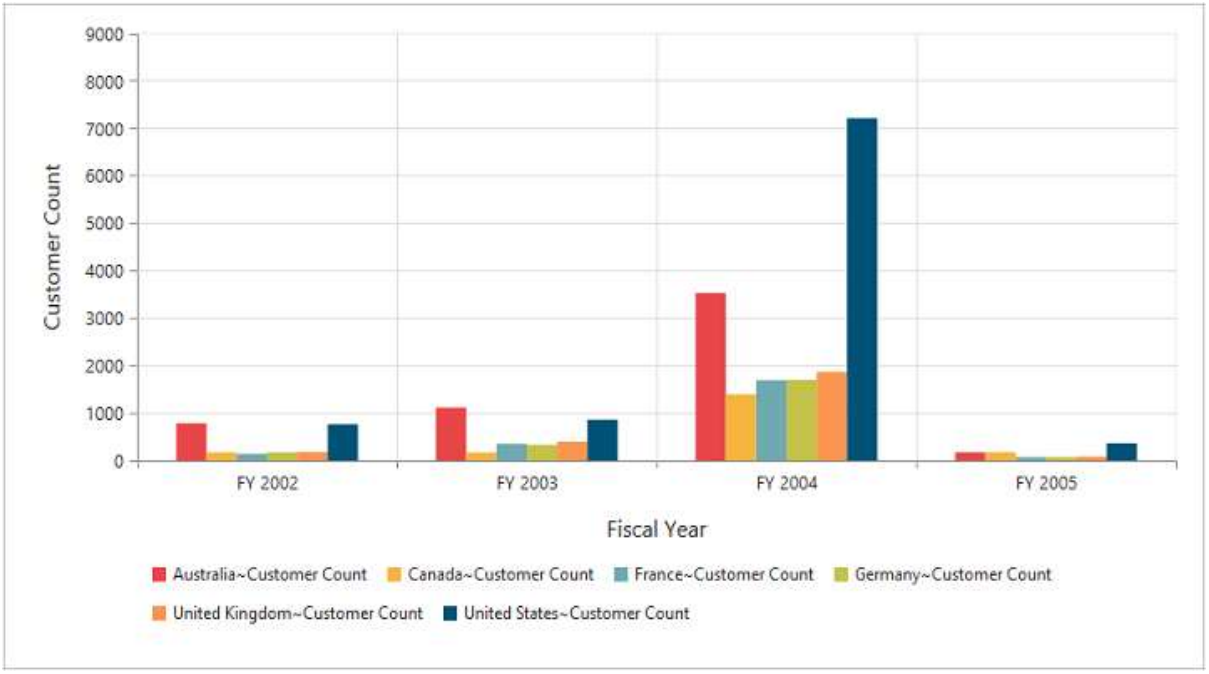
Column Chart

Column Chart is the most commonly used chart type. It uses vertical bars (called columns) to display different values of one or more items. Points from adjacent series are drawn as bars next to each other. It is used to compare the frequency, count, total or average of data in different categories. It is ideal to show the variations in the value of an item over a period of time.

ASPX-CS

```
@Html.EJ().Pivot().PivotChart("PivotChart1").Url(Url.Content("/Relational
ChartService.svc")).CommonSeriesOptions(comm => {
comm.Type(SeriesType.Column); }).Size(size =>
size.Height("460px").Width("950px"))
```

The following screenshot displays a **Column Chart**.



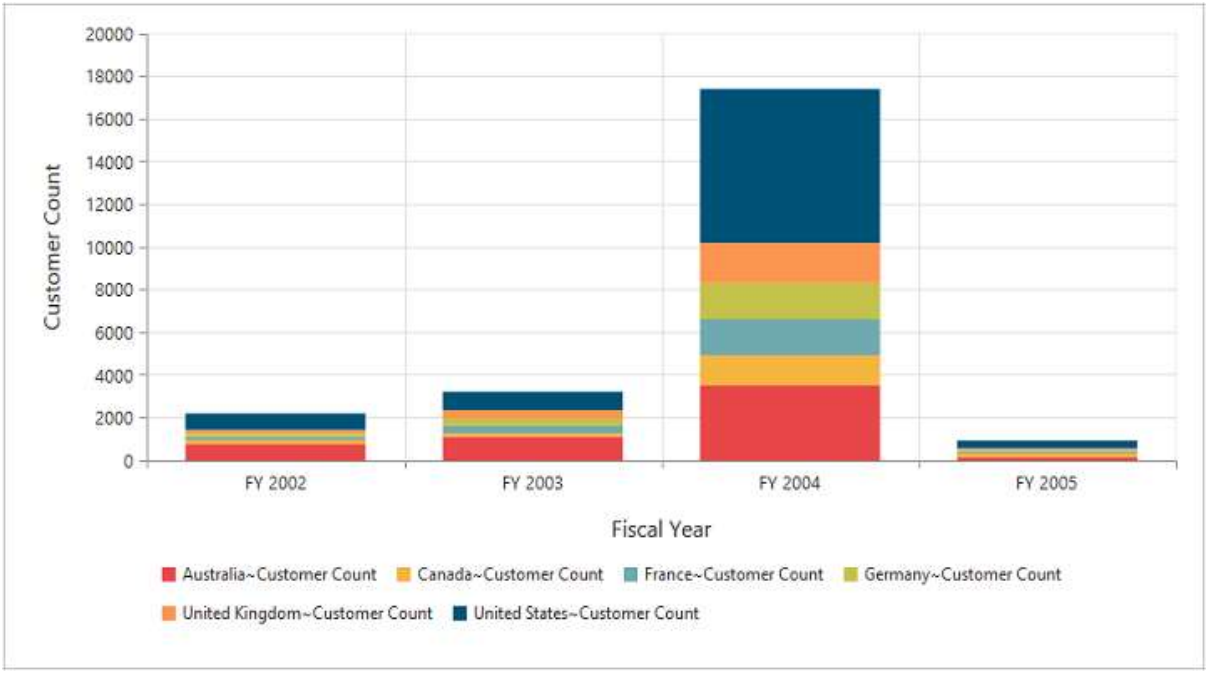
Stacking Column Chart

Stacking Column Chart is similar to column charts except the Y-values. These Y-values stack on top of each other in a specified series order. This helps to visualize the relationship of parts to whole across categories.

ASPX-CS

```
@Html.EJ().Pivot().PivotChart("PivotChart1").Url(Url.Content("/Relational
ChartService.svc")).CommonSeriesOptions(comm => {
comm.Type(SeriesType.StackingColumn); }).Size(size =>
size.Height("460px").Width("950px"))
```

The following screenshot displays the **stacking Column Chart**.



Bar Chart

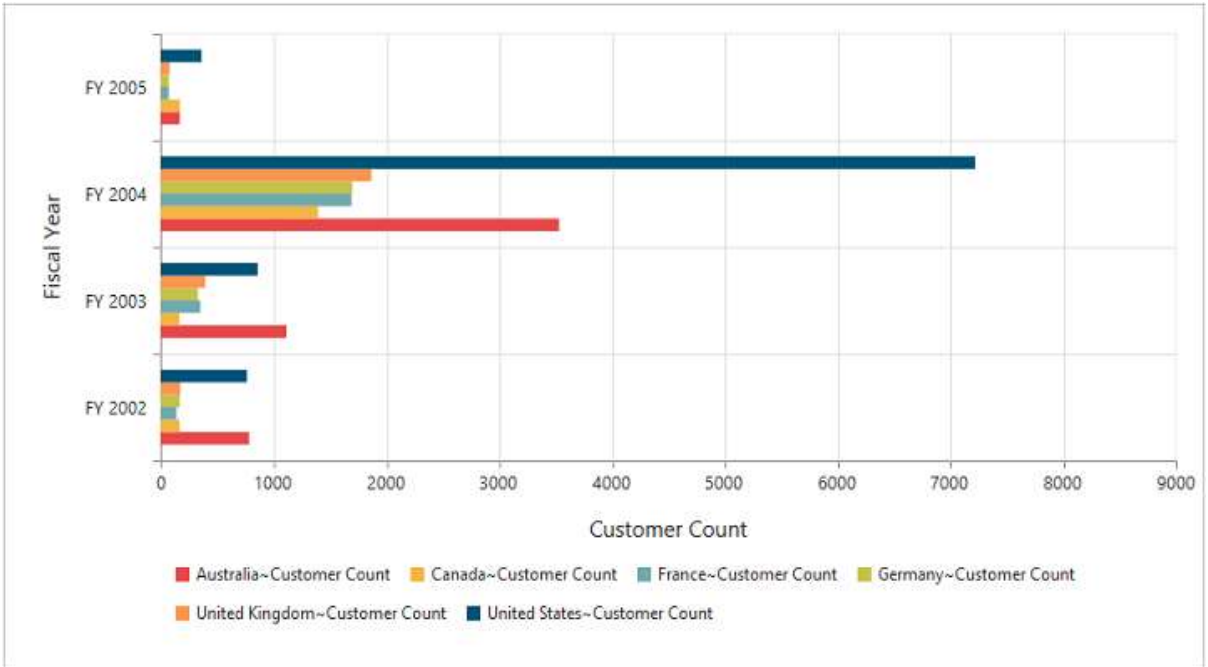
The **Bar Chart** displays horizontal bars for each point in the series and points from adjacent series. Bar charts are used to compare values across categories, for displaying the variations in the value of an item over time or for comparing the values of several items at a single point in time.

ASPX-CS

```
@Html.EJ().Pivot().PivotChart("PivotChart1").Url(Url.Content("/Relational
ChartService.svc")).CommonSeriesOptions(comm => {
comm.Type(SeriesType.Bar); }).Size(size =>
size.Height("460px").Width("950px"))
```

The following screenshot displays a **Bar Chart**.

Copyright © 2001 - 2020 Syncfusion Inc.



Stacking Bar Chart

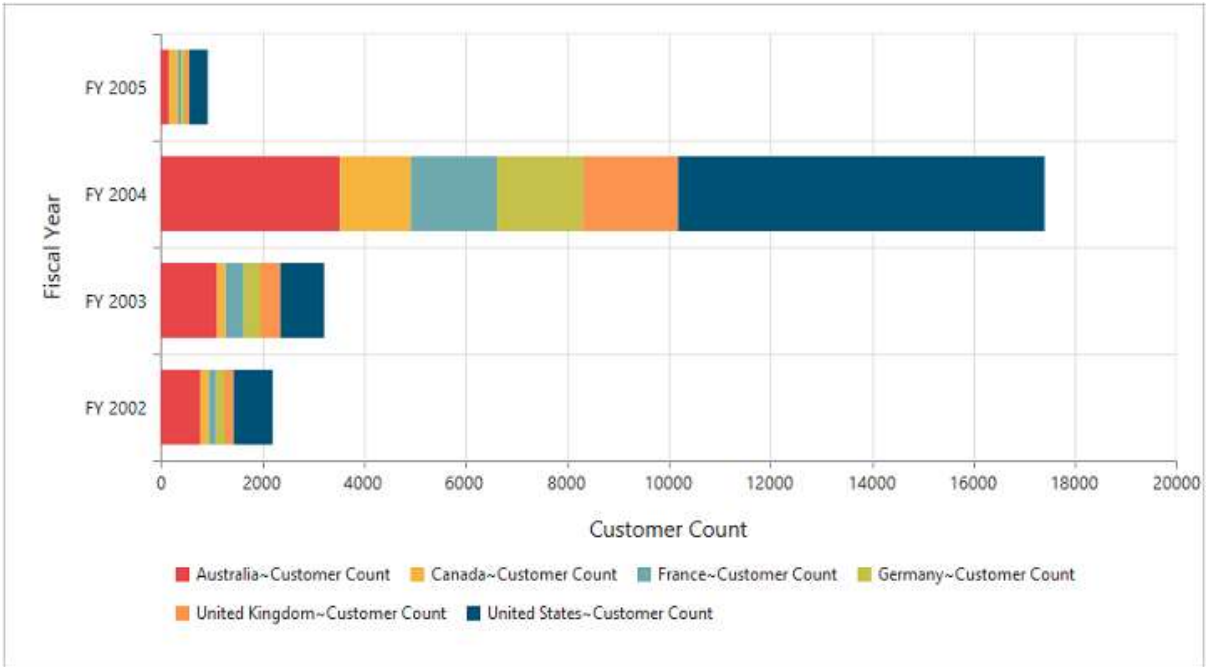
Stacking Bar Chart is a regular **bar** chart with the X-values stacked on top of each other in the specified series order.

ASPX-CS

```
@Html.EJ().Pivot().PivotChart("PivotChart1").Url(Url.Content("/Relational
ChartService.svc")).CommonSeriesOptions(comm => {
comm.Type(SeriesType.StackingBar); }).Size(size =>
size.Height("460px").Width("950px"))
```

The following screenshot displays the **Stacking Bar Chart**.

Copyright © 2001 - 2020 Syncfusion Inc.



Pie Chart

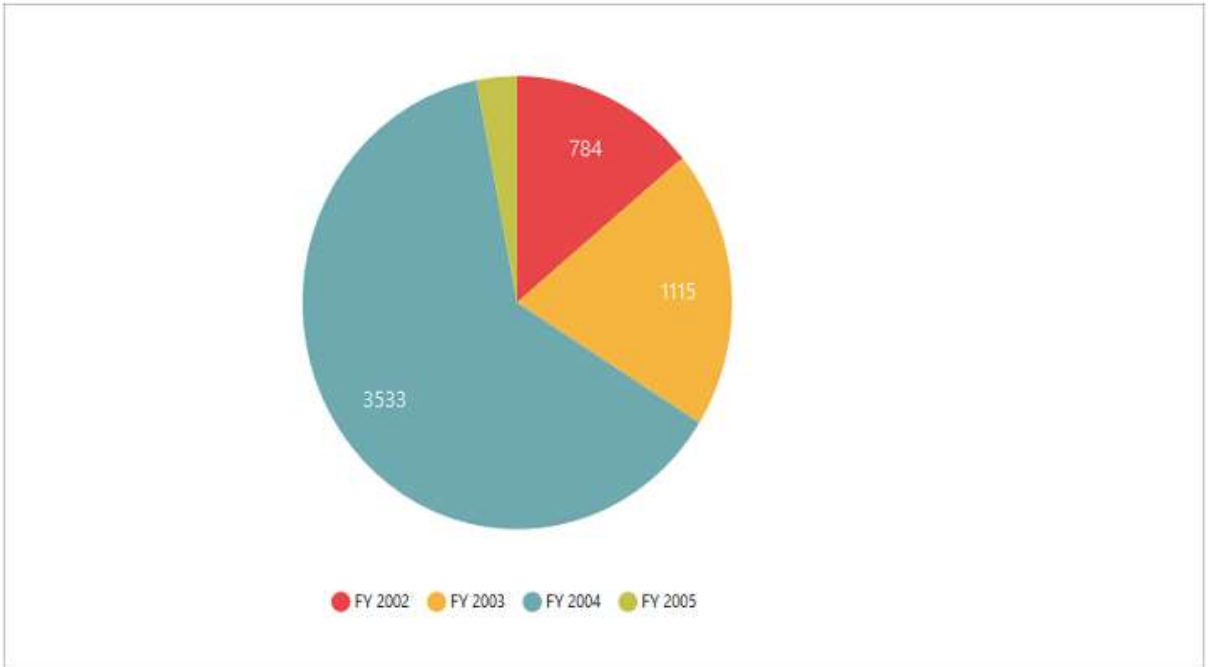
A **Pie chart** is used to summarize a set of categorical data or displaying different values of a given variable (e.g., percentage distribution). This type of chart is a circle divided into a series of segments. Each segment represents a particular category.

ASPX-CS

```
@Html.EJ().Pivot().PivotChart("PivotChart1").Url(Url.Content("/Relational
ChartService.svc")).CommonSeriesOptions(comm => {
comm.Type(SeriesType.Pie); }).Size(size =>
size.Height("460px").Width("950px"))
```

The following screenshot displays a **Pie Chart**.

Copyright © 2001 - 2020 Syncfusion Inc.



Pyramid Chart

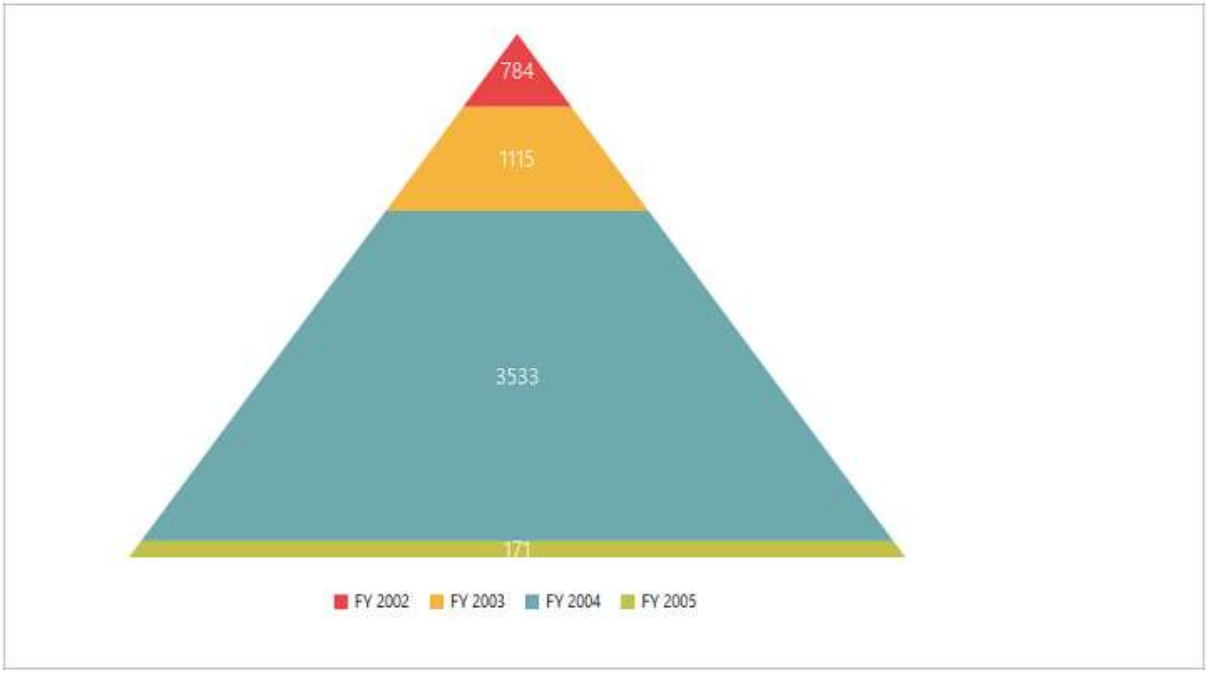
The **Pyramid Chart** type displays the data in the form of a triangle. It helps you to visualize data in a hierarchical structure without any axes.

ASPX-CS

```
@Html.EJ().Pivot().PivotChart("PivotChart1").Url(Url.Content("/Relational
ChartService.svc")).CommonSeriesOptions(comm => {
comm.Type(SeriesType.Pyramid); }).Size(size =>
size.Height("460px").Width("950px"))
```

The following screen shot displays the **Pyramid Chart**.

Copyright © 2001 - 2020 Syncfusion Inc.



Funnel Chart

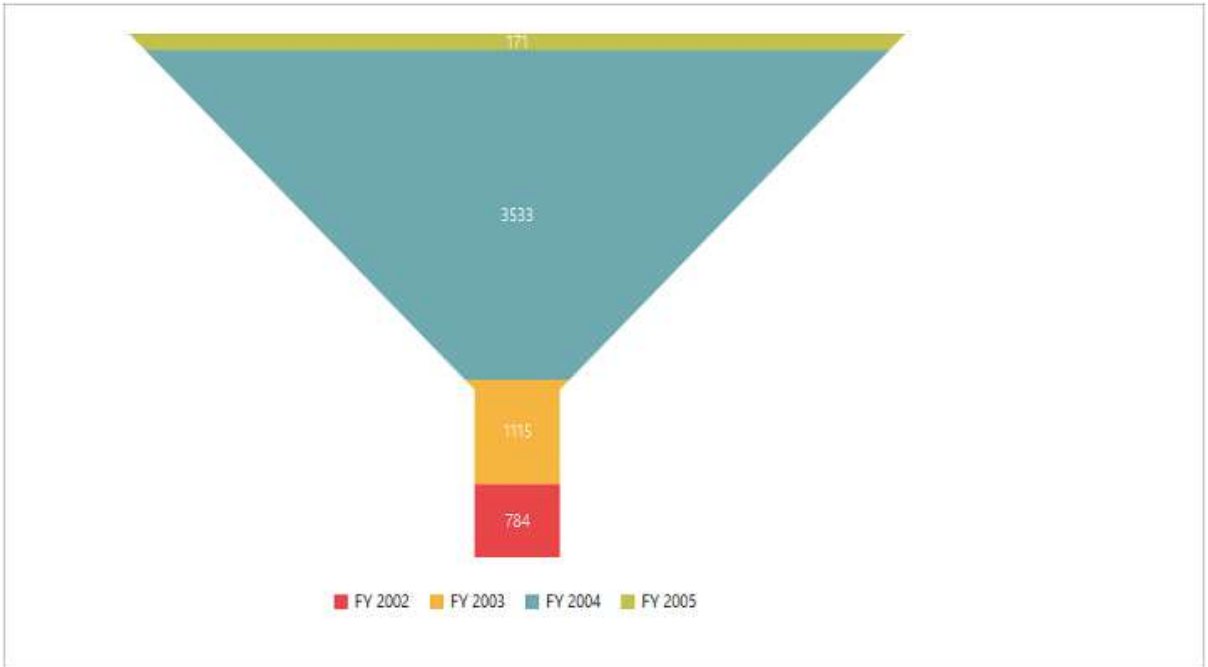
The **Funnel Chart** type displays the data in the form of an inverted triangle. It helps you to visualize data in a hierarchical structure without any axes.

ASPX-CS

```
@Html.EJ().Pivot().PivotChart("PivotChart1").Url(Url.Content("/Relational
ChartService.svc")).CommonSeriesOptions(comm => {
comm.Type(SeriesType.Funnel); }).Size(size =>
size.Height("460px").Width("950px"))
```

The following screen shot displays the **Funnel Chart**.

Copyright © 2001 - 2020 Syncfusion Inc.



Line Chart

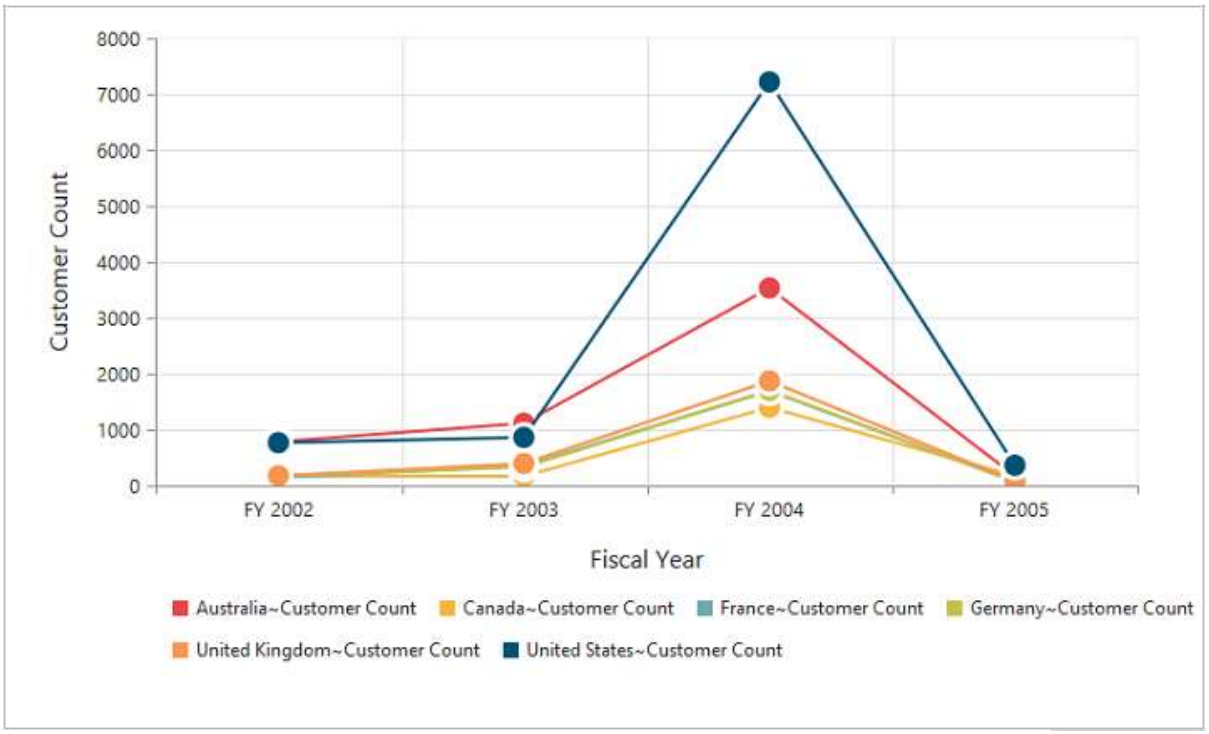
The **Line Chart** joins the data points on a plot using straight lines that show trends in data at equal intervals.

ASPX-CS

```
@Html.EJ().Pivot().PivotChart("PivotChart1").Url(Url.Content("/Relational
ChartService.svc")).CommonSeriesOptions(comm => {
comm.Type(SeriesType.Line); }).Size(size =>
size.Height("460px").Width("950px"))
```

The following screenshot displays the **Line Chart**.

Copyright © 2001 - 2020 Syncfusion Inc.



Step Line Chart

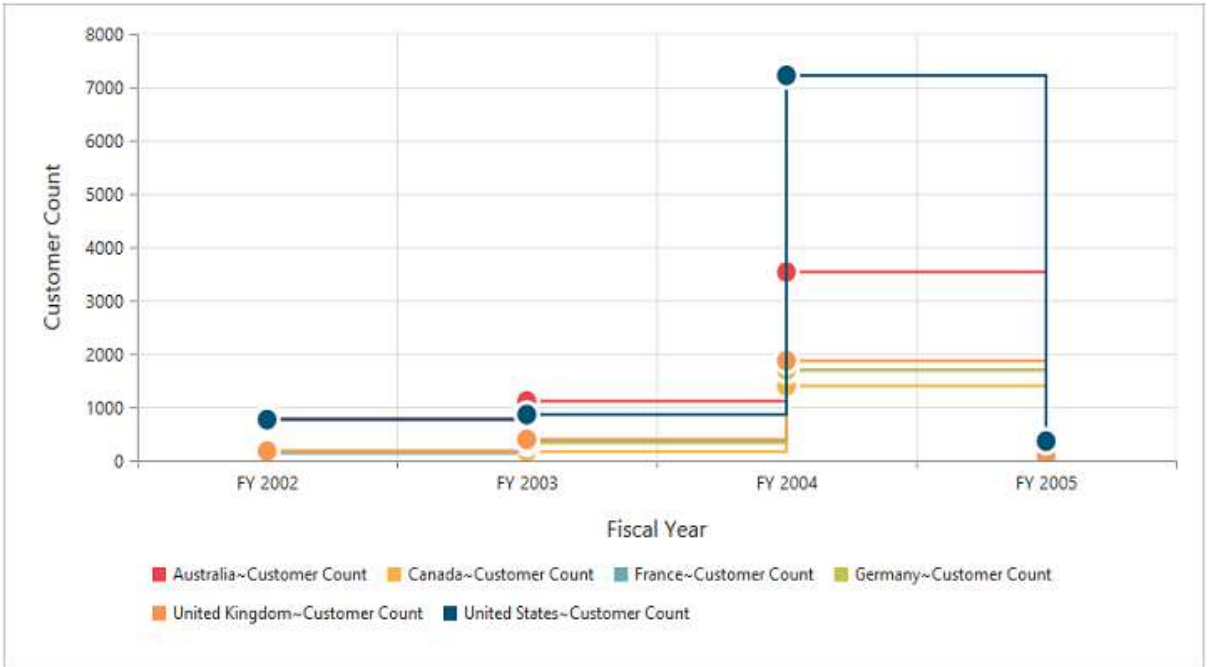
Step Line Chart uses horizontal and vertical lines to connect the data points resulting in a step like progression.

ASPX-CS

```
@Html.EJ().Pivot().PivotChart("PivotChart1").Url(Url.Content("/Relational
ChartService.svc")).CommonSeriesOptions(comm => {
comm.Type(SeriesType.StepLine); }).Size(size =>
size.Height("460px").Width("950px"))
```

The following screenshot displays the **Step Line Chart**.

Copyright © 2001 - 2020 Syncfusion Inc.



Spline Chart

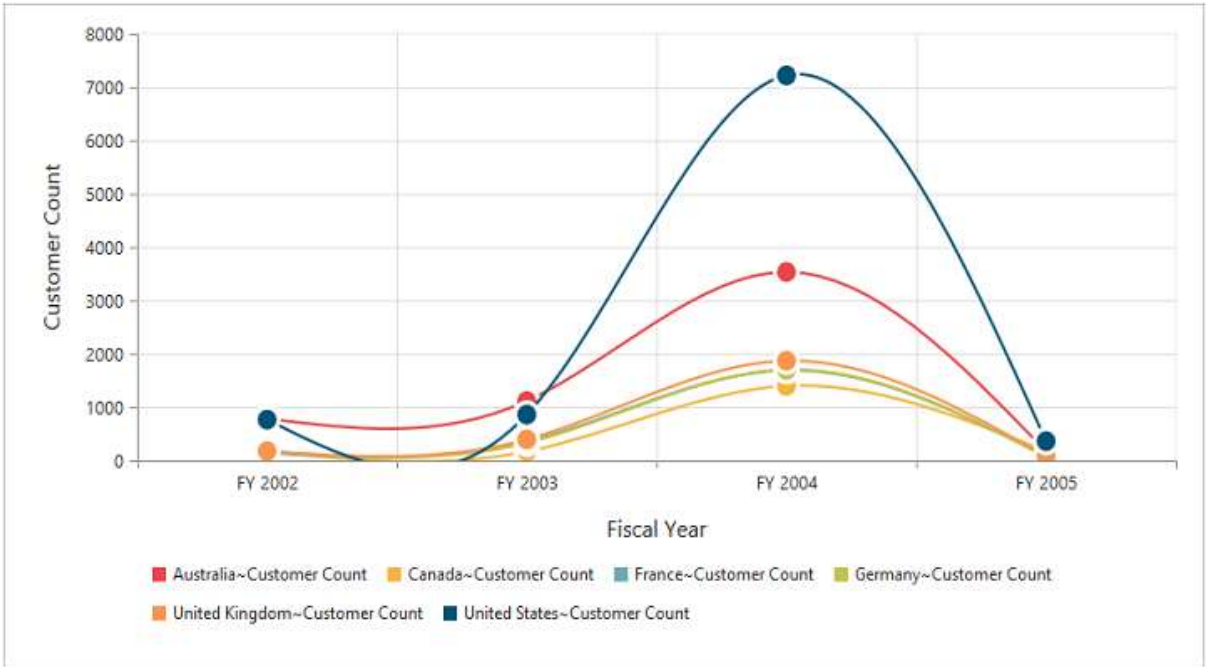
The **Spline Chart** is similar to line charts except it connects different data points using curve lines instead of straight lines.

ASPX-CS

```
@Html.EJ().Pivot().PivotChart("PivotChart1").Url(Url.Content("/Relational
ChartService.svc")).CommonSeriesOptions(comm => {
comm.Type(SeriesType.Spline); }).Size(size =>
size.Height("460px").Width("950px"))
```

The following screenshot displays the **Spline Chart**.

Copyright © 2001 - 2020 Syncfusion Inc.



Area Chart

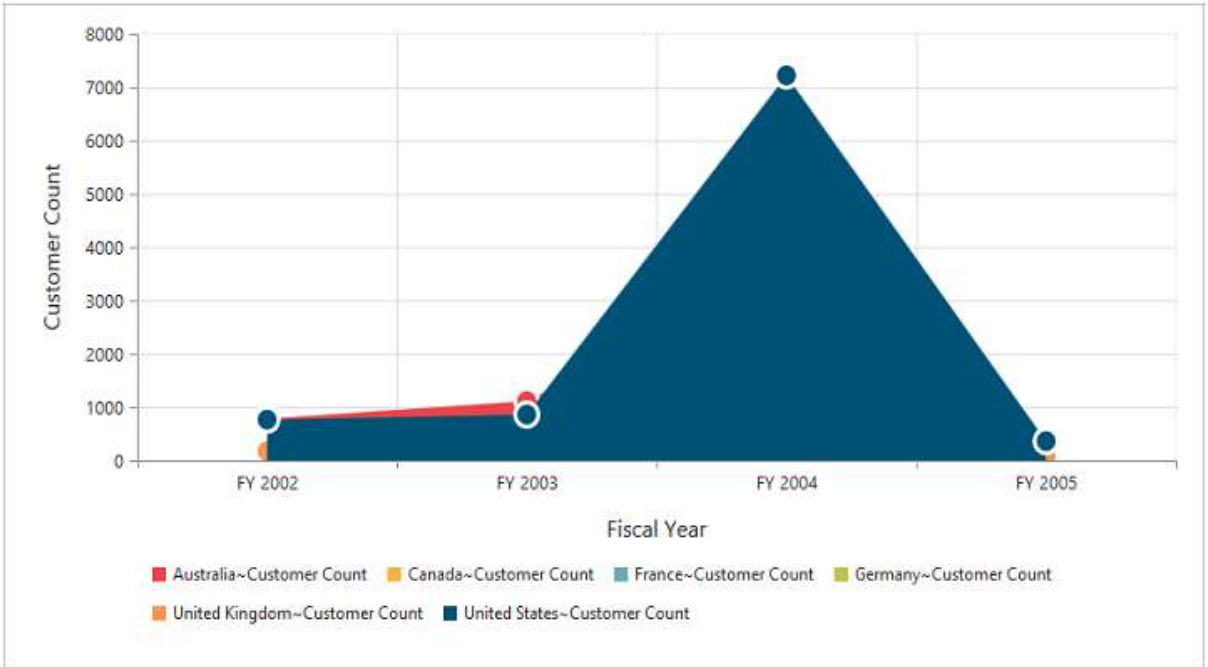
Area Chart emphasizes the degree of change of values over a period of time. Instead of rendering data as discrete bars or columns, an area chart renders it in a continuous ebb-and-flow pattern as defined against the y-axis.

ASPX-CS

```
@Html.EJ().Pivot().PivotChart("PivotChart1").Url(Url.Content("/Relational
ChartService.svc")).CommonSeriesOptions(comm => {
comm.Type(SeriesType.Area); }).Size(size =>
size.Height("460px").Width("950px"))
```

The following screenshot displays the **Area Chart**.

Copyright © 2001 - 2020 Syncfusion Inc.



Step Area Chart

Step Area chart is similar to the regular area chart except for a straight line tracing the shortest path between the data points. The values are connected by continuous vertical and horizontal lines forming a step like progression.

ASPX-CS

```
@Html.EJ().Pivot().PivotChart("PivotChart1").Url(Url.Content("/Relational
ChartService.svc")).CommonSeriesOptions(comm => {
comm.Type(SeriesType.StepArea); }).Size(size =>
size.Height("460px").Width("950px"))
```

The following screenshot displays a **Step Area Chart**.

Copyright © 2001 - 2020 Syncfusion Inc.

Spline Area Chart

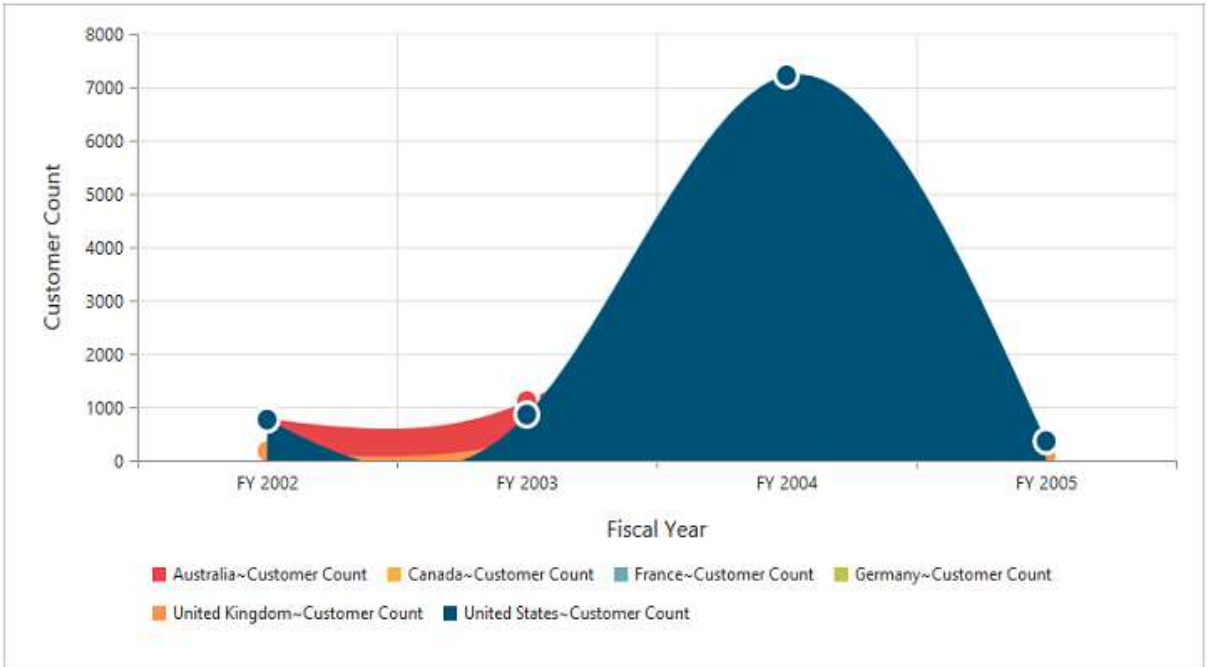
Spline Area chart is similar to Area Chart with the difference in which the data points of a series are connected. It connects each series of points by a smooth **spline curve**.

ASPX-CS

```
@Html.EJ().Pivot().PivotChart("PivotChart1").Url(Url.Content("/Relational
ChartService.svc")).CommonSeriesOptions(comm => {
comm.Type(SeriesType. SplineArea); }).Size(size =>
size.Height("460px").Width("950px"))
```

The following Screenshot displays a **Spline Area Chart**.

Copyright © 2001 - 2020 Syncfusion Inc.



Stacking Area Chart

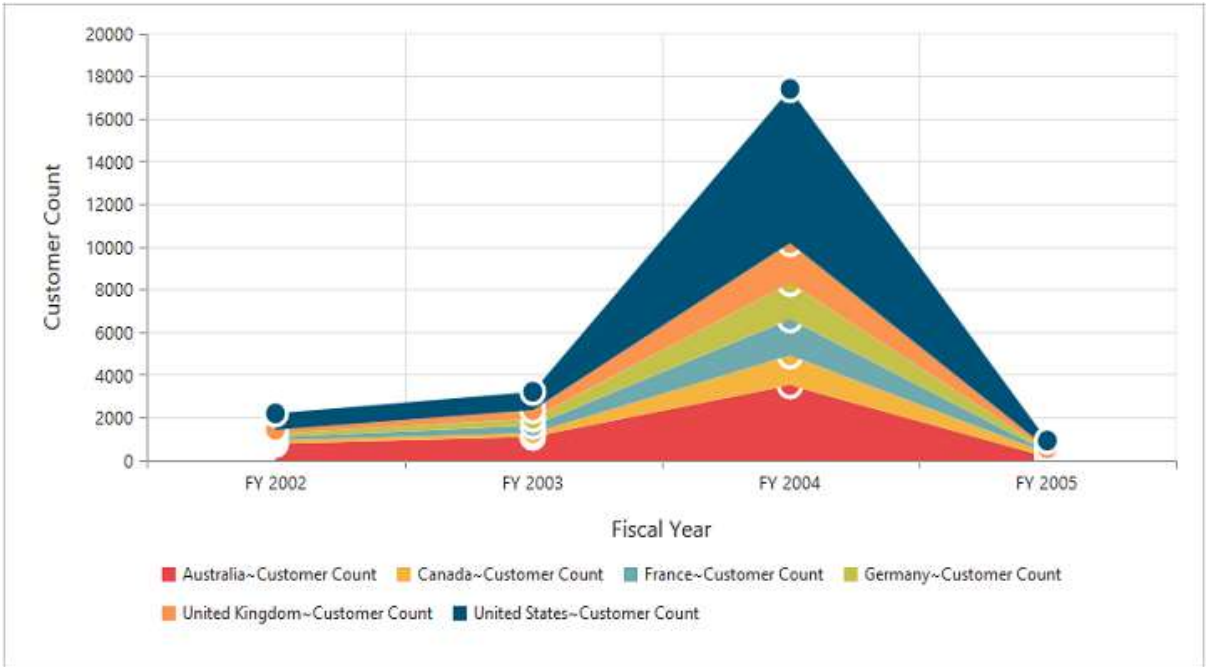
Stacking Area chart is similar to regular area chart except the “Y-values”. These “Y-values” stack on top of each other in the specified series order. This helps to visualize the relationship of parts to whole across categories.

ASPX-CS

```
@Html.EJ().Pivot().PivotChart("PivotChart1").Url(Url.Content("/Relational
ChartService.svc")).CommonSeriesOptions(comm => {
comm.Type(SeriesType.StackingArea); }).Size(size =>
size.Height("460px").Width("950px"))
```

The following screenshot displays a **Stacking Area Chart**.

Copyright © 2001 - 2020 Syncfusion Inc.



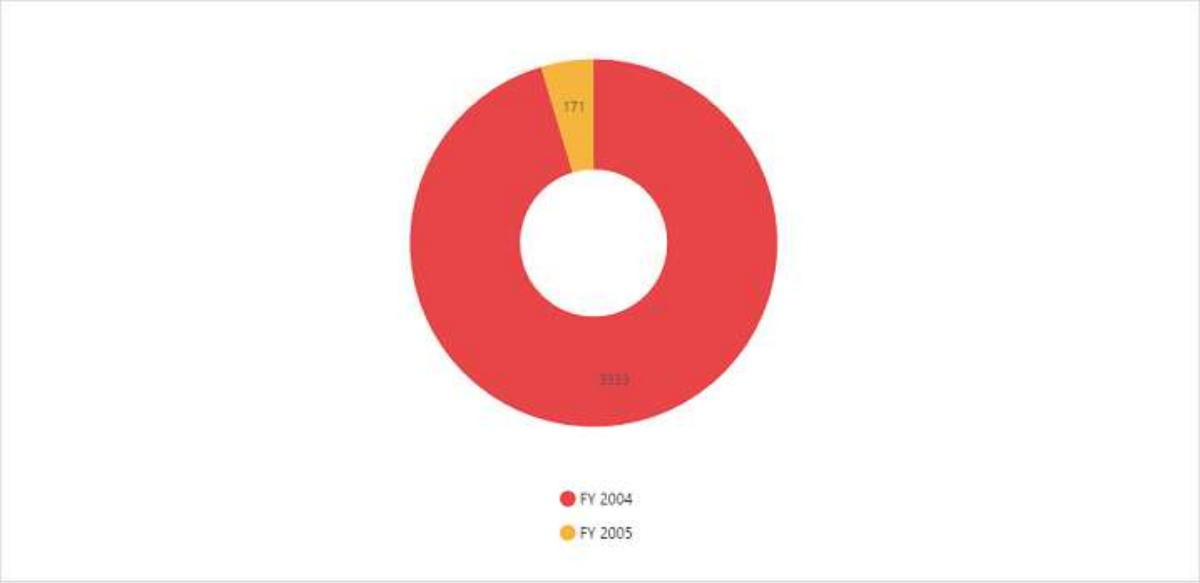
Doughnut Chart

A **Doughnut chart** is also used to summarize a set of categorical data which possesses a doughnut like structure divided into a series of segments. Each segment represents a particular category.

ASPX-CS

```
@Html.EJ().Pivot().PivotChart("PivotChart1").Url(Url.Content("/Relational
ChartService.svc")).CommonSeriesOptions(comm => {
comm.Type(SeriesType.Doughnut); }).Size(size =>
size.Height("460px").Width("950px"))
```

The following screenshot displays a **Doughnut Chart**.



Copyright © 2001 - 2020 Syncfusion Inc.

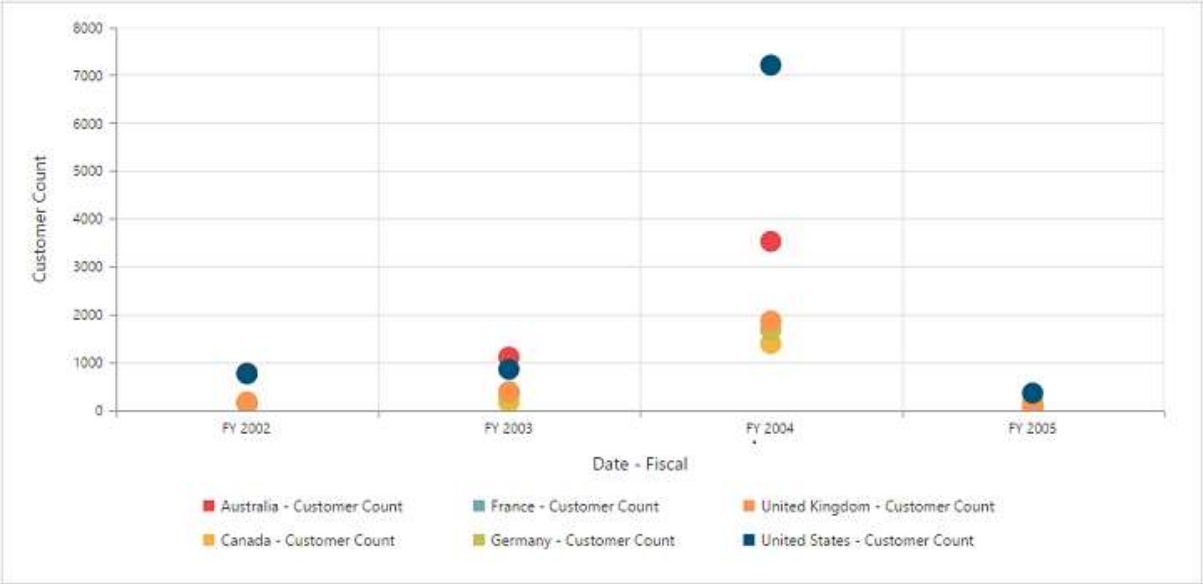
Scatter Chart

The **Scatter Chart** type displays the data as a collection of points corresponding to the associated values.

ASPX-CS

```
@Html.EJ().Pivot().PivotChart("PivotChart1").Url(Url.Content("/Relational
ChartService.svc")).CommonSeriesOptions(comm => {
comm.Type(SeriesType.Scatter); }).Size(size =>
size.Height("460px").Width("950px"))
```

The following screen shot displays the **Scatter Chart.**



Bubble Chart

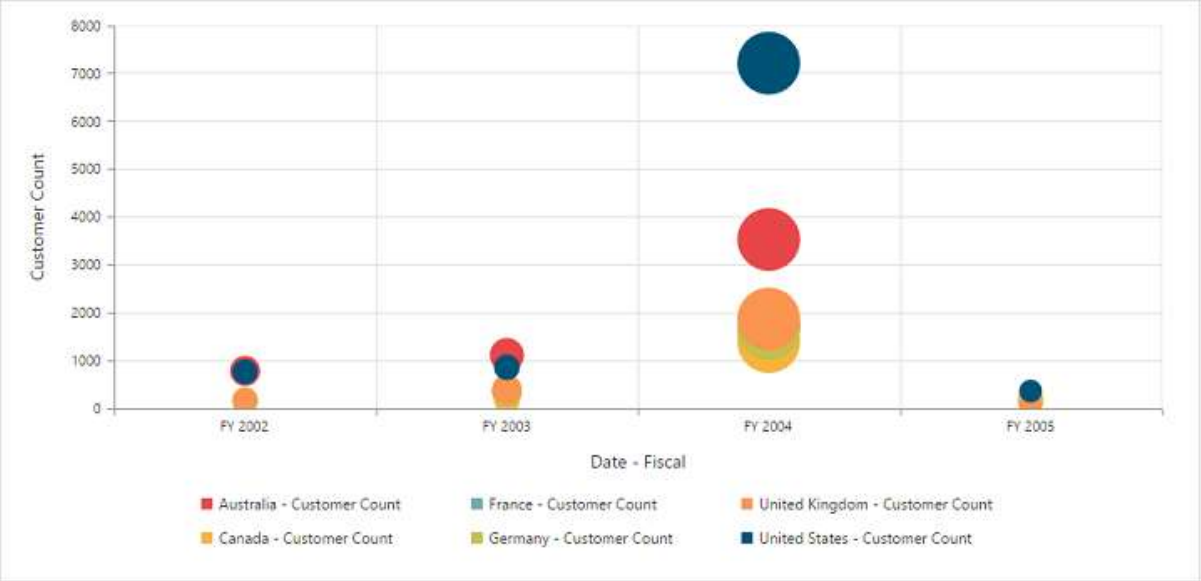
The **Bubble Chart** type displays the data as a collection of bubbles.

ASPX-CS

```
@Html.EJ().Pivot().PivotChart("PivotChart1").Url(Url.Content("/Relational
ChartService.svc")).CommonSeriesOptions(comm => {
comm.Type(SeriesType.Bubble); }).Size(size =>
size.Height("460px").Width("950px"))
```

The following screen shot displays the **Bubble Chart.**

Copyright © 2001 - 2020 Syncfusion Inc.



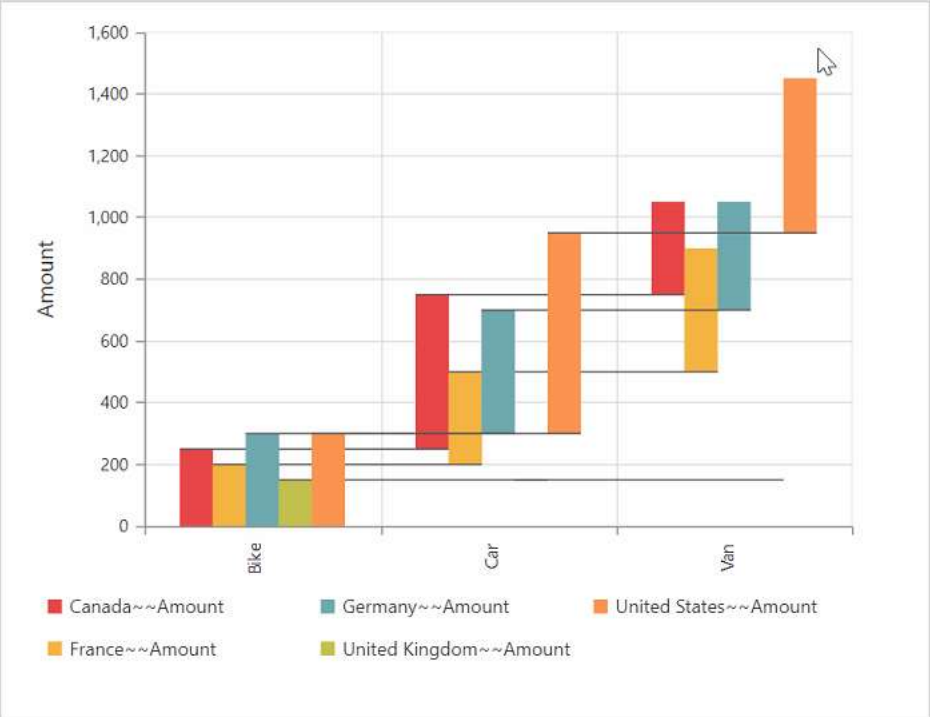
WaterFall chart

The **waterfall chart** type is used to show how an initial value is increased and decreased by a series of intermediate values, leading to a final value.

ASPX-CS

```
@Html.EJ().Pivot().PivotChart("PivotChart1").Url(Url.Content("/Relational
ChartService.svc")).CommonSeriesOptions(comm => {
comm.Type(SeriesType.WaterFall); }).Size(size =>
size.Height("460px").Width("950px"))
```

The following screenshot displays the **waterfall chart:**



Combination Chart

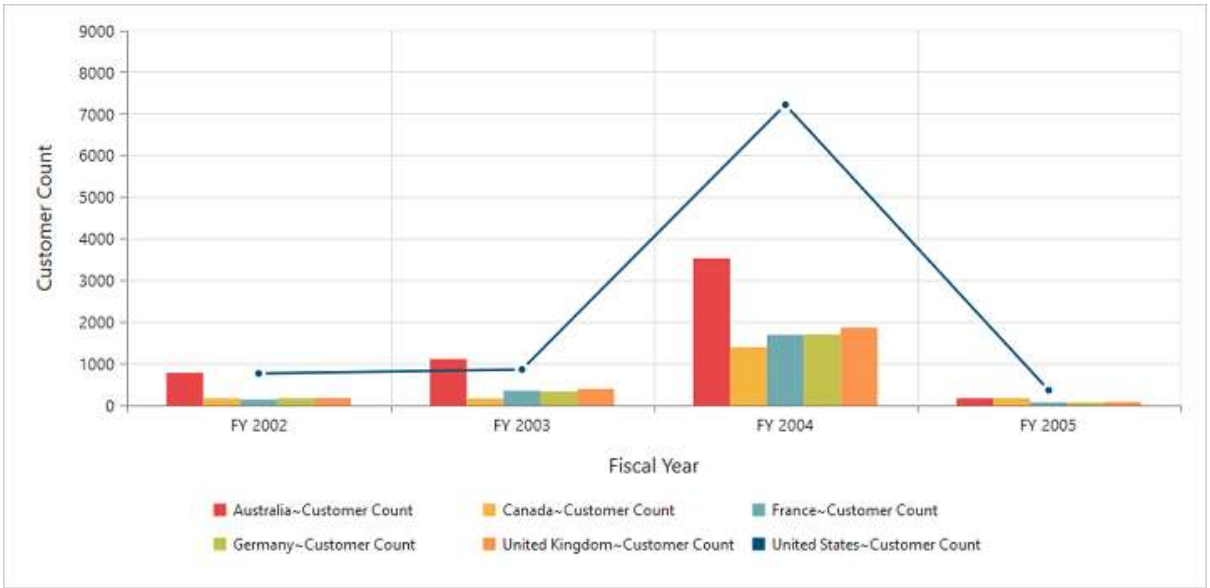
A **combination Chart** combines two or more series types in a single Chart. But there are some limitations in the combination Chart. They are:

1. Can't combine Column and Bar series.
2. Pie Chart can't be used with other series types.

ASPX-CS

```
@Html.EJ().Pivot().PivotChart("PivotChart1").Url(Url.Content("/Relational
ChartService.svc")).CommonSeriesOptions(comm => {
comm.Type(SeriesType.Column); }).Size(size =>
size.Height("460px").Width("950px")).ClientSideEvents(
oEve => { oEve.SeriesRendering("onSeriesRenders"); })
<script>
function onSeriesRenders(args) {
this.model.series[5].type = ej.PivotChart.ChartTypes.Line;
this.model.series[5].marker.visible = true;
</script>
```

The following screenshot displays a **combination Chart**.



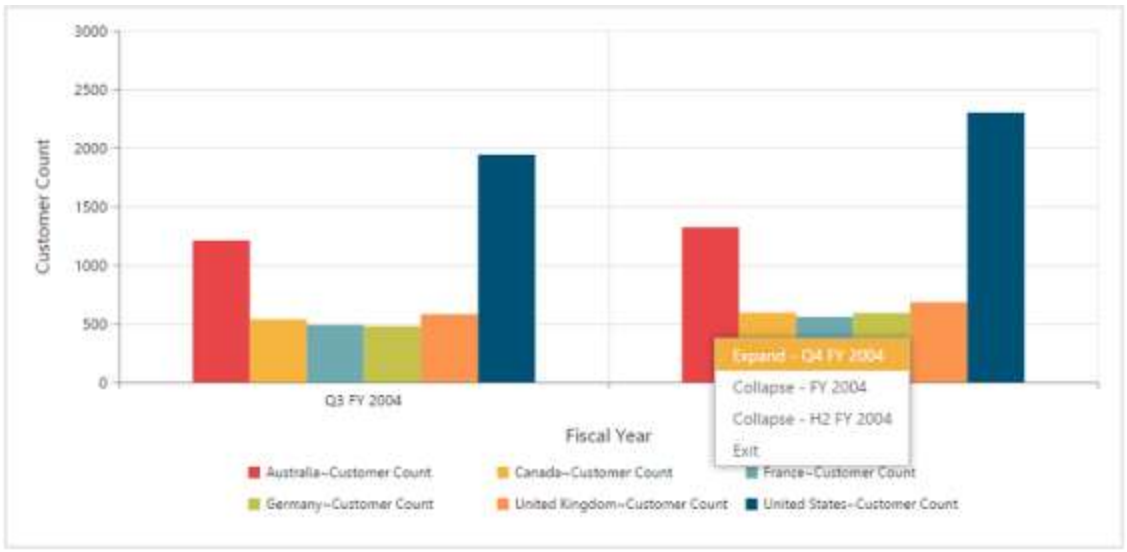
Drill Operation

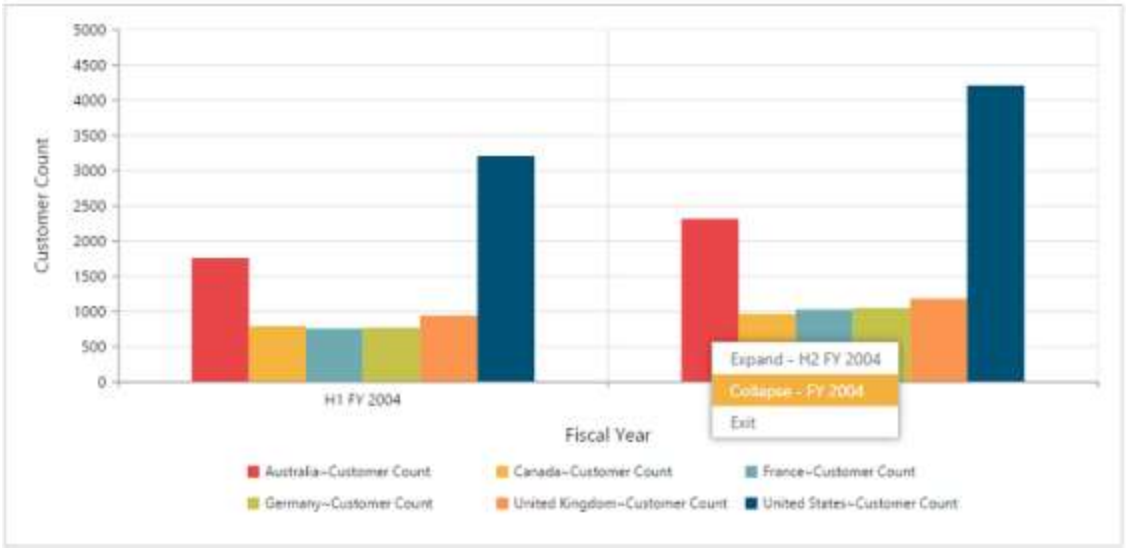
This is a basic feature of PivotChart through which the amount of information can be limited, for a better view. It allows you to drill down to access the detailed level of data or drill up to see the summarized data by using the Context Menu present in the PivotChart.

Drill up, also called roll up, navigates from more detailed data to less detailed data, by climbing up a concept hierarchy for a dimension.

Drill down, also called roll down, is the reverse of drill up. It navigates from less detailed data to more detailed data, by climbing down a concept hierarchy for a dimension.

Copyright © 2001 - 2020 Syncfusion Inc.





DrillSuccess event gets triggered when you right-click on the PivotChart and select any option available in the context menu to perform drill up or drill down operation.

ASPX-CS

```
@Html.EJ().Pivot().PivotChart("PivotChart1").Url(Url.Content("/Relational
ChartService.svc")).Size(size =>
size.Height("460px").Width("950px")).ClientSideEvents(oEve =>
{oEve.DrillSuccess("DrillSuccess")});
<script type="text/javascript">
function DrillSuccess(args) {
alert("Drill Success");
}
</script>
```

Legend

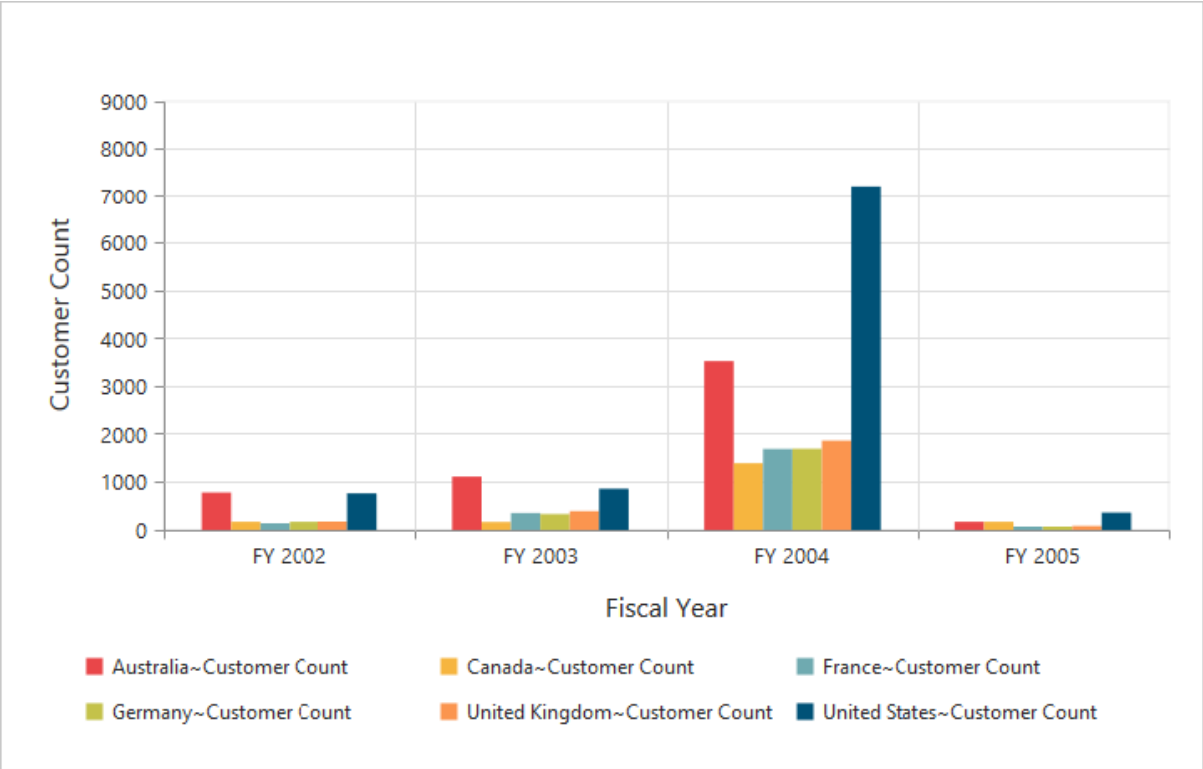
Legend Visibility

You can enable or disable legend using the Visible property inside the Legend object.

Note: By default, the legend is visible in PivotChart.

ASPX-CS

```
//Legend Visibility set as true
@Html.EJ().Pivot().PivotChart("PivotChart1").Url(Url.Content("/Relational
ChartService.svc")).Size(size =>
size.Height("460px").Width("950px")).Legend(legend =>
legend.Visible(true))
```



Legend Shape

You can customize the legend Shape in PivotChart control. Default value of legend shape is “Rectangle”. Following legend shapes that are supported:

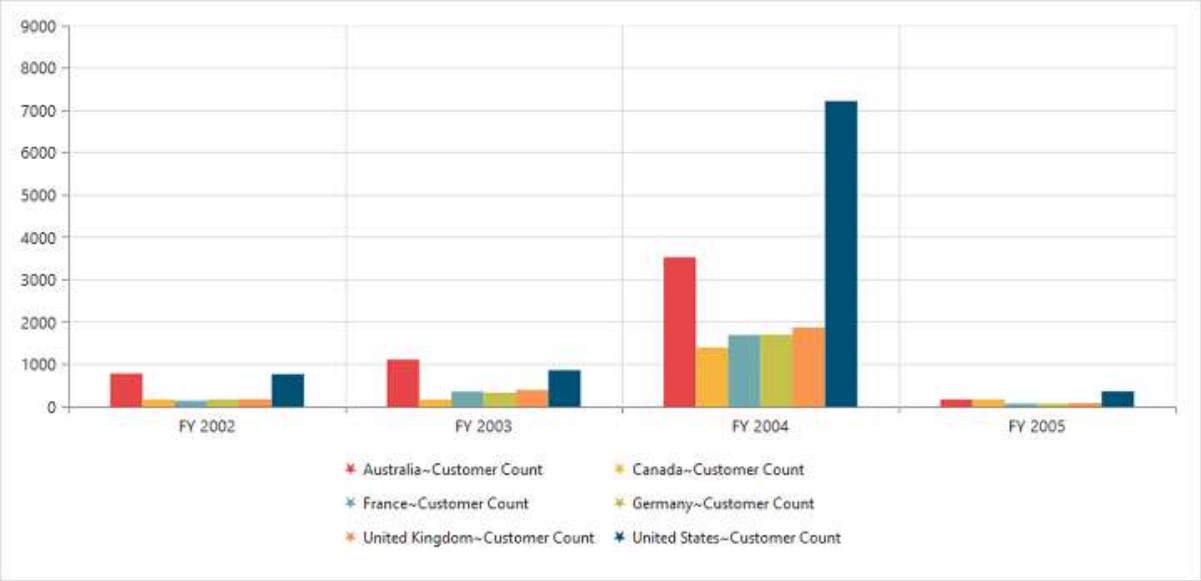
- Rectangle
- Circle
- Cross
- Diamond
- Pentagon
- Hexagon
- Star
- Ellipse
- Triangle etc.

ASPX-CS

```
//Applying legend shape
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
@Html.EJ().Pivot().PivotChart("PivotChart1").Url(Url.Content("/Relational
ChartService.svc")).Size(size =>
size.Height("460px").Width("950px")).Legend(legend =>
legend.Visible(true).Shape(ChartShape.Star))
```



Legend Position

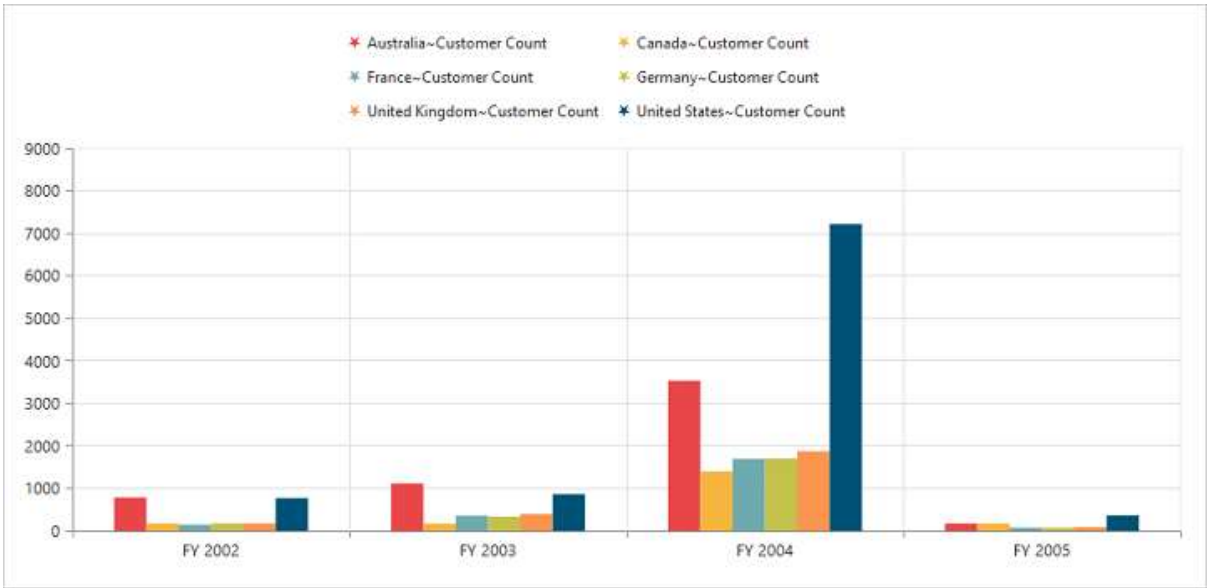
By using the Position property, you can place the legend at top, bottom, left or right of the PivotChart.

Note: Default value of legend position is "bottom" in PivotChart.

ASPX-CS

```
//Place the legend at top of the Chart
@Html.EJ().Pivot().PivotChart("PivotChart1").Url(Url.Content("/Relational
ChartService.svc")).Size(size =>
size.Height("460px").Width("950px")).Legend(legend =>
legend.Visible(true).Shape(ChartShape.Star).Position(LegendPosition.Top))
```

Copyright © 2001 - 2020 Syncfusion Inc.

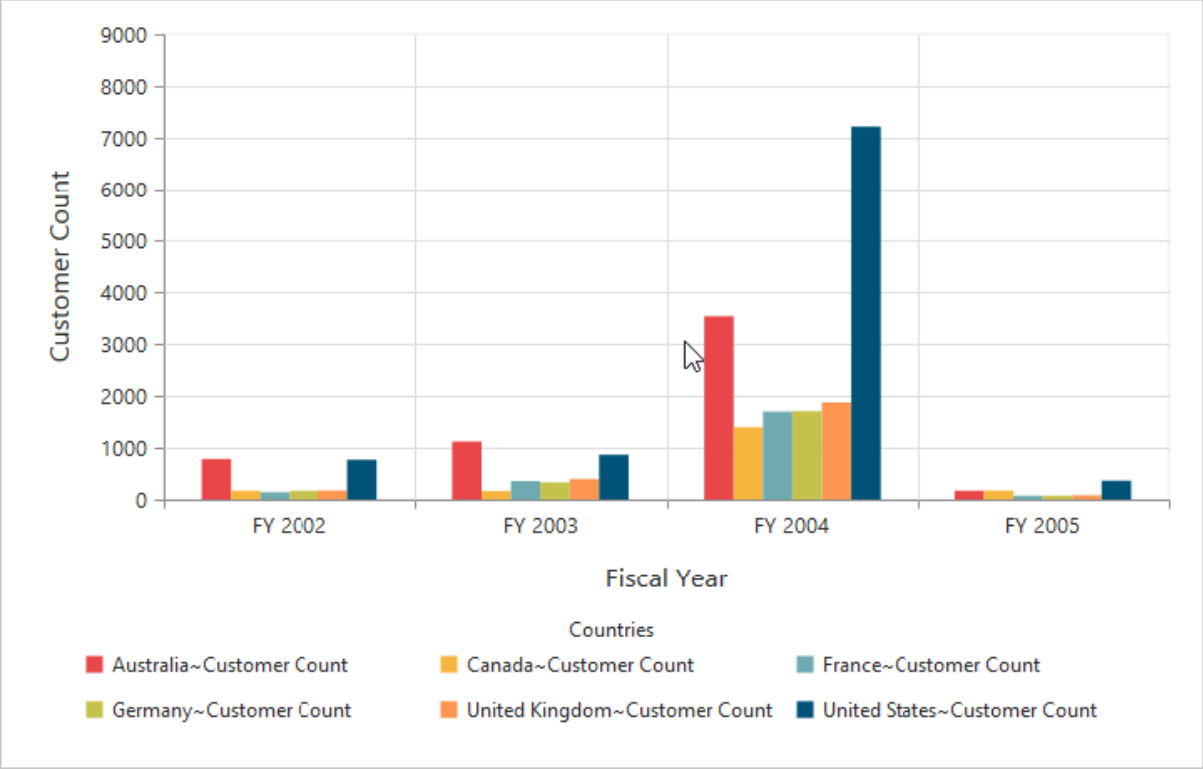


Legend Title

To add the legend title, you have to specify the title text in `title.Text` property.

ASPX-CS

```
//Add title to the Chart legend
@Html.EJ().Pivot().PivotChart("PivotChart1").Url(Url.Content("/Relational
ChartService.svc")).Size(size =>
size.Height("460px").Width("950px")).Legend(legend =>
legend.Visible(true).Title(title => title.Text("Countries")))
```



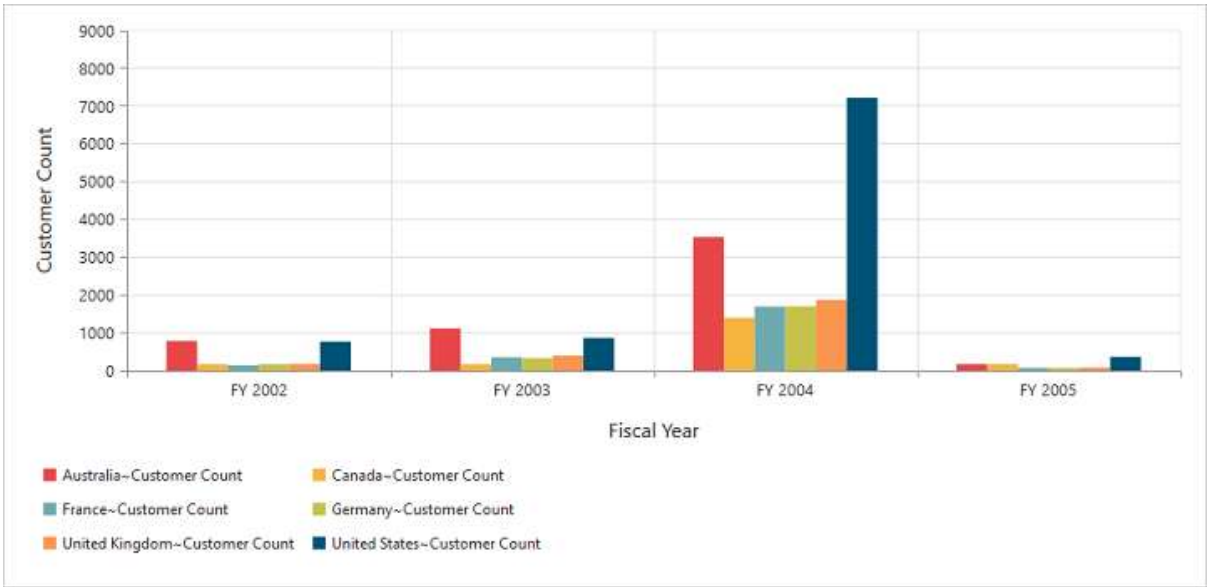
Copyright © 2001 - 2020 Syncfusion Inc.

Legend Alignment

You can align the legend to center, far and near based on its position in the Chart area using the Alignment option.

ASPX-CS

```
//Aligning the legend near to the Chart
@Html.EJ().Pivot().PivotChart("PivotChart1").Url(Url.Content("/Relational
ChartService.svc")).Size(size =>
size.Height("460px").Width("950px")).Legend(legend =>
legend.Visible(true).Alignment(TextAlignment.Near))
```



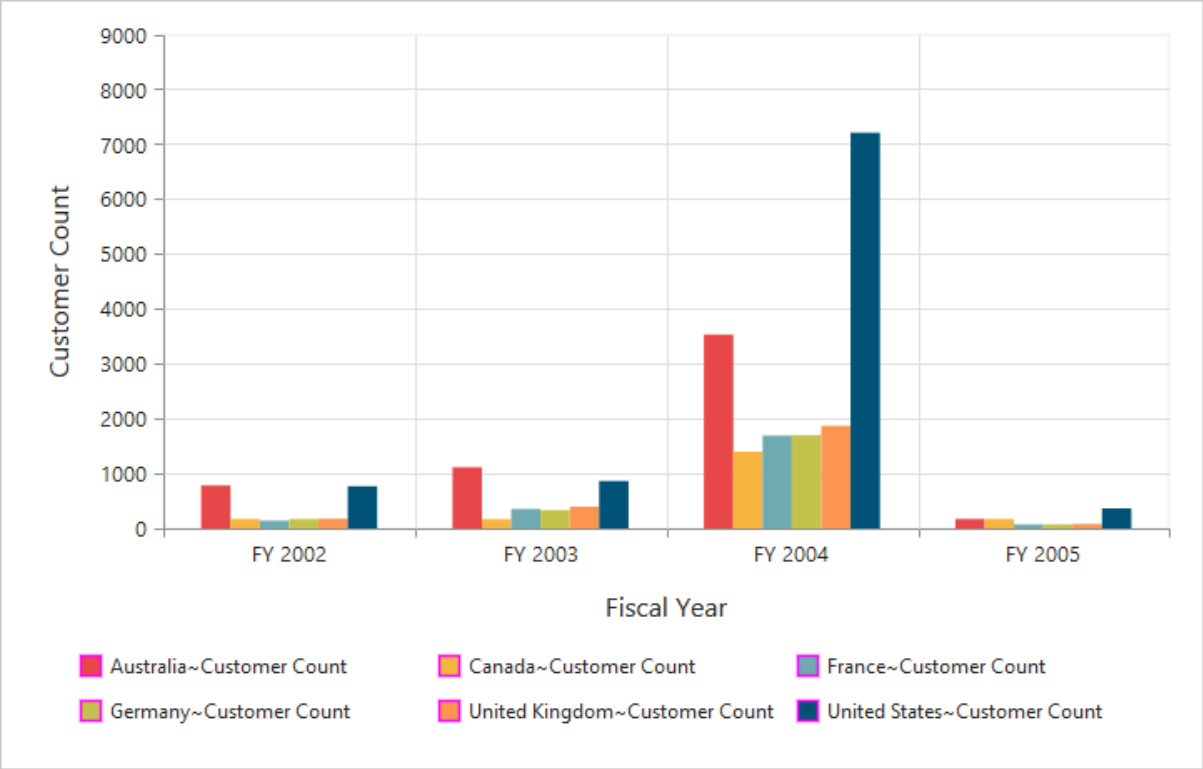
Legend Items - Size and Border

By using the legend ItemStyle.width, ItemStyle.height and ItemStyle.border properties, you can change the legend items - size and border.

ASPX-CS

```
//Changing legend items border, height and width
@Html.EJ().Pivot().PivotChart("PivotChart1").Url(Url.Content("/Relational
ChartService.svc")).Size(size =>
size.Height("460px").Width("950px")).Legend(legend =>
legend.Visible(true).ItemStyle(ItemSize => ItemSize.Border(border =>
border.Color("magenta").Width(1.5)).Height(12).Width(12)))
```

Copyright © 2001 - 2020 Syncfusion Inc.



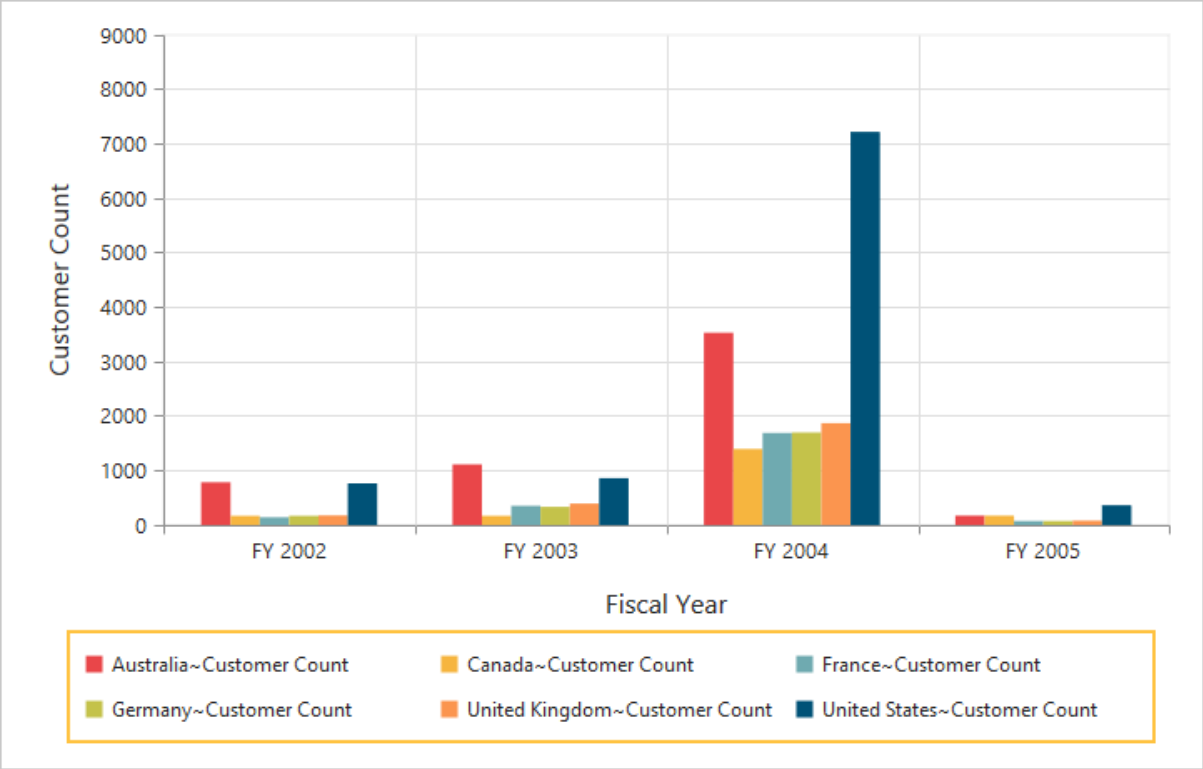
Legend Border

By using the Border option in legend, you can customize border color and width.

ASPX-CS

```
//Setting border color and width to legend
@Html.EJ().Pivot().PivotChart("PivotChart1").Url(Url.Content("/Relational
ChartService.svc")).Size(size =>
size.Height("460px").Width("950px")).Legend(legend =>
legend.Visible(true).Border(border => border.Color("#FFC342").Width(2)))
```

Copyright © 2001 - 2020 Syncfusion Inc.



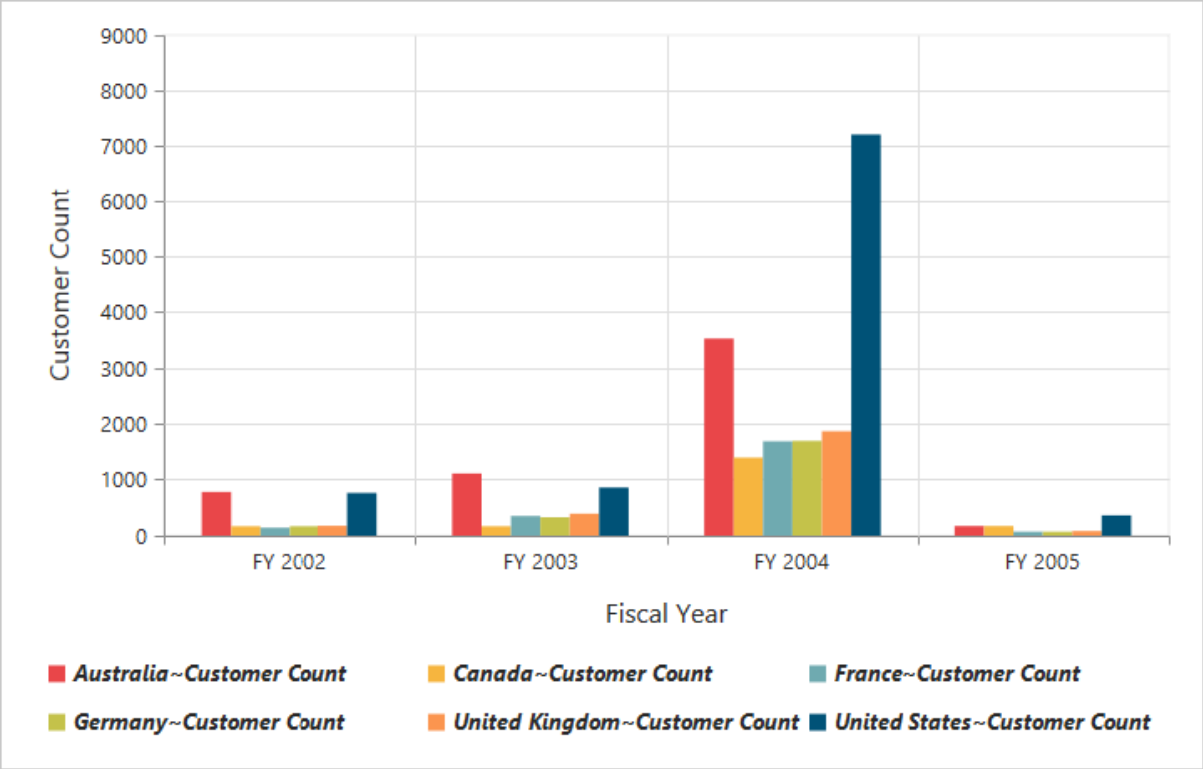
Legend Text

By using the Font option, you can customize the font family, font style, font weight and size of the legend text.

ASPX-CS

```
///Customizing the legend text
@Html.EJ().Pivot().PivotChart("PivotChart1").Url(Url.Content("/Relational
ChartService.svc")).Size(size =>
size.Height("460px").Width("950px")).Legend(legend =>
legend.Visible(true).Font(font => font.FontFamily("Segoe
UI").FontWeight(ChartFontWeight.Bold).FontStyle(ChartFontStyle.Italic).Si
ze("13px")))
```

Copyright © 2001 - 2020 Syncfusion Inc.



Axes

Label Format

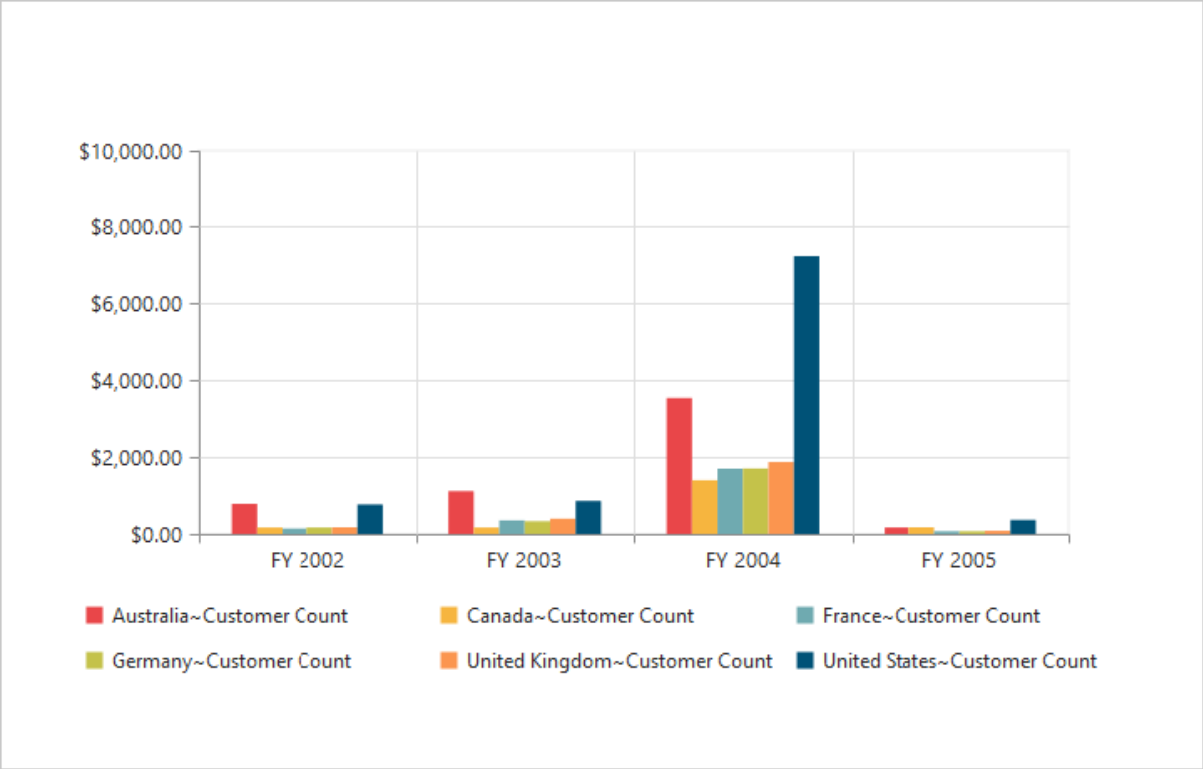
Format Numeric labels

By using the LabelFormat property, you can format the numeric labels. Numeric values can be formatted with n (number with decimal points), c (currency) and p (percentage) commands.

ASPX-CS

```
//Applying currency format to axis labels
@Html.EJ().Pivot().PivotChart("PivotChart1").PrimaryYAxis(primaryY =>
primaryY.LabelFormat("c")).Url(Url.Content("/RelationalChartService.svc")
).Size(size => size.Height("460px").Width("950px"))
```

Copyright © 2001 - 2020 Syncfusion Inc.



Following table describes the result on applying some commonly used label formats on numeric values.

Label Value	Label Format Property Value	Result	Description
1000	n1	1000.0	The Number is rounded to 1 decimal place
1000	n2	1000.00	The Number is rounded to 2 decimal place
1000	n3	1000.000	The Number is rounded to 3 decimal place
0.01	p1	1.0%	The Number is converted to percentage with 1 decimal place
0.01	p2	1.00%	The Number is converted to percentage with 2 decimal place
0.01	p3	1.000%	The Number is converted to percentage with 3 decimal place
1000	c1	$1,000.0	The Currency symbol is appended to number and number is rounded to 1 decimal place
1000	c2	$1,000.00	The Currency symbol is appended to number and number is rounded to 2 decimal place

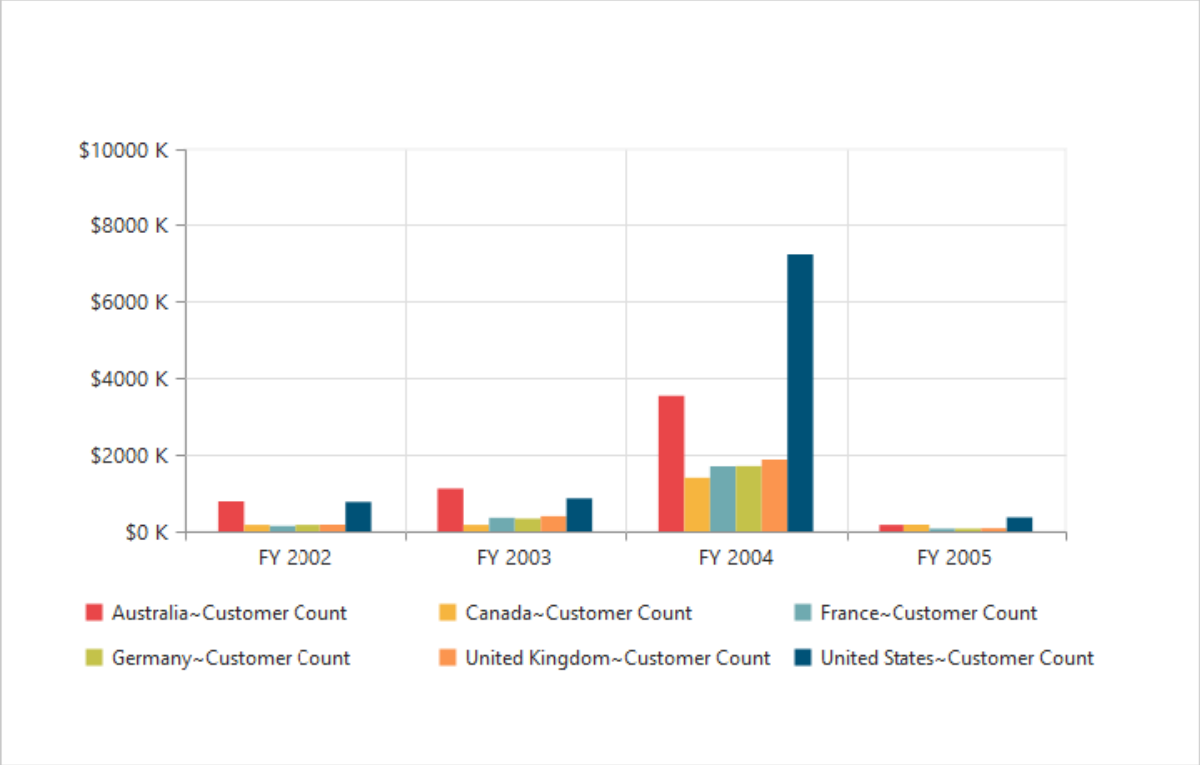
Label Format Customization

By using the `LabelFormat` property of `PrimaryYAxis`, you can add the category labels with prefix and/or suffix.

Copyright © 2001 - 2020 Syncfusion Inc.

ASPX-CS

```
//Adding prefix and suffix to axis labels
@Html.EJ().Pivot().PivotChart("PivotChart1").PrimaryYAxis(primaryY =>
primaryY.LabelFormat("${value}K")).Url(Url.Content("/RelationalChartServi
ce.svc")).Size(size => size.Height("460px").Width("950px"))
```



Common Axis Features

Axis Visibility

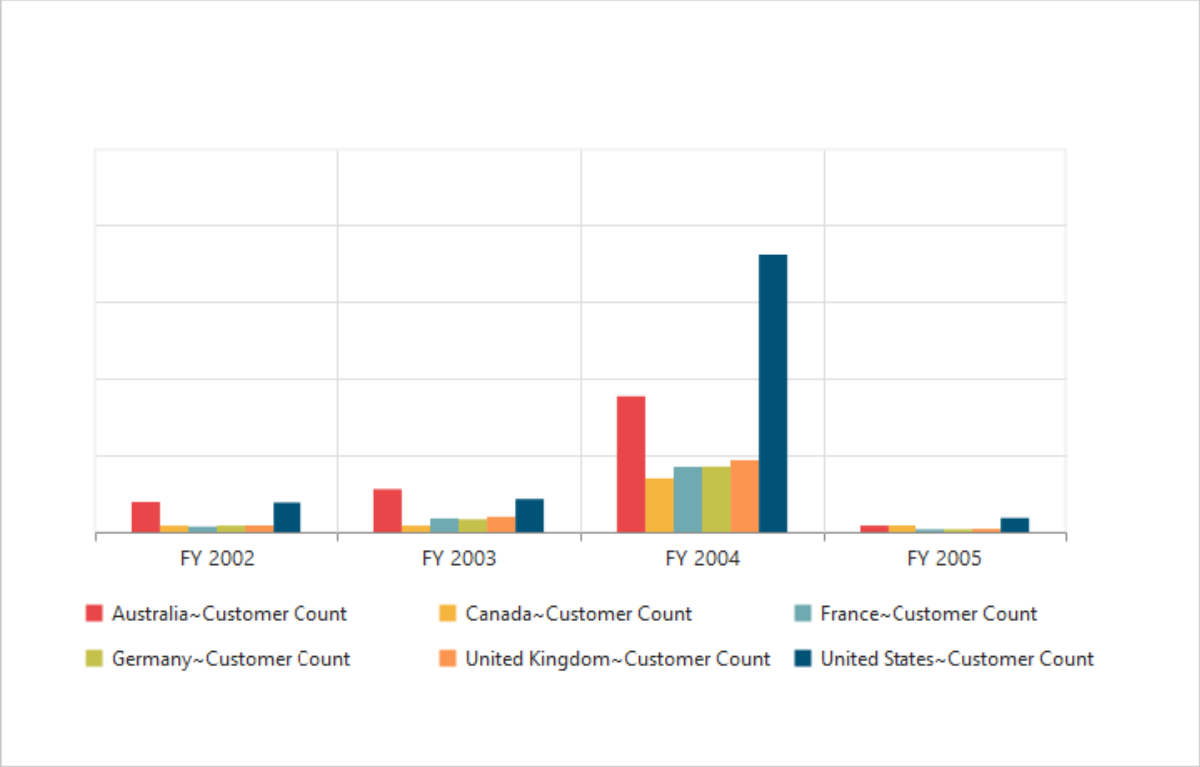
Axis visibility can be set by using the Visible property of the respective axis.

Note: By default, the value of Visible property is true in PivotChart.

ASPX-CS

```
//Disabling visibility of Y-axis
@Html.EJ().Pivot().PivotChart("PivotChart1").PrimaryYAxis(primaryY =>
primaryY.Visible(false)).Url(Url.Content("/RelationalChartService.svc")).
Size(size => size.Height("460px").Width("950px"))
```

Copyright © 2001 - 2020 Syncfusion Inc.



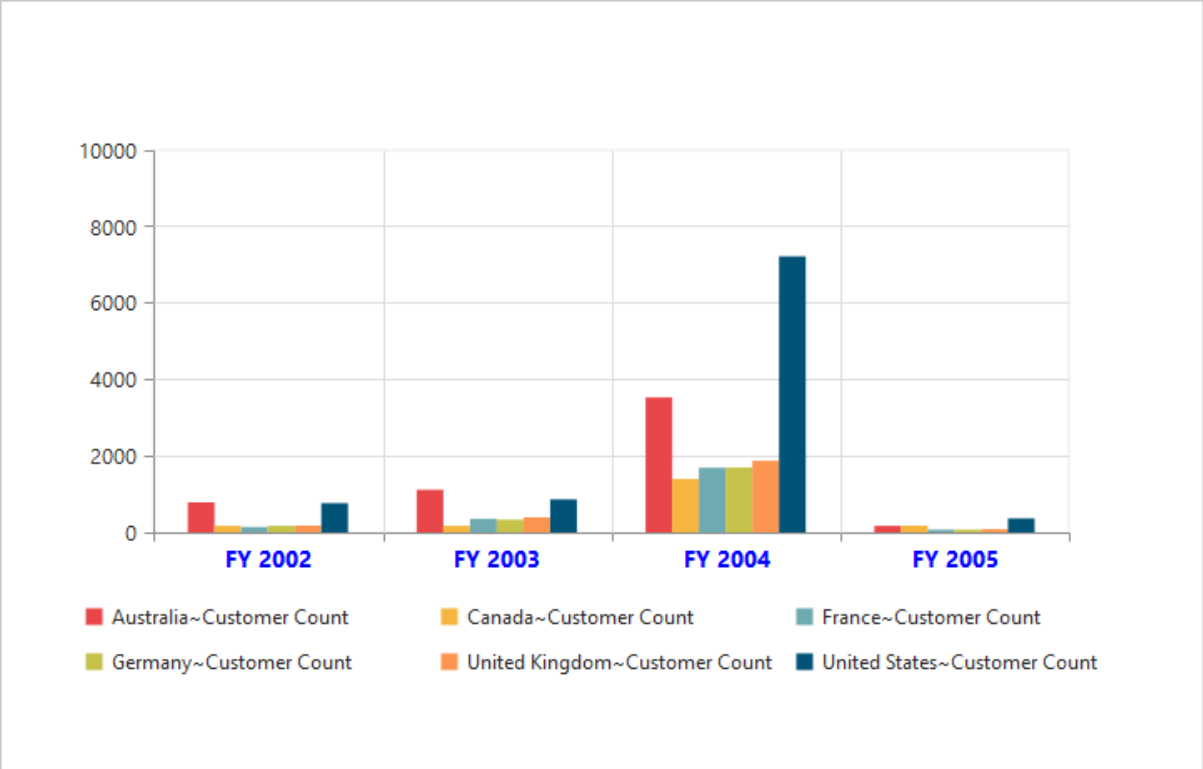
Label Customization

By using the Font property of the axis, we can customize the labels – font family, color, opacity, size and font-weight.

ASPX-CS

```
//Customizing label appearance
@Html.EJ().Pivot().PivotChart("PivotChart1").PrimaryXAxis(primaryX =>
primaryX.Font(font=>
font.Size("14px").FontWeight(ChartFontWeight.Bold).FontFamily("Segoe
UI").Color("blue"))).Url(Url.Content("/RelationalChartService.svc")).Size
(size => size.Height("460px").Width("950px"))
```

Copyright © 2001 - 2020 Syncfusion Inc.



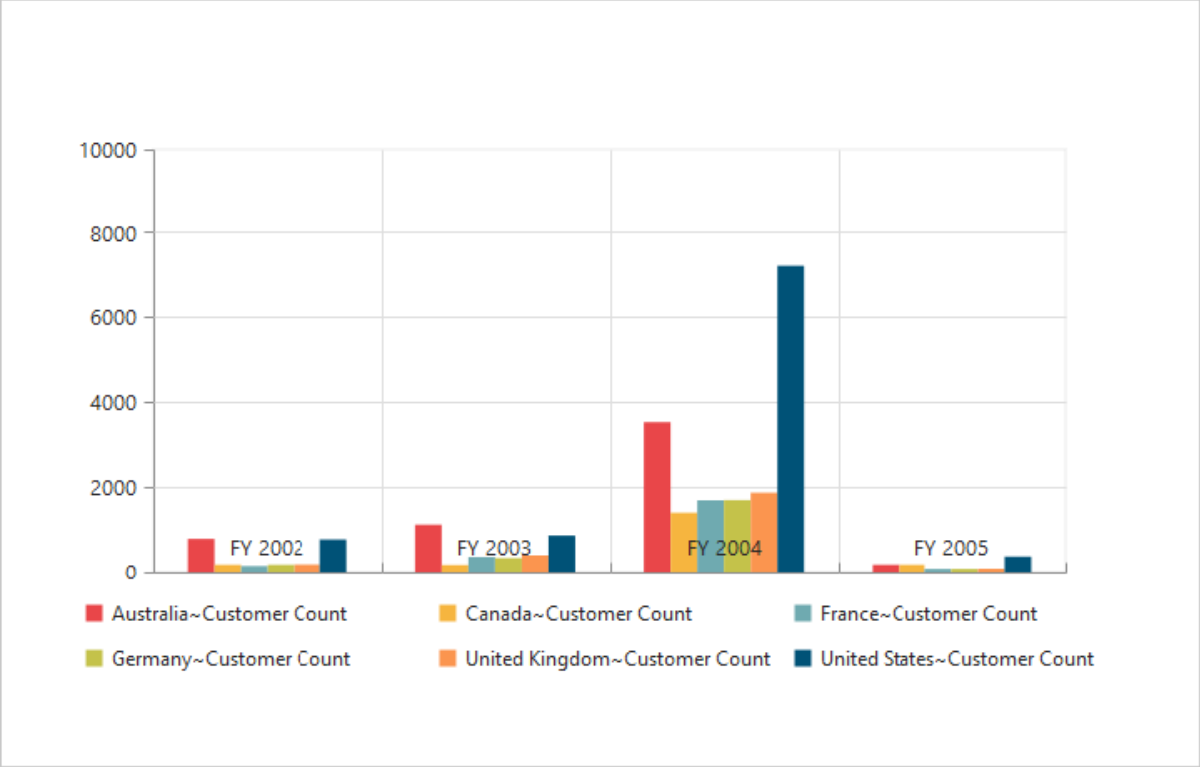
Label and Tick Positioning

Axis labels and ticks can be positioned inside or outside the Chart area by using the AxisLabelPosition and TickLinesPosition properties. The labels and ticks are positioned outside the Chart area, by default.

ASPX-CS

```
//Customizing label and tick positions
@Html.EJ().Pivot().PivotChart("PivotChart1").PrimaryXAxis(primaryX =>
primaryX.AxisLabelPosition(AxislabelPosition.Inside).TickLinesPosition(Ti
ckLinesPosition.Inside)).Url(Url.Content("/RelationalChartService.svc")).
Size(size => size.Height("460px").Width("950px"))
```

Copyright © 2001 - 2020 Syncfusion Inc.



Grid Lines Customization

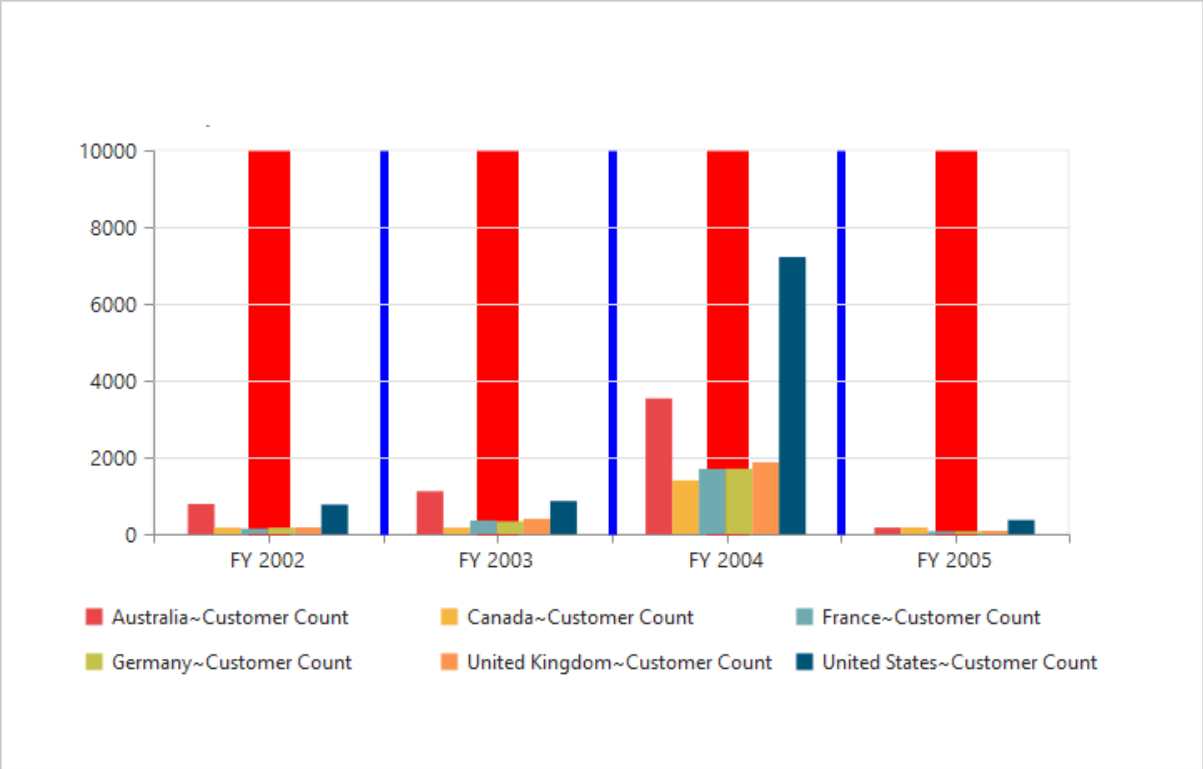
By using the MajorGridLines and MinorGridLines properties of the axis, you can customize the width, color, visibility and opacity of the grid lines.

Note: By default, the minor grid lines are not visible in PivotChart.

ASPX-CS

```
//Customizing grid lines
@Html.EJ().Pivot().PivotChart("PivotChart1").PrimaryXAxis(primaryX =>
primaryX.MajorGridLines(mr =>
mr.Width(5).Color("Blue").Visible(true)).MinorGridLines(mg =>
mg.Width(25).Color("Red").Visible(true)).MinorTicksPerInterval(1)).Url(Ur
l.Content("/RelationalChartService.svc")).Size(size =>
size.Height("460px").Width("950px"))
```

Copyright © 2001 - 2020 Syncfusion Inc.



Tick Line Customization

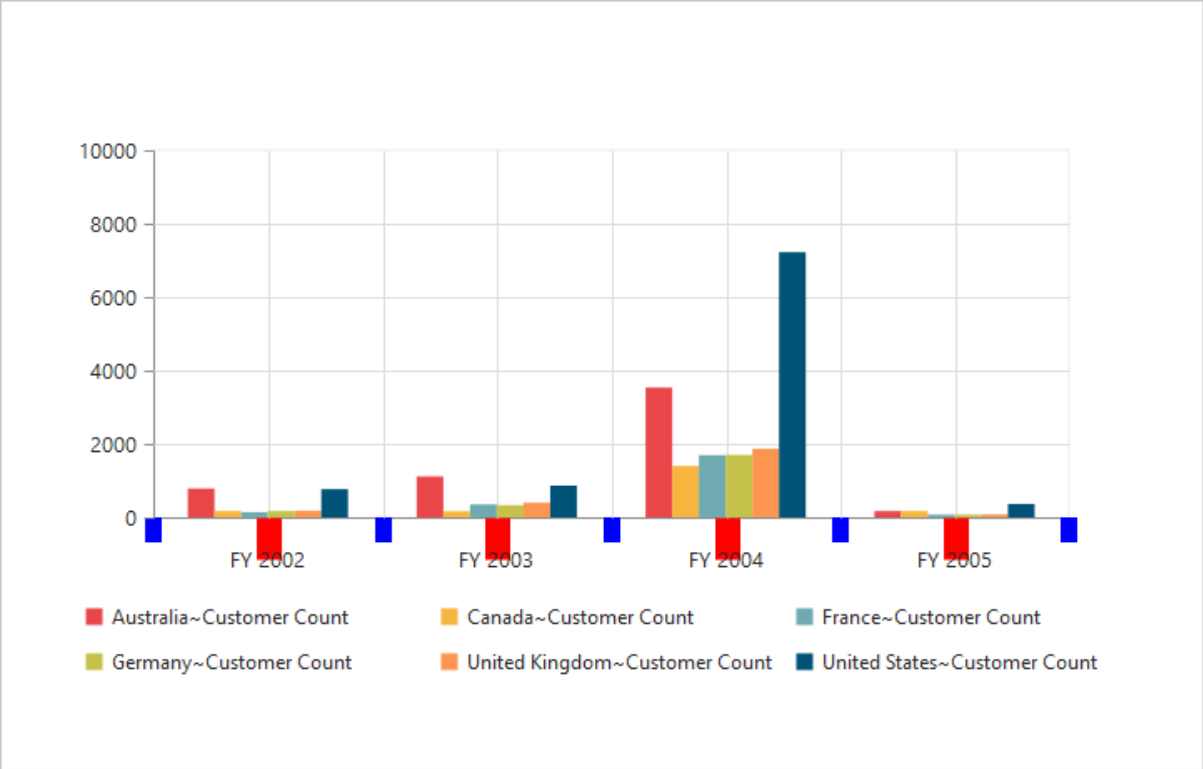
By using the MajorTickLines and MinorTickLines properties of the axis, you can customize the width, color, visibility, size and opacity of the tick lines.

Note: By default, the minor tick lines are not visible in PivotChart.

ASPX-CS

```
//Customizing tick lines
@Html.EJ().Pivot().PivotChart("PivotChart1").PrimaryXAxis(primaryX =>
primaryX.MajorTickLines(mr =>
mr.Width(10).Size(15).Color("Blue").Size(15).Visible(true)).MinorTickLine
s(mg =>
mg.Width(15).Size(25).Color("Red").Visible(true)).MinorTicksPerInterval(1
)).Url(Url.Content("/RelationalChartService.svc")).Size(size =>
size.Height("460px").Width("950px"))
```

Copyright © 2001 - 2020 Syncfusion Inc.



Inversing Axis

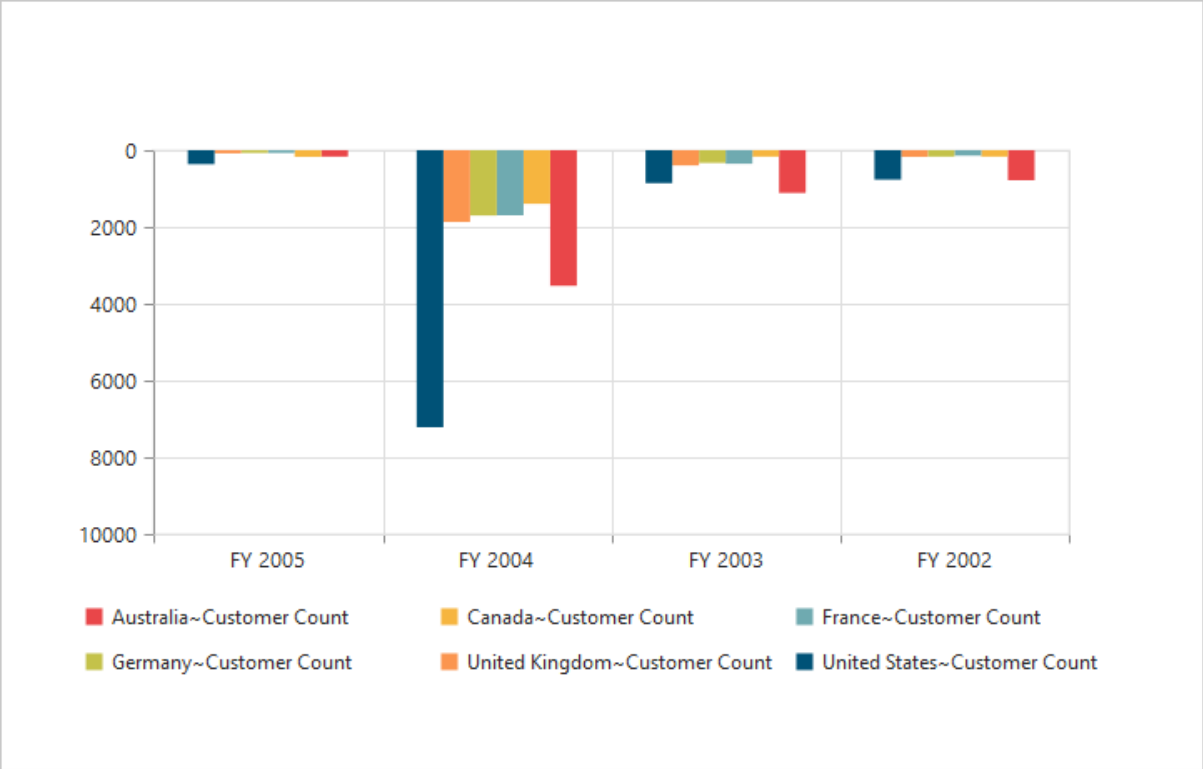
Axis can be inversed by using the `IsInversed` property of the axis.

Note: By default, the `IsInversed` property is false in PivotChart.

ASPX-CS

```
//Inversing the X and Y-axis
@Html.EJ().Pivot().PivotChart("PivotChart1").PrimaryXAxis(primaryX =>
primaryX.IsInversed(true)).PrimaryYAxis(primaryY =>
primaryY.IsInversed(true)).Url(Url.Content("/RelationalChartService.svc")
).Size(size => size.Height("460px").Width("950px"))
```

Copyright © 2001 - 2020 Syncfusion Inc.



Placing Axes at Opposite Side

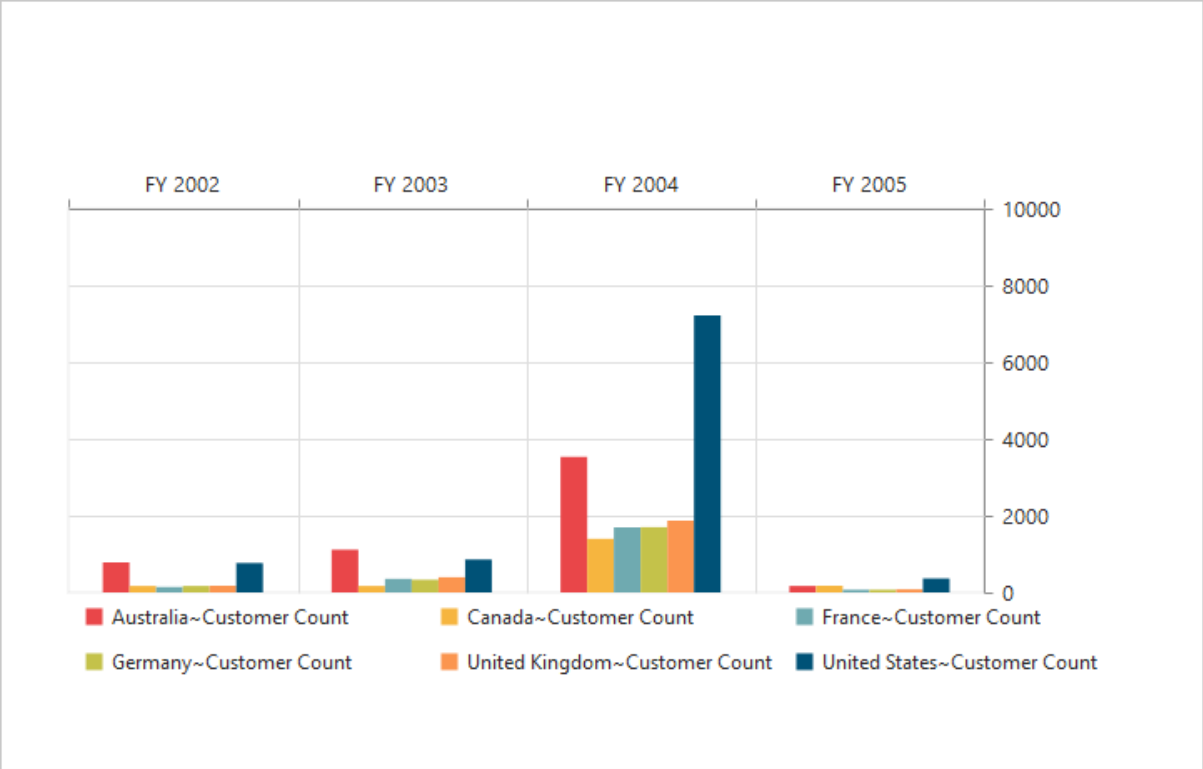
The OpposedPosition property of Chart axis can be used to place the axis at the opposite direction from its default position.

Note: By default, the OpposedPosition property is false in PivotChart.

ASPX-CS

```
//Placing axis at the opposite side of its normal position
@Html.EJ().Pivot().PivotChart("PivotChart1").PrimaryXAxis(primaryX =>
primaryX.OpposedPosition(true)).PrimaryYAxis(primaryY =>
primaryY.OpposedPosition(true)).Url(Url.Content("/RelationalChartService.
svc")).Size(size => size.Height("460px").Width("950px"))
```

Copyright © 2001 - 2020 Syncfusion Inc.



Smart Axis Labels

When the axis labels overlap with each other based on the Chart dimensions and label size, you can use `LabelIntersection` property of the axis to avoid overlapping.

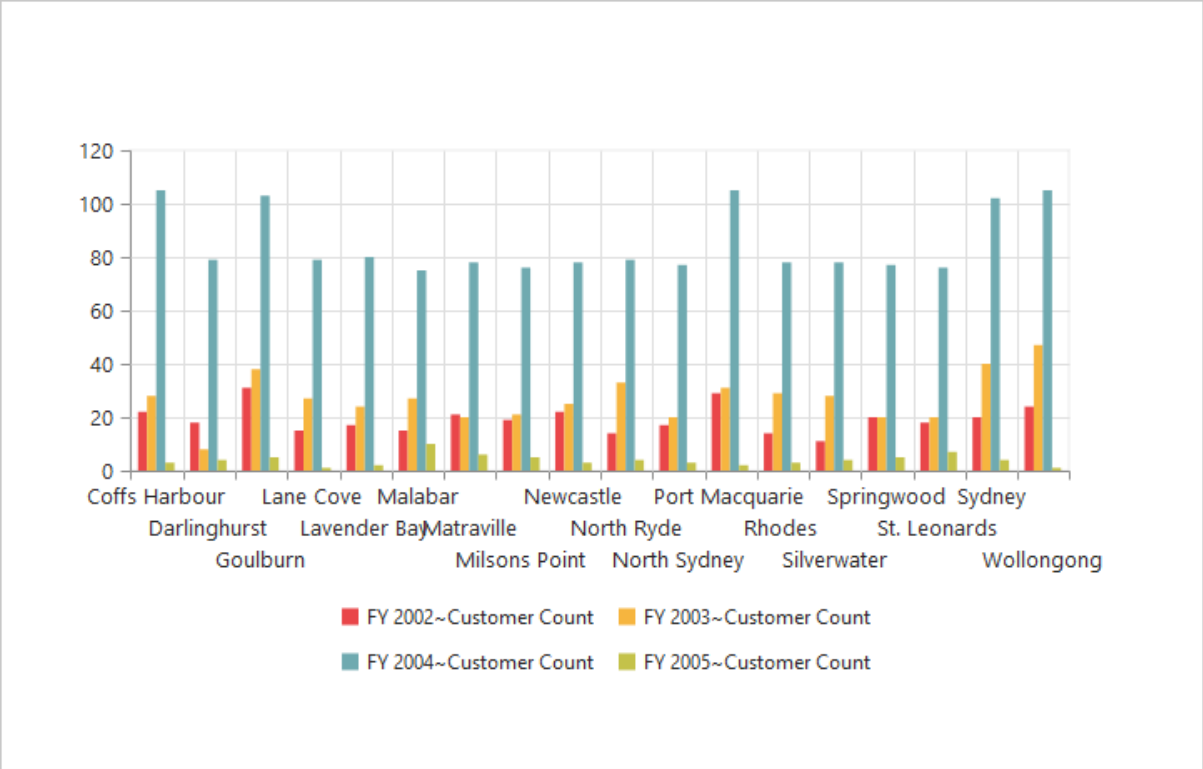
Note: By default, the `LabelIntersection` property is none in PivotChart.

- Rotate45
- Rotate90
- Trim
- MultipleRows
- Wrap
- Hide.

ASPX-CS

```
// Avoid overlapping of x-axis labels
@Html.EJ().Pivot().PivotChart("PivotChart1").PrimaryXAxis(primaryX =>
primaryX.
LabelIntersectAction(LabelIntersectAction.MultipleRows)).Url(Url.Content(
"/RelationalChartService.svc")).Size(size =>
size.Height("460px").Width("950px"))
```

Copyright © 2001 - 2020 Syncfusion Inc.



Title

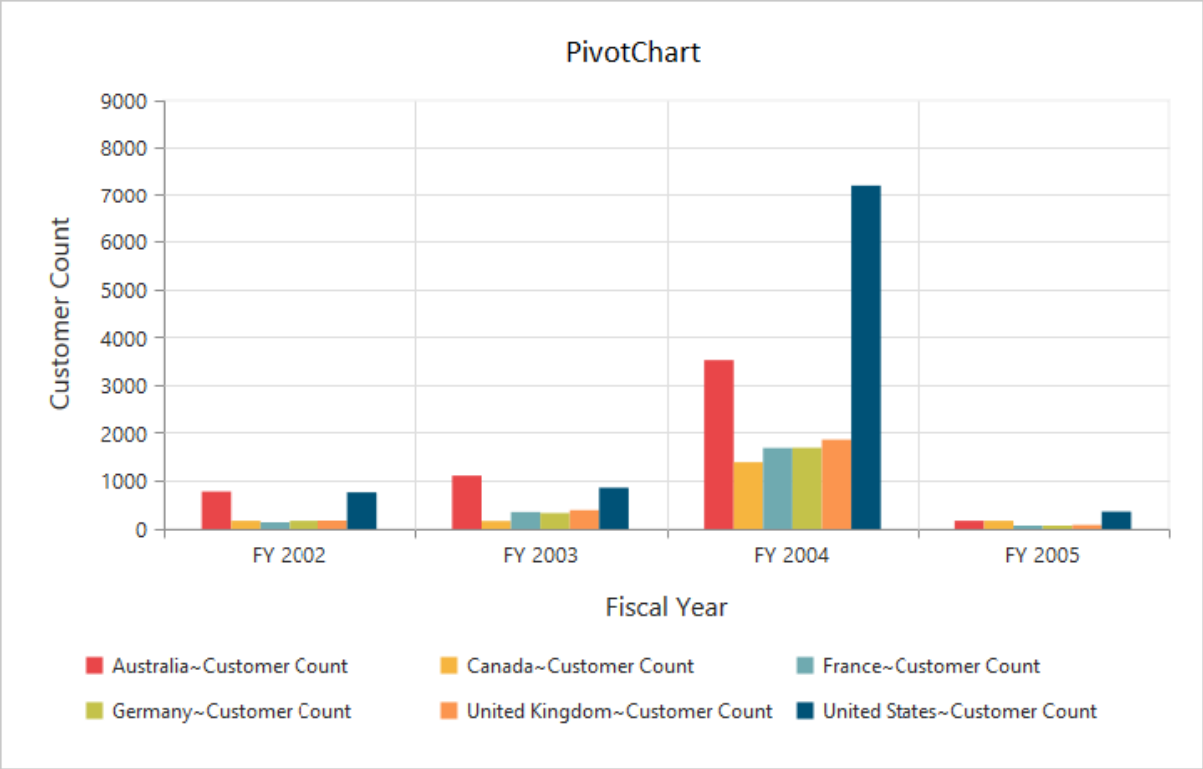
Title Text

By using the title.Text property, you can add the title text for PivotChart.

ASPX-CS

```
//Adding Chart title
@Html.EJ().Pivot().PivotChart("PivotChart1").Title(title =>
title.Text("PivotChart in
JS")).Url(Url.Content("/RelationalChartService.svc")).Size(size =>
size.Height("460px").Width("950px"))
```

Copyright © 2001 - 2020 Syncfusion Inc.



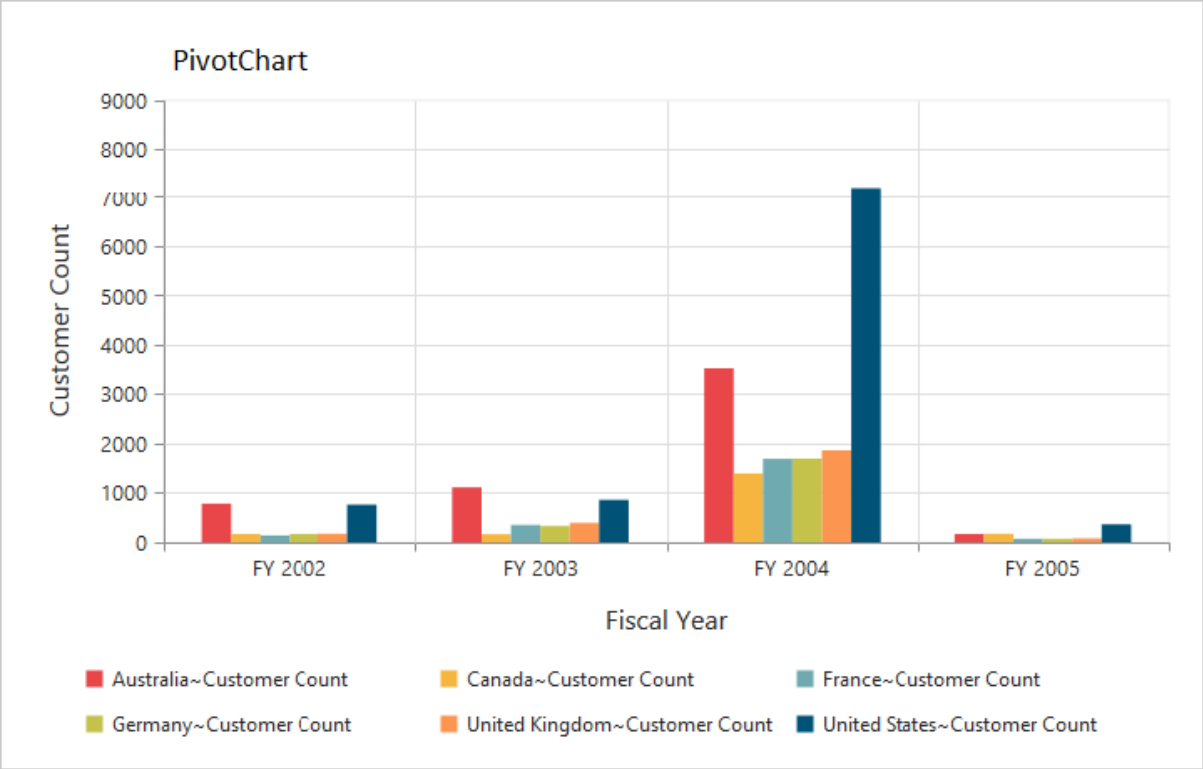
Title Alignment

By using the title.TextAlignment property, you can align the PivotChart controls title text to center, far or near.

ASPX-CS

```
//Change title text alignment
@Html.EJ().Pivot().PivotChart("PivotChart1").Title(title =>
title.Text("PivotChart in JS").TextAlignment(TextAlignment.Near)
).Url(Url.Content("/RelationalChartService.svc")).Size(size =>
size.Height("460px").Width("950px"))
```

Copyright © 2001 - 2020 Syncfusion Inc.



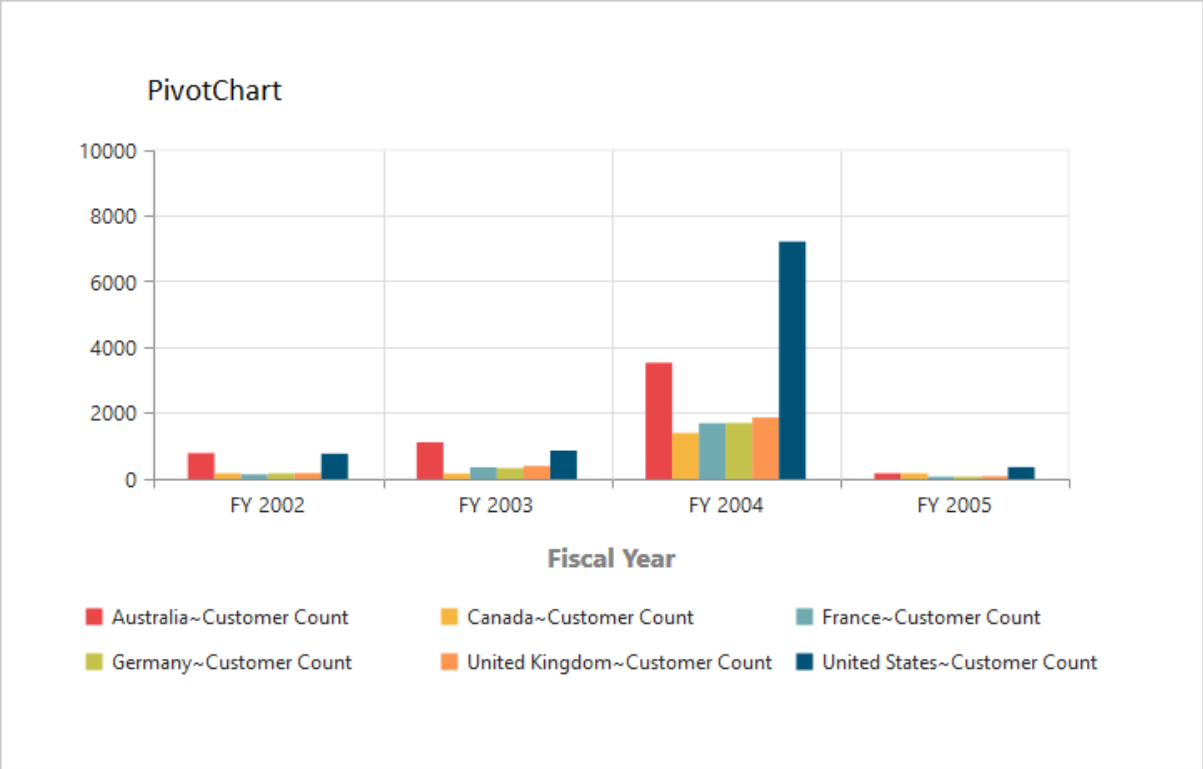
Title Customization

By using the Title property, you can add the title text for X-axis and Y-axis. Also title text can be customized by using the Text and Font properties. On setting EnableTrim to true, title text could be trimmed based on its length.

ASPX-CS

```
//Customizing axis title
@Html.EJ().Pivot().PivotChart("PivotChart1").PrimaryXAxis(primaryX =>
primaryX.Title(title => title.Text("Fiscal Year").Font(font=>
font.Size("16px").FontFamily("Segoe
UI").FontWeight(ChartFontWeight.Bold).Color("grey")))).Url(Url.Content("/
RelationalChartService.svc")).Size(size =>
size.Height("460px").Width("950px"))
```

Copyright © 2001 - 2020 Syncfusion Inc.



Series

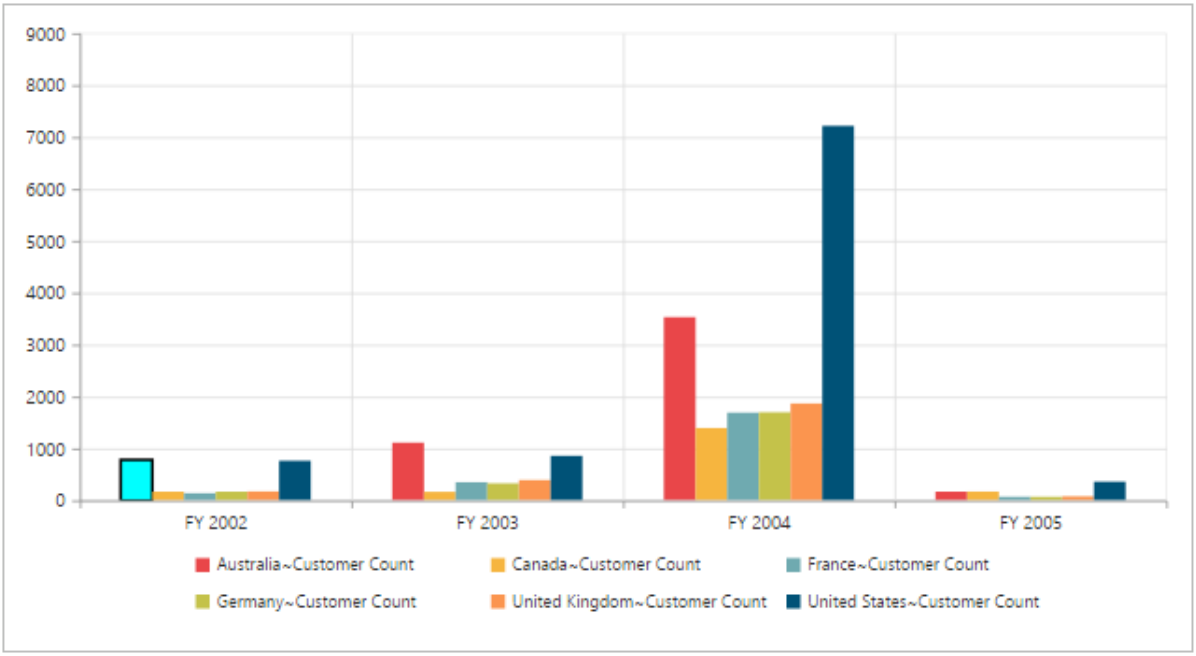
Series Point customization

By using the fill and border properties of Chart series, you can customize the PivotChart series color, border color and border width.

ASPX-CS

```
@Html.EJ().Pivot().PivotChart("PivotChart1").Url(Url.Content("/Relational
ChartService.svc")).Size(size =>
size.Height("460px").Width("950px")).ClientSideEvents(
oEve => { oEve.SeriesRendering("onSeriesRenders"); })
<script>
function onSeriesRenders(args) {
this.model.series[0].points[0].fill = "aqua";
this.model.series[0].points[0].border = {
color: "black",
width: 2
};
}
</script>
```

Copyright © 2001 - 2020 Syncfusion Inc.



Multiple Axes

You can split the pivot chart and its area into multiple panes to draw multiple series with multiple axes. Additional vertical/horizontal axes in the pivot chart can be created by the axes property.

Before rendering multiple axes in the pivot chart, you should know some important properties of axes and series of the pivot chart.

Properties of axes

- **rowIndex**: Specifies the index of the row where the axis is associated.
- **columnIndex**: Specifies the index of the column where the axis is associated.
- **opposedPosition**: Specifies whether to render the axis at the opposite side of its default position.
- **labelFormat**: Provides custom formatting for axis label and supports all standard formatting types of numerical and date time values.
- **title**: You can customize the title of the axis by the following properties.
- **enableTrim**: Specifies whether to trim the axis title when it exceeds the chart area or the maximum width of the title.
- **maximumTitleWidth**: When the title exceeds the maximum width, the title gets trimmed by setting enableTrim to true.
- **visible**: Controls the visibility of the axis title.
- **name**: Unique name of the axis. To associate an axis with the series, you have to set this name to the xAxisName/yAxisName property of the series.

To know more about axes properties, Click Here

Properties of series

- **xAxisName**: Specifies the name of the X-axis that has to be associated with this series. Add an axis instance with this name to axes collection.

Copyright © 2001 - 2020 Syncfusion Inc.

- **yAxisName**: Specifies the name of the Y-axis that has to be associated with this series. Add an axis instance with this name to axes collection.

Customizing axes at row index of zero

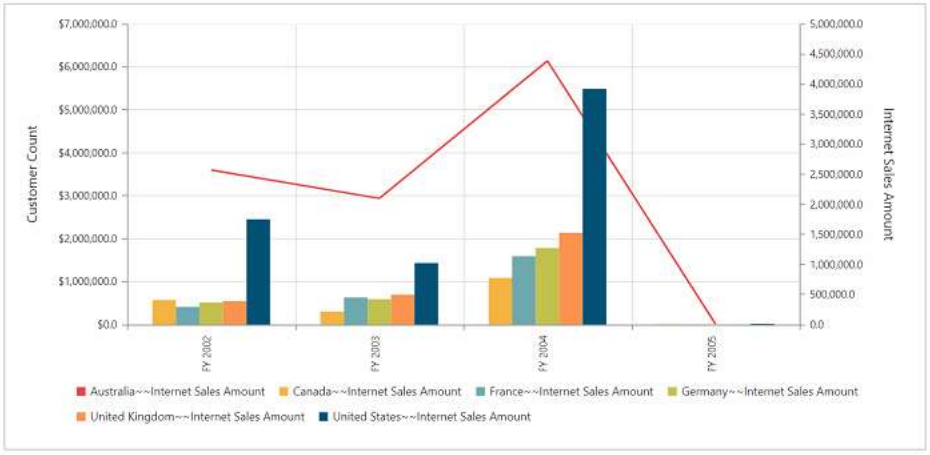
You can customize the axes in the primary pivot chart itself. To achieve this, you should give the following properties:

HTML

```
@Html.EJ().Pivot().PivotChart("PivotChart1").Axes(ax => {
ax.RowIndex(0).Name("yAxisConfig").Add();
}).ClientSideEvents(clientSideEvents =>
clientSideEvents.Load("onLoad").BeforeSeriesRender("onBeforeRender"))
//....
```

JAVASCRIPT

```
<script>
function onBeforeRender(args) {
for (var i = 0; i < args.series.length; i++) {
if (args.series[i].name.indexOf("Australia") != -1) {
args.series[i].yAxisName = "yAxisConfig";
args.series[i].type = "line";
}
}
return args;
}
</script>
```



Customizing axes at row index one

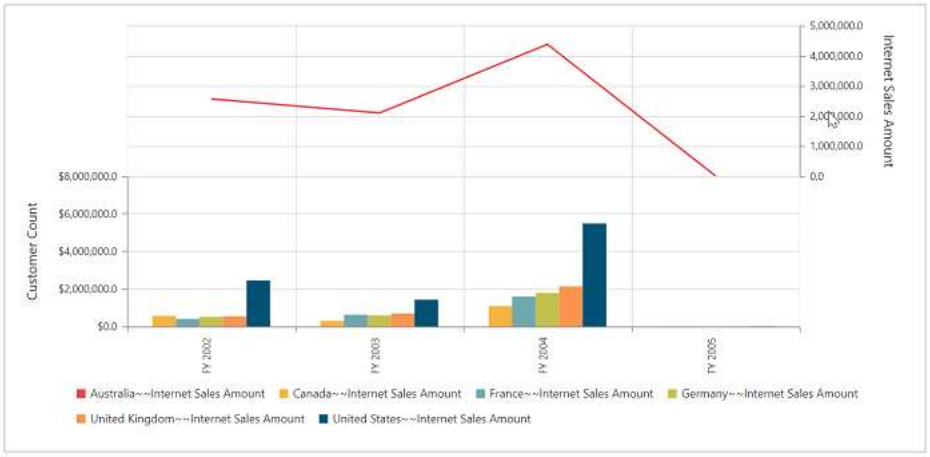
HTML

```
@Html.EJ().Pivot().PivotChart("PivotChart1").Axes(ax => {
ax.RowIndex(1).Name("yAxisConfig").Add();
}).ClientSideEvents(clientSideEvents =>
clientSideEvents.Load("onLoad").BeforeSeriesRender("onBeforeRender"))
//....
```

Copyright © 2001 - 2020 Syncfusion Inc.

JAVASCRIPT

```
<script>
function onBeforeRender(args) {
for (var i = 0; i < args.series.length; i++) {
if (args.series[i].name.indexOf("Australia") != -1) {
args.series[i].yAxisName = "yAxisConfig";
args.series[i].type = "line";
}
}
return args;
}
</script>
```



Customizing axes at column index of zero

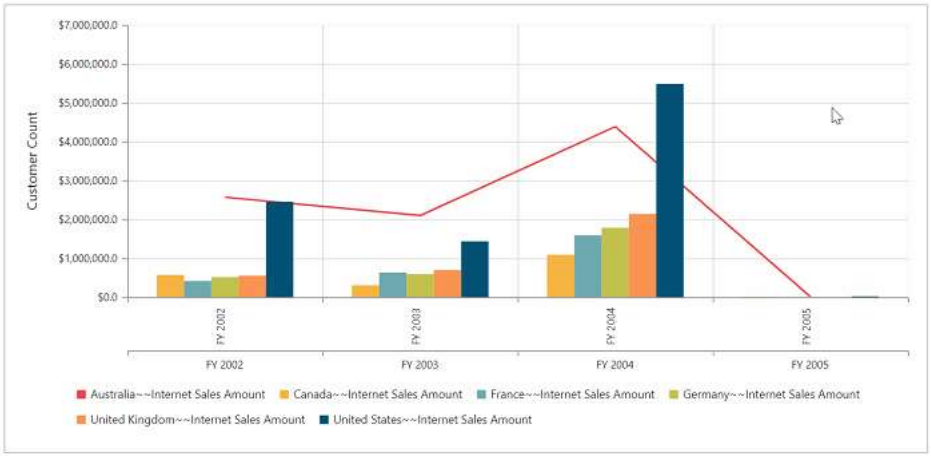
HTML

```
@Html.EJ().Pivot().PivotChart("PivotChart1").Axes(ax => {
ax.ColumnIndex(0).Name("xAxisConfig").Add();
}).ClientSideEvents(clientSideEvents =>
clientSideEvents.Load("onLoad").BeforeSeriesRender("onBeforeRender"))
//....
```

JAVASCRIPT

```
<script>
function onBeforeRender(args) {
for (var i = 0; i < args.series.length; i++) {
if (args.series[i].name.indexOf("Australia") != -1) {
args.series[i].xAxisName = "xAxisConfig";
args.series[i].type = "line";
}
}
return args;
}
</script>
```

Copyright © 2001 - 2020 Syncfusion Inc.



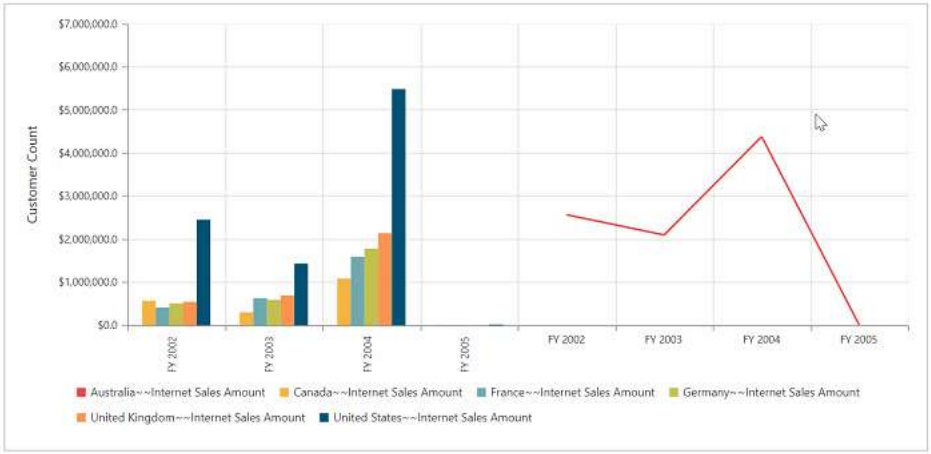
Customizing axes at column index of one

HTML

```
@Html.EJ().Pivot().PivotChart("PivotChart1").Axes(ax => {
ax.ColumnIndex(1).Name("xAxisConfig").Add();
}).ClientSideEvents(clientSideEvents =>
clientSideEvents.Load("onLoad").BeforeSeriesRender("onBeforeRender"))
//....
```

JAVASCRIPT

```
<script>
function onBeforeRender(args) {
for (var i = 0; i < args.series.length; i++) {
if (args.series[i].name.indexOf("Australia") != -1) {
args.series[i].xAxisName = "xAxisConfig";
args.series[i].type = "line";
}
}
return args;
}
</script>
```



Copyright © 2001 - 2020 Syncfusion Inc.

Customizing series

You can customize the series in multiple axes support with the help of **beforeSeriesRender** event. You can change the series type through the **onBeforeRender** event.

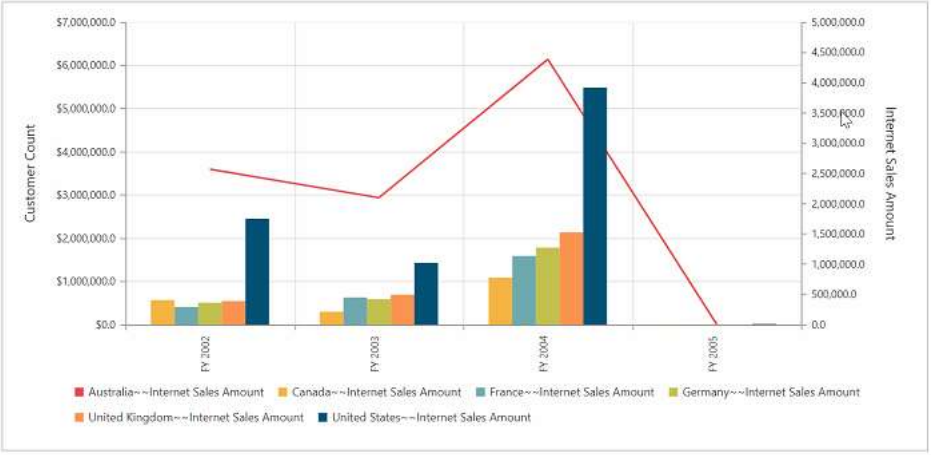
HTML

```
@Html.EJ().Pivot().PivotChart("PivotChart1").Axes(ax => {
ax.Name("yAxisConfig").Add(); }).ClientSideEvents(clientSideEvents =>
clientSideEvents.Load("onLoad").BeforeSeriesRender("onBeforeRender"))
//....
```

JAVASCRIPT

```
<script>
function onBeforeRender(args) {
for (var i = 0; i < args.series.length; i++) {
if (args.series[i].name.indexOf("Australia") != -1) {
args.series[i].yAxisName = "yAxisConfig";
args.series[i].type = "line";
}
}
return args;
}
</script>
```

Note: You have to use the same name in both name property of axes and xAxisName/yAxisName property of series in the above **beforeSeriesRender** event.



To learn more about series properties, click here.

Multiple axes support by series index

You can render the pivot chart with multiple axes by series index.

Note: This is the default behavior of multiple axes support, if you are not triggering the beforeSeriesRender event.

HTML

```
@Html.EJ().Pivot().PivotChart("PivotChart1").Axes(ax => {
ax.Name("y:0").Add();ax.Name("x:1").Add() })
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
//....
```

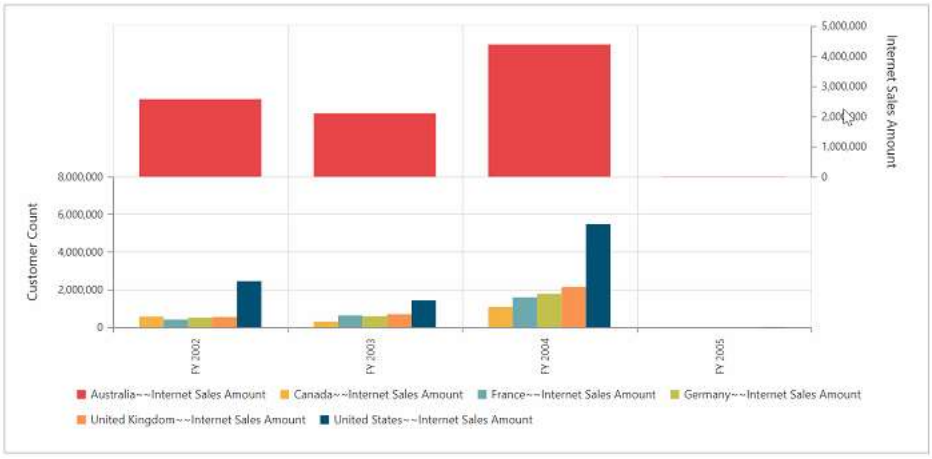
JAVASCRIPT

```
Name("y:0") => //you can create separate y axes for the series which you
want
//y indicates(yAxisName) axis in which series needs to be added.
//0 indicates the series index of pivot chart.
//you can also use pass multiple series index separated by comma(y:0,2)
Name("x:1") =>  //you can create separate x axes for the series which you
want
// x indicates(xAxisName) axis in which series needs to be added.
// 0 indicates the series index of pivot chart.
// you can also use pass multiple series index separated by comma(x:0,2)
```

For Y-axes

HTML

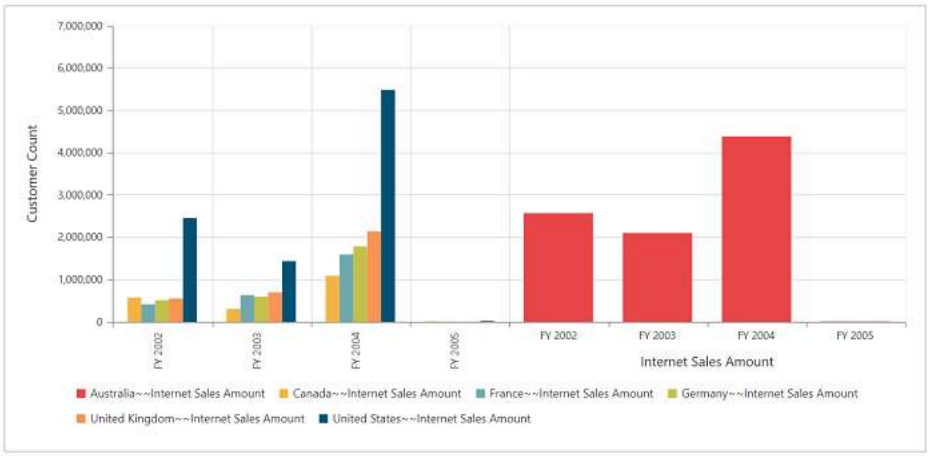
```
@Html.EJ().Pivot().PivotChart("PivotChart1").Axes(ax => {
ax.Name("y:0").Add(); })
//....
```



For X-axes

HTML

```
@Html.EJ().Pivot().PivotChart("PivotChart1").Axes(ax => {
ax.Name("x:0").Add(); })
//....
```



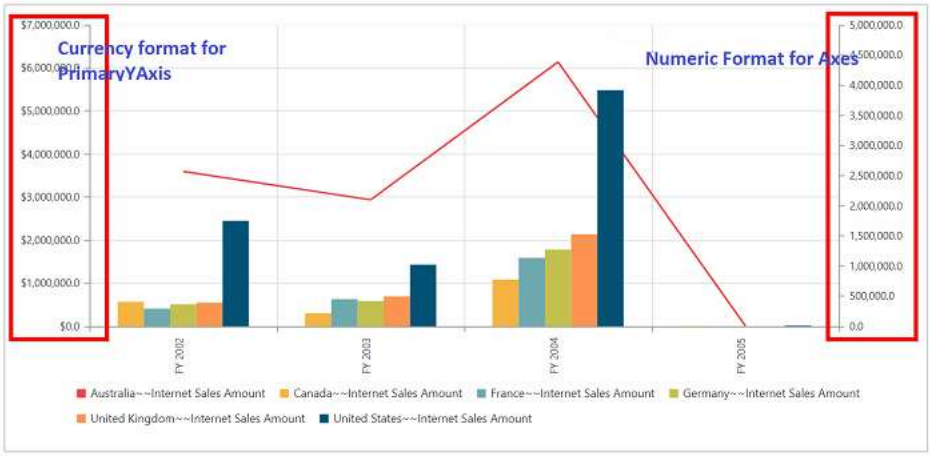
Customizing PrimaryYAxis and axes properties

labelFormat

You can customize the **labelFormat** for both PrimaryYAxis and custom axes.

HTML

```
@Html.EJ().Pivot().PivotChart("PivotChart1").Axes(ax => {
ax.LabelFormat("n1").Add(); }).PrimaryYAxis(primary => {
primary.LabelFormat("c1").Add(); })
//....
```

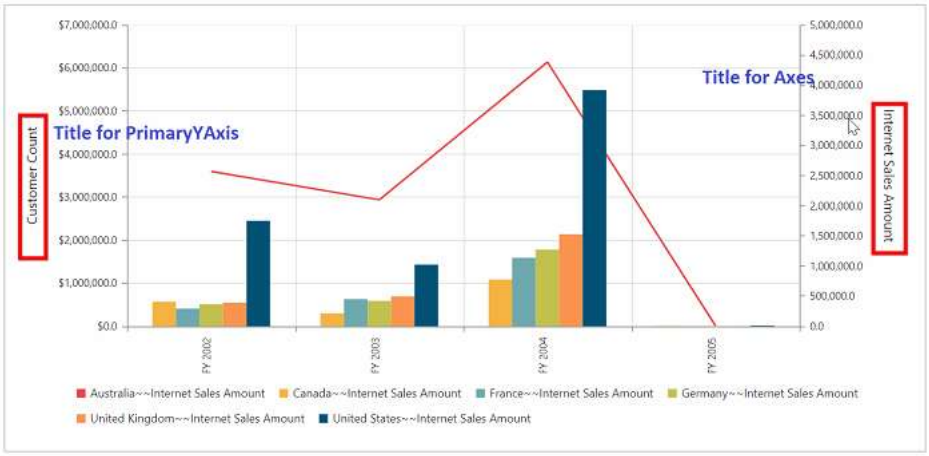


title

You can customize the title for axes by the **title** property.

HTML

```
@Html.EJ().Pivot().PivotChart("PivotChart1").Axes(ax => {
ax.Title(title=>title.Text("Internet Sales Amount")).Add();
}).PrimaryYAxis(primary => { primary.Title(title=>title.Text("Customer
Count")).Add(); })
//....
```



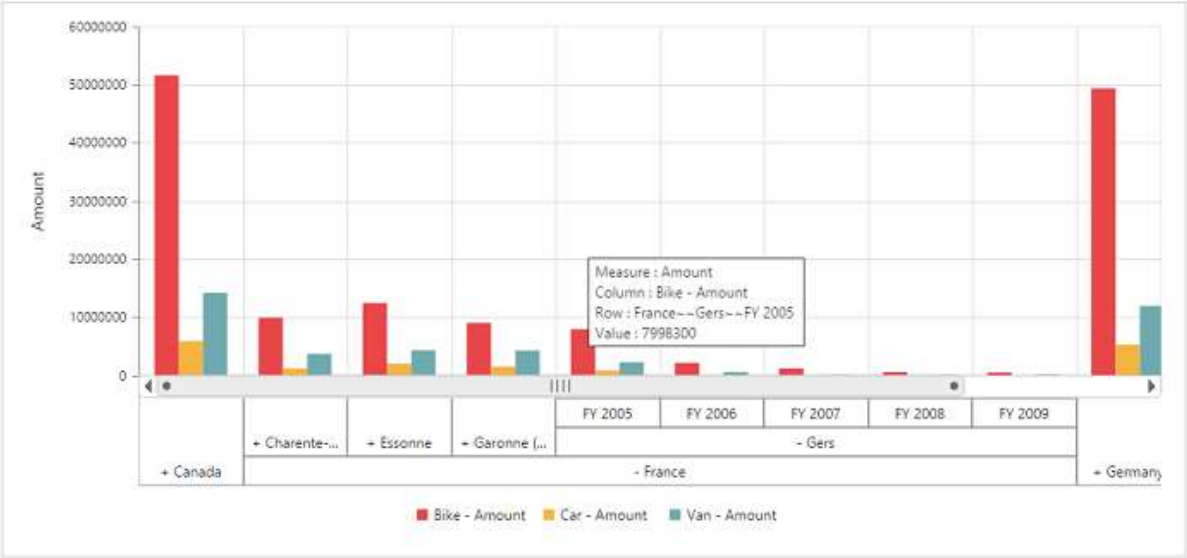
Multi-level Labels

Multi-level labels allows you to drill down to access the detailed level of data or drill up to see the summarized data by using the expander present in the OlapChart.

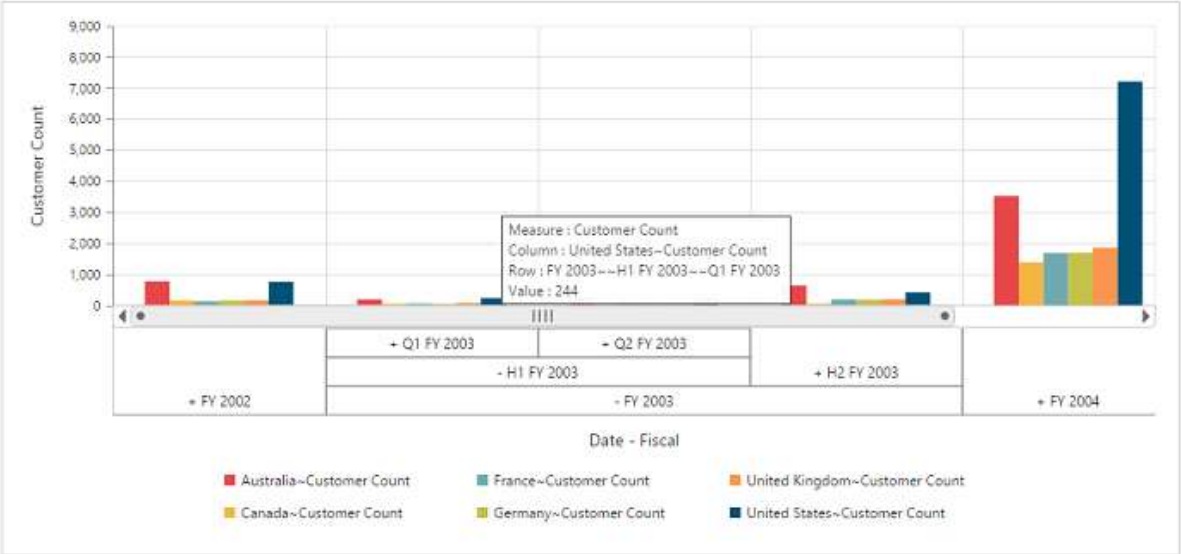
ASPX-CS

```
@Html.EJ().Pivot().PivotChart("PivotChart1").EnableMultiLevelLabels(true)
```

Relational



OLAP



3D Visualization

The PivotChart control allows you to view the data in a 3D view. Following are the chart types that are supported:

- Bar
- Column
- Stacking Bar
- Stocking Column
- Pie

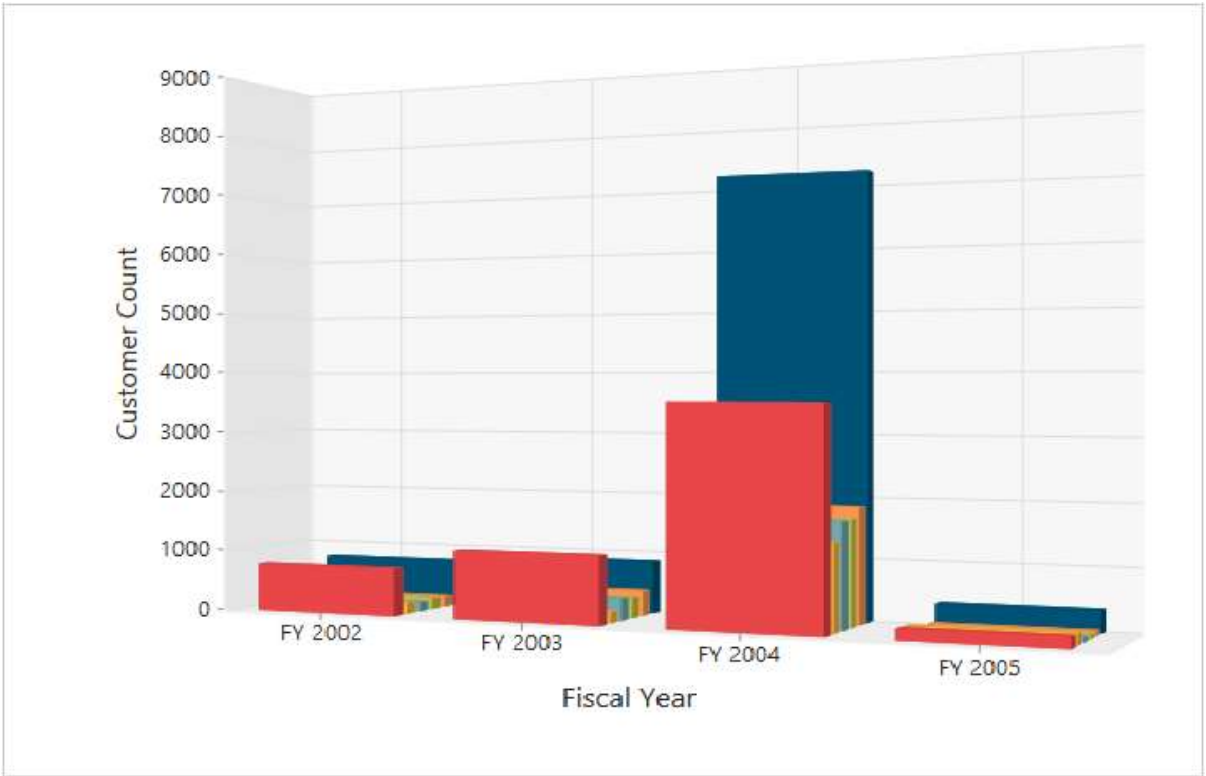
3D Column Chart

3D Column Chart is rendered by specifying the chart type as **“Column”** in the **“CommonSeriesOptions”** enumeration property as well as by setting the Enable3D property to **“true”.**

ASPX-CS

```
@Html.EJ().Pivot().PivotChart("PivotChart1").Url(Url.Content("/Relational
ChartService.svc")).Rotation(24).CommonSeriesOptions(comm => {
comm.Type(SeriesType.Column); }).Size(size =>
size.Height("450px").Width("100%")).Enable3D(true)
```

Copyright © 2001 - 2020 Syncfusion Inc.



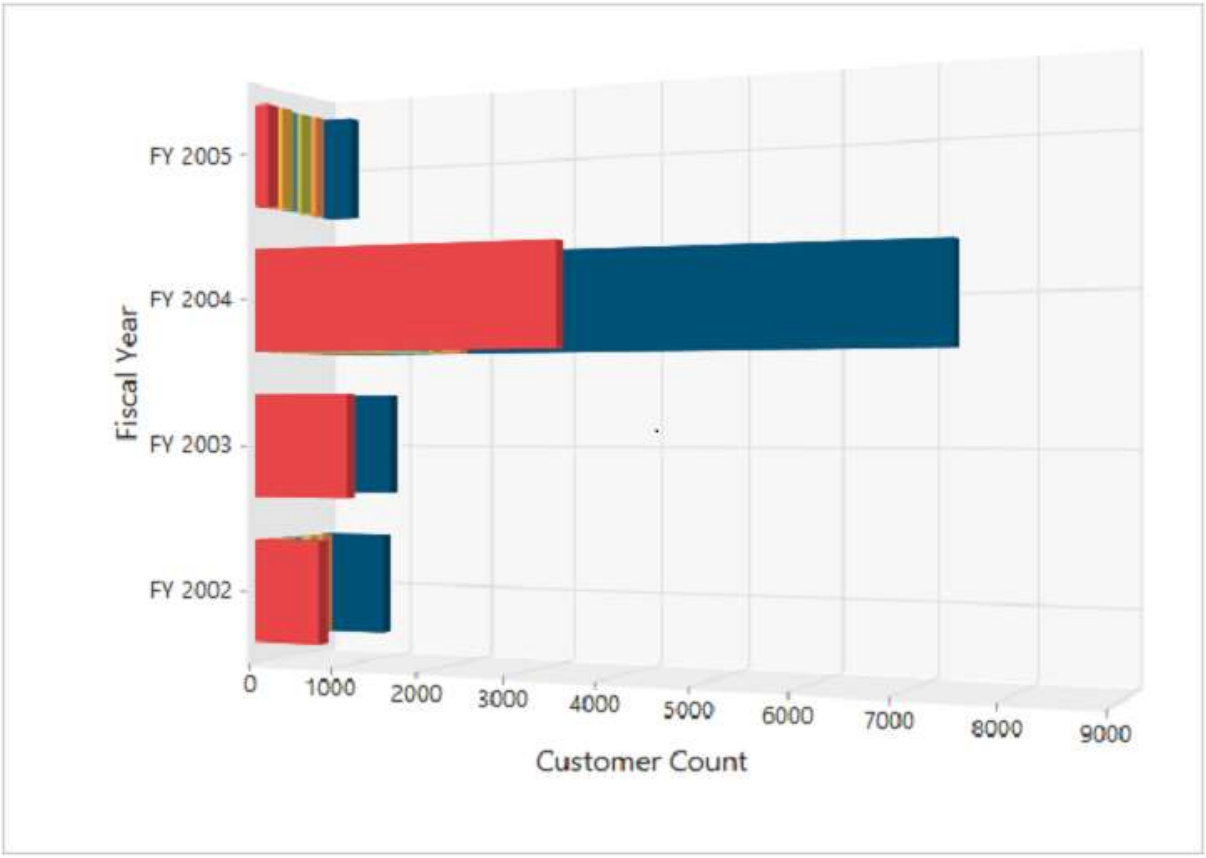
3D Bar Chart

3D Bar Chart is rendered by specifying the chart type as **"Bar"** in the **"CommonSeriesOptions"** enumeration property as well as by setting the Enable3D property to **"true".**

ASPX-CS

```
@Html.EJ().Pivot().PivotChart("PivotChart1").Url(Url.Content("/Relational
ChartService.svc")).Rotation(24).CommonSeriesOptions(comm => {
comm.Type(SeriesType.Bar); }).Size(size =>
size.Height("450px").Width("100%")).Enable3D(true)
```

Copyright © 2001 - 2020 Syncfusion Inc.



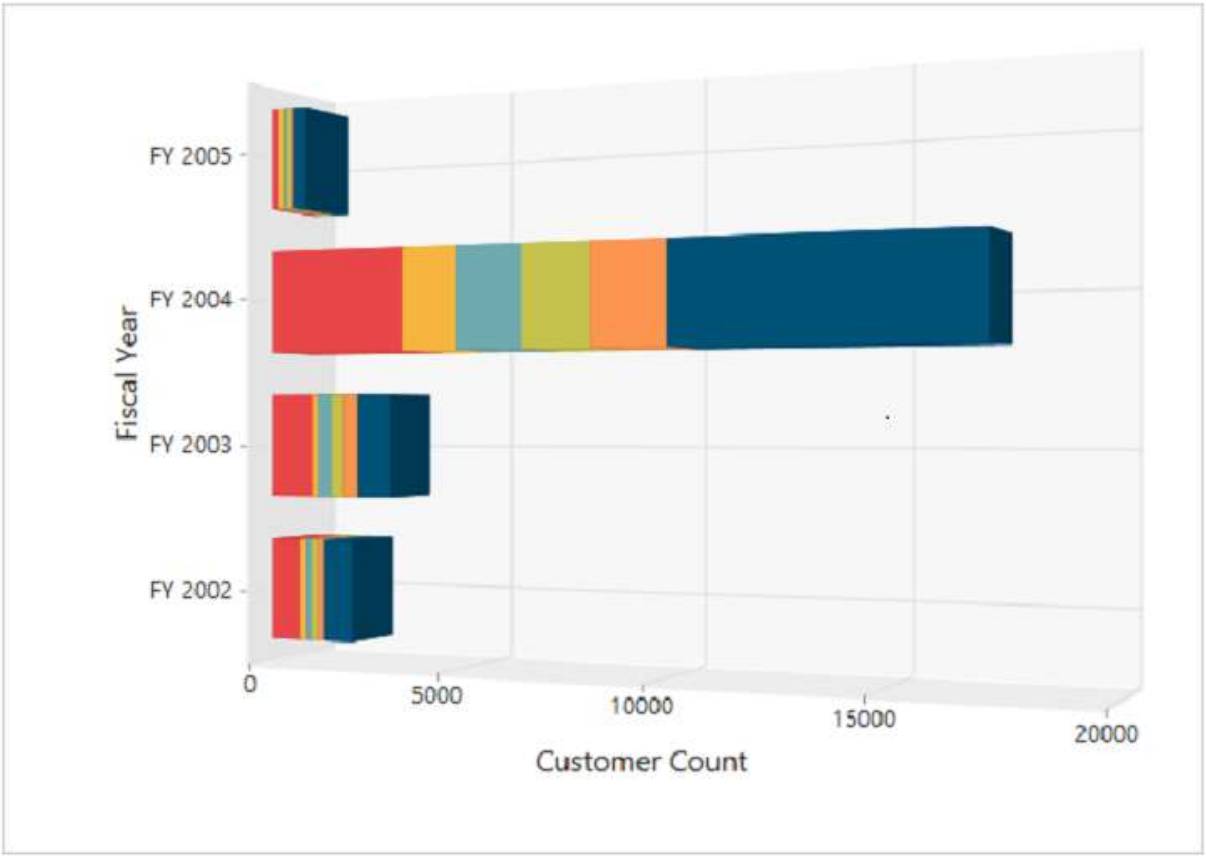
3D Stacking Bar Chart

3D Stacking Bar Chart is rendered by specifying the chart type as **"Stacking Bar"** in the **"CommonSeriesOptions"** enumeration property as well as by setting the Enable3D property to **"true".**

ASPX-CS

```
@Html.EJ().Pivot().PivotChart("PivotChart1").Url(Url.Content("/Relational
ChartService.svc")).Rotation(24).CommonSeriesOptions(comm => {
comm.Type(SeriesType.StackingBar); }).Size(size =>
size.Height("450px").Width("100%")).Enable3D(true)
```

Copyright © 2001 - 2020 Syncfusion Inc.



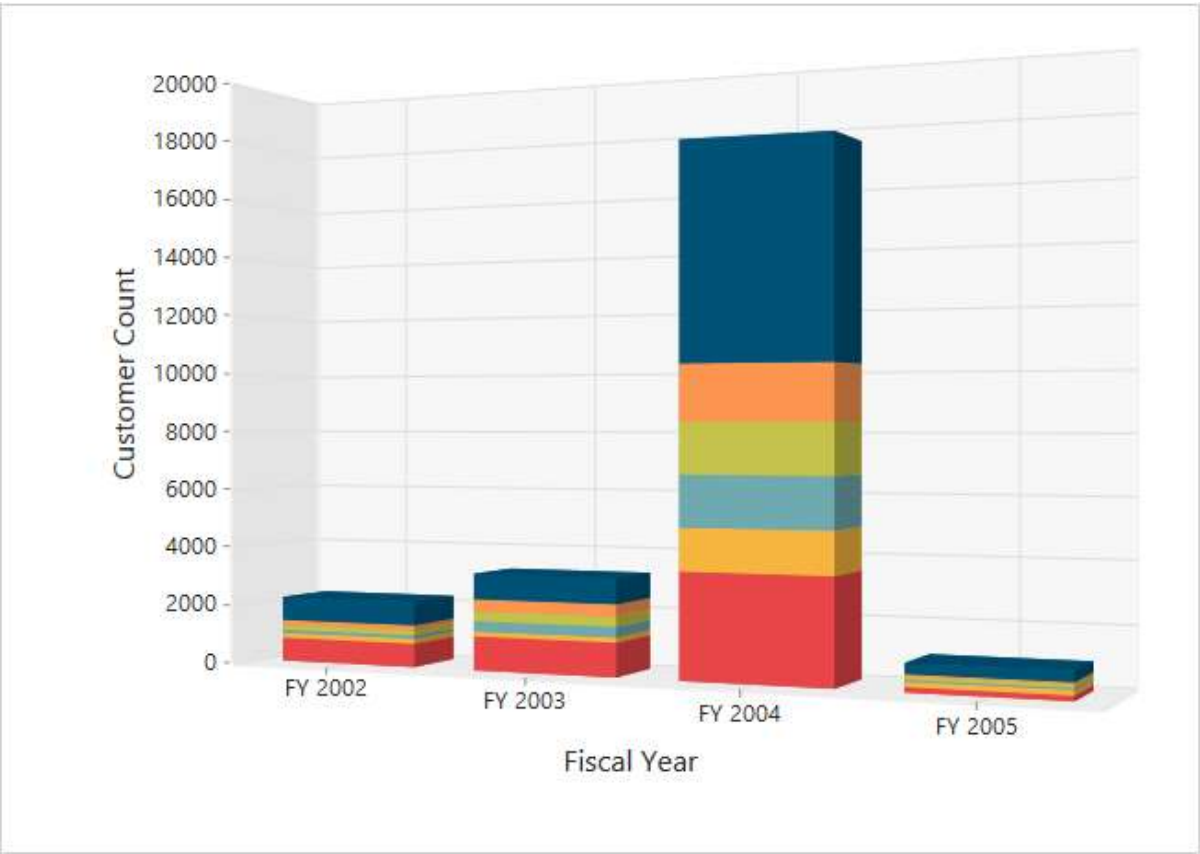
3D Stacking Column Chart

3D Stacking Column Chart is rendered by specifying the chart type as **"Stacking Column"** in the **"CommonSeriesOptions"** enumeration property as well as by setting the Enable3D property to **"true".**

ASPX-CS

```
@Html.EJ().Pivot().PivotChart("PivotChart1").Url(Url.Content("/Relational
ChartService.svc")).Rotation(24).CommonSeriesOptions(comm => {
comm.Type(SeriesType.StackingColumn); }).Size(size =>
size.Height("450px").Width("100%")).Enable3D(true)
```

Copyright © 2001 - 2020 Syncfusion Inc.



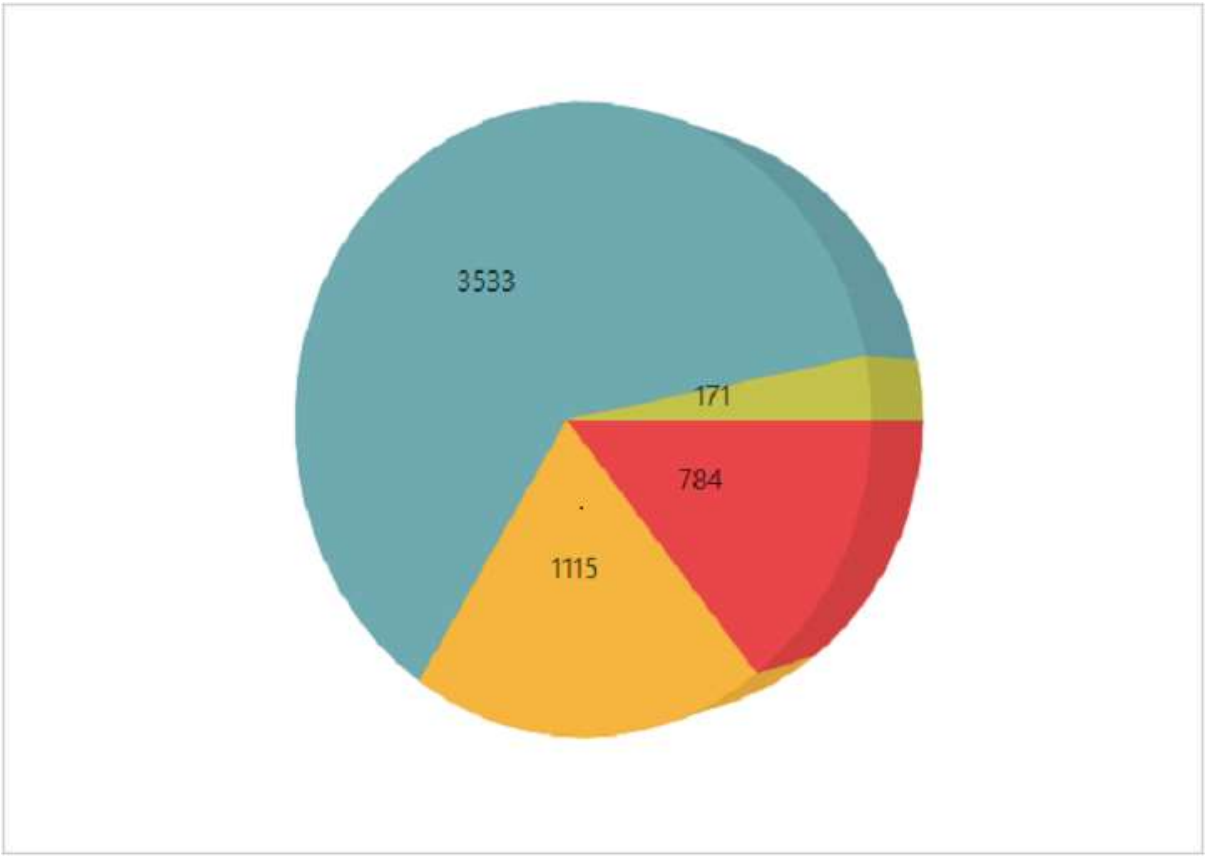
3D Pie Chart

3D Pie Chart is rendered by specifying the chart type as **“Pie”** in the **“CommonSeriesOptions”** enumeration property as well as by setting the Enable3D property to **“true”.**

ASPX-CS

```
@Html.EJ().Pivot().PivotChart("PivotChart1").Url(Url.Content("/Relational
ChartService.svc")).Rotation(24).CommonSeriesOptions(comm => {
comm.Type(SeriesType.Pie); }).Size(size =>
size.Height("450px").Width("100%")).Enable3D(true)
```

Copyright © 2001 - 2020 Syncfusion Inc.



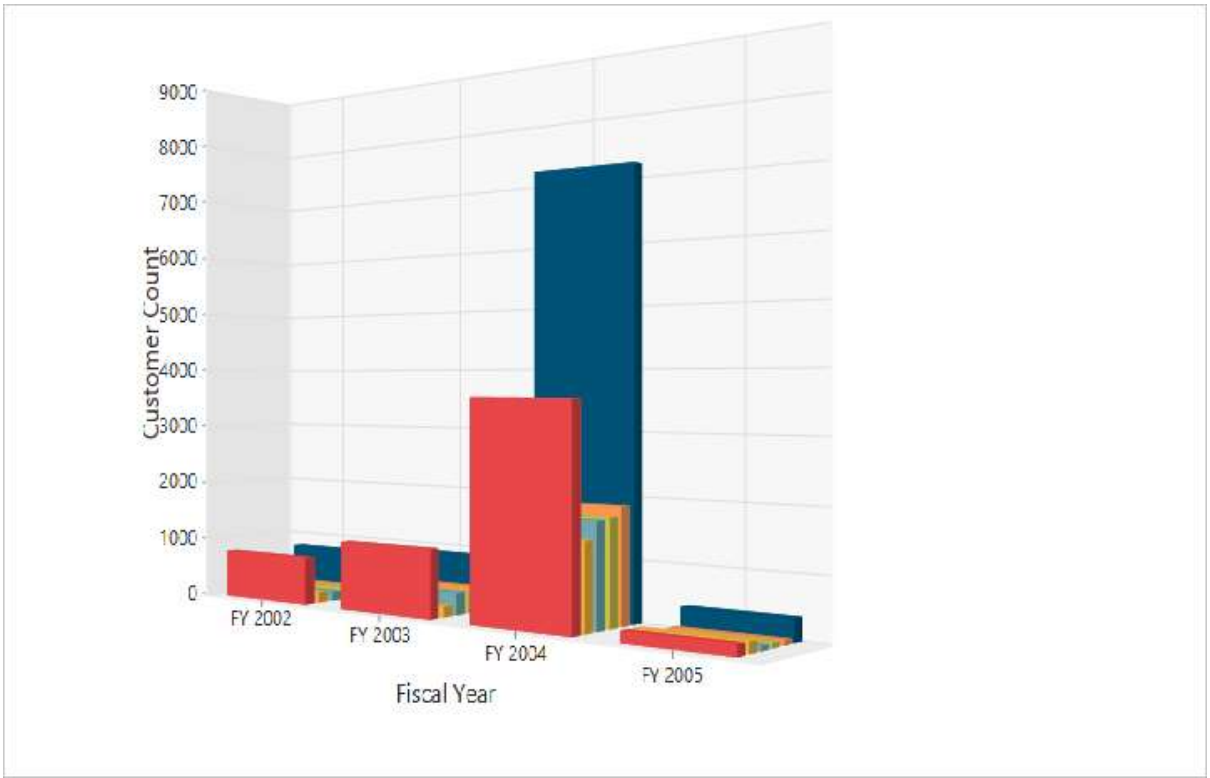
Rotating 3D Chart

We can rotate the 3D Chart towards left or right by setting an appropriate angle value to the Rotation property. The direction of the Chart display depends upon the positive or negative angle value.

ASPX-CS

```
@Html.EJ().Pivot().PivotChart("PivotChart1").Url(Url.Content("/Relational
ChartService.svc")).Rotation(40).CommonSeriesOptions(comm => {
comm.Type(SeriesType.Column); }).Size(size =>
size.Height("450px").Width("100%")).Enable3D(true)
```

Copyright © 2001 - 2020 Syncfusion Inc.



User Interactions

Tooltip

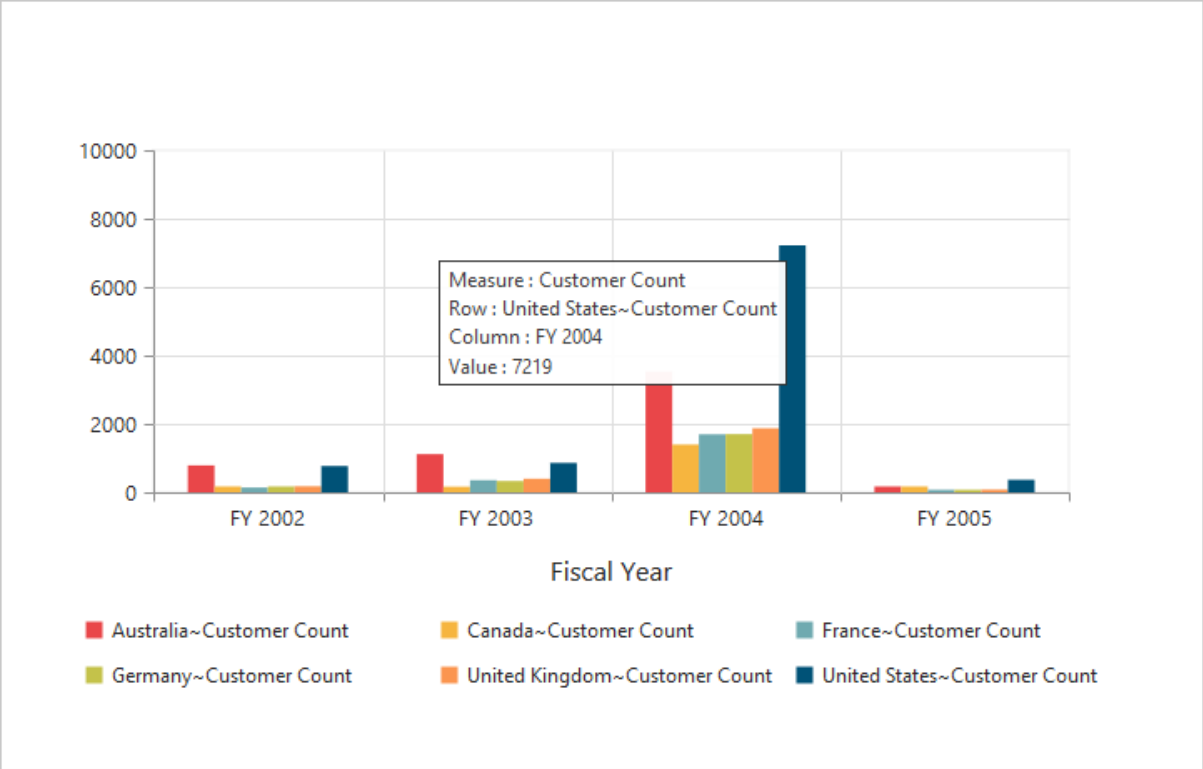
Enable Tooltip for Data Points

Tooltip for the data points can be enabled using the **“Visible”** option of the Tooltip property under **“CommonSeriesOptions”** of the PivotChart.

ASPX-CS

```
//Enabling tooltip of data point
@Html.EJ().Pivot().PivotChart("PivotChart1").Url(Url.Content("/Relational
ChartService.svc")).CommonSeriesOptions(comm => { comm.Tooltip(tool => {
tool.Visible(true); })}).Size(size => size.Height("460px").Width("100%"))
```

Copyright © 2001 - 2020 Syncfusion Inc.



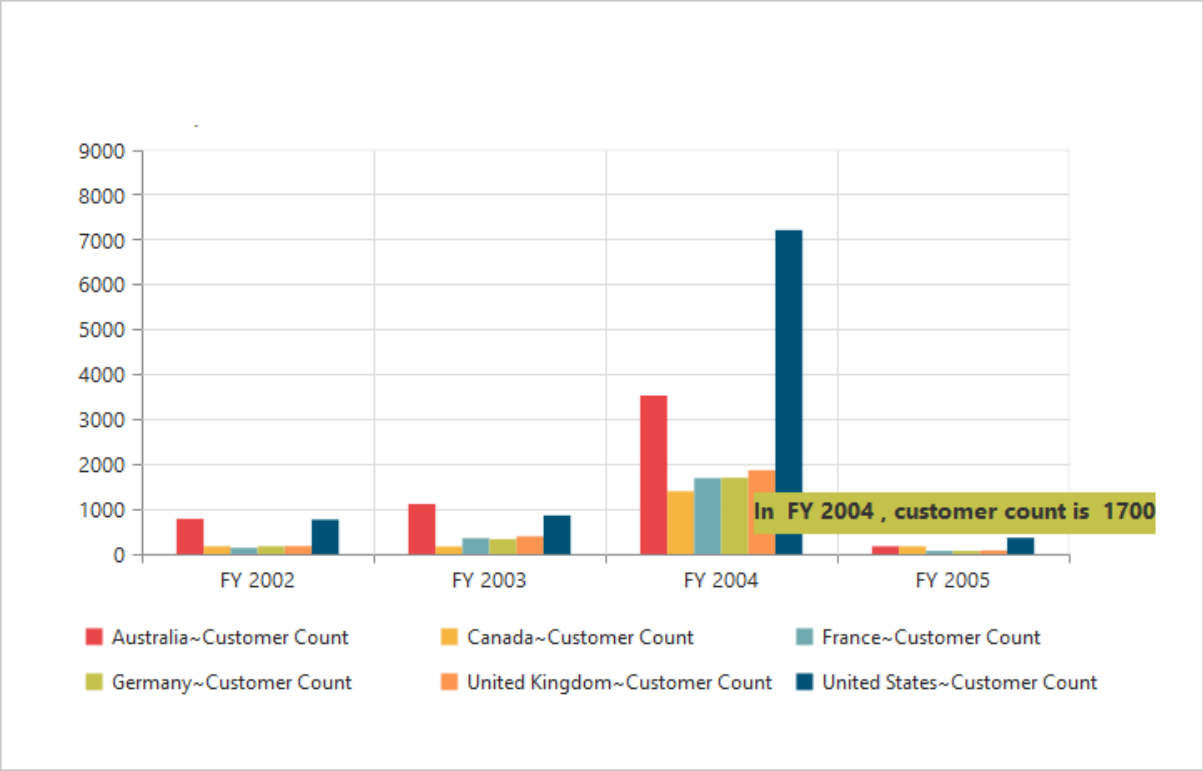
Tooltip Template

HTML elements can be displayed inside the tooltip by using the Template option. The template option takes the value of the “id” attribute from the HTML element. You can use the **#point.x#** and **#point.y#** as place holders in the HTML element to display the X and Y values of the corresponding data points.

ASPX-CS

```
<div id="Tooltip" style="display: none;">
<div id="icon"> <div id="ccicon"> </div>  </div>
<div id="value">
<div>
<label id="ccvalue"> #point.y# </label>
<label id="cc">Customer Count </label>
</div>
</div>
</div>
//Enabling tooltip of data point
@Html.EJ().Pivot().PivotChart("PivotChart1").Url(Url.Content("/Relational
ChartService.svc")).CommonSeriesOptions(comm => { comm.Tooltip(tool => {
tool.Visible(true).Template("Tooltip"); });}).Size(size =>
size.Height("460px").Width("100%"))
```

Copyright © 2001 - 2020 Syncfusion Inc.

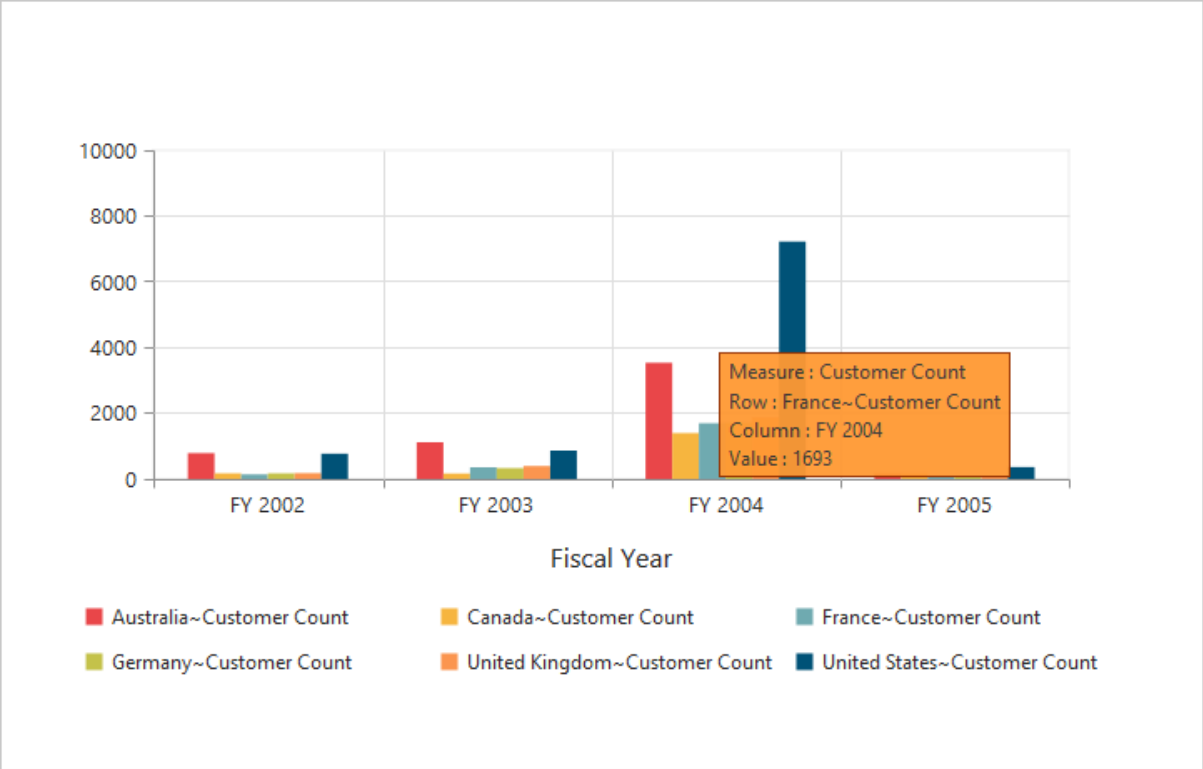


Tooltip Customization

By using Fill and Border properties of tooltip, you can customize its background color, border color and border width.

ASPX-CS

```
//Change tooltip color and border
@Html.EJ().Pivot().PivotChart("PivotChart1").Url(Url.Content("/Relational
ChartService.svc")).CommonSeriesOptions(comm => { comm.Tooltip(tool => {
tool.Visible(true). Fill("#FF9933").Border(border =>
border.Width(1).Color("#993300")); });}).Size(size =>
size.Height("460px").Width("100%"))
```



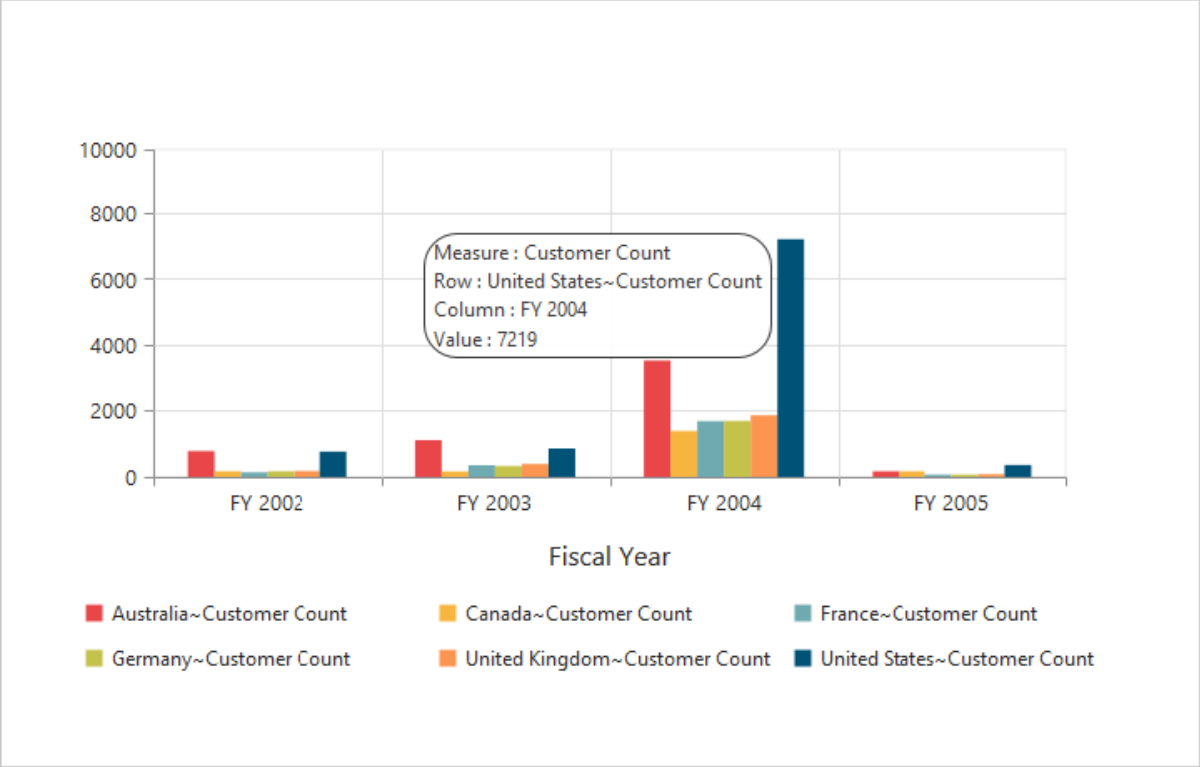
Tooltip with Rounded Corners

The tooltip properties, RX and RY are used to customize its corner radius.

ASPX-CS

```
//Customize the corner radius of the tooltip rectangle.
@Html.EJ().Pivot().PivotChart("PivotChart1").Url(Url.Content("/Relational
ChartService.svc")).CommonSeriesOptions(comm => { comm.Tooltip(tool => {
tool.Visible(true).RX(50).RY(50);});}).Size(size =>
size.Height("460px").Width("100%"))
```

Copyright © 2001 - 2020 Syncfusion Inc.



Zooming and Panning

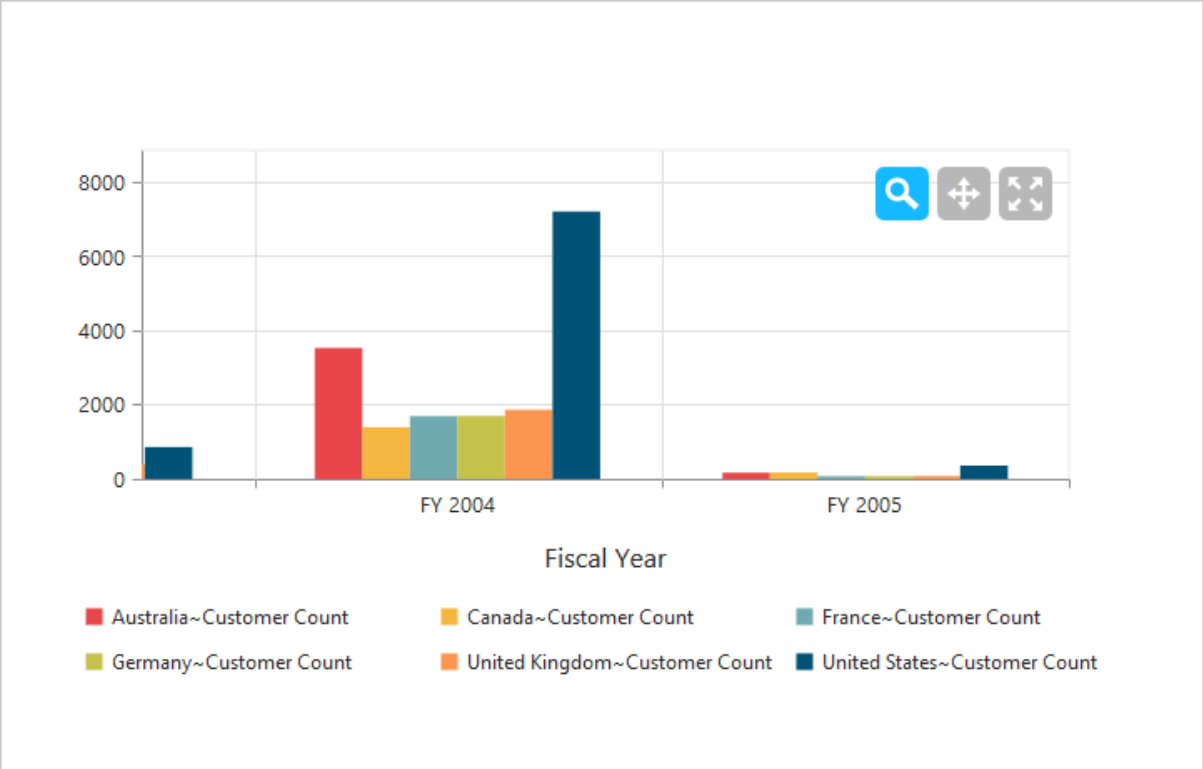
Enable Zooming

There are two ways to zoom the Chart:

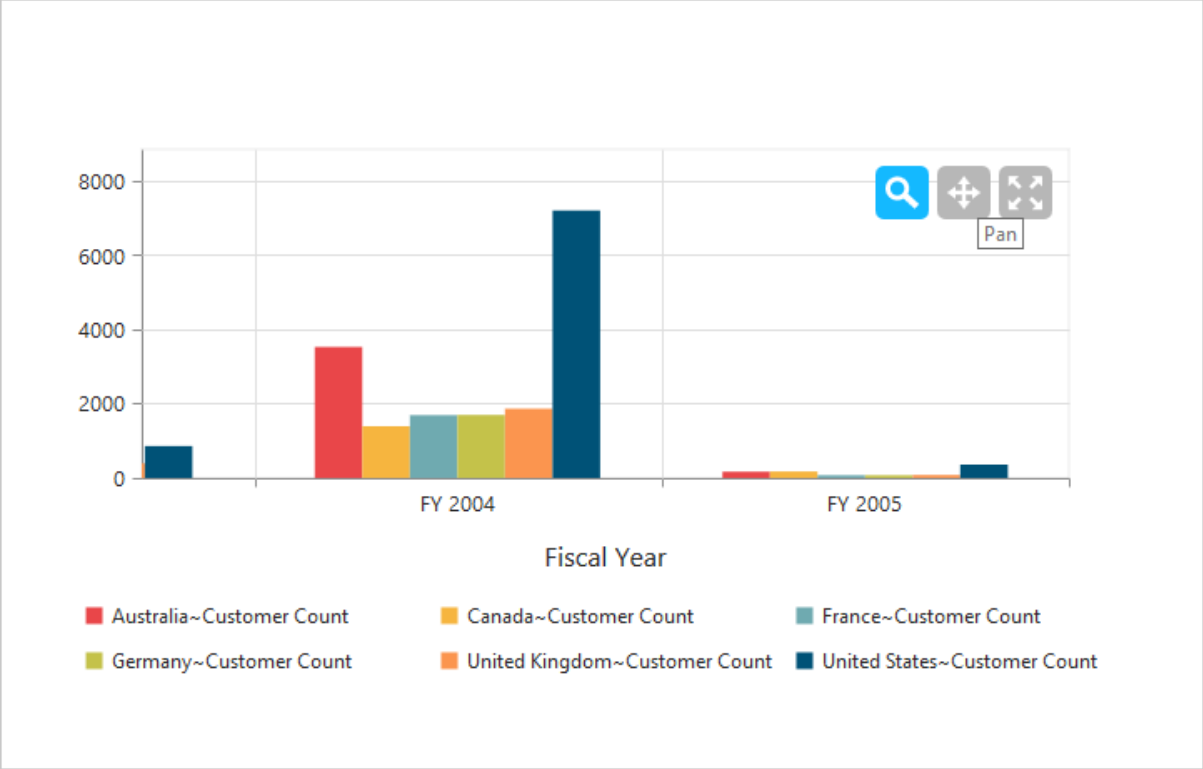
- When zooming.Enable option is set to true, you can zoom the Chart by using rubber band selection.
- When zooming.EnableMouseWheel option is set to true, you can zoom the Chart on mouse wheel scrolling.

ASPX-CS

```
//Enable zooming in chart
@Html.EJ().Pivot().PivotChart("PivotChart1").Zooming(zoom=>
zoom.Enable(true)).Url(Url.Content("/RelationalChartService.svc")).Size(s
ize => size.Height("460px").Width("950px"))
```



After zooming the Chart, a zooming toolbar will appear with options to *zoom, pan and reset*. Selecting the **"Pan"** option will allow to view the Chart and selecting the **"Reset"** option will reset the zoomed Chart.



Copyright © 2001 - 2020 Syncfusion Inc.

Types of Zooming

You can zoom the particular axis like horizontal axis or vertical axis or both axis using Type option in zooming.

Note: By default, the value for the Type option in zooming is “x,y” (indicating both axis) in PivotChart.

ASPX-CS

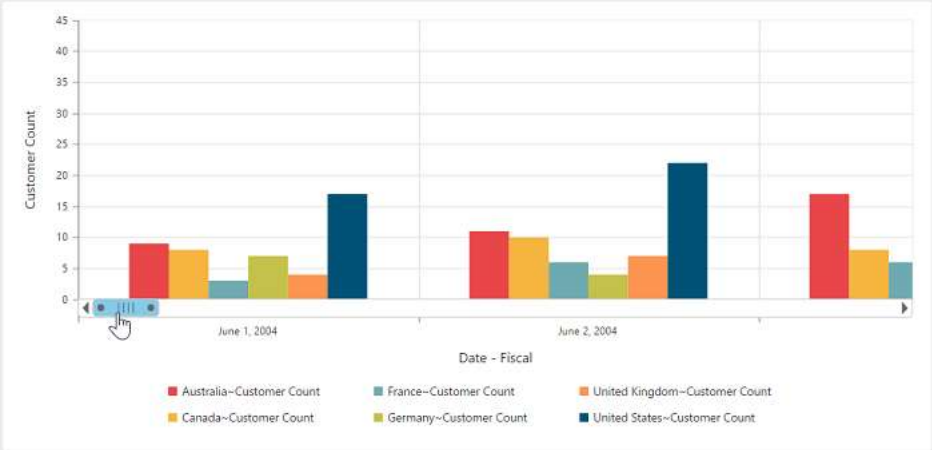
```
//Enable horizontal zooming
@Html.EJ().Pivot().PivotChart("PivotChart1").Zooming(zoom=>
zoom.Enable(true).Type("x")).Url(Url.Content("/RelationalChartService.svc
")).Size(size => size.Height("460px").Width("950px"))
```

Enable Scrollbar

- When zooming.EnableScrollbar option is set to true, the PivotChart is rendered along with the scroll bars for precise view of data. The data can be viewed by using scroll bar or by using mouse wheel scrolling.

ASPX-CS

```
@Html.EJ().Pivot().PivotChart("PivotChart1").Zooming(zoom => {
zoom.EnableScrollbar(true); })
```



Marker and Crosshair

Marker Shape Customization

In PivotChart, you can customize the marker shape with following symbols.

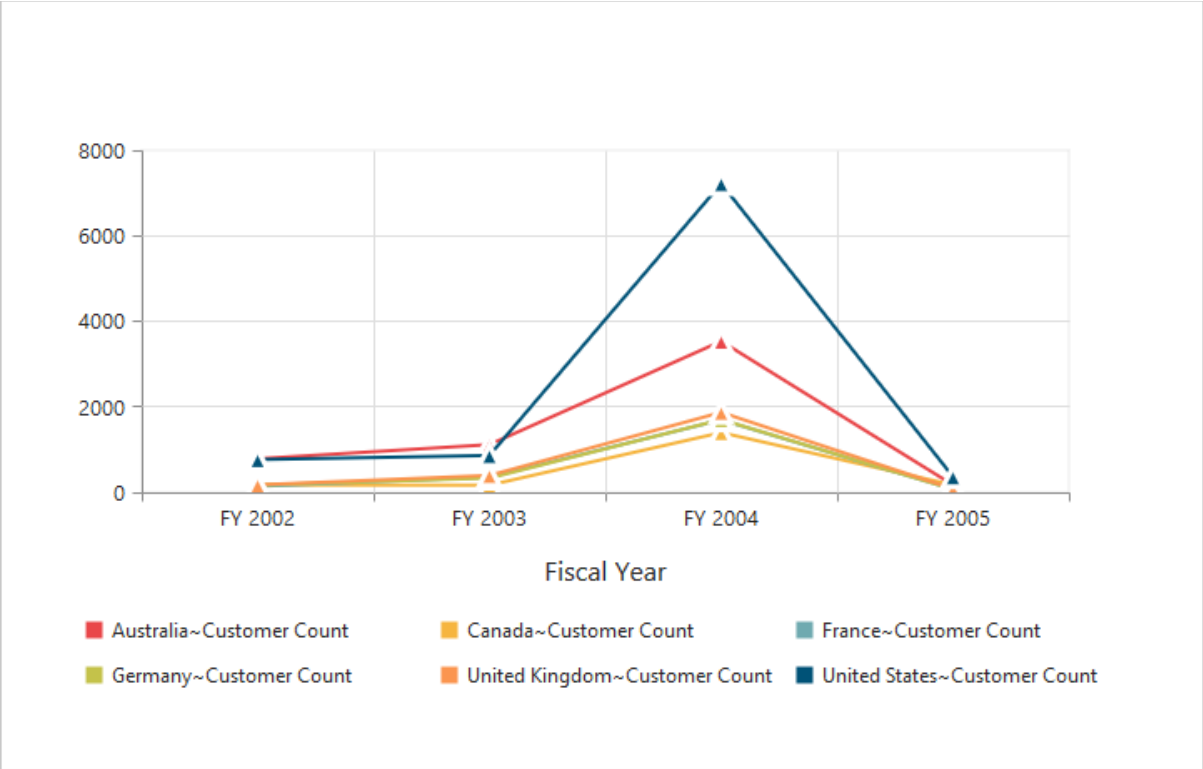
- Rectangle
- Circle
- Cross
- Diamond
- Pentagon
- Hexagon
- Star
- Ellipse

Copyright © 2001 - 2020 Syncfusion Inc.

- Triangle etc.

ASPX-CS

```
@Html.EJ().Pivot().PivotChart("PivotChart1").Url(Url.Content("/Relational
ChartService.svc")).CommonSeriesOptions(comm => {
comm.Type(SeriesType.Line);}).Size(size =>
size.Height("460px").Width("950px")).ClientSideEvents(
oEve => { oEve.SeriesRendering("onSeriesRenders"); })
<script>
function onSeriesRenders(args) {
for (var seriescount = 0; seriescount < this.model.series.length;
seriescount++)
this.model.series[seriescount].marker.shape = "Triangle";
</script>
```



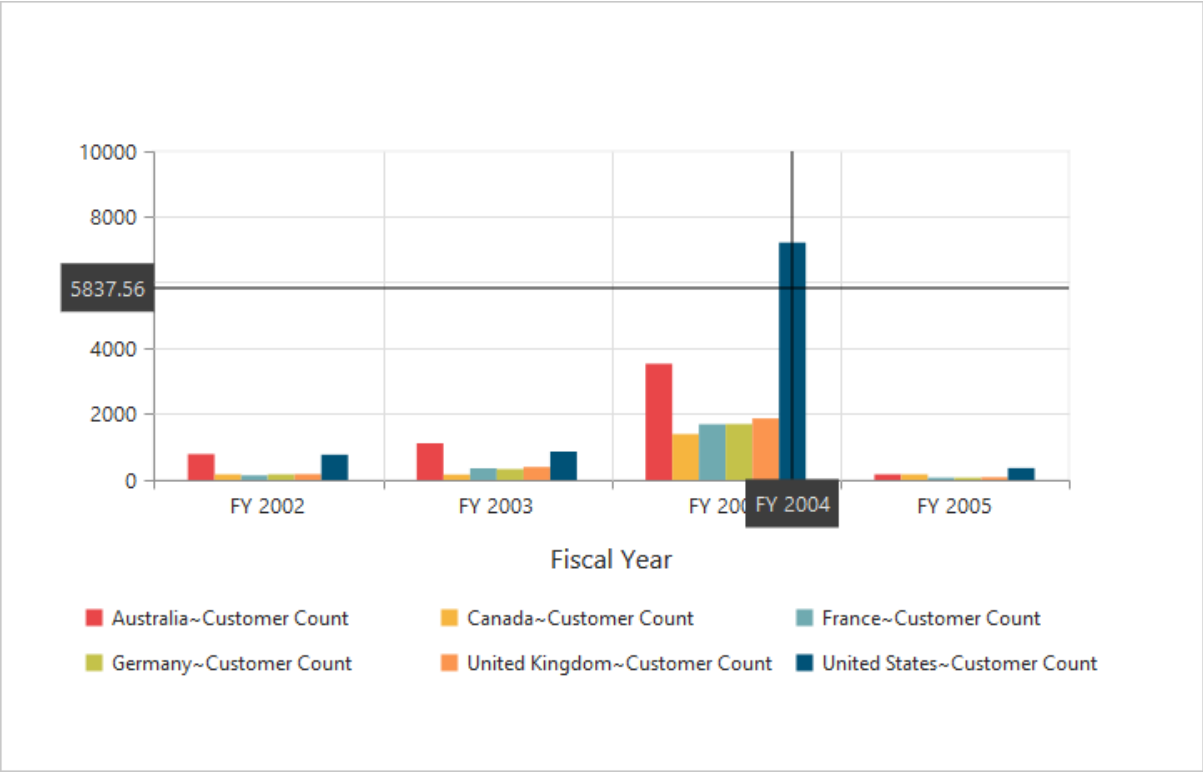
Enable Crosshair and Crosshair Label

Crosshair helps you to view the value at mouse position or touch contact point. Crosshair can be enabled by using the Visible option in CrossHair property. Crosshair label can be enabled by using the **"Visible"** option in CrosshairLabel property within its corresponding axis.

ASPX-CS

```
//Initializing Crosshair and crosshair label
@Html.EJ().Pivot().PivotChart("PivotChart1").CrossHair(crossHair =>
crossHair.Visible(true)).PrimaryXAxis(primaryX =>
primaryX.CrosshairLabel(crosshairlabel =>
crosshairlabel.Visible(true))).Url(Url.Content("/RelationalChartService.s
vc")).Size(size => size.Height("460px").Width("950px"))
```

Copyright © 2001 - 2020 Syncfusion Inc.



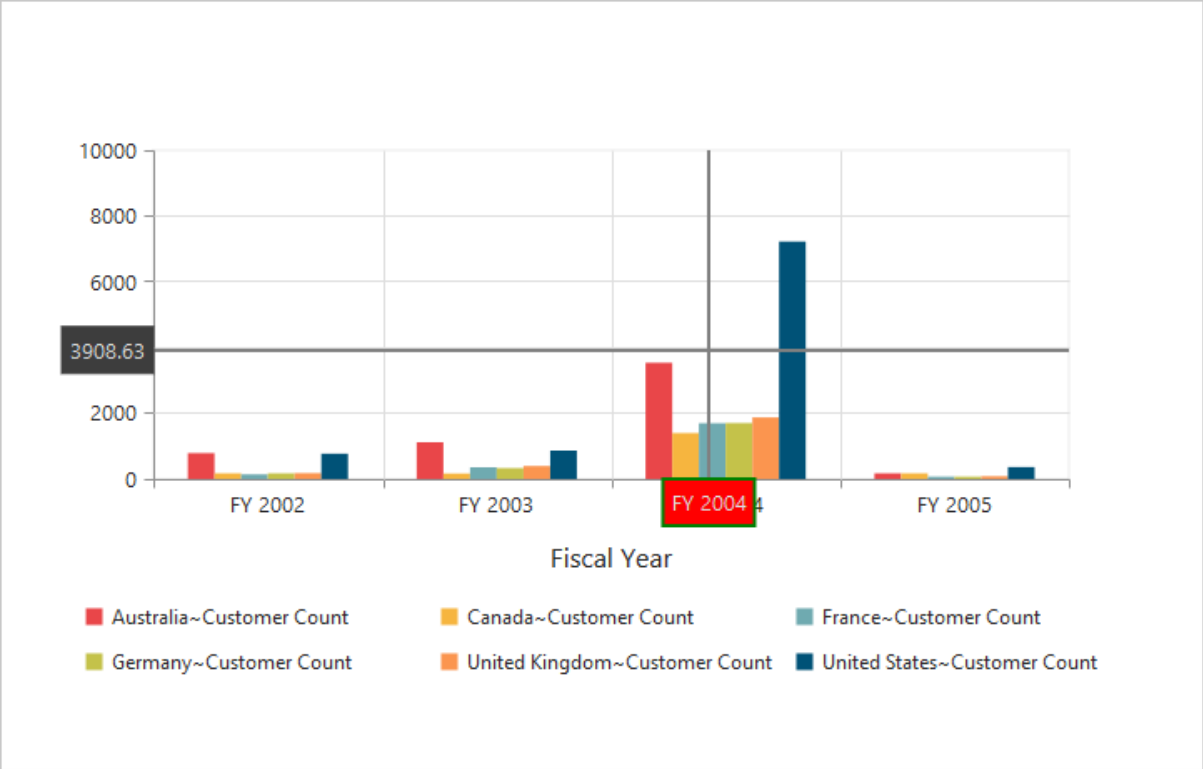
Crosshair Line and Label Customization

By using Line property of crosshair, you can customize its line color and width. Also by using Fill and Border properties of crosshair label, you can customize its background color, border color and border width.

ASPX-CS

```
//Customizing the crosshair label background color and border
@Html.EJ().Pivot().PivotChart("PivotChart1").CrossHair(crossHair =>
crossHair.Line(line =>
line.Color("gray").Width(2)).Visible(true)).PrimaryXAxis(primaryX =>
primaryX.CrosshairLabel(crosshairlabel =>
crosshairlabel.Visible(true).Fill("red").Border(border =>
border.Color("green").Width(2)))).PrimaryYAxis(primaryy =>
primaryy.CrosshairLabel(crosshairlabel =>
crosshairlabel.Visible(true))).Url(Url.Content("/RelationalChartService.s
vc")).Size(size => size.Height("460px").Width("950px"))
```

Copyright © 2001 - 2020 Syncfusion Inc.



Trackball

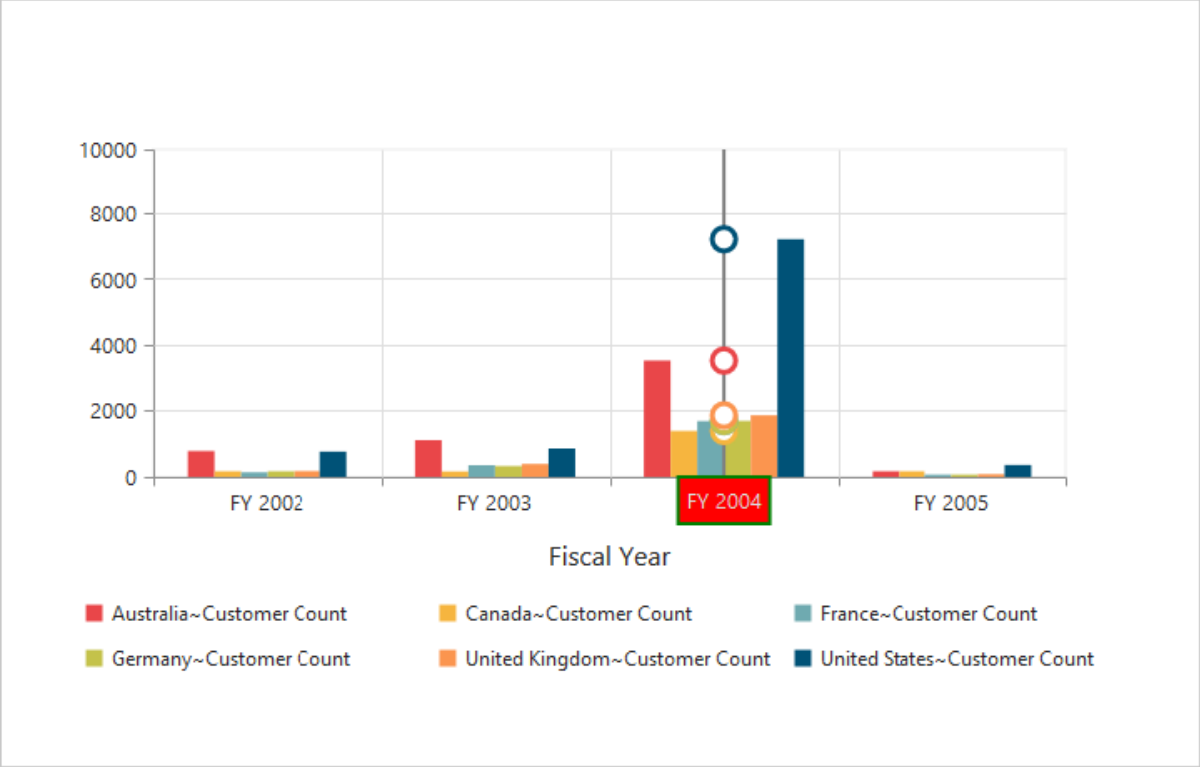
Enable trackball

Trackball can be enabled by setting both - 'Visible' option of the crosshair to true and Type option of the crosshair to **"Trackball".** The default value of type is **"Crosshair".**

ASPX-CS

```
//Change crosshair type to track ball
@Html.EJ().Pivot().PivotChart("PivotChart1").CrossHair(crossHair =>
crossHair.Visible(true).Type(CrosshairType.Trackball)).Url(Url.Content("/
RelationalChartService.svc")).Size(size =>
size.Height("460px").Width("950px"))
```

Copyright © 2001 - 2020 Syncfusion Inc.



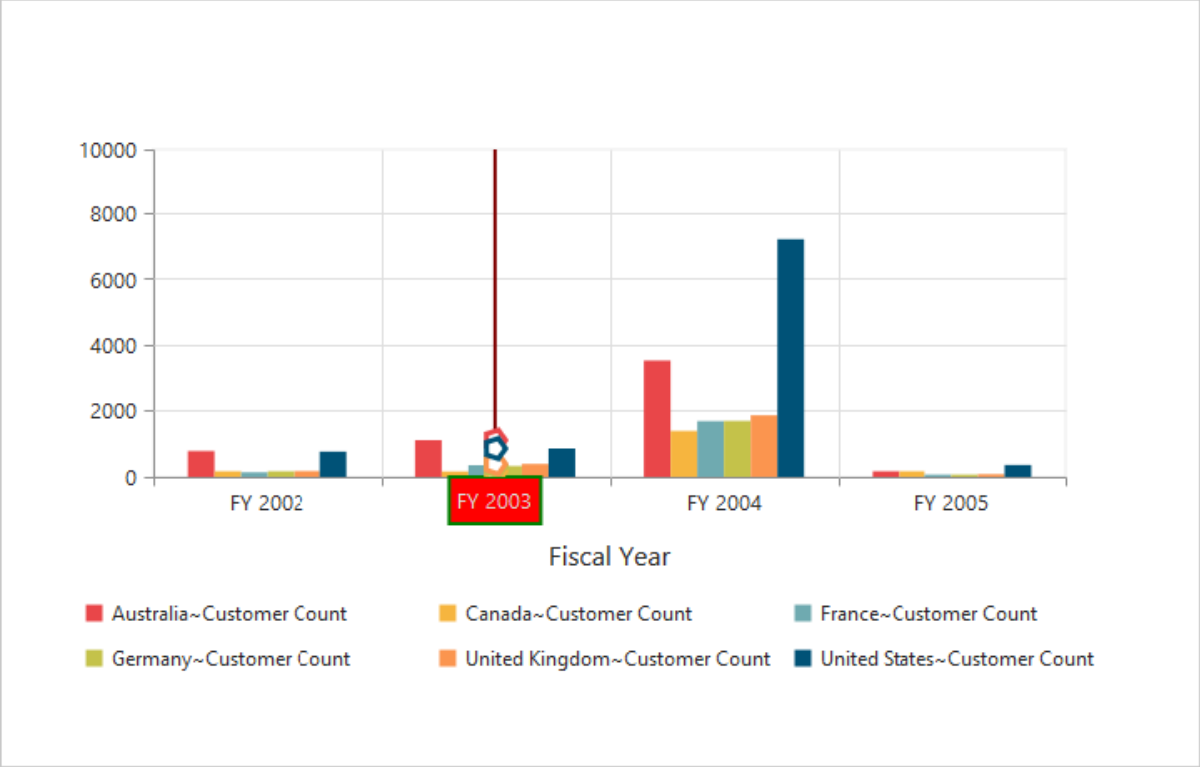
Trackball Marker and Line Customization

Shape and size of the trackball marker can be customized using the Shape and Size options of the crosshair marker. Color and width of the trackball line can be customized using the **"Line"** option in the crosshair.

ASPX-CS

```
//Customize the trackball line color and width and Marker visible and
shape
@Html.EJ().Pivot().PivotChart("PivotChart1").CrossHair(crossHair =>
crossHair.Visible(true).Type(CrosshairType.Trackball).Line(line =>
line.Color("#800000").Width(2)).Marker(marker =>
marker.Shape(ChartShape.Pentagon).Size(size =>
size.Height(9).Width(9)).Visible(true))).Url(Url.Content("/RelationalChar
tService.svc")).Size(size => size.Height("460px").Width("950px"))
```

Copyright © 2001 - 2020 Syncfusion Inc.



Highlight

PivotChart provides highlighting support for the series and data points on mouse hover. To enable highlighting, set the **"enable"** property to true in the highlightSettings option of the series.

ASPX-CS

```
@Html.EJ().Pivot().PivotChart("PivotChart1").Url(Url.Content("/Relational
ChartService.svc")).Size(size =>
size.Height("460px").Width("950px")).ClientSideEvents(
oEve => { oEve.SeriesRendering("onSeriesRenders"); })
<script>
function onSeriesRenders(args) {
for (var seriescount = 0; seriescount < this.model.series.length;
seriescount++)
this.model.series[seriescount].highlightSettings.enable = true
</script>
```

Highlight Mode

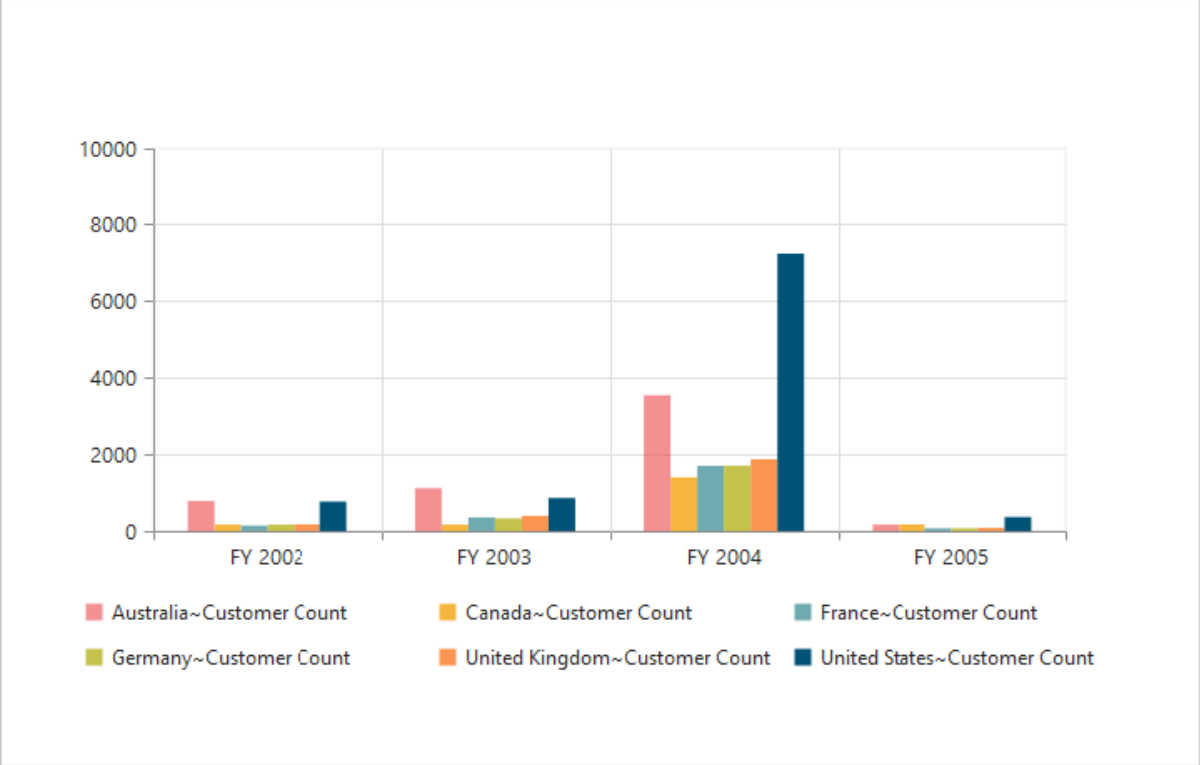
You can set three different modes for highlighting data points and series by using the mode property of the highlightSettings.

- series
- points
- cluster

ASPX-CS

Copyright © 2001 - 2020 Syncfusion Inc.

```
@Html.EJ().Pivot().PivotChart("PivotChart1").Url(Url.Content("/Relational
ChartService.svc")).Size(size =>
size.Height("460px").Width("950px")).ClientSideEvents(
oEve => { oEve.SeriesRendering("onSeriesRenders"); })
<script>
function onSeriesRenders(args) {
for (var seriescount = 0; seriescount < this.model.series.length;
seriescount++){
this.model.series[seriescount].highlightSettings.enable = true;
this.model.series[seriescount].highlightSettings.mode = "series";
}
</script>
```



Customize the Highlight Styles

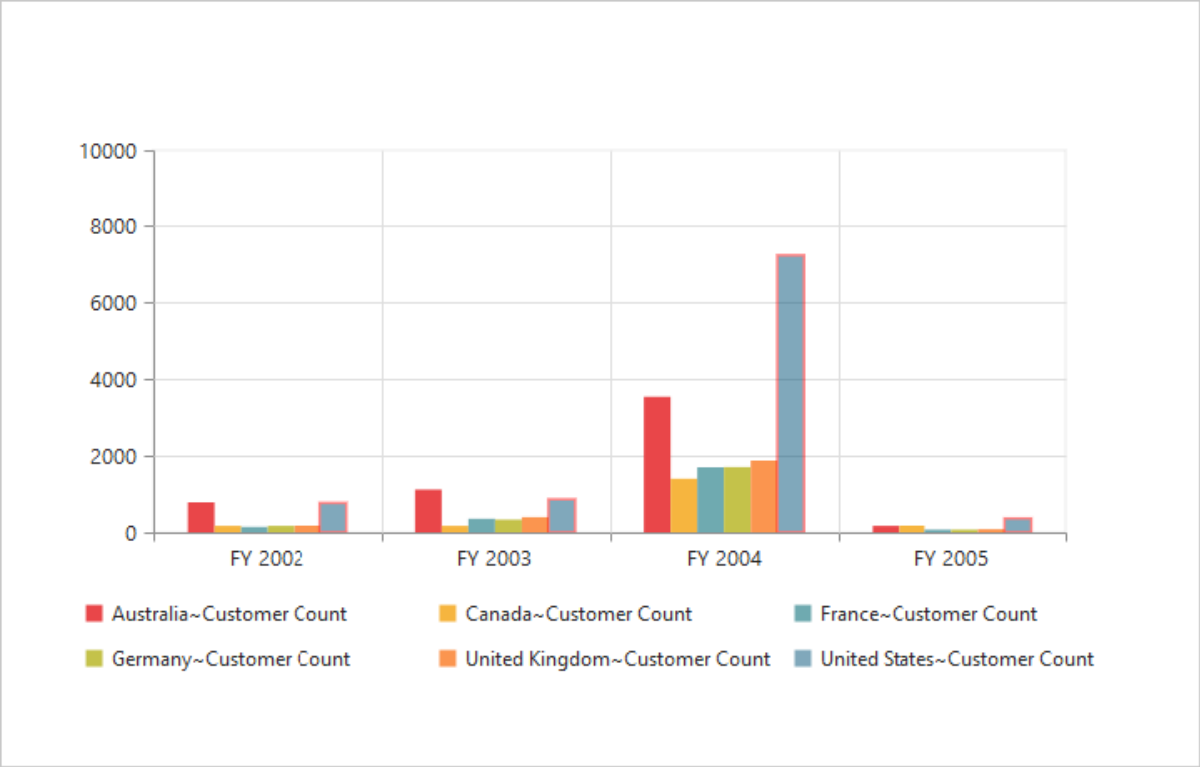
To customize the highlighted series, use border.color, border.width and opacity options in the highlightSettings property.

ASPX-CS

```
@Html.EJ().Pivot().PivotChart("PivotChart1").Url(Url.Content("/Relational
ChartService.svc")).Size(size =>
size.Height("460px").Width("950px")).ClientSideEvents(
oEve => { oEve.SeriesRendering("onSeriesRenders"); })
<script>
function onSeriesRenders(args) {
for (var seriescount = 0; seriescount < this.model.series.length;
seriescount++){
this.model.series[seriescount].highlightSettings.enable = true;
this.model.series[seriescount].highlightSettings.opacity = "0.5";
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
this.model.series[seriescount].highlightSettings.border.width = "1.5";
this.model.series[seriescount].highlightSettings.border.color = "red";
}
</script>
```



Patterns to Highlight

PivotChart provides pattern support for highlighting the data by setting an appropriate value to the `pattern` property of the `highlightSettings`. The different types of highlight patterns are as follows.

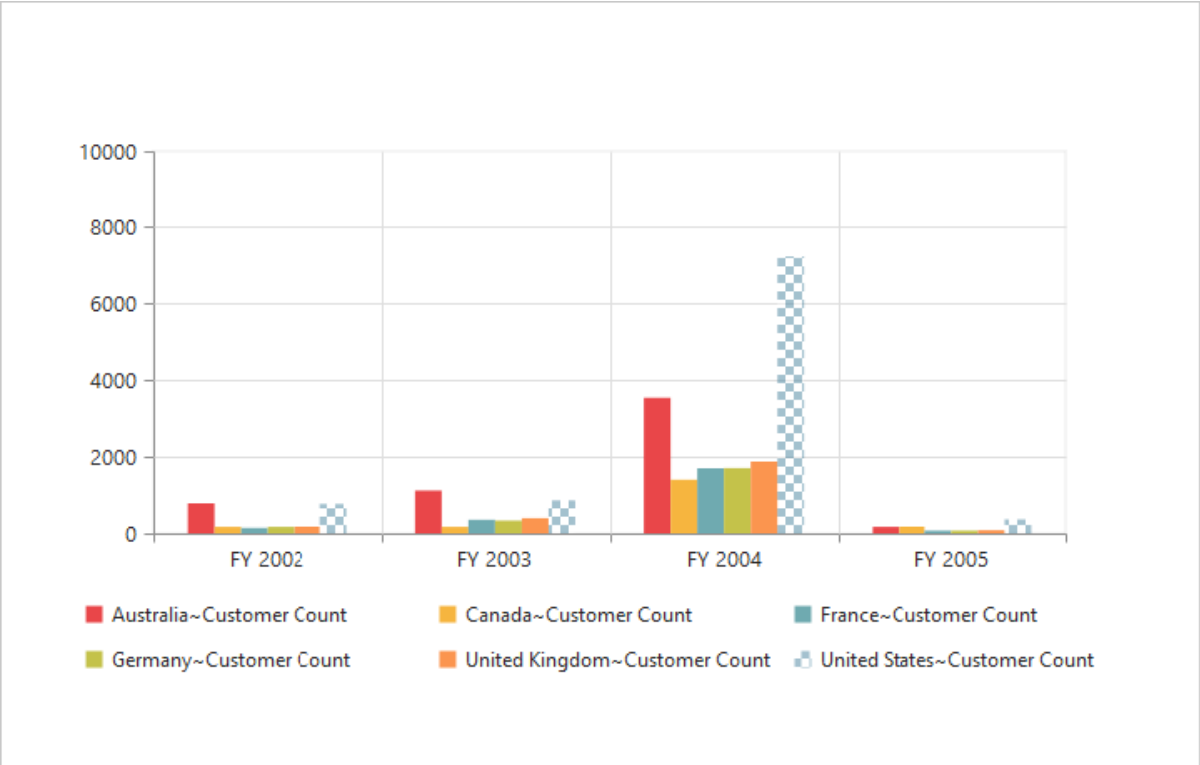
- chessboard
- crosshatch
- dots
- pacman
- grid
- turquoise
- star
- triangle
- circle
- tile
- horizontalDash
- verticalDash
- rectangle
- box
- verticalStripe
- horizontalStripe
- bubble

Copyright © 2001 - 2020 Syncfusion Inc.

- diagonalBackward
- diagonalForward

ASPX-CS

```
@Html.EJ().Pivot().PivotChart("PivotChart1").Url(Url.Content("/Relational
ChartService.svc")).Size(size =>
size.Height("460px").Width("950px")).ClientSideEvents(
oEve => { oEve.SeriesRendering("onSeriesRenders"); })
<script>
function onSeriesRenders(args) {
for (var seriescount = 0; seriescount < this.model.series.length;
seriescount++){
this.model.series[seriescount].highlightSettings.enable = true;
this.model.series[seriescount].highlightSettings.pattern = "chessboard";
}
</script>
```



Selection

PivotChart provides selection support for the series and data points on mouse click. To enable selection, set the **“enable”** property to true in the selectionSettings option of the series.

ASPX-CS

```
@Html.EJ().Pivot().PivotChart("PivotChart1").Url(Url.Content("/Relational
ChartService.svc")).Size(size =>
size.Height("460px").Width("950px")).ClientSideEvents(
oEve => { oEve.SeriesRendering("onSeriesRenders"); })
<script>
```

```
function onSeriesRenders(args) {
for (var seriescount = 0; seriescount < this.model.series.length;
seriescount++)
this.model.series[seriescount].selectionSettings.enable = true
</script>
```

Selection Mode

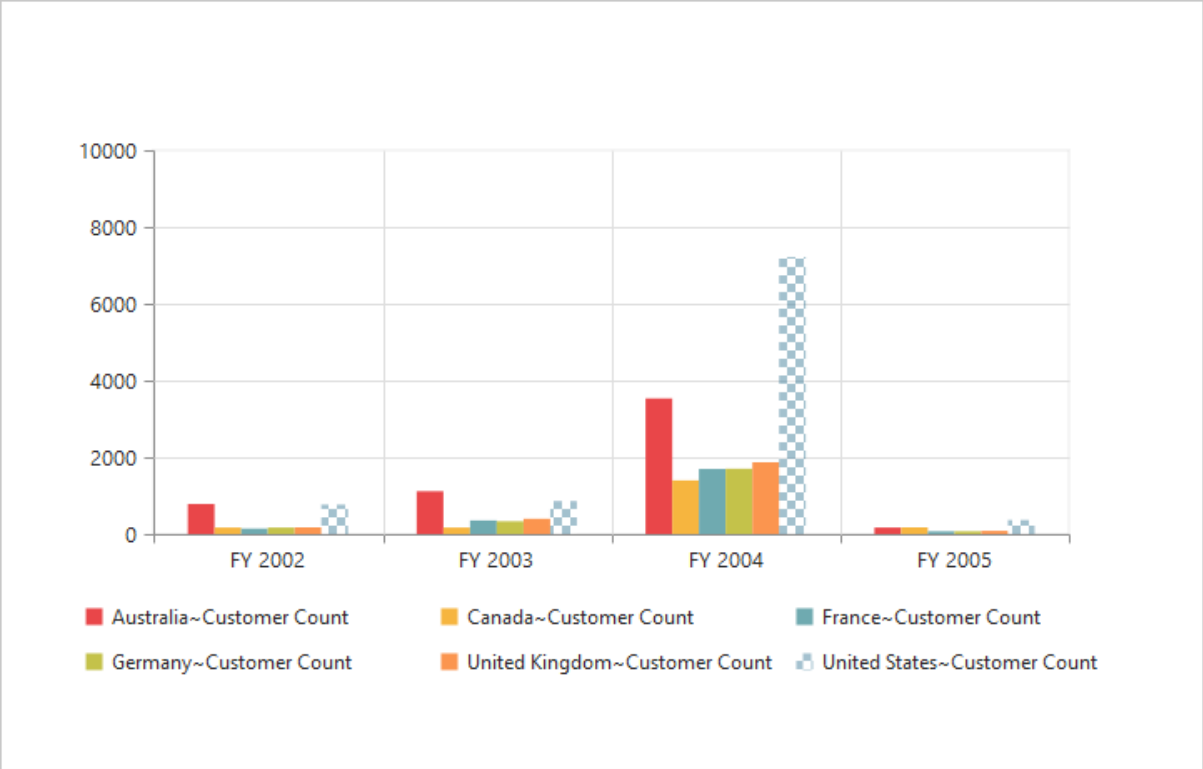
You can set three different selection mode for highlighting the data points and series by using the mode property of the selectionSettings.

- series
- points
- cluster

ASPX-CS

```
@Html.EJ().Pivot().PivotChart("PivotChart1").Url(Url.Content("/Relational
ChartService.svc")).Size(size =>
size.Height("460px").Width("950px")).ClientSideEvents(
oEve => { oEve.SeriesRendering("onSeriesRenders"); })
<script>
function onSeriesRenders(args) {
for (var seriescount = 0; seriescount < this.model.series.length;
seriescount++){
this.model.series[seriescount].selectionSettings.enable = true;
this.model.series[seriescount].selectionSettings.mode = "series";
}
</script>
```

Copyright © 2001 - 2020 Syncfusion Inc.



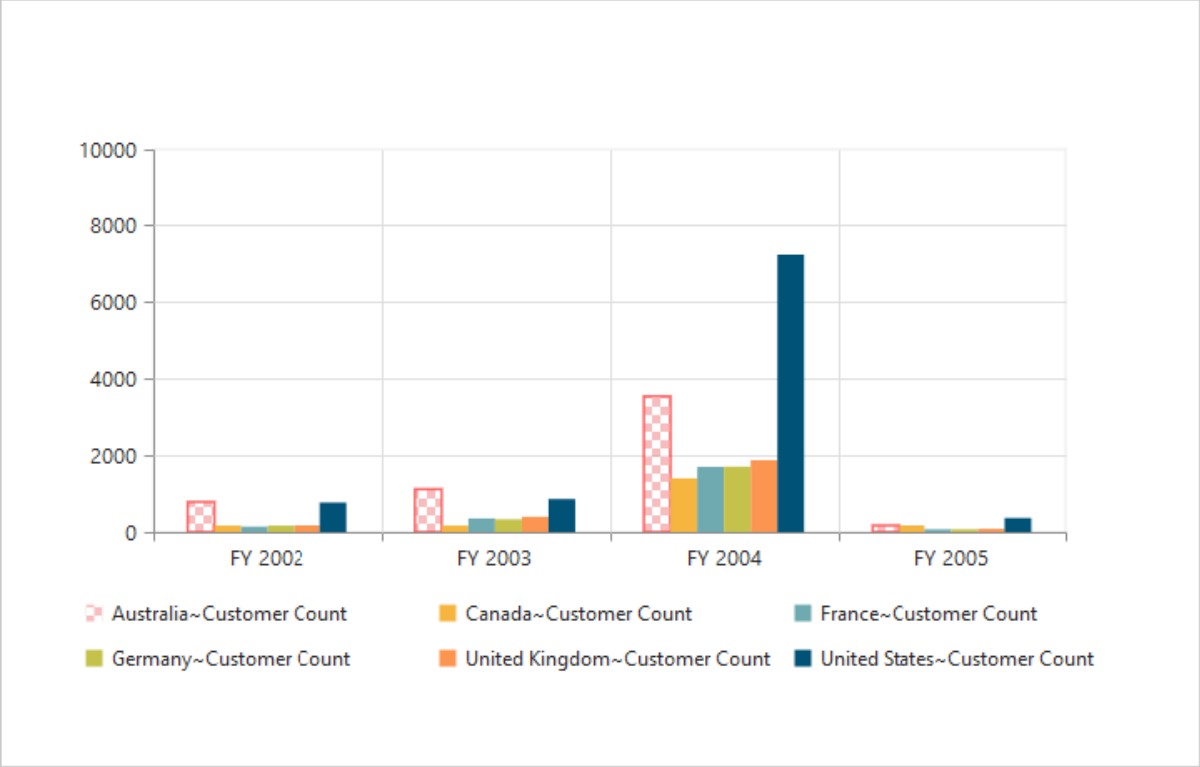
Customize the Selection Styles

To customize the selection styles, use the border.color, border.width and opacity options in the selectionSettings.

ASPX-CS

```
@Html.EJ().Pivot().PivotChart("PivotChart1").Url(Url.Content("/Relational
ChartService.svc")).Size(size =>
size.Height("460px").Width("950px")).ClientSideEvents(
oEve => { oEve.SeriesRendering("onSeriesRenders"); })
<script>
function onSeriesRenders(args) {
for (var seriescount = 0; seriescount < this.model.series.length;
seriescount++){
this.model.series[seriescount].selectionSettings.enable = true;
this.model.series[seriescount].selectionSettings.opacity = "0.5";
this.model.series[seriescount].selectionSettings.border.width = "1.5";
this.model.series[seriescount].selectionSettings.border.color = "red";
}
</script>
```

Copyright © 2001 - 2020 Syncfusion Inc.



Patterns for Selection

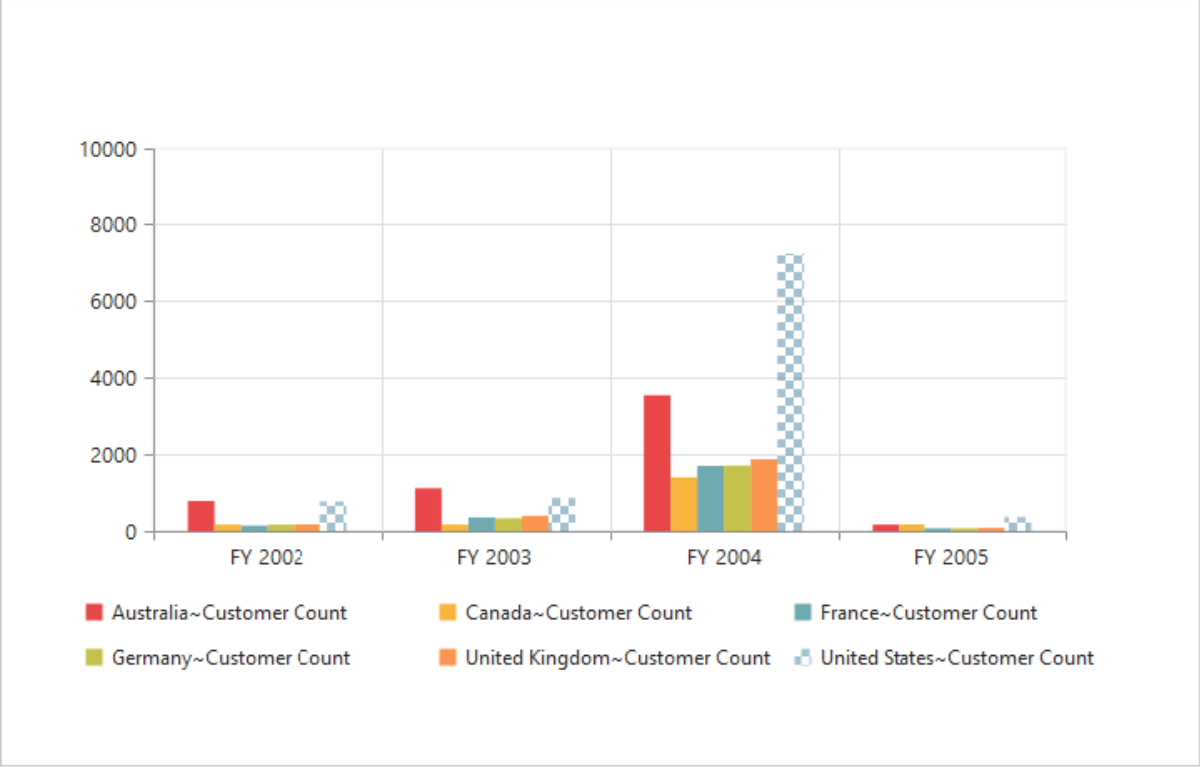
PivotChart provides pattern support for the selecting the data by setting an appropriate value to the `pattern` property of the `selectionSettings` option. The different types of selection patterns are as follows.

- chessboard
- crosshatch
- dots
- pacman
- grid
- turquoise
- star
- triangle
- circle
- tile
- horizontalDash
- verticalDash
- rectangle
- box
- verticalStripe
- horizontalStripe
- bubble
- diagonalBackward
- diagonalForward

ASPX-CS

Copyright © 2001 - 2020 Syncfusion Inc.

```
@Html.EJ().Pivot().PivotChart("PivotChart1").Url(Url.Content("/Relational
ChartService.svc")).Size(size =>
size.Height("460px").Width("950px")).ClientSideEvents(
oEve => { oEve.SeriesRendering("onSeriesRenders"); })
<script>
function onSeriesRenders(args) {
for (var seriescount = 0; seriescount < this.model.series.length;
seriescount++){
this.model.series[seriescount].selectionSettings.enable = true;
this.model.series[seriescount].selectionSettings.pattern = "chessboard";
}
</script>
```



Exporting

The PivotChart control can be exported to the following file formats.

- Excel
- Word
- PDF
- Image

The PivotChart control can be exported by invoking **“exportPivotChart”** method, with an appropriate export option as parameter.

ASPX-CS

```
//If you want to render PivotChart in Client Mode.
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
@Html.EJ().Pivot().PivotChart("PivotChart1").CommonSeriesOptions(comm =>
{ comm.Type(SeriesType.Column).Tooltip(tool => { tool.Visible(true);
}).EnableAnimation(true); }).Size(size =>
size.Height("460px").Width("100%")).PrimaryYAxis(primaryYAxis =>
primaryYAxis.Title(title => title.Text("Amount"))).Legend(legend =>
legend.Visible(true)).ClientSideEvents(oEve => { oEve.Load("load");
}).IsResponsive(true).DataSource(dataSource => dataSource.Rows(rows => {
rows.FieldName("Country").FieldCaption("Country").Add();
rows.FieldName("State").FieldCaption("State").Add(); }).Columns(columns
=> { columns.FieldName("Product").FieldCaption("Product").Add();
}).Values(values => { values.FieldName("Amount").Add(); }))
//If you want to render PivotChart in Server Mode.
@Html.EJ().Pivot().PivotChart("PivotChart1").Url(Url.Content("/Relational
ChartService.svc"))..Size(size => size.Height("460px").Width("100%"))
@Html.EJ().Button("Button1").ClientSideEvents(clientSideEvents => {
clientSideEvents.Click("exportBtnClick"); }).Text("Export")
<script type="text/javascript">
function exportBtnClick(args) {
var chartObj = $('#PivotChart1').data("ejPivotChart");
//If you render PivotChart in Client Mode, set the export option like
below.
chartObj.exportPivotChart("ExcelExport","fileName");
//If you render PivotChart in Server Mode, set the export option like
below.
chartObj.exportPivotChart(ej.PivotChart.ExportOptions.Excel);;
}
</script>
```

To achieve exporting in client mode, we need to add **"Syncfusion.EJ.Export"** dependency library into the application.

When PivotChart is rendered in Client Mode, a method needs to be added in MVC controller file of the application and we need to import **"Syncfusion.EJ.Export"** namespace in the controller file.

C#

```
public void ExcelExport()
{
System.Web.Script.Serialization.JavaScriptSerializer serializer = new
System.Web.Script.Serialization.JavaScriptSerializer() { MaxJsonLength =
Int32.MaxValue };
PivotChartExcelExport pivotChartExcelExport = new
PivotChartExcelExport();
string args =
System.Web.HttpContext.Current.Request.Form.GetValues(0)[0];
Dictionary<string, string> chartParams =
serializer.Deserialize<Dictionary<string, string>>(args);
pivotChartExcelExport.ExportToExcel(chartParams);
}
```

When PivotChart is rendered in Server Mode, a service method needs to be added in WCF/WebAPI for server side operations.

For WebAPI controller, the below method needs to be added.

C#

Copyright © 2001 - 2020 Syncfusion Inc.

```
[System.Web.Http.ActionName("Export")]
[System.Web.Http.HttpPost]
public void Export() {
string args = HttpContext.Current.Request.Form.GetValues(0)[0];
string fileName = "Sample";
htmlHelper.ExportPivotChart(args, fileName,
System.Web.HttpContext.Current.Response);
}
```

For WCF service, the below method needs to be added.

C#

```
public void Export(System.IO.Stream stream) {
System.IO.StreamReader sReader = new System.IO.StreamReader(stream);
string args =
System.Web.HttpContext.Current.Server.UrlDecode(sReader.ReadToEnd()).Remo
ve(0, 5);
string fileName = "Sample";
htmlHelper.ExportPivotChart(args, fileName,
System.Web.HttpContext.Current.Response);
}
```

Excel Export

User can export contents of the PivotChart to Excel document for future archival, references and analysis purposes.

Client Mode

To achieve Excel export, method name **"ExcelExport"** and file name is sent as the parameter.

JS

```
<script type="text/javascript">
function exportBtnClick(args)
{
var chartObj = $('#PivotChart1').data("ejPivotChart ");
chartObj.exportPivotChart("ExcelExport","fileName");
}
</script>
```

Following method need to be added in MVC controller file of the application.

C#

```
public void ExcelExport()
{
System.Web.Script.Serialization.JavaScriptSerializer serializer = new
System.Web.Script.Serialization.JavaScriptSerializer() { MaxJsonLength =
Int32.MaxValue };
PivotChartExcelExport pivotChartExcelExport = new
PivotChartExcelExport();
string args =
System.Web.HttpContext.Current.Request.Form.GetValues(0)[0];
Dictionary<string, string> chartParams =
serializer.Deserialize<Dictionary<string, string>>(args);
pivotChartExcelExport.ExportToExcel(chartParams);
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
}
```

Server Mode

To achieve Excel export, we need to add the following dependency libraries into the application.

- Syncfusion.Compression.Base
- Syncfusion.XlsIO.Base

For Excel export, **"ej.PivotChart.ExportOptions.Excel"** enumeration value is sent as the parameter.

JS

```
function exportBtnClick(args)
{
var chartObj = $('#PivotChart1').data("ejPivotChart");
//Setting export option as Excel in the exportPivotChart method for
ServerMode
chartObj.exportPivotChart(ej.PivotChart.ExportOptions.Excel);
}
```

Word Export

User can export contents of the PivotChart to Word document for future archival, references and analysis purposes.

Client Mode

To achieve Word export, method name **"WordExport"** and file name is sent as the parameter.

JS

```
<script type="text/javascript">
function exportBtnClick(args)
{
var chartObj = $('#PivotChart1').data("ejPivotChart ");
chartObj.exportPivotChart("WordExport","fileName");
}
</script>
```

Following method need to be added in MVC controller file of the application.

C#

```
public void WordExport()
{
System.Web.Script.Serialization.JavaScriptSerializer serializer = new
System.Web.Script.Serialization.JavaScriptSerializer() { MaxJsonLength =
Int32.MaxValue };
PivotChartWordExport pivotChartWordExport = new PivotChartWordExport();
string args =
System.Web.HttpContext.Current.Request.Form.GetValues(0)[0];
Dictionary<string, string> chartParams =
serializer.Deserialize<Dictionary<string, string>>(args);
pivotChartWordExport.ExportToWord(chartParams);
}
```

Copyright © 2001 - 2020 Syncfusion Inc.

Server Mode

To achieve Word export, we need to add the following dependency libraries into the application.

- Syncfusion.Compression.Base
- Syncfusion.DocIO.Base

For Word export, **“ej.PivotChart.ExportOptions.Word”** enumeration value is sent as the parameter.

JS

```
function exportBtnClick(args)
{
var chartObj = $('#PivotChart1').data("ejPivotChart");
//Setting export option as Word in the exportPivotChart method
chartObj.exportPivotChart(ej.PivotChart.ExportOptions.Word);
}
```

PDF Export

User can export contents of the PivotChart to PDF document for future archival, references and analysis purposes.

Client Mode

To achieve Word export, method name **“PDFExport”** and file name is sent as the parameter.

JS

```
<script type="text/javascript">
function exportBtnClick(args)
{
var chartObj = $('#PivotChart1').data("ejPivotChart ");
chartObj.exportPivotChart("PDFExport","fileName");
}
</script>
```

Following method need to be added in MVC controller file of the application.

C#

```
public void PDFExport()
{
System.Web.Script.Serialization.JavaScriptSerializer serializer = new
System.Web.Script.Serialization.JavaScriptSerializer() { MaxJsonLength =
Int32.MaxValue };
PivotChartPDFExport pivotChartPDFExport = new PivotChartPDFExport();
string args =
System.Web.HttpContext.Current.Request.Form.GetValues(0)[0];
Dictionary<string, string> chartParams =
serializer.Deserialize<Dictionary<string, string>>(args);
pivotChartPDFExport.ExportToPDF(chartParams);
}
```

Server Mode

To achieve PDF export, we need to add the following dependency libraries into the application.

Copyright © 2001 - 2020 Syncfusion Inc.

- Syncfusion.Compression.Base
- Syncfusion.Pdf.Base

For PDF export, **“ej.PivotChart.ExportOptions.PDF”** enumeration value is sent as the parameter.

JS

```
function exportBtnClick(args)
{
var chartObj = $('#PivotChart1').data("ejPivotChart ");
//Setting export option as PDF in the exportPivotChart method
chartObj.exportPivotChart(ej.PivotChart.ExportOptions.PDF);
}
```

Image Export

User can export contents of the PivotChart to image format for future archival, references and analysis purposes. We can export PivotChart to the following image formats.

- PNG
- EMF
- JPG
- GIF
- BMP

Client Mode

To achieve image export, method name **“ImageExport”** ,**”ej.PivotChart.ExportOptions.PNG”** and file name is sent as the parameter.This is similar to other image formats.

JS

```
<script type="text/javascript">
function exportBtnClick(args)
{
var chartObj = $('#PivotChart1').data("ejPivotChart ");
chartObj.exportPivotChart("ImageExport","fileName",ej.PivotChart.ExportOp
tions.PNG);
}
</script>
```

Following method need to be added in MVC controller file of the application.

C#

```
public void ImageExport()
{
System.Web.Script.Serialization.JavaScriptSerializer serializer = new
System.Web.Script.Serialization.JavaScriptSerializer() { MaxJsonLength =
Int32.MaxValue };
PivotChartImageExport pivotChartImageExport = new
PivotChartImageExport();
string args =
System.Web.HttpContext.Current.Request.Form.GetValues(0)[0];
Dictionary<string, string> chartParams =
serializer.Deserialize<Dictionary<string, string>>(args);
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
pivotChartImageExport.ExportToImage(chartParams);
}
```

Server Mode

To export PivotChart in PNG format, **"ej.PivotChart.ExportOptions.PNG"** enumeration value is sent as the parameter. This is similar to other image formats.

JS

```
function exportBtnClick(args)
{
var chartObj = $('#PivotChart1').data("ejPivotChart ");
//Setting export option as PNG in the exportPivotChart method
chartObj.exportPivotChart(ej.PivotChart.ExportOptions.PNG);
}
```

PivotChart format selection

Information: This option is applicable only for PivotChart specifically when exported to Excel document.

You can set an option to export PivotChart to an Excel document, either as image or PivotChart format itself by setting the boolean property `exportChartAsImage`, inside the `BeforeExport` event.

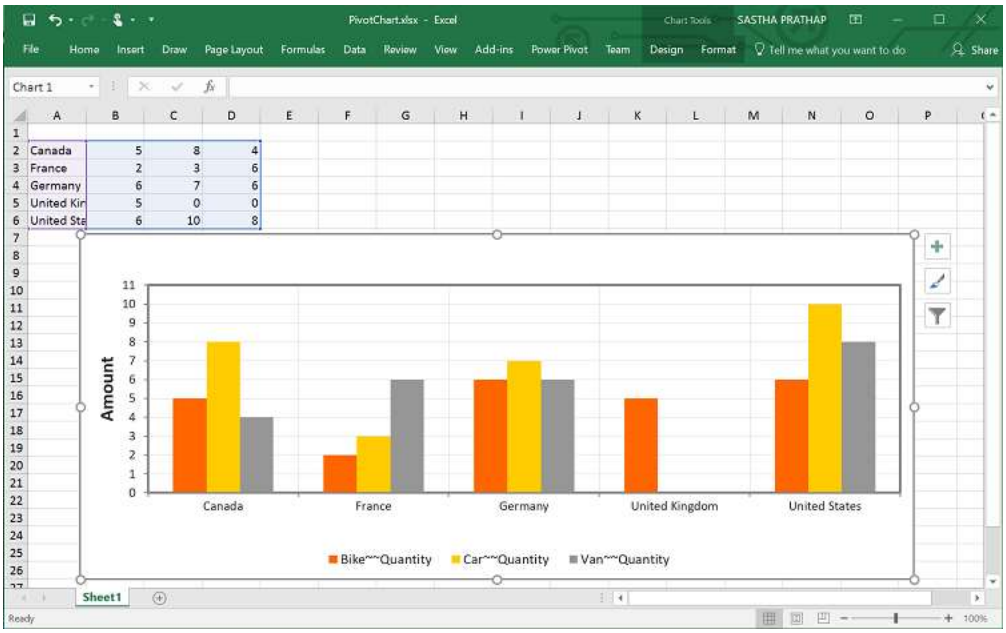
Note: By default PivotChart will be exported as image format to Excel document.

ASPX-CS

```
@Html.EJ().Pivot().PivotChart("PivotChart1").ClientSideEvents(clientSideE
vents => clientSideEvents.BeforeExport("Exporting"))
@Html.EJ().Button("Button1").ClientSideEvents(clientSideEvents => {
clientSideEvents.Click("exportBtnClick"); }).Text("Export")
<script type="text/javascript">
function exportBtnClick(args) {
var chartObj = $('#PivotChart1').data("ejPivotChart");
chartObj.exportPivotChart("ExcelExport","fileName");
}
function Exporting(args) {
args.exportChartAsImage = false; //you can set the chart format here
}
</script>
```

The below screenshot shows the control exported to Excel document showing its own format (Pivoting Chart).

Copyright © 2001 - 2020 Syncfusion Inc.



Exporting Customization

You can add title and description to the exporting document by using title and description property obtained in the "beforeExport" event.

Note: Title and description cannot be added to image formats.

ASPX-CS

```
@Html.EJ().Pivot().PivotChart("PivotChart1").ClientSideEvents(clientSideE
vents => clientSideEvents.BeforeExport("Exporting"))
@Html.EJ().Button("Button1").ClientSideEvents(clientSideEvents => {
clientSideEvents.Click("exportBtnClick"); }).Text("Export")
<script type="text/javascript">
function exportBtnClick(args) {
var chartObj = $('#PivotChart1').data("ejPivotChart");
//If you render PivotChart in Client Mode, set the export option like
below.
chartObj.exportPivotChart("ExcelExport","fileName");
//If you render PivotChart in Server Mode, set the export option like
below.
chartObj.exportPivotChart(ej.PivotChart.ExportOptions.Excel);;
}
function Exporting(args) {
args.title = "PivotChart";
args.description = "Visualizes both OLAP and Relational datasource in
graphical format";
}
</script>
```

You can also edit the exporting document with the use of a server side event for required exporting option.

C#

```
//...
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
using Syncfusion.EJ.Export;
using Syncfusion.Compression.Base;
using Syncfusion.XlsIO;
using Syncfusion.DocIO.Base;
using Syncfusion.Pdf.Base;
//Following methods needs to be added in MVC controller file of the
application for JSON export
public void ExcelExport()
{
PivotChartExcelExport pivotChartExcelExport = new
PivotChartExcelExport();
string args =
System.Web.HttpContext.Current.Request.Form.GetValues(0)[0];
pivotChartExcelExport.ExcelExport += pivotChartExcelExport_ExcelExport;
Dictionary<string, string> chartParams =
serializer.Deserialize<Dictionary<string, string>>(args);
pivotChartExcelExport.ExportToExcel(chartParams);
}
void pivotChartExcelExport_ExcelExport(object sender,
Syncfusion.XlsIO.IWorkbook workBook)
{
//You can customize exporting document here.
}
public void WordExport()
{
PivotChartWordExport pivotChartWordExport = new PivotChartWordExport();
string args =
System.Web.HttpContext.Current.Request.Form.GetValues(0)[0];
pivotChartWordExport.WordExport += pivotChartWordExport_WordExport;
Dictionary<string, string> chartParams =
serializer.Deserialize<Dictionary<string, string>>(args);
pivotChartWordExport.ExportToWord(chartParams);
}
void pivotChartWordExport_WordExport(object sender,
Syncfusion.DocIO.DLS.WordDocument document)
{
//You can customize exporting document here.
}
public void PDFExport()
{
PivotChartPDFExport pivotChartPDFExport = new PivotChartPDFExport();
string args =
System.Web.HttpContext.Current.Request.Form.GetValues(0)[0];
pivotChartPDFExport.AddPDFHeaderFooter +=
pivotChartPDFExport_AddPDFHeaderFooter;
pivotChartPDFExport.PDFExport += pivotChartPDFExport_PDFExport;
Dictionary<string, string> chartParams =
serializer.Deserialize<Dictionary<string, string>>(args);
pivotChartPDFExport.ExportToPDF(chartParams);
}
void pivotChartPDFExport_PDFExport(object sender,
Syncfusion.Pdf.PdfDocument pdfDoc)
{
//You can customize exporting document here.
}
void pivotChartPDFExport_AddPDFHeaderFooter(object sender,
Syncfusion.Pdf.PdfDocument pdfDoc)
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
{
//You can add header/footer information to the PDF document.
}
//Following service method needs to be added in WCF/WebAPI for
PivotEngine.
[System.Web.Http.ActionName("Export")]
[System.Web.Http.HttpPost]
public void Export()
{
string args = HttpContext.Current.Request.Form.GetValues(0)[0];
string fileName = "Sample";
htmlHelper.ExcelExport += htmlHelper_ExcelExport;
htmlHelper.WordExport += htmlHelper_WordExport;
htmlHelper.AddPDFHeaderFooter += htmlHelper_AddPDFHeaderFooter;
htmlHelper.PDFExport += htmlHelper_PDFExport;
htmlHelper.ExportPivotChart(args, fileName,
System.Web.HttpContext.Current.Response);
}
void htmlHelper_PDFExport(object sender, Syncfusion.Pdf.PdfDocument
pdfDoc)
{
//You can customize exporting document here.
}
void htmlHelper_AddPDFHeaderFooter(object sender,
Syncfusion.Pdf.PdfDocument pdfDoc)
{
//You can add header/footer information to the PDF document.
}
void htmlHelper_WordExport(object sender,
Syncfusion.DocIO.DLS.WordDocument document)
{
//You can customize exporting document here.
}
void htmlHelper_ExcelExport(object sender, Syncfusion.XlsIO.IWorkbook
workBook)
{
//You can customize exporting document here.
}
```

The name of the document can be customized as per the users requirement.

For Client mode, we need to send file name as parameter to the **“exportPivotChart”** method along with service URL.

JAVASCRIPT

```
function exportBtnClick(args)
{
var chartObj = $('#PivotChart1').data("ejPivotChart ");
chartObj.exportPivotChart("https://js.syncfusion.com/ejservices/api/Pivot
Chart/Olap/ExcelExport", "fileName");
}
```

For Server mode, the exporting document name is provided in the WebAPI controller as found in the below code snippet.

Copyright © 2001 - 2020 Syncfusion Inc.

C#

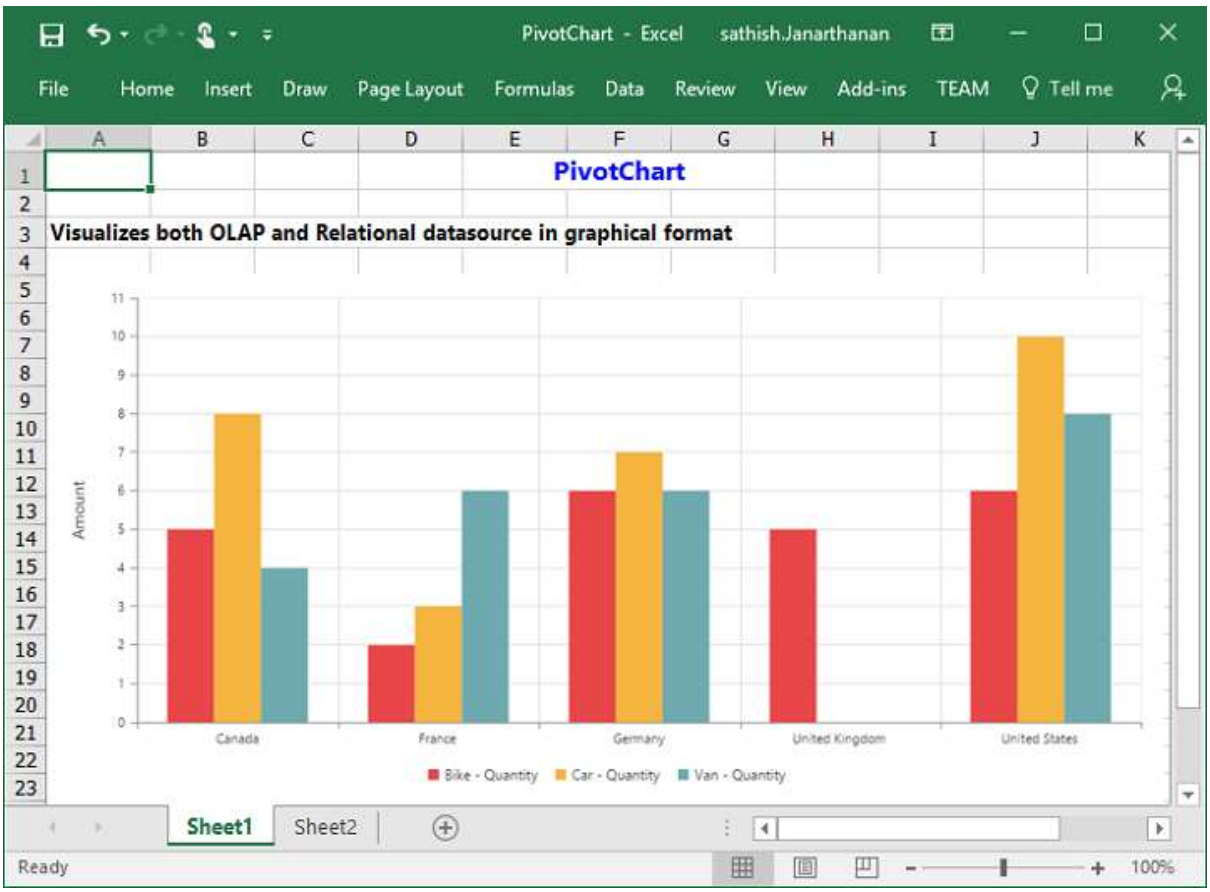
```
[System.Web.Http.ActionName("Export")]
[System.Web.Http.HttpPost]
public void Export() {
string args = HttpContext.Current.Request.Form.GetValues(0)[0];
string fileName = "File name is customized here";
htmlHelper.ExportPivotChart(args, fileName,
System.Web.HttpContext.Current.Response);
}
```

For customizing name in WCF Service, below code snippet is used.

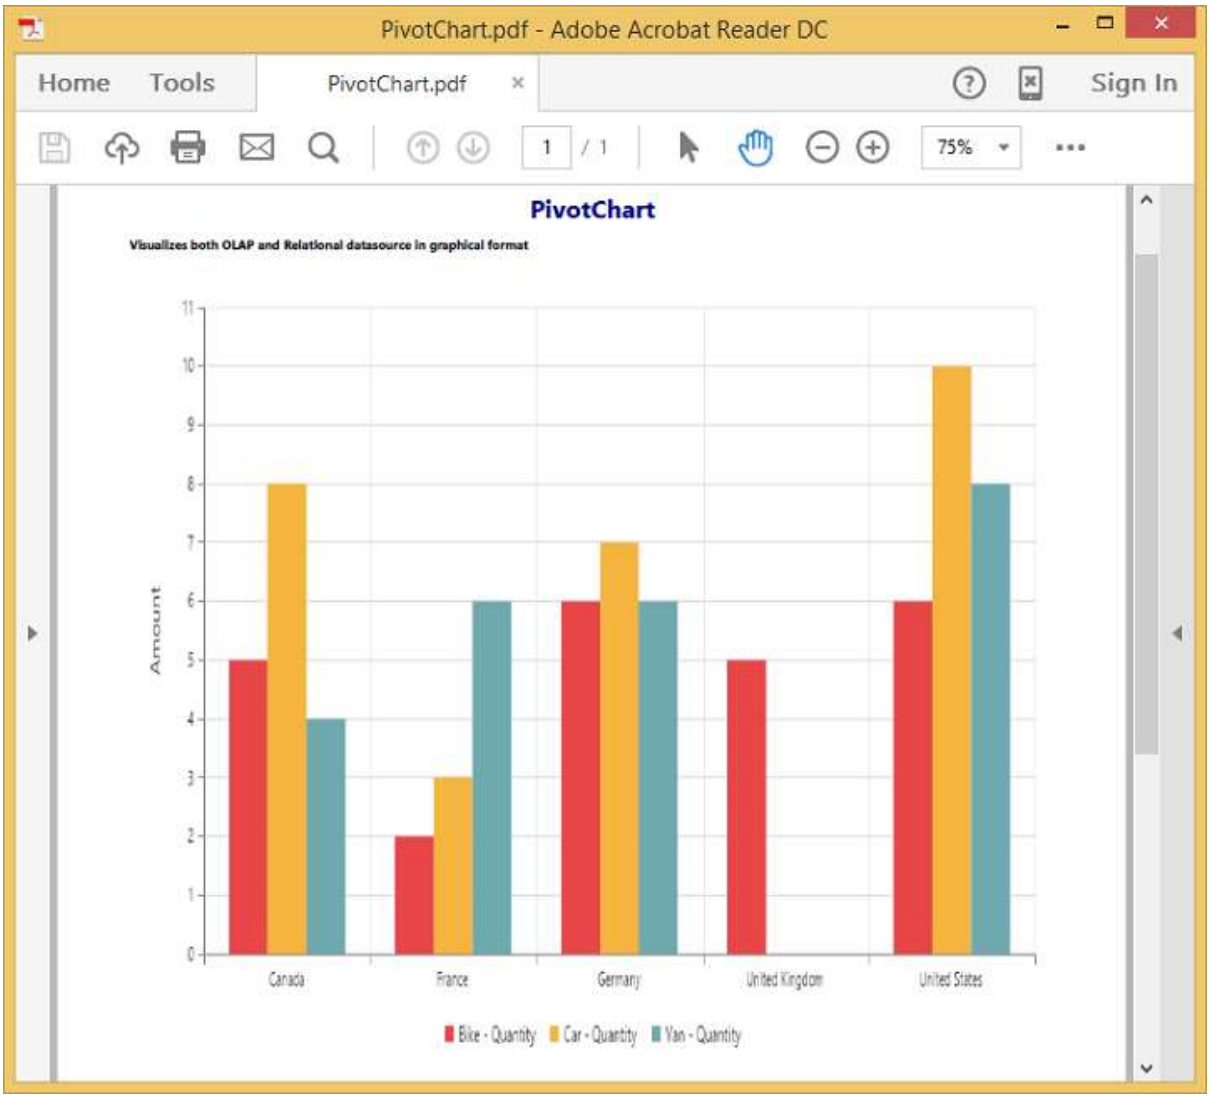
C#

```
public void Export(System.IO.Stream stream) {
System.IO.StreamReader sReader = new System.IO.StreamReader(stream);
string args =
System.Web.HttpContext.Current.Server.UrlDecode(sReader.ReadToEnd()).Remo
ve(0, 5);
string fileName = " File name is customized here ";
htmlHelper.ExportPivotChart(args, fileName,
System.Web.HttpContext.Current.Response);
}
```

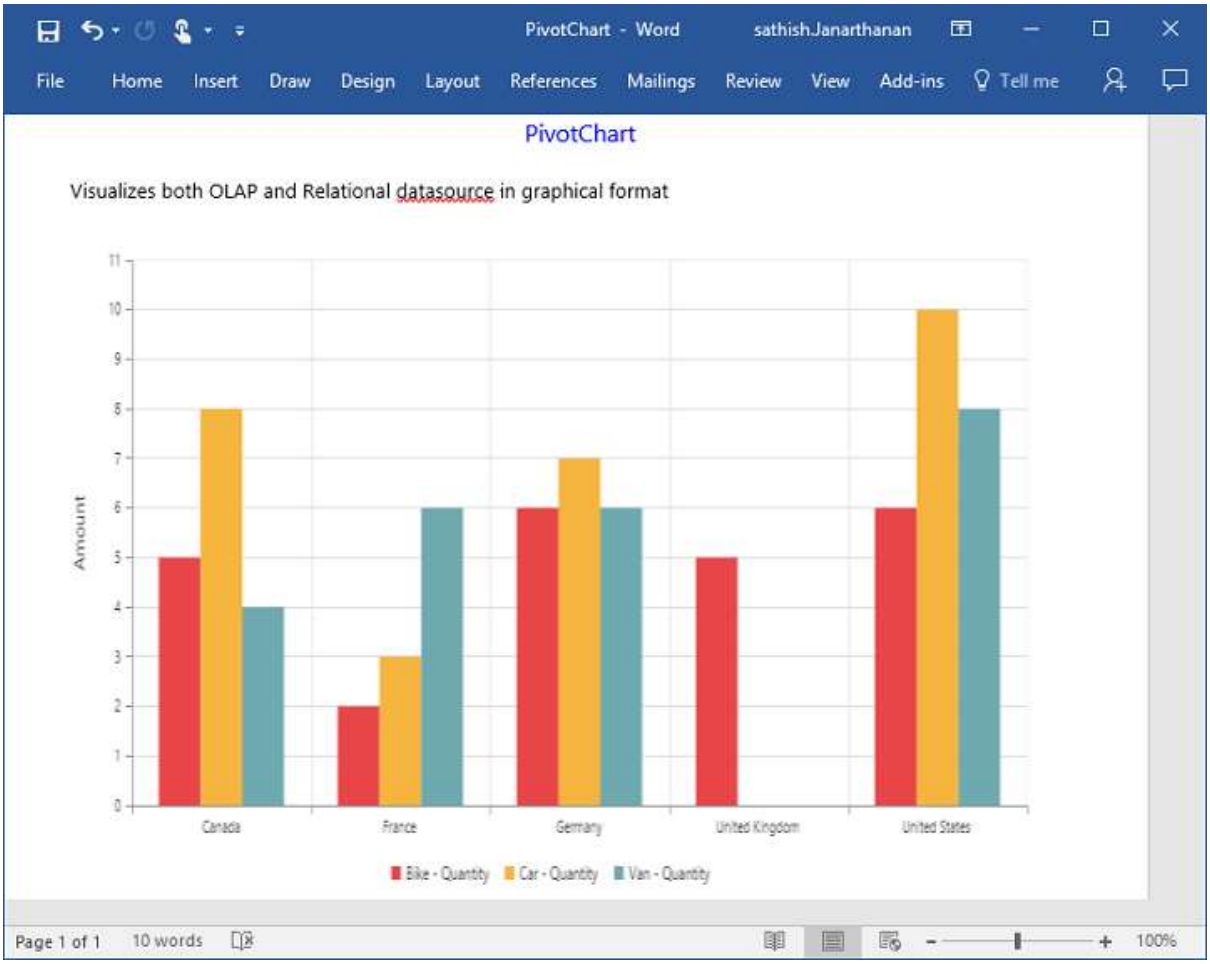
The below screenshot shows the PivotChart control exported to Excel document.



The below screenshot shows the PivotChart control exported to PDF document.



The below screenshot shows the PivotChart control exported to Word document.



The below screenshot shows the PivotChart control exported to PNG format.

Appearance

Built-in Themes

Following are the built-in themes available in the PivotChart.

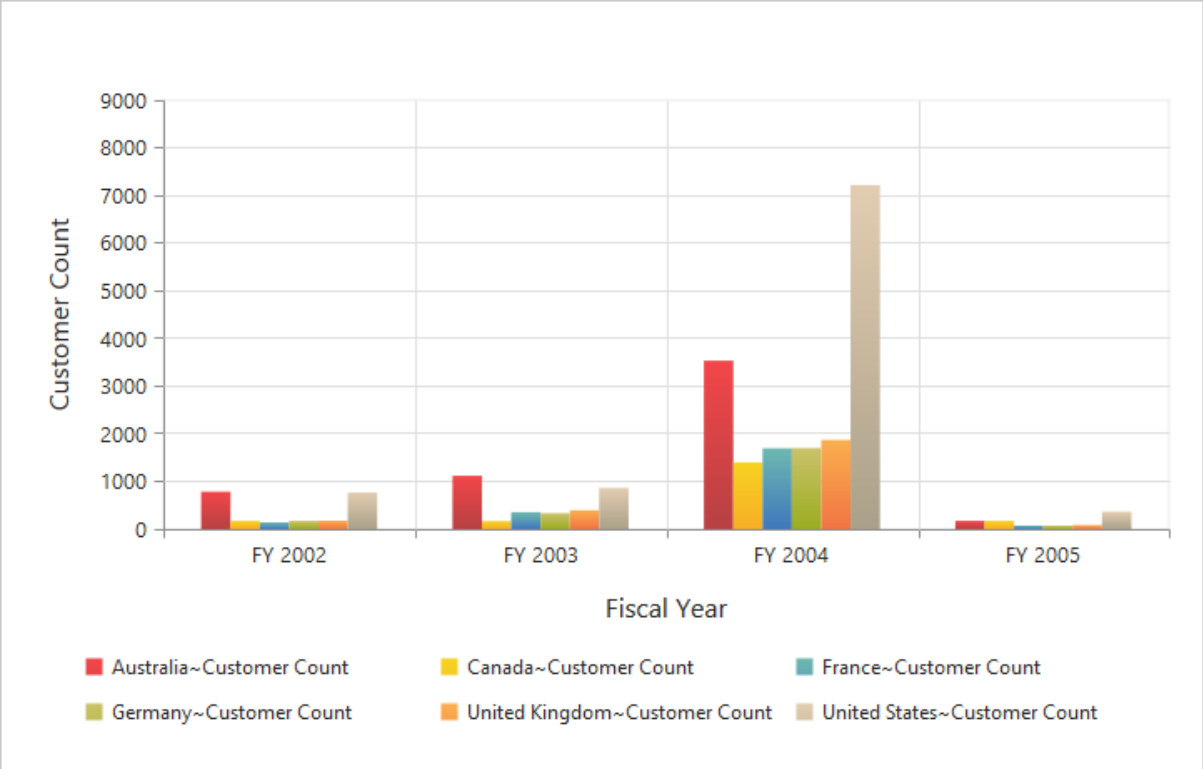
- flatlight
- gradientlight
- gradientdark
- azure
- azuredark
- lime
- limedark
- saffron
- saffrondark
- gradientlight
- gradientdark
- highcontrast01
- highcontrast02
- material
- office365
- bootstrap

By using the Theme property, you can set the desired theme in PivotChart. By default, **“Flat Light”** theme is applied to PivotChart.

ASPX-CS

Copyright © 2001 - 2020 Syncfusion Inc.

```
//Using gradient theme
@Html.EJ().Pivot().PivotChart("PivotChart1").Theme(Syncfusion.JavaScript.
DataVisualization.ChartTheme.GradientLight).Url(Url.Content("/RelationalC
hartService.svc")).Size(size => size.Height("460px").Width("950px"))
```



PivotChart - Area Customization

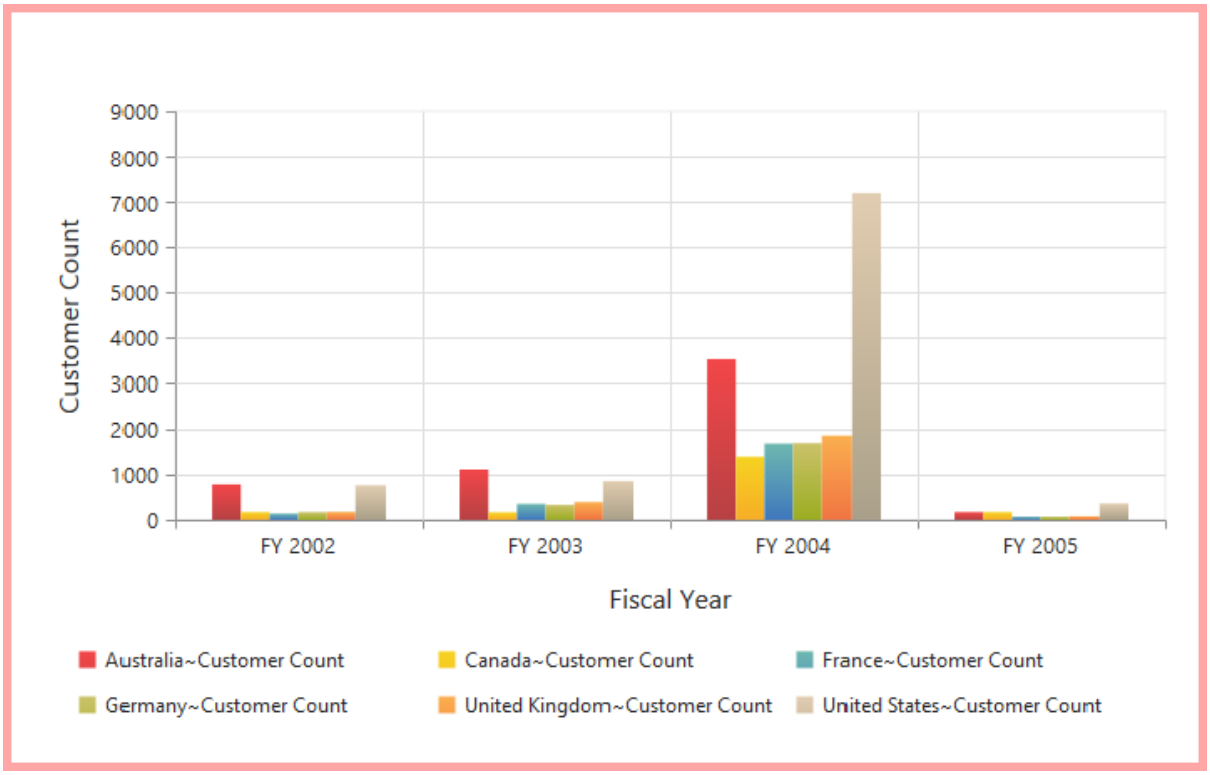
Border Customization

To customize the PivotChart border, use Border property in PivotChart.

ASPX-CS

```
//Customize the chart border and opacity
@Html.EJ().Pivot().PivotChart("PivotChart1").Border(border =>
border.Color("#FF0000").Width(5)).Url(Url.Content("/RelationalChartServic
e.svc")).Size(size => size.Height("460px").Width("950px"))
```

Copyright © 2001 - 2020 Syncfusion Inc.



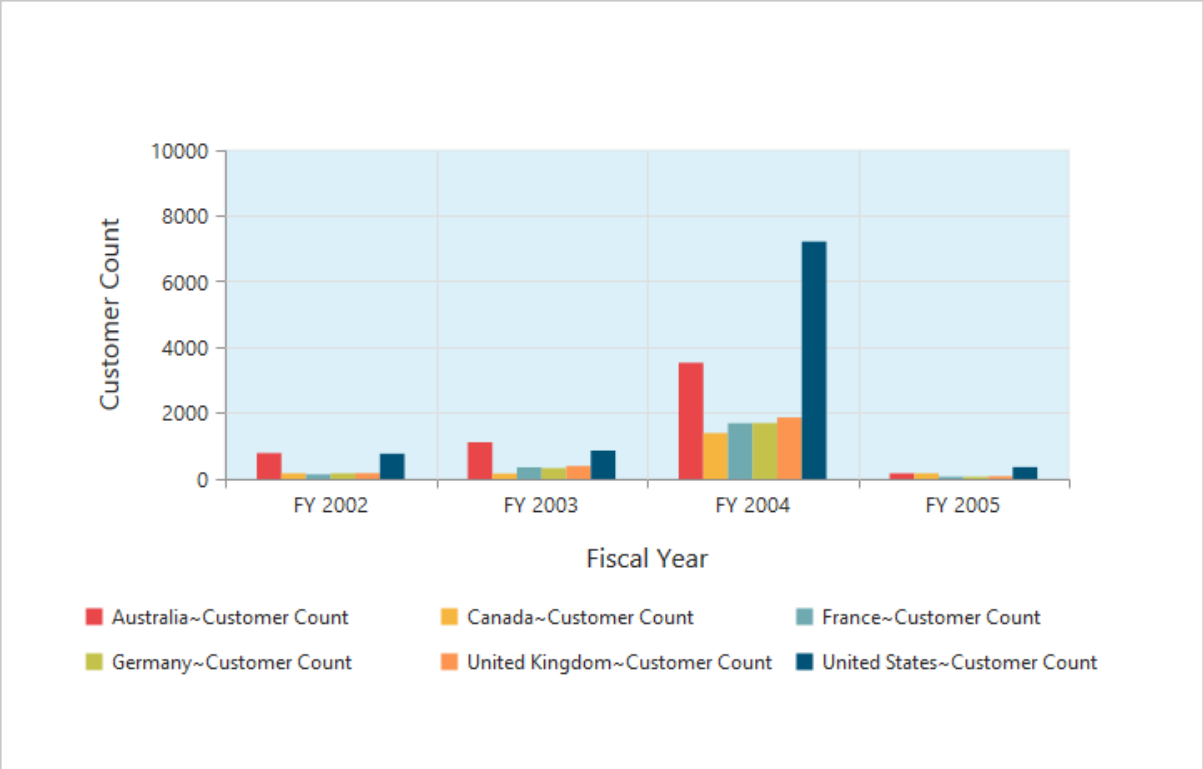
Background Customization

The PivotChart control background can be customized by using the Background property in the Chart area.

ASPX-CS

```
//Setting background for Chart area
@Html.EJ().Pivot().PivotChart("PivotChart1").ChartArea(area =>
area.Background("skyblue")).Url(Url.Content("/RelationalChartService.svc"
)).Size(size => size.Height("460px").Width("950px"))
```

Copyright © 2001 - 2020 Syncfusion Inc.



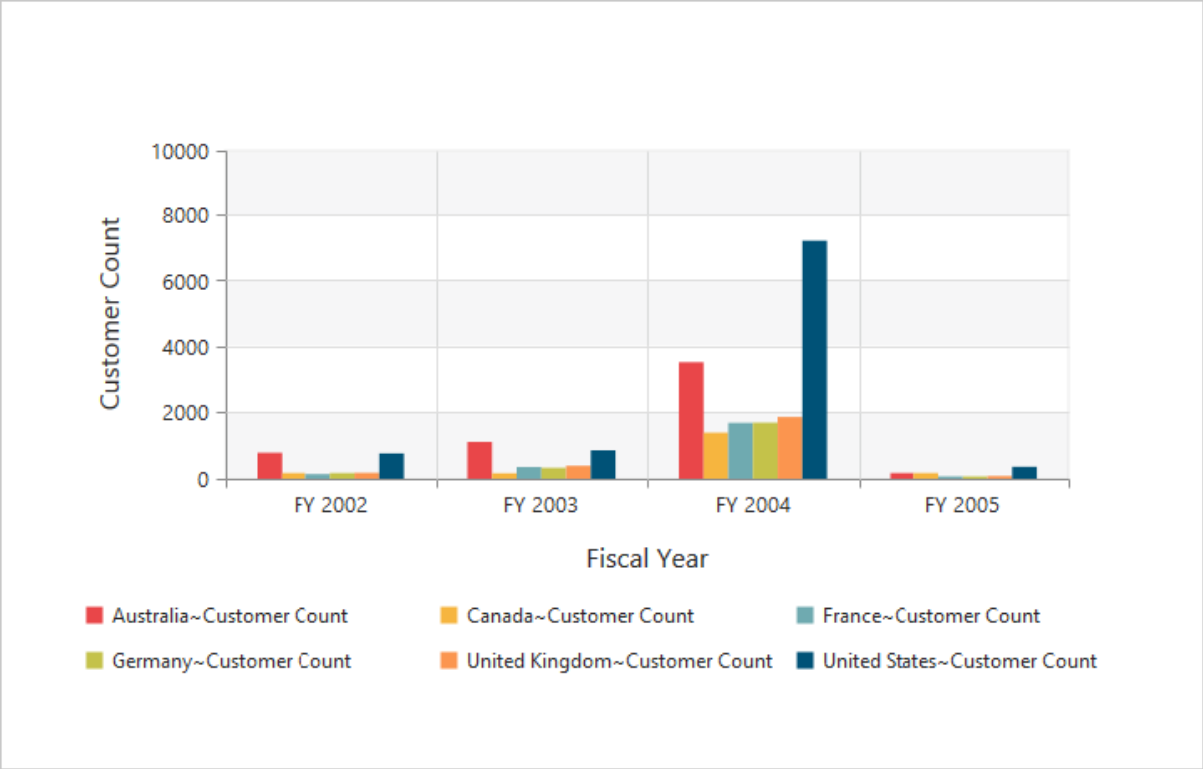
Grid Bands Customization

By using the AlternateGridBand property of the axis, you can provide different color for grid rows and columns formed by the grid lines in the Chart area. The properties Odd and Even are used to customize the grid bands at odd and even positions respectively.

ASPX-CS

```
//Customizing horizontal grid bands at even position
@Html.EJ().Pivot().PivotChart("PivotChart1").PrimaryYAxis(primaryYAxis =>
primaryYAxis.AlternateGridBand(gridband => gridband.Even(even =>
even.Fill("#A7A9AB").Opacity(0.1)))).Url(Url.Content("/RelationalChartSer
vice.svc")).Size(size => size.Height("460px").Width("950px"))
```

Copyright © 2001 - 2020 Syncfusion Inc.



Animation

You can enable animation by using the EnableAnimation property under CommonSeriesOptions of the PivotChart control. This animates the Chart series on two occasions - when the Chart is loaded for the first time and when you change the series type by using the Type property.

ASPX-CS

```
//Enabling animation in series
@Html.EJ().Pivot().PivotChart("PivotChart1").Url(Url.Content("/Relational
ChartService.svc")).CommonSeriesOptions(comm => {
comm.EnableAnimation(true); }).Size(size =>
size.Height("460px").Width("100%"))
```

Localization

Localization in PivotChart

We can localize the PivotChart controls text with a collection of localized strings using **ej.PivotChart.Locale** for different cultures. By default, the PivotChart control is localized in **“en-US”.**

Following code example illustrates on how to localize PivotChart based on **“French”** culture.

ASPX-CS

```
@Html.EJ().Pivot().PivotChart("PivotChart1").Url(Url.Content("/Relational
ChartService.svc")).Locale("fr-FR").Size(size =>
size.Height("320px").Width("100%"))
<script type="text/javascript">
ej.PivotChart.Locale["fr-FR"] = {
Measure: "Mesure",
Row: "Rangée",
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
Column: "Colonne",
Value: "Valeur",
Expand: "Développer",
Collapse: "Effondrement",
Exit: "Quitter"
};
</script>
```

Following table localizes the in-built keywords to **“French”** culture for PivotChart.

Keywords	Values
Measure	“Mesure”
Row	"Rangée "
Column	"Colonne”
Value	"Valeur "
Expand	"Développer "
Collapse	"Effondrement "
Exit	“Quitter "

Localization and Globalization of Cube Info (Client Mode)

Content displayed within the PivotChart control are obtained from the OLAP Cube. So following are the steps that needs to be done to get the localized and globalized Cube content.

- To get localized data from OLAP Cube, we need to set **“Locale Identifier”** in the connection string to a specific culture in the **“Data”** property present inside **“DataSource”**.
- To bind the globalized content in PivotChart control, we need to set **“Locale”** property to a specific culture and want to refer specific culture file in the sample.

Note: Culture files are present under **“[installed drive]:\Users\[user name]\AppData\Local\Syncfusion\EssentialStudio\X.X.X.X\MVC\Samples\web\Scripts\cultures”.**

ASPX-CS

```
//1036 refers to “fr-FR” culture.
@Html.EJ().Pivot().PivotChart("PivotChart1").Locale("fr-
FR").CommonSeriesOptions(comm => {
comm.Type(SeriesType.Column).Tooltip(tool => { tool.Visible(true);
}).EnableAnimation(true); }).Size(size =>
size.Height("350px").Width("100%")).PrimaryXAxis(primaryXAxis =>
primaryXAxis.Title(title => title.Text("Date -
Fiscal")).LabelRotation(0)).PrimaryYAxis(primaryYAxis =>
primaryYAxis.Title(title => title.Text("Internet Sales
Amount"))).Legend(legend =>
legend.Visible(true).RowCount(2)).ClientSideEvents(
oEve => { oEve.Load("loadTheme");
}).IsResponsive(true).DataSource(dataSource =>
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
dataSource.Rows(rows=>{rows.FieldName("[Date].[Fiscal]").Add();}).Columns
(columns=>{columns.FieldName("[Customer].[Customer
Geography]").Add();}).Values(values => { values.Measures(measures => {
measures.FieldName("[Measures].[Internet Sales Amount]").Add();
}).Axis(AxisName.Column).Add();})
.Data("https://bi.syncfusion.com/olap/msmdpump.dll;Locale
Identifier=1036;").Catalog("Adventure Works DW 2008 SE").Cube("Adventure
Works"))
```

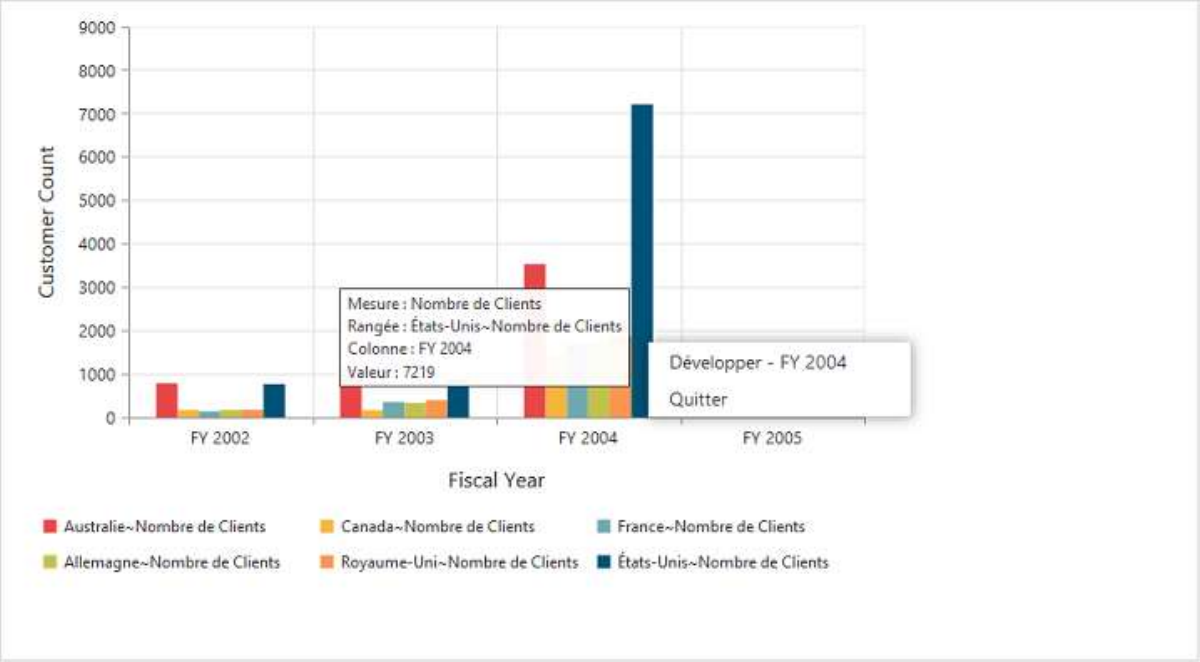
Localization and Globalization of Cube Info

Content displayed within the PivotChart control are obtained from the OLAP Cube. So following are the steps that needs to be done to get the localized and globalized Cube content.

- To get the localized string based on different cultures, from OLAP Cube, we need to set **"Locale Identifier"** in the connection string to a specific culture.
- To bind the globalized content in PivotGrid control, we need to set **"Culture"** and **"OverrideDefaultFormatStrings"** properties in OlapDataManager class to a specific culture.

C#

```
//1036 refers to "fr-FR" culture.
string connectionString = "Data Source=localhost; Initial
Catalog=Adventure Works DW; Locale Identifier=1036;";
DataManager = new OlapDataManager(connectionString);
DataManager.Culture = new System.Globalization.CultureInfo(1036);
DataManager.OverrideDefaultFormatStrings = true;
```



How to

Configure pivot chart through the model properties

There comes a time when you want to set pivot chart properties other than using PivotChartPropertiesBuilder i.e., in the Controller side. At that time, you can pass PivotChartProperties model instance as a parameter to the pivot chart helper method.

We can set properties to pivot chart control in server-side using the PivotChartProperties class and it is used in the view page with the help of pivot chart helper overload.

In addition to the id parameter of pivot chart helper method, we can also pass PivotChartProperties model as another parameter to the pivot chart helper method.

Relational

The following code example explains how to render the pivot chart control in relational mode.

RAZOR

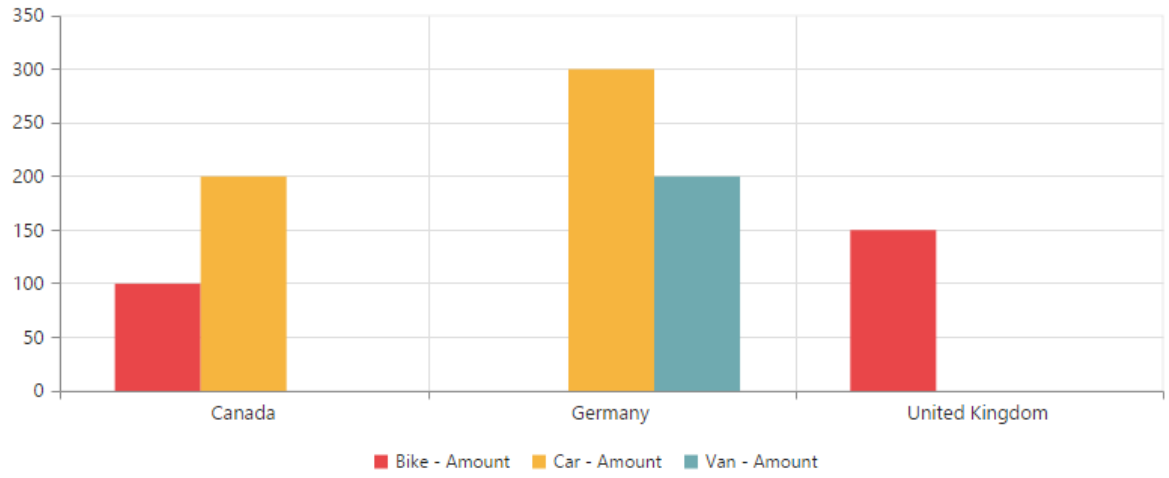
```
@model Syncfusion.JavaScript.Models.PivotChartProperties
@(Html.EJ().Pivot().PivotChart("PivotChart", Model))
<script type="text/javascript">
function load(args) {
args.model.dataSource.data = pivot_dataset;
}
</script>
```

C#

```
namespace PivotChart
{
public class PivotChartController: Controller
{
public ActionResult PivotChartFeatures()
{
Syncfusion.JavaScript.Models.PivotChartProperties pivotchart = new
Syncfusion.JavaScript.Models.PivotChartProperties();
PivotDataSource pivotchartDS = new PivotDataSource();
List<Field> rows = new List<Field>();
rows.Add(new Field() { FieldName = "Country", FieldCaption = "Country"
});
rows.Add(new Field() { FieldName = "State", FieldCaption = "State" });
pivotchartDS.Rows = rows;
List<Field> cols = new List<Field>();
cols.Add(new Field() { FieldName = "Product", FieldCaption = "Product"
});
pivotchartDS.Columns = cols;
pivotchart.Load = "load";
List<Field> values = new List<Field>();
values.Add(new Field() { FieldName = "Amount" });
pivotchartDS.Values = values;
pivotchart.DataSource = pivotchartDS;
return View(pivotchart);
}
}
}
```

Copyright © 2001 - 2020 Syncfusion Inc.

As a result of the previous code example, the pivot chart will be displayed as shown below:



OLAP

The following code example explains how to render the pivot chart control in OLAP mode.

RAZOR

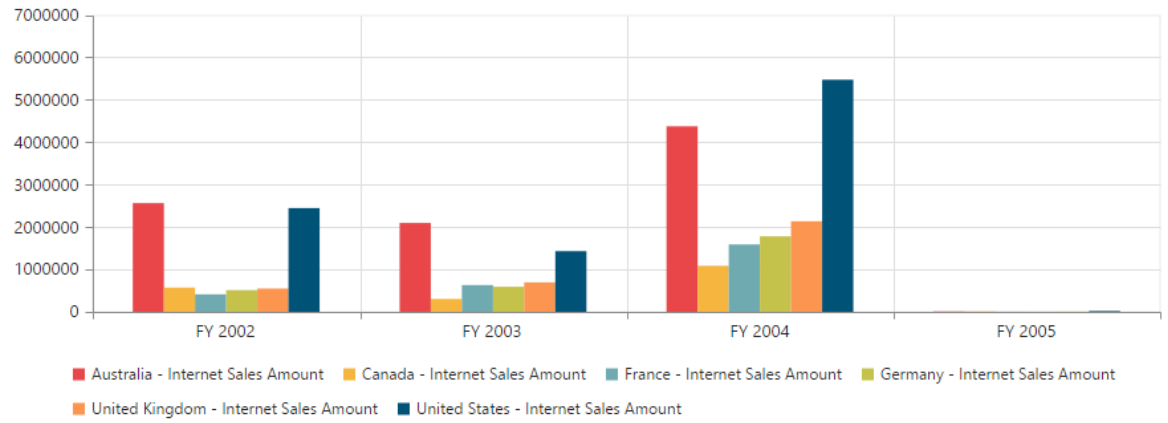
```
@model Syncfusion.JavaScript.Models.PivotChartProperties
@(Html.EJ().Pivot().PivotChart("PivotChart", Model))
```

C#

```
namespace PivotChart
{
public class PivotChartController: Controller
{
public ActionResult PivotChartFeatures()
{
Syncfusion.JavaScript.Models.PivotChartProperties pivotchart = new
Syncfusion.JavaScript.Models.PivotChartProperties();
PivotDataSource pivotchartDS = new PivotDataSource();
pivotchartDS.Data = "https://bi.syncfusion.com/olap/msmdpump.dll";
pivotchartDS.Cube = "Adventure Works";
pivotchartDS.Catalog = "Adventure Works DW 2008 SE";
List<Field> rows = new List<Field>();
rows.Add(new Field() { FieldName = "[Date].[Fiscal]" });
pivotchartDS.Rows = rows;
List<Field> cols = new List<Field>();
cols.Add(new Field() { FieldName = "[Customer].[Customer Geography]" });
pivotchartDS.Rows = cols;
List<MeasuresItems> measures = new List<MeasuresItems>();
measures.Add(new MeasuresItems() { FieldName = "[Measures].[Internet
Sales Amount]" });
List<Field> values = new List<Field>();
values.Add(new Field() { Measures = measures, Axis =
Syncfusion.JavaScript.AxisName.Column });
pivotchartDS.Values = values;
pivotchart.DataSource = pivotchartDS;
return View(pivotchart);
```

```
}
}
}
```

As a result of the previous code example, the pivot chart will be displayed as shown below:



PivotClient

PivotClient

The **PivotClient** control for ASP.NET MVC provides support to bind both OLAP and Relational data sources. You can visualize the results in graphical and tabular formats (chart and grid).The **PivotClient** control is also used to create and edit a report on-the-fly that is stored for later use.

Key Features

The key features of the **PivotClient** control is as follows:

- **Data Source:** Binds the **PivotClient** control with Relational data source and with Microsoft Analysis Services databases and **XML/A** data sources.
- **Axis Element Builder:** Allows building an **OLAP/Pivot** report by placing elements in the different axes of the **PivotClient**. There are four axes that are supported namely column, row, slicer and values.
- **Member Editor:** Lists out the members of the selected field for Relational data source and members of the selected hierarchy in a tree-view-like structure for OLAP data source.
- **Toolbar:** The toolbar of the **PivotClient** component provide options for exporting and manipulating the **OLAP/Pivot** report such as add report, new report, remove report, etc.,
- **Cube Dimension Browser:** A tree-view-like structure that organizes the dimensions, measures and named sets from the selected OLAP cube into independent logical groups.
- **Field List:** List which explores the fields available in Relational data source connected.
- **Visualization Controls:** For a diagrammatic representation of multidimensional data.

Getting Started

Getting Started

Important

Copyright © 2001 - 2020 Syncfusion Inc.

Starting with v16.2.0.x, if you refer to Syncfusion assemblies from trial setup or from the NuGet feed, include a license key in your projects. Refer to this link to learn about registering Syncfusion license key in your ASP.NET Core application to use our components.

Creating a simple application with PivotClient and Relational datasource (Client Mode)

This section covers the information that you need to know to populate a simple PivotClient with Relational data completely on the client-side.

Project Initialization

Create a new **ASP.NET MVC Web Application** using Visual Studio IDE and name the project as **"PivotClientDemo"**.

Select the View engine as **'Razor'** and Project template as **'Internet Application'** and finally click **OK** button to create an application.

Now add the following dependency libraries as references into your MVC Web Application. In order to add them to your application, right-click on **References** in Solution Explorer and select Add Reference. Now in the **Reference Manager** dialog, under **Assemblies > Extension**, the following Syncfusion libraries will be found.

- Syncfusion.EJ
- Syncfusion.EJ.Pivot
- Syncfusion.EJ.Export
- Syncfusion.EJ.MVC

The version of Syncfusion libraries based on .NET Framework and MVC version are classified below. For example, version is illustrated as,

MVC Version	MVC Version of Syncfusion assembly	Base Version of Syncfusion assembly	System.Web.Mvc	System.Web.WebPages
MVC3	{{ site.mvc3releaseversion }}	{{ site.35esreleaseversion }}	3.0	1.0
MVC4	{{ site.mvc4releaseversion }}	{{ site.40esreleaseversion }}	4.0	2.0
MVC5	{{ site.mvc5releaseversion }}	{{ site.45esreleaseversion }}	5.0	3.0

Register the referred assemblies in Web.config files available inside Views folder and also at the root of the application.

XML

```
<compilation debug="true" targetFramework="4.0">
<assemblies>
……
……
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
<add assembly="Syncfusion.EJ, Version= {{ site.40esreleaseversion }},
Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.EJ.Pivot, Version= {{ site.40esreleaseversion
}}, Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.EJ.Export, Version= {{ site.40esreleaseversion
}}, Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.EJ.Mvc, Version= {{ site.40esreleaseversion }},
Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
</assemblies>
</compilation>
```

Register the required namespaces in Web.config files available inside Views folder and also at the root of the application

XML

```
<namespaces>
……
……
<add namespace="Syncfusion.MVC.EJ" />
<add namespace="Syncfusion.JavaScript" />
</namespaces>
```

Note: Registering assemblies and namespaces earlier helps to include the control in view page with the help of intellisense.

Set the **UnobtrusiveJavaScriptEnabled** property to false under **appSettings** tag in Web.config file at the root folder.

XML

```
<configuration>
……
……
<appSettings>
……
……
<add key="UnobtrusiveJavaScriptEnabled" value="false" />
</appSettings>
</configuration>
```

Scripts and CSS References

The scripts and style sheets that are mandatorily required to render PivotClient control in a MVC Web Application are mentioned in an appropriate order below:

1. ej.web.all.min.css
2. jQuery-3.0.0.min.js
3. ej.web.all.min.js
4. jsrender.min.js

Scripts and style sheets are referred under the <head> tag in _Layout.cshtml file which is found inside Views > Shared folder.

Copyright © 2001 - 2020 Syncfusion Inc.

HTML

```
<head>
<link href="http://cdn.syncfusion.com/{{ site.releaseversion
}}/js/web/flat-azure/ej.web.all.min.css" rel="stylesheet" type="text/css"
/>
<script src="http://cdn.syncfusion.com/js/assets/external/jquery-
3.0.0.min.js" type="text/javascript"></script>
<script src="http://cdn.syncfusion.com/{{ site.releaseversion
}}/js/web/ej.web.all.min.js" type="text/javascript"></script>
<script
src="http://cdn.syncfusion.com/js/assets/external/jsrender.min.js"
type="text/javascript"></script>
</head>
```

The script manager is initialized immediately after the RenderBody() function call in **_Layout.cshtml** file in-order to generate control related scripts.

ASPX-CS

```
<body>
……
……
@RenderBody()
@(Html.EJ().ScriptManager())
</body>
```

Initialize PivotClient

Before initializing, empty the contents of Index.cshtml file under Views > Home folder and add the following codes.

HTML

```
@Html.EJ().Pivot().PivotClient("PivotClient1").Title("Relational
Browser")
```

Populate PivotClient With Data

Let us now see how to populate the PivotClient control using a sample JSON data as shown below.

HTML

```
@Html.EJ().Pivot().PivotClient("PivotClient1").Title("Relational
Browser").ClientSideEvents(clientSideEvents =>
clientSideEvents.Load("onLoad"))
<script type="text/javascript">
function onLoad(args) {
args.model.dataSource.data = [
{ Amount: 100, Country: "Canada", Date: "FY 2005", Product: "Bike",
Quantity: 2, State: "Alberta" },
{ Amount: 200, Country: "Canada", Date: "FY 2006", Product: "Van",
Quantity: 3, State: "British Columbia" },
{ Amount: 300, Country: "Canada", Date: "FY 2007", Product: "Car",
Quantity: 4, State: "Brunswick" },
{ Amount: 150, Country: "Canada", Date: "FY 2008", Product: "Bike",
Quantity: 3, State: "Manitoba" },
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
{ Amount: 200, Country: "Canada", Date: "FY 2006", Product: "Car",
Quantity: 4, State: "Ontario" },
{ Amount: 100, Country: "Canada", Date: "FY 2007", Product: "Van",
Quantity: 1, State: "Quebec" },
{ Amount: 200, Country: "France", Date: "FY 2005", Product: "Bike",
Quantity: 2, State: "Charente-Maritime" },
{ Amount: 250, Country: "France", Date: "FY 2006", Product: "Van",
Quantity: 4, State: "Essonne" },
{ Amount: 300, Country: "France", Date: "FY 2007", Product: "Car",
Quantity: 3, State: "Garonne (Haute)" },
{ Amount: 150, Country: "France", Date: "FY 2008", Product: "Van",
Quantity: 2, State: "Gers" },
{ Amount: 200, Country: "Germany", Date: "FY 2006", Product: "Van",
Quantity: 3, State: "Bayern" },
{ Amount: 250, Country: "Germany", Date: "FY 2007", Product: "Car",
Quantity: 3, State: "Brandenburg" },
{ Amount: 150, Country: "Germany", Date: "FY 2008", Product: "Car",
Quantity: 4, State: "Hamburg" },
{ Amount: 200, Country: "Germany", Date: "FY 2008", Product: "Bike",
Quantity: 4, State: "Hessen" },
{ Amount: 150, Country: "Germany", Date: "FY 2007", Product: "Van",
Quantity: 3, State: "Nordrhein-Westfalen" },
{ Amount: 100, Country: "Germany", Date: "FY 2005", Product: "Bike",
Quantity: 2, State: "Saarland" },
{ Amount: 150, Country: "United Kingdom", Date: "FY 2008", Product:
"Bike", Quantity: 5, State: "England" },
{ Amount: 250, Country: "United States", Date: "FY 2007", Product: "Car",
Quantity: 4, State: "Alabama" },
{ Amount: 200, Country: "United States", Date: "FY 2005", Product: "Van",
Quantity: 4, State: "California" },
{ Amount: 100, Country: "United States", Date: "FY 2006", Product:
"Bike", Quantity: 2, State: "Colorado" },
{ Amount: 150, Country: "United States", Date: "FY 2008", Product: "Car",
Quantity: 3, State: "New Mexico" },
{ Amount: 200, Country: "United States", Date: "FY 2005", Product:
"Bike", Quantity: 4, State: "New York" },
{ Amount: 250, Country: "United States", Date: "FY 2008", Product: "Car",
Quantity: 3, State: "North Carolina" },
{ Amount: 300, Country: "United States", Date: "FY 2007", Product: "Van",
Quantity: 4, State: "South Carolina" }
]
}
</script>
```

The JSON data is set to the **"data"** property present inside the **"dataSource"** object. **"dataSource"** object allows us to set both datasource as well as the fields that needs to be displayed in the row, column, value and filter section of the PivotClient control.

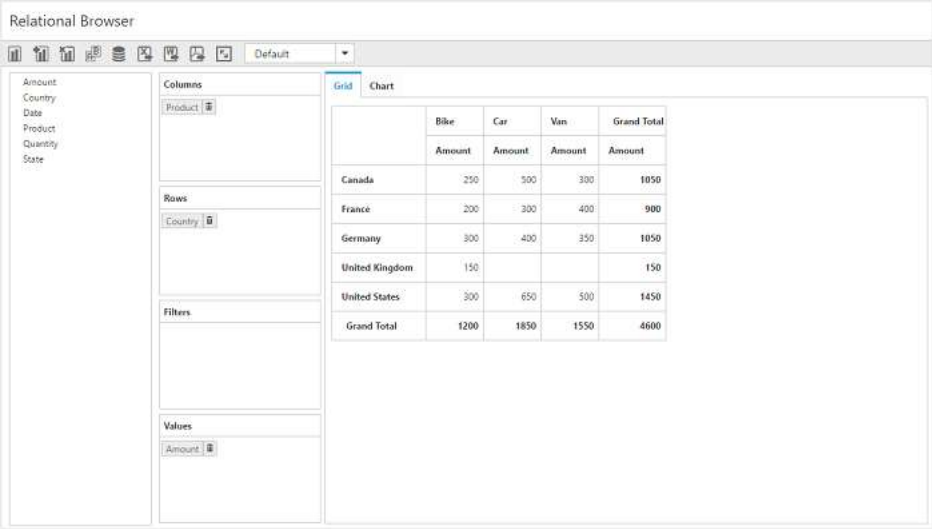
HTML

```
@Html.EJ().Pivot().PivotClient("PivotClient1").Title("Relational
Browser").ClientSideEvents(clientSideEvents =>
clientSideEvents.Load("onLoad")).DataSource(dataSource =>
dataSource.Rows(rows => {
rows.FieldName("Country").FieldCaption("Country").Add();}).Columns(column
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
s => { columns.FieldName("Product").FieldCaption("Product").Add();
}).Values(values => { values.FieldName("Amount").Add();}))
```

Now, PivotClient is rendered with PivotChart and PivotGrid with "Country" field in Row, "Product" field in Column and "Amount" field in Value section.



Creating a simple application with PivotClient and Relational datasource (Server Mode)

This section covers the information required to create a simple PivotClient bound to Relational datasource.

Note: ASP.NET MVC Web Application will contain a service that transfers data to server-side, processes and returns back to client-side for control rendering and re-rendering. The service utilized for communication could be either WCF or WebAPI based on user requirement.

Project Initialization

Create a new **ASP.NET MVC Web Application** using Visual Studio IDE and name the project as **"PivotClientDemo"**.

Select the View engine as **'Razor'** and Project template as **'Internet Application'** and finally click **OK** button to create an application.

Now add the following dependency libraries as references into your MVC Web Application. In order to add them to your application, right-click on **References** in Solution Explorer and select Add Reference. Now in the **Reference Manager** dialog, under **Assemblies > Extension**, the following Syncfusion libraries will be found.

Note: If you have installed any version of Essential Studio, then the location of Syncfusion libraries is [system drive:\Program Files (x86)\Syncfusion\Essential Studio\{{ site.releaseversion }}\Assemblies].

- Syncfusion.Compression.Base
- Syncfusion.Linq.Base
- Syncfusion.Olap.Base
- Syncfusion.PivotAnalysis.Base
- System.Data.SqlServerCe (Version: 4.0.0.0)
- Syncfusion.XlsIO.Base

Copyright © 2001 - 2020 Syncfusion Inc.

- Syncfusion.Pdf.Base
- Syncfusion.DocIO.Base
- Syncfusion.EJ
- Syncfusion.EJ.Export
- Syncfusion.EJ.Pivot
- Syncfusion.EJ.MVC

The version of Syncfusion libraries based on .NET Framework and MVC version are classified below. For example, version is illustrated as,

MVC Version	MVC Version of Syncfusion assembly	Base Version of Syncfusion assembly	System.Web.Mvc	System.Web.WebPages
MVC3	{{ site.mvc3releaseversion }}	{{ site.35esreleaseversion }}	3.0	1.0
MVC4	{{ site.mvc4releaseversion }}	{{ site.40esreleaseversion }}	4.0	2.0
MVC5	{{ site.mvc5releaseversion }}	{{ site.45esreleaseversion }}	5.0	3.0

Register the referenced assemblies in "Web.config" files available inside Views folder and also at the root of the application.

XML

```
<compilation debug="true" targetFramework="4.0">
<assemblies>
……
……
<add assembly="Syncfusion.EJ, Version= {{ site.40esreleaseversion }},
Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.EJ.Pivot, Version= {{ site.40esreleaseversion
}}, Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.EJ.Mvc, Version= {{ site.40esreleaseversion }},
Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.Linq.Base, Version= {{ site.40esreleaseversion
}}, Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.EJ.Export, Version= {{ site.40esreleaseversion
}}, Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.Olap.Base, Version= {{ site.40esreleaseversion
}}, Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.Compression.Base, Version= {{
site.40esreleaseversion }}, Culture=neutral,
PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.PivotAnalysis.Base, Version= {{
site.40esreleaseversion }}, Culture=neutral,
PublicKeyToken=3d67ed1f87d44c89" />
```

```
<add assembly="Syncfusion.Pdf.Base, Version= {{ site.40esreleaseversion
}}, Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.XlsIO.Base, Version= {{ site.40esreleaseversion
}}, Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.DocIO.Base, Version= {{ site.40esreleaseversion
}}, Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
</assemblies>
</compilation>
```

Register the required namespaces in Web.config files available inside Views folder and also at the root of the application.

XML

```
<namespaces>
……
……
<add namespace="Syncfusion.MVC.EJ" />
<add namespace="Syncfusion.JavaScript" />
</namespaces>
```

Note: Registering assemblies and namespaces earlier helps to include the control in view page with the help of intellisense.

Set the **UnobtrusiveJavaScriptEnabled** property to false under **appSettings** tag in "Web.config" file at the root folder.

XML

```
<configuration>
……
……
<appSettings>
……
……
<add key="UnobtrusiveJavaScriptEnabled" value="false" />
</appSettings>
</configuration>
```

Scripts and CSS Initialization

The scripts and style sheets that are mandatorily required to render PivotClient control in a MVC Web Application are mentioned in an appropriate order below:

1. ej.web.all.min.css
2. jQuery-3.0.0.min.js
3. ej.web.all.min.js
4. jsrender.min.js

Click here here to know more about scripts and style sheets available online (CDN Link).

Scripts and style sheets are referred under the <head> tag in **_Layout.cshtml** file which is found inside **Views > Shared folder.**

Copyright © 2001 - 2020 Syncfusion Inc.

HTML

```
<head>
<link href="http://cdn.syncfusion.com/{{ site.releaseversion
}}/js/web/flat-azure/ej.web.all.min.css" rel="stylesheet" type="text/css"
/>
<script src="http://cdn.syncfusion.com/js/assets/external/jquery-
3.0.0.min.js" type="text/javascript"></script>
<script src="http://cdn.syncfusion.com/{{ site.releaseversion
}}/js/web/ej.web.all.min.js" type="text/javascript"></script>
<script
src="http://cdn.syncfusion.com/js/assets/external/jsrender.min.js"
type="text/javascript"></script>
</head>
```

The script manager is initialized immediately after the RenderBody() function call in **_Layout.cshtml** file in-order to generate control related scripts.

HTML

```
<body>
……
……
@RenderBody()
@(Html.EJ().ScriptManager())
</body>
```

Control Initialization

Before initializing, empty the contents of **Index.cshtml** file under **Views > Home** folder and add the following codes. Register the namespaces at the top of the page and then add the control.

HTML

```
@using Syncfusion.JavaScript;
@Html.EJ().Pivot().PivotClient("PivotClient1").Title("Relational
Browser").Url(Url.Content("/Relational"))
```

The **“Url”** property in PivotClient control points the service endpoint, where data are processed and fetched in the form of JSON. The services used in PivotClient control as endpoint are WCF and WebAPI.

Note: The above "Index.cshtml" contains WebAPI URL, which is "/Relational". If WCF service is used as endpoint, the URL would look like "/RelationalService.svc".

WebAPI

Adding a WebAPI Controller

To add a WebAPI controller in an existing MVC Web Application, right-click on the project in Solution Explorer and select **Add > New Item**. In the **Add New Item** window, select **WebAPI Controller Class** and name it **“RelationalController.cs”**, click **Add**.

Now, WebAPI controller is added to the application successfully with the file **“RelationalController.cs”**.

Note: While adding WebAPI Controller Class, name it with the suffix ‘Controller’ which is mandatory. For example, in this demo the controller is named as “RelationalController”.

Copyright © 2001 - 2020 Syncfusion Inc.

Next, remove all the existing methods such as "Get", "Post", "Put" and "Delete" present inside RelationalController.cs file.

C#

```
namespace PivotClientDemo
{
public class RelationalController: ApiController
{
}
}
```

Adding the List of Namespaces

The following are the list of namespaces to be added on top of the main class inside RelationalController.cs file.

C#

```
using Syncfusion.JavaScript;
using Syncfusion.PivotAnalysis.Base;
using System;
using System.Collections.Generic;
using System.Data;
using System.Data.SqlServerCe;
using System.Linq;
using System.Net.Http;
using System.Text;
using System.Web;
using System.Web.Http;
using System.Web.Script.Serialization;
namespace PivotClientDemo
{
public class RelationalController : ApiController
{
}
}
```

Datasource Initialization

A simple collection is provided as a datasource for the PivotClient in this demo section. This datasource is placed inside a separate class “ProductSales” in RelationalController.cs file. Refer to the following code example.

C#

```
namespace PivotClientDemo {
.....
.....
internal class ProductSales {
public string Product {
get;
set;
}
public string Date {
get;
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
set;
}
public string Country {
get;
set;
}
public string State {
get;
set;
}
public int Quantity {
get;
set;
}
public double Amount {
get;
set;
}
public static ProductSalesCollection GetSalesData() {
/// Geography
string[] countries = new string[] {
"Australia",
"Canada",
"France",
"Germany",
"United Kingdom",
"United States"
};
string[] ausStates = new string[] {
"New South Wales",
"Queensland",
"South Australia",
"Tasmania",
"Victoria"
};
string[] canadaStates = new string[] {
"Alberta",
"British Columbia",
"Brunswick",
"Manitoba",
"Ontario",
"Quebec"
};
string[] franceStates = new string[] {
"Charente-Maritime",
"Essonne",
"Garonne (Haute)",
"Gers",
};
string[] germanyStates = new string[] {
"Bayern",
"Brandenburg",
"Hamburg",
"Hessen",
"Nordrhein-Westfalen",
"Saarland"
};
```

```
string[] ukStates = new string[] {
"England"
};
string[] ussStates = new string[] {
"New York",
"North Carolina",
"Alabama",
"California",
"Colorado",
"New Mexico",
"South Carolina"
};
/// Time
string[] dates = new string[] {
"FY 2005",
"FY 2006",
"FY 2007",
"FY 2008",
"FY 2009"
};
/// Products
string[] products = new string[] {
"Bike",
"Van",
"Car"
};
Random r = new Random(123345345);
int numberOfRecords = 2000;
ProductSalesCollection listOfProductSales = new ProductSalesCollection();
for (int i = 0; i < numberOfRecords; i++) {
ProductSales sales = new ProductSales();
sales.Country = countries[r.Next(1, countries.GetLength(0))];
sales.Quantity = r.Next(1, 12);
/// 1 percent discount for 1 quantity
double discount = (30000 * sales.Quantity) *
(double.Parse(sales.Quantity.ToString()) / 100);
sales.Amount = (30000 * sales.Quantity) - discount;
sales.Date = dates[r.Next(r.Next(dates.GetLength(0) + 1))];
sales.Product = products[r.Next(r.Next(products.GetLength(0) + 1))];
switch (sales.Product) {
case "Car":
{
sales.Date = "FY 2005";
break;
}
}
switch (sales.Country) {
case "Australia":
{
sales.State = ausStates[r.Next(ausStates.GetLength(0))];
break;
}
case "Canada":
{
sales.State = canadaStates[r.Next(canadaStates.GetLength(0))];
break;
}
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
case "France":
{
sales.State = franceStates[r.Next(franceStates.GetLength(0))];
break;
}
case "Germany":
{
sales.State = germanyStates[r.Next(germanyStates.GetLength(0))];
break;
}
case "United Kingdom":
{
sales.State = ukStates[r.Next(ukStates.GetLength(0))];
break;
}
case "United States":
{
sales.State = ussStates[r.Next(ussStates.GetLength(0))];
break;
}
}
listOfProductSales.Add(sales);
}
return listOfProductSales;
}
public override string ToString() {
return string.Format("{0}-{1}-{2}", this.Country, this.State,
this.Product);
}
public class ProductSalesCollection: List < ProductSales > {}
}
}
```

Service methods in WebAPI Controller

Define the service methods inside RelationalController class, found inside RelationalController.cs file, created while adding WebAPI Controller Class to the Application.

C#

```
namespace PivotClientDemo {
public class RelationalController: ApiController
{
PivotClient pivotClient = new PivotClient();
PivotChart pivotChart = new PivotChart();
PivotGrid pivotGrid = new PivotGrid();
JavaScriptSerializer serializer = new JavaScriptSerializer();
string conStringforDB = "";//Enter appropriate connection string to
connect database for saving and loading operation of reports.
[System.Web.Http.ActionName("InitializeClient")]
[System.Web.Http.HttpPost]
public Dictionary<string, object> InitializeClient(Dictionary<string,
object> jsonResult)
{
this.BindData();
```

```
return pivotClient.GetJsonData(jsonResult["action"].ToString(),
ProductSales.GetSalesData(), null);
}
[System.Web.Http.ActionName("FetchMembers")]
[System.Web.Http.HttpPost]
public Dictionary<string, object> FetchMembers(Dictionary<string, object>
jsonResult)
{
pivotClient.PopulateData(jsonResult["currentReport"].ToString());
var dict = pivotClient.GetJsonData(jsonResult["action"].ToString(),
ProductSales.GetSalesData(), jsonResult["headerTag"].ToString());
return dict;
}
[System.Web.Http.ActionName("DrillChart")]
[System.Web.Http.HttpPost]
public Dictionary<string, object> DrillChart(Dictionary<string, object>
jsonResult)
{
this.BindData();
this.pivotChart.PivotEngine.PivotRows =
this.pivotClient.PivotReport.PivotRows;
this.pivotChart.PivotEngine.PivotColumns =
this.pivotClient.PivotReport.PivotColumns;
this.pivotChart.PivotEngine.PivotCalculations =
this.pivotClient.PivotReport.PivotCalculations;
return pivotChart.GetJsonData(jsonResult["action"].ToString(),
ProductSales.GetSalesData(), jsonResult["drilledSeries"].ToString());
}
[System.Web.Http.ActionName("Filtering")]
[System.Web.Http.HttpPost]
public Dictionary<string, object> Filtering(Dictionary<string, object>
jsonResult)
{
pivotClient.PopulateData(jsonResult["currentReport"].ToString());
var dict = pivotClient.GetJsonData(jsonResult["action"].ToString(),
ProductSales.GetSalesData(), jsonResult["filterParams"].ToString());
return dict;
}
[System.Web.Http.ActionName("NodeDropped")]
[System.Web.Http.HttpPost]
public Dictionary<string, object> NodeDropped(Dictionary<string, object>
jsonResult)
{
Dictionary<string, object> dict =
pivotClient.GetJsonData(jsonResult["action"].ToString(),
ProductSales.GetSalesData(), jsonResult["args"].ToString());
return dict;
}
[System.Web.Http.ActionName("ToolbarOperations")]
[System.Web.Http.HttpPost]
public Dictionary<string, object> ToolbarOperations(Dictionary<string,
object> jsonResult)
{
Dictionary<string, object> dict =
pivotClient.GetJsonData(jsonResult["action"].ToString(),
ProductSales.GetSalesData(), jsonResult["args"].ToString());
return dict;
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
}
[System.Web.Http.ActionName("Export")]
[System.Web.Http.HttpPost]
public void Export()
{
string args = HttpContext.Current.Request.Form.GetValues(0)[0];
Dictionary<string, string> gridParams =
serializer.Deserialize<Dictionary<string, string>>(args);
pivotClient.PopulateData(gridParams["currentReport"]);
string fileName = "Sample";
pivotClient.ExportPivotClient(ProductSales.GetSalesData(), args,
fileName, System.Web.HttpContext.Current.Response);
}
[System.Web.Http.ActionName("SaveReportToDB")]
[System.Web.Http.HttpPost]
public Dictionary<string, object> SaveReportToDB(Dictionary<string,

});
}
}
.....
..... // Initialize the datasource
.....
}
```

Configure routing in WebAPIConfig Class

Open the "WebApiConfig.cs" file found in **App_Start** folder. Then routing could be configured as shown in the following code example.

C#

```
public static class WebApiConfig
{
public static void Register(HttpConfiguration config)
{
config.Routes.MapHttpRoute(
name: "DefaultApi",
routeTemplate: "{controller}/{action}/{id}",
defaults: new { id = RouteParameter.Optional }
);
}
}
```

Now, **PivotClient** is rendered with PivotChart and PivotGird with "Country" field in Row, "Product" field in Column and "Amount" field in Value section.

WCF

This section demonstrates the utilization of WCF service as endpoint binding Relational datasource to a simple PivotClient. For more details on this topic, click here.

Getting Started

Important

Starting with v16.2.0.x, if you refer to Syncfusion assemblies from trial setup or from the NuGet feed, include a license key in your projects. Refer to this link to learn about registering Syncfusion license key in your ASP.NET Core application to use our components.

Creating a simple application with PivotClient and OLAP datasource (Client Mode)

This section covers the information that you need to know to populate a simple PivotClient with OLAP data completely on the client-side.

Project Initialization

Create a new **ASP.NET MVC Web Application** using Visual Studio IDE and name the project as **"PivotClientDemo"**.

Select the View engine as **'Razor'** and Project template as **'Internet Application'** and finally click **OK** button to create an application.

Now add the following dependency libraries as references into your MVC Web Application. In order to add them to your application, right-click on **References** in Solution Explorer and select Add Reference. Now in the **Reference Manager** dialog, under **Assemblies > Extension**, the following Syncfusion libraries will be found.

- Syncfusion.EJ
- Syncfusion.EJ.Pivot
- Syncfusion.EJ.Export
- Syncfusion.EJ.MVC

The version of Syncfusion libraries based on .NET Framework and MVC version are classified below. For example, version is illustrated as,

Copyright © 2001 - 2020 Syncfusion Inc.

MVC Version	MVC Version of Syncfusion assembly	Base Version of Syncfusion assembly	System.Web.Mvc	System.Web.WebPages
MVC3	{{ site.mvc3releaseversion }}	{{ site.35esreleaseversion }}	3.0	1.0
MVC4	{{ site.mvc4releaseversion }}	{{ site.40esreleaseversion }}	4.0	2.0
MVC5	{{ site.mvc5releaseversion }}	{{ site.45esreleaseversion }}	5.0	3.0

Register the referred assemblies in "Web.config" files available inside Views folder and also at the root of the application.

XML

```
<compilation debug="true" targetFramework="4.0">
<assemblies>
……
……
<add assembly="Syncfusion.EJ, Version= {{ site.40esreleaseversion }},
Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.EJ.Pivot, Version= {{ site.40esreleaseversion
}}, Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.EJ.Export, Version= {{ site.40esreleaseversion
}}, Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.EJ.Mvc, Version= {{ site.40esreleaseversion }},
Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
</assemblies>
</compilation>
```

Register the required namespaces in "Web.config" files available inside Views folder and also at the root of the application.

XML

```
<namespaces>
……
……
<add namespace="Syncfusion.MVC.EJ" />
<add namespace="Syncfusion.JavaScript" />
</namespaces>
```

Note: Registering assemblies and namespaces earlier helps to include the control in view page with the help of intellisense.

Set the **UnobtrusiveJavaScriptEnabled** property to false under **appSettings** tag in Web.config file at the root folder.

Copyright © 2001 - 2020 Syncfusion Inc.

XML

```
<configuration>
……
……
<appSettings>
……
……
<add key="UnobtrusiveJavaScriptEnabled" value="false" />
</appSettings>
</configuration>
```

Scripts and CSS References

The scripts and style sheets that are mandatorily required to render PivotClient control in a MVC Web Application are mentioned in an appropriate order below:

1. ej.web.all.min.css
2. jQuery-3.0.0.min.js
3. ej.web.all.min.js
4. jsrender.min.js

Scripts and style sheets are referred under the <head> tag in _Layout.cshtml file which is found inside Views > Shared folder.

HTML

```
<head>
<link href="http://cdn.syncfusion.com/{{ site.releaseversion
}}/js/web/flat-azure/ej.web.all.min.css" rel="stylesheet" type="text/css"
/>
<script src="http://cdn.syncfusion.com/js/assets/external/jquery-
3.0.0.min.js" type="text/javascript"></script>
<script src="http://cdn.syncfusion.com/{{ site.releaseversion
}}/js/web/ej.web.all.min.js" type="text/javascript"></script>
<script
src="http://cdn.syncfusion.com/js/assets/external/jsrender.min.js"
type="text/javascript"></script>
</head>
```

The script manager is initialized immediately after the RenderBody() function call in **_Layout.cshtml** file in-order to generate control related scripts.

ASPX-CS

```
<body>
……
……
@RenderBody()
@(Html.EJ().ScriptManager())
</body>
```

Copyright © 2001 - 2020 Syncfusion Inc.

Initialize PivotClient

Before initializing, empty the contents of Index.cshtml file under Views > Home folder and add the following codes.

HTML

```
@Html.EJ().Pivot().PivotClient("PivotClient1").Title("OLAP Browser")
```

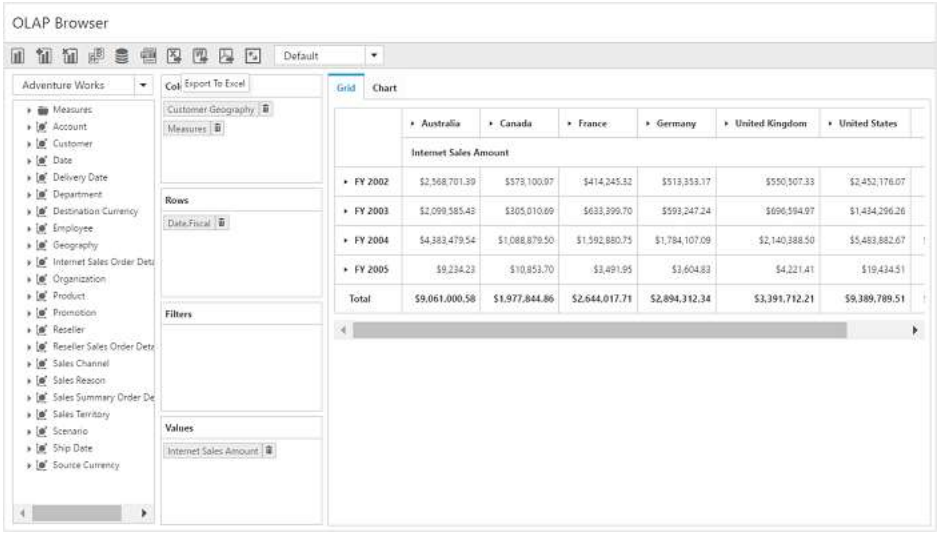
Populate PivotClient With DataSource

Initializes the OLAP datasource for PivotClient control as shown below.

HTML

```
@Html.EJ().Pivot().PivotClient("PivotClient1").Title("OLAP
Browser").DataSource(dataSource =>
dataSource.Rows(rows=>{rows.FieldName("[Date].[Fiscal]").Add();}).Columns
(columns=>{columns.FieldName("[Customer].[Customer
Geography]").Add();}).Values(values => { values.Measures(measures => {
measures.FieldName("[Measures].[Internet Sales Amount]").Add();
}).Axis(AxisName.Column).Add();}).Data("https://bi.syncfusion.com/olap/ms
mdpump.dll").Catalog("Adventure Works DW 2008 SE").Cube("Adventure
Works"))
```

Now, PivotClient is rendered with PivotChart and PivotGrid with "Customer Geography" field in Column, "Fiscal" field in Row and "Internet Sales Amount" field in Value section.



Creating a simple application with PivotClient and OLAP datasource (Server Mode)

This section covers the information required to create a simple PivotClient bound to OLAP datasource.

Note: ASP.NET MVC Web Application will contain a service that transfers data to server-side, processes and returns back to client-side for control rendering and re-rendering. The service utilized for communication could be either WCF or WebAPI based on user requirement.

Project Initialization

Create a new **ASP.NET MVC Web Application** using Visual Studio IDE and name the project as **"PivotClientDemo"**.

Select the View engine as **'Razor'** and Project template as **'Internet Application'** and finally click **OK** button to create an application.

Now add the following dependency libraries as references into your MVC Web Application. In order to add them to your application, right-click on **References** in Solution Explorer and select **Add Reference**. Now in the **Reference Manager** dialog, under **Assemblies > Extension**, the following Syncfusion libraries will be found.

Note: If you have installed any version of SQL Server Analysis Service (SSAS) or Microsoft ADOMD.NET utility, then the location of Microsoft.AnalysisServices.AdomdClient library is [system drive:\Program Files (x86)\Microsoft.NET\ADOMD.NET]. And if you have installed any version of Essential Studio, then the location of Syncfusion libraries is [system drive:\Program Files (x86)\Syncfusion\Essential Studio\{{ site.releaseversion }}\Assemblies].

- Microsoft.AnalysisServices.AdomdClient
- Syncfusion.Compression.Base
- Syncfusion.Linq.Base
- Syncfusion.Olap.Base
- Syncfusion.PivotAnalysis.Base
- System.Data.SqlServerCe (Version: 4.0.0.0)
- Syncfusion.XlsIO.Base
- Syncfusion.Pdf.Base
- Syncfusion.DocIO.Base
- Syncfusion.EJ
- Syncfusion.EJ.Export
- Syncfusion.EJ.Pivot
- Syncfusion.EJ.MVC

The version of Syncfusion libraries based on .NET Framework and MVC version are classified below. For example, version is illustrated as,

MVC Version	MVC Version of Syncfusion assembly	Base Version of Syncfusion assembly	System.Web.Mvc	System.Web.WebPages
MVC3	{{ site.mvc3releaseversion }}	{{ site.35esreleaseversion }}	3.0	1.0
MVC4	{{ site.mvc4releaseversion }}	{{ site.40esreleaseversion }}	4.0	2.0
MVC5	{{ site.mvc5releaseversion }}	{{ site.45esreleaseversion }}	5.0	3.0

Register the referenced assemblies in "Web.config" files available inside Views folder and also at the root of the application.

XML

Copyright © 2001 - 2020 Syncfusion Inc.

```
<compilation debug="true" targetFramework="4.0">
<assemblies>
……
……
<add assembly="Syncfusion.EJ, Version= {{ site.40esreleaseversion }},
Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.EJ.Pivot, Version= {{ site.40esreleaseversion
}}, Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.EJ.Export, Version= {{ site.40esreleaseversion
}}, Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.EJ.Mvc, Version= {{ site.40esreleaseversion }},
Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.Linq.Base, Version= {{ site.40esreleaseversion
}}, Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.Olap.Base, Version= {{ site.40esreleaseversion
}}, Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.Compression.Base, Version= {{
site.40esreleaseversion }}, Culture=neutral,
PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.PivotAnalysis.Base, Version= {{
site.40esreleaseversion }}, Culture=neutral,
PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.Pdf.Base, Version= {{ site.40esreleaseversion
}}, Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.XlsIO.Base, Version= {{ site.40esreleaseversion
}}, Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.DocIO.Base, Version= {{ site.40esreleaseversion
}}, Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
</assemblies>
</compilation>
```

Register the required namespaces in "Web.config" files available inside Views folder and also at the root of the application.

XML

```
<namespaces>
……
……
<add namespace="Syncfusion.MVC.EJ" />
<add namespace="Syncfusion.JavaScript" />
</namespaces>
```

Note: Registering assemblies and namespaces earlier helps to include the control in view page with the help of intellisense.

Set the **UnobtrusiveJavaScriptEnabled** property to false under **appSettings** tag in "Web.config" file at the root folder.

XML

```
<configuration>
……
……
<appSettings>
……
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
……
<add key="UnobtrusiveJavaScriptEnabled" value="false" />
</appSettings>
</configuration>
```

Scripts and CSS Initialization

The scripts and style sheets that are mandatorily required to render PivotClient control in a MVC Web Application are mentioned in an appropriate order below:

1. ej.web.all.min.css
2. jQuery-3.0.0.min.js
3. ej.web.all.min.js
4. jsrender.min.js

Click here here to know more about scripts and style sheets available online (CDN Link).

Scripts and style sheets are referred under the **head** tag in **_Layout.cshtml** file which is found inside **Views > Shared folder.**

HTML

```
<head>
<link href="http://cdn.syncfusion.com/{{ site.releaseversion
}}/js/web/flat-azure/ej.web.all.min.css" rel="stylesheet" type="text/css"
/>
<script src="http://cdn.syncfusion.com/js/assets/external/jquery-
3.0.0.min.js" type="text/javascript"></script>
<script src="http://cdn.syncfusion.com/{{ site.releaseversion
}}/js/web/ej.web.all.min.js" type="text/javascript"></script>
<script
src="http://cdn.syncfusion.com/js/assets/external/jsrender.min.js"
type="text/javascript"></script>
</head>
```

The script manager is initialized immediately after the RenderBody() function call in **_Layout.cshtml** file in-order to generate control related scripts.

HTML

```
<body>
……
……
@RenderBody()
@(Html.EJ().ScriptManager())
</body>
```

Control Initialization

Before initializing, empty the contents of **Index.cshtml** file under **Views > Home** folder and add the following codes. Register the namespaces at the top of the page and then add the control.

HTML

```
@using Syncfusion.JavaScript;
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
<div>
@Html.EJ().Pivot().PivotClient("PivotClient1").Title("OLAP
Browser").Url(Url.Content("/Olap"))
</div>
```

The **"Url"** property in PivotClient control points the service endpoint, where data are processed and fetched in the form of JSON. The services used in PivotClient control as endpoint are WCF and WebAPI.

Note: The above "Index.cshtml" contains WebAPI URL, which is "/Olap". If WCF service is used as endpoint, the URL would look like "/OlapService.svc".

WebAPI

Adding a WebAPI Controller

To add a WebAPI controller in an existing Web Application, right-click on the project in Solution Explorer and select **Add > New Item**. In the **Add New Item** window, select **WebAPI Controller Class** and name it as OlapController.cs, click Add.

Now, WebAPI controller is added to the application successfully with the file **"OlapController.cs"**.

Note: While adding WebAPI Controller Class, name it with the suffix 'Controller' that is mandatory. For example, in this demo the controller is named as **"OlapController"**.

Next, remove all the existing methods such as "Get", "Post", "Put" and "Delete" present inside OlapController.cs file.

C#

```
namespace PivotClientDemo
{
public class OlapController: ApiController
{
}
}
```

Adding the List of Namespaces

The following are the list of namespaces to be added on top of the main class inside OlapController.cs file.

C#

```
using Syncfusion.JavaScript;
using Syncfusion.Olap.Manager;
using Syncfusion.Olap.Reports;
using System;
using System.Collections.Generic;
using System.Configuration;
using System.Data;
using System.Data.SqlServerCe;
using System.Linq;
using System.Text;
using System.Web;
using System.Web.Http;
using System.Web.Script.Serialization;
using OLAPUTILS = Syncfusion.JavaScript.Olap;
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
namespace PivotClientDemo
{
public class OlapController: ApiController
{
}
}
```

Datasource Initialization

Now, the connection string to connect OLAP Cube, PivotClient and JavaScriptSerializer instances are created immediately inside the main class in OlapController.cs file.

C#

```
namespace PivotClientDemo
{
public class OlapController: ApiController
{
PivotClient pivotClientHelper = new PivotClient();
PivotTreeMap treeMapHelper = new PivotTreeMap();
PivotChart chartHelper = new PivotChart();
JavaScriptSerializer serializer = new JavaScriptSerializer();
string connectionString = "Data
Source=https://bi.syncfusion.com/olap/msmdpump.dll; Initial
Catalog=Adventure Works DW 2008 SE;";
string conStringforDB = "";//Enter appropriate connection string to
connect database for saving and loading operation of reports
//Other codes
}
}
```

Service methods in WebAPI Controller

Define the service methods inside "OlapController" class, found inside OlapController.cs file, created while adding WebAPI Controller Class to the Application.

C#

```
namespace PivotClientDemo {
public class OlapController: ApiController
{
PivotClient pivotClientHelper = new PivotClient();
PivotTreeMap treeMapHelper = new PivotTreeMap();
PivotChart chartHelper = new PivotChart();
JavaScriptSerializer serializer = new JavaScriptSerializer();
string connectionString = "Data
Source=https://bi.syncfusion.com/olap/msmdpump.dll; Initial
Catalog=Adventure Works DW 2008 SE;";
string conStringforDB = "";//Enter appropriate connection string to
connect database for saving and loading operation of reports

Configure routing in WebAPIConfig Class

Open the "WebAPIConfig.cs" file found in **App_Start** folder. Then routing could be configured as shown in the following code example.

C#

```
public static class WebApiConfig
{
public static void Register(HttpConfiguration config)
{
config.Routes.MapHttpRoute(
name: "DefaultApi",
routeTemplate: "{controller}/{action}/{id}",
defaults: new { id = RouteParameter.Optional }
);
}
}
```

Now, **PivotClient** is rendered with PivotChart and PivotGrid showing Customer Count over a period of fiscal years.

WCF

This section demonstrates the utilization of WCF service as endpoint binding OLAP datasource to a simple PivotClient. For more details on this topic, click here.

Data Binding

Data Binding

Binding PivotClient to Collection

This section demonstrates binding of a collection to the PivotClient control as datasource. For more information on this datasource refer the following links.

If you are using WebAPI controller, refer the "Datasource Initialization" section under the following link.

If you are using WCF Service, refer the "Datasource Initialization" section below.

WCF

Adding a WCF Service

To add a WCF service in an existing MVC Application, right-click on the project in Solution Explorer and select **Add > New Item**. In the **Add New Item** window, select WCF Service and name it as RelationalService.svc, click **Add.**

Now, WCF service is added into the application successfully that comprises of the following files. The utilization of these files is explained in the immediate sections

- RelationalService.svc
- RelationalService.svc.cs
- IRelationalService.cs

Configuring WCF Service Class

Copyright © 2001 - 2020 Syncfusion Inc.

Remove the **"DoWork"** method present inside both RelationalService.svc.cs and IRelationalService.cs files. Next, add **"AspNetCompatibilityRequirements"** attribute on top of main class present inside RelationalService.svc.cs and set **"RequirementsMode"** value to **"Allowed"**.

C#

```
namespace PivotClientDemo
{
[AspNetCompatibilityRequirements(RequirementsMode =
AspNetCompatibilityRequirementsMode.Allowed)]
public class RelationalService : IRelationalService
{
}
}
```

List of Dependency Libraries

Next you need to add the below mentioned dependency libraries into your Web Application. These libraries could be found in GAC (Global Assembly Cache) as well.

To add them to your Web Application, right-click on **References** in Solution Explorer and select **Add Reference**. Now in the **Reference Manager** dialog, under **Assemblies > Extension**, the following Syncfusion libraries are found.

Note: If you have installed any version of Essential Studio, then the location of Syncfusion libraries is [system drive:\Program Files (x86)\Syncfusion\Essential Studio\{{ site.releaseversion }}\Assemblies].

- Syncfusion.Compression.Base
- Syncfusion.Linq.Base
- Syncfusion.Olap.Base
- Syncfusion.PivotAnalysis.Base
- System.Data.SqlServerCe (Version: 4.0.0.0)
- Syncfusion.XlsIO.Base
- Syncfusion.Pdf.Base
- Syncfusion.DocIO.Base
- Syncfusion.EJ
- Syncfusion.EJ.Export
- Syncfusion.EJ.Pivot
- Syncfusion.EJ.MVC

List of Namespaces

Following are the list of namespaces to be added on top of the main class inside RelationalService.svc.cs file.

C#

```
using Syncfusion.JavaScript;
using Syncfusion.PivotAnalysis.Base;
using System;
using System.Collections.Generic;
using System.Data;
using System.ServiceModel.Activation;
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
using System.Data.SqlServerCe;
using Syncfusion.Olap.Manager;
using System.Linq;
using System.Net.Http;
using System.Text;
using System.Web;
using System.Web.Http;
using System.Web.Script.Serialization;
using OLAPUTILS = Syncfusion.JavaScript.Olap;
namespace PivotClientDemo
{
[AspNetCompatibilityRequirements(RequirementsMode =
AspNetCompatibilityRequirementsMode.Allowed)]
public class RelationalService : IRelationalService
{
}
}
```

Datasource Initialization

A simple collection is provided as a datasource for our PivotClient in this demo section. This datasource is placed inside a separate class named “ProductSales” in RelationalService.svc.cs file. Refer to the following code example.

C#

```
namespace PivotClientDemo
{
[AspNetCompatibilityRequirements(RequirementsMode =
AspNetCompatibilityRequirementsMode.Allowed)]
public class RelationalService : IRelationalService
{
……
……
}
internal class ProductSales
{
public string Product { get; set; }
public string Date { get; set; }
public string Country { get; set; }
public string State { get; set; }
public int Quantity { get; set; }
public double Amount { get; set; }
public static ProductSalesCollection GetSalesData()
{
/// Geography
string[] countries = new string[] { "Australia", "Canada", "France",
"Germany", "United Kingdom", "United States" };
string[] ausStates = new string[] { "New South Wales", "Queensland",
"South Australia", "Tasmania", "Victoria" };
string[] canadaStates = new string[] { "Alberta", "British Columbia",
"Brunswick", "Manitoba", "Ontario", "Quebec" };
string[] franceStates = new string[] { "Charente-Maritime", "Essonne",
"Garonne (Haute)", "Gers", };
string[] germanyStates = new string[] { "Bayern", "Brandenburg",
"Hamburg", "Hessen", "Nordrhein-Westfalen", "Saarland" };
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
string[] ukStates = new string[] { "England" };
string[] ussStates = new string[] { "New York", "North Carolina",
"Alabama", "California", "Colorado", "New Mexico", "South Carolina" };
/// Time
string[] dates = new string[] { "FY 2005", "FY 2006", "FY 2007", "FY
2008", "FY 2009" };
/// Products
string[] products = new string[] { "Bike", "Van", "Car" };
Random r = new Random(123345345);
int numberOfRecords = 2000;
ProductSalesCollection listOfProductSales = new ProductSalesCollection();
for (int i = 0; i < numberOfRecords; i++)
{
ProductSales sales = new ProductSales();
sales.Country = countries[r.Next(1, countries.GetLength(0))];
sales.Quantity = r.Next(1, 12);
/// 1 percent discount for 1 quantity
double discount = (30000 * sales.Quantity) *
(double.Parse(sales.Quantity.ToString()) / 100);
sales.Amount = (30000 * sales.Quantity) - discount;
sales.Date = dates[r.Next(r.Next(dates.GetLength(0) + 1))];
sales.Product = products[r.Next(r.Next(products.GetLength(0) + 1))];
switch (sales.Product)
{
case "Car":
{
sales.Date = "FY 2005";
break;
}
}
switch (sales.Country)
{
case "Australia":
{
sales.State = ausStates[r.Next(ausStates.GetLength(0))];
break;
}
case "Canada":
{
sales.State = canadaStates[r.Next(canadaStates.GetLength(0))];
break;
}
case "France":
{
sales.State = franceStates[r.Next(franceStates.GetLength(0))];
break;
}
case "Germany":
{
sales.State = germanyStates[r.Next(germanyStates.GetLength(0))];
break;
}
case "United Kingdom":
{
sales.State = ukStates[r.Next(ukStates.GetLength(0))];
break;
}
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
case "United States":
{
sales.State = ussStates[r.Next(ussStates.GetLength(0))];
break;
}
}
listOfProductSales.Add(sales);
}
return listOfProductSales;
}
public override string ToString()
{
return string.Format("{0}-{1}-{2}", this.Country, this.State,
this.Product);
}
public class ProductSalesCollection : List<ProductSales>
{
}
}
}
```

Service methods in WCF Service

First, declare the service methods inside **IRelationalService** interface, found in IRelationalService.cs file created while adding WCF Service to the Application.

C#

```
namespace PivotClientDemo {
[ServiceContract]
public interface IRelationalService
{
[OperationContract]
Dictionary<string, object> InitializeClient(string action);
[OperationContract]
Dictionary<string, object> FetchMembers(string action, string
currentReport, string customObject, string headerTag);
[OperationContract]
Dictionary<string, object> DrillChart(string action, string
drilledSeries);
[OperationContract]
Dictionary<string, object> Filtering(string action, string filterParams,
string currentReport, string customObject);
[OperationContract]
Dictionary<string, object> NodeDropped(string action, string args);
[OperationContract]
Dictionary<string, object> ToolbarOperations(string action, string args);
[OperationContract]
Dictionary<string, object> SaveReportToDB(string reportName, string
operationalMode, string analysisMode, string olapReport, string
clientReports);
[OperationContract]
Dictionary<string, object> RemoveReportFromDB(string reportName, string
operationalMode, string analysisMode);
[OperationContract]
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
Dictionary<string, object> RenameReportInDB(string selectedReport, string
renameReport, string operationalMode, string analysisMode);
[OperationContract]
Dictionary<string, object> LoadReportFromDB(string reportName, string
operationalMode, string analysisMode, string olapReport, string
clientReports);
[OperationContract]
Dictionary<string, object> FetchReportListFromDB(string action, string
operationalMode, string analysisMode);
[OperationContract]
void Export(System.IO.Stream stream);
}
}
```

Then, elaborate the service methods inside the main class, found in RelationalService.svc.cs file.

C#

```
namespace PivotClientDemo {
[AspNetCompatibilityRequirements(RequirementsMode =
AspNetCompatibilityRequirementsMode.Allowed)]
public class RelationalService: IRelationalService
{
PivotClient pivotClient = new PivotClient();
PivotChart pivotChart = new PivotChart();
PivotGrid pivotGrid = new PivotGrid();
string conStringforDB = ""; //Enter appropriate connection string to
connect database for saving and loading operation of reports
JavaScriptSerializer serializer = new JavaScriptSerializer();
public Dictionary<string, object> InitializeClient(string action)
{
this.BindData();
return pivotClient.GetJsonData(action, ProductSales.GetSalesData(),
null);
}
public Dictionary<string, object> FetchMembers(string action, string
currentReport, string customObject, string headerTag)
{
pivotClient.PopulateData(currentReport);
return pivotClient.GetJsonData(action, ProductSales.GetSalesData(),

});
}
}
.....
..... // Initialize the datasource
.....
}
```

Configuring Web Configuration File

The services could be exposed through the properties, binding, contract and address by using an endpoint.

- Contract: This property indicates that the contract of the endpoint is exposing. Here you are referring to IRelationalService contract and hence it is PivotClientDemo.IRelationalService.
- Binding: In your application, you use webHttpBinding to post and receive the requests and responses between the client-end and the service.
- BehaviorConfiguration: This property contains the name of the behavior to be used in the endpoint

The endpointBehaviors are illustrated as follows

XML

```
<system.serviceModel>
……
……
<services>
```

```
<service name="PivotClientDemo.RelationalService">
<endpoint address=""
behaviorConfiguration="PivotClientDemo.RelationalServiceAspNetAjaxBehavio
r" binding="webHttpBinding" contract="PivotClientDemo.IRelationalService"
/>
</service>
</services>
</system.serviceModel>
```

The endpointBehaviors contain all the behaviors for an endpoint. You can link each endpoint to the respective behavior only by using this name property.

XML

```
<system.serviceModel>
<behaviors>
<endpointBehaviors>
<behavior name="PivotClientDemo.RelationalServiceAspNetAjaxBehavior">
<enableWebScript />
</behavior>
</endpointBehaviors>
</behaviors>
……
……
</system.serviceModel>
```

Note: In this example, **"PivotClientDemo"** indicates the name and root namespace of the Web Application created in Visual Studio IDE and "RelationalService" indicates the name of the WCF service created.

Configuring routing file

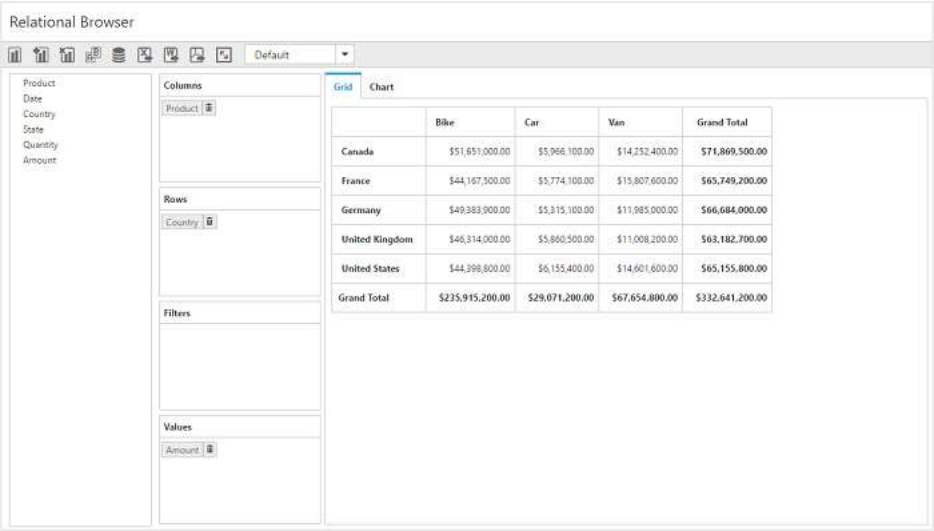
Routing configuration needs to be done in RouteConfig.cs file found under **AppStart** folder. The configuration would allow picking appropriate WCF service without any issues.

C#

```
public static void RegisterRoutes(RouteCollection routes) {
routes.IgnoreRoute("{resource}.axd/{*pathInfo}");
//NOTE: In the following highlighted lines _wcf_ is just the folder name
inside which service files(*.svc) are present.
routes.IgnoreRoute("{resource}.svc/{*pathInfo}");
routes.IgnoreRoute("{resource}.svc");
routes.MapRoute(
name: "Default",
url: "{controller}/{action}/{id}",
defaults: new {
controller = "Home", action = "Index", id = UrlParameter.Optional
},
namespaces: new [] {
"PivotClientDemo.Controllers"
}
);
}
```

Copyright © 2001 - 2020 Syncfusion Inc.

Now, **PivotClient** is rendered with PivotChart and PivotGrid with "Country" field in Row, "Product" field in Column and "Amount" field in Value section.



Data Binding

Binding PivotClient to Offline Cube

To connect an OLAP Cube available in local machine, set the physical path of the Cube in the connection string. The following code example illustrates the same.

C#

```
string connectionString = @"DataSource= system
drive:\OfflineCube\Adventure_Works_Ext.cub; Provider = MSOLAP;";
OlapDataManager DataManager = new OlapDataManager(connectionString);
```

Binding PivotClient to Cube in local SQL Server

To connect an OLAP Cube available in SQL Server Analysis Service in local machine, set the server name and database name in the connection string. When you have any credentials to connect your Cube, then set the “User ID” and “Password” attributes accordingly. The following code example illustrates the same.

C#

```
string connectionString = "Data source=localhost; Initial
Catalog=Adventure Works DW;";
OlapDataManager DataManager = new OlapDataManager(connectionString);
```

Binding PivotClient to Cube in online SQL Server

To connect an OLAP Cube available in SQL Server Analysis Service in online server through **XML/A**, set the host server link and database name in the connection string. When you have any credentials to connect your Cube, then set the “User ID” and “Password” attributes accordingly. The following code example illustrates the same.

C#

Copyright © 2001 - 2020 Syncfusion Inc.

```
static string connectionString = "Data
Source=https://bi.syncfusion.com/olap/msmdpump.dll; Initial
Catalog=Adventure Works DW 2008 SE;";
OlapDataManager DataManager = new OlapDataManager(connectionString);
```

Binding PivotClient to Cube in online Mondrian Server

To connect an OLAP Cube available in Mondrian Server through **XML/A**, set the host server link and database name in the connection string. When you have any credentials to connect your Cube, then set the “User ID” and “Password” attributes accordingly. The following code example illustrates the same.

C#

```
string connectionString = @"Data Source =
https://localhost:8080/mondrian/xmla; Initial Catalog =FoodMart;";
OlapDataManager DataManager = new OlapDataManager(connectionString);
DataManager.DataProvider.ProviderName =
Syncfusion.Olap.DataProvider.Providers.Mondrian;
```

Binding PivotClient to Cube in online ActivePivot Server

To connect an OLAP Cube available in ActivePivot Server through **XML/A**, set the host server link and database name in the connection string. When you have any credentials to connect your Cube, then set the “User ID” and “Password” attributes accordingly. The following code example illustrates the same.

C#

```
string connectionString=@"Data Source =
https://localhost:8080/cva_s/xmla; Initial Catalog = CVAS;";
OlapDataManager DataManager = new OlapDataManager(connectionString);
DataManager.DataProvider.ProviderName=Syncfusion.Olap.DataProvider.Provid
ers.ActivePivot;
```

WCF

Adding a WCF Service

To add a WCF service in an existing MVC web application, right-click on project in Solution Explorer and select **Add > New Item**. In the **Add New Item** window, select WCF Service and name it as **OlapService.svc**, click Add.

Now, WCF service is added into your application successfully and it comprises of the following files. The utilization of these files is explained in the immediate sections.

- OlapService.svc
- OlapService.svc.cs
- IOlapService.svc.cs

Configuring WCF Service Class

Remove the **“DoWork”** method present inside both OlapService.svc.cs and IOlapService.cs files. Next, add **“AspNetCompatibilityRequirements”** attribute on top of main class present inside OlapService.svc.cs file and set **“RequirementsMode”** value to **“Allowed”**.

C#

Copyright © 2001 - 2020 Syncfusion Inc.

```
namespace PivotClientDemo
{
[AspNetCompatibilityRequirements(RequirementsMode =
AspNetCompatibilityRequirementsMode.Allowed)]
public class OlapService: IOlapService
{
}
}
```

List of Dependency Libraries

Next you need to add the below mentioned dependency libraries into your Web Application. These libraries could be found in GAC (Global Assembly Cache) as well.

To add them to your Web Application, right-click on **References** in Solution Explorer and select **Add Reference**. Now in the **Reference Manager** dialog, under **Assemblies > Extension**, the following Syncfusion libraries are found.

Note: If you have installed any version of SQL Server Analysis Service (SSAS) or Microsoft ADOMD.NET utility, then the location of Microsoft.AnalysisServices.AdomdClient library is [system drive:\Program Files (x86)\Microsoft.NET\ADOMD.NET]. And if you have installed any version of Essential Studio, then the location of Syncfusion libraries is [system drive:\Program Files (x86)\Syncfusion\Essential Studio\{{ site.releaseversion }}\Assemblies].

- Microsoft.AnalysisServices.AdomdClient
- Syncfusion.Compression.Base
- Syncfusion.Linq.Base
- Syncfusion.Olap.Base
- Syncfusion.PivotAnalysis.Base
- System.Data.SqlServerCe (Version: 4.0.0.0)
- Syncfusion.XlsIO.Base
- Syncfusion.Pdf.Base
- Syncfusion.DocIO.Base
- Syncfusion.EJ
- Syncfusion.EJ.Export
- Syncfusion.EJ.Pivot
- Syncfusion.EJ.MVC

List of Namespaces

Following are the list of namespaces to be added on top of the main class inside OlapService.svc.cs file.

C#

```
using Syncfusion.JavaScript;
using Syncfusion.Olap.Manager;
using Syncfusion.Olap.Reports;
using System;
using System.Collections.Generic;
using System.Configuration;
using System.Data;
using System.ServiceModel.Activation;
using System.Data.SqlServerCe;
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
using System.IO;
using System.Linq;
using System.Text;
using System.Web;
using System.Web.Http;
using System.Web.Script.Serialization;
using OLAPUTILS = Syncfusion.JavaScript.Olap;
namespace PivotClientDemo
{
[AspNetCompatibilityRequirements(RequirementsMode =
AspNetCompatibilityRequirementsMode.Allowed)]
public class OlapService: IOlapService
{
}
}
```

Datasource Initialization

Now, the connection string to connect OLAP Cube, PivotClient and "JavaScriptSerializer" instances are created immediately inside the main class in OlapService.svc.cs file.

C#

```
namespace PivotClientDemo
{
[AspNetCompatibilityRequirements(RequirementsMode =
AspNetCompatibilityRequirementsMode.Allowed)]
public class OlapService: IOlapService
{
PivotClient pivotClientHelper = new PivotClient();
PivotTreeMap treemapHelper = new PivotTreeMap();
PivotChart chartHelper = new PivotChart();
JavaScriptSerializer serializer = new JavaScriptSerializer();
string connectionString = "Data
Source=https://bi.syncfusion.com/olap/msmdpump.dll; Initial
Catalog=Adventure Works DW 2008 SE;";
string conStringforDB = "";//Enter appropriate connection string to
connect database for saving and loading operation of reports
//Other codes
}
}
```

Service methods in WCF Service

First, define the service methods inside **IOlapService** interface, found in IOlapService.cs file, created while adding WCF Service to your Web Application.

C#

```
namespace PivotClientDemo {
[ServiceContract]
public interface IOlapService
{
[OperationContract]
Dictionary<string, object> InitializeClient(string action, string
customObject, string clientParams);
```

```
[OperationContract]
Dictionary<string, object> FetchMemberTreeNodes(string action, string
dimensionName, string olapReport);
[OperationContract]
Dictionary<string, object> InitializeChart(string action, string
currentReport, string customObject);
[OperationContract]
Dictionary<string, object> InitializeTreeMap(string action, string
currentReport, string customObject);
[OperationContract]
Dictionary<string, object> DrillChart(string action, string
drilledSeries, string olapReport, string clientReports);
[OperationContract]
Dictionary<string, object> DrillTreeMap(string action, string drillInfo,
string olapReport, string clientReports);
[OperationContract]
Dictionary<string, object> InitializeGrid(string action, string
currentReport, string gridLayout, string customObject);
[OperationContract]
Dictionary<string, object> DrillGrid(string action, string cellPosition,
string currentReport, string clientReports, string headerInfo, string
layout);
[OperationContract]
Dictionary<string, object> FilterElement(string action, string
clientParams, string olapReport, string clientReports);
[OperationContract]
Dictionary<string, object> RemoveSplitButton(string action, string
clientParams, string olapReport, string clientReports);
[OperationContract]
Dictionary<string, object> NodeDropped(string action, string dropType,
string nodeInfo, string olapReport, string clientReports);
[OperationContract]
Dictionary<string, object> CubeChanged(string action, string cubeName,
string clientParams,string olapReport, string clientReports);
[OperationContract]
Dictionary<string, object> MeasureGroupChanged(string action, string
measureGroupName);
[OperationContract]
Dictionary<string, object> ToolbarOperations(string action, string
toolbarOperation, string clientInfo, string olapReport, string
clientReports);
[OperationContract]
Dictionary<string, object> UpdateReport(string action, string
clientParams, string olapReport, string clientReports);
[OperationContract]
Dictionary<string, object> SaveReportToDB(string reportName, string
operationalMode, string analysisMode, string olapReport, string
clientReports);
[OperationContract]
Dictionary<string, object> RemoveReportFromDB(string reportName, string
operationalMode, string analysisMode);
[OperationContract]
Dictionary<string, object> RenameReportInDB(string selectedReport, string
renameReport, string operationalMode, string analysisMode);
[OperationContract]
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
Dictionary<string, object> LoadReportFromDB(string reportName, string
operationalMode, string analysisMode, string olapReport, string
clientReports);
[OperationContract]
Dictionary<string, object> FetchReportListFromDB(string action, string
operationalMode, string analysisMode);
[OperationContract]
Dictionary<string, object> MemberExpanded(string action, bool
checkedStatus, string parentNode, string tag, string dimensionName,
string cubeName, string olapReport, string clientReports);
[OperationContract]
void Export(System.IO.Stream stream);
[OperationContract]
string GetMDXQuery(string olapReport);
[OperationContract]
Dictionary<string, object> ToggleAxis(string action, string
currentReport, string clientReports);
}
}
```

Secondly, elaborate the service methods inside the main class, found in OlapService.svc.cs file

C#

```
namespace PivotClientDemo {
[AspNetCompatibilityRequirements(RequirementsMode =
AspNetCompatibilityRequirementsMode.Allowed)]
public class OlapService: IOlapService
{
PivotClient pivotClientHelper = new PivotClient();
PivotTreeMap treemapHelper = new PivotTreeMap();
PivotChart chartHelper = new PivotChart();
JavaScriptSerializer serializer = new JavaScriptSerializer();
string connectionString = "Data
Source=https://bi.syncfusion.com/olap/msmdpump.dll; Initial
Catalog=Adventure Works DW 2008 SE;";
string conStringforDB = "";//Enter appropriate connection string to
connect database for saving and loading operation of reports
public Dictionary<string, object> InitializeClient(string action, string
customObject, string clientParams)
{
OlapDataManager DataManager = null;
DataManager = new OlapDataManager(connectionString);
DataManager.SetCurrentReport(CreateOlapReport());
return pivotClientHelper.GetJsonData(action, DataManager, clientParams);
}
public Dictionary<string, object> InitializeGrid(string action, string
currentReport, string gridLayout, string customObject)
{
OlapDataManager DataManager = new OlapDataManager(connectionString);
DataManager.SetCurrentReport(OLAPUTILS.Utils.DeserializeOlapReport(curren
tReport));
return pivotClientHelper.GetJsonData(action, DataManager, gridLayout);
}
public Dictionary<string, object> InitializeChart(string action, string
currentReport, string customObject)
```

Copyright © 2001 - 2020 Syncfusion Inc.

```

Configuring Web Configuration File

You can expose services through the properties, binding, contract and address by using an endpoint.

- Contract: This property indicates that the contract of the endpoint is exposing. Here you are referring to IOlapService contract and hence it is PivotClientDemo.IOlapService.
- Binding: In your application, you use webHttpBinding to post and receive the requests and responses between the client-end and the service.
- behaviorConfiguration: This property contains the name of the behavior to be used in the endpoint.

The endpointBehaviors are illustrated as follows.

XML

```
<system.serviceModel>
……
……
<services>
<service name="PivotClientDemo.OlapService">
<endpoint address=""
behaviorConfiguration="PivotClientDemo.OlapServiceAspNetAjaxBehavior"
binding="webHttpBinding" contract="PivotClientDemo.IOlapService" />
</service>
</services>
</system.serviceModel>
```

The endpointBehaviors contain all the behaviors for an endpoint. You can link each endpoint to the respective behavior only by using this name property.

XML

```
<system.serviceModel>
<behaviors>
<endpointBehaviors>
<behavior name="PivotClientDemo.OlapServiceAspNetAjaxBehavior">
<enableWebScript /> </behavior>
</endpointBehaviors>
</behaviors>
……
……
</system.serviceModel>
```

Configuring routing file

Routing configuration needs to be done in RouteConfig.cs file found under **AppStart** folder. The configuration would allow picking appropriate WCF service without any issues.

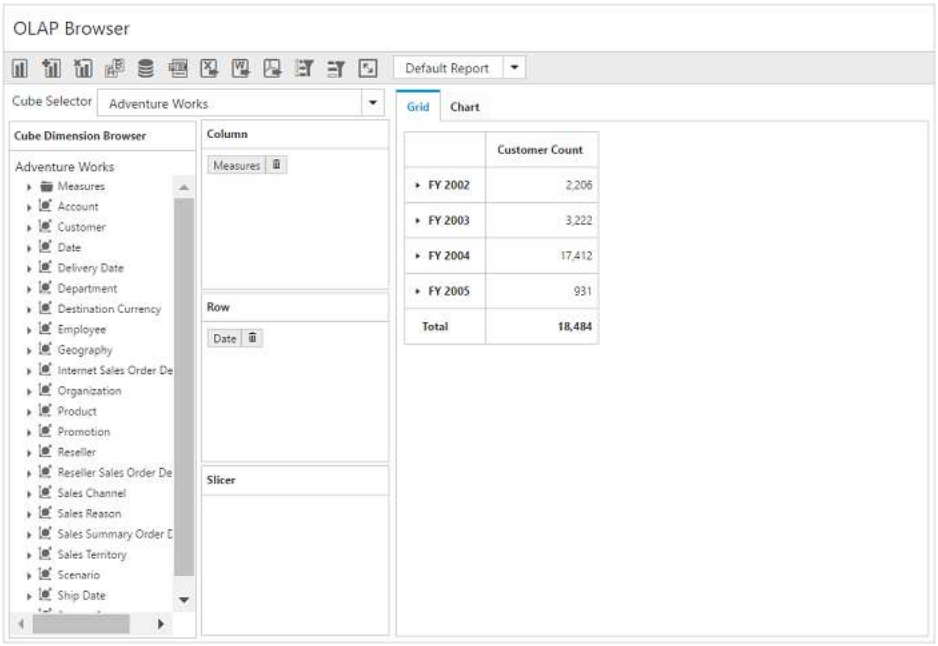
Copyright © 2001 - 2020 Syncfusion Inc.

C#

```
public static void RegisterRoutes(RouteCollection routes) {
routes.IgnoreRoute("{resource}.axd/{*pathInfo}");
//NOTE: In the following highlighted lines _wcf_ is just the folder name
inside which service files(*.svc) are present.
routes.IgnoreRoute("{resource}.svc/{*pathInfo}");
routes.IgnoreRoute("{resource}.svc");
routes.MapRoute(
name: "Default",
url: "{controller}/{action}/{id}",
defaults: new {
controller = "Home", action = "Index", id = UrlParameter.Optional
},
namespaces: new [] {
"PivotClientDemo.Controllers"
}
);
}
```

Note: In this example, **"PivotClientDemo"** indicates the name and root namespace of the Web Application created in Visual Studio IDE and "OlapService" indicates the name of the created WCF service.

Now, **PivotClient** is rendered with PivotChart and PivotGrid showing Customer Count over a period of fiscal years.



PivotClient: Elements

Cube Selector

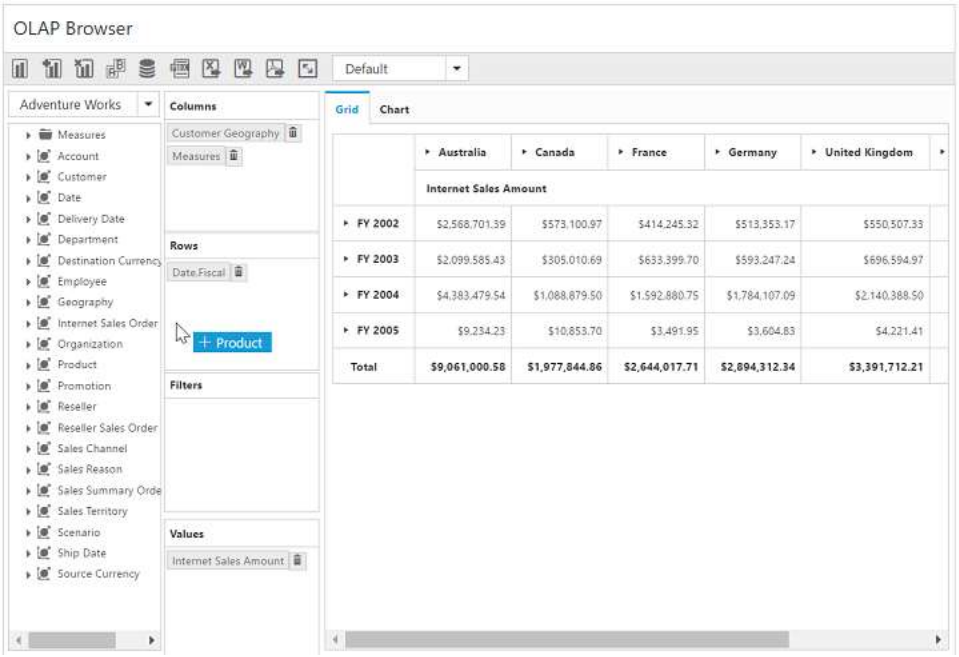
Cube Selector allows to select any one of the cubes that are available in connected database. This can be achieved with a drop-down list displaying the list of cube names. On selecting a cube from the drop-down list the corresponding cube elements get loaded.

Cube Dimension Browser

Cube Dimension Browser is a treeview like structure that organizes the cube elements such as dimensions, hierarchies, measures, etc., from the selected cube into independent logical groups.

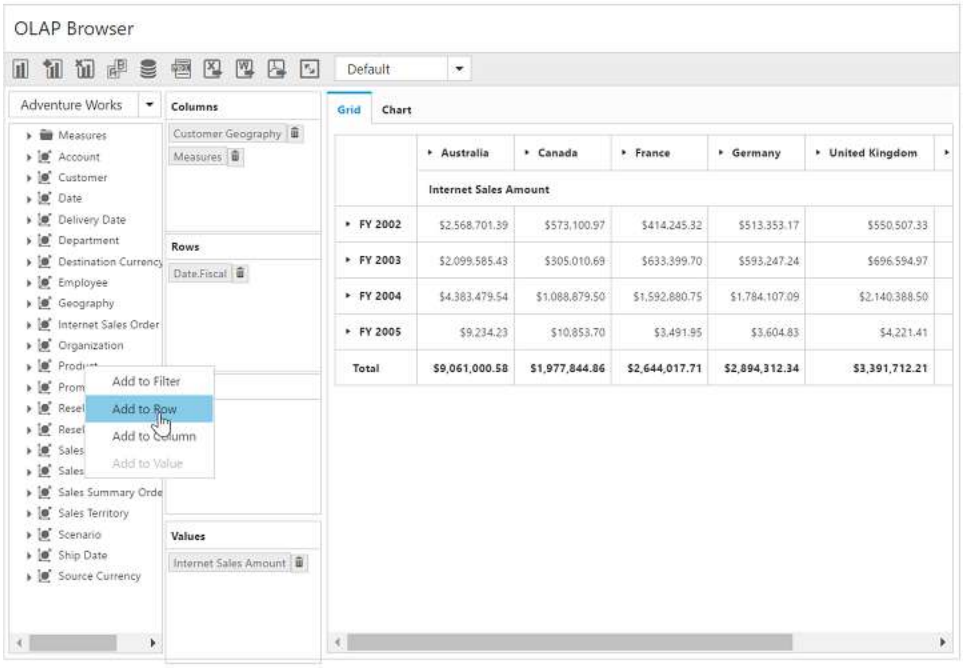
Drag and Drop

You can alter the report on fly through drag-and-drop operation.



Context Menu

You can also alter the report by using context menu.



Types of Node in Cube Dimension Browser

- **Display Folder** - Folder that contains a set of similar elements.
- **Measure** - Quantity available for analysis.
- **Dimension** - A name given to the parts of the cube that categorize the data.
- **Attribute Hierarchy** - Level of attributes down the hierarchy.
- **User-defined Hierarchy** - Members of a dimension in a hierarchical structure.
- **Level** - Denotes a specific level in the category.
- **Named Set** - A collection of tuples and members, which can be defined and saved as a part of the cube definition.

Attribute Hierarchy

Attribute hierarchy contains the following levels:

- A leaf level that contains each distinct attribute member, with each member of the leaf level also known as a leaf member.
- Intermediate levels if the attribute hierarchy is a parent-child hierarchy.
- An optional (All) level (IsAggregatable=True) containing the aggregated value of the attribute hierarchy's leaf members, with the member of the (All) level also known as the (All) member.

User-Defined Hierarchy

User-defined hierarchy organizes the members of a dimension into hierarchical structure and provides navigation paths in a cube. For example, take a dimension table that supports three attributes such as Year, Quarter and Month. The Year, Quarter and Month attributes are used to construct a user-defined hierarchy, named Calendar, in the time dimension which relates all the levels.

Copyright © 2001 - 2020 Syncfusion Inc.

Differentiating User-defined hierarchy and Attribute hierarchy

- User-defined hierarchy may contain more than one level whereas attribute hierarchy contains only one level.
- User-defined hierarchy provides the navigation path between the levels taken from attribute hierarchies of the same dimension.
- In our component, visually these two types are differed by the folder icons mentioned in the immediate topic.

Symbolic representation of the nodes inside Cube Dimension Browser

Icon	Name	Node type	Is Draggable

Axis Element Builder

Axis Element Builder allows you to build the elements in the axes of PivotClient. It supports three axes namely Categorical, Series and Slicer. Based on the construction of axes, PivotGrid and PivotChart will display the resultant data.

Categorical (Column)

The categorical axis defines one or more elements that are displayed along the Chart's y-axis as labels and in the columns of the Grid. If more than one dimension is on the categorical axis, the Chart/Grid will stack each dimension. The order in which the dimensions are stacked is based on the order that they appear on the categorical axis.

Series (Row)

The series axis defines one or more dimensions that are displayed along the Chart's x-axis as labels and in the rows of the Grid. If more than one dimension is on the series axis, the Chart/Grid will stack each dimension. The order in which the dimensions are stacked is based on the order that they appear on the series axis.

Slicer

The slicer axis filters the multidimensional data displayed in the Chart/Grid. It lets you analyze any member of a dimension, in-depth. For the slicer to display the member's data, that member must not be present on both categorical axis and series axis.

![Axis element builder in ASP NET MVC pivot client control](OLAP-Client-Elements_images/Axis Element Builder.png)

Split Button

Split Button highlights the elements in the Axis Element Builder. It holds measures, dimensions, named set. When a dimension/hierarchy/level/named set node is dragged and dropped from Cube Dimensional Browser into Axis Element Builder, a Split Button is created along with displaying the corresponding dimension/named set caption.

When a measure node is dragged and dropped, the Axis Element Builder will create a Split Button for holding the Measures. The next time when a measure is added, it maintains the same single Split Button to hold the entire measure collection.

Split Buttons can be removed with the help of remove button which is available on its side.

![Measure split button in JavScript pivot client control](OLAP-Client-Elements_images/Measure split button.png)

Addition Elements to an Axis

The measure, dimension, hierarchy, level and named set elements can be dragged from the Cube Dimension Browser and dropped into the Axis Element Builder at desired position using the drag-and-drop operation. Also the measure, dimension, hierarchy, level and named set elements can be moved from one axis to another by dragging an appropriate Split Button and dropping them at desired position.

![Adding elements to an axis in ASP NET MVC pivot client control](OLAP-Client-Elements_images/add element.png)

Remove Elements from an Axis

In order to remove measures, dimension, hierarchy, level and named set element from the Axis Element Builder, click the remove button available next to the Split Button.

Copyright © 2001 - 2020 Syncfusion Inc.

![Removing elements from an axis in ASP NET MVC pivot client control](OLAP-Client-Elements_images/remove element.png)

Rearrange Elements in an Axis

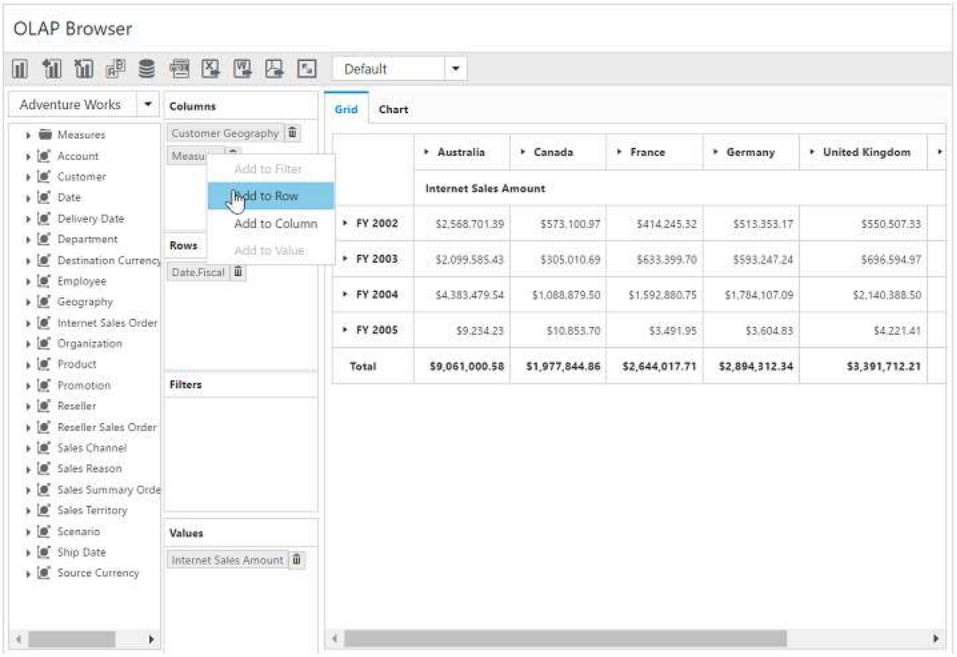
Rearranging can be done by dragging an element and dropping at desired position.

![Rearranging elements in an axis of ASP NET MVC pivot client control](OLAP-Client-Elements_images/rearragne element.png)

![Rearranged elements in ASP NET MVC pivot client control](OLAP-Client-Elements_images/rearrange 1.png)

Context Menu

You can alter the report by using context menu.



Elements Editor

Measure Editor

Measure Editor is a dialog that displays the collection of measures in the current report.

![Measure editor in ASP NET MVC pivot client control](OLAP-Client-Elements_images/measure editor.png)

To remove a measure, click the remove icon next to the corresponding measure. To avoid removing the current selection, click Cancel.

![Removing measure from ASP NET MVC pivot client control](OLAP-Client-Elements_images/remove measure editor.png)

Member Editor

Member Editor is a dialog which displays the members of the current hierarchy in a treeview structure.

![Member editor in ASP NET MVC pivot client control](OLAP-Client-Elements_images/member editor.png)

Copyright © 2001 - 2020 Syncfusion Inc.

The “Check All” and “Uncheck All” option in the dialog lets the user to select and unselect entire nodes for filtering. For more details, about filtering, click here.

Toolbar

The options available in the toolbar are,

- **New Report** - Creates a new reports list, clearing the existing report collection in order to provide a new platform for new deployment based on the existing cube elements.
- **Add Report** - Adds a new report to the existing list of reports.
- **Remove Report** - Removes the current report from the report list. It could not be possible to remove if the report list contains only one report in it.
- **Rename Report** - The rename option lets the user to change the name of the current report.
- **Report Manipulation in DB** - which contains the options to manipulate the reports in the Database.
- **MDX Query** – This option displays the MDX query executed to retrieve the data at that instant.
- **Defer Update** – This option lets the user to update the widget on-demand rather than updating it for every interaction.
- **Export to Excel** - This option is used to export the Grid and Chart into an Excel worksheet.
- **Export to Word** – This option is used to export the Grid and Chart into a Word document.
- **Export to PDF** – This option is used to export the Grid and Chart into a PDF document.
- **Full Screen View** – Displays the active control (Chart/Grid) in full/maximized view.
- **Filter/Sort Column** - Filters/Sorts the data in the OlapReport with respect to Column.
- **Filter/Sort Row** - Filters/Sorts the data in the OlapReport with respect to Row.
- **Toggle Axis** – Interchanges the items between Categorical and Series axes.
- **Chart types** – Allows user to change the Chart type dynamically.
- **Report List** - It holds all the reports of the current session of the PivotClient control and displays in a dropdown list. By default, from the dropdown list a report can be selected.

Following are the options available for database report manipulation,

- **Save** - The save option stores the report collection by only one name in a database.
- **Save As** - The save as option stores the report collection by more than one name in a database.
- **Load** - The load option picks the saved report collection from the database and loads it by clearing the existing collection of reports.
- **Remove** - Removes the selected report from the saved report list in a database.
- **Rename** - The rename option lets the user to change the name of the selected report from the saved report list in a database.

Report Manipulation

New Report

New Report option helps the user to create a new report collection with a single report along with clear the existing report collection. On clicking the New Report icon in toolbar, the New Report dialog opens as shown below.

Copyright © 2001 - 2020 Syncfusion Inc.

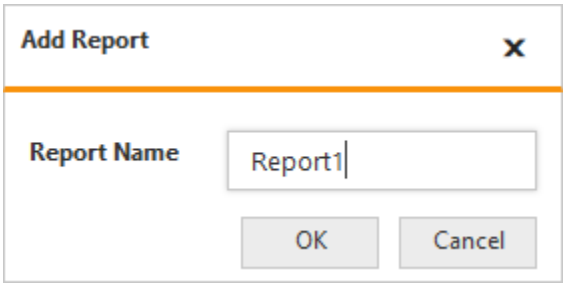
![New report in ASP NET MVC pivot client control](OLAP-Client-Elements_images/add new report.png)

By giving the required name and clicking OK, the report collection gets loaded with only one empty report with entered name. On clicking Cancel button, report creation gets canceled.

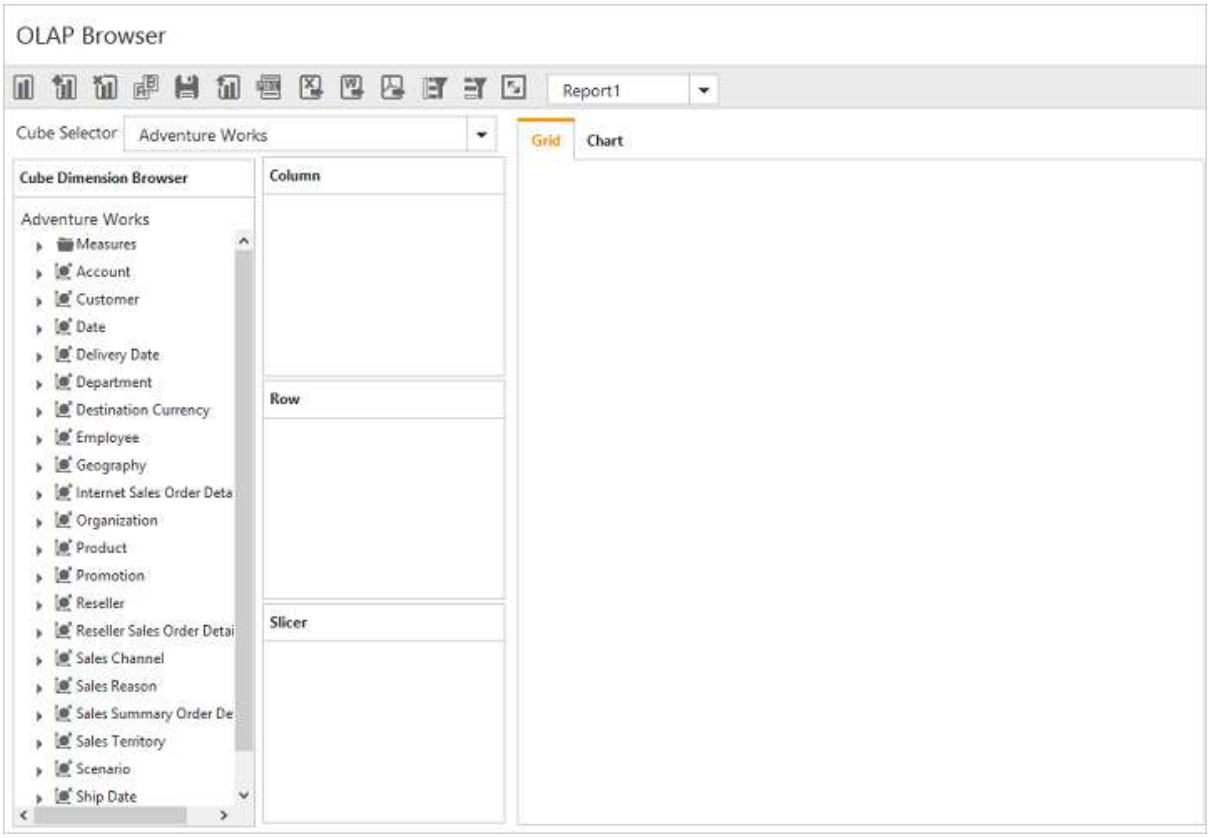
![New report in ASP NET MVC pivot client control](OLAP-Client-Elements_images/add new report1.png)

Add Report

Add Report option lets the user to add a report to the existing report collection. On clicking the Add Report icon in toolbar, the Add Report dialog opens prompting for a name for the report to be added as shown below.



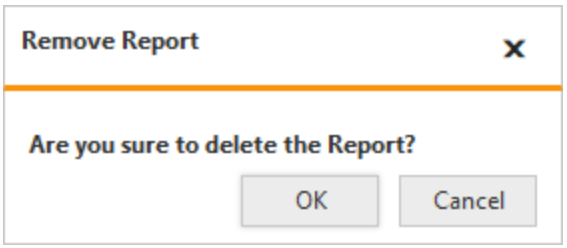
On clicking OK button after giving appropriate name in the respective column, a report with the entered name is added to the collection. On clicking Cancel button, report creation gets canceled.



Remove Report

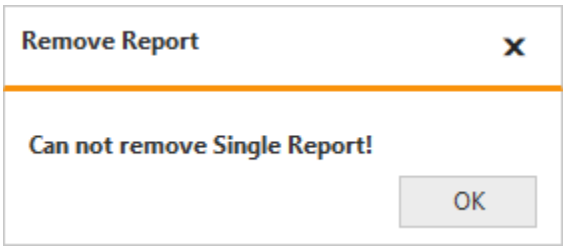
Remove Report option removes the current/active report from the report collection. On clicking the icon at toolbar, a dialog will open prompting for user's confirmation on removal of report as shown below.

Copyright © 2001 - 2020 Syncfusion Inc.



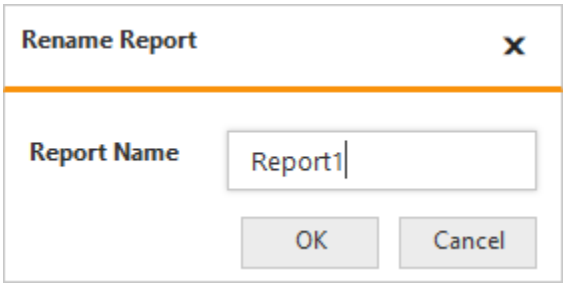
On clicking OK button, the report gets removed from the collection. On clicking Cancel button, the operation gets aborted.

This option works only if the report collection has more than one report. If not, the below dialog opens on clicking the Remove Report toolbar icon which displays a message that single report cannot be removed.



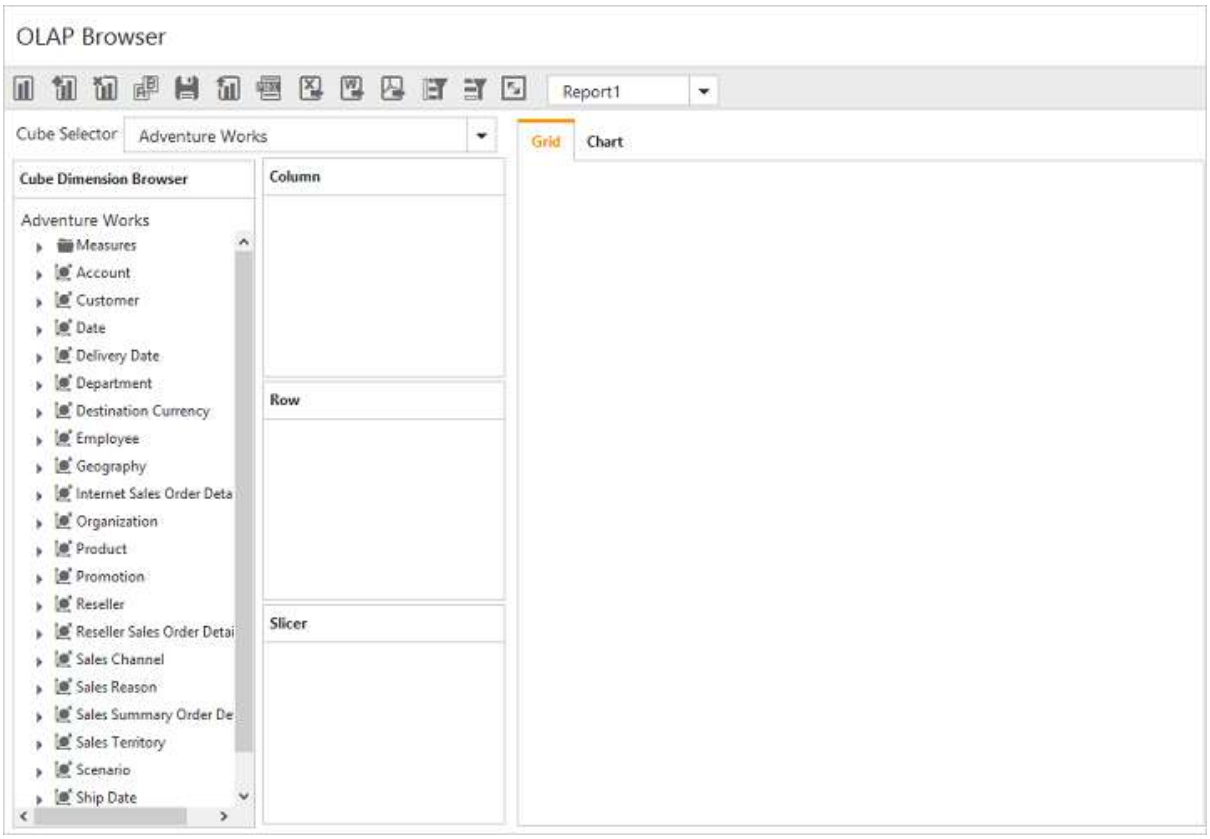
Rename Report

Rename Report option lets the user to rename the current/active report. On clicking the corresponding icon at toolbar, the below dialog opens prompting the new name.



After giving a name and clicking OK, the active report gets refreshed with the new name. On clicking Cancel button, the operation gets canceled.

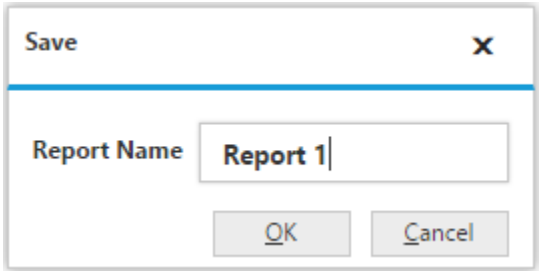
Copyright © 2001 - 2020 Syncfusion Inc.



Save

Save option saves the entire report collection by only one name to a database. The database is connected to the application through a connection string provided in the service.

On clicking the Save icon, the Save dialog is opened prompting for a name with which the report collection needs to be stored.



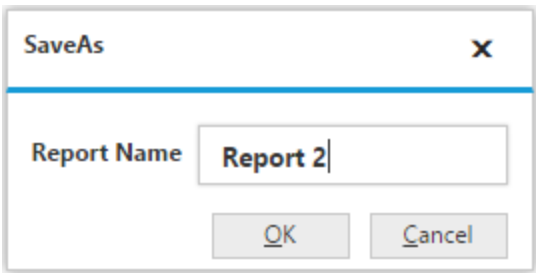
After providing appropriate name and clicking OK, the report collection will get saved to the connected database. Clicking Cancel button, withdraws the saving operation.

Save As

Save As option saves the entire report collection by two or more name to a database. The database is connected to the application through a connection string provided in the service.

On clicking the Save As icon, the Save As dialog is opened prompting for a name with which the report collection needs to be stored.

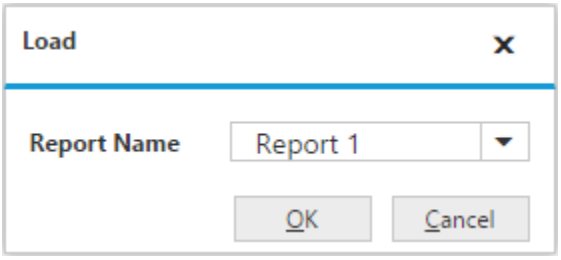
Copyright © 2001 - 2020 Syncfusion Inc.



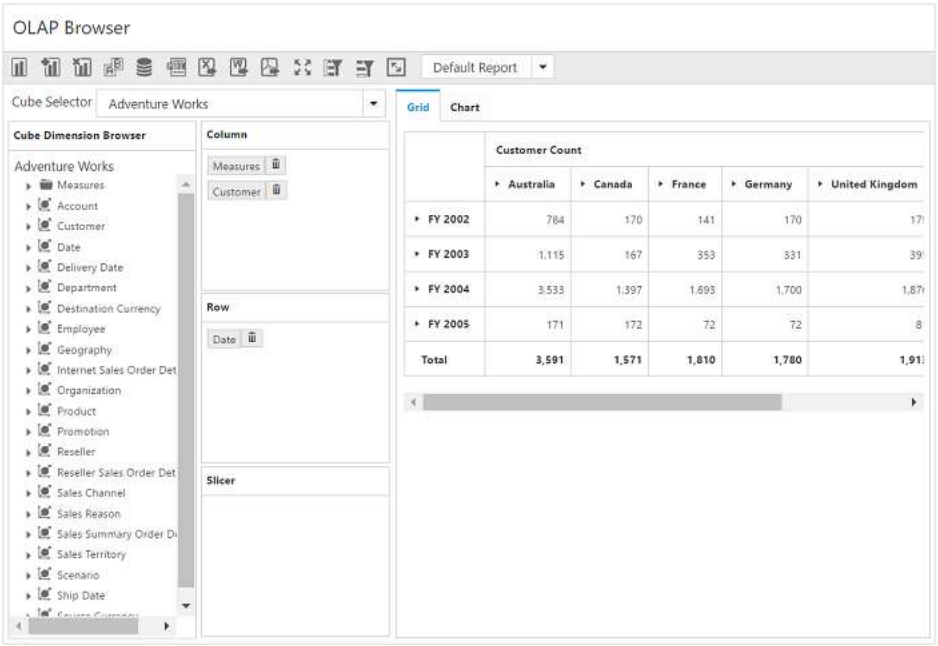
After providing appropriate name and clicking OK, the report collection will get saved to the connected database. Clicking Cancel button, withdraws the saving operation.

Load

Load option loads a saved report collection from the database via service. Clicking the respective icon at toolbar, the Load dialog opens.



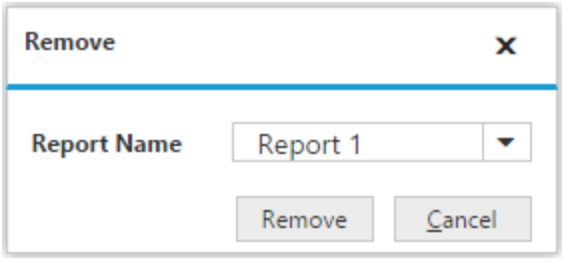
Any one of the report from the report collection could be selected from the drop-down list and OK button is clicked for loading the selected report collection. Cancel button is used for to abort the report loading operation.



Remove

Remove option removes the saved report from the report collection. On clicking the icon at toolbar, a dialog will open prompting for user's confirmation on removal of report as shown below.

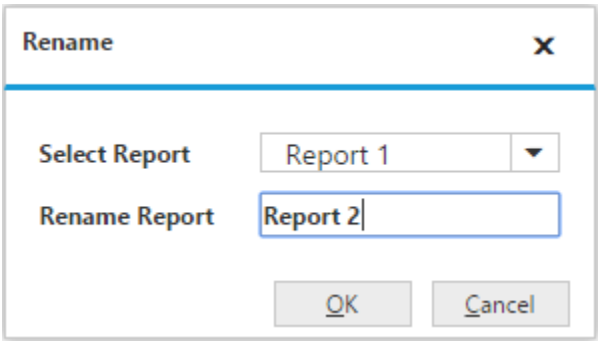
Copyright © 2001 - 2020 Syncfusion Inc.



On clicking OK button, the report gets removed from the collection. On clicking Cancel button, the operation gets aborted.

Rename

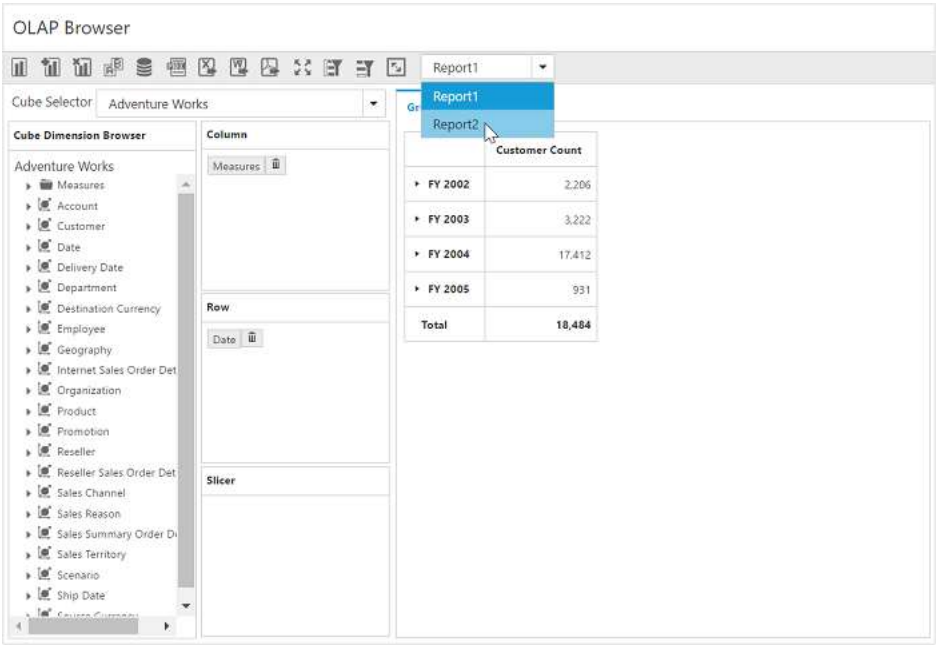
Rename option lets the user to rename the saved report. On clicking the corresponding icon at toolbar, the below dialog opens prompting the new name.



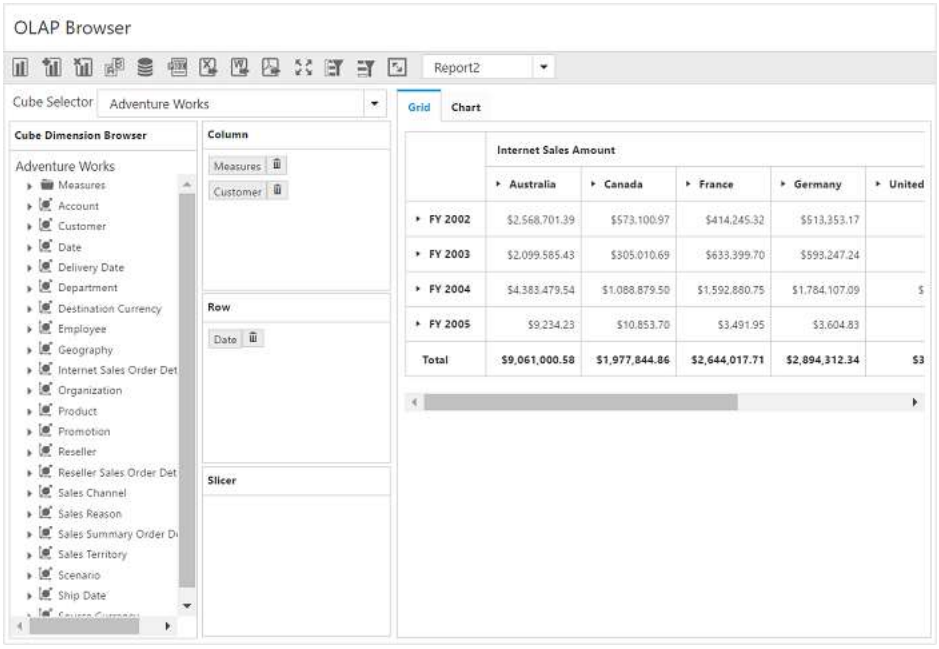
After giving a name and clicking OK, the active report gets refreshed with the new name. On clicking Cancel button, the operation gets canceled.

Report List

Report List drop-down contains the names of all the reports in the report collection.



On selecting the required report from the report list, the selected report will be set as active report and gets loaded.



PivotGrid and PivotChart

The PivotGrid and PivotChart controls will be rendered with respect to the operations done at axis element builder.

Relational

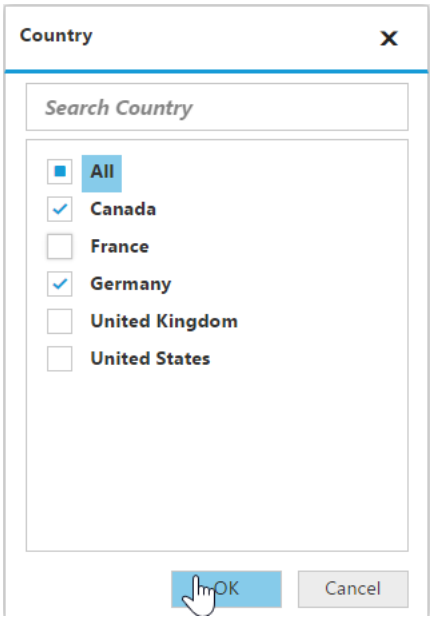
Data Exploration

Filtering

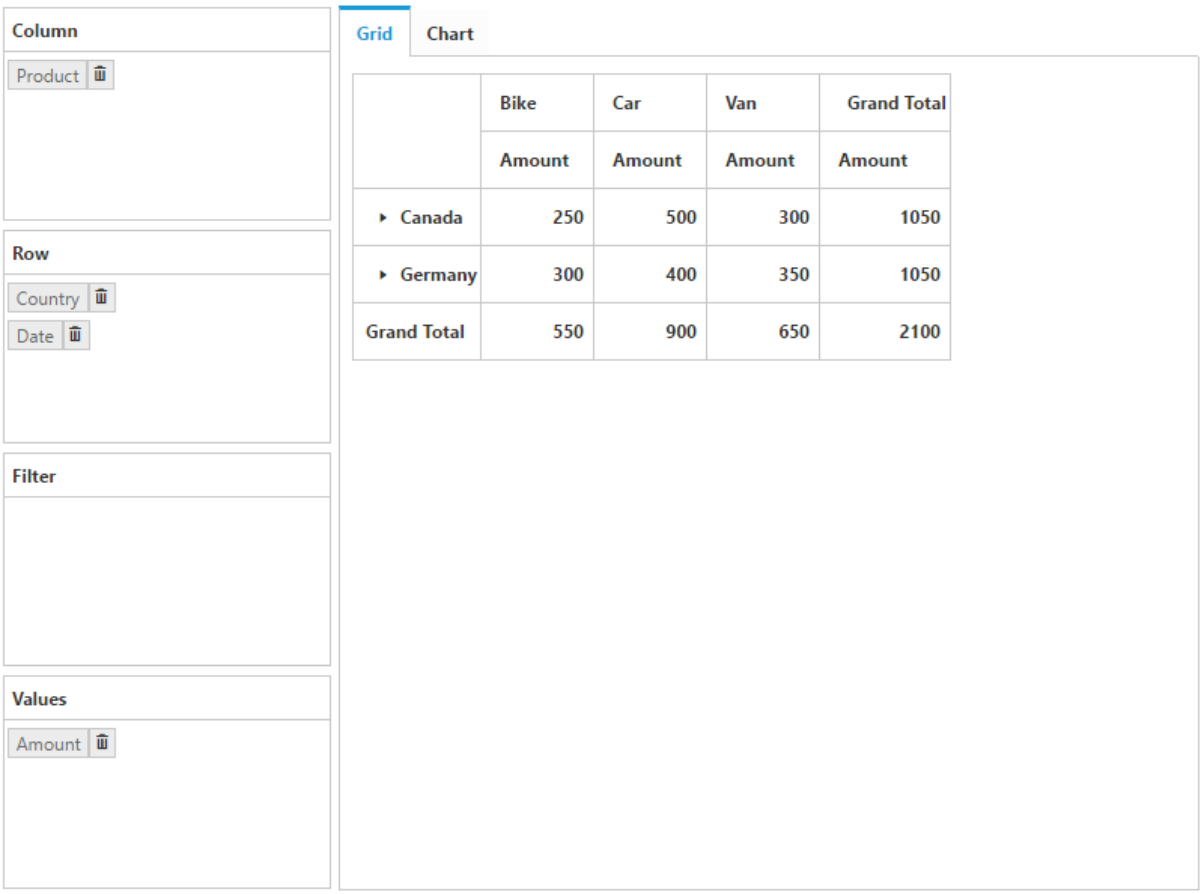
Filtering by Member

By clicking Split Button of a field, Member Editor dialog opens through which members are filtered by checking and unchecking the check boxes corresponding to the members.

Copyright © 2001 - 2020 Syncfusion Inc.



On clicking the "OK" button, based on the selected members in the Member Editor dialog, PivotReport gets updated and refreshes the PivotGrid and PivotChart controls. The "Cancel" button is used to cancel the selection.



The above filter illustrates that the members 'Canada' and 'Germany' are alone included in the Grid and Chart controls.

Grouping

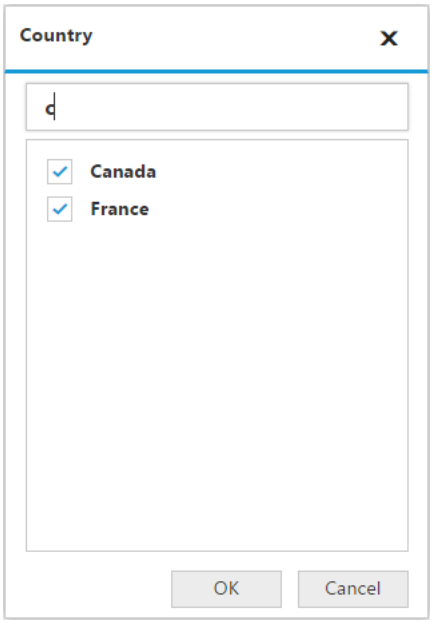
The data can be grouped when more than one field element is added to Categorical or Series in Axis Element Builder. Based on the order of addition, data is grouped and the report is updated. In the following example, the **Date** dimension values get grouped, with respect to **Country** dimension values. Likewise multiple field members can be grouped by dragging the elements from pivot field list to Axis Element Builder.

		Bike	Car	Van	Grand Total
		Amount	Amount	Amount	Amount
▼ Canada	FY 2005	100			100
	FY 2006		200	200	400
	FY 2007		300	100	400
	FY 2008	150			150
Canada Total		250	500	300	1050
▸ France		200	300	400	900
▸ Germany		300	400	350	1050
▸ United Kingdom		150			150
▸ United States		300	650	500	1450
Grand Total		1200	1850	1550	4600

Searching

Members can be searched and displayed from the members list inside the Member Editor dialog.

Copyright © 2001 - 2020 Syncfusion Inc.



Exporting

Chart and Grid in the PivotClient widget can be exported to Excel, Word and PDF documents by clicking the respective toolbar icons.

Exporting feature provides an option that allows you to export either PivotChart or PivotGrid or both with the use of the property ClientExportMode.

The property ClientExportMode takes any one of the following value:

- **ChartAndGrid** – Exports both PivotChart and PivotGrid controls. This is the default mode.
- **ChartOnly** – Exports PivotChart control alone.
- **GridOnly** – Exports PivotGrid control alone.

JOSN Export

Information: By default, exporting is done with the use of JSON Records maintained in client-side for both client and server modes.

In order to make use of exporting with client side JSON data. The control can be exported by invoking “BeforeExport” event, with an appropriate export option as parameter.

ASPX-CS

```
@Html.EJ().Pivot().PivotClient("PivotClient1").ClientSideEvents(clientSid
eEvents =>
clientSideEvents.Load("onLoad").BeforeExport("Export")).DataSource(dataSo
urce => dataSource.Rows(rows => {
rows.FieldName("Country").FieldCaption("Country").Add();
}).Columns(columns => {
columns.FieldName("Product").FieldCaption("Product").Add();
}).Values(values => {
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
values.FieldName("Amount").Format("currency").Add();
})).ClientExportMode(ClientExportMode.ChartAndGrid)
<script type="text/javascript">
function Export(args) {
args.url = "ExportPivotClient";
}
</script>
```

When PivotClient is exported with JSON mode, a method needs to be added in MVC controller file of the application.

C#

```
public void ExportPivotClient()
{
JavaScriptSerializer serializer = new JavaScriptSerializer() {
MaxJsonLength = Int32.MaxValue };
PivotClientExport pivotClient = new PivotClientExport();
string args =
System.Web.HttpContext.Current.Request.Form.GetValues(0)[0];
pivotClient.ExportPivotClient(string.Empty, args,
System.Web.HttpContext.Current.Response);
}
```

Customize the export document name

The document name to be exported could be customized. Following code sample illustrates the same.

ASPX-CS

```
@Html.EJ().Pivot().PivotClient("PivotClient1").ClientSideEvents(clientSid
eEvents =>
clientSideEvents.Load("onLoad").BeforeExport("Export")).DataSource(dataSo
urce => dataSource.Rows(rows => {
rows.FieldName("Country").FieldCaption("Country").Add();
}).Columns(columns => {
columns.FieldName("Product").FieldCaption("Product").Add();
}).Values(values => {
values.FieldName("Amount").Format("currency").Add();
})).ClientExportMode(ClientExportMode.ChartAndGrid)
<script type="text/javascript">
function Export(args) {
args.url = "ExportPivotClient";
args.fileName=" File name is customized here ";
}
</script>
```

PivotEngine Export

Information: This feature is applicable only at server mode operation.

In order to perform exporting with the use of PivotEngine available in server-side, the 'exportMode' property obtained in the “BeforeExport” event is set to "ej.PivotClient.ExportMode.PivotEngine" as shown below.

ASPX-CS

```
@Html.EJ().Pivot().PivotClient("PivotClient1").Url(Url.Content("/Relation
alClient")).ClientExportMode(ClientExportMode.ChartAndGrid).ClientSideEve
nts(oEve => { oEve.BeforeExport("Export"); })
<script type="text/javascript">
function Export(args) {
args.exportMode = ej.PivotClient.ExportMode.PivotEngine;
}
</script>
```

For WebAPI controller, the below method needs to be added to perform exporting with PivotEngine.

C#

```
[System.Web.Http.ActionName("Export")]
[System.Web.Http.HttpPost]
public void Export()
{
string args = HttpContext.Current.Request.Form.GetValues(0)[0];
Dictionary<string, string> gridParams =
serializer.Deserialize<Dictionary<string, string>>(args);
pivotClient.PopulateData(gridParams["currentReport"]);
string fileName = "Sample";
pivotClient.ExportPivotClient(ProductSales.GetSalesData(), args,
fileName, System.Web.HttpContext.Current.Response);
}
```

For WCF service, the below service method needs to be added to perform exporting with PivotEngine.

C#

```
public void Export(System.IO.Stream stream)
{
System.IO.StreamReader sReader = new System.IO.StreamReader(stream);
string args =
System.Web.HttpContext.Current.Server.UrlDecode(sReader.ReadToEnd()).Remo
ve(0, 5);
Dictionary<string, string> gridParams =
serializer.Deserialize<Dictionary<string, string>>(args);
pivotClient.PopulateData(gridParams["currentReport"]);
string fileName = "Sample";
pivotClient.ExportPivotClient(ProductSales.GetSalesData(), args,
fileName, System.Web.HttpContext.Current.Response);
}
```

File format selection

Information: This option is applicable only for PivotClient excel export.

You can set the option for exporting excel sheet as either *.xls* or *.xlsx* format before export the document by using 'fileFormat' property obtained in the “BeforeExport” event.

Note: By default excel document can be exported as ".xls" format using PivotEngine export.

ASPX-CS

```
@Html.EJ().Pivot().PivotClient("PivotClient1").ClientSideEvents(oEve => {
oEve.BeforeExport("Exporting"); })
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
<script type="text/javascript">
function Exporting(args) {
args.exportMode = ej.PivotClient.ExportMode.PivotEngine;
args.fileFormat = ".xlsx"; //you can set the excel sheet format here
}
</script>
```

Customize the export document name

The document name could be customized inside the method in WebAPI Controller. Following code sample illustrates the same.

C#

```
[System.Web.Http.ActionName("Export")]
[System.Web.Http.HttpPost]
public void Export()
{
string args = HttpContext.Current.Request.Form.GetValues(0)[0];
Dictionary<string, string> gridParams =
serializer.Deserialize<Dictionary<string, string>>(args);
pivotClient.PopulateData(gridParams["currentReport"]);
string fileName = " File name is customized here ";
pivotClient.ExportPivotClient(ProductSales.GetSalesData(), args,
fileName, System.Web.HttpContext.Current.Response);
}
```

For customizing name in WCF Service, below code snippet is used.

C#

```
public void Export(System.IO.Stream stream)
{
System.IO.StreamReader sReader = new System.IO.StreamReader(stream);
string args =
System.Web.HttpContext.Current.Server.UrlDecode(sReader.ReadToEnd()).Remo
ve(0, 5);
Dictionary<string, string> gridParams =
serializer.Deserialize<Dictionary<string, string>>(args);
pivotClient.PopulateData(gridParams["currentReport"]);
string fileName = " File name is customized here ";
pivotClient.ExportPivotClient(ProductSales.GetSalesData(), args,
fileName, System.Web.HttpContext.Current.Response);
}
```

PivotChart - Exporting Format

Information: This option is applicable only for PivotChart in PivotClient specifically when exported to Excel document.

You can set an option to export PivotChart to an Excel document, either as image or PivotChart format itself by setting the boolean property `exportChartAsImage`, inside the `BeforeExport` event.

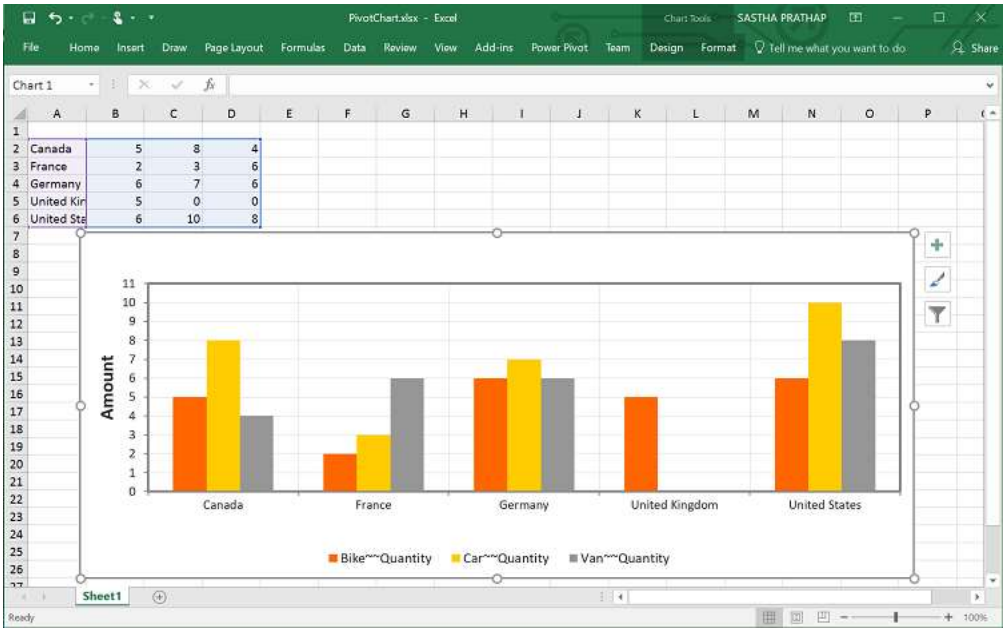
Note: By default PivotChart will be exported as image format to Excel document.

ASPX-CS

Copyright © 2001 - 2020 Syncfusion Inc.

```
@Html.EJ().Pivot().PivotClient("PivotClient1").Url(Url.Content("/Relation
alClient")).ClientExportMode(ClientExportMode.ChartOnly).ClientSideEvents
(oEve => { oEve.BeforeExport("Export"); })
<script type="text/javascript">
function Export(args) {
args.exportChartAsImage = false; //you can set the chart format here
}
</script>
```

The below screenshot shows the control exported to Excel document showing its own format (Pivoting Chart).



Exporting Customization

You can add title and description to the exporting document by using the title and description properties respectively obtained in the BeforeExport event. Similarly, you can enable or disable styling on the exported document by using the exportWithStyle property.

ASPX-CS

```
@Html.EJ().Pivot().PivotClient("PivotClient1").ClientSideEvents(oEve => {
oEve.BeforeExport("Exporting"); })
<script type="text/javascript">
function Exporting(args) {
//ClientMode export
args.url = "ExportPivotClient";
//PivotEngine Export
args.exportMode = ej.PivotClient.ExportMode.PivotEngine;
args.title = "PivotClient";
args.description = "Visualizes both OLAP and Relational datasource in
tabular and graphical formats";
args.exportWithStyle = true;   // by default it sets as true. It improves
performance on exporting huge data when it sets as false.
}
</script>
```

Copyright © 2001 - 2020 Syncfusion Inc.

You can also edit the exporting document with the use of a server side event for required exporting option.

C#

```
//...
using Syncfusion.EJ.Export;
using Syncfusion.Compression.Base;
using Syncfusion.XlsIO;
using Syncfusion.DocIO.Base;
using Syncfusion.Pdf.Base;
//Following methods needs to be added in MVC controller file of the
application for JSON Export.
public void ExportPivotClient()
{
JavaScriptSerializer serializer = new JavaScriptSerializer() {
MaxJsonLength = Int32.MaxValue };
PivotClientExport pivotClient = new PivotClientExport();
string args =
System.Web.HttpContext.Current.Request.Form.GetValues(0)[0];
pivotClient.ExcelExport += pivotClient_ExcelExport;

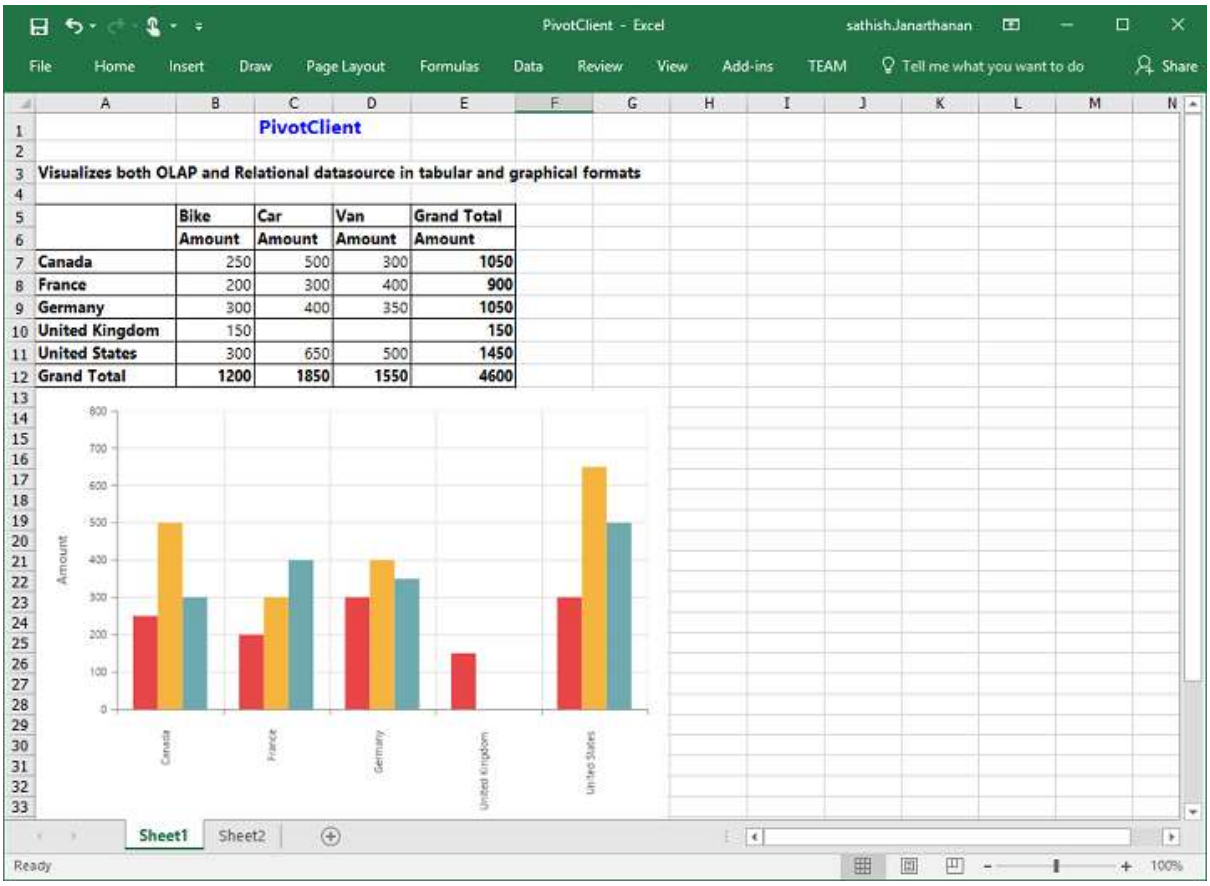
The below screenshot shows the PivotGrid and PivotChart controls exported to Excel document.

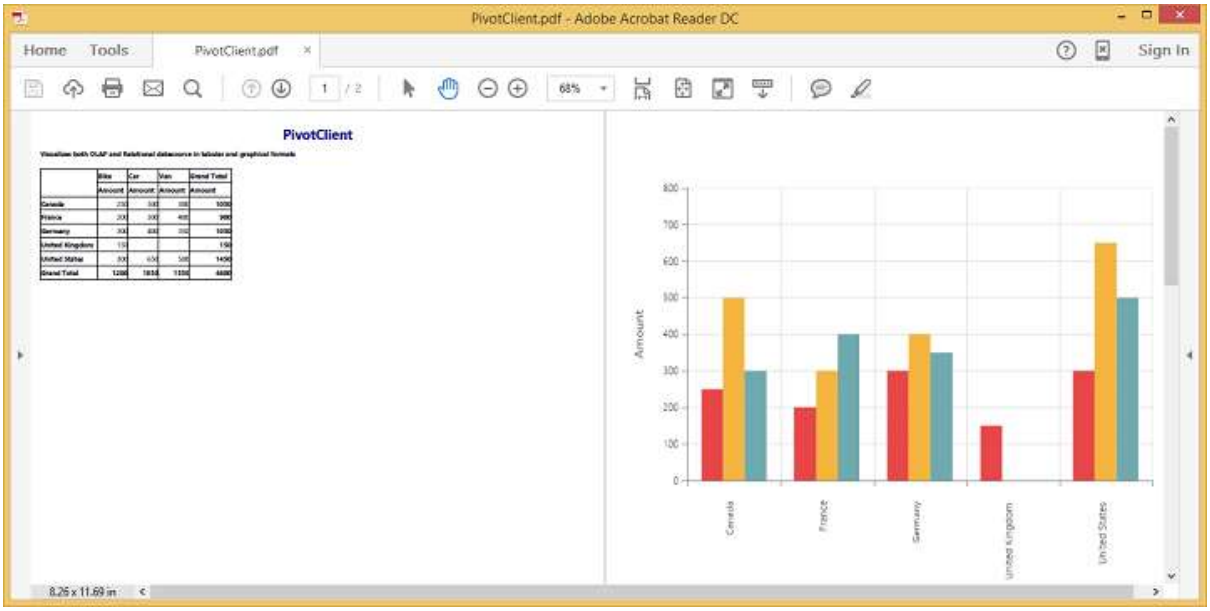
Copyright © 2001 - 2020 Syncfusion Inc.



The below screenshot shows the PivotGrid and PivotChart controls exported to Word document.

	Bike	Car	Van	Grand Total
	Amount	Amount	Amount	Amount
Canada	250	500	300	1050
France	200	300	400	900
Germany	300	400	350	1050
United Kingdom	150			150
United States	300	650	500	1450
Grand Total	1200	1850	1550	4600

The below screenshot shows the PivotGrid and PivotChart controls exported to PDF document.



Value Sorting

Information: This feature is applicable only for the relational datasource.

PivotClient provides support for value sorting that allows you to sort columns and rows based on value fields.

Copyright © 2001 - 2020 Syncfusion Inc.

The headers of the column to be sorted are given in the HeaderText property under ValueSortSettings in field wise order separated by a string. The string which is used to separate the headers is given in the HeaderDelimiters property.

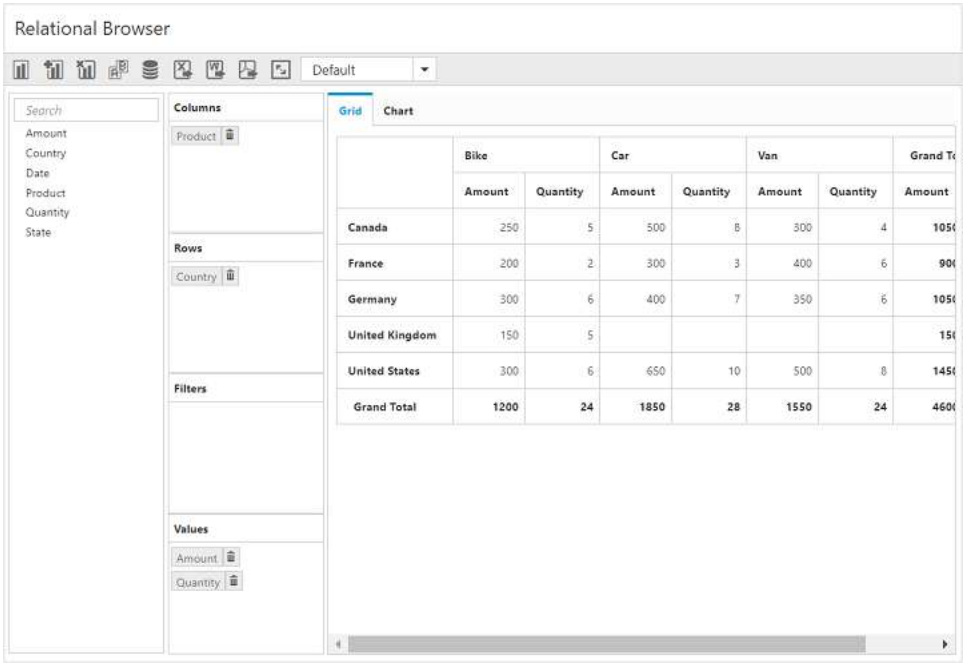
Also, you can sort the column by clicking the column header. By clicking the same header once again, the sorting direction will be reversed. The sorting operation is performed by the using the sortOrder property.

The following code snippet shows how to sort values in descending order.

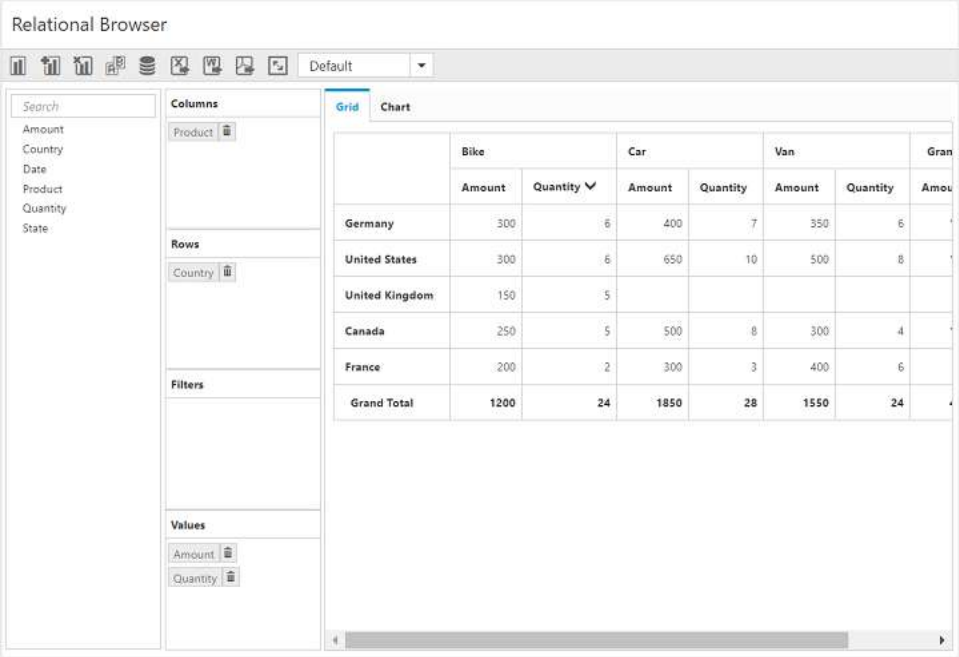
JS

```
@Html.EJ().Pivot().PivotClient("PivotClient1").DataSource(dataSource =>
dataSource.Rows(rows => {
rows.FieldName("Country").FieldCaption("Country").Add();
}).Columns(columns => {
columns.FieldName("Product").FieldCaption("Product").Add();
}).Values(values => { values.FieldName("Amount").Add();
values.FieldName("Quantity").Add();
})).ValueSortSettings(valuesortsettings=>valuesortsettings.HeaderText("Bi
ke##Quantity").HeaderDelimiters("##").SortOrder(SortOrder.Descending))
```

The below screenshot shows PivotClient before applying value sorting.



The below screenshot shows PivotClient after applying value sorting.



Summary Types

Information: This feature is applicable only for the relational datasource.

Allows you to perform calculations over a group of values using summaryType option. This property includes several types of aggregations like sum, average, minimum, maximum etc. You can see the totals of PivotClient control with any one of the below mentioned summary types.

Also, summary type options are added in the context menu of pivot buttons, in values section, to change the resultant summary value dynamically.

Client Mode

Client mode supports the following summary types. By default, sum is applied.

- Sum
- Average
- Count
- Min
- Max

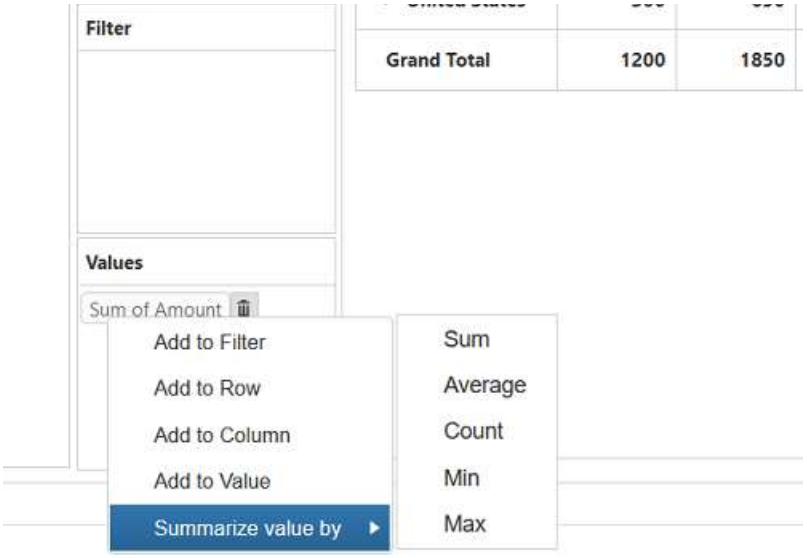
Refer the following code sample to implement summary type through code behind.

ASPX-CS

```
@Html.EJ().Pivot().PivotClient("PivotClient1").ClientSideEvents(clientSid
eEvents => clientSideEvents.Load("onLoad")).DataSource(dataSource =>
dataSource.Rows(rows => {
rows.FieldName("Country").FieldCaption("Country").Add();
}).Columns(columns => {
columns.FieldName("Product").FieldCaption("Product").Add();
}).Values(values => {
values.FieldName("Amount").SummaryType(PivotAnalysisSummaryType.Average).
Add();
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
values.FieldName("Quantity").FieldCaption("Quantity").SummaryType(PivotAn
alysisSummaryType.TotalSum).Add(); }))
<script type="text/javascript">
function onLoad(args) {
args.model.dataSource.data = pivot_dataset; // Datasource
}
</script>
```



Server Mode

Server mode supports the following summary types. By default, count is applied.

- Sum
- Average
- Count
- Min
- Max
- DoubleTotalSum
- DoubleAverage
- DoubleMaximum
- DoubleMinimum
- DoubleStandardDeviation
- DoubleVariance
- DecimalTotalSum
- IntTotalSum
- DisplayIfDiscreteValuesEqual
- Count numbers
- Standard deviation
- Standard deviation of population
- Variance
- Variance of population

Copyright © 2001 - 2020 Syncfusion Inc.

Through code behind

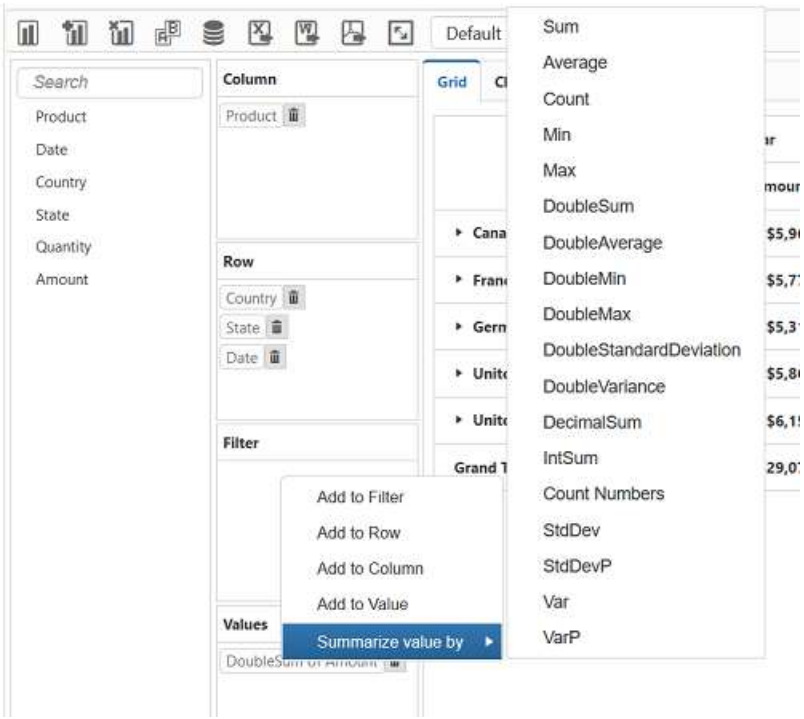
Refer the following code sample to implement summary type through code behind.

C#

```
private PivotReport BindDefaultData()
{
PivotReport pivotSetting = new PivotReport();
//...
pivotSetting.PivotCalculations.Add(new PivotComputationInfo {
CalculationName = "Amount", Description = "Amount", FieldHeader =
"Amount", FieldName = "Amount", Format = "C", SummaryType =
Syncfusion.PivotAnalysis.Base.SummaryType.DoubleTotalSum });
return pivotSetting;
}
```

Through UI interaction

You can change summary types at run-time through built-in context menu for respective value field. Once the summary type is selected, the corresponding pivot item will be updated with the respective summary type.



To achieve this behavior at run-time, add the following `ChangeSummaryType` method in WebAPI/WCF service.

WebAPI

C#

```
[System.Web.Http.ActionName("ChangeSummaryType")]
[System.Web.Http.HttpPost]
public Dictionary<string, object> ChangeSummaryType(Dictionary<string,
object> jsonResult)
{
```

```
pivotClient.PopulateData(jsonResult["currentReport"].ToString());
var dictionary = pivotClient.GetJsonData(jsonResult["action"].ToString(),
ProductSales.GetSalesData(), jsonResult["summaryType"].ToString());
return dictionary;
}
```

WCF

C#

```
public Dictionary<string, object> ChangeSummaryType(string action, string
currentReport, string summaryType)
{
pivotClient.PopulateData(currentReport);
return pivotClient.GetJsonData(action, ProductSales.GetSalesData(),
summaryType);
}
```

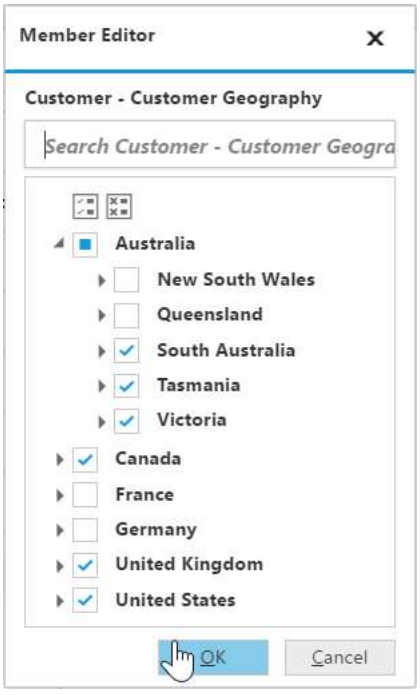
OLAP

Data Exploration

Filtering

Filtering by Member

After clicking Split button of a dimension, Member Editor dialog opens through which members are filtered by checking and unchecking the check boxes corresponding to the members. On clicking the "OK" button, based on the selected members in the Member Editor dialog, OlapReport gets updated and refreshes the PivotGrid and PivotChart controls. The "Cancel" button is used to cancel the selection.



The above filter illustrates that the members France and Germany, along with New South Wales and Queensland are excluded from the Grid and Chart controls.

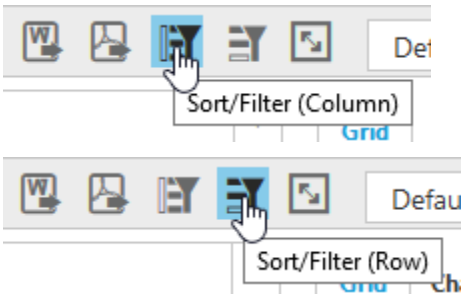
Filtering by Value

Information: This feature is applicable only for OLAP data source bound from server-side.

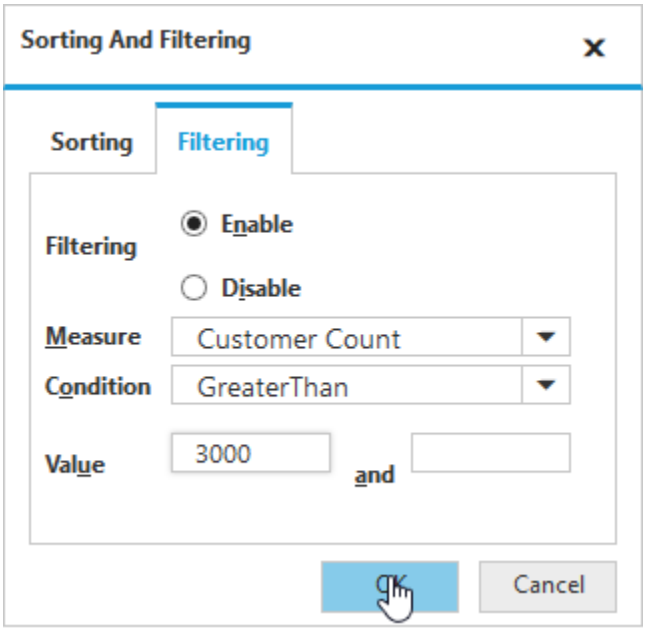
The Filtering tab in the Sorting and Filtering dialog box of PivotClient provides the options to apply custom filters on the multi-dimensional data. It enables the user to filter the rows and columns of the selected Measure.

- **Column Filter** - Filters the columns related to the specified measure according to the condition applied for filtering.
- **Row Filter** - Filters the rows related to the specified measure according to the condition applied for filtering.

Sorting and Filtering dialog box for rows and columns are opened by clicking the corresponding icon in the toolbar.



The following screenshot displays the Filtering tab in Sorting and Filtering dialog box.



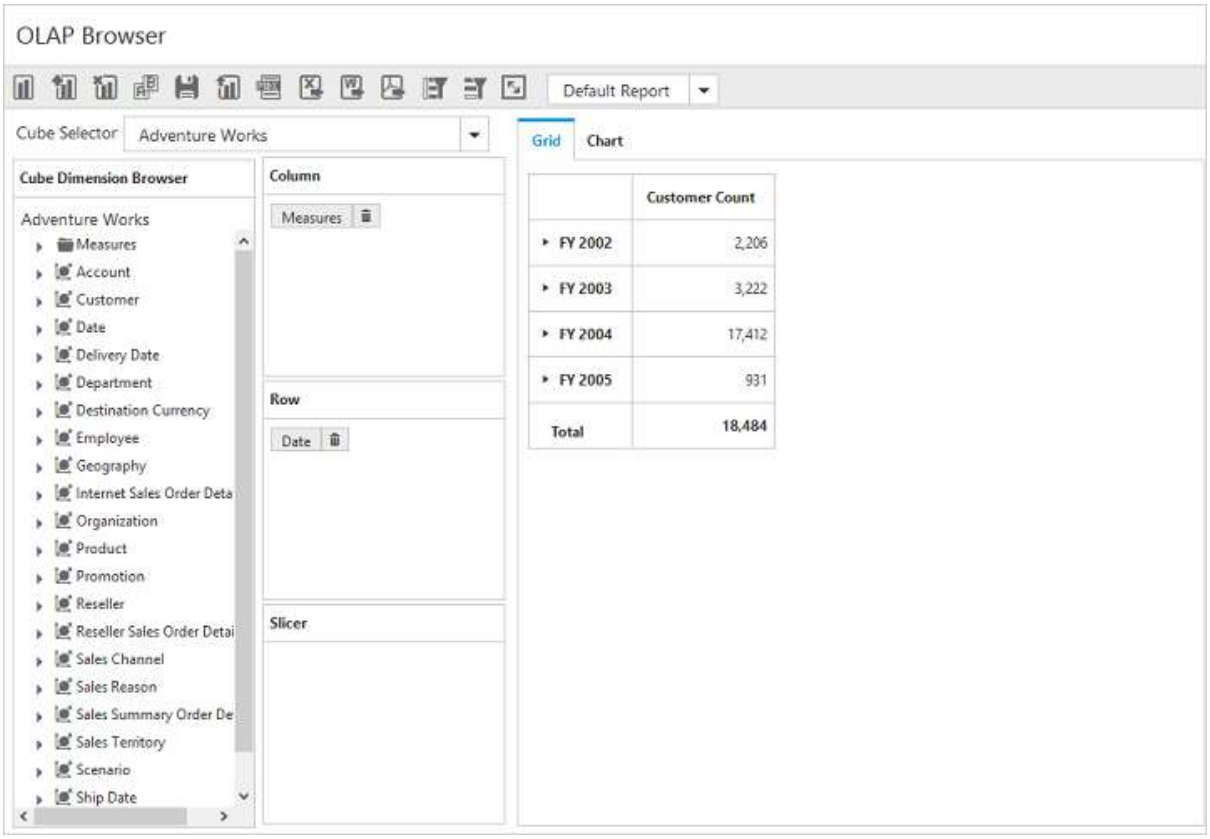
The options in the Filtering tab are as follows:

- **Enabling Filtering** – Enables/Disables the Filtering option.
- **Measure** – The measure for filtering is selected from the collection of measures in drop down list.
- **Condition** – Condition with which the filtering is applied.

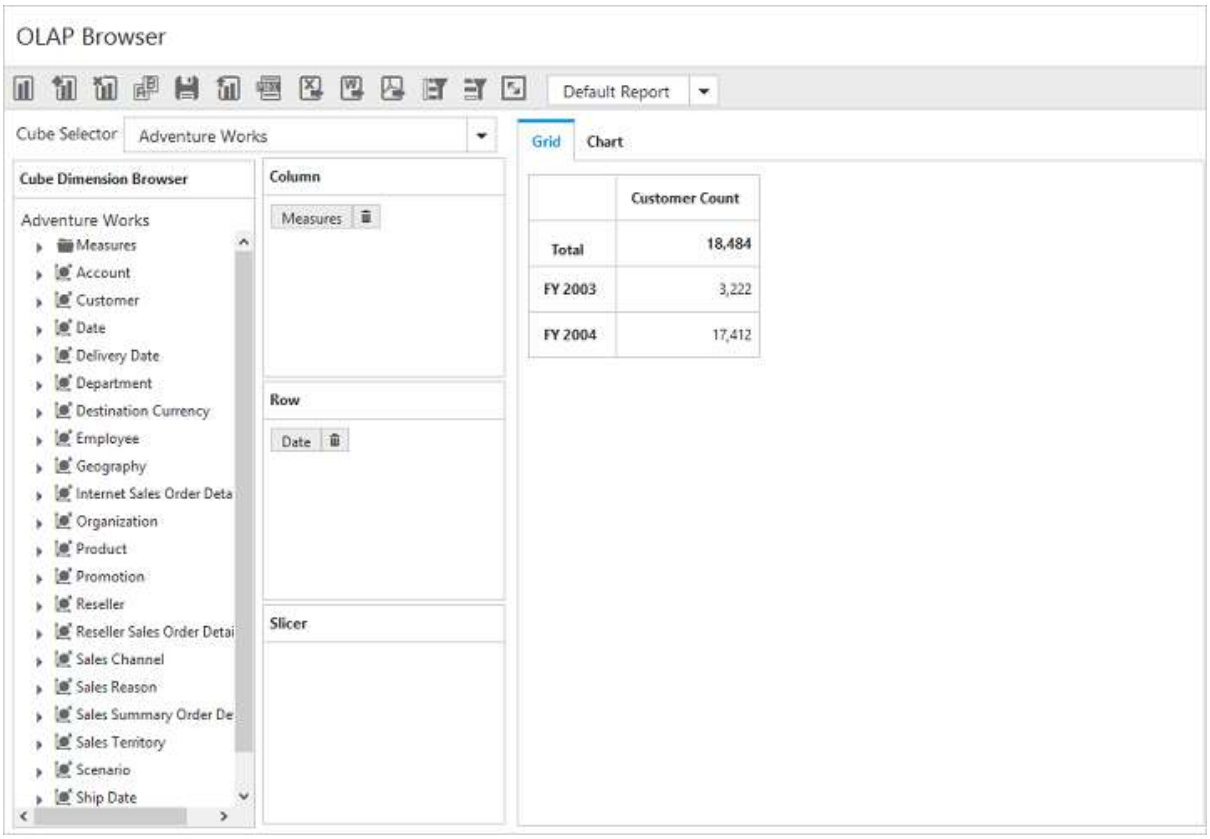
Copyright © 2001 - 2020 Syncfusion Inc.

- **Value** – Value to compare with each data according to the condition.

The following screenshot displays data before Filtering.



The following screenshot displays the data after Filtering.

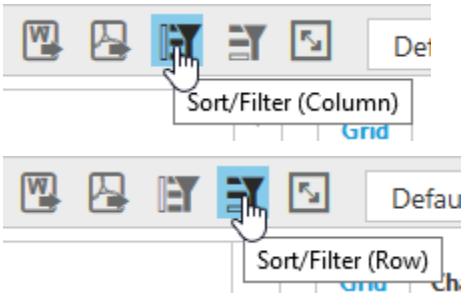


Sorting

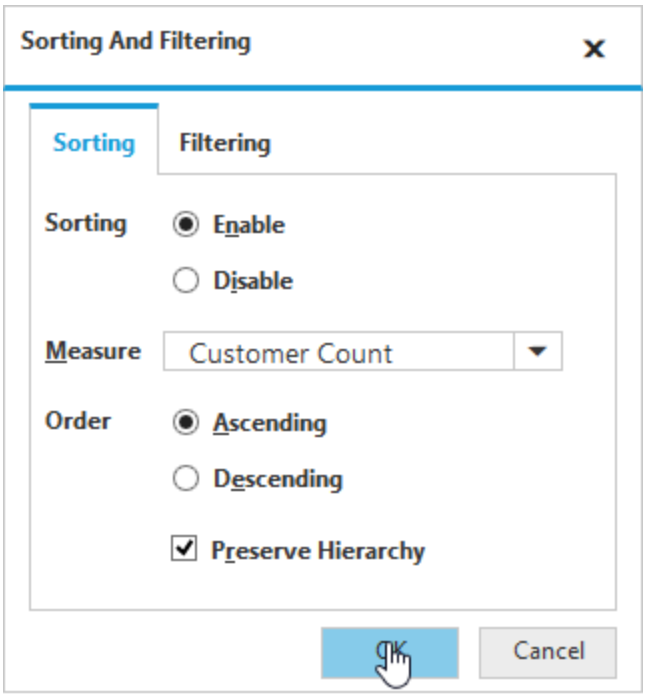
The Sorting tab in the Sorting And Filtering dialog box provides the option to sort the results by rows/columns, either in ascending or descending order.

- **Column sorting** - Sorts the columns based on the summary values of each column.
- **Row sorting** - Sorts the rows based on the summary values of each row.

Sorting And Filtering dialog box for rows and columns are opened by clicking the corresponding icon in the toolbar.



The following screenshot displays the Sorting And Filtering dialog box.

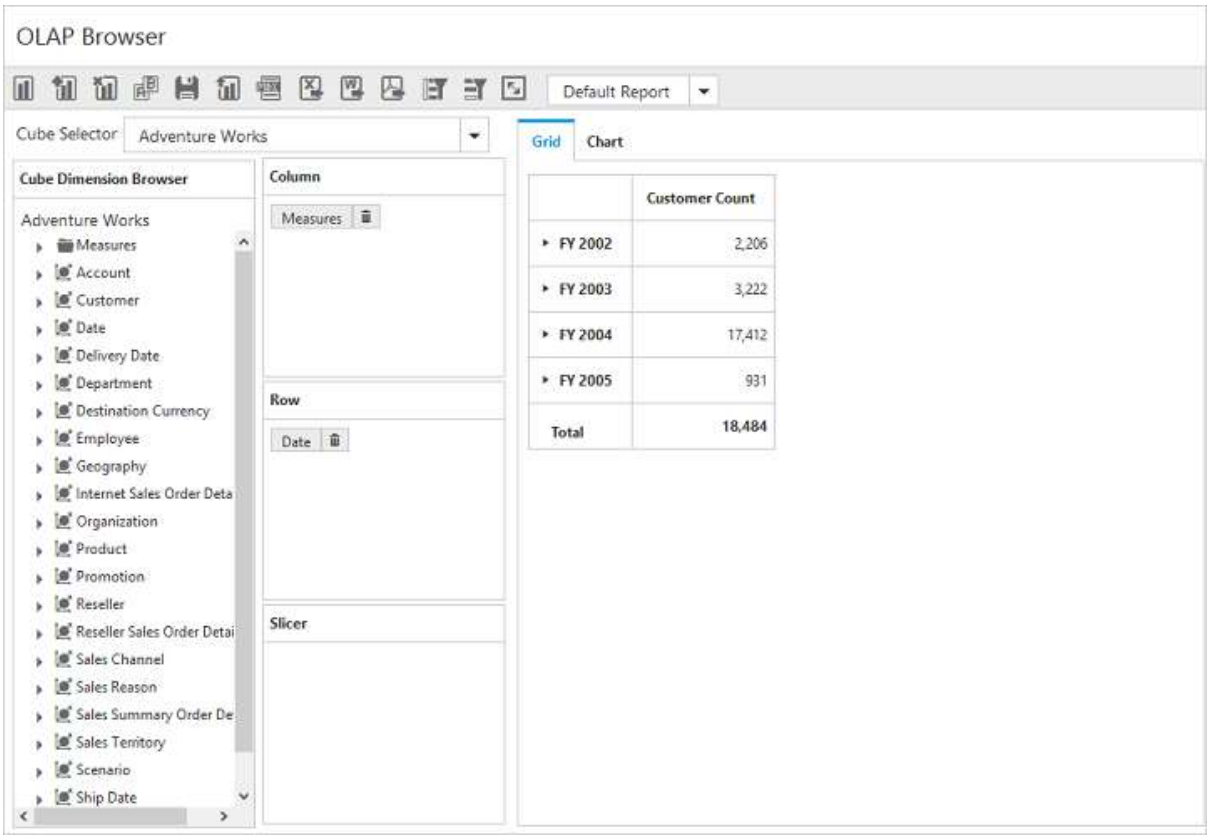


The options in the Sorting tab are as follows:

- **Measure** – The measure for sorting is selected from the collection of measures in drop-down list.
- **Order** – Specifies the sorting order.
- **Preserve Hierarchy** – Sorts the records without changing the hierarchy order.

The following screenshot displays the data after applying sorting in ascending order for rows.

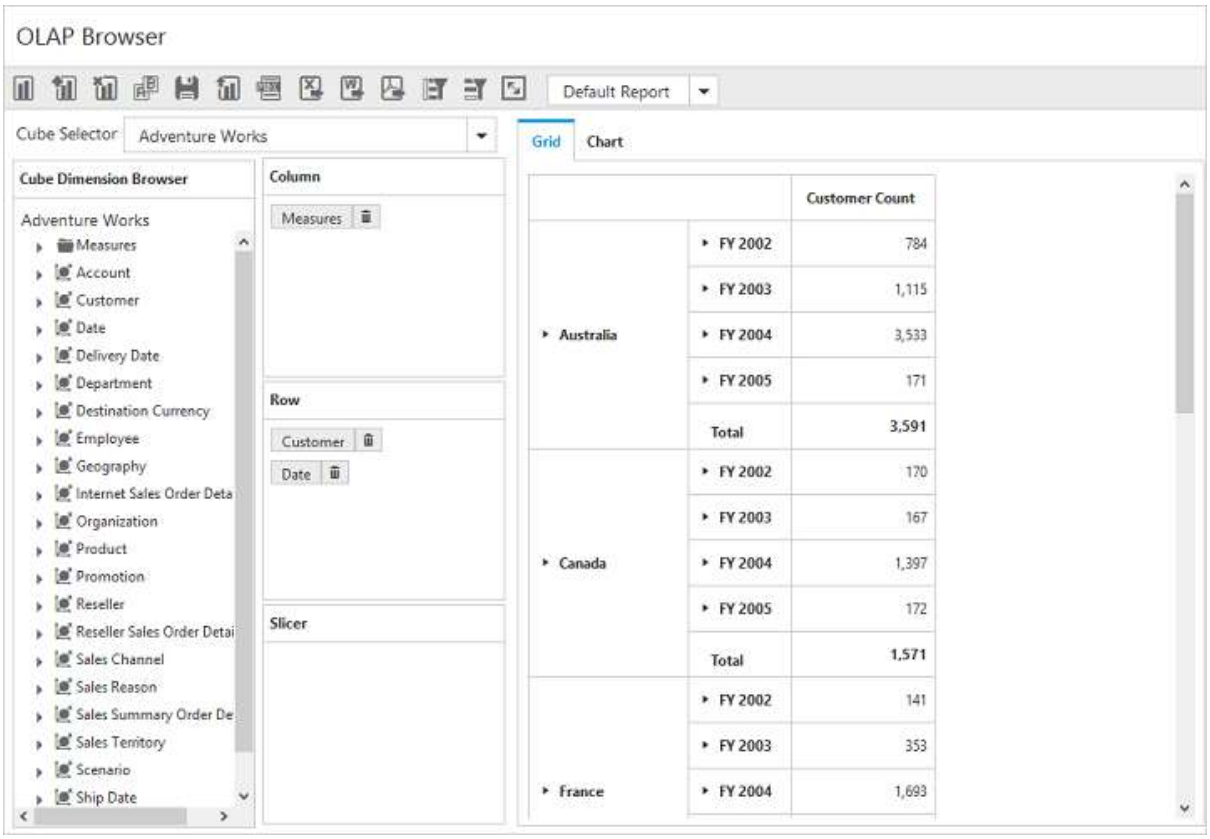
Copyright © 2001 - 2020 Syncfusion Inc.



Grouping

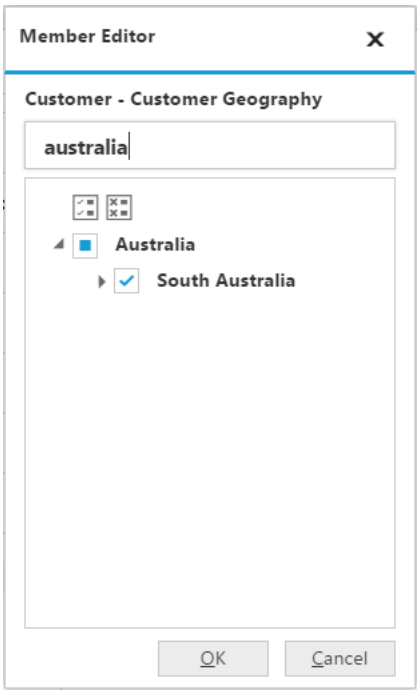
The data can be grouped when more than one dimension element is added to column or row in Axis Element Builder. Based on the order of addition, data is grouped and the report is updated. In the following example, members of the **Date** dimension get grouped, with respect to the members of **Customer** dimension. Likewise, multiple dimension members can be grouped by dragging the elements from Cube Dimension Browser to Axis Element Builder.

Copyright © 2001 - 2020 Syncfusion Inc.



Searching

Members can be searched and displayed from the members list inside the Member Editor dialog.



Exporting

PivotChart and PivotGrid in the PivotClient widget can be exported to Excel, Word and PDF documents by clicking the respective toolbar icons.

Exporting feature provides an option that allows you to export either PivotChart or PivotGrid or both with the use of the property ClientExportMode.

The property ClientExportMode takes any one of the following value:

- **ChartAndGrid** – Exports both PivotChart and PivotGrid controls. This is the default mode.
- **ChartOnly** – Exports PivotChart control alone.
- **GridOnly** – Exports PivotGrid control alone.

JSON Export

Note: By default, exporting is done with the use of JSON Records maintained in client-side for both client and server modes

In order to perform exporting with the use of a custom service method, the service containing the exporting method is hosted and its link is given in url as shown below. Without giving any value to the 'url' property it takes our default exporting service link.

ASPX-CS

```
@Html.EJ().Pivot().PivotClient("PivotClient1").Url(Url.Content("/OlapClie
nt")).ClientExportMode(ClientExportMode.ChartAndGrid).ClientSideEvents(oE
ve => { oEve.BeforeExport("Export"); })
<script type="text/javascript">
function Export(args) {
args.url = "ExportPivotClient";
}
</script>
```

When PivotClient is exported with JSON export mode, a method needs to be added in MVC controller file of the application.

C#

```
public void ExportPivotClient()
{
JavaScriptSerializer serializer = new JavaScriptSerializer() {
MaxJsonLength = Int32.MaxValue };
PivotClientExport pivotClient = new PivotClientExport();
string args =
System.Web.HttpContext.Current.Request.Form.GetValues(0)[0];
pivotClient.ExportPivotClient(string.Empty, args,
System.Web.HttpContext.Current.Response);
}
```

Customize the export document name

The name of the document to be exported could be customized. Following code sample illustrates the same.

Copyright © 2001 - 2020 Syncfusion Inc.

ASPX-CS

```
@Html.EJ().Pivot().PivotClient("PivotClient1").Url(Url.Content("/OlapServ
ice")).ClientExportMode(ClientExportMode.ChartAndGrid).ClientSideEvents(o
Eve => { oEve.BeforeExport("Export"); })
<script type="text/javascript">
function Export(args) {
args.url = "ExportPivotClient";
args.fileName=" File name is customized here ";
}
</script>
```

PivotEngine Export

Information: This feature is applicable only at server mode operation.

In order to perform exporting with the use of PivotEngine available in server-side, the 'exportMode' property obtained in the “BeforeExport” event is set to "ej.PivotClient.ExportMode.PivotEngine" as shown below.

ASPX-CS

```
@Html.EJ().Pivot().PivotClient("PivotClient1").Url(Url.Content("/OlapClie
nt")).ClientExportMode(ClientExportMode.ChartAndGrid).ClientSideEvents(oE
ve => { oEve.BeforeExport("Export"); })
<script type="text/javascript">
function Export(args) {
args.exportMode = ej.PivotClient.ExportMode.PivotEngine;
}
</script>
```

For WebAPI controller, the below method needs to be added to perform exporting with PivotEngine.

C#

```
[System.Web.Http.ActionName("Export")]
[System.Web.Http.HttpPost]
public void Export()
{
string args = HttpContext.Current.Request.Form.GetValues(0)[0];
OlapDataManager DataManager = new OlapDataManager(connectionString);
string fileName = "Sample";
olapClientHelper.ExportPivotClient(DataManager, args, fileName,
System.Web.HttpContext.Current.Response);
}
```

For WCF service, the below service method needs to be added to perform exporting with PivotEngine.

C#

```
public void Export(Stream stream)
{
System.IO.StreamReader sReader = new System.IO.StreamReader(stream);
string args =
System.Web.HttpContext.Current.Server.UrlDecode(sReader.ReadToEnd()).Remo
ve(0, 5);
OlapDataManager DataManager = new OlapDataManager(connectionString);
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
string fileName = "Sample";
olapClientHelper.ExportPivotClient(DataManager, args, fileName,
System.Web.HttpContext.Current.Response);
}
```

File format selection

Information: This option is applicable only for PivotClient when exporting to Excel document.

You can set the option for exporting the control to Excel document either in *.xls* or *.xlsx* format, using fileFormat property inside the BeforeExport event.

Note: By default excel document will be exported to ".xls" format using PivotEngine export.

ASPX-CS

```
@Html.EJ().Pivot().PivotClient("PivotClient1").ClientSideEvents(oEve => {
oEve.BeforeExport("Exporting"); })
<script type="text/javascript">
function Exporting(args) {
args.exportMode = ej.PivotClient.ExportMode.PivotEngine;
args.fileFormat = ".xlsx"; //you can set the excel sheet format here
}
</script>
```

Customize the export document name

The document name could be customized inside the method in WebAPI Controller. Following code sample illustrates the same.

C#

```
[System.Web.Http.ActionName("Export")]
[System.Web.Http.HttpPost]
public void Export()
{
string args = HttpContext.Current.Request.Form.GetValues(0)[0];
OlapDataManager DataManager = new OlapDataManager(connectionString);
string fileName = " File name is customized here ";
olapClientHelper.ExportPivotClient(DataManager, args, fileName,
System.Web.HttpContext.Current.Response);
}
```

For customizing name in WCF Service, below code snippet is used.

C#

```
public void Export(Stream stream)
{
System.IO.StreamReader sReader = new System.IO.StreamReader(stream);
string args =
System.Web.HttpContext.Current.Server.UrlDecode(sReader.ReadToEnd()).Remo
ve(0, 5);
OlapDataManager DataManager = new OlapDataManager(connectionString);
string fileName =  " File name is customized here ";
olapClientHelper.ExportPivotClient(DataManager, args, fileName,
System.Web.HttpContext.Current.Response);
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
}
```

PivotChart - Exporting Format

Information: This option is applicable only for PivotChart in PivotClient specifically when exported to Excel document.

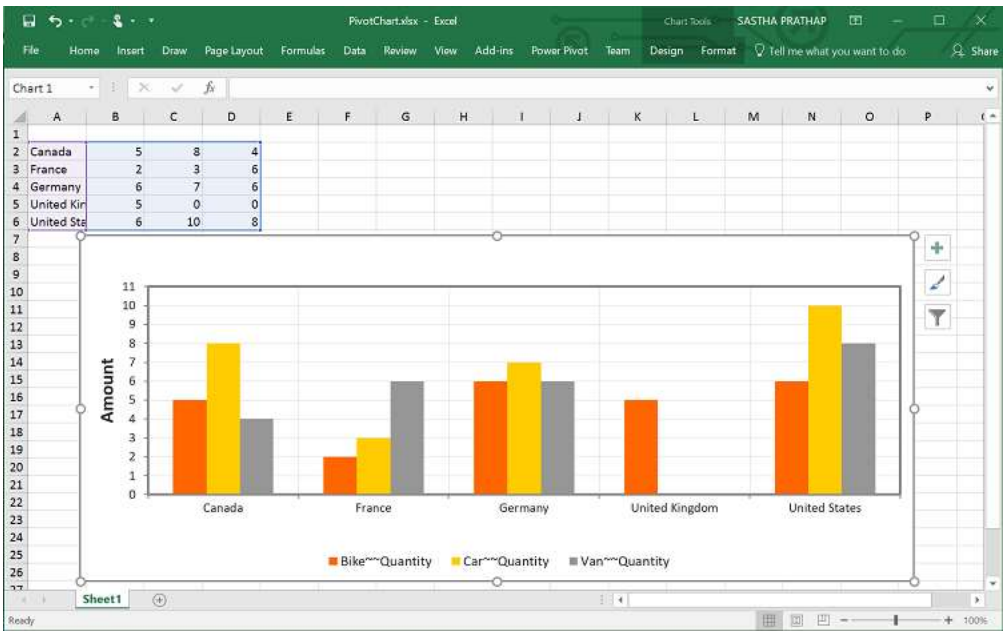
You can set an option to export PivotChart to an Excel document, either as image or PivotChart format itself by setting the Boolean property exportChartAsImage, inside the BeforeExport event.

Note: By default PivotChart will be exported as image format to Excel document.

ASPX-CS

```
@Html.EJ().Pivot().PivotClient("PivotClient1").Url(Url.Content("/OlapClie
nt")).ClientExportMode(ClientExportMode.ChartOnly).ClientSideEvents(oEve
=> { oEve.BeforeExport("Export"); })
<script type="text/javascript">
function Export(args) {
args.exportChartAsImage = false; //You can set the chart format here
}
</script>
```

The below screenshot shows the control exported to Excel document showing its own format (Pivoting Chart).



Exporting Customization

You can add title and description to the exporting document by using the title and description properties respectively obtained in the BeforeExport event. Similarly, you can enable or disable styling on the exported document by using the exportWithStyle property.

ASPX-CS

```
@Html.EJ().Pivot().PivotClient("PivotClient1").ClientSideEvents(oEve => {
oEve.BeforeExport("Exporting"); })
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
<script type="text/javascript">
function Exporting(args) {
//ClientMode export
args.url = "ExportPivotClient";
//PivotEngine Export
args.exportMode = ej.PivotClient.ExportMode.PivotEngine;
args.title = "PivotClient";
args.description = "Visualizes both OLAP and Relational datasource in
tabular and graphical formats";
args.exportWithStyle = true;   // by default it sets as true. It improves
performance on exporting huge data when it sets as false.
}
</script>
```

You can also edit the exporting document with the use of a server side event for required exporting option.

C#

```
//...
using Syncfusion.EJ.Export;
using Syncfusion.Compression.Base;
using Syncfusion.XlsIO;
using Syncfusion.DocIO.Base;
using Syncfusion.Pdf.Base;
//Following methods needs to be added in MVC controller file of the
application for JSON Export.
public void ExportPivotClient()
{
JavaScriptSerializer serializer = new JavaScriptSerializer() {
MaxJsonLength = Int32.MaxValue };
PivotClientExport pivotClient = new PivotClientExport();
string args =
System.Web.HttpContext.Current.Request.Form.GetValues(0)[0];
pivotClient.ExcelExport += pivotClient_ExcelExport;
pivotClient.WordExport += pivotClient_WordExport;
pivotClient.AddPDFHeaderFooter += pivotClient_AddPDFHeaderFooter;
pivotClient.PDFExport += pivotClient_PDFExport;
pivotClient.ExportPivotClient(string.Empty, args,
System.Web.HttpContext.Current.Response);
}
void pivotClient_PDFExport(object sender, Syncfusion.Pdf.PdfDocument
pdfDoc)
{
//You can customize exporting document here.
}
void pivotClient_AddPDFHeaderFooter(object sender,
Syncfusion.Pdf.PdfDocument pdfDoc)
{
//You can add header/footer information to the PDF document.
}
void pivotClient_WordExport(object sender,
Syncfusion.DocIO.DLS.WordDocument document)
{
//You can customize exporting document here.
}
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
void pivotClient_ExcelExport(object sender, Syncfusion.XlsIO.IWorkbook
workBook)
{
//You can customize exporting document here.
}
//Following service method needs to be added in WebAPI controller for
PivotEngine Export.
[System.Web.Http.ActionName("ExportOlapClient")]
[System.Web.Http.HttpPost]
public void ExportOlapClient()
{
string args = HttpContext.Current.Request.Form.GetValues(0)[0];
OlapDataManager DataManager = new OlapDataManager(connectionString);
olapClientHelper.ExcelExport += olapClientHelper_ExcelExport;
olapClientHelper.WordExport += olapClientHelper_WordExport;
olapClientHelper.AddPDFHeaderFooter +=
olapClientHelper_AddPDFHeaderFooter;
olapClientHelper.PDFExport += olapClientHelper_PDFExport;
string fileName = "Sample";
olapClientHelper.ExportPivotClient(DataManager, args, fileName,
System.Web.HttpContext.Current.Response);
}
void olapClientHelper_PDFExport(object sender, Syncfusion.Pdf.PdfDocument
pdfDoc)
{
//You can customize exporting document here.
}
void olapClientHelper_AddPDFHeaderFooter(object sender,
Syncfusion.Pdf.PdfDocument pdfDoc)
{
//You can add header/footer information to the PDF document.
}
void olapClientHelper_WordExport(object sender,
Syncfusion.DocIO.DLS.WordDocument document)
{
//You can customize exporting document here.
}
void olapClientHelper_ExcelExport(object sender,
Syncfusion.XlsIO.IWorkbook workBook)
{
//You can customize exporting document here.
}
```

Exporting complete data on Paging

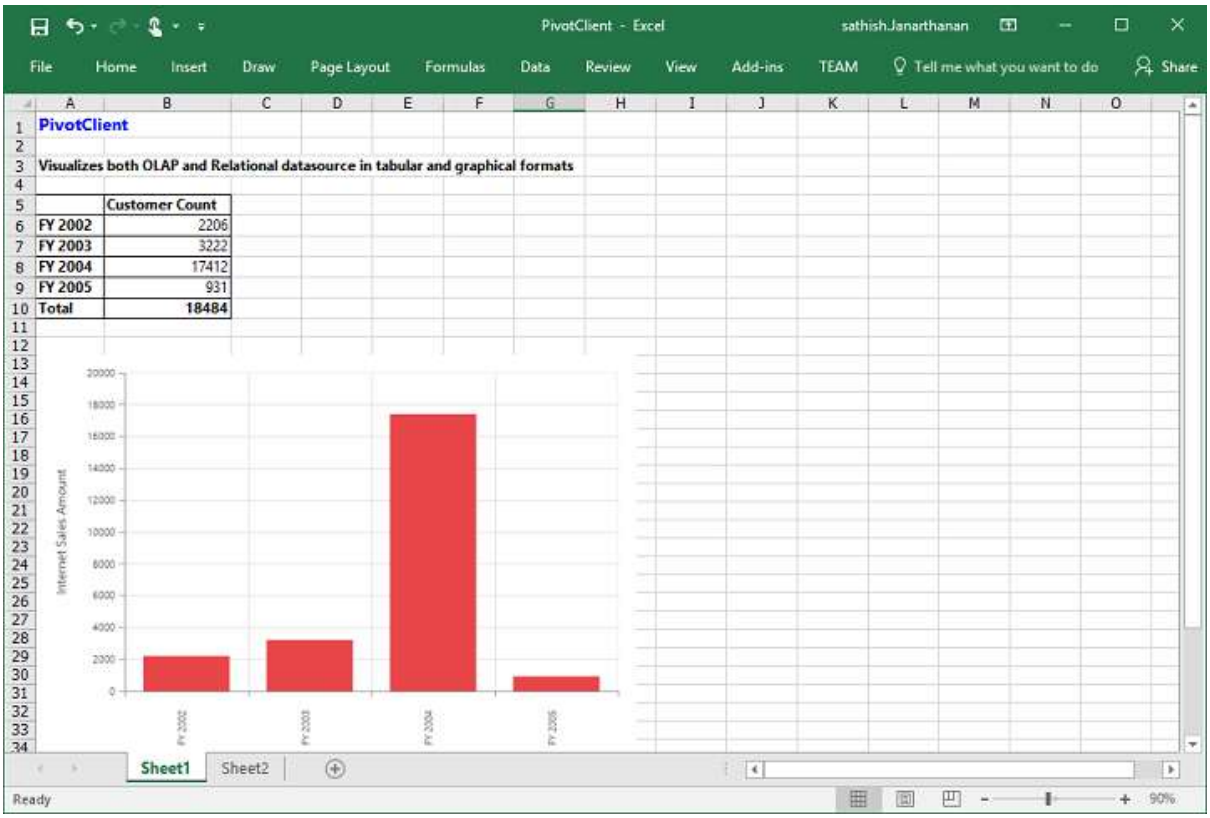
When paging is enabled, you can export the complete data by enabling the `EnableCompleteDataExport` property. It is supported in both types of JSON and PivotEngine export and it is applicable for all kinds of exporting formats available in PivotClient.

ASPX-CS

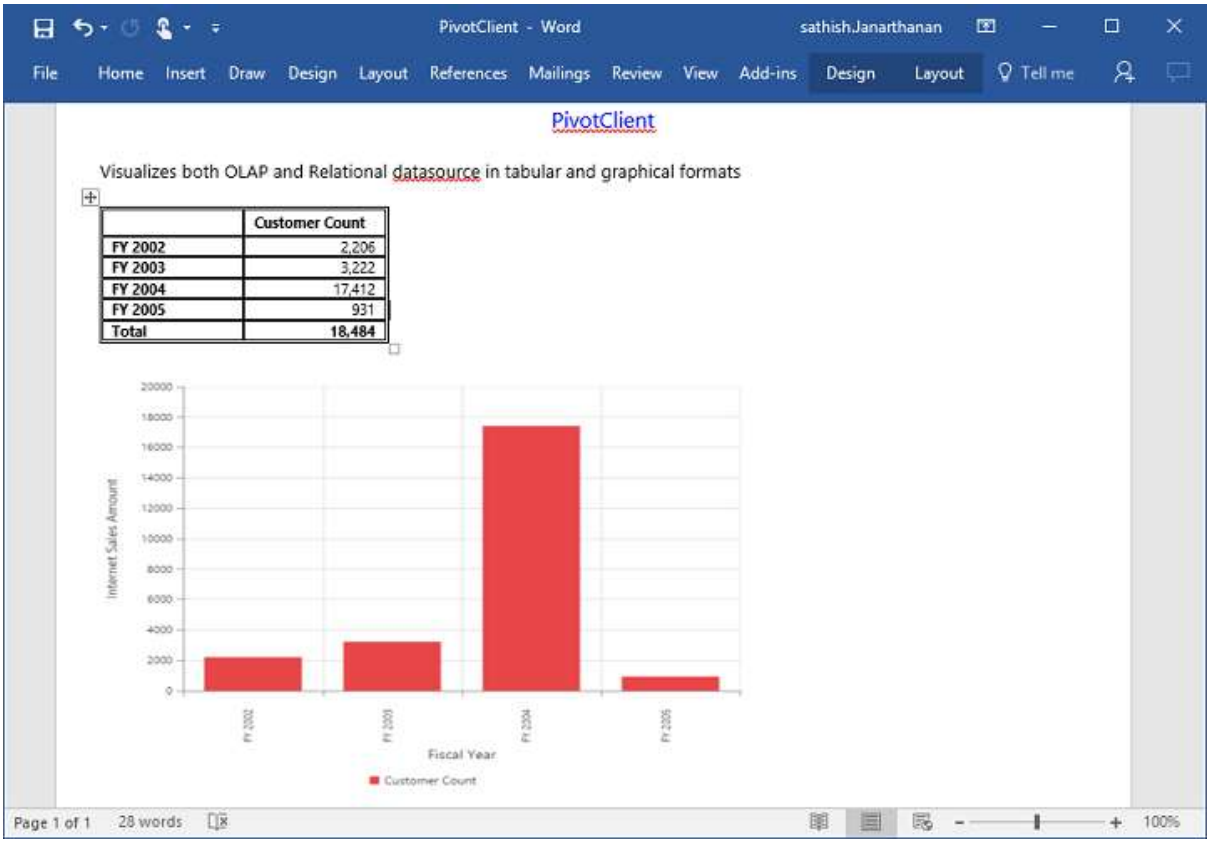
```
@Html.EJ().Pivot().PivotClient("PivotClient1").EnableCompleteDataExport(t
rue)
```

The below screenshot shows the PivotGrid and PivotChart controls exported to Excel document.

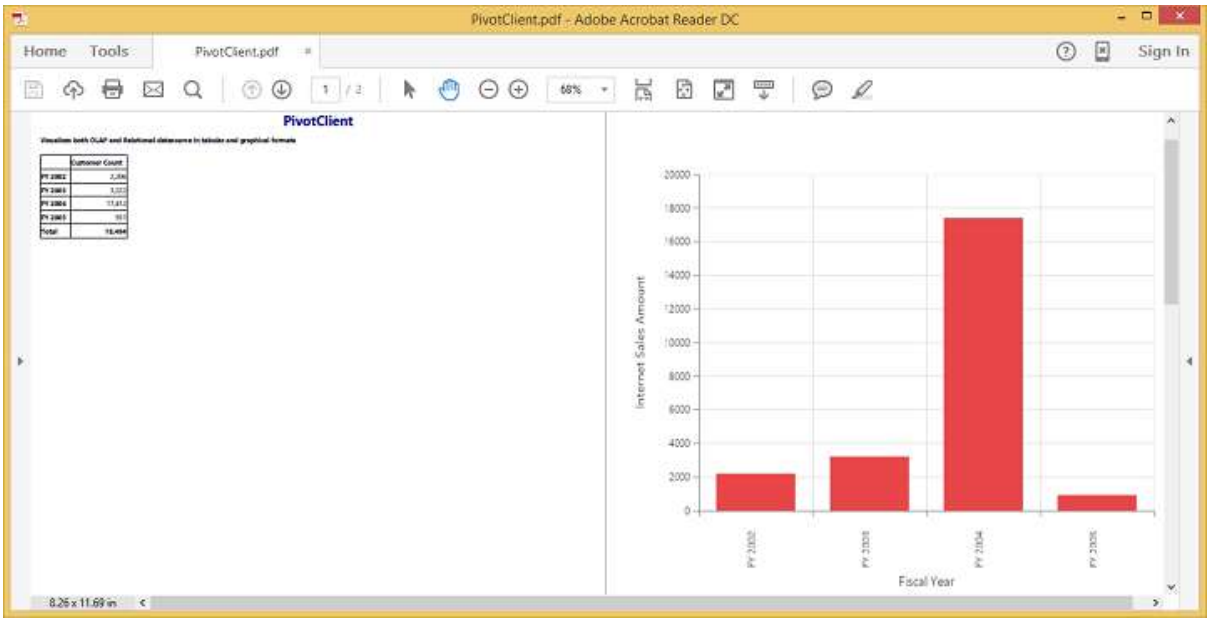
Copyright © 2001 - 2020 Syncfusion Inc.



The below screenshot shows the PivotGrid and PivotChart controls exported to Word document.



The below screenshot shows the PivotGrid and PivotChart controls exported to PDF document.



Defer Update

Information: This feature is applicable only for OLAP data source bound from server-side.

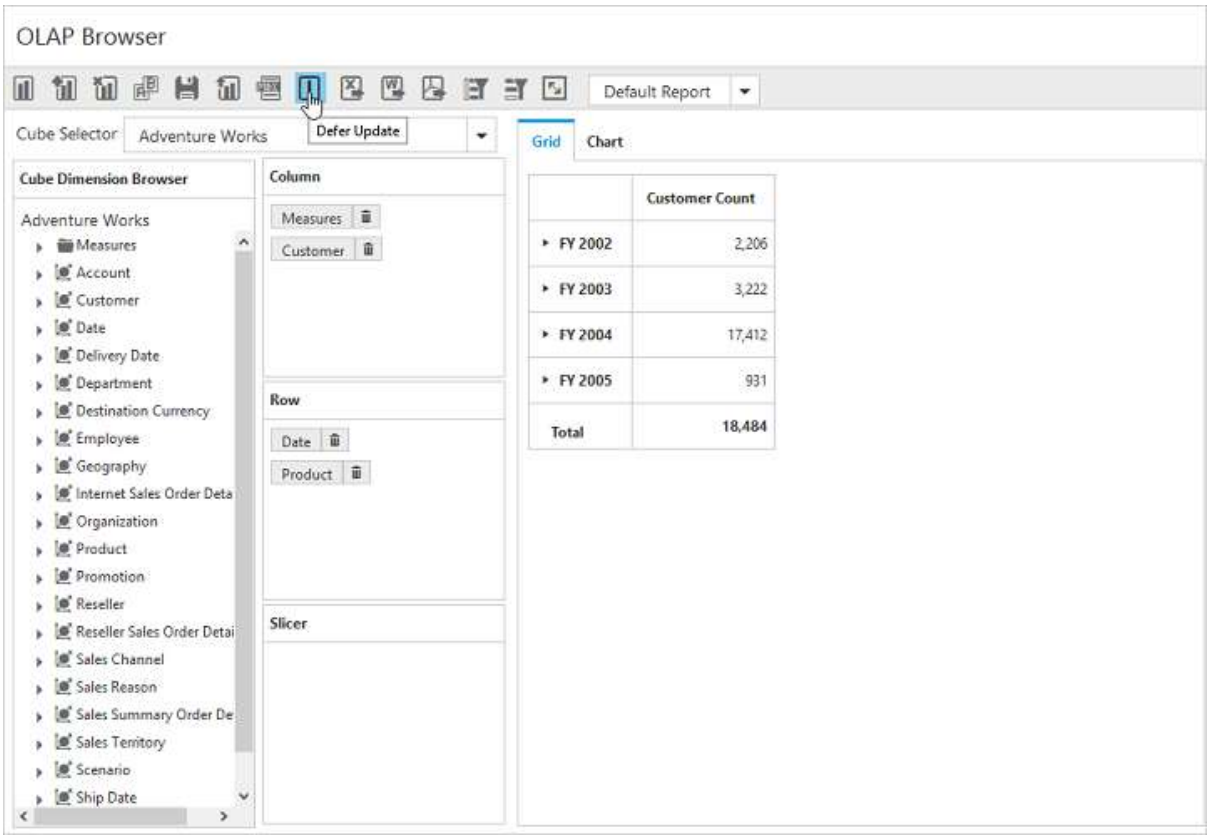
Defer Update support allows the user to refresh the control on-demand and not during every user interaction. To enable this functionality, set the EnableDeferUpdate property to true. By default, the value is set to false.

ASPX-CS

```
@Html.EJ().Pivot().PivotClient("PivotClient1").Url(Url.Content("/OlapClie
nt")).Title("Olap Browser").EnableDeferUpdate(true)
```

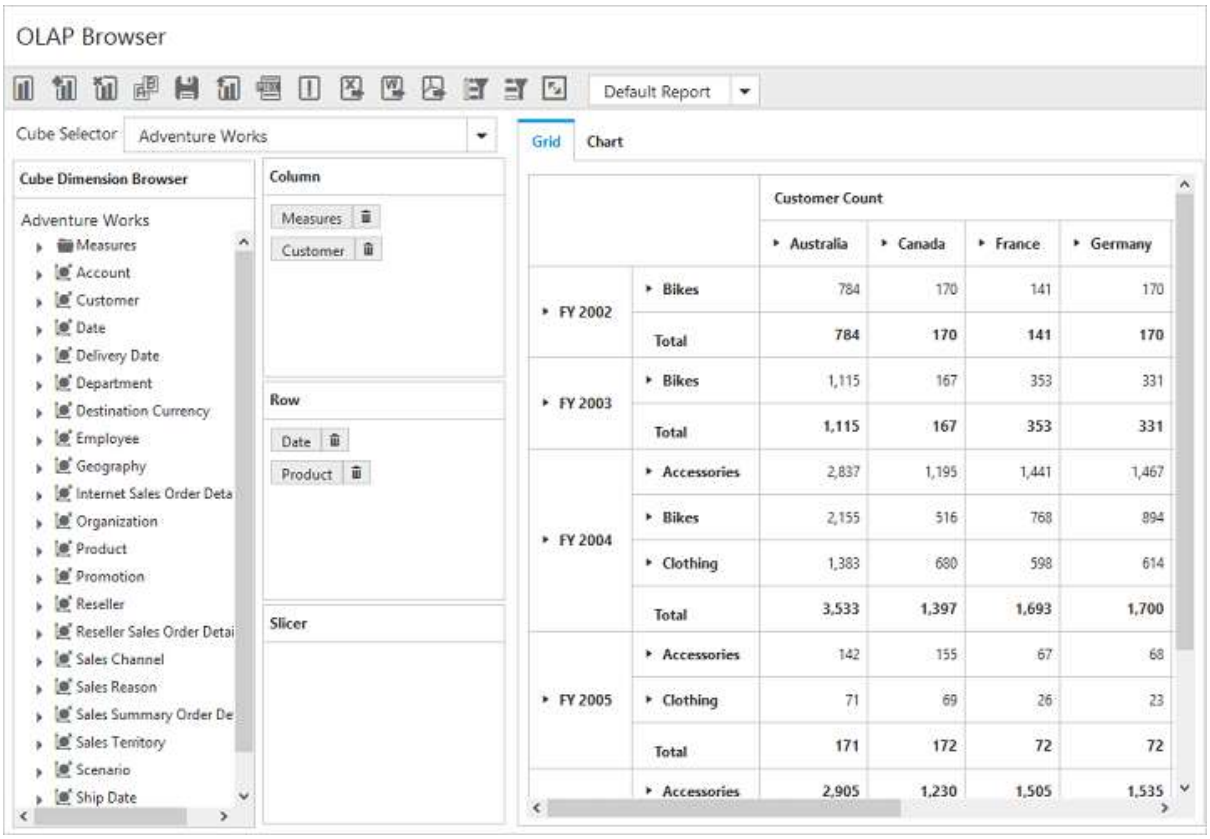
After enabling this property, an icon for Defer Update will appear inside the toolbar.

Copyright © 2001 - 2020 Syncfusion Inc.



On clicking the icon, after making the necessary UI interactions, the PivotGrid and PivotChart controls will be updated according to the OlapReport available at that instant.

Copyright © 2001 - 2020 Syncfusion Inc.



KPI

Key Performance Indicators (KPIs) are business metric that help to figure out the progress of an enterprise in meeting its business goals.

The different indicators available in KPI are:

- KPI Value: A physical measure or a calculated measure.
- KPI Goal: Defines the target for the measure.
- KPI Status: Evaluates the current status of the value compared to the goal.
- KPI Trend: Evaluate the current trend of the value compared to the goal.

The **“KpiElements”** class in OLAP Base library holds the KPI name and when its object is added to an OlapReport, you can view the resultant information in PivotClient.

To enable KPI option set the property `EnableKPI` to `true`.

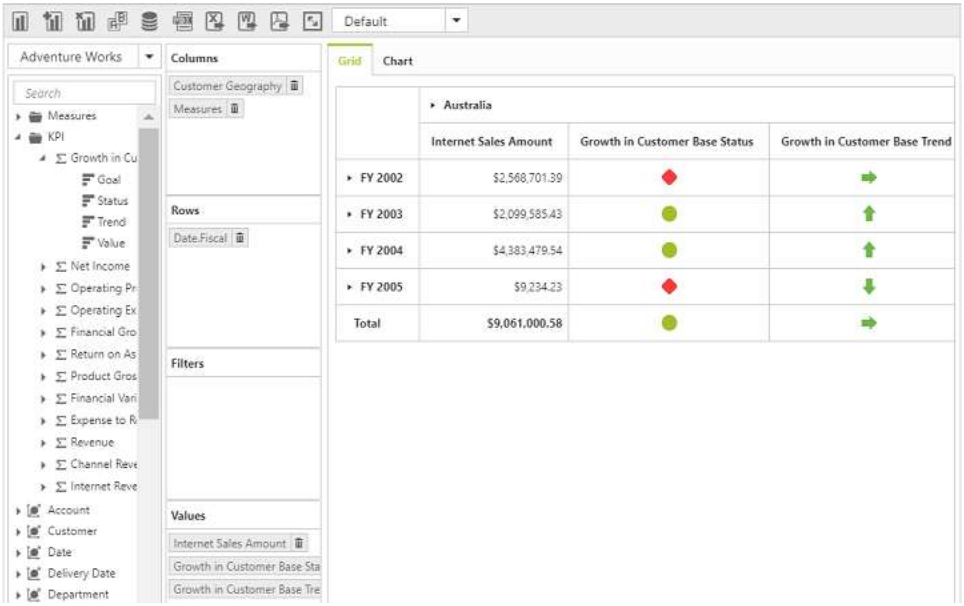
Client Mode

ASPX-CS

```
@Html.EJ().Pivot().PivotClient("PivotClient1").DataSource(dataSource =>
dataSource.Rows(rows => { rows.FieldName("[Date].[Fiscal]").Add();
}).Columns(columns => { columns.FieldName("[Product].[Product
Categories]").Add(); }).Values(values => { values.Measures(measures => {
measures.FieldName("[Measures].[Internet Sales Amount]").Add();
measures.FieldName("[Measures].[Growth in Customer Base Trend]").Add();
measures.FieldName("[Measures].[Growth in Customer Base Status]").Add();
}).Axis(AxisName.Column).Add();
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
}).Data("https://bi.syncfusion.com/olap/msmdpump.dll").Catalog("Adventure Works DW 2008 SE").Cube("Adventure Works")).EnableKPI(true)
```



Server Mode

Client side property declaration

ASPX-CS

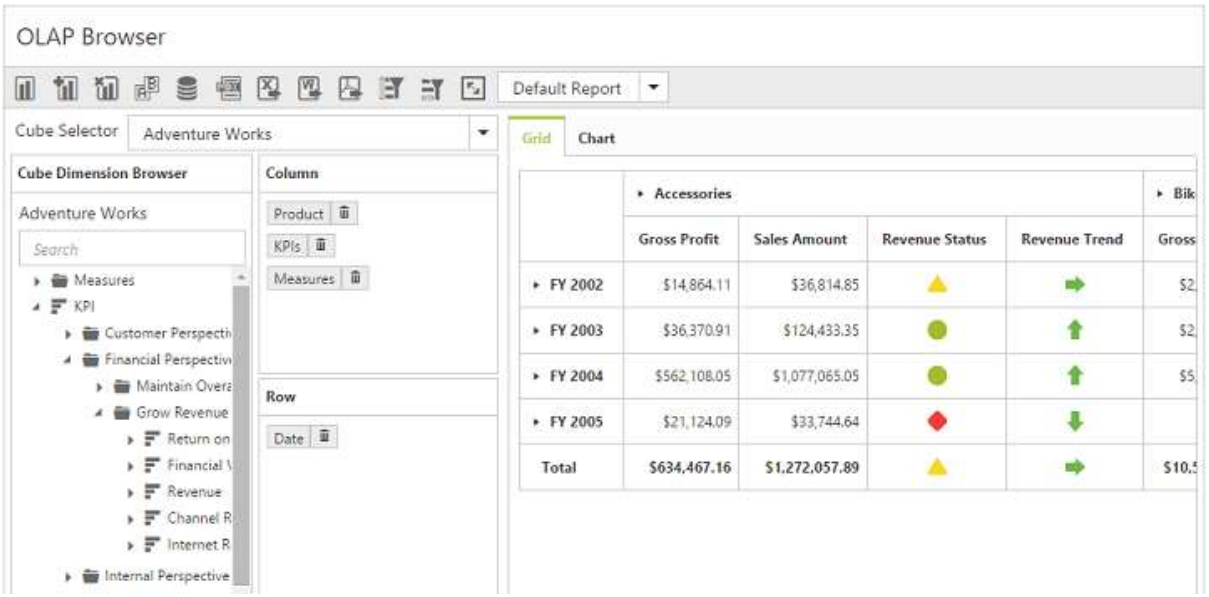
```
@Html.EJ().Pivot().PivotClient("PivotClient1").Url(Url.Content("/OlapClient")).Title("OLAP Browser").EnableKPI(true)
```

Framing OlapReport with KPI Elements

C#

```
OlapReport olapReport = new OlapReport();
olapReport.Name = "KPI Report";
olapReport.CurrentCubeName = "Adventure Works";
MeasureElements measureElementColumn = new MeasureElements();
measureElementColumn.Elements.Add(new MeasureElement {
Name = "Gross Profit"
});
DimensionElement dimensionElementRow = new DimensionElement();
dimensionElementRow.Name = "Date";
dimensionElementRow.AddLevel("Fiscal", "Fiscal Year");
KpiElements kpiElement = new KpiElements();
kpiElement.Elements.Add(new KpiElement {
Name = "Revenue", ShowKPIStatus = true, ShowKPIGoal = false, ShowKPITrend = true, ShowKPIValue = true
});
olapReport.CategoricalElements.Add(kpiElement);
olapReport.CategoricalElements.Add(measureElementColumn);
olapReport.SeriesElements.Add(dimensionElementRow);
```

Copyright © 2001 - 2020 Syncfusion Inc.



Measure Groups

Information: This feature is applicable only for OLAP data source bound from server-side.

In Cube Dimension Browser, treeview can be viewed in a filtered manner through the Measures option. This feature allows you to view the list of measure groups and dimensions associated with the selected measure group from the cube. For enabling this, the EnableMeasureGroups property is set to true. By default, its value is set to false.

ASPX-CS

```
@Html.EJ().Pivot().PivotClient("PivotClient1").Url(Url.Content("/OlapClie
nt")).Title("OLAP Browser").EnableMeasureGroups(true)
```

On selecting a measure group from the drop-down list, the Cube Dimension Browser treeview displays the related measures and dimensions as follows.

Paging

Information: This feature is applicable only for OLAP data source.

Paging helps to improve the rendering performance of the PivotClient control by dividing large amount of data into sections and displaying one section at a time.

Using Pager

You can enable Pager in PivotClient by setting the EnablePaging property to true. You can provide the page size and current page details for each axis through PagerOptions property.

Client Mode

ASPX-CS

```
@Html.EJ().Pivot().PivotClient("PivotClient1").DataSource(dataSource =>
dataSource.PagerOptions(pagerOptions => {
pagerOptions.CategoricalPageSize(3).SeriesPageSize(3).CategoricalCurrentP
age(1).SeriesCurrentPage(1); })).EnablePaging(true)
```

Server Mode

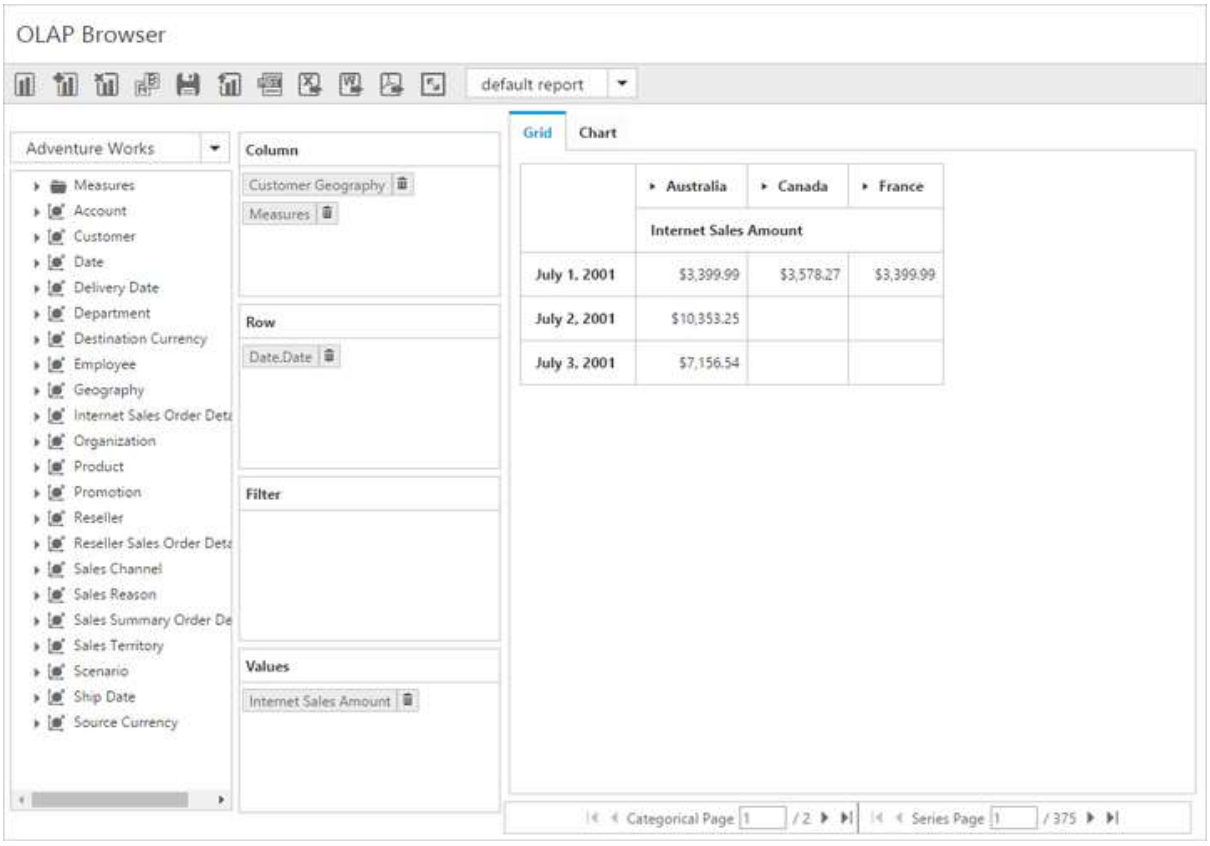
ASPX-CS

```
@Html.EJ().Pivot().PivotClient("PivotClient1").EnablePaging(True).Url("/O
lapService")
```

Following are the navigation option available in Pager.

- Move First - Navigates to the first page.
- Move Last - Navigates to the last page.
- Move Previous - Navigates to the previous page from the current page.
- Move Next - Navigates to the next page from the current page.
- Numeric Box - Navigates to the desired page by entering an appropriate page number in numeric value.

Copyright © 2001 - 2020 Syncfusion Inc.



Using Virtual Scrolling

Virtual Scrolling is a technique that allows user to view the PivotClient information page by page with the use of vertical and horizontal scrollbar. You can enable Virtual Scrolling option in PivotClient by setting the enableVirtualScrolling property to true. You can provide the page size and current page details for each axis through PagerOptions property.

Client Mode

ASPX-CS

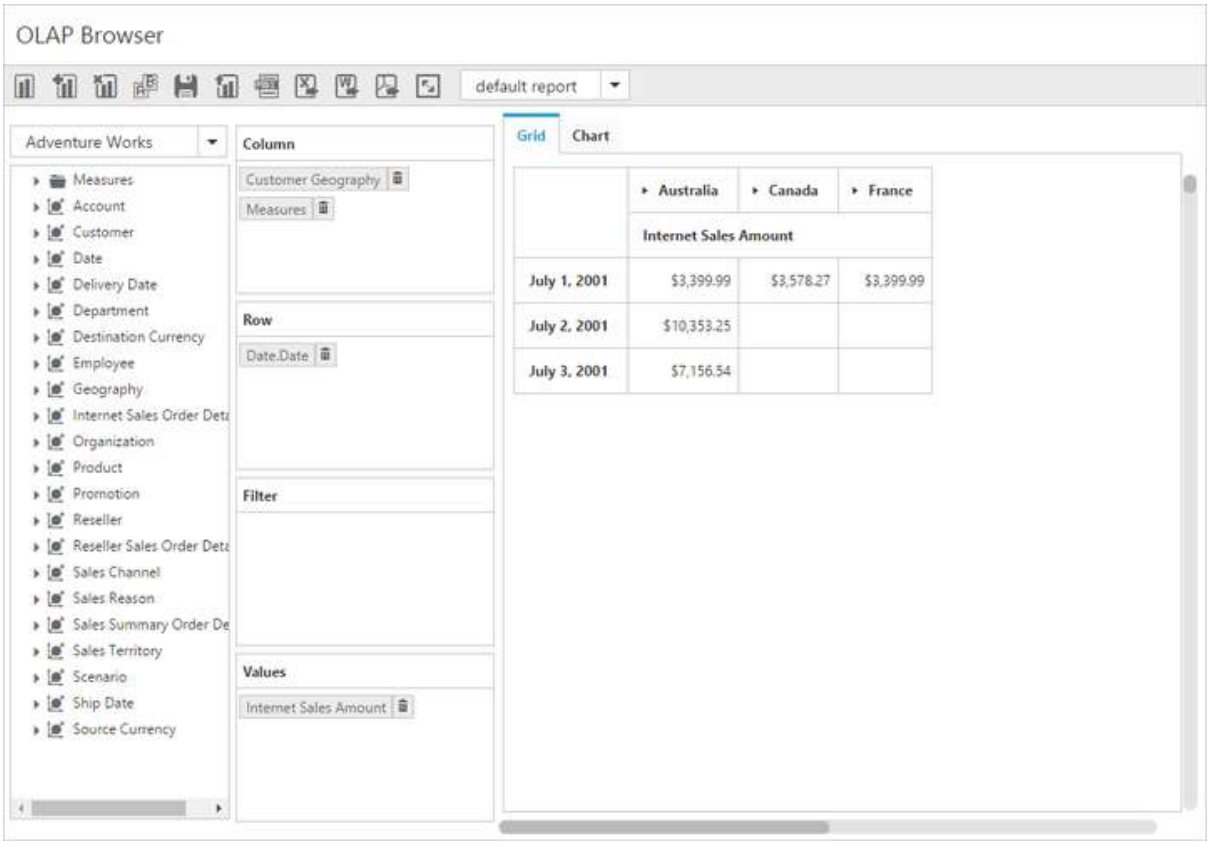
```
@Html.EJ().Pivot().PivotClient("PivotClient1").DataSource(dataSource =>
dataSource.PagerOptions(pagerOptions => {
pagerOptions.CategoricalPageSize(3).SeriesPageSize(3).CategoricalCurrentP
age(1).SeriesCurrentPage(1); })).enableVirtualScrolling(true)
```

Server Mode

ASPX-CS

```
@Html.EJ().Pivot().PivotClient("PivotClient1").EnableVirtualScrolling(Tru
e).Url("/OlapService")
```

Copyright © 2001 - 2020 Syncfusion Inc.



Page Settings

The properties associated to paging are:

- EnablePaging – This property is used to enable/disable paging in PivotClient control.
- PagerOptions.CategoricalPageSize - Specifies the number of categorical columns to be displayed within a page of the PivotClient control.
- PagerOptions.SeriesPageSize - Specifies the number of series rows to be displayed within a page of the PivotClient control.
- PagerOptions.CategoricalCurrentPage - Sets the current page of the categorical axis in PivotClient control.
- PagerOptions.SeriesCurrentPage - Sets the current page of the series axis in PivotClient control.

For client mode, the page setting for categorical and series axes are mandatorily needed to be set in data source property by using the following properties.

ASPX-CS

```
@Html.EJ().Pivot().PivotClient("PivotClient1").DataSource(dataSource =>
dataSource.PagerOptions(pagerOptions => {
pagerOptions.CategoricalPageSize(3).SeriesPageSize(3).CategoricalCurrentP
age(1).SeriesCurrentPage(1); })).EnablePaging(true)
```

For server mode, the page settings for categorical and series axes are done only through OlapReport object, created inside WebAPI or WCF file.

C#

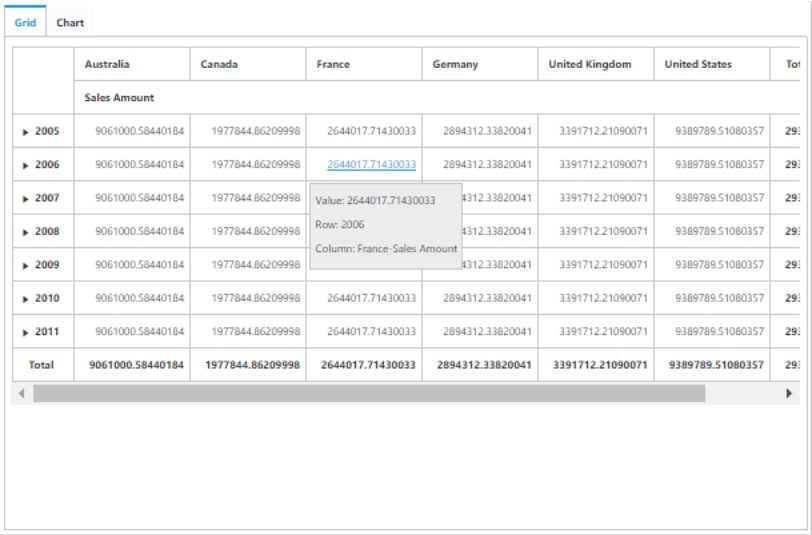
Copyright © 2001 - 2020 Syncfusion Inc.

```
OlapReport olapReport = new OlapReport();
olapReport.CurrentCubeName = "Adventure Works";
olapReport.EnablePaging = true;
olapReport.PagerOptions.SeriesPageSize = 4;
olapReport.PagerOptions.CategoricalPageSize = 5;
```

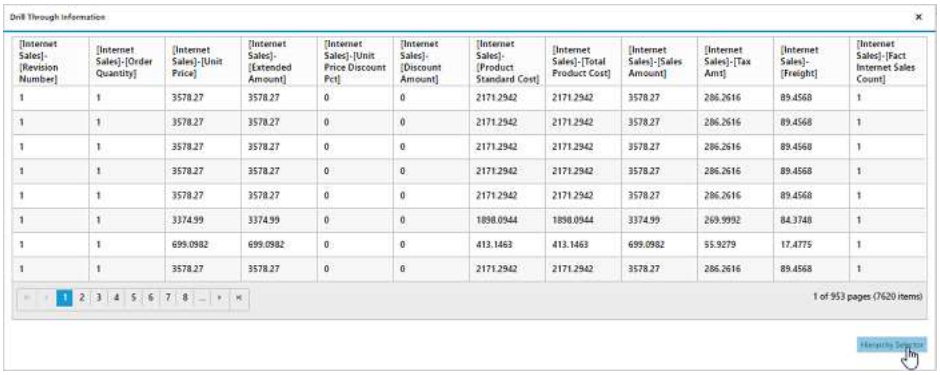
Drill Through

Drill-through retrieves the raw items that are used to create a specified cell. To enable drill-through support, set EnableDrillThrough property to true. Raw items are obtained through the drillThrough event, using which user can bind them to an external widget for precise view.

Note: Drill-through is supported in PivotGrid only when we configure and enable drill-through action at the Cube.

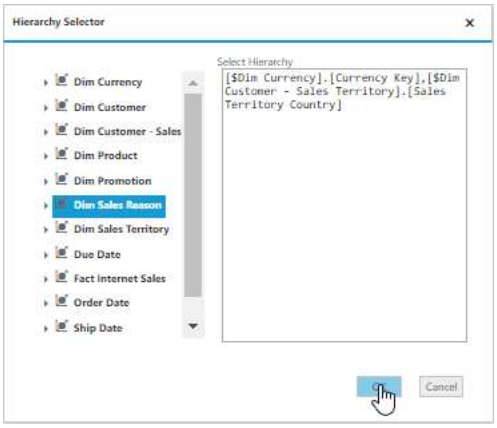


On clicking any value cell, the "Drill Through Information" dialog will be opened. It consists of Grid with data which are associated with the measure values of the clicked value cell. In this example, the measure behind the respective cell is “Sales Amount” and the values of the dimensions which are associated with this measure are alone displayed in the Grid.



On clicking the "Hierarchy Selector" button which is displayed below the Grid, the "Hierarchy Selector" dialog will be opened. It consists of the dimensions which are associated with the measure of clicked value cell. In this example, the measure behind the respective cell is “Sales Amount” and the dimensions associated with this measure are alone displayed in the dialog.

Copyright © 2001 - 2020 Syncfusion Inc.



By dragging and dropping the respective hierarchies and finally clicking “OK” button, Drill through MDX query will be framed and executed internally and provides back the raw items through "DrillThrough" event. In this example, we have bound the raw items obtained to our ejGrid widget. Please refer the code sample and screen-shot below.

OLAP

Client Mode

ASPX-CS

```
@Html.EJ().Pivot().PivotClient("PivotClient1").DataSource(.....).EnableDr
illThrough(true).ClientSideEvents(oEve => {
oEve.DrillThrough("drilledData"); })
<script type="text/javascript">
function drilledData(args) {
$(".e-dialog, .e-clientDialog, .e-tableDlg").remove();
gridData = JSON.parse(args.data);
var dialogContent = ej.buildTag("div#" + this._id + "_tableDlg.e-
tableDlg", $("<div id=\"Grid1\"></div>"))[0].outerHTML;
var dialogFooter = ej.buildTag("div", ej.buildTag("button#btnOK.e-
dialogBtnOK", "Hierarchy Selector")[0].outerHTML, { "float": "right",
"margin": "-5px 0 6px" })[0].outerHTML
ejDialog = ej.buildTag("div#clientDialog.e-clientDialog", dialogContent +
dialogFooter, { "opacity": "1" }).attr("title", "Drill Through
Information")[0].outerHTML;
$(ejDialog).appendTo("#" + this._id);
$("#btnOK").ejButton().css({ margin: "30px 0 20px 0" });
$("#Grid1").ejGrid({
dataSource: gridData,
allowPaging: true,
allowTextWrap: true,
pageSettings: { pageSize: 8 }
});
this.element.find(".e-clientDialog").ejDialog({ width: "70%", content:
"#" + this._id, enableResize: false, close:
ej.proxy(ej.Pivot.closePreventPanel, this) });
var pivotClient = $("#" + this._id).data("ejPivotClient");
$("#btnOK").click(function () {
ej.Pivot.openHierarchySelector(pivotClient);
});
}
</script>
```

Copyright © 2001 - 2020 Syncfusion Inc.

Server Mode

HTML

```
@Html.EJ().Pivot().PivotClient("PivotClient1").Url(Url.Content("/OlapClie
nt")).EnableDrillThrough(true).ClientSideEvents(oEve => {
oEve.DrillThrough("drilledData"); })
<script type="text/javascript">
function drilledData(args) {
$(".e-dialog, .e-clientDialog, .e-tableDlg").remove();
gridData = ej.isNullOrUndefined(args.data.d) ?
JSON.parse(args.data.DrillDataTable) : JSON.parse(args.data.d[1].Value);
var dialogContent = ej.buildTag("div#" + this._id + "_tableDlg.e-
tableDlg", $("<div id=\"Grid1\"></div>"))[0].outerHTML;
var dialogFooter = ej.buildTag("div", ej.buildTag("button#btnOK.e-
dialogBtnOK", "Hierarchy Selector")[0].outerHTML, { "float": "right",
"margin": "-5px 0 6px" })[0].outerHTML
ejDialog = ej.buildTag("div#clientDialog.e-clientDialog", dialogContent +
dialogFooter, { "opacity": "1" }).attr("title", "Drill Through
Information")[0].outerHTML;
$(ejDialog).appendTo("#" + this._id);
$("#btnOK").ejButton().css({ margin: "30px 0 20px 0" });
$("#Grid1").ejGrid({
dataSource: gridData,
allowPaging: true,
allowTextWrap: true,
pageSettings: { pageSize: 8 }
});
this.element.find(".e-clientDialog").ejDialog({ width: "70%", content:
"#" + this._id, enableResize: false, close:
ej.proxy(ej.Pivot.closePreventPanel, this) });
var pivotClient = this;
$("#btnOK").click(function () {
$(".e-dialog, .e-clientDialog, .e-tableDlg").remove();
if (pivotClient.model.operationalMode ==
ej.PivotGrid.OperationalMode.ServerMode) {
pivotClient._waitingPopup.show()
pivotClient.doAjaxPost("POST", pivotClient.model.url + "/" +
pivotClient.model.serviceMethodSettings.drillThroughHierarchies,
JSON.stringify({ "currentReport": pivotClient.currentReport, "layout":
pivotClient.model.layout, "cellPos": "", "customObject":
JSON.stringify(pivotClient.model.customObject) }), function (args) {
ej.Pivot.openHierarchySelector(pivotClient, args);
})
}
});
}
</script>
```

When PivotGrid is rendered in server mode, below service methods need to be added in WCF/WebAPI for drill through operation.

For WebAPI controller, the below methods need to be added.

C#

Copyright © 2001 - 2020 Syncfusion Inc.

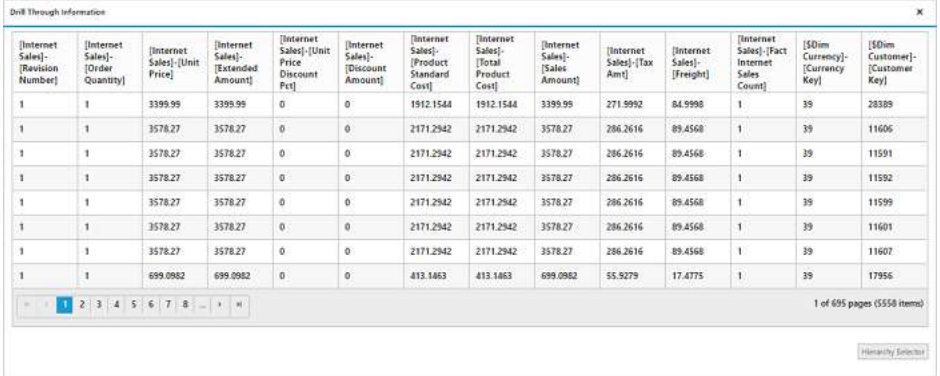
```
[System.Web.Http.ActionName("DrillThroughHierarchies")]
[System.Web.Http.HttpPost]
public string DrillThroughHierarchies(Dictionary<string, object>
jsonResult)
{
OlapDataManager DataManager = new OlapDataManager(connectionString);
DataManager.SetCurrentReport(OLAPUTILS.Utils.DeserializeOlapReport(jsonRe
sult["currentReport"].ToString()));
return pivotClientHelper.DrillthroughHierarchies(DataManager,
jsonResult["layout"].ToString(), jsonResult["cellPos"].ToString());
}
[System.Web.Http.ActionName("DrillThroughDataTable")]
[System.Web.Http.HttpPost]
public Dictionary<string, object>
DrillThroughDataTable(Dictionary<string, object> jsonResult)
{
OlapDataManager DataManager = new OlapDataManager(connectionString);
DataManager.SetCurrentReport(OLAPUTILS.Utils.DeserializeOlapReport(jsonRe
sult["currentReport"].ToString()));
return pivotClientHelper.DrillthroughDataTable(DataManager,
jsonResult["layout"].ToString(), jsonResult["cellPos"].ToString(),
jsonResult["selector"].ToString());
}
```

For WCF service, the below methods need to be added.

C#

```
public string DrillThroughHierarchies(string currentReport, string
layout, string cellPos)
{
OlapDataManager DataManager = new OlapDataManager(connectionString);
DataManager.SetCurrentReport(OLAPUTILS.Utils.DeserializeOlapReport(curren
tReport));
return pivotClientHelper.DrillthroughHierarchies(DataManager, layout,
cellPos);
}
public Dictionary<string, object> DrillThroughDataTable(string
currentReport, string layout, string cellPos, string selector)
{
OlapDataManager DataManager = new OlapDataManager(connectionString);
DataManager.SetCurrentReport(OLAPUTILS.Utils.DeserializeOlapReport(curren
tReport));
return pivotClientHelper.DrillthroughDataTable(DataManager, layout,
cellPos, selector);
}
```

Copyright © 2001 - 2020 Syncfusion Inc.



Relational

To enable drill-through support, set the enableDrillThrough property to true. Raw items are obtained through the drillThrough event.

ASPX-CS

```
@Html.EJ().Pivot().PivotClient("PivotClient1").DataSource(.....).EnableDr
illThrough(true).ClientSideEvents(oEve => {
oEve.DrillThrough("drilledData").Load("onLoad"); })
```

HTML

```
<script type="text/javascript">
function onLoad(args) {
this.model.analysisMode = "pivot";
}
function drilledData(args) {
gridData = args.selectedData;
var dialogContent = ej.buildTag("div#Grid", { })[0].outerHTML;
ejDialog = ej.buildTag("div#clientDialog.e-clientDialog", dialogContent,
{ "opacity": "1" }).attr("title", "Drill Through
Information")[0].outerHTML;
$(ejDialog).appendTo("#" + this._id);
this.element.find(".e-clientDialog").ejDialog({ width: "70%", content:
"#" + this._id, enableResize: false, close:
ej.proxy(ej.Pivot.closePreventPanel, this) });
$("#Grid").ejGrid({
dataSource: gridData,
allowScrolling: true,
scrollSettings: { width: "85%" },
allowPaging: true,
allowResizing: true,
allowResizeToFit: true,
pageSettings: {pageSize: 8}
});
}
</script>
![DrillThrough data in ASP NET MVC relational pivot
client](DrillThrough_images/relational_drilledData.png)
```

Calculated Members

Information: This feature is applicable only for Server Mode bound with OLAP data source.

Copyright © 2001 - 2020 Syncfusion Inc.

Calculated members are the customized dimension members or measures that are defined based on the cube data. Values for calculated members are computed at run-time.

The two types of calculated members are as follows:

Calculated Measure – Calculated measure created from a measure element.

Calculated Dimension – Calculated member created from a dimension element.

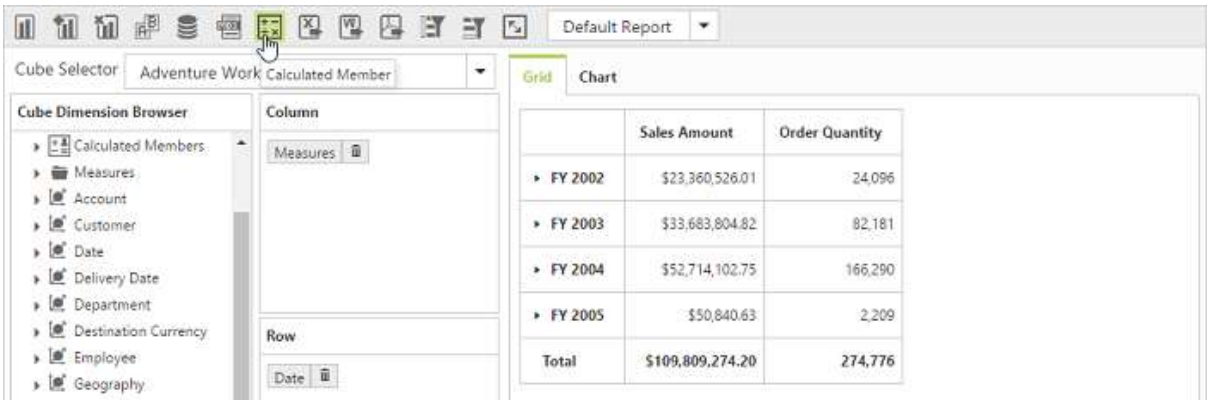
PivotClient provides support to insert new calculated members based on the existing OLAP field members either through UI dialog or code behind.

Through UI

To show the icon in toolbar panel, we need to set the property `EnableCalculatedMember` as `true` under `ToolbarIconSettings` object.

ASPX-CS

```
@Html.EJ().Pivot().PivotClient("PivotClient1").Url(Url.Content("~/api/OlapClient")).ToolbarIconSettings(toolbaricon => {
toolbaricon.EnableCalculatedMember(true); })
```



To insert a new calculated member, open the Calculated Member dialog by clicking the icon available in toolbar panel. We can define following options inside the dialog.

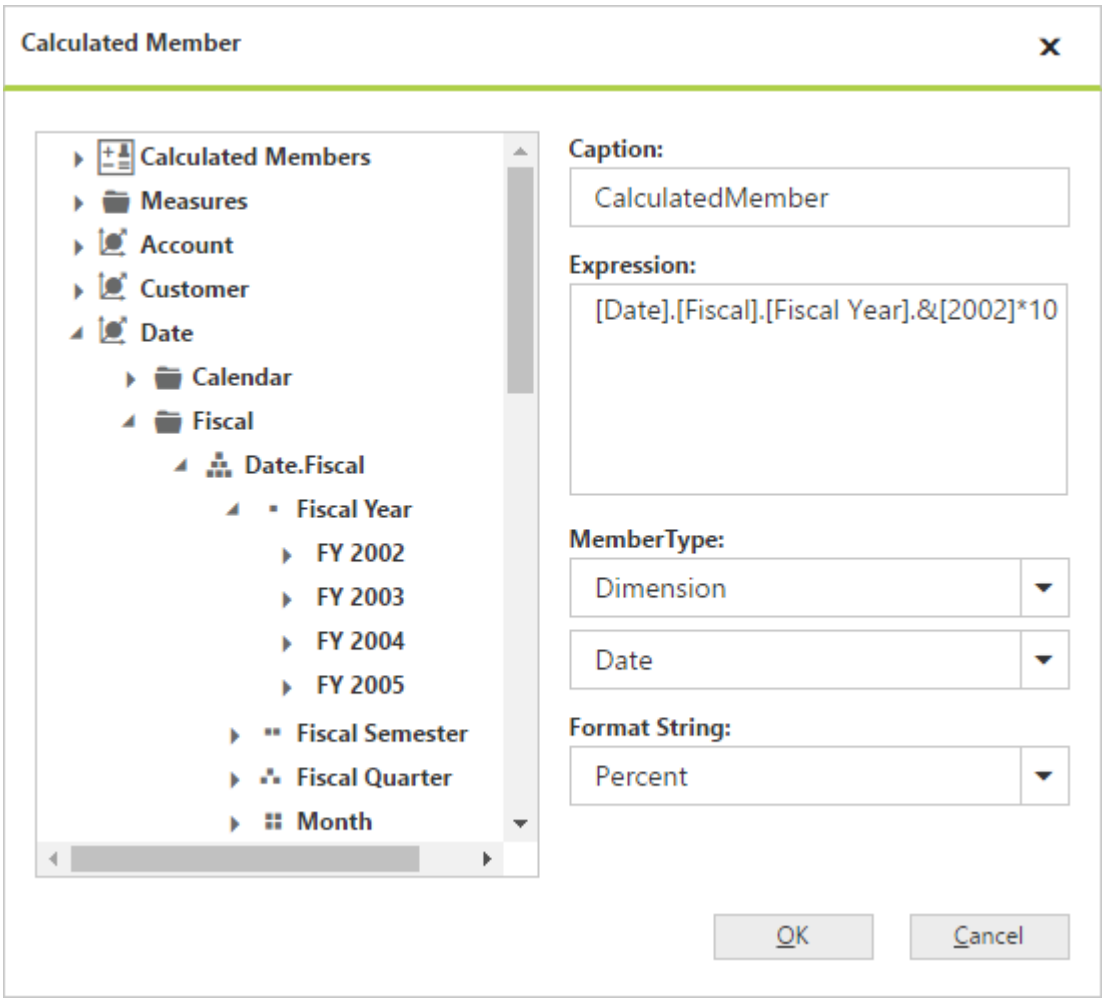
Caption - To set the name for the calculated member.

Expression - To set the formula for the calculated member where you can insert required members through Cube Dimension Browser by a simple drag and drop option with required operators to make formula.

Member Type - To specify the hierarchy of the member set in expression.

Format String - To set the format for the calculated member.

Copyright © 2001 - 2020 Syncfusion Inc.



Through Code Behind

For code-behind, we can create the calculated members by defining formula in OlapReport with the following definitions.

Name – Name of the calculated member.

Expression – Expression to form the calculated member.

Measure/Dimension Element – You should add a measure or dimension element from which the calculated member should be created.

Following steps will explain how to create and add a calculated member in an OlapReport:

1. Create the dimension measure or element from which the calculated member has to be created.
2. Create the calculated member by giving the name and expression.
3. Add the element created in Step 1 to the calculated member.
4. Once the calculated member is defined, add that member to the calculated members collection in the OlapReport.
5. Add the newly created calculated members in categorical or series axis of an OlapReport.

Following code snippet will describe the creation and addition of a calculated members in OlapReport:

Copyright © 2001 - 2020 Syncfusion Inc.

Calculated Measure

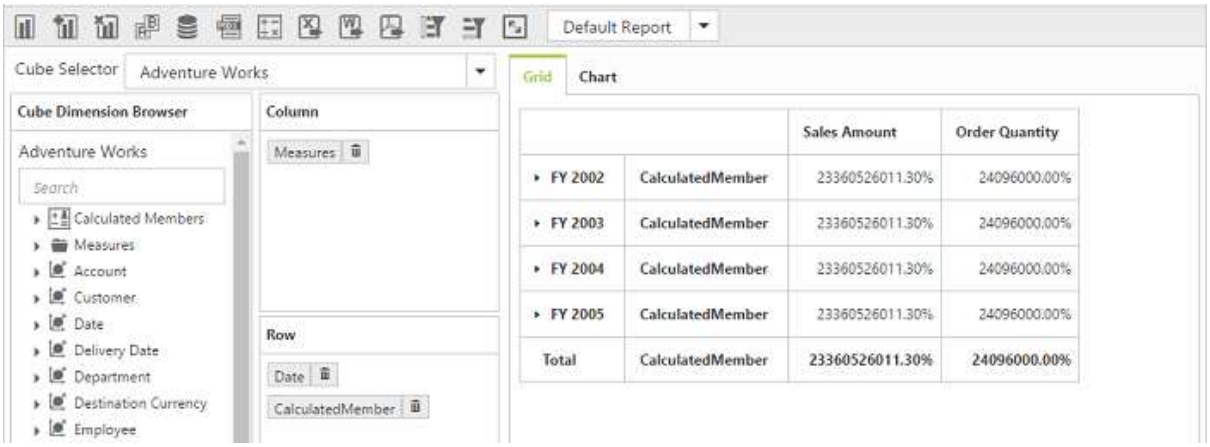
C#

```
MeasureElement measureElement = new MeasureElement();
measureElement.Name = "Order Quantity";
CalculatedMember calculatedMeasure = new CalculatedMember();
calculatedMeasure.Name = "Oder on Discount";
calculatedMeasure.Expression = "[Measures].[Order Quantity] +
([Measures].[Order Quantity] * 0.10)";
calculatedMeasure.AddElement(measureElement);
olapReport.CalculatedMembers.Add(calculatedMeasure);
olapReport.CategoricalElements.Add(calculatedMeasure);
```

Calculated Dimension

C#

```
DimensionElement internalDimension = new DimensionElement();
internalDimension.Name = "Product";
internalDimension.AddLevel("Product Categories", "Category");
// Calculated Dimension
CalculatedMember calculatedDimension = new CalculatedMember();
calculatedDimension.Name = "Bikes & Components";
calculatedDimension.Expression = "([Product].[Product
Categories].[Category].[Bikes] + [Product].[Product
Categories].[Category].[Components] )";
calculatedDimension.AddElement(internalDimension);
olapReport.CalculatedMembers.Add(calculatedDimension);
olapReport.CategoricalElements.Add(calculatedDimension);
```



Common

Save and Load Report

Save and load report allows you to save the current report collection of PivotClient and render the control later on loading the same.

We can save and load the report in two ways.

- Database
- Local Storage

Copyright © 2001 - 2020 Syncfusion Inc.

Save Report to Database

We can store the report collection of PivotClient to database, by using the SaveReport event in PivotClient.

ASPX-CS

```
@Html.EJ().Pivot().PivotClient("PivotClient1”).ClientSideEvents(events =>
events.SaveReport("saveReportSettings"))
<script>
function saveReportSettings(args) {
if(args.saveReportSettings)
return args.saveReportSetting.url = "../wcf/OlapClientService.svc";
}
</script>
```

Service method needs to be added in WCF/WebAPI for storing PivotClient report collection in database.

For WebAPI controller, the below method needs to be added.

C#

```
[System.Web.Http.ActionName("SaveReportToDB")]
[System.Web.Http.HttpPost]
public Dictionary<string, object> SaveReportToDB(Dictionary<string,
object> jsonResult)
{
string operationalMode = jsonResult["operationalMode"].ToString(),
analysisMode = jsonResult["analysisMode"].ToString(), reportName =
string.Empty;
bool isDuplicate = true;
SqlCeConnection con = new SqlCeConnection() { ConnectionString =
conStringforDB };
con.Open();
reportName = jsonResult["reportName"].ToString() + "##" +
operationalMode.ToLower() + "#>>#" + analysisMode.ToLower();
SqlCeCommand cmd1 = null;
foreach (DataRow row in GetDataTable().Rows)
{
if ((row.ItemArray[0] as string).Equals(reportName))
{
isDuplicate = false;
cmd1 = new SqlCeCommand("update ReportsTable set Report=@Reports where
ReportName like @ReportName", con);
}
}
if (isDuplicate)
{
cmd1 = new SqlCeCommand("insert into ReportsTable
Values(@ReportName,@Reports)", con);
}
cmd1.Parameters.Add("@ReportName", reportName);
cmd1.Parameters.Add("@Reports",
Encoding.UTF8.GetBytes(jsonResult["clientReports"].ToString()).ToArray())
;
cmd1.ExecuteNonQuery();
con.Close();
Dictionary<string, object> dictionary = new Dictionary<string, object>();
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
dictionary.Add("CurrentAction", "Save");
return dictionary;
}
```

For WCF controller, the below method needs to be added.

C#

```
public Dictionary<string, object> SaveReportToDB(string reportName,
string operationalMode, string analysisMode, string olapReport, string
clientReports)
{
reportName = reportName + "##" + operationalMode.ToLower() + "#>>#" +
analysisMode.ToLower();
bool isDuplicate = true;
SqlCeConnection con = new SqlCeConnection() { ConnectionString =
conStringforDB };
con.Open();
SqlCeCommand cmd1 = null;
foreach (DataRow row in GetDataTable().Rows)
{
if ((row.ItemArray[0] as string).Equals(reportName))
{
isDuplicate = false;
cmd1 = new SqlCeCommand("update ReportsTable set Report=@Reports where
ReportName like @ReportName", con);
}
}
if (isDuplicate)
{
cmd1 = new SqlCeCommand("insert into ReportsTable
Values(@ReportName,@Reports)", con);
}
cmd1.Parameters.Add("@ReportName", reportName);
cmd1.Parameters.Add("@Reports",
Encoding.UTF8.GetBytes(clientReports).ToArray());
cmd1.ExecuteNonQuery();
con.Close();
Dictionary<string, object> dictionary = new Dictionary<string, object>();
dictionary.Add("CurrentAction", "Save");
return dictionary;
}
```

Save Report to Local Storage

We can store the report collection of PivotClient to local storage, by setting the EnableLocalStorage property to true and by defining the SaveReport event of PivotClient.

ASPX-CS

```
@Html.EJ().Pivot().PivotClient("PivotClient1”).ClientSideEvents(events =>
events.SaveReport("saveReportSettings")).EnableLocalStorage(true)
<script>
function saveReportSettings(args) {
var reportCollection = [];
if ((localStorage.pivotClientRPTCollection != "" &&
!ej.isNullOrUndefined(localStorage.pivotClientRPTCollection))) {
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
reportCollection = JSON.parse(localStorage.pivotClientRPTCollection);
}
if(args.saveReportSettings){
reportCollection.push(({ reportName: args.saveReportSetting.reportName,
reportCol: args.saveReportSetting.reportCollection }));
localStorage.pivotClientRPTCollection =
JSON.stringify(reportCollection);;
}
}
</script>
```

Load Report from Database

We can load the stored report collection of PivotClient from database, by using the FetchReport and LoadReport events in PivotClient.

ASPX-CS

```
@Html.EJ().Pivot().PivotClient("PivotClient1”).ClientSideEvents(events =>
events.LoadReport("reportSettings").FetchReport(”reportSettings”))
<script>
function reportSettings(args) {
if (args.fetchReportSetting)
return args.fetchReportSetting.url = "../wcf/OlapClientService.svc";
else if (args.loadReportSetting)
return args.loadReportSetting.url = "../wcf/OlapClientService.svc";
}
</script>
```

Service methods need to be added in WCF/WebAPI for storing PivotClient report collection in database.

For WebAPI controller, the below methods need to be added.

C#

```
[System.Web.Http.ActionName("FetchReportListFromDB")]
[System.Web.Http.HttpPost]
public Dictionary<string, object>
FetchReportListFromDB(Dictionary<string, object> jsonResult)
{
string reportNames = string.Empty, currentRptName = string.Empty,
operationalMode = jsonResult["operationalMode"].ToString(), analysisMode
= jsonResult["analysisMode"].ToString();
foreach (System.Data.DataRow row in GetDataTable().Rows)
{
currentRptName = (row.ItemArray[0] as string);
if (currentRptName.IndexOf("##" + operationalMode + "#>>#" +
analysisMode) >= 0)
{
currentRptName = currentRptName.Replace("##" + operationalMode + "#>>#" +
analysisMode, "");
reportNames = reportNames == "" ? currentRptName : reportNames + "__" +
currentRptName;
}
}
Dictionary<string, object> dictionary = new Dictionary<string, object>();
dictionary.Add("ReportNameList", reportNames);
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
dictionary.Add("action", jsonResult["action"].ToString());
return dictionary;
}
[System.Web.Http.ActionName("LoadReportFromDB")]
[System.Web.Http.HttpPost]
public Dictionary<string, object> LoadReportFromDB(Dictionary<string,
object> jsonResult)
{
PivotReport report = new PivotReport();
string operationalMode = jsonResult["operationalMode"].ToString(),
analysisMode = jsonResult["analysisMode"].ToString();
Dictionary<string, object> dictionary = new Dictionary<string, object>();
string currentRptName = string.Empty;
foreach (DataRow row in GetDataTable().Rows)
{
currentRptName = (row.ItemArray[0] as string).Replace("##" +
operationalMode.ToLower() + "#>>#" + analysisMode.ToLower(), "");
if (currentRptName.Equals(jsonResult["reportName"].ToString()))
{
byte[] reportByte = new byte[2 * 1024];

return dSet.Tables[0];
}
```

Copyright © 2001 - 2020 Syncfusion Inc.

Load Report from Local Storage

We can load the stored report collection of PivotClient from local storage, by setting the EnableLocalStorage property to true and using the LoadReport and FetchReport events in PivotClient.

ASPX-CS

```
@Html.EJ().Pivot().PivotClient("PivotClient1”).ClientSideEvents(events =>
events.LoadReport("reportSettings").FetchReport(”reportSettings”)).Enable
LocalStorage(true)
<script>
function reportSettings(args) {
var reportCollection = [];
if ((localStorage.pivotClientRPTCollection != "" &&
!ej.isNullOrUndefined(localStorage.pivotClientRPTCollection))) {
reportCollection = JSON.parse(localStorage.pivotClientRPTCollection);
}
if (args.fetchReportSetting)
args.fetchReportSetting.reportList = $.map(reportCollection, function
(item, index) { return item.reportName; }).join("__");
else if (args.loadReportSetting)
args.loadReportSetting.reportCollection = $.map(reportCollection,
function (item, index) { if (item.reportName ==
args.loadReportSetting.selectedReport) return item.reportCol; });
}
</script>
```

Layout Customization

Size

Allows you to render PivotClient in different sizes. You can set height and width under size property.

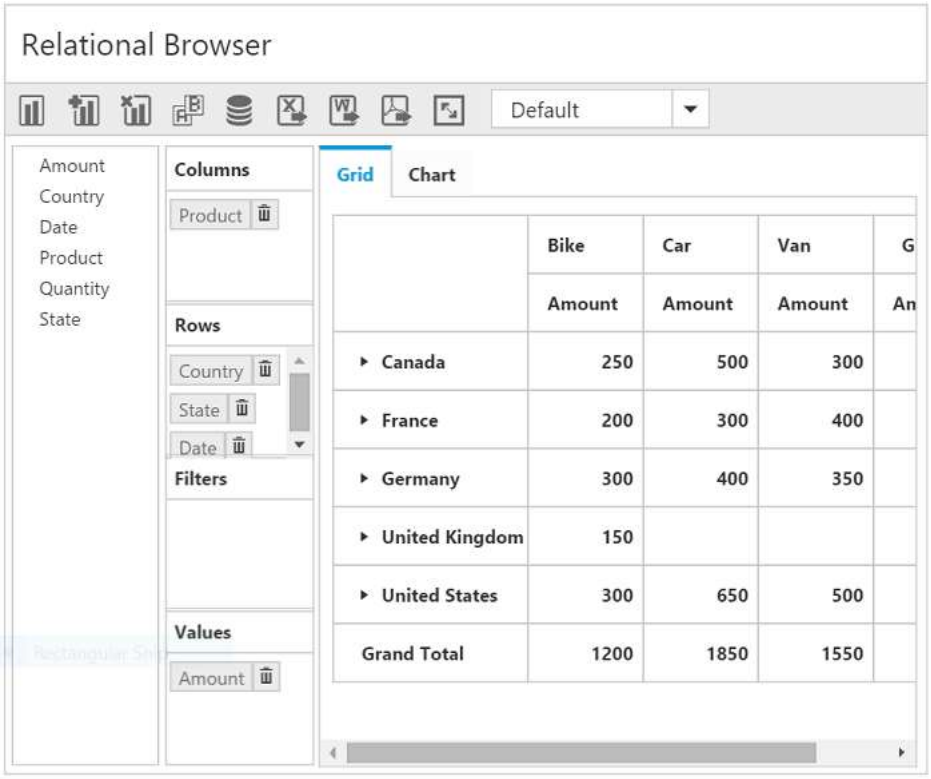
Set size in Pixels

ASPX-CS

```
@Html.EJ().Pivot().PivotClient("PivotClient1").ClientSideEvents(clientSid
eEvents => clientSideEvents.Load("onLoad")).DataSource(dataSource =>
dataSource.Rows(rows => {
rows.FieldName("Country").FieldCaption("Country").Add();
}).Columns(columns => {
columns.FieldName("Product").FieldCaption("Product").Add();
}).Values(values => {
values.FieldName("Amount").Format("currency").Add(); })).size(siz => {
siz.Height("685px"); siz.Width("1000px"); })
```

PivotClient with decreased size from default size.

Copyright © 2001 - 2020 Syncfusion Inc.



Set size in percentage

You can set the PivotClient size in percentage also.

Note: Size of the parent container should be set in Pixels.

ASPX-CS

```
@Html.EJ().Pivot().PivotClient("PivotClient1").ClientSideEvents(clientSid
eEvents => clientSideEvents.Load("onLoad")).DataSource(dataSource =>
dataSource.Rows(rows => {
rows.FieldName("Country").FieldCaption("Country").Add();
}).Columns(columns => {
columns.FieldName("Product").FieldCaption("Product").Add();
}).Values(values => {
values.FieldName("Amount").Format("currency").Add(); })).size(siz => {
siz.Height("80%"); siz.Width("50%"); })
```

Control Placement

Tab View

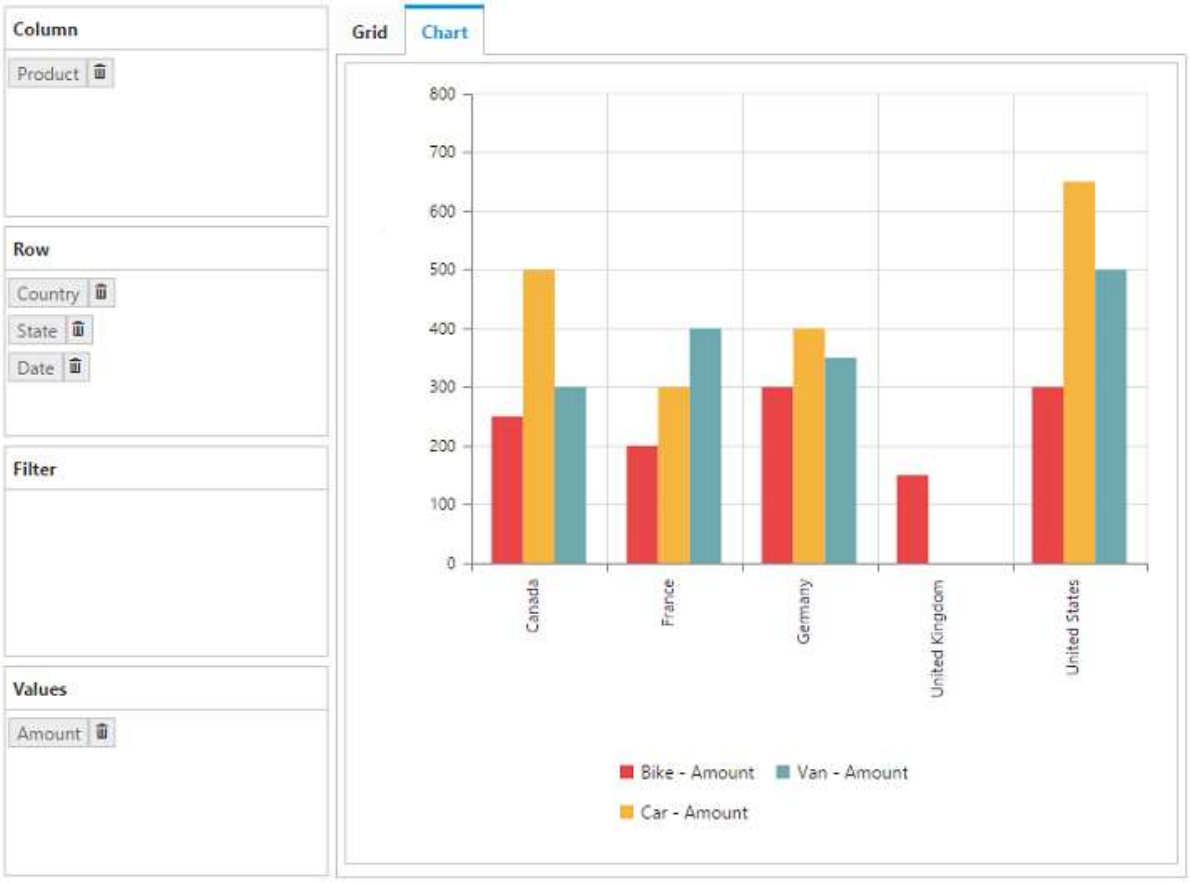
In Tab view representation, both Grid and Chart will be displayed in separate tabs. This could be set by using the ControlPlacement property under the DisplaySettings option. By default, **Tab** value is set.

ASPX-CS

```
@Html.EJ().Pivot().PivotClient("PivotClient1").ClientSideEvents(clientSid
eEvents => clientSideEvents.Load("onLoad")).DataSource(dataSource =>
dataSource.Rows(rows => {
rows.FieldName("Country").FieldCaption("Country").Add();
}).Columns(columns => {
columns.FieldName("Product").FieldCaption("Product").Add();
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
}).Values(values => {
values.FieldName("Amount").Format("currency").Add();
})).DisplaySettings(displaySettings=>displaySettings.ControlPlacement(
PivotClientControlPlacement.Tab))
```



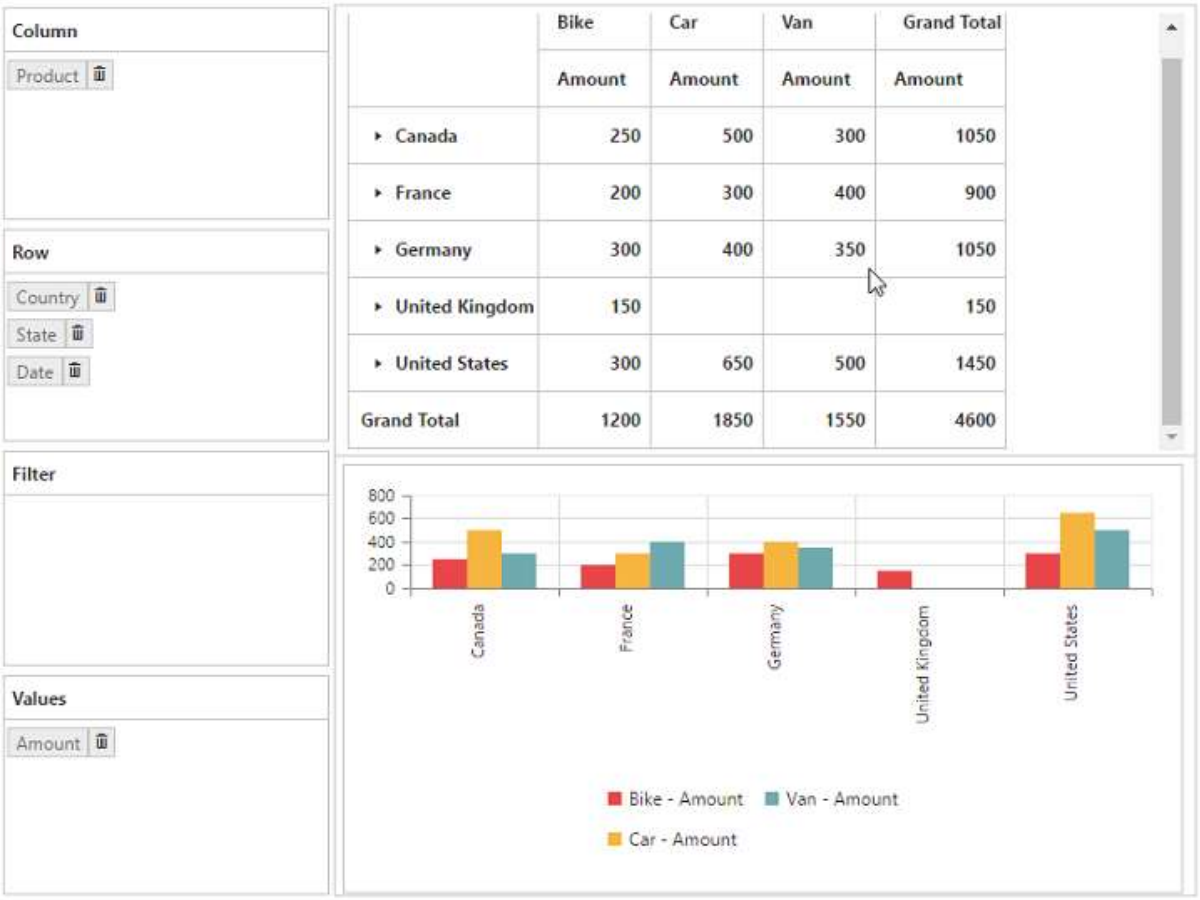
Tile View

In Tile View representation, both Grid and Chart will be displayed one above the other, in the same layout. Tile view can be set by using the ControlPlacement property under the DisplaySettings option.

ASPX-CS

```
@Html.EJ().Pivot().PivotClient("PivotClient1").ClientSideEvents(clientSid
eEvents => clientSideEvents.Load("onLoad")).DataSource(dataSource =>
dataSource.Rows(rows => {
rows.FieldName("Country").FieldCaption("Country").Add();
}).Columns(columns => {
columns.FieldName("Product").FieldCaption("Product").Add();
}).Values(values => {
values.FieldName("Amount").Format("currency").Add();
})).DisplaySettings(displaySettings=>displaySettings.ControlPlacement(Piv
otClientControlPlacement.Tile))
```

Copyright © 2001 - 2020 Syncfusion Inc.



Default View

Grid View

To display Grid control by default, set DefaultView property under DisplaySettings option to **Grid**, which is the default value of the property.

ASPX-CS

```
@Html.EJ().Pivot().PivotClient("PivotClient1").ClientSideEvents(clientSid
eEvents => clientSideEvents.Load("onLoad")).DataSource(dataSource =>
dataSource.Rows(rows => {
rows.FieldName("Country").FieldCaption("Country").Add();
}).Columns(columns => {
columns.FieldName("Product").FieldCaption("Product").Add();
}).Values(values => {
values.FieldName("Amount").Format("currency").Add();
})).DisplaySettings(displaySettings=>displaySettings.DefaultView(
PivotClientDefaultView.Grid))
```

Copyright © 2001 - 2020 Syncfusion Inc.

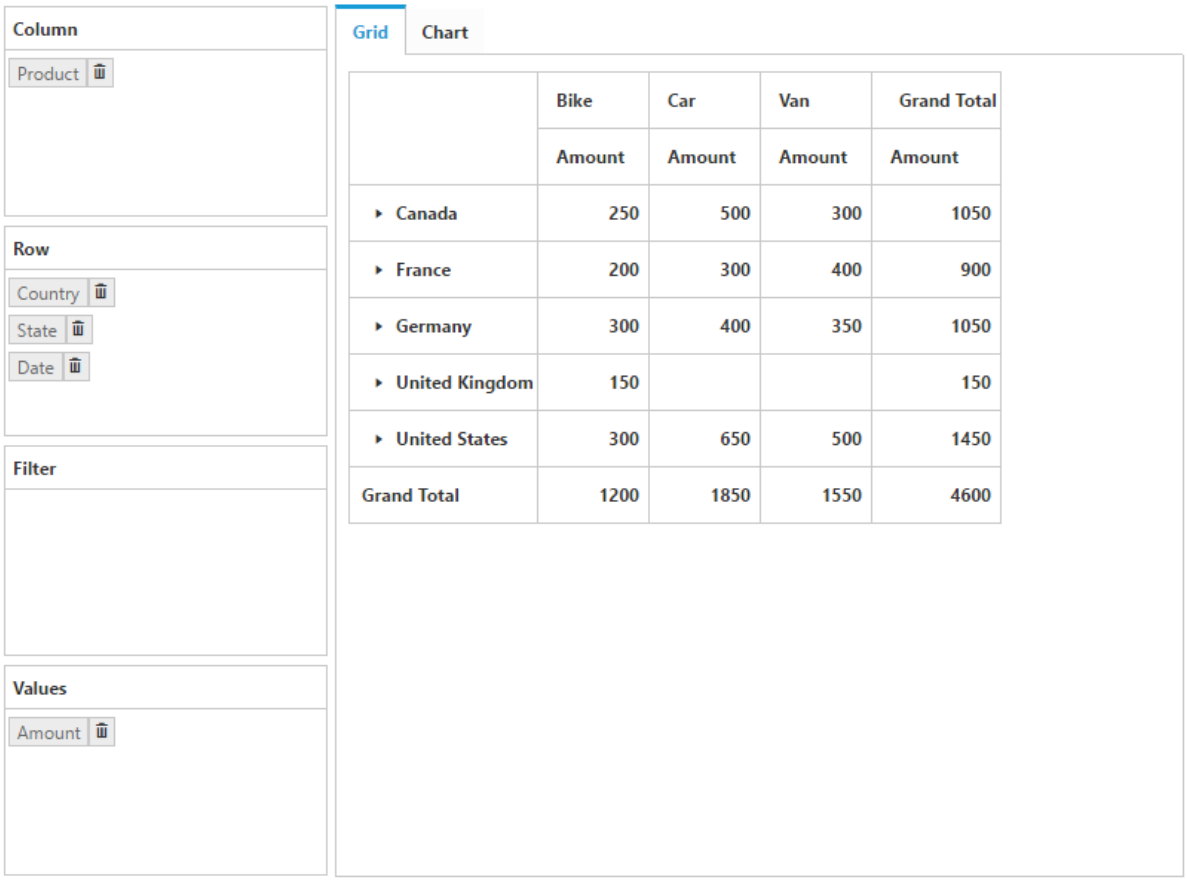


Chart View

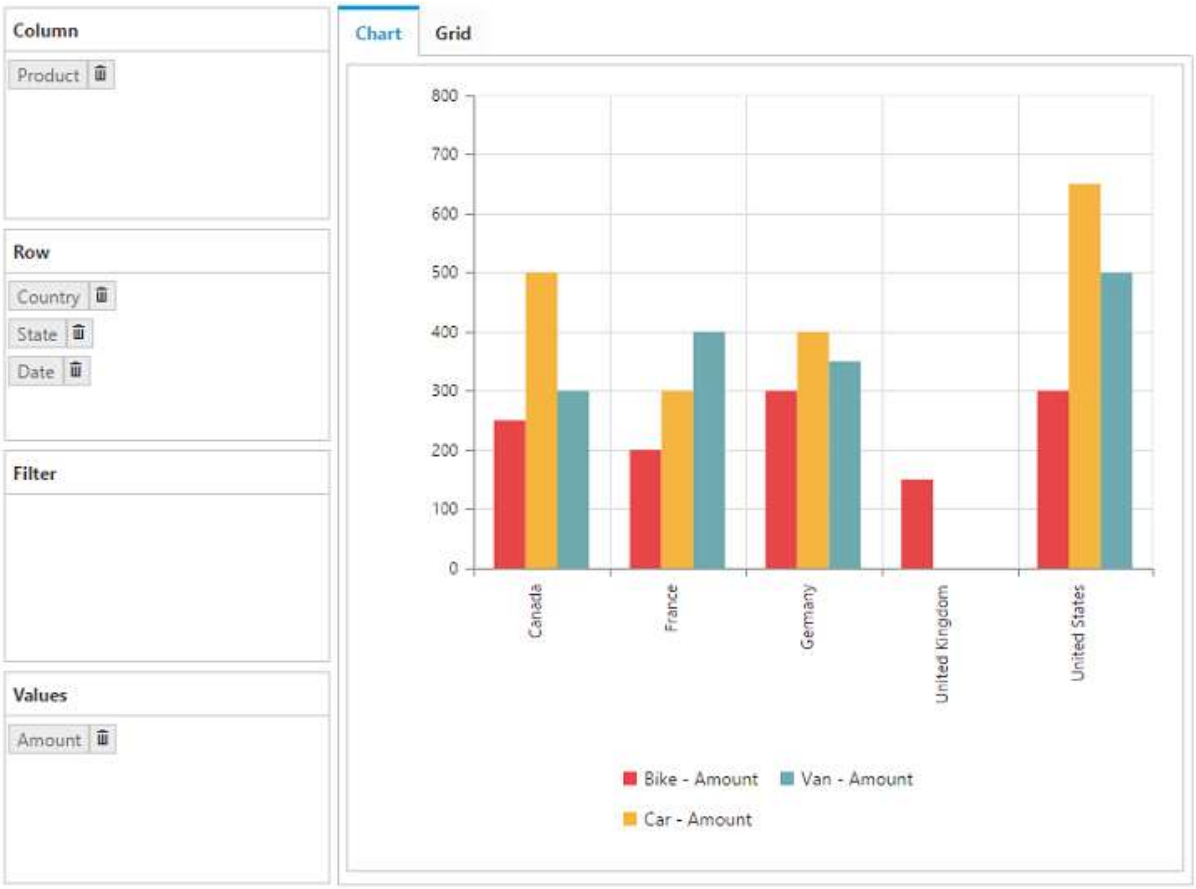
To display Chart control by default, set the DefaultView property to **Chart**.

ASPX-CS

```
@Html.EJ().Pivot().PivotClient("PivotClient1").ClientSideEvents(clientSid
eEvents => clientSideEvents.Load("onLoad")).DataSource(dataSource =>
dataSource.Rows(rows => {
rows.FieldName("Country").FieldCaption("Country").Add();
}).Columns(columns => {
columns.FieldName("Product").FieldCaption("Product").Add();
}).Values(values => {
values.FieldName("Amount").Format("currency").Add();
})).DisplaySettings(displaySettings=>displaySettings.DefaultView(
PivotClientDefaultView.Chart))
```

Copyright © 2001 - 2020 Syncfusion Inc.



Display Mode

Grid Only

By the Mode property under DisplaySettings option to **GridOnly**, PivotGrid component alone will get rendered and PivotChart will not be rendered.

ASPX-CS

```
@Html.EJ().Pivot().PivotClient("PivotClient1").ClientSideEvents(clientSid
eEvents => clientSideEvents.Load("onLoad")).DataSource(dataSource =>
dataSource.Rows(rows => {
rows.FieldName("Country").FieldCaption("Country").Add();
}).Columns(columns => {
columns.FieldName("Product").FieldCaption("Product").Add();
}).Values(values => {
values.FieldName("Amount").Format("currency").Add();
})).DisplaySettings(displaySettings=>displaySettings.Mode(
PivotClientDisplayMode.GridOnly))
```

Copyright © 2001 - 2020 Syncfusion Inc.

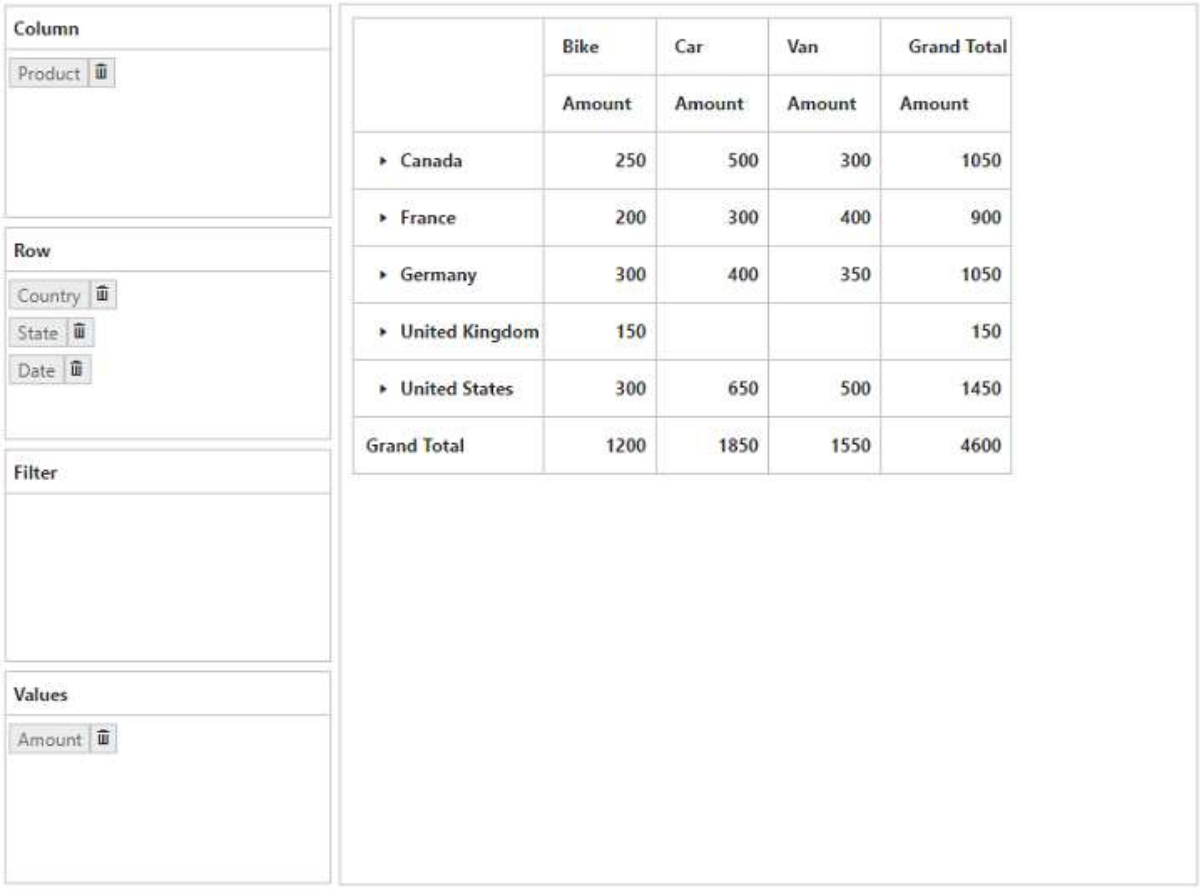


Chart Only

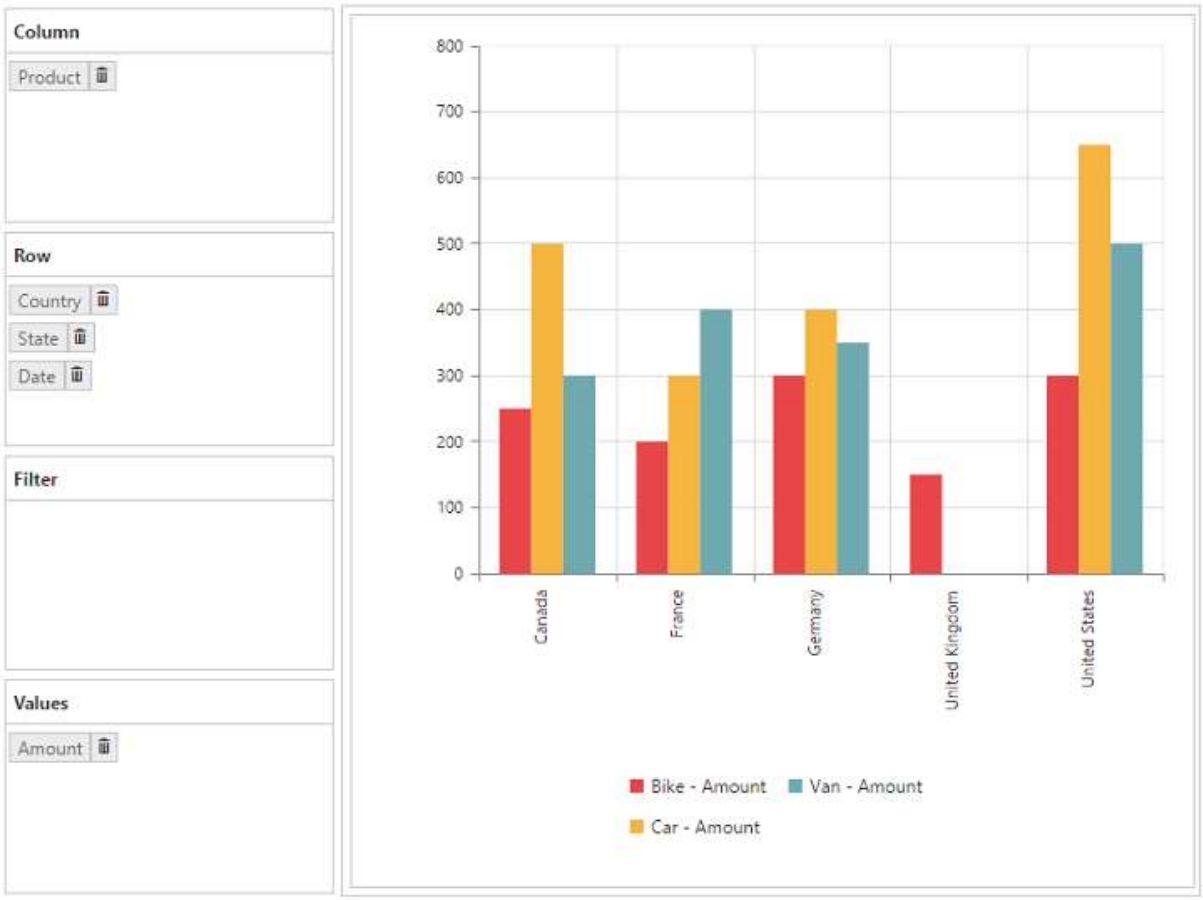
By the Mode property under DisplaySettings option to **ChartOnly**, PivotChart component alone will get rendered and PivotGrid will not be rendered.

ASPX-CS

```
@Html.EJ().Pivot().PivotClient("PivotClient1").ClientSideEvents(clientSid
eEvents => clientSideEvents.Load("onLoad")).DataSource(dataSource =>
dataSource.Rows(rows => {
rows.FieldName("Country").FieldCaption("Country").Add();
}).Columns(columns => {
columns.FieldName("Product").FieldCaption("Product").Add();
}).Values(values => {
values.FieldName("Amount").Format("currency").Add();
})).DisplaySettings(displaySettings=>displaySettings.Mode(
PivotClientDisplayMode.ChartOnly))
```

Copyright © 2001 - 2020 Syncfusion Inc.



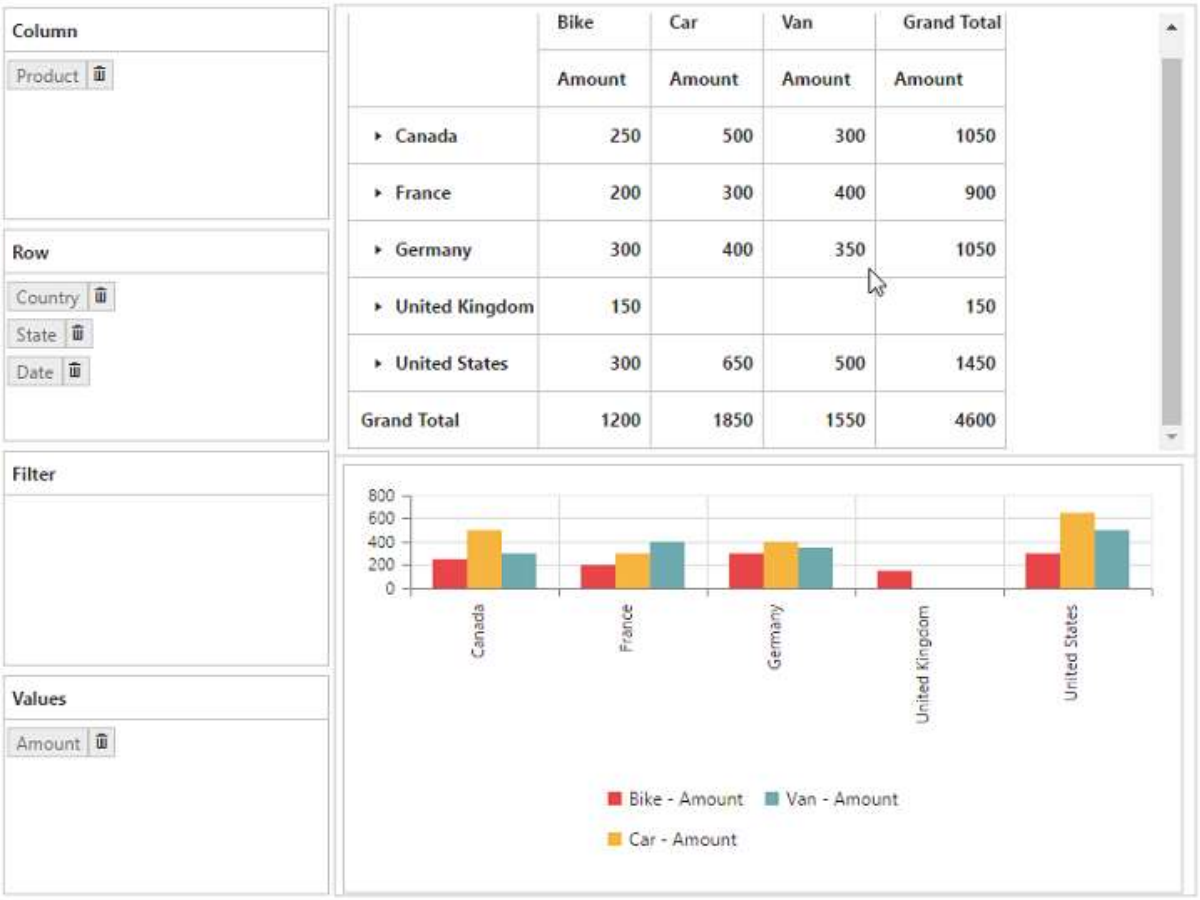
Both Chart and Grid

By the Mode property under DisplaySettings option to **ChartAndGrid**, data is displayed in both Grid and Chart. This is the default value of the property.

ASPX-CS

```
@Html.EJ().Pivot().PivotClient("PivotClient1").ClientSideEvents(clientSid
eEvents => clientSideEvents.Load("onLoad")).DataSource(dataSource =>
dataSource.Rows(rows => {
rows.FieldName("Country").FieldCaption("Country").Add();
}).Columns(columns => {
columns.FieldName("Product").FieldCaption("Product").Add();
}).Values(values => {
values.FieldName("Amount").Format("currency").Add();
})).DisplaySettings(displaySettings=>displaySettings.Mode(
PivotClientDisplayMode.ChartAndGrid))
```

Copyright © 2001 - 2020 Syncfusion Inc.



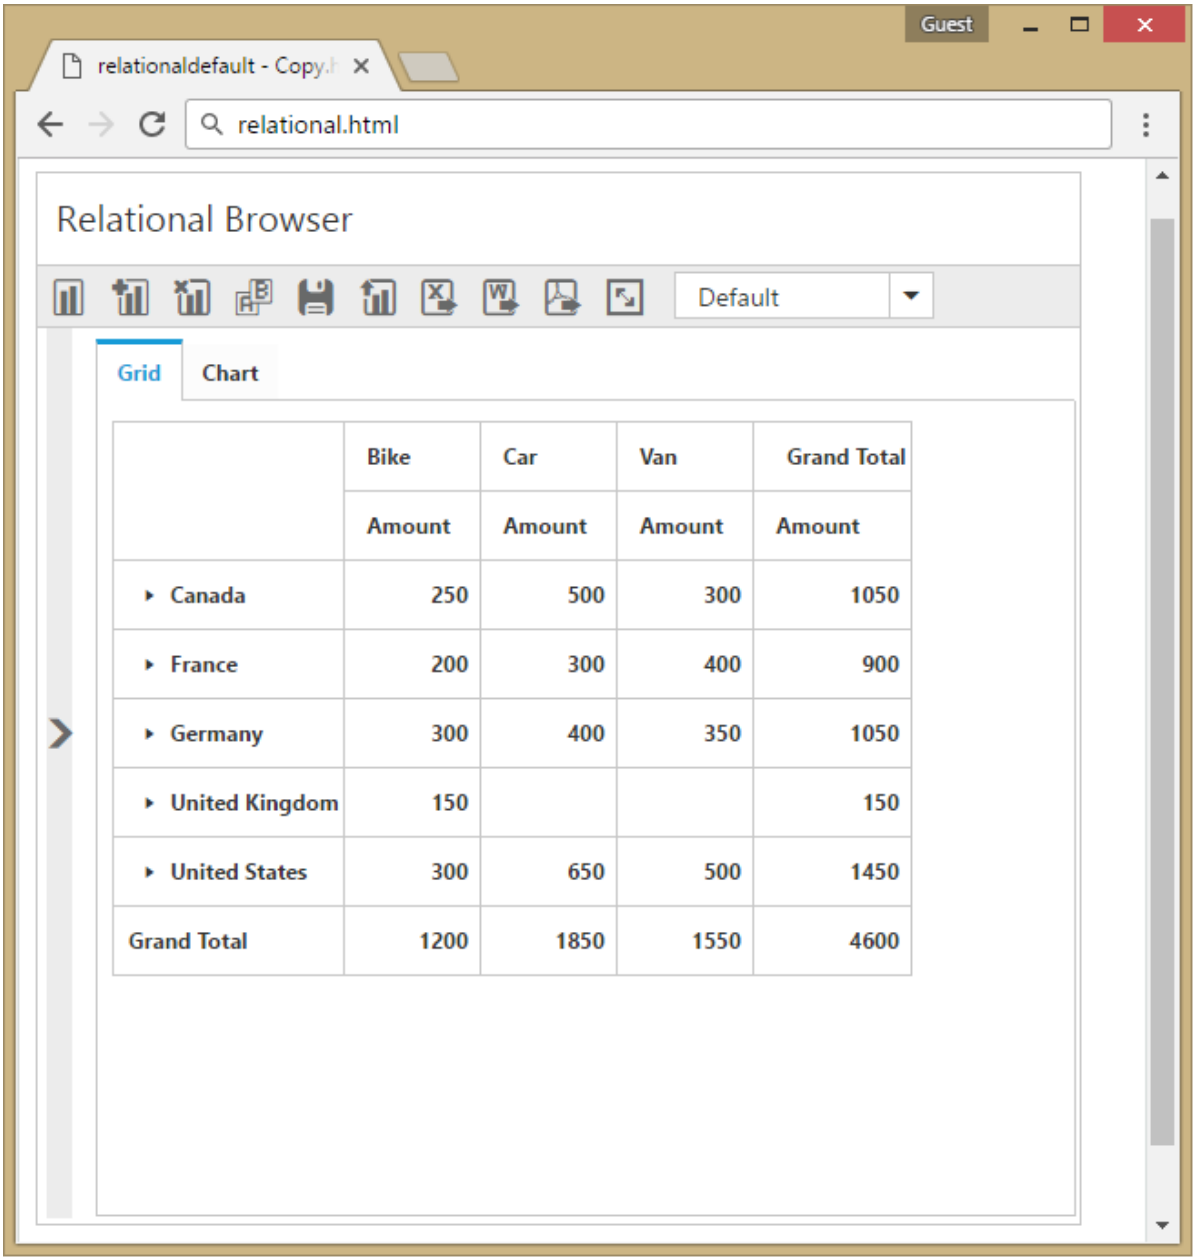
Toggle Panel

Toggle panel option lets the user to toggle the visibility of Axis Element Builder and Cube Dimension Browser panels in PivotClient with a use of a button. The button could be added to the control by enabling the EnableTogglePanel property under DisplaySettings option. This property is disabled by default.

ASPX-CS

```
@Html.EJ().Pivot().PivotClient("PivotClient1").ClientSideEvents(clientSid
eEvents => clientSideEvents.Load("onLoad")).DataSource(dataSource =>
dataSource.Rows(rows => {
rows.FieldName("Country").FieldCaption("Country").Add();
}).Columns(columns => {
columns.FieldName("Product").FieldCaption("Product").Add();
}).Values(values => {
values.FieldName("Amount").Format("currency").Add();
})).DisplaySettings(displaySettings=>displaySettings.EnableTogglePanel(tr
ue))
```

Copyright © 2001 - 2020 Syncfusion Inc.



Collapse Toggle Panel By Default

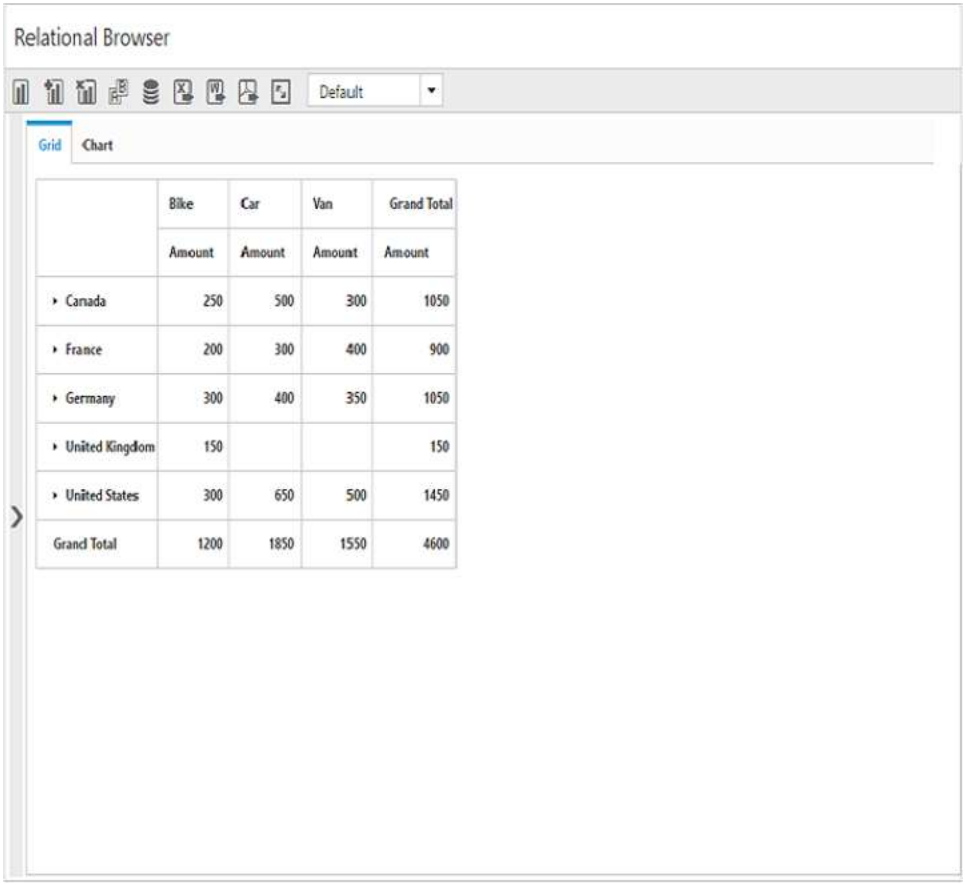
Allows the user to hide “Cube Browser” and “Axis Element Builder” panels while initiating the widget. You can enable this option in PivotClient by setting the `CollapseCubeBrowserByDefault` property to true.

ASPX-CS

```
@Html.EJ().Pivot().PivotClient("PivotClient1").ClientSideEvents(clientSid
eEvents => clientSideEvents.Load("onLoad")).DataSource(dataSource =>
dataSource.Rows(rows => {
rows.FieldName("Country").FieldCaption("Country").Add();
}).Columns(columns => {
columns.FieldName("Product").FieldCaption("Product").Add();
}).Values(values => {
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
values.FieldName("Amount").Format("currency").Add();
})).CollapseCubeBrowserByDefault(true)
```



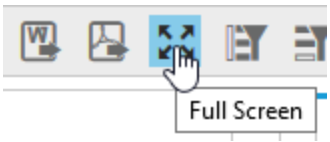
Maximized/Full Screen View

Full screen view helps to visualize the PivotGrid and PivotChart controls inside PivotClient precisely according to the browser window size. By selecting full screen icon in the toolbar, the control which is in the view gets maximized. Drilldown action can also be performed in both PivotGrid and PivotChart in the maximized view. This option is enabled by setting the EnableFullScreen property under DisplaySettings option to true. The value is false by default.

ASPX-CS

```
@Html.EJ().Pivot().PivotClient("PivotClient1").ClientSideEvents(clientSid
eEvents => clientSideEvents.Load("onLoad")).DataSource(dataSource =>
dataSource.Rows(rows => {
rows.FieldName("Country").FieldCaption("Country").Add();
}).Columns(columns => {
columns.FieldName("Product").FieldCaption("Product").Add();
}).Values(values => {
values.FieldName("Amount").Format("currency").Add();
})).DisplaySettings(displaySettings=>displaySettings.EnableFullScreen(tru
e))
```

Copyright © 2001 - 2020 Syncfusion Inc.



The following screenshot shows the maximized view of PivotGrid.

	Bike	Car	Van	Grand Total
	Amount	Amount	Amount	Amount
▸ Canada	250	500	300	1050
▸ France	200	300	400	900
▸ Germany	300	400	350	1050
▸ United Kingdom	150			150
▸ United States	300	650	500	1450
Grand Total	1200	1850	1550	4600

Chart Types

While loading the PivotClient initially, the PivotChart widget can be rendered in any one of the available chart types using the ChartType property.

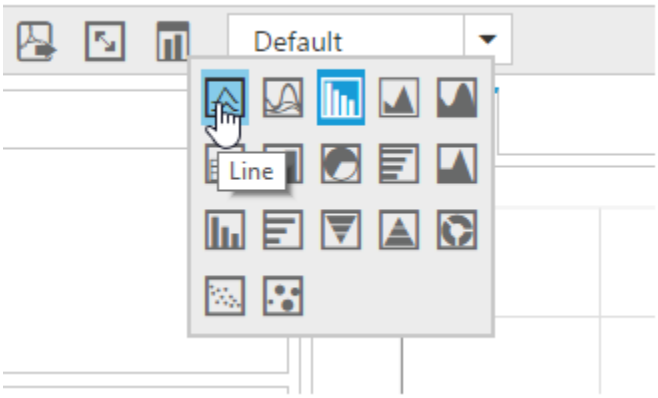
ASPX-CS

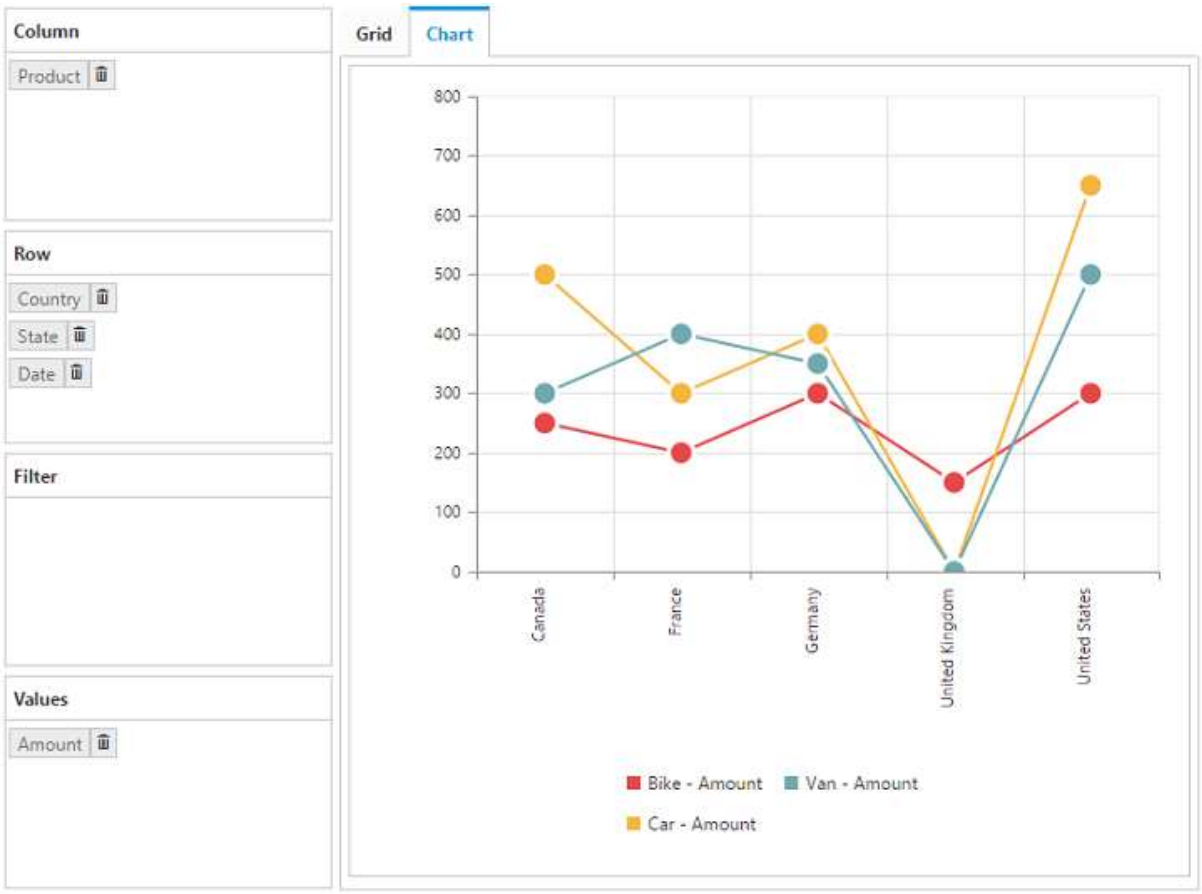
```
@Html.EJ().Pivot().PivotClient("PivotClient1").ClientSideEvents(clientSid
eEvents => clientSideEvents.Load("onLoad")).DataSource(dataSource =>
dataSource.Rows(rows => {
rows.FieldName("Country").FieldCaption("Country").Add();
}).Columns(columns => {
columns.FieldName("Product").FieldCaption("Product").Add();
}).Values(values => {
values.FieldName("Amount").Format("currency").Add();
})).ChartType(PivotChartType.Column)
```

Copyright © 2001 - 2020 Syncfusion Inc.

The ChartType property takes Column Chart by default. The types available are Column, Stacking Column, Bar, Stacking Bar, Line, Spline, Step Line, Area, Spline Area, Step Area, Stacking Area, Pie, Funnel and Pyramid.

The Chart Type can also be changed dynamically through the toolbar icon.





PivotTreeMap

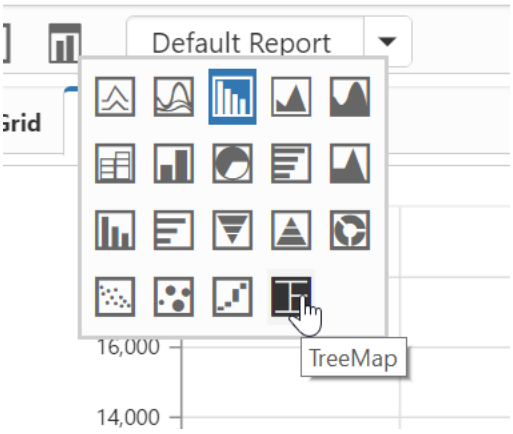
Information: This feature is applicable only for OLAP data source bound from server-side.

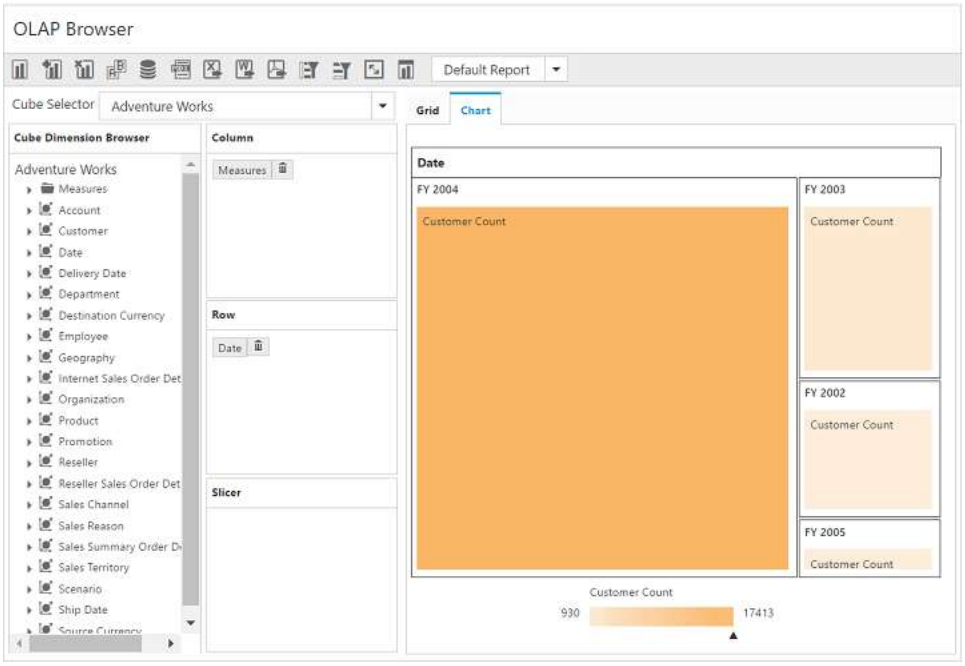
You can include the PivotTreeMap component as one of the chart types by setting EnablePivotTreeMap property to true.

Copyright © 2001 - 2020 Syncfusion Inc.

ASPX-CS

```
@Html.EJ().Pivot().PivotClient("PivotClient1").ClientSideEvents(clientSid
eEvents => clientSideEvents.Load("onLoad")).DataSource(dataSource =>
dataSource.Rows(rows => {
rows.FieldName("Country").FieldCaption("Country").Add();
}).Columns(columns => {
columns.FieldName("Product").FieldCaption("Product").Add();
}).Values(values => {
values.FieldName("Amount").Format("currency").Add();
})).EnablePivotTreeMap(true)
```





Report Toolbar

You can customize the display of toolbar by enabling/disabling the visibility of each of the icons. This can be achieved by setting the properties under ToolbarIconSettings option to false. The values are true by default.

ASPX-CS

```
@Html.EJ().Pivot().PivotClient("PivotClient1”).ToolbarIconSettings(toolba
ricon => {
toolbaricon.EnableAddReport(false).EnableNewReport(false).EnableRemoveRep
ort(false); })
```

The following screenshot shows after disabling the toolbar icons.

Advanced Filtering and Sorting

It allows to filter and sort the field members in PivotClient.

Client Mode

In client mode, you can enable Advanced Filtering and Sorting option in PivotClient by setting the EnableAdvancedFilter property under DataSource to true.

HTML

```
@Html.EJ().Pivot().PivotClient("PivotClient1").DataSource(dataSource =>
dataSource.EnableAdvancedFilter(true))
```

Server Mode

In server mode, you can enable the Advanced Filtering and Sorting option in PivotClient by setting the EnableAdvancedFilter property to true.

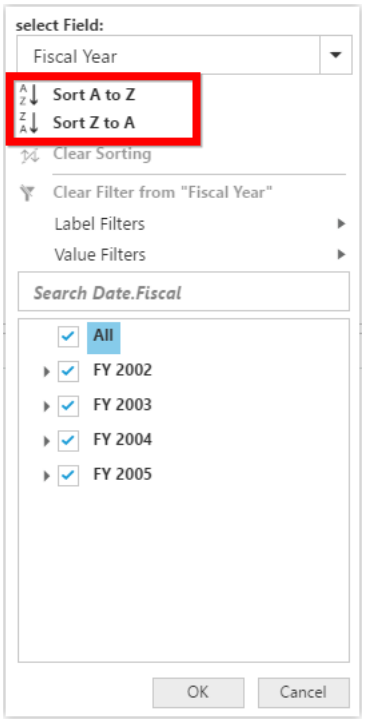
HTML

```
@Html.EJ().Pivot().PivotClient("PivotClient1").EnableAdvancedFilter(true)
```

Sorting

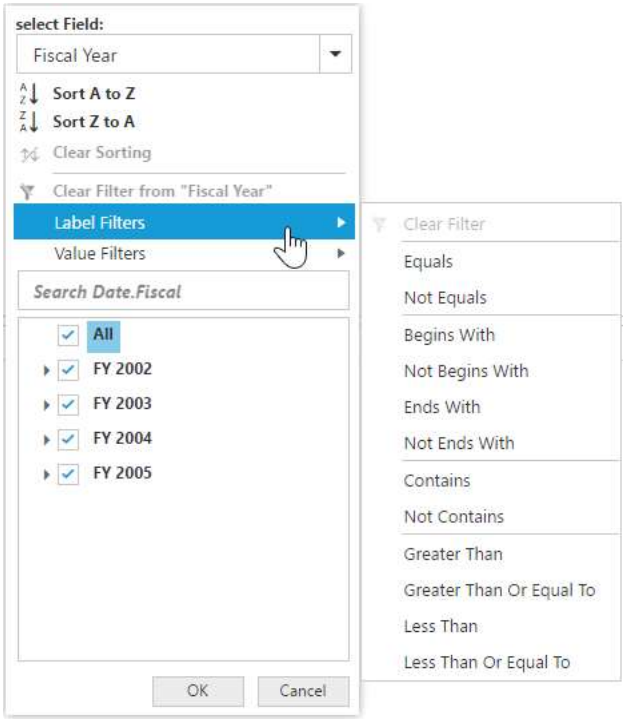
Sorting provides an option to sort the members of a field either in ascending or descending order.

Copyright © 2001 - 2020 Syncfusion Inc.



Label Filtering

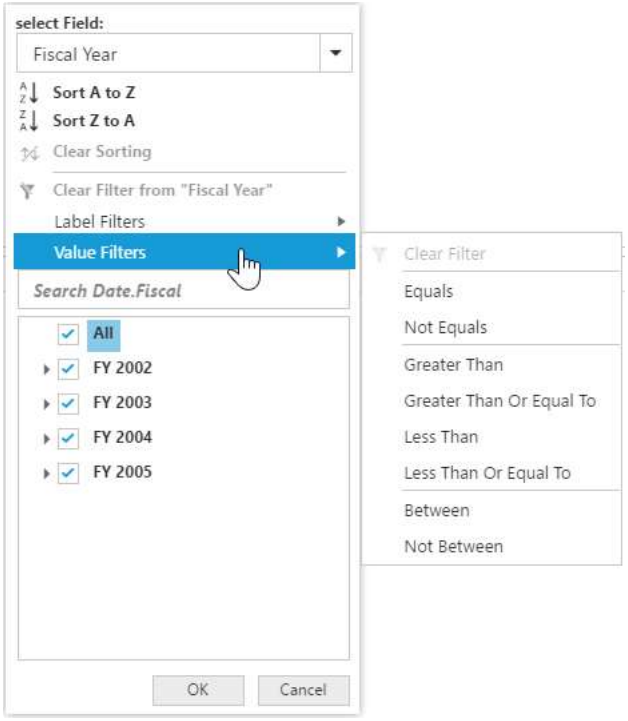
Label filtering provides an option to filter the members of a field purely based on their caption.

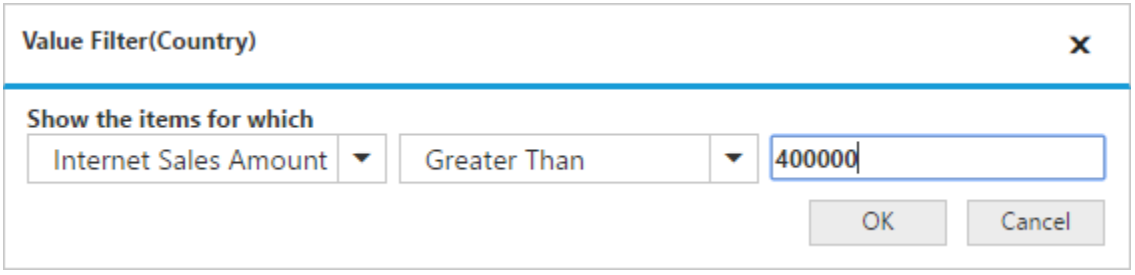


Copyright © 2001 - 2020 Syncfusion Inc.

Value Filtering

Value filtering provides an option to filter members based on the total values of the appropriate measure between the members of the level.

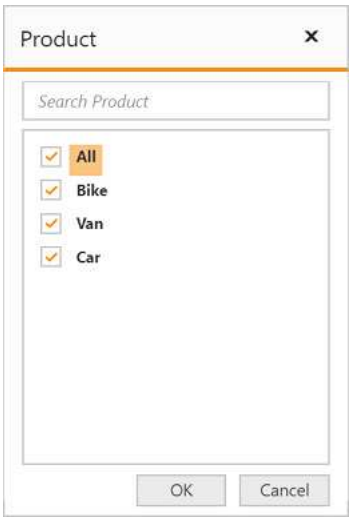




Member Editor

Member editor is a dialog that displays the members of the current field in a tree view structure, which can be opened by clicking the pivot button available in the axis elements. It helps to search, filter, and sort the field members available in the pivot client control.

Copyright © 2001 - 2020 Syncfusion Inc.



Member editor - Paging

Member editor paging helps to improve the rendering performance of the dialog by dividing large amount of data into sections and displaying them.

You can enable member editor paging and set member editor page size in PivotClient control by setting the EnableMemberEditorPaging and MemberEditorPageSize properties.

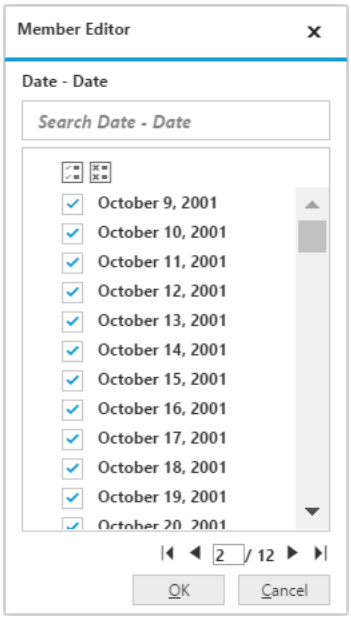
ASPX-CS

```
@Html.EJ().Pivot().PivotClient("PivotClient1").EnableMemberEditorPaging(t
rue).MemberEditorPageSize(100)
```

Following are the navigation option available in Member Editor Pager.

- Move First - Navigates to the first page.
- Move Previous - Navigates to the previous page from the current page.
- Move Next - Navigates to the next page from the current page.
- Move Last - Navigates to the last page.
- Numeric Box - Navigates to the desired page by entering an appropriate page number in numeric value.

Copyright © 2001 - 2020 Syncfusion Inc.



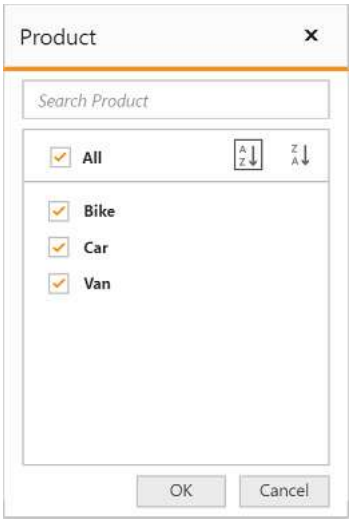
Member editor - Sorting

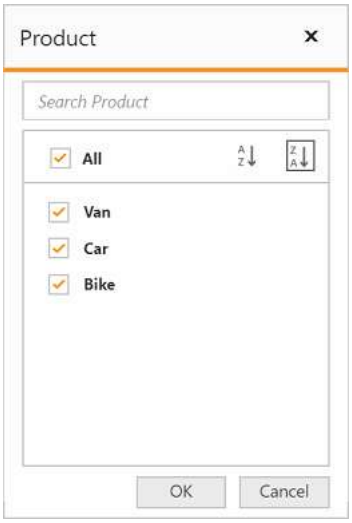
The sorting support in member editor helps you to sort the field members either in ascending or descending order.

You can enable the member editor sorting in the pivot grid control by setting the [EnableMemberEditorSorting] property.

ASPX-CS

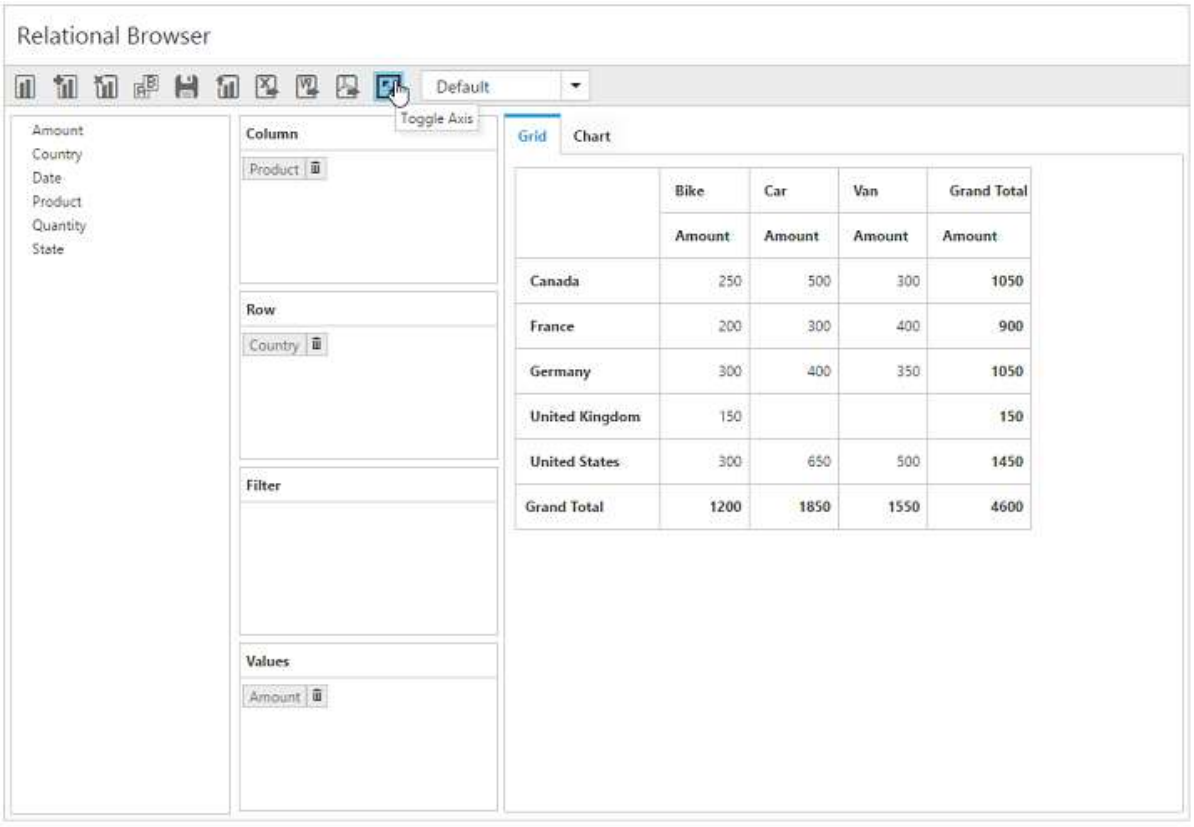
```
@Html.EJ().Pivot().PivotClient("PivotClient1").EnableMemberEditorSorting(
true)
```



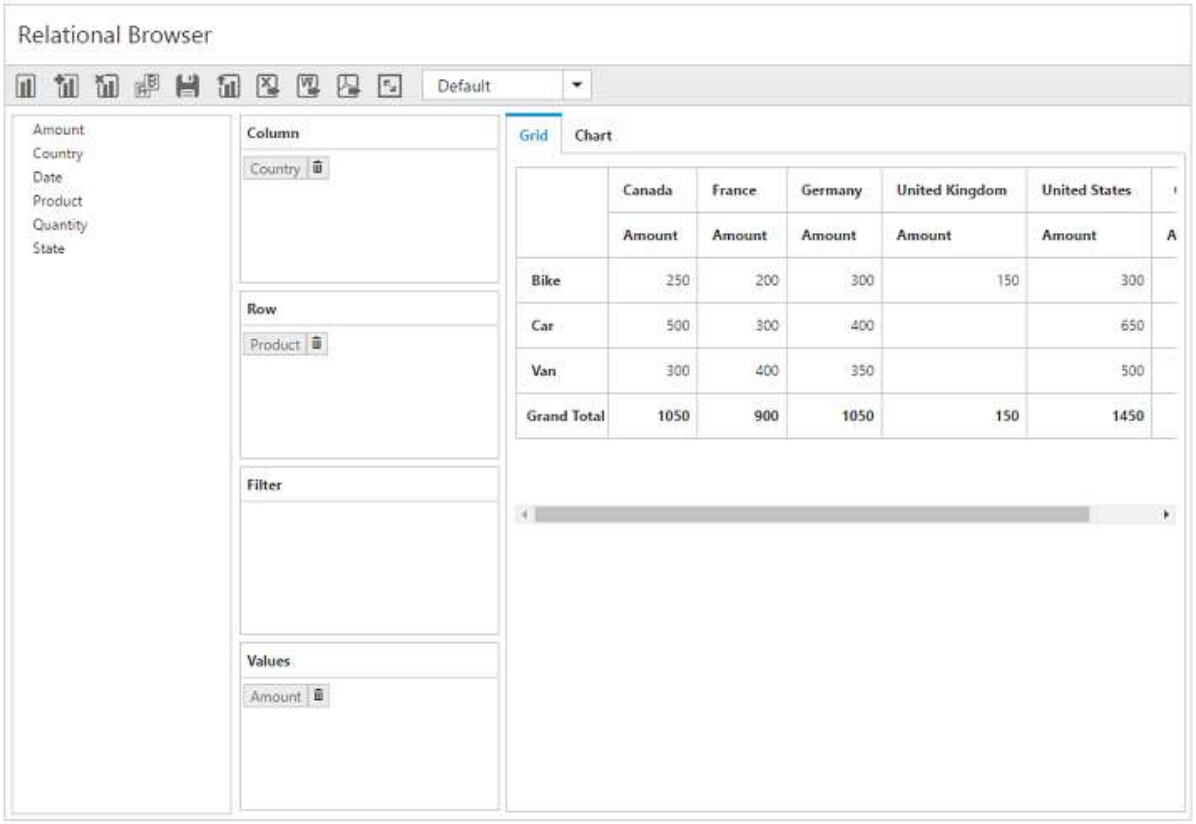


Toggle Axis

Toggle Axis support swaps all the axis elements between column and row axes, thereby refreshing PivotChart and PivotGrid view. This can be achieved with the use of a toolbar icon.



Copyright © 2001 - 2020 Syncfusion Inc.



Localization and Globalization

Localization in PivotClient control

We can localize the PivotClient control texts with a collection of localized strings using **“ej.PivotClient.Locale”** for different cultures.

Note: By default, the PivotClient control is localized in **“en-US”.**

Following code example illustrates on how to localize PivotClient based on **“French”** culture.

ASPX-CS

```
<script type="text/javascript">
ej.PivotClient.Locale["fr-FR"] = {
DeferUpdate: "Différer Mise à jour",
MDXQuery: "de requêtes MDX",
Column: "Colonne",
Row: "Rangée",
Slicer: "Tranche",
CubeSelector: "Sélecteur de Cube",
ReportName: "Nom du rapport",
NewReport: "Nouveau rapport",
CubeDimensionBrowser: "Cube navigateur dimnesion",
AddReport: "Ajouter un rapport",
RemoveReport: "Retirer rapport",
//...
}
ej.PivotGrid.Locale["fr-FR"] = {
ToolTipRow: "Rangée",
ToolTipColumn: "Colonne",
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
ToolTipValue: "Valeur"
}
ej.PivotChart.Locale["fr-FR"] = {
Measure: "Mesure",
Row: "Rangée",
Column: "Colonne",
Value: "Valeur",
Expand: "Développer",
Collapse: "Effondrement",
Exit: "Quitter"
}
ej.PivotSchemaDesigner.Locale["fr-FR"] = {
AddToFilter: "Ajouter au filtre",
AddToRow: "Ajouter à la rangée",
AddToColumn: "Ajouter à la colonne",
AddToValues: "Ajouter à la valeur",
PivotTableFieldList: "Liste des champs PivotTable",
//...
}
</script>
@Html.EJ().Pivot().PivotClient("PivotClient1").Url(Url.Content("/OlapClie
nt")).Locale("fr-FR")
```

Following table localizes the in-built keywords to **French** culture for PivotClient.

Keywords	Values
DeferUpdate	DiffÃ©rer Mise Ã jour
MDXQuery	de requÃªtes MDX
Column	Colonne

Localization and Globalization of Cube Info (Client Mode)

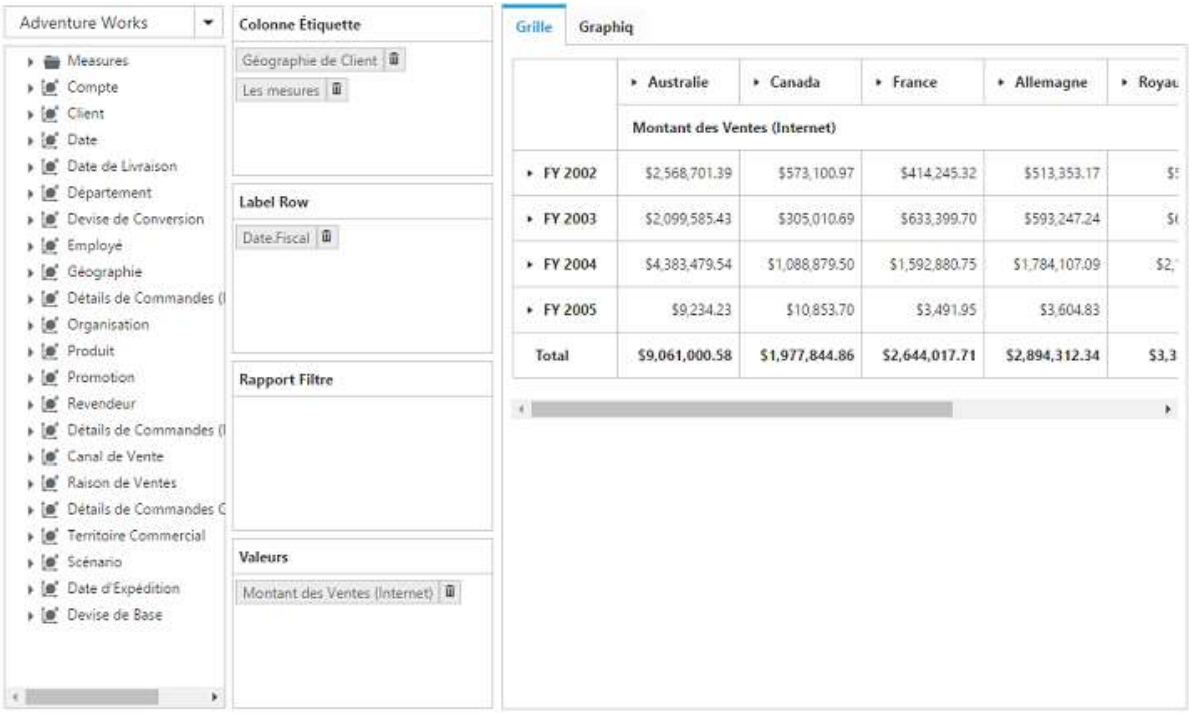
Content displayed within the PivotClient control are obtained from the OLAP cube. Following are the steps to get the localized and globalized cube content.

- To get localized data from OLAP cube, we need to set **"Locale Identifier"** in the connection string to a specific culture in the **"Data"** property present inside **"DataSource"**.
- To bind the globalized content in PivotClient control, we need to set **"Locale"** property to a specific culture and the specific culture file is referred in the sample.

Note: Culture files are present under **"[installed drive]:\Users\[user name]\AppData\Local\Syncfusion\EssentialStudio\X.X.X.X\MVC\Samples\web\Scripts\cultures".**

ASPX-CS

```
//1036 refers to "fr-FR" culture.
@Html.EJ().Pivot().PivotClient("PivotClient1").DataSource(dataSource =>
dataSource.Rows(rows=>{rows.FieldName("[Date].[Fiscal]").Add();}).Columns
(columns=>{columns.FieldName("[Customer].[Customer
Geography]").Add();}).Values(values => { values.Measures(measures => {
measures.FieldName("[Measures].[Internet Sales Amount]").Add();
}).Axis(AxisName.Column).Add();})
.Data("https://bi.syncfusion.com/olap/msmdpump.dll;Locale
Identifier=1036;").Catalog("Adventure Works DW 2008 SE").Cube("Adventure
Works")).Locale("fr-FR")
```



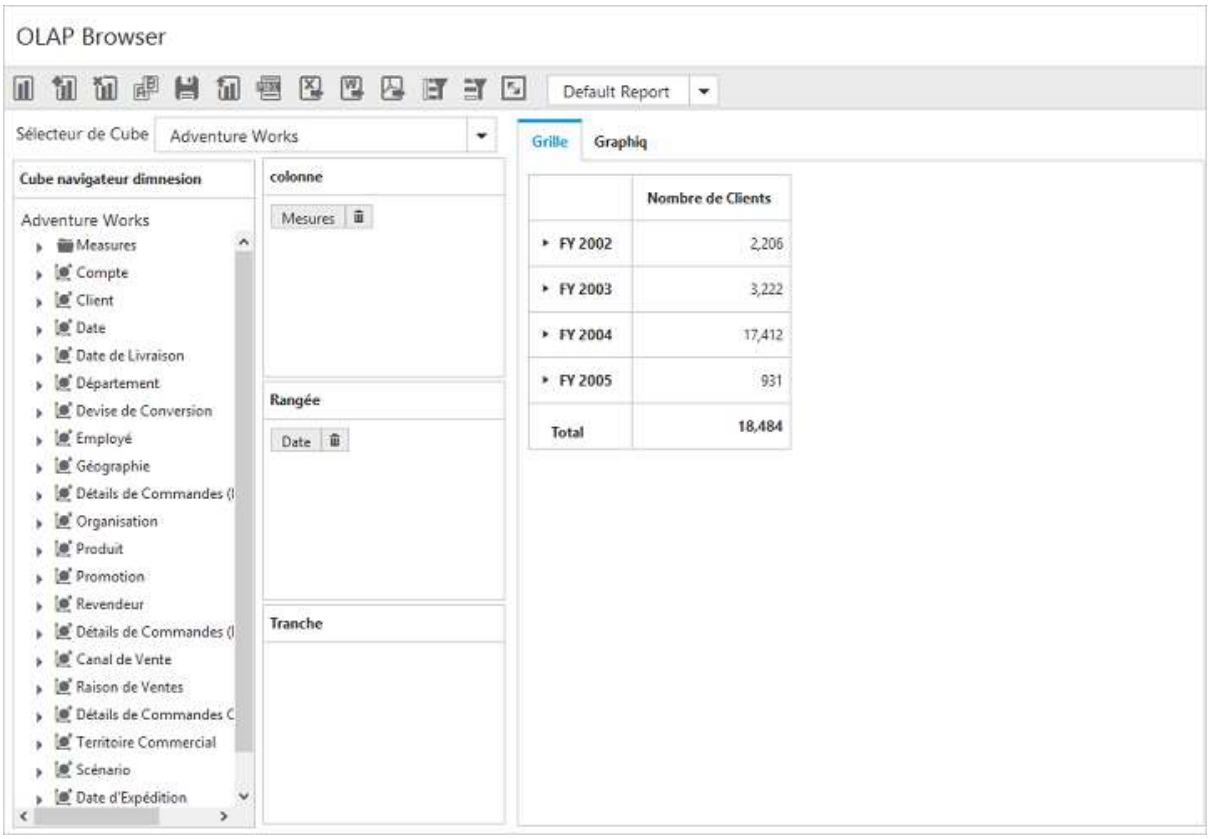
Localization and Globalization of Cube Info (Server Mode)

Content displayed within the PivotClient control are obtained from the OLAP cube. Following are the steps to get the localized and globalized Cube content.

- To get the localized string based on different cultures, from OLAP cube, you need to set **"Locale Identifier"** in the connection string to a specific culture.
- To bind the globalized content in PivotClient control, you need to set **"Culture"** and OverrideDefaultFormatStrings properties in OlapDataManager class to a specific culture.

C#

```
//1036 refers to "fr-FR" culture.
string connectionString = "Data Source=localhost; Initial
Catalog=Adventure Works DW; Locale Identifier=1036;";
DataManager = new OlapDataManager(connectionString);
DataManager.Culture = new System.Globalization.CultureInfo(1036);
DataManager.OverrideDefaultFormatStrings = true;
```



Localization and Globalization of Relational Info (Client Mode)

Content displayed within the PivotClient control are obtained from the Relational datasource. Following are the steps to get localized as well as globalized content.

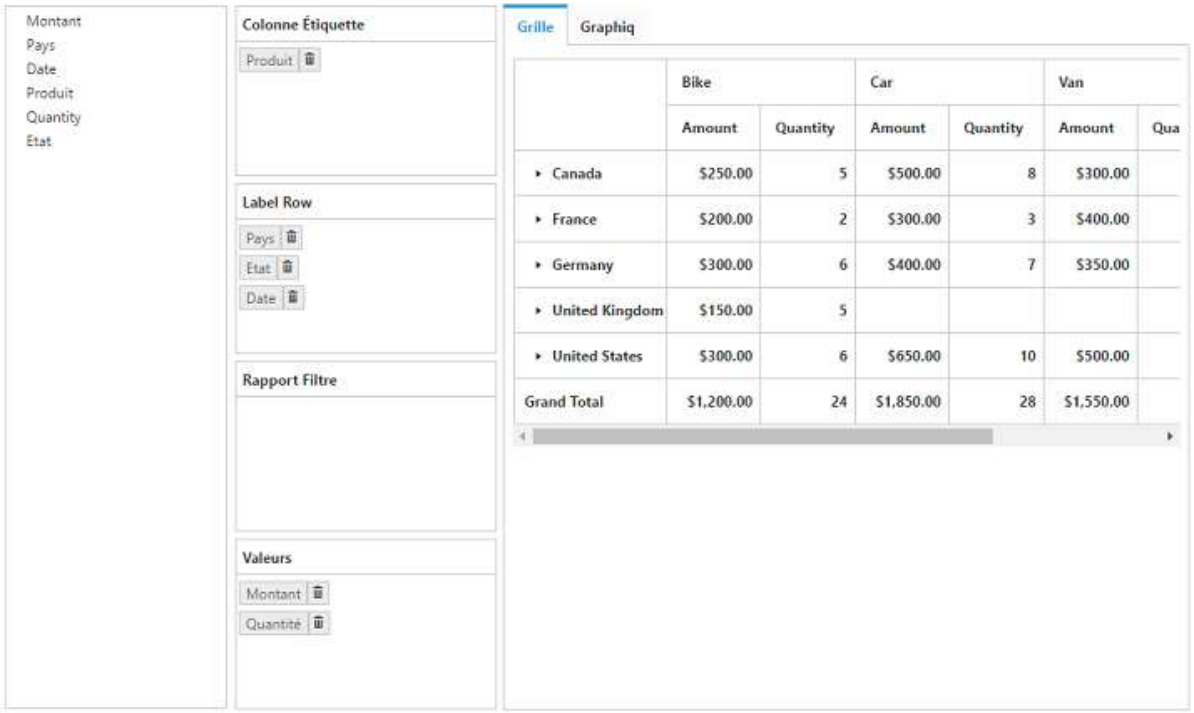
- To get the localized content, the Relational datasource must have localized headers in them which will be directly applied to PivotClient.
- To globalize the values appeared in PivotClient, we need to set the **"Format"** and **"Locale"** property accordingly. Also the specific culture file is referred in the sample.

Note: Culture files are present under **"[installed drive]:\Users\[user name]\AppData\Local\Syncfusion\EssentialStudio\X.X.X.X\MVC\Samples\web\Scripts\cultures".**

Copyright © 2001 - 2020 Syncfusion Inc.

ASPX-CS

```
@Html.EJ().Pivot().PivotClient("PivotClient1").ClientSideEvents(clientSid
eEvents => clientSideEvents.Load("onLoad")).DataSource(dataSource =>
dataSource.Rows(rows => {
rows.FieldName("Country").FieldCaption("Country").Add();
}).Columns(columns => {
columns.FieldName("Product").FieldCaption("Product").Add();
}).Values(values => {
values.FieldName("Amount").Format("currency").Add(); }))
```



Localization and Globalization of Relational Info (Server Mode)

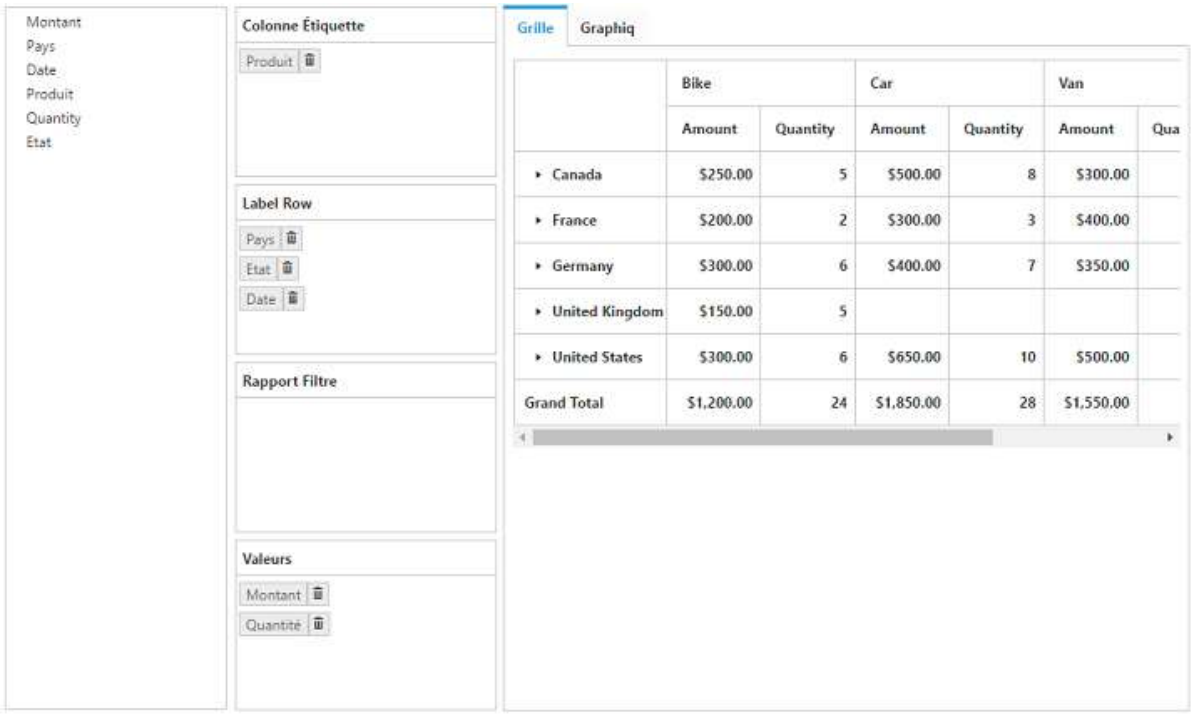
Content displayed within the PivotClient control are obtained from the Relational datasource. Following are the steps to get localized as well as globalized content.

- To get the localized content, the Relational datasource must have localized headers in them which will be directly applied to PivotClient.
- **"Format"** settings in "PivotComputationInfo" class would globalize the values appeared in PivotClient.

C#

```
PivotReport pivotSetting = new PivotReport();
//...
pivotSetting.PivotCalculations.Add(new PivotComputationInfo {
CalculationName = "Amount", Description = "Amount", FieldHeader =
"Amount", FieldName = "Amount", Format = "C", SummaryType =
Syncfusion.PivotAnalysis.Base.SummaryType.DoubleTotalSum
});
//...
```

Copyright © 2001 - 2020 Syncfusion Inc.



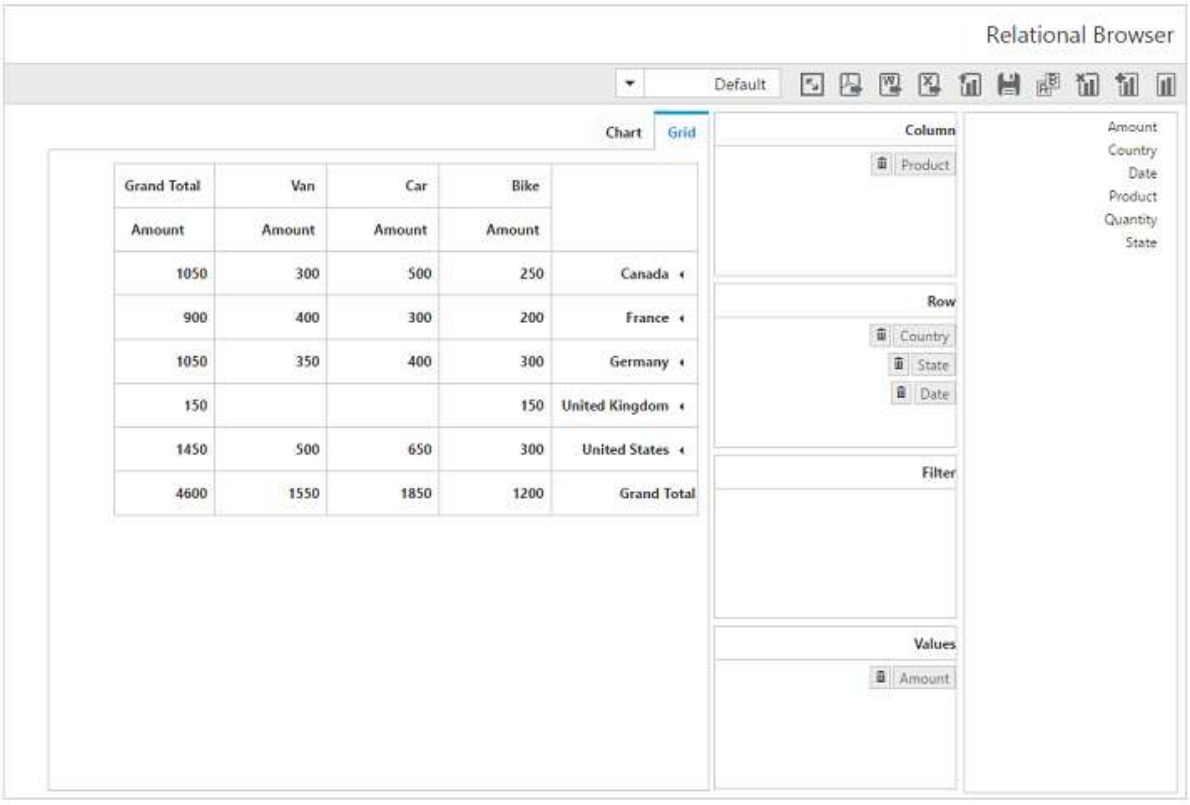
RTL

You can render our PivotClient control from Right to Left by setting EnableRTL property to true.

ASPX-CS

```
@Html.EJ().Pivot().PivotClient("PivotClient1").ClientSideEvents(clientSid
eEvents => clientSideEvents.Load("onLoad")).DataSource(dataSource =>
dataSource.Rows(rows => {
rows.FieldName("Country").FieldCaption("Country").Add();
}).Columns(columns => {
columns.FieldName("Product").FieldCaption("Product").Add();
}).Values(values => {
values.FieldName("Amount").Format("currency").Add(); })).EnableRTL(true)
```

Copyright © 2001 - 2020 Syncfusion Inc.



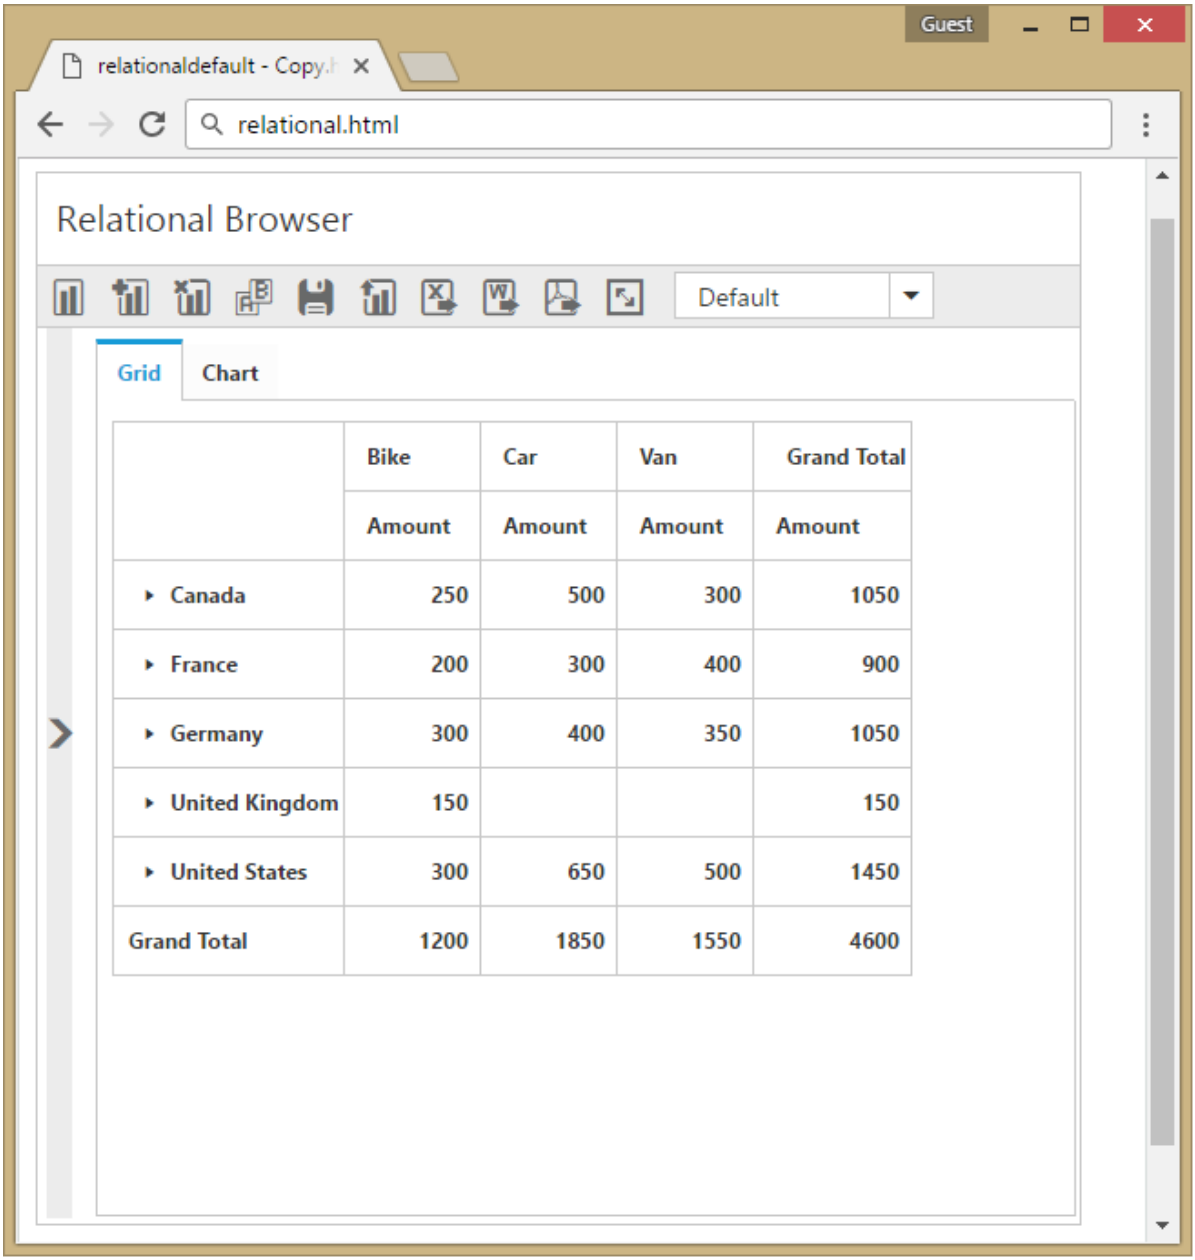
Responsive Layout

PivotClient widget supports responsive rendering based on the target device (desktop and tablet) resolution. It supports resolution up to 1024x600. You can enable responsiveness in PivotClient by setting IsResponsive property to true.

ASPX-CS

```
@Html.EJ().Pivot().PivotClient("PivotClient1").ClientSideEvents(clientSid
eEvents => clientSideEvents.Load("onLoad")).DataSource(dataSource =>
dataSource.Rows(rows => {
rows.FieldName("Country").FieldCaption("Country").Add();
}).Columns(columns => {
columns.FieldName("Product").FieldCaption("Product").Add();
}).Values(values => {
values.FieldName("Amount").Format("currency").Add();
})).IsResponsive(true)
```

Copyright © 2001 - 2020 Syncfusion Inc.



Splitter

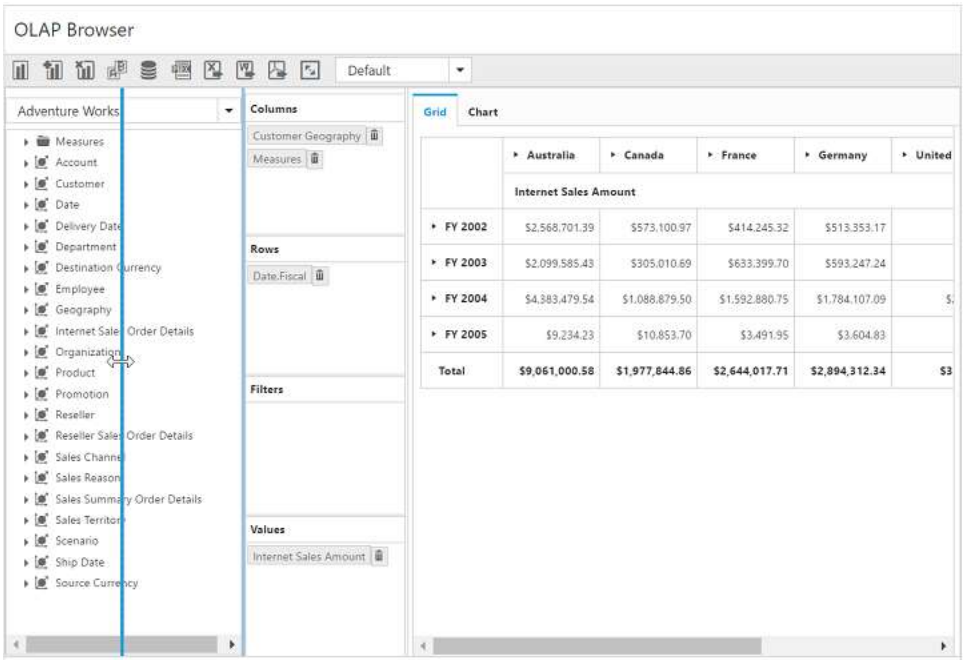
Information: This feature is not applicable for OLAP datasource bound from server-side.

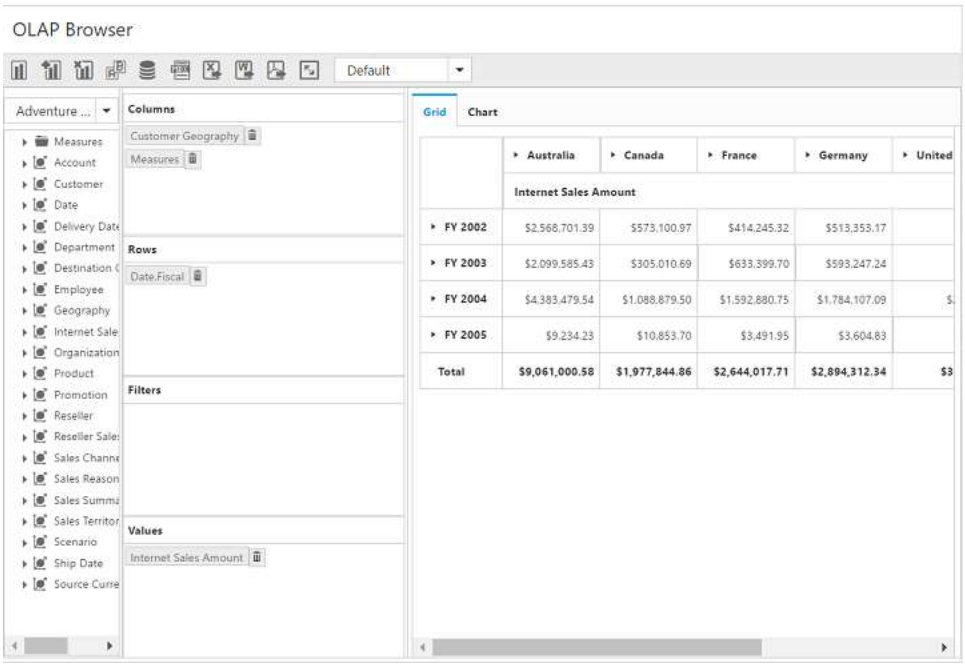
You can resize Cube Dimension Browser and Axis Element Builder by setting EnableSplitter property to true.This property is disabled by default.

ASPX-CS

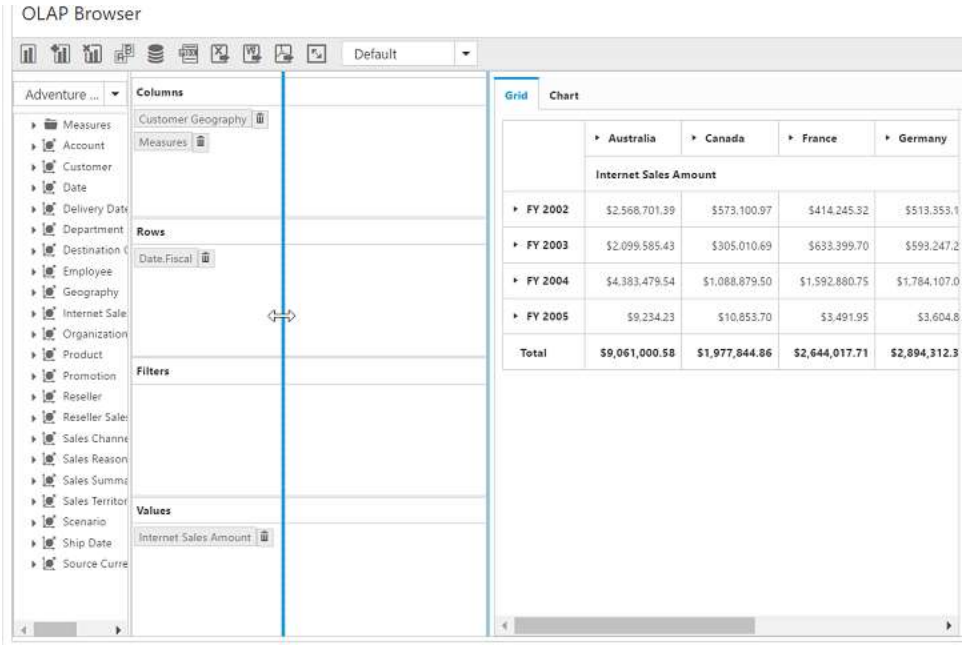
```
@Html.EJ().Pivot().PivotClient("PivotClient1").ClientSideEvents(clientSid
eEvents => clientSideEvents.Load("onLoad")).DataSource(dataSource =>
dataSource.Rows(rows => {
rows.FieldName("Country").FieldCaption("Country").Add();
}).Columns(columns => {
columns.FieldName("Product").FieldCaption("Product").Add();
```

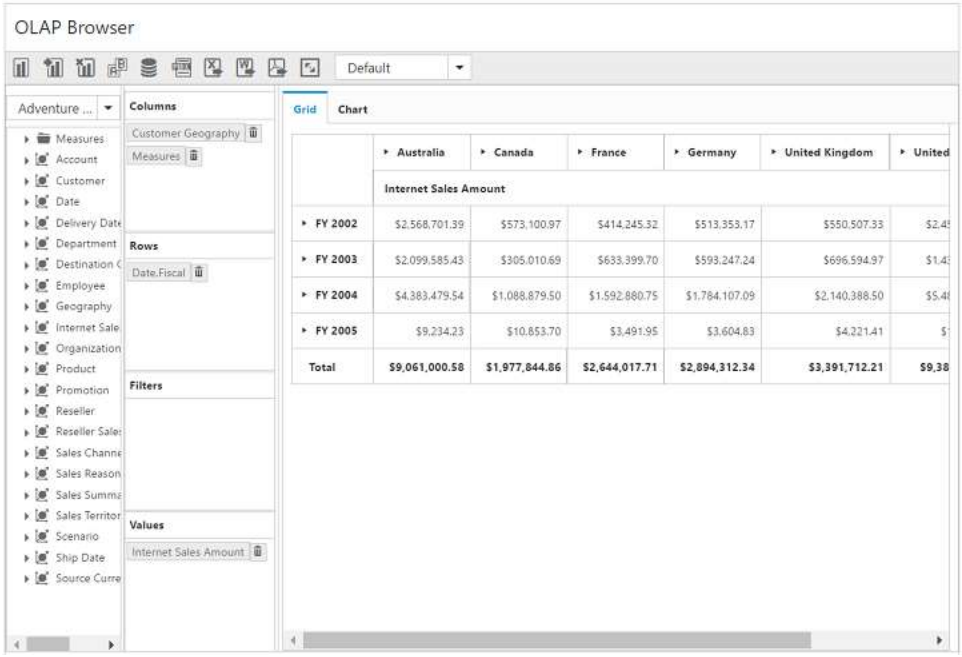
```
}).Values(values => {
values.FieldName("Amount").Format("currency").Add();
})).EnableSplitter(true)
```





Copyright © 2001 - 2020 Syncfusion Inc.





How to

Configure pivot client through the model properties

There comes a time when you want to set pivot client properties other than using `PivotClientPropertiesBuilder` i.e., in the Controller side. At that time, you can pass `PivotClientProperties` model instance as a parameter to the pivot client helper method.

We can set properties to pivot client control in server-side using the `PivotClientProperties` class and it is used in the view page with the help of pivot client helper overload.

In addition to the `id` parameter of pivot client helper method, we can also pass `PivotClientProperties` model as another parameter to the pivot client helper method.

Copyright © 2001 - 2020 Syncfusion Inc.

Relational

The following code example explains how to render the pivot client control in relational mode.

RAZOR

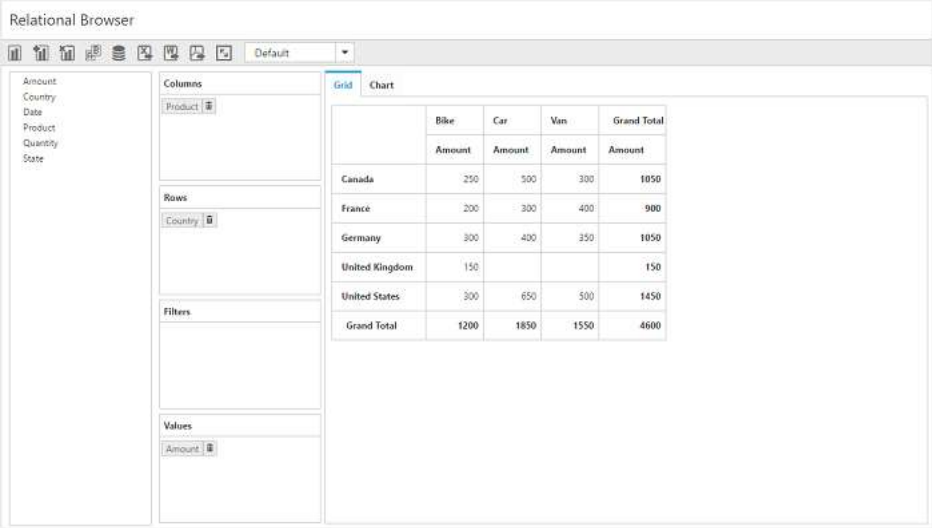
```
@model Syncfusion.JavaScript.Models.PivotClientProperties
@(Html.EJ().Pivot().PivotClient("PivotClient", Model))
<script type="text/javascript">
function load(args) {
args.model.dataSource.data = pivot_dataset;
}
</script>
```

C#

```
namespace PivotClient
{
public class PivotClientController: Controller
{
public ActionResult PivotClientFeatures()
{
Syncfusion.JavaScript.Models.PivotClientProperties pivotclient = new
Syncfusion.JavaScript.Models.PivotClientProperties();
PivotDataSource pivotclientDS = new PivotDataSource();
List<Field> rows = new List<Field>();
rows.Add(new Field() { FieldName = "Country", FieldCaption = "Country"
});
rows.Add(new Field() { FieldName = "State", FieldCaption = "State" });
pivotclientDS.Rows = rows;
List<Field> cols = new List<Field>();
cols.Add(new Field() { FieldName = "Product", FieldCaption = "Product"
});
pivotclientDS.Columns = cols;
pivotclient.Load = "load";
List<Field> values = new List<Field>();
values.Add(new Field() { FieldName = "Amount" });
pivotclientDS.Values = values;
pivotclient.DataSource = pivotclientDS;
return View(pivotclient);
}
}
}
```

As a result of the previous code example, the pivot client will be displayed as shown below:

Copyright © 2001 - 2020 Syncfusion Inc.



OLAP

The following code example explains how to render the pivot client control in OLAP mode.

RAZOR

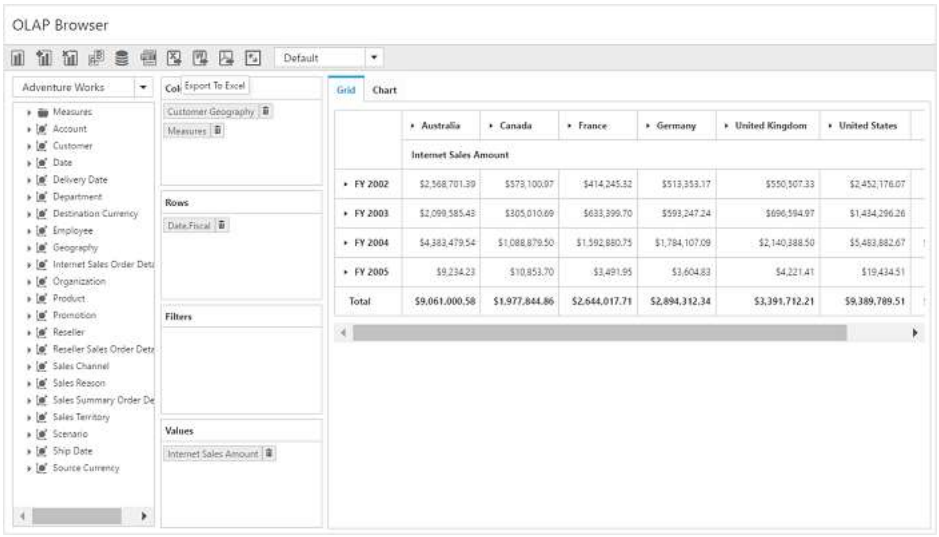
```
@model Syncfusion.JavaScript.Models.PivotClientProperties
@(Html.EJ().Pivot().PivotClient("PivotClient", Model))
```

C#

```
namespace PivotClient
{
public class PivotClientController: Controller
{
public ActionResult PivotClientFeatures()
{
Syncfusion.JavaScript.Models.PivotClientProperties pivotclient = new
Syncfusion.JavaScript.Models.PivotClientProperties();
PivotDataSource pivotclientDS = new PivotDataSource();
pivotclientDS.Data = "https://bi.syncfusion.com/olap/msmdpump.dll";
pivotclientDS.Cube = "Adventure Works";
pivotclientDS.Catalog = "Adventure Works DW 2008 SE";
List<Field> rows = new List<Field>();
rows.Add(new Field() { FieldName = "[Date].[Fiscal]" });
pivotclientDS.Rows = rows;
List<Field> cols = new List<Field>();
cols.Add(new Field() { FieldName = "[Customer].[Customer Geography]" });
pivotclientDS.Columns = cols;
List<MeasuresItems> measures = new List<MeasuresItems>();
measures.Add(new MeasuresItems() { FieldName = "[Measures].[Internet
Sales Amount]" });
List<Field> values = new List<Field>();
values.Add(new Field() { Measures = measures, Axis =
Syncfusion.JavaScript.AxisName.Column });
pivotclientDS.Values = values;
pivotclient.DataSource = pivotclientDS;
return View(pivotclient);
}
```

```
}
}
```

As a result of the previous code example, the pivot client will be displayed as shown below:



PivotGauge

Overview

The **PivotGauge** control for **Essential ASP.NET MVC** reads both **OLAP** and **Relational** datasource.

Key Features

The key features of the **PivotGauge** control is as follows:

- **Data source:** Supports OLAP data binding with Microsoft Analysis Service database, **XML/A** data sources and Relational data sources.
- **Tooltip:** Displays the value and goal information in the tooltip.
- **Multiple gauges and Layouts:** Support to customize the layout while rendering multiple controls.
- **Frame types:** Built-in frame types provide a rich appearance of control.
- **Indicators:** Displays the active/inactive state of PivotGauge.
- **Ranges:** Highlighting the range of values in scale.
- **Pointers:** Points the actual value and goal information.
- **Header labels:** Support to show or hide header labels and indicators.

Getting Started

Getting Started

Important

Starting with v16.2.0.x, if you refer to Syncfusion assemblies from trial setup or from the NuGet feed, include a license key in your projects. Refer to this link to learn about registering Syncfusion license key in your ASP.NET Core application to use our components.

Creating a simple application with PivotGauge and Relational datasource (Client Mode)

This section covers the information required to populate a simple PivotGauge with Relational data completely on the client-side.

Project Initialization

Create a new **ASP.NET MVC Web Application** using Visual Studio IDE and name the project as **"PivotGaugeDemo"**.

Select the View engine as **'Razor'** and Project template as **'Internet Application'** and finally click **OK** button to create an application.

Now add the following dependency libraries as references into your MVC Web Application. In order to add them to your application, right-click on **References** in Solution Explorer and select Add Reference. Now in the **Reference Manager** dialog, under **Assemblies > Extension**, the following Syncfusion libraries will be found.

- Syncfusion.EJ
- Syncfusion.EJ.Export
- Syncfusion.EJ.Pivot
- Syncfusion.EJ.MVC

The version of Syncfusion libraries based on .NET Framework and MVC version are classified below. For example, version is illustrated as,

MVC Version	MVC Version of Syncfusion assembly	Base Version of Syncfusion assembly	System.Web.Mvc	System.Web.WebPages
MVC3	{{ site.mvc3releaseversion }}	{{ site.35esreleaseversion }}	3.0	1.0
MVC4	{{ site.mvc4releaseversion }}	{{ site.40esreleaseversion }}	4.0	2.0
MVC5	{{ site.mvc5releaseversion }}	{{ site.45esreleaseversion }}	5.0	3.0

Register the referred assemblies in "Web.config" files available inside Views folder and also at the root of the application.

XML

```
<compilation debug="true" targetFramework="4.0">
<assemblies>
……
……
<add assembly="Syncfusion.EJ, Version= {{ site.40esreleaseversion }},
Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.EJ.Pivot, Version= {{ site.40esreleaseversion
}}, Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
<add assembly="Syncfusion.EJ.Export, Version= {{ site.40esreleaseversion
}}, Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.EJ.Mvc, Version= {{ site.40esreleaseversion }},
Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
</assemblies>
</compilation>
```

Register the required namespaces in "Web.config" files available inside Views folder and also at the root of the application

XML

```
<namespaces>
……
……
<add namespace="Syncfusion.MVC.EJ" />
<add namespace="Syncfusion.JavaScript" />
</namespaces>
```

Note: Registering assemblies and namespaces earlier helps to include the control in view page with the help of intellisense.

Set the **UnobtrusiveJavaScriptEnabled** property to false under **appSettings** tag in "Web.config" file at the root folder.

XML

```
<configuration>
……
……
<appSettings>
……
……
<add key="UnobtrusiveJavaScriptEnabled" value="false" />
</appSettings>
</configuration>
```

Scripts and CSS Initialization

The scripts and style sheets that are mandatorily required to render PivotGauge widget in a MVC Web Application are mentioned in an appropriate order below:

1. ej.web.all.min.css
2. jQuery-3.0.0.min.js
3. ej.web.all.min.js

Click here here to know more about scripts and style sheets available online (CDN Link).

Scripts and style sheets are referred under the <head> tag in **_Layout.cshtml** file which is found inside **Views > Shared folder.**

ASPX-CS

```
<head>
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
<link href="http://cdn.syncfusion.com/{{ site.releaseversion
}}/js/web/flat-azure/ej.web.all.min.css" rel="stylesheet" type="text/css"
/>
<script src="http://cdn.syncfusion.com/js/assets/external/jquery-
3.0.0.min.js" type="text/javascript"></script>
<script src="http://cdn.syncfusion.com/{{ site.releaseversion
}}/js/web/ej.web.all.min.js" type="text/javascript"></script>
</head>
```

The script manager is initialized immediately after the RenderBody() function call in **_Layout.cshtml** file in-order to generate widget related scripts.

ASPX-CS

```
<body>
……
……
@RenderBody()
@(Html.EJ().ScriptManager())
</body>
```

Initialize PivotGauge

Before initializing, empty the contents of "Index.cshtml" file under Views > Home folder and add the following codes.

ASPX-CS

```
@using Syncfusion.JavaScript;
@Html.EJ().Pivot().PivotGauge("PivotGauge1")
```

Populate PivotGauge With Data

Let us now see how to populate the PivotGauge control using a sample JSON data as shown below.

ASPX-CS

```
@Html.EJ().Pivot().PivotGauge("PivotGauge1").ClientSideEvents(clientSideE
vents => clientSideEvents.Load("onLoad"))
<script type="text/javascript">
function onLoad(args) {
args.model.dataSource.data = [
{ Amount: 100, Country: "Canada", Product: "Bike" },
{ Amount: 200, Country: "Germany", Product: "Van" },
{ Amount: 300, Country: "Germany", Product: "Car" },
{ Amount: 150, Country: "United Kingdom", Product: "Bike" },
{ Amount: 200, Country: "Canada", Product: "Car" }
]
}
</script>
```

The JSON data is set to the **“Data”** property present inside the **“DataSource”** object. The **“DataSource”** object allows us to set the raw data input and the fields in the rows, columns, values and filters.

ASPX-CS

Copyright © 2001 - 2020 Syncfusion Inc.

```
@Html.EJ().Pivot().PivotGauge("PivotGauge1").ClientSideEvents(clientSideE
vents => clientSideEvents.Load("onLoad")).DataSource(dataSource =>
dataSource.Rows(rows => {
rows.FieldName("Country").FieldCaption("Country").Add();}).Columns(column
s => { columns.FieldName("Product").FieldCaption("Product").Add();
}).Values(values => { values.FieldName("Amount").Add();})).Scales(scale
=>
{
scale.ShowRanges(true).Radius(150).ShowScaleBar(true).Size(1).Border(bor
=> bor.Width(0.5)).ShowIndicators(true).ShowLabels(true).
Pointers(pointer =>
{
pointer.ShowBackNeedle(true).BackNeedleLength(20).Length(120).Width(7).Ad
d();
pointer.Type(PointerType.Marker).DistanceFromScale(5).Placement(PointerPl
acement.Center).BackgroundColor("#29A4D9").Length(25).Width(15).MarkerTyp
e(MarkerType.Diamond).Add();
}).
Ticks(ticks =>
{
ticks.Type(CircularTickTypes.Major).DistanceFromScale(2).Height(16).Width
(1).Color("#8c8c8c").Add();
ticks.Type(CircularTickTypes.Minor).Height(6).Width(1).DistanceFromScale(
2).Color("#8c8c8c").Add();
})
.Labels(labels => { labels.Color("#8c8c8c").Add(); })
.Ranges(ranges =>
{
ranges.DistanceFromScale(-5).BackgroundColor("#fc0606").Border(bor =>
bor.Color("#fc0606")).Add();
ranges.DistanceFromScale(-5).Add();
})
.CustomLabels(customLabel =>
{
customLabel.Position(location => location.X(180).Y(290)).Font(font =>
font.Size("10px").FontFamily("Segoe
UI").FontStyle("Normal")).Color("#666666").Add();
customLabel.Position(location => location.X(180).Y(320)).Font(font =>
font.Size("10px").FontFamily("Segoe
UI").FontStyle("Normal")).Color("#666666").Add();
customLabel.Position(location => location.X(180).Y(150)).Font(font =>
font.Size("12px").FontFamily("Segoe
UI").FontStyle("Normal")).Color("#666666").Add();
}).Add();
})
```

The above code will generate a simple PivotGauge as shown below.

Copyright © 2001 - 2020 Syncfusion Inc.

Creating a simple application with PivotGauge and Relational datasource (Server Mode)

This section covers the information required to create a simple PivotGauge bound to Relational datasource from server-side.

Note: ASP.NET MVC Web Application will contain a service that transfers data to server-side, processes and returns back to client-side for control rendering and re-rendering. The service utilized for communication could be either WCF or WebAPI based on user requirement.

Project Initialization

Create a new **ASP.NET MVC Web Application** using Visual Studio IDE and name the project as **"PivotGaugeDemo"**.

Select the View engine as **'Razor'** and Project template as **'Internet Application'** and finally click **OK** button to create an application.

Now add the following dependency libraries as references into your MVC Web Application. In order to add them to your application, right-click on **References** in Solution Explorer and select Add Reference. Now in the **Reference Manager** dialog, under **Assemblies > Extension**, the following Syncfusion libraries will be found.

Note: If you have installed any version of Essential Studio, then the location of Syncfusion libraries is [system drive:\Program Files (x86)\Syncfusion\Essential Studio\{{ site.releaseversion }}\Assemblies].

- Syncfusion.Compression.Base
- Syncfusion.Linq.Base
- Syncfusion.Olap.Base
- Syncfusion.PivotAnalysis.Base
- Syncfusion.EJ
- Syncfusion.EJ.Export

Copyright © 2001 - 2020 Syncfusion Inc.

- Syncfusion.EJ.Pivot
- Syncfusion.EJ.MVC

The version of Syncfusion libraries based on .NET Framework and MVC version are classified below. For example, version is illustrated as,

MVC Version	MVC Version of Syncfusion assembly	Base Version of Syncfusion assembly	System.Web.Mvc	System.Web.WebPages
MVC3	{{ site.mvc3releaseversion }}	{{ site.35esreleaseversion }}	3.0	1.0
MVC4	{{ site.mvc4releaseversion }}	{{ site.40esreleaseversion }}	4.0	2.0
MVC5	{{ site.mvc5releaseversion }}	{{ site.45esreleaseversion }}	5.0	3.0

Register the referred assemblies in "Web.config" files available inside Views folder and also at the root of the application.

XML

```
<compilation debug="true" targetFramework="4.0">
<assemblies>
……
……
<add assembly="Syncfusion.EJ, Version= {{ site.40esreleaseversion }},
Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.EJ.Pivot, Version= {{ site.40esreleaseversion
}}, Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.EJ.Export, Version= {{ site.40esreleaseversion
}}, Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.EJ.Mvc, Version= {{ site.40esreleaseversion }},
Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
</assemblies>
</compilation>
```

Register the required namespaces in "Web.config" files available inside Views folder and also at the root of the application

XML

```
<namespaces>
……
……
<add namespace="Syncfusion.MVC.EJ" />
<add namespace="Syncfusion.JavaScript" />
</namespaces>
```

Copyright © 2001 - 2020 Syncfusion Inc.

Note: Registering assemblies and namespaces earlier helps to include the control in view page with the help of intellisense.

Set the **UnobtrusiveJavaScriptEnabled** property to false under **appSettings** tag in "Web.config" file at the root folder.

XML

```
<configuration>
……
……
<appSettings>
……
……
<add key="UnobtrusiveJavaScriptEnabled" value="false" />
</appSettings>
</configuration>
```

Scripts and CSS Initialization

The scripts and style sheets that are mandatorily required to render PivotGauge widget in a MVC Web Application are mentioned in an appropriate order below:

1. ej.web.all.min.css
2. jQuery-3.0.0.min.js
3. ej.web.all.min.js

Click here here to know more about scripts and style sheets available online (CDN Link).

Scripts and style sheets are referred under the <head> tag in **_Layout.cshtml** file which is found inside **Views > Shared folder.**

ASPX-CS

```
<head>
<link href="http://cdn.syncfusion.com/{{ site.releaseversion
}}/js/web/flat-azure/ej.web.all.min.css" rel="stylesheet" type="text/css"
/>
<script src="http://cdn.syncfusion.com/js/assets/external/jquery-
3.0.0.min.js" type="text/javascript"></script>
<script src="http://cdn.syncfusion.com/{{ site.releaseversion
}}/js/web/ej.web.all.min.js" type="text/javascript"></script>
</head>
```

The script manager is initialized immediately after the RenderBody() function call in **_Layout.cshtml** file in-order to generate widget related scripts.

ASPX-CS

```
<body>
//....
//....
@RenderBody()
@(Html.EJ().ScriptManager())
</body>
```

Copyright © 2001 - 2020 Syncfusion Inc.

Control Initialization

Before initializing, empty the contents of **Index.cshtml** file under **Views > Home** folder and add the following codes. Register the namespaces at the top of the page and then add the control.

ASPX-CS

```
@using Syncfusion.JavaScript;
@Html.EJ().Pivot().PivotGauge("PivotGauge1").Url(Url.Content("/Relational
")).BackgroundColor("transparent").EnableTooltip(true).Scales(scale =>
{
scale.ShowRanges(true).Radius(150).ShowScaleBar(true).Size(1).Border(bor
=> bor.Width(0.5)).ShowIndicators(true).ShowLabels(true).
Pointers(pointer =>
{
pointer.ShowBackNeedle(true).BackNeedleLength(20).Length(120).Width(7).Ad
d();
pointer.Type(PointerType.Marker).DistanceFromScale(5).Placement(PointerPl
acement.Center).BackgroundColor("#29A4D9").Length(25).Width(15).MarkerTyp
e(MarkerType.Diamond).Add();
}).
Ticks(ticks =>
{
ticks.Type(CircularTickTypes.Major).DistanceFromScale(2).Height(16).Width
(1).Color("#8c8c8c").Add();
ticks.Type(CircularTickTypes.Minor).Height(6).Width(1).DistanceFromScale(
2).Color("#8c8c8c").Add();
})
.Labels(labels => { labels.Color("#8c8c8c").Add(); })
.Ranges(ranges =>
{
ranges.DistanceFromScale(-5).BackgroundColor("#fc0606").Border(bor =>
bor.Color("#fc0606")).Add();
ranges.DistanceFromScale(-5).Add();
})
.CustomLabels(customLabel =>
{
customLabel.Position(location => location.X(180).Y(290)).Font(font =>
font.Size("10px").FontFamily("Segoe
UI").FontStyle("Normal")).Color("#666666").Add();
customLabel.Position(location => location.X(180).Y(320)).Font(font =>
font.Size("10px").FontFamily("Segoe
UI").FontStyle("Normal")).Color("#666666").Add();
customLabel.Position(location => location.X(180).Y(150)).Font(font =>
font.Size("12px").FontFamily("Segoe
UI").FontStyle("Normal")).Color("#666666").Add();
}).Add();
}).ClientSideEvents(oCli => { oCli.RenderSuccess("loadPivotGaugeTheme");
}).IsResponsive(true).LabelFormatSettings(labelFormatSettings=>
labelFormatSettings.DecimalPlaces(2))
```

The **"Url"** property in PivotGauge widget points the service endpoint, where data are processed and fetched in the form of JSON. The services used in PivotGauge widget as endpoint are WCF and WebAPI.

Copyright © 2001 - 2020 Syncfusion Inc.

Note: The above "Index.cshtml" contains WebAPI URL, which is "/Relational". If WCF service is used as endpoint, the URL would look like "/RelationalService.svc".

WebAPI

Adding a WebAPI Controller

To add a WebAPI controller in an existing MVC Web Application, right-click on the project in Solution Explorer and select **Add > New Item**. In the **Add New Item** window, select **WebAPI Controller Class** and name it as **"RelationalController.cs"**, click **Add**.

Now, WebAPI controller is added to the application successfully with the file **"RelationalController.cs"**.

Note: While adding WebAPI Controller Class, name it with the suffix "Controller" that is mandatory. For example, in demo the controller is named as "RelationalController".

Next, remove all the existing methods such as "Get", "Post", "Put" and "Delete" present inside RelationalController.cs file.

C#

```
namespace PivotGaugeDemo
{
public class RelationalController: ApiController
{
}
}
```

List of Namespaces

Following are the list of namespaces to be added on top of the main class inside RelationalController.cs file.

C#

```
using Syncfusion.JavaScript;
using Syncfusion.PivotAnalysis.Base;
namespace PivotGaugeDemo
{
public class RelationalController : ApiController
{
}
}
```

Datasource Initialization

A simple collection is provided as a datasource for the PivotGauge in this demo section. This datasource is placed inside a separate class "ProductSales" in RelationalController.cs file. Refer to the following code example.

C#

```
namespace PivotGaugeDemo
{
//....
//....
internal class ProductSales
{
```

```
public string Product { get; set; }
public string Date { get; set; }
public string Country { get; set; }
public string State { get; set; }
public int Quantity { get; set; }
public double Amount { get; set; }
public static ProductSalesCollection GetSalesData()
{
/// Geography
string[] countries = new string[] { "Australia", "Canada", "France",
"Germany", "United Kingdom", "United States" };
string[] ausStates = new string[] { "New South Wales", "Queensland",
"South Australia", "Tasmania", "Victoria" };
string[] canadaStates = new string[] { "Alberta", "British Columbia",
"Brunswick", "Manitoba", "Ontario", "Quebec" };
string[] franceStates = new string[] { "Charente-Maritime", "Essonne",
"Garonne (Haute)", "Gers", };
string[] germanyStates = new string[] { "Bayern", "Brandenburg",
"Hamburg", "Hessen", "Nordrhein-Westfalen", "Saarland" };
string[] ukStates = new string[] { "England" };
string[] ussStates = new string[] { "New York", "North Carolina",
"Alabama", "California", "Colorado", "New Mexico", "South Carolina" };
/// Time
string[] dates = new string[] { "FY 2005", "FY 2006", "FY 2007", "FY
2008", "FY 2009" };
/// Products
string[] products = new string[] { "Bike", "Van", "Car" };
Random r = new Random(123345345);
int numberOfRecords = 2000;
ProductSalesCollection listOfProductSales = new ProductSalesCollection();
for (int i = 0; i < numberOfRecords; i++)
{
ProductSales sales = new ProductSales();
sales.Country = countries[r.Next(1, countries.GetLength(0))];
sales.Quantity = r.Next(1, 12);
/// 1 percent discount for 1 quantity
double discount = (30000 * sales.Quantity) *
(double.Parse(sales.Quantity.ToString()) / 100);
sales.Amount = (30000 * sales.Quantity) - discount;
sales.Date = dates[r.Next(r.Next(dates.GetLength(0) + 1))];
sales.Product = products[r.Next(r.Next(products.GetLength(0) + 1))];
switch (sales.Product)
{
case "Car":
{
sales.Date = "FY 2005";
break;
}
}
switch (sales.Country)
{
case "Australia":
{
sales.State = ausStates[r.Next(ausStates.GetLength(0))];
break;
}
case "Canada":
```

```
{
sales.State = canadaStates[r.Next(canadaStates.GetLength(0))];
break;
}
case "France":
{
sales.State = franceStates[r.Next(franceStates.GetLength(0))];
break;
}
case "Germany":
{
sales.State = germanyStates[r.Next(germanyStates.GetLength(0))];
break;
}
case "United Kingdom":
{
sales.State = ukStates[r.Next(ukStates.GetLength(0))];
break;
}
case "United States":
{
sales.State = ussStates[r.Next(ussStates.GetLength(0))];
break;
}
}
listOfProductSales.Add(sales);
}
return listOfProductSales;
}
public override string ToString()
{
return string.Format("{0}-{1}-{2}", this.Country, this.State,
this.Product);
}
public class ProductSalesCollection : List<ProductSales>
{
}
}
}
```

Service methods in WebAPI Controller

Now you need to define the service methods inside RelationalController class, found inside RelationalController.cs file, created while adding WebAPI Controller Class to your Web Application.

C#

```
namespace PivotGaugeDemo
{
public class RelationalController : ApiController
{
PivotGauge pivotGauge = new PivotGauge();
[HttpPost]
[ActionName("InitializeGauge")]
public Dictionary<string, object> InitializeGauge(Dictionary<string,
object> jsonResult)
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
{
pivotGauge.PivotReport = BindDefaultData();
return pivotGauge.GetJsonData(jsonResult["action"].ToString(),
ProductSales.GetSalesData());
}
private PivotReport BindDefaultData()
{
PivotReport pivotSetting = new PivotReport();
pivotSetting.PivotRows.Add(new PivotItem { FieldMappingName = "Date",
FieldHeader = "Date", TotalHeader = "Total" });
pivotSetting.PivotColumns.Add(new PivotItem { FieldMappingName =
"Product", FieldHeader = "Product", TotalHeader = "Total" });
pivotSetting.PivotCalculations.Add(new PivotComputationInfo {
CalculationName = "Amount", Description = "Amount", FieldHeader =
"Amount", FieldName = "Amount", Format = "C", SummaryType =
Syncfusion.PivotAnalysis.Base.SummaryType.DoubleTotalSum });
return pivotSetting;
}
}
}
```

Configure routing in WebAPIConfig Class

Open the "WebAPIConfig.cs" file found in **App_Start** folder. Then routing could be configured as shown in the following code example.

C#

```
public static class WebApiConfig
{
public static void Register(HttpConfiguration config)
{
config.Routes.MapHttpRoute(
name: "DefaultApi",
routeTemplate: "{controller}/{action}/{id}",
defaults: new { id = RouteParameter.Optional }
);
}
}
```

Now, **PivotGauge** will be rendered as shown in the below figure.

Copyright © 2001 - 2020 Syncfusion Inc.

WCF

This section demonstrates the utilization of WCF service as endpoint binding Relational datasource to a simple PivotGauge. For more details on this topic, click here.

Getting Started

Important

Starting with v16.2.0.x, if you refer to Syncfusion assemblies from trial setup or from the NuGet feed, include a license key in your projects. Refer to this link to learn about registering Syncfusion license key in your ASP.NET Core application to use our components.

Creating a simple application with PivotGauge and OLAP datasource (Client Mode)

This section covers the information required to populate a simple PivotGauge with OLAP data completely on the client-side.

Project Initialization

Create a new **ASP.NET MVC Web Application** using Visual Studio IDE and name the project as **"PivotGaugeDemo"**.

Select the View engine as **'Razor'** and Project template as **'Internet Application'** and finally click **OK** button to create an application.

Now add the following dependency libraries as references into your MVC Web Application. In order to add them to your application, right-click on **References** in Solution Explorer and select Add Reference. Now in the **Reference Manager** dialog, under **Assemblies > Extension**, the following Syncfusion libraries will be found.

- Syncfusion.EJ
- Syncfusion.EJ.Export
- Syncfusion.EJ.Pivot

Copyright © 2001 - 2020 Syncfusion Inc.

- Syncfusion.EJ.MVC

The version of Syncfusion libraries based on .NET Framework and MVC version are classified below. For example, version is illustrated as,

MVC Version	MVC Version of Syncfusion assembly	Base Version of Syncfusion assembly	System.Web.Mvc	System.Web.WebPages
MVC3	{{ site.mvc3releaseversion }}	{{ site.35esreleaseversion }}	3.0	1.0
MVC4	{{ site.mvc4releaseversion }}	{{ site.40esreleaseversion }}	4.0	2.0
MVC5	{{ site.mvc5releaseversion }}	{{ site.45esreleaseversion }}	5.0	3.0

Register the referred assemblies in "Web.config" files available inside Views folder and also at the root of the application.

XML

```
<compilation debug="true" targetFramework="4.0">
<assemblies>
……
……
<add assembly="Syncfusion.EJ, Version= {{ site.40esreleaseversion }},
Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.EJ.Pivot, Version= {{ site.40esreleaseversion
}}, Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.EJ.Export, Version= {{ site.40esreleaseversion
}}, Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.EJ.Mvc, Version= {{ site.40esreleaseversion }},
Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
</assemblies>
</compilation>
```

Register the required namespaces in "Web.config" files available inside Views folder and also at the root of the application

XML

```
<namespaces>
……
……
<add namespace="Syncfusion.MVC.EJ" />
<add namespace="Syncfusion.JavaScript" />
</namespaces>
```

Copyright © 2001 - 2020 Syncfusion Inc.

Note: Registering assemblies and namespaces earlier helps to include the control in view page with the help of intellisense.

Set the **UnobtrusiveJavaScriptEnabled** property to false under **appSettings** tag in Web.config file at the root folder.

XML

```
<configuration>
……
……
<appSettings>
……
……
<add key="UnobtrusiveJavaScriptEnabled" value="false" />
</appSettings>
</configuration>
```

Scripts and CSS Initialization

The scripts and style sheets that are mandatorily required to render PivotGauge widget in a MVC Web Application are mentioned in an appropriate order below:

1. ej.web.all.min.css
2. jQuery-3.0.0.min.js
3. ej.web.all.min.js

Click here here to know more about scripts and style sheets available online (CDN Link).

Scripts and style sheets are referred under the <head> tag in **_Layout.cshtml** file which is found inside **Views > Shared folder.**

ASPX-CS

```
<head>
<link href="http://cdn.syncfusion.com/{{ site.releaseversion
}}/js/web/flat-azure/ej.web.all.min.css" rel="stylesheet" type="text/css"
/>
<script src="http://cdn.syncfusion.com/js/assets/external/jquery-
3.0.0.min.js" type="text/javascript"></script>
<script src="http://cdn.syncfusion.com/{{ site.releaseversion
}}/js/web/ej.web.all.min.js" type="text/javascript"></script>
</head>
```

The script manager is initialized immediately after the RenderBody() function call in **_Layout.cshtml** file in-order to generate widget related scripts.

ASPX-CS

```
<body>
……
……
@RenderBody()
@(Html.EJ().ScriptManager())
</body>
```

Copyright © 2001 - 2020 Syncfusion Inc.

Initialize PivotGauge

Before initializing, empty the contents of "Index.cshtml" file under Views > Home folder and add the following codes.

ASPX-CS

```
@using Syncfusion.JavaScript;
@Html.EJ().Pivot().PivotGauge("PivotGauge1")
```

Populate PivotGauge With DataSource

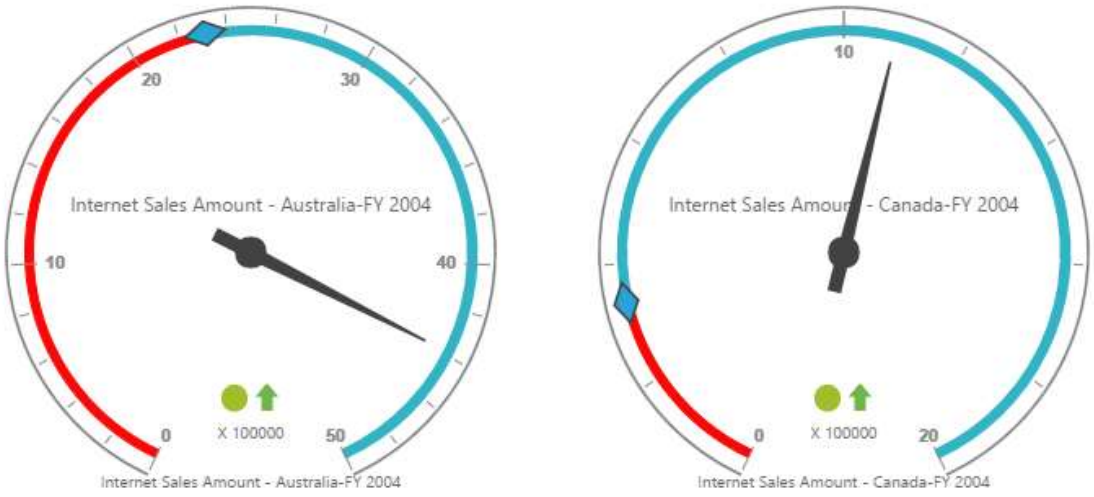
Initializes the OLAP datasource for PivotGauge widget as shown below.

HTML

```
@Html.EJ().Pivot().PivotGauge("PivotGauge1").DataSource(dataSource =>
dataSource.Rows(rows => { rows.FieldName("[Date].[Fiscal]").Add();
}).Columns(columns => { columns.FieldName("[Customer].[Customer
Geography]").Add(); }).Values(values => { values.Measures(measures => {
measures.FieldName("[Measures].[Internet Sales Amount]").Add();
measures.FieldName("[Measures].[Internet Revenue Status]").Add();
measures.FieldName("[Measures].[Internet Revenue Trend]").Add();
measures.FieldName("[Measures].[Internet Revenue Goal]").Add();
}).Axis(AxisName.Column).Add(); })
.Data("http://bi.syncfusion.com/olap/msmdpump.dll").Catalog("Adventure
Works DW 2008 SE").Cube("Adventure Works")).Scales(scale =>
{
scale.ShowRanges(true).Radius(150).ShowScaleBar(true).Size(1).Border(bor
=> bor.Width(0.5)).ShowIndicators(true).ShowLabels(true).
Pointers(pointer =>
{
pointer.ShowBackNeedle(true).BackNeedleLength(20).Length(120).Width(7).Ad
d();
pointer.Type(PointerType.Marker).DistanceFromScale(5).Placement(PointerPl
acement.Center).BackgroundColor("#29A4D9").Length(25).Width(15).MarkerTyp
e(MarkerType.Diamond).Add();
}).
Ticks(ticks =>
{
ticks.Type(CircularTickTypes.Major).DistanceFromScale(2).Height(16).Width
(1).Color("#8c8c8c").Add();
ticks.Type(CircularTickTypes.Minor).Height(6).Width(1).DistanceFromScale(
2).Color("#8c8c8c").Add();
})
.Labels(labels => { labels.Color("#8c8c8c").Add(); })
.Ranges(ranges =>
{
ranges.DistanceFromScale(-5).BackgroundColor("#fc0606").Border(bor =>
bor.Color("#fc0606")).Add();
ranges.DistanceFromScale(-5).Add();
})
.CustomLabels(customLabel =>
{
customLabel.Position(location => location.X(180).Y(290)).Font(font =>
font.Size("10px").FontFamily("Segoe
UI").FontStyle("Normal")).Color("#666666").Add();
```

```
customLabel.Position(location => location.X(180).Y(320)).Font(font =>
font.Size("10px").FontFamily("Segoe
UI").FontStyle("Normal")).Color("#666666").Add();
customLabel.Position(location => location.X(180).Y(150)).Font(font =>
font.Size("12px").FontFamily("Segoe
UI").FontStyle("Normal")).Color("#666666").Add();
}).Add();
})
```

The above code will generate a simple PivotGauge as shown in below figure.



Creating a simple application with PivotGauge and OLAP datasource (Server Mode)

This section covers the information required to create a simple PivotGauge bound to OLAP datasource.

Note: ASP.NET MVC Web Application will contain a service that transfers data to server-side, processes and returns back to client-side for control rendering and re-rendering. The service utilized for communication could be either WCF or WebAPI based on user requirement.

Project Initialization

Create a new **ASP.NET MVC Web Application** using Visual Studio IDE and name the project as **"PivotGaugeDemo"**.

Select the View engine as **'Razor'** and Project template as **'Internet Application'** and finally click **OK** button to create an application.

Now add the following dependency libraries as references into your MVC Web Application. In order to add them to your application, right-click on **References** in Solution Explorer and select **Add Reference**. Now in the **Reference Manager** dialog, under **Assemblies > Extension**, the following Syncfusion libraries will be found.

Note: If you have installed any version of SQL Server Analysis Service (SSAS) or Microsoft ADOMD.NET utility, then the location of Microsoft.AnalysisServices.AdomdClient library is [system drive:\Program Files (x86)\Microsoft.NET\ADOMD.NET]. And if you have installed any version of Essential Studio, then the location of Syncfusion libraries is [system drive:\Program Files (x86)\Syncfusion\Essential Studio\{{ site.releaseversion }}\Assemblies].

- Microsoft.AnalysisServices.AdomdClient
- Syncfusion.Compression.Base
- Syncfusion.Linq.Base
- Syncfusion.Olap.Base
- Syncfusion.PivotAnalysis.Base
- Syncfusion.EJ
- Syncfusion.EJ.Export
- Syncfusion.EJ.Pivot
- Syncfusion.EJ.MVC

The version of Syncfusion libraries based on .NET Framework and MVC version are classified below. For example, version is illustrated as,

MVC Version	MVC Version of Syncfusion assembly	Base Version of Syncfusion assembly	System.Web.Mvc	System.Web.WebPages
MVC3	{{ site.mvc3releaseversion }}	{{ site.35esreleaseversion }}	3.0	1.0
MVC4	{{ site.mvc4releaseversion }}	{{ site.40esreleaseversion }}	4.0	2.0
MVC5	{{ site.mvc5releaseversion }}	{{ site.45esreleaseversion }}	5.0	3.0

Register the referred assemblies in Web.config files available inside Views folder and also at the root of the application.

XML

```
<compilation debug="true" targetFramework="4.0">
<assemblies>
……
……
<add assembly="Syncfusion.EJ, Version= {{ site.40esreleaseversion }},
Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.EJ.Pivot, Version= {{ site.40esreleaseversion
}}, Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.EJ.Export, Version= {{ site.40esreleaseversion
}}, Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.EJ.Mvc, Version= {{ site.40esreleaseversion }},
Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
</assemblies>
</compilation>
```

Register the required namespaces in "Web.config" files available inside Views folder and also at the root of the application.

XML

```
<namespaces>
……
……
<add namespace="Syncfusion.MVC.EJ" />
<add namespace="Syncfusion.JavaScript" />
</namespaces>
```

Note: Registering assemblies and namespaces earlier helps to include the control in view page with the help of intellisense.

Set the **UnobtrusiveJavaScriptEnabled** property to false under **appSettings** tag in Web.config file at the root folder.

XML

```
<configuration>
……
……
<appSettings>
……
……
<add key="UnobtrusiveJavaScriptEnabled" value="false" />
</appSettings>
</configuration>
```

Scripts and CSS Initialization

The scripts and style sheets that are mandatorily required to render PivotGauge widget in a MVC Web Application are mentioned in an appropriate order below:

1. ej.web.all.min.css
2. jQuery-3.0.0.min.js
3. ej.web.all.min.js

Click here here to know more about scripts and style sheets available online (CDN Link).

Scripts and style sheets are referred under the **head** tag in **_Layout.cshtml** file which is found inside **Views > Shared folder.**

ASPX-CS

```
<head>
<link href="http://cdn.syncfusion.com/{{ site.releaseversion
}}/js/web/flat-azure/ej.web.all.min.css" rel="stylesheet" type="text/css"
/>
<script src="http://cdn.syncfusion.com/js/assets/external/jquery-
3.0.0.min.js" type="text/javascript"></script>
<script src="http://cdn.syncfusion.com/{{ site.releaseversion
}}/js/web/ej.web.all.min.js" type="text/javascript"></script>
</head>
```

The script manager is initialized immediately after the `RenderBody()` function call in **_Layout.cshtml** file in-order to generate widget related scripts.

Copyright © 2001 - 2020 Syncfusion Inc.

ASPX-CS

```
<body>
……
……
@RenderBody()
@(Html.EJ().ScriptManager())
</body>
```

Control Initialization

Before initializing, empty the contents of **Index.cshtml** file under **Views > Home** folder and add the following codes. Register the namespaces at the top of the page and then add the control.

ASPX-CS

```
@using Syncfusion.JavaScript;
@Html.EJ().Pivot().PivotGauge("PivotGauge1").Url(Url.Content("/Olap")).Ba
ckgroundColor("transparent").EnableTooltip(true).Scales(scale =>
{
scale.ShowRanges(true).Radius(150).ShowScaleBar(true).Size(1).Border(bor
=> bor.Width(0.5)).ShowIndicators(true).ShowLabels(true).
Pointers(pointer =>
{
pointer.ShowBackNeedle(true).BackNeedleLength(20).Length(120).Width(7).Ad
d();
pointer.Type(PointerType.Marker).DistanceFromScale(5).Placement(PointerPl
acement.Center).BackgroundColor("#29A4D9").Length(25).Width(15).MarkerTyp
e(MarkerType.Diamond).Add();
}).
Ticks(ticks =>
{
ticks.Type(CircularTickTypes.Major).DistanceFromScale(2).Height(16).Width
(1).Color("#8c8c8c").Add();
ticks.Type(CircularTickTypes.Minor).Height(6).Width(1).DistanceFromScale(
2).Color("#8c8c8c").Add();
})
.Labels(labels => { labels.Color("#8c8c8c").Add(); })
.Ranges(ranges =>
{
ranges.DistanceFromScale(-5).BackgroundColor("#fc0606").Border(bor =>
bor.Color("#fc0606")).Add();
ranges.DistanceFromScale(-5).Add();
})
.CustomLabels(customLabel =>
{
customLabel.Position(location => location.X(180).Y(290)).Font(font =>
font.Size("10px").FontFamily("Segoe
UI").FontStyle("Normal")).Color("#666666").Add();
customLabel.Position(location => location.X(180).Y(320)).Font(font =>
font.Size("10px").FontFamily("Segoe
UI").FontStyle("Normal")).Color("#666666").Add();
customLabel.Position(location => location.X(180).Y(150)).Font(font =>
font.Size("12px").FontFamily("Segoe
UI").FontStyle("Normal")).Color("#666666").Add();
}).Add();
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
}).ClientSideEvents(oCli => { oCli.RenderSuccess("loadPivotGaugeTheme");
}).IsResponsive(true).LabelFormatSettings(labelFormatSettings=>
labelFormatSettings.DecimalPlaces(2))
```

The **"Url"** property in PivotGauge widget points the service endpoint, where data are processed and fetched in the form of JSON. The services used in PivotGauge widget as endpoint are WCF and WebAPI.

Note: The above "Index.cshtml" contains WebAPI URL, which is "/Olap". If WCF service is used as endpoint, the URL would look like "/OlapService.svc".

WebAPI

Adding a WebAPI Controller

To add a WebAPI controller in your existing Web Application, right-click on the project in Solution Explorer and select **Add > New Item.** In the **Add New Item** window, select **WebAPI Controller Class** and name it as "OlapController.cs", click **Add.**

Now WebAPI controller is added into your application successfully which in-turn comprise of the following file. The utilization of this file will be explained in the following sections.

- OlapController.cs

Note: While adding WebAPI Controller Class, name it with the suffix "Controller" that is mandatory. For example, in demo the controller is named as "OlapController".

Next, remove all the existing methods such as "Get", "Post", "Put" and "Delete" present inside OlapController.cs file.

C#

```
namespace PivotGaugeDemo
{
public class OlapController : ApiController
{
}
}
```

List of Namespaces

Following are the list of namespaces to be added on top of the main class inside OlapController.cs file.

C#

```
using Syncfusion.Olap.Manager;
using Syncfusion.Olap.Reports;
using Syncfusion.JavaScript;
namespace PivotGaugeDemo
{
public class OlapController : ApiController
{
}
}
```

Datasource Initialization

Now, the connection string to connect OLAP Cube and PivotGauge instances are created immediately inside the main class in OlapController.cs file.

C#

```
namespace PivotGaugeDemo
{
public class OlapController : ApiController
{
string connectionString = "Data
Source=http://bi.syncfusion.com/olap/msmdpump.dll; Initial
Catalog=Adventure Works DW 2008 SE;";
PivotGauge pivotGauge = new PivotGauge();
//Other codes
}
}
```

Service methods in WebAPI Controller

Now you need to define the service methods inside OlapController class, found inside OlapController.cs file, created while adding WebAPI Controller Class to your Web Application.

C#

```
namespace PivotGaugeDemo
{
public class OlapController : ApiController
{
string connectionString = "Data
Source=http://bi.syncfusion.com/olap/msmdpump.dll; Initial
Catalog=Adventure Works DW 2008 SE;";
PivotGauge pivotGauge = new PivotGauge();
[System.Web.Http.ActionName("InitializeGauge")]
[System.Web.Http.HttpPost]
public Dictionary<string, object> InitializeGauge(Dictionary<string,
object> jsonResult)
{
OlapDataManager DataManager = new OlapDataManager(connectionString);
DataManager.SetCurrentReport(CreateOlapReport());
return pivotGauge.GetJsonData(jsonResult["action"].ToString(),
DataManager);
}
private OlapReport CreateOlapReport()
{
OlapReport olapReport = new OlapReport();
olapReport.Name = "Default Report";
olapReport.CurrentCubeName = "Adventure Works";
DimensionElement dimensionElementColumn = new DimensionElement();
//Specifying the Name for the Dimension Element
dimensionElementColumn.Name = "Customer";
dimensionElementColumn.AddLevel("Customer Geography", "Country");
MeasureElements measureElementColumn = new MeasureElements();
//Specifying the Name for the Measure Element
measureElementColumn.Elements.Add(new MeasureElement { Name = "Customer
Count" });
DimensionElement dimensionElementRow = new DimensionElement();
//Specifying the Dimension Name
```

```
dimensionElementRow.Name = "Date";
dimensionElementRow.AddLevel("Fiscal", "Fiscal Year");
///Adding Row Members
olapReport.SeriesElements.Add(dimensionElementRow);
///Adding Column Members
olapReport.CategoricalElements.Add(dimensionElementColumn);
///Adding Measure Element
olapReport.CategoricalElements.Add(measureElementColumn);
return olapReport;
}
}
}
```

Configure routing in WebAPIConfig Class

Open the WebAPIConfig.cs file found in **App_Start** folder. Then routing could be configured as shown in the following code example.

C#

```
public static class WebApiConfig
{
public static void Register(HttpConfiguration config)
{
config.Routes.MapHttpRoute(
name: "DefaultApi",
routeTemplate: "{controller}/{action}/{id}",
defaults: new { id = RouteParameter.Optional }
);
}
}
```

Now, PivotGauge will be rendered with the provided data as shown below.

WCF

This section demonstrates the utilization of WCF service as endpoint binding OLAP datasource to a simple PivotGauge. For more details on this topic, click here.

Data Binding

DataBinding

Binding PivotGauge to Collection

This section demonstrates binding of a collection to the PivotGauge control as datasource. For more information on this datasource refer to the following links.

When you are using WebAPI controller, refer to the “Datasource Initialization” section under the following link.

If you are using WCF Service, refer the "Datasource Initialization" section below.

WCF

Adding a WCF Service

To add a WCF service in an existing application, right-click on the project in Solution Explorer and select **Add > New Item**. In the **Add New Item** window, select **WCF Service** and name it as **“RelationalService.svc”** and click **Add**.

Now WCF service is added into your application successfully which in-turn comprise of the following files. The utilization of these files will be explained in the immediate sections.

- RelationalService.svc
- RelationalService.svc.cs
- IRelationalService.cs

Configuring WCF Service Class

Remove the “DoWork” method present inside both RelationalService.svc.cs and IRelationalService.cs files. Next, add “AspNetCompatibilityRequirements” attribute on top of main class present inside RelationalService.svc.cs and set **“RequirementsMode”** value to **“Allowed”**.

C#

```
namespace PivotGaugeDemo
{
[AspNetCompatibilityRequirements(RequirementsMode =
AspNetCompatibilityRequirementsMode.Allowed)]
public class RelationalService : IRelationalService
{
}
}
```

List of Dependency Libraries

Next you need to add the below mentioned dependency libraries into your application. These libraries could be found in GAC (Global Assembly Cache) as well.

To add them to your application, right-click on **References** in Solution Explorer and select **Add Reference**. Now in the **Reference Manager** dialog, under **Assemblies > Extension**, the following Syncfusion libraries are found.

Copyright © 2001 - 2020 Syncfusion Inc.

Note: If you have installed any version of Essential Studio, then the location of Syncfusion libraries is [system drive:\Program Files (x86)\Syncfusion\Essential Studio\{{ site.releaseversion }}\Assemblies].

- Syncfusion.Compression.Base
- Syncfusion.Linq.Base
- Syncfusion.Olap.Base
- Syncfusion.PivotAnalysis.Base
- Syncfusion.EJ
- Syncfusion.EJ.MVC
- Syncfusion.EJ.Export
- Syncfusion.EJ.Pivot

List of Namespaces

Following are the list of namespaces to be added on top of the main class inside RelationalService.svc.cs file.

C#

```
using System.ServiceModel.Activation;
using Syncfusion.JavaScript;
using Syncfusion.PivotAnalysis.Base;
namespace PivotGaugeDemo
{
[AspNetCompatibilityRequirements(RequirementsMode =
AspNetCompatibilityRequirementsMode.Allowed)]
public class RelationalService : IRelationalService
{
}
}
```

Datasource Initialization

A simple collection is provided as a datasource for our PivotGauge in this demo section. This datasource is placed inside a separate class named “ProductSales” in RelationalService.svc.cs file. Refer to the following code example.

C#

```
namespace PivotGaugeDemo
{
[AspNetCompatibilityRequirements(RequirementsMode =
AspNetCompatibilityRequirementsMode.Allowed)]
public class RelationalService : IRelationalService
{
//....
//....
}
internal class ProductSales
{
public string Product { get; set; }
public string Date { get; set; }
public string Country { get; set; }
public string State { get; set; }
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
public int Quantity { get; set; }
public double Amount { get; set; }
public static ProductSalesCollection GetSalesData()
{
/// Geography
string[] countries = new string[] { "Australia", "Canada", "France",
"Germany", "United Kingdom", "United States" };
string[] ausStates = new string[] { "New South Wales", "Queensland",
"South Australia", "Tasmania", "Victoria" };
string[] canadaStates = new string[] { "Alberta", "British Columbia",
"Brunswick", "Manitoba", "Ontario", "Quebec" };
string[] franceStates = new string[] { "Charente-Maritime", "Essonne",
"Garonne (Haute)", "Gers", };
string[] germanyStates = new string[] { "Bayern", "Brandenburg",
"Hamburg", "Hessen", "Nordrhein-Westfalen", "Saarland" };
string[] ukStates = new string[] { "England" };
string[] ussStates = new string[] { "New York", "North Carolina",
"Alabama", "California", "Colorado", "New Mexico", "South Carolina" };
/// Time
string[] dates = new string[] { "FY 2005", "FY 2006", "FY 2007", "FY
2008", "FY 2009" };
/// Products
string[] products = new string[] { "Bike", "Van", "Car" };
Random r = new Random(123345345);
int numberOfRecords = 2000;
ProductSalesCollection listOfProductSales = new ProductSalesCollection();
for (int i = 0; i < numberOfRecords; i++)
{
ProductSales sales = new ProductSales();
sales.Country = countries[r.Next(1, countries.GetLength(0))];
sales.Quantity = r.Next(1, 12);
/// 1 percent discount for 1 quantity
double discount = (30000 * sales.Quantity) *
(double.Parse(sales.Quantity.ToString()) / 100);
sales.Amount = (30000 * sales.Quantity) - discount;
sales.Date = dates[r.Next(r.Next(dates.GetLength(0) + 1))];
sales.Product = products[r.Next(r.Next(products.GetLength(0) + 1))];
switch (sales.Product)
{
case "Car":
{
sales.Date = "FY 2005";
break;
}
}
switch (sales.Country)
{
case "Australia":
{
sales.State = ausStates[r.Next(ausStates.GetLength(0))];
break;
}
case "Canada":
{
sales.State = canadaStates[r.Next(canadaStates.GetLength(0))];
break;
}
```

```
case "France":
{
sales.State = franceStates[r.Next(franceStates.GetLength(0))];
break;
}
case "Germany":
{
sales.State = germanyStates[r.Next(germanyStates.GetLength(0))];
break;
}
case "United Kingdom":
{
sales.State = ukStates[r.Next(ukStates.GetLength(0))];
break;
}
case "United States":
{
sales.State = ussStates[r.Next(ussStates.GetLength(0))];
break;
}
}
listOfProductSales.Add(sales);
}
return listOfProductSales;
}
public override string ToString()
{
return string.Format("{0}-{1}-{2}", this.Country, this.State,
this.Product);
}
public class ProductSalesCollection : List<ProductSales>
{
}
}
}
```

Service methods in WCF Service

First, you need to define the service methods inside IRelationalService interface, found in IRelationalService.cs file, created while adding WCF service to your application.

C#

```
namespace PivotGaugeDemo
{
[ServiceContract]
public interface IRelationalService
{
[OperationContract]
Dictionary<string, object> InitializeGauge(string action, string
customObject);
}
}
```

Copyright © 2001 - 2020 Syncfusion Inc.

Secondly, you need to elaborate the service methods inside the main class, found in RelationalService.svc.cs file.

C#

```
namespace PivotGaugeDemo
{
[AspNetCompatibilityRequirements(RequirementsMode =
AspNetCompatibilityRequirementsMode.Allowed)]
public class RelationalService : IRelationalService
{
PivotGauge pivotGauge = new PivotGauge();
public Dictionary<string, object> InitializeGauge(string action, string
customObject)
{
pivotGauge.PivotReport = this.BindDefaultData();
return pivotGauge.GetJsonData(action, ProductSales.GetSalesData());
}
private PivotReport BindDefaultData()
{
PivotReport pivotSetting = new PivotReport();
pivotSetting.PivotRows.Add(new PivotItem { FieldMappingName = "Date",
FieldHeader = "Date", TotalHeader = "Total" });
pivotSetting.PivotColumns.Add(new PivotItem { FieldMappingName =
"Product", FieldHeader = "Product", TotalHeader = "Total" });
pivotSetting.PivotCalculations.Add(new PivotComputationInfo {
CalculationName = "Amount", Description = "Amount", FieldHeader =
"Amount", FieldName = "Amount", Format = "C", SummaryType =
Syncfusion.PivotAnalysis.Base.SummaryType.DoubleTotalSum });
return pivotSetting;
}
}
.....
..... // Datasource initialization
.....
}
```

Configuring Web Configuration File

You can expose services through the properties such as binding, contract and address by using an endpoint.

1. Contract: This property indicates that the contract of the endpoint is exposing. Here you are referring to IRelationalService contract and hence it is PivotGaugeDemo.IRelationalService.
2. Binding: In your application, you use webHttpBinding to post and receive the requests and responses between the client-end and the service.
3. behaviorConfiguration: This property contains the name of the behavior to be used in the endpoint.

The endpointBehaviors are illustrated as follows.

XML

```
<system.serviceModel>
……
```

```
……
<services>
<service name="PivotGaugeDemo.RelationalService">
<endpoint address=""
behaviorConfiguration="PivotGaugeDemo.RelationalServiceAspNetAjaxBehavior
"
binding="webHttpBinding" contract="PivotGaugeDemo.IRelationalService" />
</service>
</services>
</system.serviceModel>
```

The endpointBehaviors contain all the behaviors for an endpoint. You can link each endpoint to the respective behavior only by using this name property.

XML

```
<system.serviceModel>
<behaviors>
<endpointBehaviors>
<behavior name="PivotGaugeDemo.RelationalServiceAspNetAjaxBehavior">
<enableWebScript />
</behavior>
</endpointBehaviors>
</behaviors>
……
……
</system.serviceModel>
```

Note: In this example, **"PivotGaugeDemo"** indicates the name and root namespace of the application created in Visual Studio IDE and **"RelationalService"** indicates the name of the WCF service created.

Configuring routing file

Routing configuration needs to be done in RouteConfig.cs file found under **AppStart** folder. The configuration would allow picking appropriate WCF service without any issues.

C#

```
public static void RegisterRoutes(RouteCollection routes) {
routes.IgnoreRoute("{resource}.axd/{*pathInfo}");
routes.IgnoreRoute("{resource}.svc/{*pathInfo}");
routes.IgnoreRoute("{resource}.svc");
routes.MapRoute(
name: "Default",
url: "{controller}/{action}/{id}",
defaults: new { controller = "Home", action = "Index", id =
UrlParameter.Optional }
);
}
```

Now, **PivotGauge** will be rendered as shown in the below figure.

Copyright © 2001 - 2020 Syncfusion Inc.

DataBinding

Binding PivotGauge to Offline Cube

To connect an OLAP Cube available in local machine, set the physical path of the Cube in the connection string. The following code example illustrates the same.

C#

```
string connectionString = @"DataSource = system
drive:\OfflineCube\Adventure_Works_Ext.cub; Provider = MSOLAP;";
OlapDataManager DataManager = new OlapDataManager(connectionString);
```

Binding PivotGauge to Cube in local SQL Server

To connect an OLAP Cube available in SQL Server Analysis Service in local machine, set the server name and database name in the connection string. When you have any credentials to connect your Cube, then set the “User ID” and “Password” attributes accordingly. The following code example illustrates the same.

C#

```
string connectionString = "Data source=localhost; Initial
Catalog=Adventure Works DW;";
OlapDataManager DataManager = new OlapDataManager(connectionString);
```

Binding PivotGauge to Cube in online SQL Server

To connect an OLAP Cube available in SQL Server Analysis Service in online server through **XML/A**, set the host server link and database name in the connection string. When you have any credentials to connect your Cube, then set the “User ID” and “Password” attributes accordingly. The following code example illustrates the same.

C#

Copyright © 2001 - 2020 Syncfusion Inc.

```
string connectionString = "Data
Source=http://bi.syncfusion.com/olap/msmdpump.dll; Initial
Catalog=Adventure Works DW 2008 SE;";
OlapDataManager DataManager = new OlapDataManager(connectionString);
```

Binding PivotGauge to Cube in online Mondrian Server

To connect an OLAP Cube available in Mondrian Server through **XML/A**, set the host server link and database name in the connection string. When you have any credentials to connect your Cube, then set the “User ID” and “Password” attributes accordingly. The following code example illustrates the same.

C#

```
string connectionString = @"Data Source =
http://localhost:8080/mondrian/xmla; Initial Catalog =FoodMart;";
OlapDataManager DataManager = new OlapDataManager(connectionString);
DataManager.DataProvider.ProviderName =
Syncfusion.Olap.DataProvider.Providers.Mondrian;
```

Binding PivotGauge to Cube in online ActivePivot Server

To connect an OLAP Cube available in ActivePivot Server through **XML/A**, set the host server link and database name in the connection string. When you have any credentials to connect your Cube, then set the “User ID” and “Password” attributes accordingly. The following code example illustrates the same.

C#

```
string connectionString = @"Data Source =
http://localhost:8080/cva_s/xmla; Initial Catalog = CVAS;";
OlapDataManager DataManager = new OlapDataManager(connectionString);
DataManager.DataProvider.ProviderName=Syncfusion.Olap.DataProvider.Provid
ers.ActivePivot;
```

WCF

Adding a WCF Service

To add a WCF service in an existing web application, right-click on the project in Solution Explorer and select **Add > New Item**. In the **Add New Item** window, select WCF Service and name it as **“OlapService.svc”**, click **Add**.

Now WCF service is added into your application successfully which in-turn comprise of the following files. The utilization of these files will be explained in the immediate sections.

- OlapService.svc
- OlapService.svc.cs
- IOlapService.cs

Configuring WCF Service Class

Remove the “DoWork” method present inside both OlapService.svc.cs and IOlapService.cs files. Next, add “AspNetCompatibilityRequirements” attribute on top of main class present inside OlapService.svc.cs and set “RequirementsMode” value to “Allowed”.

C#

```
namespace PivotGaugeDemo
{
[AspNetCompatibilityRequirements(RequirementsMode =
AspNetCompatibilityRequirementsMode.Allowed)]
public class OlapService : IOlapService
{
}
}
```

List of Dependency Libraries

Next you need to add the below mentioned dependency libraries into your Web Application. These libraries could be found in GAC (Global Assembly Cache) as well.

To add them to your Web Application, right-click on **References** in Solution Explorer and select **Add Reference**. Now in the **Reference Manager** dialog, under **Assemblies > Extension**, the following Syncfusion libraries are found.

Note: If you have installed any version of SQL Server Analysis Service (SSAS) or Microsoft ADOMD.NET utility, then the location of Microsoft.AnalysisServices.AdomdClient library is [system drive:\Program Files (x86)\Microsoft.NET\ADOMD.NET]. And if you have installed any version of Essential Studio, then the location of Syncfusion libraries is [system drive:\Program Files (x86)\Syncfusion\Essential Studio\{{ site.releaseversion }}\Assemblies].

- Microsoft.AnalysisServices.AdomdClient
- Syncfusion.Compression.Base
- Syncfusion.Linq.Base
- Syncfusion.Olap.Base
- Syncfusion.PivotAnalysis.Base
- Syncfusion.EJ
- Syncfusion.EJ.MVC
- Syncfusion.EJ.Export
- Syncfusion.EJ.Pivot

List of Namespaces

Following are the list of namespaces to be added on top of the main class inside OlapService.svc.cs file.

C#

```
using System.ServiceModel.Activation;
using Syncfusion.Olap.Manager;
using Syncfusion.Olap.Reports;
using Syncfusion.JavaScript;
using System.Collections.Generic;
namespace PivotGaugeDemo
{
[AspNetCompatibilityRequirements(RequirementsMode =
AspNetCompatibilityRequirementsMode.Allowed)]
public class OlapService : IOlapService
{
}
}
```

Copyright © 2001 - 2020 Syncfusion Inc.

Datasource Initialization

Now the connection string to connect OLAP Cube and PivotGauge instances are created immediately inside the main class in OlapService.svc.cs file.

C#

```
namespace PivotGaugeDemo
{
[AspNetCompatibilityRequirements(RequirementsMode =
AspNetCompatibilityRequirementsMode.Allowed)]
public class OlapService : IOlapService
{
PivotGauge pivotGauge = new PivotGauge();
string connectionString = "Data
Source=http://bi.syncfusion.com/olap/msmdpump.dll; Initial
Catalog=Adventure Works DW 2008 SE;";
//Other codes
}
}
```

Service methods in WCF Service

First, you need to define the service methods inside IOlapService interface, found in IOlapService.cs file, created while adding WCF Service to your Web Application.

C#

```
namespace PivotGaugeDemo
{
[ServiceContract]
public interface IOlapService
{
[OperationContract]
Dictionary<string, object> InitializeGauge(string action,string
customObject);
}
}
```

Secondly, you need to elaborate the service methods inside the main class, found in OlapService.svc.cs file

C#

```
namespace PivotGaugeDemo
{
[AspNetCompatibilityRequirements(RequirementsMode =
AspNetCompatibilityRequirementsMode.Allowed)]
public class OlapService : IOlapService
{
PivotGauge pivotGauge = new PivotGauge();
string connectionString = "Data
Source=http://bi.syncfusion.com/olap/msmdpump.dll; Initial
Catalog=Adventure Works DW 2008 SE;";
public Dictionary<string, object> InitializeGauge(string action,string
customObject)
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
{
OlapDataManager DataManager = new OlapDataManager(connectionString);
DataManager.SetCurrentReport(CreateOlapReport());
return pivotGauge.GetJsonData(action, DataManager);
}
private OlapReport CreateOlapReport()
{
OlapReport report = new OlapReport();
report.CurrentCubeName = "Adventure Works";
//Specifying the KPI name
KpiElements kpiElement = new KpiElements();
kpiElement.Elements.Add(new KpiElement { Name = "Internet Revenue",
ShowKPIGoal = true, ShowKPIStatus = true, ShowKPIValue = true,
ShowKPITrend = true });
DimensionElement dimensionElementColumn = new DimensionElement();
//Specifying the dimension name
dimensionElementColumn.Name = "Customer";
//Adding the level with the hierarchy Name
dimensionElementColumn.AddLevel("Customer Geography", "Country");
//Specifying the measure name
MeasureElements measureElementColumn = new MeasureElements();
measureElementColumn.Elements.Add(new MeasureElement { Name = "Internet
Sales Amount" });
DimensionElement dimensionElementRow = new DimensionElement();
//Specifying the dimension name
dimensionElementRow.Name = "Date";
//Adding the level with the hierarchy Name
dimensionElementRow.AddLevel("Fiscal", "Fiscal Year");
dimensionElementRow.Hierarchy.LevelElements["Fiscal Year"].Add("FY
2004");
dimensionElementRow.Hierarchy.LevelElements["Fiscal
Year"].IncludeAvailableMembers = true;
report.CategoricalElements.Add(dimensionElementColumn);
report.CategoricalElements.Add(kpiElement);
report.CategoricalElements.Add(measureElementColumn);
report.SeriesElements.Add(dimensionElementRow);
return report;
}
}
}
```

Configuring Web Configuration File

You can expose services through the properties such as binding, contract and address by using an endpoint.

- Contract: This property indicates that the contract of the endpoint is exposing. Here you are referring to **IOlapService** contract and hence it is **PivotGaugeDemo.IOlapService**.
- Binding: In your application, you use **webHttpBinding** to post and receive the requests and responses between the client-end and the service.
- behaviorConfiguration: This property contains the name of the behavior to be used in the endpoint.

The endpointBehaviors are illustrated as follows.

Copyright © 2001 - 2020 Syncfusion Inc.

XML

```
<system.serviceModel>
……
……
<services>
<service name="PivotGaugeDemo.OlapService">
<endpoint address=""
behaviorConfiguration="PivotGaugeDemo.OlapServiceAspNetAjaxBehavior"
binding="webHttpBinding" contract="PivotGaugeDemo.IOlapService" />
</service>
</services>
</system.serviceModel>
```

The endpointBehaviors contain all the behaviors for an endpoint. You can link each endpoint to the respective behavior only by using this name property.

XML

```
<system.serviceModel>
<behaviors>
<endpointBehaviors>
<behavior name="PivotGaugeDemo.OlapServiceAspNetAjaxBehavior">
<enableWebScript />
</behavior>
</endpointBehaviors>
</behaviors>
……
……
</system.serviceModel>
```

Note: In this example, “PivotGaugeDemo” indicates the name and root namespace of the Web Application created in Visual Studio IDE and “OlapService” indicates the name of the WCF service created.

Configuring routing file

Routing configuration needs to be done in RouteConfig.cs file found under **AppStart** folder. The configuration would allow picking appropriate WCF service without any issues.

C#

```
public static void RegisterRoutes(RouteCollection routes) {
routes.IgnoreRoute("{resource}.axd/{*pathInfo}");
routes.IgnoreRoute("{resource}.svc/{*pathInfo}");
routes.IgnoreRoute("{resource}.svc");
routes.MapRoute(
name: "Default",
url: "{controller}/{action}/{id}",
defaults: new { controller = "Home", action = "Index", id =
UrlParameter.Optional }
);
}
```

Now, PivotGauge is rendered with customer count over across different customer geographic locations.

Copyright © 2001 - 2020 Syncfusion Inc.

Frame Type

Full Circle

Full Circle frame lets the PivotGauge display in circular shape. Frame type can be set using the FrameType property. By default, the frame type is "FullCircle".

ASPX-CS

```
@Html.EJ().Pivot().PivotGauge("PivotGauge1").Frame(frame=> {
frame.FrameType(Frame.FullCircle) })
```

Copyright © 2001 - 2020 Syncfusion Inc.

Half Circle

Half Circle frame lets the PivotGauge to display in semi-circular shape. For this, frame type needs to be set as "HalfCircle" within the FrameType property and need to set StartAngle and SweepAngle for the PivotGauge in the Scales property.

ASPX-CS

```
@Html.EJ().Pivot().PivotGauge("PivotGauge1").Frame(frame=>frame.FrameType
(Frame.HalfCircle).HalfCircleFrameStartAngle(180).HalfCircleFrameEndAngle
(360)).Scales(scale =>{ scale.StartAngle(180).SweepAngle(180).Add();})
```

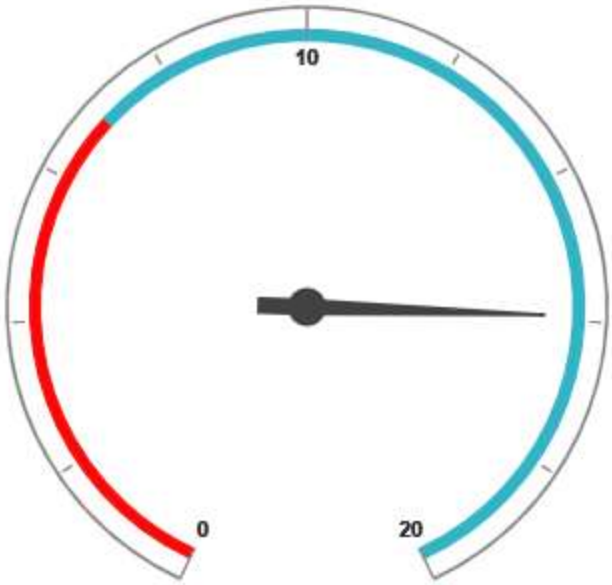
Scale

Adding Scale

Scale can be added within the PivotGauge control.

ASPX-CS

```
@Html.EJ().Pivot().PivotGauge("PivotGauge1").Scales(scales => {
scales.ShowScaleBar(true).Radius(150).Add(); })
```



Scale Customization

Pointer Cap

Pointer Cap is a circular shape element which is located at the center of the PivotGauge. It can be customized with the property PointerCap inside the scales option. Following are the properties used to customize its appearance.

- **Radius** – sets the radius of the pointer cap.
- **BorderColor** – sets the color of the pointer cap border.
- **BorderWidth** – sets the width of the pointer cap border.
- **BackgroundColor** – sets the background color of the pointer cap.

ASPX-CS

```
@Html.EJ().Pivot().PivotGauge("PivotGauge1").Scales(scales => {
scales.ShowScaleBar(true).PointerCap(pointerCap =>
pointerCap.Radius(5).BorderWidth(2).BorderColor("green").BackgroundColor(
"yellow")).Add();
})
```

Copyright © 2001 - 2020 Syncfusion Inc.

Appearance

The appearance of the scale can be customized through the following properties.

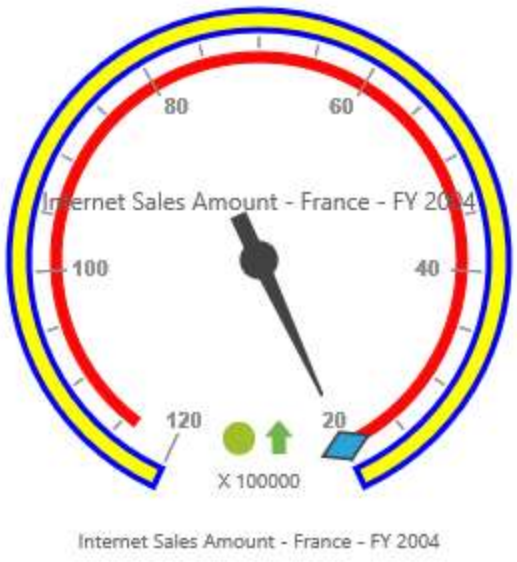
- **Radius** – sets the radius of the scale.
- **BackgroundColor** – sets the background color of the scale.
- **Border** – sets the border of the scale with color and width properties.
- **Size** – sets the size of the scale.
- **Minimum** – sets the least value of the scale.
- **Maximum** – sets the highest value of the scale.
- **MajorIntervalValue** – sets the interval between minor ticks in the scale.
- **MinorIntervalValue** – sets the interval between major ticks in the scale.
- **Direction** – sets the direction of the scale. By default it takes “Clockwise” direction.

The ShowIndicators, ShowTicks, ShowRanges, ShowPointers, and ShowScaleBar properties are used to enable/disable the indicators, ticks, ranges, pointers and scale bar respectively. By default, ShowTicks and ShowPointers are set to true, and other properties are set as false.

ASPX-CS

```
@Html.EJ().Pivot().PivotGauge("PivotGauge1").Scales(scales => {
scales.ShowScaleBar(true).Radius(120).BackgroundColor("yellow").Border(bo
rder =>
border.Color("blue").Width(3)).Size(10).Minimum(20).Maximum(120).MajorInt
ervalValue(20).MinorIntervalValue(5).Direction(Directions.CounterClockwis
e).Add();
})
```

Copyright © 2001 - 2020 Syncfusion Inc.



Pointers

Pointer Types

PivotGauge pointers has two types such as,

- Needle
- Marker

Needle type pointers are the default pointers which is always located at the center of the Gauge. Following shapes that are supported for the needle pointers are:

- Rectangle
- Triangle
- Trapezoid
- Arrow
- Image.

ASPX-CS

```
@Html.EJ().Pivot().PivotGauge("PivotGauge1").Scales(scales => {
scales.Pointers(pointers => {
pointers.Type(PointerType.Needle).NeedleType(NeedleType.Trapezoid).Add();
}).Add(); })
```

Copyright © 2001 - 2020 Syncfusion Inc.

For marker pointer, the available shapes are Rectangle, Triangle, Ellipse, Diamond, Pentagon, Circle, Slider, Pointer, Wedge, Trapezoid, RoundedRectangle and Image.

ASPX-CS

```
@Html.EJ().Pivot().PivotGauge("PivotGauge1").Scales(scales => {
scales.Pointers(pointers => {
pointers.Type(PointerType.Marker).MarkerType(MarkerType.Diamond).Add();
}).Add(); })
```

Copyright © 2001 - 2020 Syncfusion Inc.

Adding Pointer Collection

Pointer collection can be directly added to the scales option within the PivotGauge control.

ASPX-CS

```
@Html.EJ().Pivot().PivotGauge("PivotGauge1").Scales(scales => {
scales.Pointers(pointers => {
pointers.Type(PointerType.Needle).NeedleType(NeedleType.Triangle).Add();
pointers.Type(PointerType.Marker).MarkerType(MarkerType.Diamond).Add();
}).Add(); })
```

Appearance Customization

The appearance of the pointer can be customized through the following properties.

- **Border** – sets the "Color" and "Width" of the pointer border.
- **BackgroundColor** – sets the background color of the pointer.
- **Length** – sets the length of the pointer.
- **Width** – sets the width of the pointer.
- **Opacity** – sets the opacity of the pointer. By default, the value is 1.
- **Type** – sets the type of the pointer. By default, the type is "Needle".

ASPX-CS

```
@Html.EJ().Pivot().PivotGauge("PivotGauge1").Scales(scales => {
scales.Pointers(pointers => {
//For customizing needle pointer
pointers.Border(border =>
border.Color("green").Width(2)).BackgroundColor("yellow").Length(120).Wid
th(7).Opacity(0.6).Type(PointerType.Needle).NeedleType(NeedleType.Triangl
e).Add();
//For customizing marker pointer
```

```
pointers.Border(border =>
border.Color("green").Width(2)).BackgroundColor("yellow").Length(25).Widt
h(15).Opacity(0.8).Type(PointerType.Marker).MarkerType(MarkerType.Diamond
).Add();
}).Add();
})
```

Pointer Position

Pointer can be positioned with the help of below two properties.

- **DistanceFromScale** - defines the distance between scale and pointer. By default, the value is 0.
- **Placement** - defines the location of the pointer. By default, the value is "Center".

Note: Both the properties can be applied only if the pointer type is set to “Marker”. Needle pointer type appears only at the center of the control, which is its default position.

ASPX-CS

```
@Html.EJ().Pivot().PivotGauge("PivotGauge1").Scales(scales => {
scales.Pointers(pointers => {
pointers.Type(PointerType.Marker).DistanceFromScale(2).Placement(PointerP
lacement.Far).Add(); }).Add();
})
```

Copyright © 2001 - 2020 Syncfusion Inc.

Pointer Image

It is possible to replace the pointers with image. To view the pointers as image, we need to set the appropriate location in the ImageUrl property.

ASPX-CS

```
@Html.EJ().Pivot().PivotGauge("PivotGauge1").Scales(scales => {
scales.Pointers(pointers => {
//For replacing needle pointer with image
pointers.Type(PointerType.Needle).NeedleType(NeedleType.Image).ImageUrl("
../image.png").Add();
//For replacing marker pointer with image
pointers.Type(PointerType.Marker).MarkerType(MarkerType.Image).ImageUrl("
../image.png").Add();
}).Add();
})
```

Copyright © 2001 - 2020 Syncfusion Inc.

Pointer Value Text

To display the current value of the pointers in PivotGauge control, **"PointerValueText"** option inside pointers is used. Following are the properties used to enable and customize the pointer value text.

- **ShowValue** – enables the pointer value text by setting the property to "true". By default, its value is "true".
- **Distance** – sets the distance between pointer and text.
- **Color** – sets the color of the text.
- **Opacity** – sets the opacity of the text. By default, its value is 1.
- **Angle** – sets the rotation angle of the text. By default, its value is 0.
- **Font** – sets the font size, font style and font family of the text.

ASPX-CS

```
@Html.EJ().Pivot().PivotGauge("PivotGauge1").Scales(scales => {
scales.Pointers(pointers => {
//For needle type
pointers.Type(PointerType.Needle).PointerValueText(pointerValueText =>
pointerValueText.ShowValue(true).Distance(10).Color("red").Opacity(70).An
gle(20).Font(font =>
font.FontFamily("Arial").FontStyle("Normal").Size("15px"))).Add();
//For marker type
pointers.Type(PointerType.Marker).PointerValueText(pointerValueText =>
pointerValueText.ShowValue(true).Distance(40).Color("red").Opacity(70).An
gle(-40).Font(font =>
font.FontFamily("Arial").FontStyle("Normal").Size("15px"))).Add();
}).Add();
})
```

Copyright © 2001 - 2020 Syncfusion Inc.

Ticks

Adding Tick Collection

Tick collection can be directly added to the scales option within the PivotGauge control.

ASPX-CS

```
@Html.EJ().Pivot().PivotGauge("PivotGauge1").Scales(scales => {
scales.Ticks(ticks => { ticks.Type(CircularTickTypes.Major).Add();
}).Add();
})
```

Tick Customization

The appearance of the tick can be customized through the following properties.

- **Type** – indicates whether ticks are for major or minor intervals. By default, the type is "Major".
- **Height** – sets the height of the ticks.
- **Width** – sets the width of the ticks.
- **Angle** – rotates the ticks to a specified angle. By default, the angle value is 0.
- **Color** – displays the ticks in specified color.
- **DistanceFromScale** – sets the distance between scale and ticks. By default, the values is 0.
- **Placement** – positions the ticks with respect to the scale. By default, the value is set to "Far".

ASPX-CS

```
@Html.EJ().Pivot().PivotGauge("PivotGauge1").Scales(scales => {
scales.Ticks(ticks => {
ticks.Type(CircularTickTypes.Major).Height(15).Width(4).Angle(0).Color("g
reen").DistanceFromScale(2).Placement(TickPlacement.Near).Add();
}).Add();
})
```

Copyright © 2001 - 2020 Syncfusion Inc.

Ranges

Adding Range Collection

Range collection can be directly added to the scales option within the PivotGauge control.

ASPX-CS

```
@Html.EJ().Pivot().PivotGauge("PivotGauge1").Scales(scales => {
scales.ShowRanges(true).Ranges(ranges => {
ranges.DistanceFromScale(10).Add(); }).Add();
})
```

Appearance Customization

The appearance of the range can be customized through the following properties.

- StartValue – defines the start position of the range.
- EndValue – defines the end position of the range.
- StartWidth – sets the width at starting position of the range.
- EndWidth – sets the width at ending position of the range.
- BackgroundColor – sets the background color of the range.
- Border – sets the height and width of the border of the range.
- Placement – sets the position of the range.
- DistanceFromScale – sets the distance between the range and scale.

Positioning the range could be set either through Placement or DistanceFromScale property.

Note: By default, placement takes the value “Near”, whereas other enumeration values available are “Far” and “Center”.

ASPX-CS

```
@Html.EJ().Pivot().PivotGauge("PivotGauge1").Scales(scales => {
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
scales.ShowRanges(true).Ranges(ranges => {
ranges.StartValue(20).EndValue(50).StartWidth(2).EndWidth(6).Border(borde
r =>
border.Color("red").Width(2)).BackgroundColor("yellow").DistanceFromScale
(20).Add();
ranges.StartValue(50).EndValue(100).StartWidth(2).EndWidth(7).Border(bord
er =>
border.Color("green").Width(2)).BackgroundColor("blue").Placement(RangePl
acement.Near).Add();
}).Add();
})
```

Note: On setting both the position properties - "DistanceFromScale" and "Placement" for a range, the value set in "DistanceFromScale" is given preference.

Multiple Ranges

Multiple ranges can be added in Ranges to the scales option within the PivotGauge control.

ASPX-CS

```
@Html.EJ().Pivot().PivotGauge("PivotGauge1").Scales(scales => {
scales.ShowRanges(true).Ranges(ranges => {
ranges.StartValue(0).EndValue(10).BackgroundColor("green").DistanceFromSc
ale(-5).Add();
ranges.StartValue(10).EndValue(30).BackgroundColor("yellow").DistanceFrom
Scale(-5).Add();
ranges.StartValue(30).EndValue(50).BackgroundColor("red").DistanceFromSca
le(-5).Add();
}).Add();
})
```

Copyright © 2001 - 2020 Syncfusion Inc.

Layout

Row-wise Layout

Gauges can be arranged in specified number of rows by using the RowsCount property.

ASPX-CS

```
@Html.EJ().Pivot().PivotGauge("PivotGauge1").RowsCount(2)
```

Column-wise Layout

Gauges can be arranged in specified number of columns by using the ColumnsCount property.

ASPX-CS

```
@Html.EJ().Pivot().PivotGauge("PivotGauge1").ColumnsCount(2)
```

Copyright © 2001 - 2020 Syncfusion Inc.

Labels

Adding Label Collection

Label collection can be directly added to the scales option within the PivotGauge control.

ASPX-CS

```
@Html.EJ().Pivot().PivotGauge("PivotGauge1").Scales(scales => {
scales.Labels(labels => { labels.Angle(20).Add(); }).Add();
})
```

Appearance Customization

The appearance of the Label can be customized through the following properties.

- **Angle** – used to display labels in a rotated manner. By default, the value is 0.
- **Color** – displays the label in specified color
- **Opacity** – sets the opacity of the label. By default, the value is 1.
- **Type** – indicates the label for major intervals or minor intervals. By default, it takes major intervals.
- **IncludeFirstValue** – includes the initial value based on user requirement. By default, the value is “true”.
- **Font** – sets the font size, font style and font family of the label.

ASPX-CS

```
@Html.EJ().Pivot().PivotGauge("PivotGauge1").Scales(scales => {
scales.Labels(labels =>
{
//for Major labels
labels.Type(GaugeTypes.Major).Color("#1AFF01").Opacity(80).IncludeFirstVa
lue(false).Font(font =>
font.Size("15px").FontFamily("Arial").FontStyle("Bold")).Add();
//for Minor labels
labels.Type(GaugeTypes.Minor).Color("#FF103F").Opacity(80).IncludeFirstVa
lue(true).Font(font =>
font.Size("10px").FontFamily("Arial").FontStyle("Normal")).Add();
}).Add();
})
```

Copyright © 2001 - 2020 Syncfusion Inc.

Unit Text

The UnitText property is used to add some text along with the labels. Normally, we indicate the unit/measurement of the numeric value through unit text. Using the UnitTextPosition property, the text can be positioned either in front or back.

Note: By default, text appears at the back.

ASPX-CS

```
@Html.EJ().Pivot().PivotGauge("PivotGauge1").Scales(scales => {
scales.Labels(labels => {
//for Major labels
labels.Type(GaugeTypes.Minor).UnitText("$").UnitTextPosition(UnitTextPlac
ement.Front).Add();
//for Minor labels
labels.Type(GaugeTypes.Minor).UnitText("$").UnitTextPosition(UnitTextPlac
ement.Front).Add();
}).Add();
})
```

Copyright © 2001 - 2020 Syncfusion Inc.

Custom labels

Adding Custom Label Collection

You can apply custom custom label Collection by using `CustomLabels` which can be directly added to the scales option within the PivotGauge control.

ASPX-CS

```
@Html.EJ().Pivot().PivotGauge("PivotGauge1").Scales(scales => {
scales.CustomLabels(customLabels => { customLabels.Position(position =>
position.X(180).Y(290)).Add(); }).Add();
})
```

Appearance Customization

The appearance of the custom labels can be customized through the following properties.

- **Position** – used to set the position of the labels.
- **Font** – sets the font size, font style and font family of the label text.
- **Color** – sets the color of the label text.
- **TextAngle** – rotates the label to a specified angle. By default, the value is 0.

ASPX-CS

```
@Html.EJ().Pivot().PivotGauge("PivotGauge1").Scales(scales => {
scales.CustomLabels(customLabels =>
{
customLabels.Position(position => position.X(180).Y(320)).Font(font =>
font.Size("12px").FontFamily("Segoe
UI").FontStyle("Normal")).Color("blue").TextAngle(20).Add();
}).Add();
})
```

Copyright © 2001 - 2020 Syncfusion Inc.

Multiple Custom Labels

Multiple ranges can be added in CustomLabels to the scales option within the PivotGauge control.

ASPX-CS

```
@Html.EJ().Pivot().PivotGauge("PivotGauge1").Scales(scales => {
scales.CustomLabels(customLabels =>
{
customLabels.Position(position => position.X(180).Y(150)).Font(font =>
font.Size("12px").FontFamily("Segoe
UI").FontStyle("Normal")).Color("red").Add();
customLabels.Position(position => position.X(180).Y(320)).Font(font =>
font.Size("10px").FontFamily("Segoe
UI").FontStyle("Normal")).Color("green").Add();
customLabels.Position(position => position.X(180).Y(290)).Font(font =>
font.Size("10px").FontFamily("Segoe
UI").FontStyle("Normal")).Color("blue").Add();
}).Add();
})
```

Copyright © 2001 - 2020 Syncfusion Inc.

Label Format

You can customize the format of labels displayed in the PivotGauge control using LabelFormatSettings property.

Following are the formats that can be applied to labels in PivotGauge:

- NumberFormats - Allows the user to change the number format of the label values in PivotGauge.
- DecimalPlaces - Allows you to set the number of digits displayed after decimal point.
- PrefixText - Allows you to add a text at the beginning of the label.
- SuffixText - Allows you to add text at the end of the label.

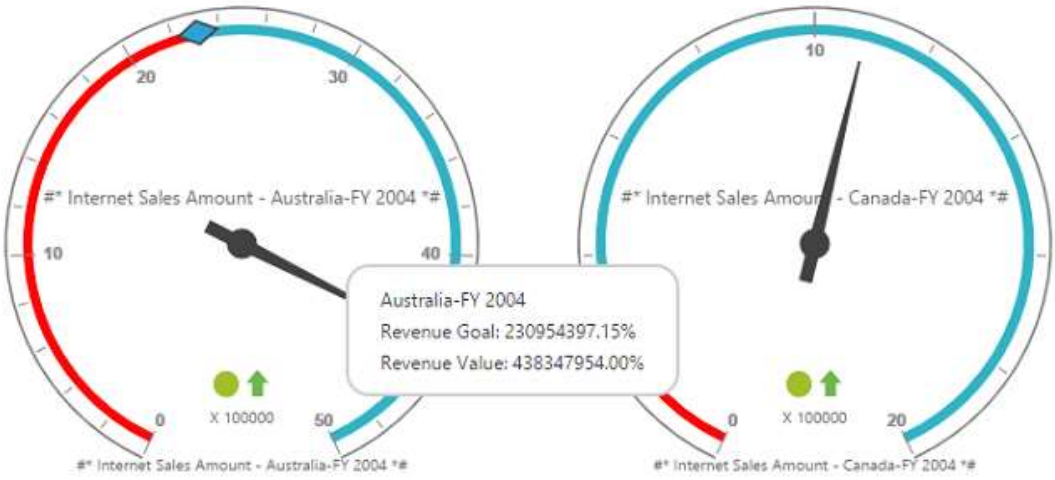
Number format for the label values can be set to any of the following type:

- Default
- Currency
- Percentage
- Fraction
- Scientific
- Text
- Notation

ASPX-CS

```
@Html.EJ().Pivot().PivotGauge("PivotGauge1").LabelFormatSettings(labelFor
matSettings=>
labelFormatSettings.NumberFormats(NumberFormat.Percentage).DecimalPlaces(
2).PrefixText("#*").SuffixText("*#"))
```

Copyright © 2001 - 2020 Syncfusion Inc.



Tooltip

Tooltip can be enabled by using the `EnableTooltip` property.

Note: By default, this property is set to "false".

ASPX-CS

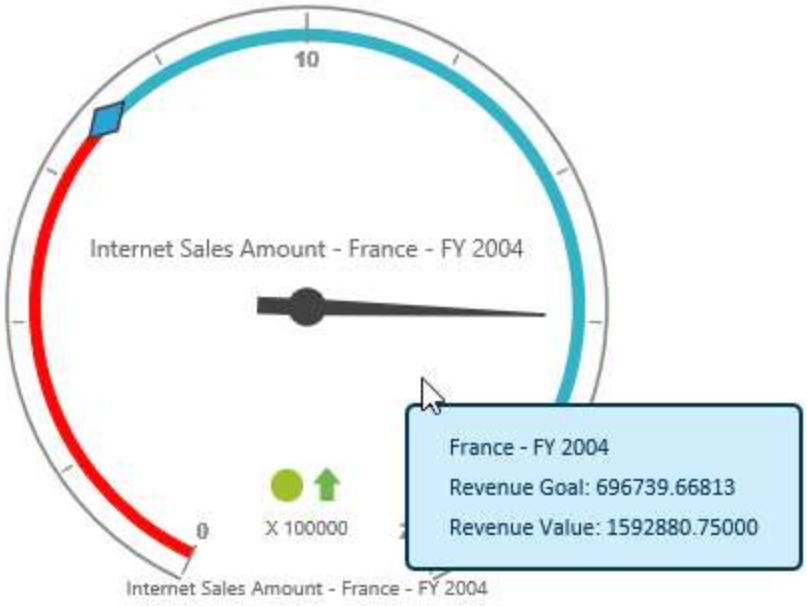
```
@Html.EJ().Pivot().PivotGauge("PivotGauge1").EnableTooltip(true)
```

Tooltip appearance can be customized by overriding its CSS class.

CSS

```
.e-pivotgauge-tooltip {
background-color: #D2E9FE!important;
border: 2px solid #01465C!important;
color: #01232E!important;
border-radius: 5px!important;
margin-top: 20px;
text-align: left;
font: 12 px Segoe UI;
line-height: 20px;
}
```

Copyright © 2001 - 2020 Syncfusion Inc.



Animation

The animation option makes the pointer to rotate from minimum value to actual value with animation effects. The animation can be enabled/disabled by using the EnableAnimation property. Speed of the pointer can be controlled by using the AnimationSpeed property. Time is represented in milliseconds.

ASPX-CS

```
@Html.EJ().Pivot().PivotGauge("PivotGauge1").EnableAnimation(true).Animat
ionSpeed(1000)
```

Localization

Localization in PivotGauge Control

We can localize the PivotGauge control texts with a collection of localized strings using **"ej.PivotGauge.Locale"** for different cultures.

Note: By default, the PivotGauge control is localized in **"en-US"**.

Following code example illustrates on how to localize PivotGauge based on **"French"** culture.

ASPX-CS

```
<script>
ej.PivotGauge.Locale["fr-FR"] = {
RevenueGoal: "Objectif de chiffre d'affaires",
RevenueValue: "Valeur du chiffre d'affaires"
}
</script>
@Html.EJ().Pivot().PivotGauge("PivotGauge1").Locale("fr-FR")
```

Following table localizes the in-built keywords to **"French"** culture for PivotGauge.

Copyright © 2001 - 2020 Syncfusion Inc.

Keywords	Values
RevenueGoal	"Objectif de chiffre d'affaires"
RevenueValue	"Valeur du chiffre d'affaires "

Localization and Globalization of Cube Info

Content displayed within the PivotGauge control are obtained from the OLAP Cube. So following are the steps that needs to be done to get the localized and globalized Cube content.

To get the localized string based on different cultures, from OLAP Cube, we need to set **"Locale Identifier"** in the connection string to a specific culture. The attribute is set for PivotGauge in Client Mode as shown below

ASPX-CS

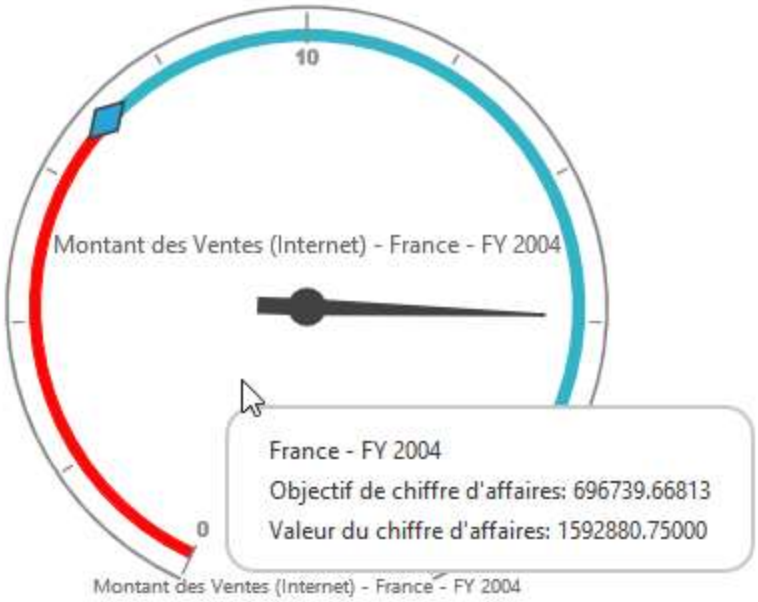
```
@Html.EJ().Pivot().PivotGauge("PivotGauge1").Locale("fr-
FR").DataSource(dataSource =>
dataSource.Data("http://bi.syncfusion.com/olap/msmdpump.dll;Locale
Identifier=1036;"))
```

For Server Mode, we need to set **"Culture"** and **"OverrideDefaultFormatStrings"** properties in "OlapDataManager" class to a specific culture along with setting **"Locale Identifier"** in connection string.

C#

```
//1036 refers to "fr-FR" culture.
string connectionString = "Data Source=localhost; Initial
Catalog=Adventure Works DW; Locale Identifier=1036;";
DataManager = new OlapDataManager(connectionString);
DataManager.Culture = new System.Globalization.CultureInfo(1036);
DataManager.OverrideDefaultFormatStrings = true;
```

Copyright © 2001 - 2020 Syncfusion Inc.

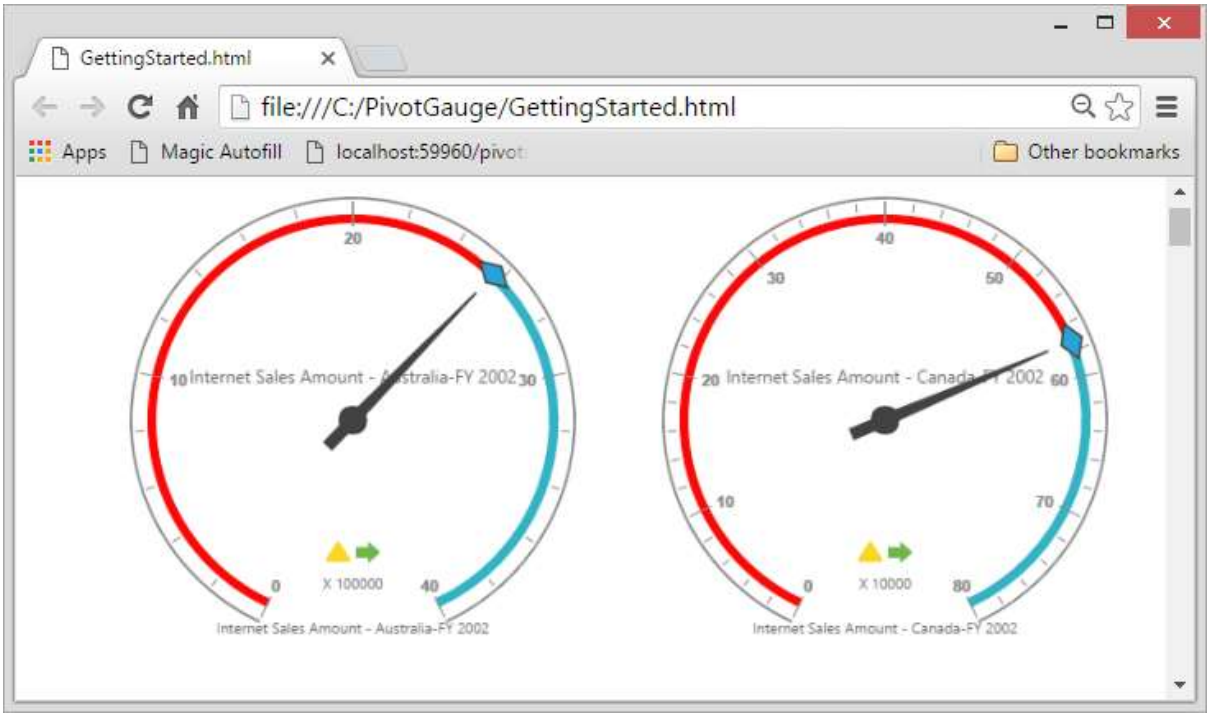


Responsive Layout

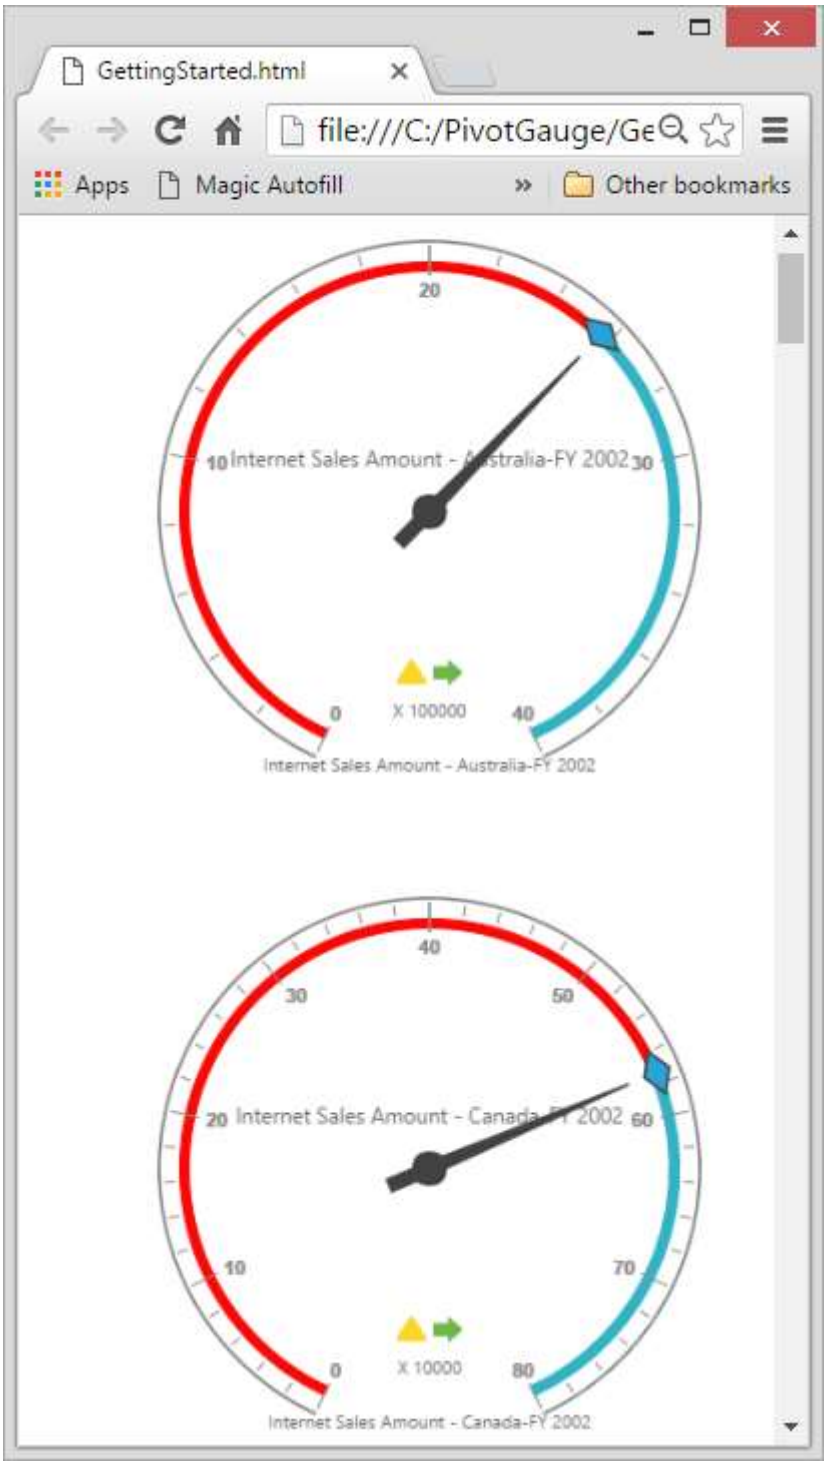
PivotGauge control supports responsive rendering based on the target device (desktop and tablet) resolution. It supports resolution upto 1024x600. You can enable responsiveness in PivotGauge by setting `IsResponsive` property to true.

ASPX-CS

```
@Html.EJ().Pivot().PivotGauge("PivotGauge1").IsResponsive(true)
```



Normal View



Responsive View

How to

Configure pivot gauge through the model properties

There comes a time when you want to set pivot gauge properties other than using PivotGaugePropertiesBuilder i.e., in the Controller side. At that time, you can pass PivotGaugeProperties model instance as a parameter to the pivot gauge helper method.

We can set properties to pivot gauge control in server-side using the PivotGaugeProperties class and it is used in the view page with the help of pivot gauge helper overload.

In addition to the id parameter of pivot gauge helper method, we can also pass PivotGaugeProperties model as another parameter to the pivot gauge helper method.

Relational

The following code example explains how to render the pivot gauge control in relational mode.

RAZOR

```
@model Syncfusion.JavaScript.Models.PivotGaugeProperties
@(Html.EJ().Pivot().PivotGauge("PivotGauge", Model))
<script type="text/javascript">
function load(args) {
args.model.dataSource.data = pivot_dataset;
}
</script>
```

C#

```
namespace PivotGauge
{
public class PivotGaugeController: Controller
{
public ActionResult PivotGaugeFeatures()
{
Syncfusion.JavaScript.Models.PivotGaugeProperties pivotgauge = new
Syncfusion.JavaScript.Models.PivotGaugeProperties();
PivotDataSource pivotgaugeDS = new PivotDataSource();
List<Field> rows = new List<Field>();
rows.Add(new Field() { FieldName = "Country", FieldCaption = "Country"
});
rows.Add(new Field() { FieldName = "State", FieldCaption = "State" });
pivotgaugeDS.Rows = rows;
List<Field> cols = new List<Field>();
cols.Add(new Field() { FieldName = "Product", FieldCaption = "Product"
});
pivotgaugeDS.Columns = cols;
pivotgauge.Load = "load";
List<Field> values = new List<Field>();
values.Add(new Field() { FieldName = "Amount" });
pivotgaugeDS.Values = values;
pivotgauge.DataSource = pivotgaugeDS;
return View(pivotgauge);
}
}
}
```

Copyright © 2001 - 2020 Syncfusion Inc.

As a result of the previous code example, the pivot gauge will be displayed as shown below:

OLAP

The following code example explains how to render the pivot gauge control in OLAP mode.

RAZOR

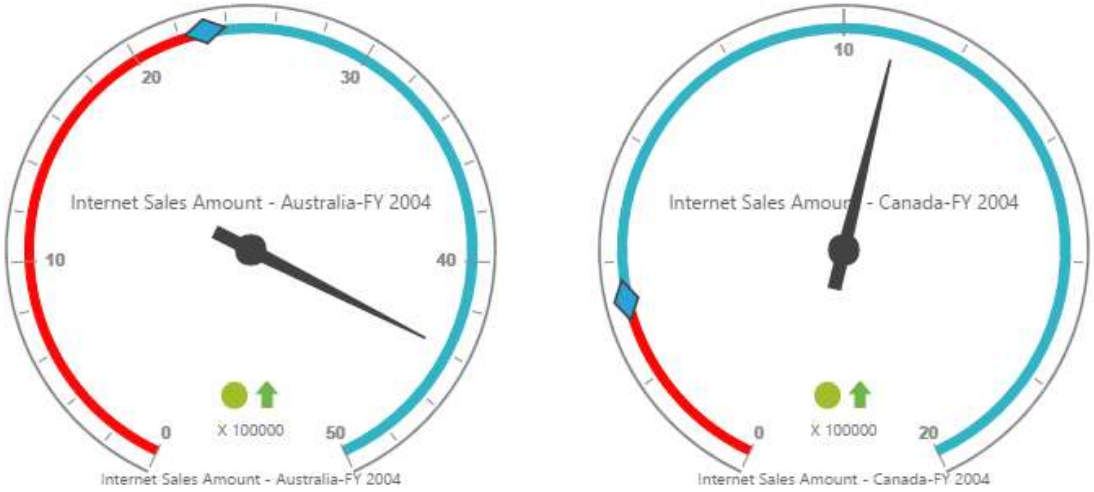
```
@model Syncfusion.JavaScript.Models.PivotGaugeProperties
@(Html.EJ().Pivot().PivotGauge("PivotGauge", Model))
```

C#

```
namespace PivotGauge
{
public class PivotGaugeController: Controller
{
public ActionResult PivotGaugeFeatures()
{
Syncfusion.JavaScript.Models.PivotGaugeProperties pivotgauge = new
Syncfusion.JavaScript.Models.PivotGaugeProperties();
PivotDataSource pivotgaugeDS = new PivotDataSource();
pivotgaugeDS.Data = "https://bi.syncfusion.com/olap/msmdpump.dll";
pivotgaugeDS.Cube = "Adventure Works";
pivotgaugeDS.Catalog = "Adventure Works DW 2008 SE";
List<Field> rows = new List<Field>();
rows.Add(new Field() { FieldName = "[Date].[Fiscal]" });
pivotgaugeDS.Rows = rows;
List<Field> cols = new List<Field>();
cols.Add(new Field() { FieldName = "[Customer].[Customer Geography]" });
pivotgaugeDS.Rows = cols;
List<MeasuresItems> measures = new List<MeasuresItems>();
```

```
measures.Add(new MeasuresItems() { FieldName = "[Measures].[Internet
Sales Amount]" });
List<Field> values = new List<Field>();
values.Add(new Field() { Measures = measures, Axis =
Syncfusion.JavaScript.AxisName.Column });
pivotgaugeDS.Values = values;
pivotgauge.DataSource = pivotgaugeDS;
return View(pivotgauge);
}
}
}
```

As a result of the previous code example, the pivot gauge will be displayed as shown below:



PivotTreeMap

Overview

The PivotTreeMap control lets the user to visualize OLAP data in the form of nested nodes in hierarchical order with the ability to drill up and down.

Key Features

- **Data Source** - Binds the PivotTreeMap control with the Microsoft SQL Server Analysis Services (SSAS) and XML/A data sources.
- **Drill Support** - Enables you to navigate through the inner levels of a hierarchy elements.
- **Color Mapping** - Allows user to differentiate leaf nodes using various color codes either based on their value or members.
- **Legend** - Differentiates the color code based on value range (from minimum to maximum).

Getting Started

Important

Starting with v16.2.0.x, if you refer to Syncfusion assemblies from trial setup or from the NuGet feed, include a license key in your projects. Refer to this link to learn about registering Syncfusion license key in your ASP.NET Core application to use our components.

Creating a simple application with PivotTreeMap and OLAP datasource (Client Mode)

This section covers the information that you need to know to populate a simple PivotTreeMap with OLAP data completely on the client-side.

Project Initialization

Create a new **ASP.NET MVC Empty Web Application** by using Visual Studio IDE and name the project as **"PivotTreeMapDemo"**.

Select the View engine as **'Razor'** and Project template as **'Internet Application'** and finally click **OK** button to create an application.

Now add the following dependency libraries as references into your MVC Web Application. In order to add them to your application, right-click on **References** in Solution Explorer and select Add Reference. Now in the **Reference Manager** dialog, under **Assemblies > Extension**, the following Syncfusion libraries will be found.

- Syncfusion.EJ
- Syncfusion.EJ.Export
- Syncfusion.EJ.Pivot
- Syncfusion.EJ.MVC

The version of Syncfusion libraries based on .NET Framework and MVC version are classified below. For example, version is illustrated as,

MVC Version	MVC Version of Syncfusion assembly	Base Version of Syncfusion assembly	System.Web.Mvc	System.Web.WebPages
MVC3	{{ site.mvc3releaseversion }}	{{ site.35esreleaseversion }}	3.0	1.0
MVC4	{{ site.mvc4releaseversion }}	{{ site.40esreleaseversion }}	4.0	2.0
MVC5	{{ site.mvc5releaseversion }}	{{ site.45esreleaseversion }}	5.0	3.0

Register the referred assemblies in "Web.config" files available inside Views folder and also at the root of the application.

XML

```
<compilation debug="true" targetFramework="4.0">
<assemblies>
……
……
```

```
<add assembly="Syncfusion.EJ, Version= {{ site.40esreleaseversion }},
Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.EJ.Pivot, Version= {{ site.40esreleaseversion
}}, Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.EJ.Export, Version= {{ site.40esreleaseversion
}}, Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.EJ.Mvc, Version= {{ site.40esreleaseversion }},
Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
</assemblies>
</compilation>
```

Register the required namespaces in "Web.config" files available inside Views folder and also at the root of the application

XML

```
<namespaces>
……
……
<add namespace="Syncfusion.MVC.EJ" />
<add namespace="Syncfusion.JavaScript" />
</namespaces>
```

Note: Registering assemblies and namespaces earlier helps to include the control in view page with the help of intellisense.

Set the **UnobtrusiveJavaScriptEnabled** property to false under **appSettings** tag in "Web.config" file at the root folder.

XML

```
<configuration>
……
……
<appSettings>
……
……
<add key="UnobtrusiveJavaScriptEnabled" value="false" />
</appSettings>
</configuration>
```

Scripts and CSS References

The scripts and style sheets that are mandatorily required to render PivotTreeMap control in a MVC Web Application which are highlighted below in an appropriate order.

1. ej.web.all.min.css
2. jQuery-3.0.0.min.js
3. ej.web.all.min.js
4. jsrender.min.js

Scripts and style sheets are referred under the <head> tag in _Layout.cshtml file which is found inside Views > Shared folder.

Copyright © 2001 - 2020 Syncfusion Inc.

HTML

```
<head>
<link href="http://cdn.syncfusion.com/{{ site.releaseversion
}}/js/web/flat-azure/ej.web.all.min.css" rel="stylesheet" type="text/css"
/>
<script src="http://cdn.syncfusion.com/js/assets/external/jquery-
3.0.0.min.js" type="text/javascript"></script>
<script src="http://cdn.syncfusion.com/{{ site.releaseversion
}}/js/web/ej.web.all.min.js" type="text/javascript"></script>
<script
src="http://cdn.syncfusion.com/js/assets/external/jsrender.min.js"
type="text/javascript"></script>
</head>
```

The script manager is initialized immediately after the RenderBody() function call in **_Layout.cshtml** file in-order to generate control related scripts.

HTML

```
<body>
……
……
@RenderBody()
@(Html.EJ().ScriptManager())
</body>
```

Initialize PivotTreeMap

Before initializing, empty the contents of "Index.cshtml" file under Views > Home folder and add the following codes.

HTML

```
@using Syncfusion.JavaScript;
@Html.EJ().Pivot().PivotTreeMap("PivotTreeMap1")
```

Populate PivotTreeMap with DataSource

Initializes the OLAP datasource for PivotTreeMap control as shown below.

HTML

```
@Html.EJ().Pivot().PivotTreeMap("PivotTreeMap1").IsResponsive(true).DataS
ource(dataSource =>
dataSource.Rows(rows=>{rows.FieldName("[Date].[Fiscal]").Add();}).Columns
(columns=>{columns.FieldName("[Customer].[Customer
Geography]").Add();}).Values(values => { values.Measures(measures => {
measures.FieldName("[Measures].[Internet Sales Amount]").Add();
}).Axis(AxisName.Column).Add();})
.Data("http://bi.syncfusion.com/olap/msmdpump.dll").Catalog("Adventure
Works DW 2008 SE").Cube("Adventure Works"))
<!--Tooltip labels can be localized here-->
<script id="tooltipTemplate" type="application/jsrender">
<div style="background:White; color:black; font-size:12px; font-
weight:normal; border: 1px solid #4D4D4D; white-space: nowrap;border-
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
radius: 2px; margin-right: 25px; min-width: 110px;padding-right: 5px;
padding-left: 5px; padding-bottom: 2px ;width: auto; height: auto;">
<div>Measure(s) : {{:~Measures(#data)}}</div><div>Row :
{{:~Row(#data)}}</div><div>Column : {{:~Column(#data)}}</div><div>Value :
{{:~Value(#data)}}</div>
</div>
</script>
```

The above code will generate a simple PivotTreeMap with "Internet Sales Amount" over a period of fiscal years across different customer geographic locations.

Creating a simple application with PivotTreeMap and OLAP datasource (Server Mode)

This section covers the information required to create a simple PivotTreeMap bound to OLAP datasource.

Note: We will be illustrating this section by creating a simple Web Application through Visual Studio IDE since PivotTreeMap can also act as a server-side control with .NET dependency. ASP.NET MVC Web Application will contain a service that transfers data to server-side, processes and returns back to client-side for control rendering and re-rendering. The service utilized for communication could be either WCF or WebAPI based on user requirement.

Project Initialization

Create a new **ASP.NET MVC Empty Web Application** by using Visual Studio IDE and name the project as **"PivotTreeMapDemo"**.

Select the View engine as **'Razor'** and Project template as **'Internet Application'** and finally click **OK** button to create an application.

Now add the following dependency libraries as references into your Web Application. In order to add them to your application, right-click on **References** in Solution Explorer and select **Add Reference**. Now in the **Reference Manager** dialog, under **Assemblies > Extension**, the following Syncfusion libraries will be found.

Note: If you have installed any version of SQL Server Analysis Service (SSAS) or Microsoft ADOMD.NET utility, then the location of Microsoft.AnalysisServices.AdomdClient library is [system drive:\Program Files (x86)\Microsoft.NET\ADOMD.NET]. And if you have installed any version of Essential Studio, then the location of Syncfusion libraries is [system drive:\Program Files (x86)\Syncfusion\Essential Studio\{{ site.releaseversion }}\Assemblies].

- Microsoft.AnalysisServices.AdomdClient
- Syncfusion.Compression.Base
- Syncfusion.Linq.Base
- Syncfusion.Olap.Base
- Syncfusion.PivotAnalysis.Base
- Syncfusion.EJ
- Syncfusion.EJ.MVC
- Syncfusion.EJ.Pivot

The version of Syncfusion libraries based on .NET Framework and MVC version are classified below. For example, 14.2 version is illustrated as,

MVC Version	MVC Version of Syncfusion assembly	Base Version of Syncfusion assembly	System.Web.Mvc	System.Web.WebPages
MVC3	{{ site.mvc3releaseversion }}	{{ site.35esreleaseversion }}	3.0	1.0
MVC4	{{ site.mvc4releaseversion }}	{{ site.40esreleaseversion }}	4.0	2.0
MVC5	{{ site.mvc5releaseversion }}	{{ site.45esreleaseversion }}	5.0	3.0

Register the referenced assemblies in "Web.config" files available inside Views folder and also at the root of the application.

XML

```
<compilation debug="true" targetFramework="4.0">
<assemblies>
……
……
<add assembly="Syncfusion.EJ, Version= {{ site.40esreleaseversion }}, Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.EJ.Pivot, Version= {{ site.40esreleaseversion }}, Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.EJ.Mvc, Version= {{ site.40esreleaseversion }}, Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.Linq.Base, Version= {{ site.40esreleaseversion }}, Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
<add assembly="Syncfusion.Olap.Base, Version= {{ site.40esreleaseversion
}}, Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.Compression.Base, Version= {{
site.40esreleaseversion }}, Culture=neutral,
PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.PivotAnalysis.Base, Version= {{
site.40esreleaseversion }}, Culture=neutral,
PublicKeyToken=3d67ed1f87d44c89" />
</assemblies>
</compilation>
```

Register the required namespaces in "Web.config" files available inside Views folder and also at the root of the application

XML

```
<namespaces>
……
……
<add namespace="Syncfusion.MVC.EJ" />
<add namespace="Syncfusion.JavaScript" />
</namespaces>
```

Note: Registering assemblies and namespaces earlier helps to include the control in view page with the help of intellisense.

Set the **UnobtrusiveJavaScriptEnabled** property to false under **appSettings** tag in "Web.config" file at the root folder.

XML

```
<configuration>
……
……
<appSettings>
……
……
<add key="UnobtrusiveJavaScriptEnabled" value="false" />
</appSettings>
</configuration>
```

Scripts and CSS Initialization

The scripts and style sheets that are mandatorily required to render a PivotTreeMap control in a Web Application are mentioned in an appropriate order.

1. ej.web.all.min.css
2. jQuery-3.0.0.min.js
3. ej.web.all.min.js
4. jsrender.min.js

Click here to know more about script and style sheets available online (CDN Link).

Copyright © 2001 - 2020 Syncfusion Inc.

Scripts and style sheets are referred under the **head** tag in **_Layout.cshtml** file which is found inside **Views > Shared folder.**

HTML

```
<head>
<link href="http://cdn.syncfusion.com/{{ site.releaseversion
}}/js/web/flat-azure/ej.web.all.min.css" rel="stylesheet" type="text/css"
/>
<script src="http://cdn.syncfusion.com/js/assets/external/jquery-
3.0.0.min.js" type="text/javascript"></script>
<script src="http://cdn.syncfusion.com/{{ site.releaseversion
}}/js/web/ej.web.all.min.js" type="text/javascript"></script>
<script
src="http://cdn.syncfusion.com/js/assets/external/jsrender.min.js"
type="text/javascript"></script>
</head>
```

The script manager is initialized immediately after the RenderBody() function call in **_Layout.cshtml** file in-order to generate control related scripts.

HTML

```
<body>
……
……
@RenderBody()
@(Html.EJ().ScriptManager())
</body>
```

Control Initialization

Before initializing, empty the contents of **Index.cshtml** file under **Views > Home** folder and add the following codes. Register the namespaces at the top of the page and then add the control.

HTML

```
@using Syncfusion.JavaScript;
<div>
@Html.EJ().Pivot().PivotTreeMap("PivotTreeMap1").Url(Url.Content("/Olap")
)
</div>
<!--Tooltip labels can be localized here-->
<script id="tooltipTemplate" type="application/jsrender">
<div style="background:White; color:black; font-size:12px; font-
weight:normal; border: 1px solid #4D4D4D; white-space: nowrap;border-
radius: 2px; margin-right: 25px; min-width: 110px;padding-right: 5px;
padding-left: 5px; padding-bottom: 2px ;width: auto; height: auto;">
<div>Measure(s) : {{:~Measures(#data)}}</div><div>Row :
{{:~Row(#data)}}</div><div>Column : {{:~Column(#data)}}</div><div>Value :
{{:~Value(#data)}}</div>
</div>
</script>
```

Copyright © 2001 - 2020 Syncfusion Inc.

The **"Url"** property in PivotTreeMap control points the service endpoint, where data are processed and fetched in the form of JSON. The services used in PivotTreeMap control as endpoint are WCF and WebAPI.

Note: The above "Index.cshtml" contains WebAPI URL, which is "/Olap". If WCF service is used as endpoint, the URL would look like "/OlapService.svc".

WebAPI

Adding a WebAPI Controller

To add a WebAPI controller in your existing Web Application, right-click on the project in Solution Explorer and select **Add > New Item.** In the **Add New Item** window, select **WebAPI Controller Class** and name it as "OlapController.cs", click **Add.**

Now WebAPI controller is added into your application successfully which in-turn comprise of the following file. The utilization of this file will be explained in the following sections.

- OlapController.cs

Note: While adding WebAPI Controller Class, name it with the suffix "Controller" that is mandatory. For example, in demo the controller is named as "OlapController".

Next, remove all the existing methods such as "Get", "Post", "Put" and "Delete" present inside OlapController.cs file.

C#

```
namespace PivotTreeMapDemo
{
public class OlapController : ApiController
{
}
}
```

Adding the List of Namespaces

Following are the list of namespaces to be added on top of the main class inside OlapController.cs file.

C#

```
using System.Web;
using System.Collections.Generic;
using System.Configuration;
using System.Linq;
using System.Net;
using System.Net.Http;
using System.Web.Http;
using System.Web.Script.Serialization;
using Syncfusion.Olap.Manager;
using Syncfusion.Olap.Reports;
using Syncfusion.JavaScript;
using OLAPUTILS = Syncfusion.JavaScript.Olap;
namespace PivotTreeMapDemo
{
public class OlapController : ApiController
{
```

```
}
}
```

Datasource Initialization

Now, the connection string to connect OLAP Cube and PivotTreeMap instances are created immediately inside the main class in OlapController.cs file.

C#

```
namespace PivotTreeMapDemo
{
public class OlapController : ApiController
{
PivotTreeMap htmlHelper = new PivotTreeMap();
string connectionString = "Data
Source=http://bi.syncfusion.com/olap/msmdpump.dll; Initial
Catalog=Adventure Works DW 2008 SE;";
//Other codes
}
}
```

Service methods in WebAPI Controller

Now you need to define the service methods inside "OlapController" class, found inside OlapController.cs file, created while adding WebAPI Controller Class to your Web Application.

C#

```
namespace PivotTreeMapDemo
{
public class OlapController : ApiController
{
PivotTreeMap htmlHelper = new PivotTreeMap();
string connectionString = "Data
Source=http://bi.syncfusion.com/olap/msmdpump.dll; Initial
Catalog=Adventure Works DW 2008 SE;";
[System.Web.Http.ActionName("InitializeTreeMap")]
[System.Web.Http.HttpPost]
public Dictionary< string, object > InitializeTreeMap(Dictionary<string,
object> jsonResult)
{
OlapDataManager DataManager = null;
DataManager = new OlapDataManager(connectionString);
DataManager.SetCurrentReport(CreateOlapReport());
return htmlHelper.GetJsonData(jsonResult["action"].ToString(),
DataManager);
}
[System.Web.Http.ActionName("DrillTreeMap")]
[System.Web.Http.HttpPost]
public Dictionary<string, object> DrillTreeMap(Dictionary<string, object>
jsonResult)
{
OlapDataManager DataManager = new OlapDataManager(connectionString);
DataManager = new OlapDataManager(connectionString);
```

```
DataManager.SetCurrentReport(OLAPUTILS.Utils.DeserializeOlapReport(jsonRe
sult["olapReport"].ToString()));
return htmlHelper.GetJsonData(jsonResult["action"].ToString(),
DataManager, jsonResult["drillInfo"].ToString());
}
private OlapReport CreateOlapReport()
{
OlapReport olapReport = new OlapReport();
olapReport.Name = "Default Report";
olapReport.CurrentCubeName = "Adventure Works";
DimensionElement dimensionElementColumn = new DimensionElement();
//Specifying the Name for the Dimension Element
dimensionElementColumn.Name = "Date";
dimensionElementColumn.AddLevel("Fiscal", "Fiscal Year");
MeasureElements measureElementColumn = new MeasureElements();
//Specifying the Name for the Measure Element
measureElementColumn.Elements.Add(new MeasureElement { Name = "Customer
Count" });
DimensionElement dimensionElementRow = new DimensionElement();
//Specifying the Dimension Name
dimensionElementRow.Name = "Customer";
dimensionElementRow.AddLevel("Customer Geography", "Country");
DimensionElement dimensionElementRow1 = new DimensionElement();
///Adding Row Members
olapReport.SeriesElements.Add(dimensionElementRow);
///Adding Column Members
olapReport.CategoricalElements.Add(dimensionElementColumn);
///Adding Measure Element
olapReport.CategoricalElements.Add(measureElementColumn);
return olapReport;
}
}
}
```

Configure routing in WebAPIConfig Class

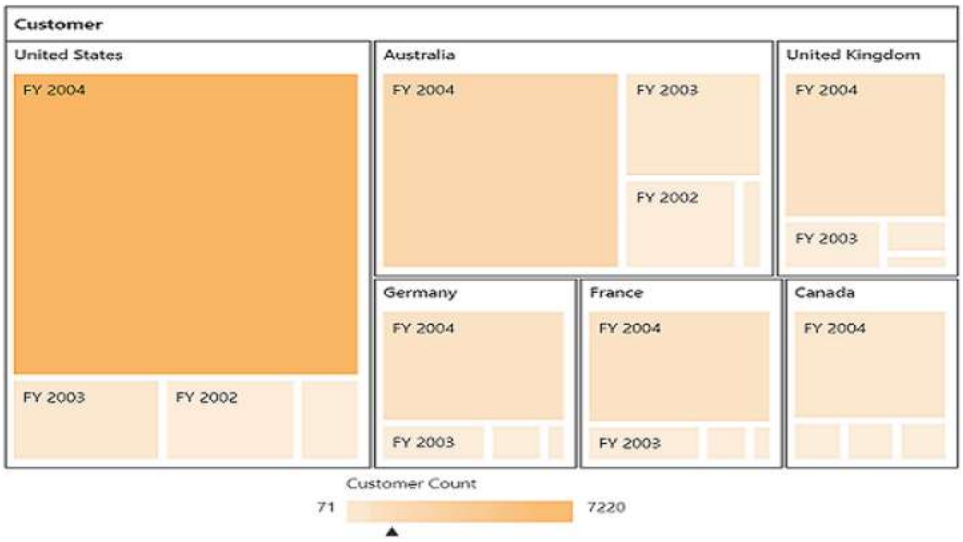
Open the WebAPIConfig.cs file found in **App_Start** folder. Then routing could be configured as shown in the following code example.

C#

```
public static class WebApiConfig
{
public static void Register(HttpConfiguration config)
{
config.Routes.MapHttpRoute(
name: "DefaultApi",
routeTemplate: "{controller}/{action}/{id}",
defaults: new { id = RouteParameter.Optional }
);
}
}
```

Now, PivotTreeMap is rendered with customer count over different customer geographic locations across a period of fiscal years.

Copyright © 2001 - 2020 Syncfusion Inc.



WCF

This section demonstrates the utilization of WCF service as endpoint binding OLAP datasource to a simple PivotTreeMap. For more details on this topic, click here.

DataBinding

Binding PivotTreeMap to Offline Cube

To connect an OLAP Cube available in local machine, physical path of the Cube needs to be set in the connection string. Below code sample illustrates the same.

C#

```
string connectionString = @"DataSource = system
drive:\OfflineCube\Adventure_Works_Ext.cub; Provider = MSOLAP;";
OlapDataManager DataManager = new OlapDataManager(connectionString);
```

Binding PivotTreeMap to Cube in local SQL Server

To connect an OLAP Cube available in SQL Server Analysis Service in local machine, server name and database name needs to be set in the connection string. If you have any credentials to connect your Cube, then set the “User ID” and “Password” attributes accordingly. Below code sample illustrates the same.

C#

```
string connectionString = "Data source=localhost; Initial
Catalog=Adventure Works DW;";
OlapDataManager DataManager = new OlapDataManager(connectionString);
```

Binding PivotTreeMap to Cube in online SQL Server

To connect an OLAP Cube available in SQL Server Analysis Service in online server through **XML/A**, host server link and database name needs to be set in the connection string. If you have any credentials to connect your Cube, then set the “User ID” and “Password” attributes accordingly. Below code sample illustrates the same.

C#

Copyright © 2001 - 2020 Syncfusion Inc.

```
string connectionString = "Data
Source=http://bi.syncfusion.com/olap/msmdpump.dll; Initial
Catalog=Adventure Works DW 2008 SE;";
OlapDataManager DataManager = new OlapDataManager(connectionString);
```

Binding PivotTreeMap to Cube in online Mondrian Server

To connect an OLAP Cube available in Mondrian Server through **XML/A**, host server link and database name needs to be set in the connection string. If you have any credentials to connect your Cube, then set the “User ID” and “Password” attributes accordingly. Below code sample illustrates the same.

C#

```
string connectionString = @"Data Source =
http://localhost:8080/mondrian/xmla; Initial Catalog =FoodMart;";
OlapDataManager DataManager = new OlapDataManager(connectionString);
DataManager.DataProvider.ProviderName =
Syncfusion.Olap.DataProvider.Providers.Mondrian;
```

Binding PivotTreeMap to Cube in online ActivePivot Server

To connect an OLAP Cube available in ActivePivot Server through **XML/A**, host server link and database name needs to be set in the connection string. If you have any credentials to connect your Cube, then set the “User ID” and “Password” attributes accordingly. Below code sample illustrates the same.

C#

```
string connectionString = @"Data Source =
http://localhost:8080/cva_s/xmla; Initial Catalog = CVAS;";
OlapDataManager DataManager = new OlapDataManager(connectionString);
DataManager.DataProvider.ProviderName=Syncfusion.Olap.DataProvider.Provid
ers.ActivePivot;
```

WCF

Adding a WCF Service

To add a WCF service in an existing Web application, right-click on the project in Solution Explorer and select **Add > New Item**. In the **Add New Item** window, select WCF Service and name it as OlapService.svc, click **Add**.

Now WCF service is added into your application successfully which in-turn comprise of the following files. The utilization of these files will be explained in the immediate sections.

- OlapService.svc
- OlapService.svc.cs
- IOlapService.cs

Configuring WCF Service Class

Remove the **“DoWork”** method present inside both OlapService.svc.cs and IOlapService.cs files. Next, add **“AspNetCompatibilityRequirements”** attribute on top of main class present inside OlapService.svc.cs and set **“RequirementsMode”** value to **“Allowed”**.

C#

```
namespace PivotTreeMapDemo
{
[AspNetCompatibilityRequirements(RequirementsMode =
AspNetCompatibilityRequirementsMode.Allowed)]
public class OlapService : IOlapService
{
}
}
```

List of Dependency Libraries

Next you need to add the below mentioned dependency libraries into your Web Application. These libraries could be found in GAC (Global Assembly Cache) as well.

To add them to your Web Application, right-click on **References** in Solution Explorer and select **Add Reference**. Now in the **Reference Manager** dialog, under **Assemblies > Extension**, the following Syncfusion libraries are found.

Note: If you have installed any version of SQL Server Analysis Service (SSAS) or Microsoft ADOMD.NET utility, then the location of Microsoft.AnalysisServices.AdomdClient library is [system drive:\Program Files (x86)\Microsoft.NET\ADOMD.NET]. And if you have installed any version of Essential Studio, then the location of Syncfusion libraries is [system drive:\Program Files (x86)\Syncfusion\Essential Studio\{{ site.releaseversion }}\Assemblies].

- Microsoft.AnalysisServices.AdomdClient
- Syncfusion.Compression.Base
- Syncfusion.Linq.Base
- Syncfusion.Olap.Base
- Syncfusion.PivotAnalysis.Base
- Syncfusion.EJ
- Syncfusion.EJ.MVC
- Syncfusion.EJ.Export
- Syncfusion.EJ.Pivot

List of Namespaces

Following are the list of namespaces to be added on top of the main class inside OlapService.svc.cs file.

C#

```
using System.Web;
using System.Collections.Generic;
using System.Configuration;
using System.Linq;
using System.Net;
using System.Web.Script.Serialization;
using Syncfusion.Olap.Manager;
using Syncfusion.Olap.Reports;
using Syncfusion.JavaScript;
using OLAPUTILS = Syncfusion.JavaScript.Olap;
using System.ServiceModel.Activation;
namespace PivotTreeMaptDemo
{
```

```
[AspNetCompatibilityRequirements(RequirementsMode =
AspNetCompatibilityRequirementsMode.Allowed)]
public class OlapService : IOlapService
{
}
}
```

Datasource Initialization

Now the connection string to connect OLAP Cube, PivotTreeMap, and "JavaScriptSerializer" instances are created immediately inside the main class in OlapService.svc.cs file.

C#

```
namespace PivotTreeMaptDemo
{
[AspNetCompatibilityRequirements(RequirementsMode =
AspNetCompatibilityRequirementsMode.Allowed)]
public class OlapService : IOlapService
{
PivotTreeMap htmlHelper = new PivotTreeMap();
string connectionString = "Data
Source=http://bi.syncfusion.com/olap/msmdpump.dll; Initial
Catalog=Adventure Works DW 2008 SE;";
JavaScriptSerializer serializer = new JavaScriptSerializer();
//Other codes
}
}
```

Service methods in WCF Service

First, declare the service methods inside **IOlapService** interface, found in IOlapService.cs file, created while adding WCF Service to the Application.

C#

```
namespace PivotTreeMaptDemo
{
[ServiceContract]
public interface IOlapService
{
[OperationContract]
Dictionary< string, object > InitializeTreeMap(string action, string
currentReport, string customObject);
[OperationContract]
Dictionary<string, object> DrillTreeMap(string action, string drillInfo,
string olapReport, string customObject);
}
}
```

Then, elaborate the service methods inside the main class, found in OlapService.svc.cs file.

C#

```
namespace PivotTreeMaptDemo
{
```

```
[AspNetCompatibilityRequirements(RequirementsMode =
AspNetCompatibilityRequirementsMode.Allowed)]
public class OlapService : IOlapService
{
PivotTreeMap htmlHelper = new PivotTreeMap();
string connectionString = "Data
Source=http://bi.syncfusion.com/olap/msmdpump.dll; Initial
Catalog=Adventure Works DW 2008 SE;";
JavaScriptSerializer serializer = new JavaScriptSerializer();
//This method provides the required information from the server side when
initializing the PivotTreeMap.
public Dictionary< string, object > InitializeTreeMap(string action,
string currentReport, string customObject)
{
OlapDataManager DataManager = null;
DataManager = new OlapDataManager(connectionString);
DataManager.SetCurrentReport(CreateOlapReport());
return htmlHelper.GetJsonData(action, DataManager);
}
public Dictionary<string, object> DrillTreeMap(string action, string
drillInfo, string olapReport, string customObject)
{
OlapDataManager DataManager = new OlapDataManager(connectionString);
DataManager.SetCurrentReport(OLAPUTILS.Utils.DeserializeOlapReport(olapRe
port));
return htmlHelper.GetJsonData(action, DataManager, drillInfo);
}
private OlapReport CreateOlapReport()
{
OlapReport olapReport = new OlapReport();
olapReport.Name = "Default Report";
olapReport.CurrentCubeName = "Adventure Works";
DimensionElement dimensionElementColumn = new DimensionElement();
//Specifying the Name for the Dimension Element
dimensionElementColumn.Name = "Date";
dimensionElementColumn.AddLevel("Fiscal", "Fiscal Year");
MeasureElements measureElementColumn = new MeasureElements();
//Specifying the Name for the Measure Element
measureElementColumn.Elements.Add(new MeasureElement { Name = "Customer
Count" });
DimensionElement dimensionElementRow = new DimensionElement();
//Specifying the Dimension Name
dimensionElementRow.Name = "Customer";
dimensionElementRow.AddLevel("Customer Geography", "Country");
///Adding Row Members
olapReport.SeriesElements.Add(dimensionElementRow);
///Adding Column Members
olapReport.CategoricalElements.Add(dimensionElementColumn);
///Adding Measure Element
olapReport.CategoricalElements.Add(measureElementColumn);
return olapReport;
}
}
}
```

Configuring Web Configuration File

Copyright © 2001 - 2020 Syncfusion Inc.

The services could be exposed through the properties, binding, contract and address by using an endpoint.

- Contract: This property indicates that the contract of the endpoint is exposing. Here you are referring to IOlapService contract and hence it is PivotTreeMapDemo.IOlapService.
- Binding: In your application, you use webHttpBinding to post and receive the requests and responses between the client-end and the service.
- BehaviorConfiguration: This property contains the name of the behavior to be used in the endpoint.

The endpointBehaviors are illustrated as follows.

XML

```
<system.serviceModel>
......
......
<services>
<service name="PivotTreeMapDemo.OlapService">
<endpoint address=""
behaviorConfiguration="PivotTreeMapDemo.OlapServiceAspNetAjaxBehavior"
binding="webHttpBinding" contract="PivotTreeMapDemo.IOlapService" />
</service>
</services>
</system.serviceModel>
```

The endpointBehaviors contain all the behaviors for an endpoint. You can link each endpoint to the respective behavior only by using this name property.

XML

```
<system.serviceModel>
<behaviors>
<endpointBehaviors>
<behavior name="PivotTreeMapDemo.OlapServiceAspNetAjaxBehavior">
<enableWebScript />
</behavior>
</endpointBehaviors>
</behaviors>
......
......
</system.serviceModel>
```

Note: In this example, **"PivotTreeMapDemo"** indicates the name and root namespace of the Application created in Visual Studio IDE and **"OlapService"** indicates the name of the WCF service created.

Configuring routing file

Routing configuration needs to be done in RouteConfig.cs file found under **AppStart** folder. The configuration would allow picking appropriate WCF service without any issues.

C#

Copyright © 2001 - 2020 Syncfusion Inc.

```
public static void RegisterRoutes(RouteCollection routes) {
routes.IgnoreRoute("{resource}.axd/{*pathInfo}");
routes.IgnoreRoute("{resource}.svc/{*pathInfo}");
routes.IgnoreRoute("{resource}.svc");
routes.MapRoute(
name: "Default",
url: "{controller}/{action}/{id}",
defaults: new { controller = "Home", action = "Index", id =
UrlParameter.Optional }
);
}
```

The above code will generate a simple PivotTreeMap showing Customer Count over different customer geographic locations across a period of fiscal years.

{% include image.html url="/js/PivotTreeMap/OLAP-Connectivity_images/olapwebapi.png" %}

Drill Operation

Drill down exposes the hierarchy by clicking on a node and this results in allowing the TreeMap to move to the next level or sub level. We can return back to the normal TreeMap view by clicking on the node header at the top.

Named Sets

Named Sets is a multidimensional expression (MDX) that returns a set of dimension members, which can be created by combining cube data, arithmetic operators, numbers, and functions.

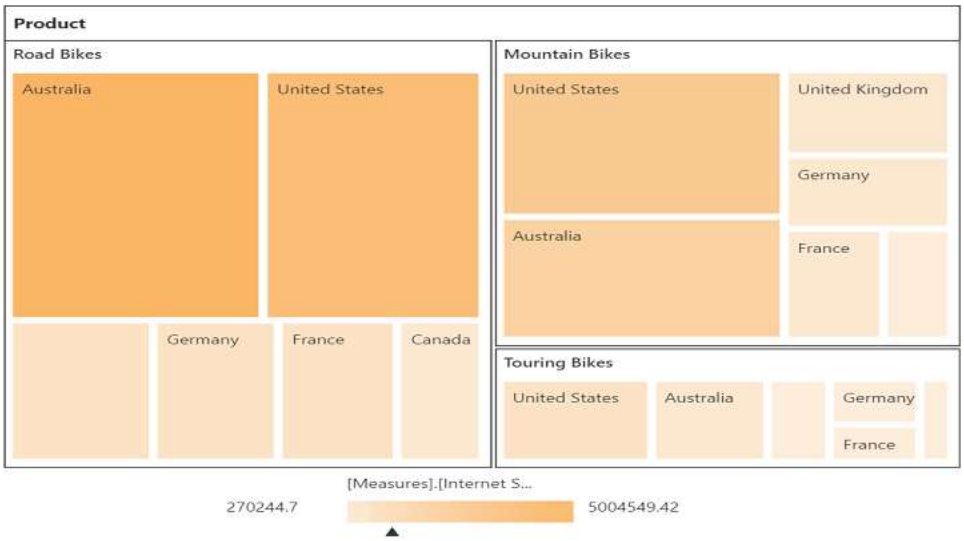
Client Mode

You can bind the Named Sets in PivotTreeMap by setting it's unique name in the `FieldName` property either in row or column axis and `IsNamedSets` Boolean property to "true".

JS

```
<!--Create a tag which acts as a container for PivotTreeMap-->
@Html.EJ().Pivot().PivotTreeMap("PivotTreeMap1").DataSource(dataSource =>
dataSource.Rows(rows => { rows.FieldName("[Core Product
Group]").IsNamedSets(true).Add(); }).Columns(columns => {
columns.FieldName("[Customer].[Customer Geography]").Add();
}).Values(values => { values.Measures(measures => {
measures.FieldName("[Measures].[Internet Sales Amount]").Add();
}).Axis(AxisName.Column).Add(); })
.Data("http://bi.syncfusion.com/olap/msmdpump.dll").Catalog("Adventure
Works DW 2008 SE").Cube("Adventure Works"))
<! --Tooltip labels can be localized here-->
<script id="tooltipTemplate" type="application/jsrender">
<div style="background:White; color:black; font-size:12px; font-
weight:normal; border: 1px solid #4D4D4D; white-space: nowrap;border-
radius: 2px; margin-right: 25px; min-width: 110px;padding-right: 5px;
padding-left: 5px; padding-bottom: 2px ;width: auto; height: auto;">
<div>Measure(s) : {{:~Measures(#data)}}</div><div>Row :
{{:~Row(#data)}}</div><div>Column : {{:~Column(#data)}}</div><div>Value :
{{:~Value(#data)}}</div>
</div>
```

```
</script>
```



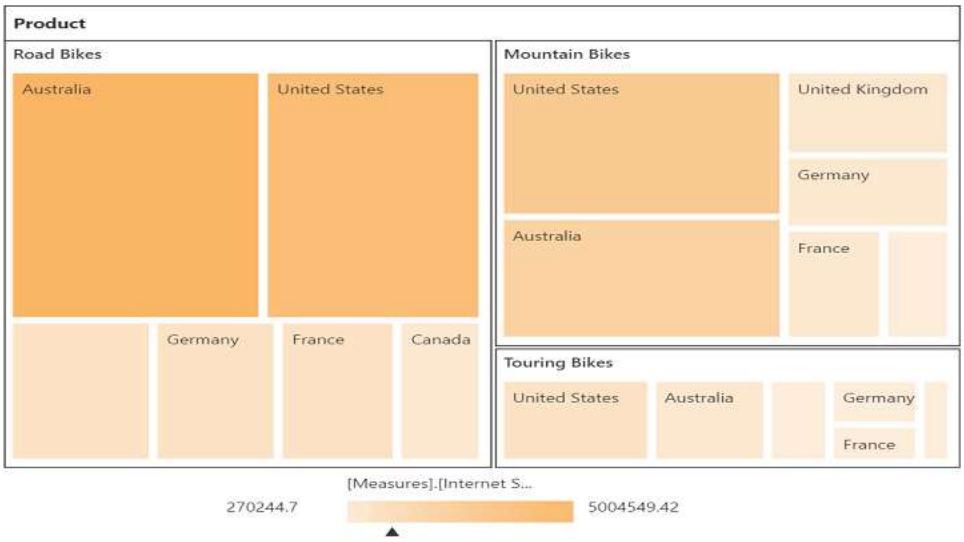
Server Mode

You can add Named Sets in the PivotTreeMap by using NamedSetElement class in the OlapReport.

C#

```
OlapReport olapReport = new OlapReport();
olapReport.Name = "Customer Report";
olapReport.CurrentCubeName = "Adventure Works";
DimensionElement dimensionElementColumn = new DimensionElement();
dimensionElementColumn.Name = "Customer";
dimensionElementColumn.AddLevel("Customer Geography", "Country ");
MeasureElements measureElementColumn = new MeasureElements();
measureElementColumn.Elements.Add(new MeasureElement {
Name = "Internet Sales Amount"
});
NamedSetElement dimensionElementRow = new NamedSetElement();
dimensionElementRow.Name = "Core Product Group";
olapReport.CategoricalElements.Add(dimensionElementColumn);
olapReport.CategoricalElements.Add(measureElementColumn);
olapReport.SeriesElements.Add(dimensionElementRow);
```

Copyright © 2001 - 2020 Syncfusion Inc.



Color Mapping

You can customize the colors of the leaf nodes of PivotTreeMap using the color mapping support.

Color mapping is categorized into two different types such as,

- Normal
- Range

You can color all the leaf nodes with the different colors by setting the color value of the rangeColorMapping property.

Normal Color Mapping

You can customize the nodes based on number of leaf items using different color ranges. You can also define the color value range using from and to properties.

The following code sample explains how to customize PivotTreeMap appearance using **Normal** mode (i.e., differentiate color based on number of the leaf items in each header).

JS

```
<! --Create a tag which acts as a container for PivotTreeMap-->
@Html.EJ().Pivot().PivotTreeMap("PivotTreeMap1").DataSource(dataSource =>
dataSource.Rows(rows => { rows.FieldName("[Date].[Fiscal]").Add();
}).Columns(columns => { columns.FieldName("[Customer].[Customer
Geography]").Add(); }).Values(values => { values.Measures(measures => {
measures.FieldName("[Measures].[Customer Count]").Add();
}).Axis(AxisName.Column).Add();
}).Data("http://bi.syncfusion.com/olap/msmdpump.dll").Catalog("Adventure
Works DW 2008 SE").Cube("Adventure Works")).ClientSideEvents(oEve => {
oEve.RenderSuccess("onTypeChange"); })
<script type="text/javascript">
function onTypeChange(args) {
treemapTarget = $('#PivotTreeMap1TreeMapContainer').data("ejTreeMap");
treemapTarget.model.colorValuePath = "";
treemapTarget.model.enableGradient = false;
treemapTarget.model.showLegend = false;
treemapTarget.model.legendSettings.leftLabel = "";
```

```
treemapTarget.model.legendSettings.rightLabel = "";
treemapTarget.model.rangeColorMapping = [];
treemapTarget.model.colorValuePath = "Index";
treemapTarget.model.rangeColorMapping.push(
{ color: "#9de24f", from: "0", to: "0" },
{ color: "#a2e2fe", from: "1", to: "1" },
{ color: "#ffff66", from: "2", to: "2" },
{ color: "#FF0040", from: "3", to: "3" },
{ color: "#f6b53f", from: "4", to: "4" },
{ color: "#6FAAB0", from: "5", to: "5" },
{ color: "#C4C24A", from: "6", to: "6" }
)
treemapTarget.refresh();
}
</script>
<! --Tooltip labels can be localized here-->
<script id="tooltipTemplate" type="application/jsrender">
<div style="background:White; color:black; font-size:12px; font-
weight:normal; border: 1px solid #4D4D4D; white-space: nowrap;border-
radius: 2px; margin-right: 25px; min-width: 110px;padding-right: 5px;
padding-left: 5px; padding-bottom: 2px ;width: auto; height: auto;">
<div>Measure(s) : {{:~Measures(#data)}}</div><div>Row :
{{:~Row(#data)}}</div><div>Column : {{:~Column(#data)}}</div><div>Value :
{{:~Value(#data)}}</div>
</div>
</script>
```

Range Color Mapping

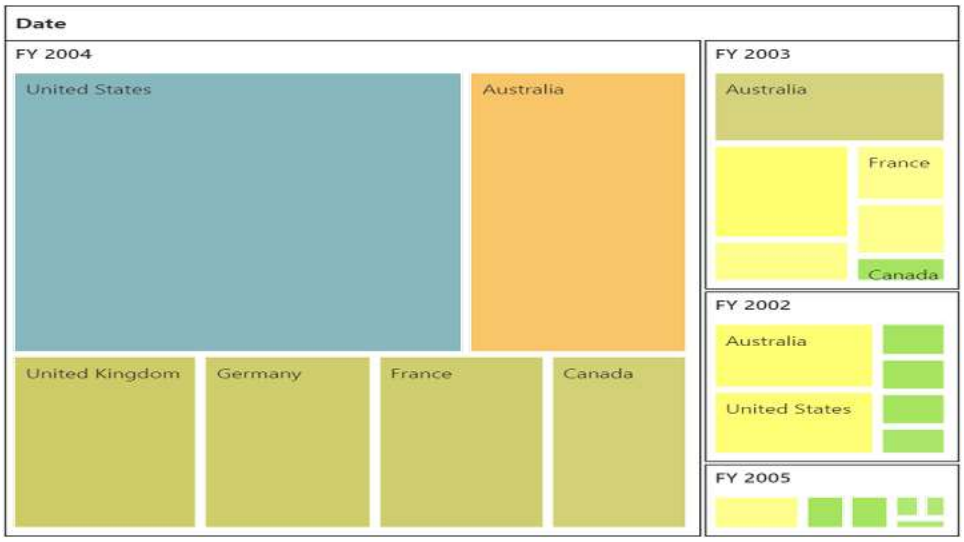
You can customize the nodes based on its value and color ranges using **Range** color. You can also define the color value range using from and to properties.

The following code sample explains how to customize PivotTreeMap appearance using **Range** mode (i.e., differentiate color for leaf items based on values).

JS

```
<script type="text/javascript">
function onTypeChange(args) {
```

```
treemapTarget = $('#PivotTreeMap1TreeMapContainer').data("ejTreeMap");
treemapTarget.model.colorValuePath = "";
treemapTarget.model.enableGradient = false;
treemapTarget.model.showLegend = false;
treemapTarget.model.legendSettings.leftLabel = "";
treemapTarget.model.legendSettings.rightLabel = "";
treemapTarget.model.rangeColorMapping = [];
treemapTarget.model.colorValuePath = "Value";
treemapTarget.model.rangeColorMapping.push(
{ color: "#a2e2fe", from: "0", to: "10" },
{ color: "#9de24f", from: "11", to: "250" },
{ color: "#ffff66", from: "251", to: "1000" },
{ color: "#C4C24A", from: "1001", to: "3000" },
{ color: "#f6b53f", from: "3001", to: "5000" },
{ color: "#6FAAB0", from: "5001", to: "10000" },
{ color: "#FF0040", from: "10001", to: "20000" }
)
treemapTarget.refresh();
}
</script>
```



Legend

Legend Visibility

The legend shows the value range differences and color occurrence in the respective leaf node while you hover it with the cursor.

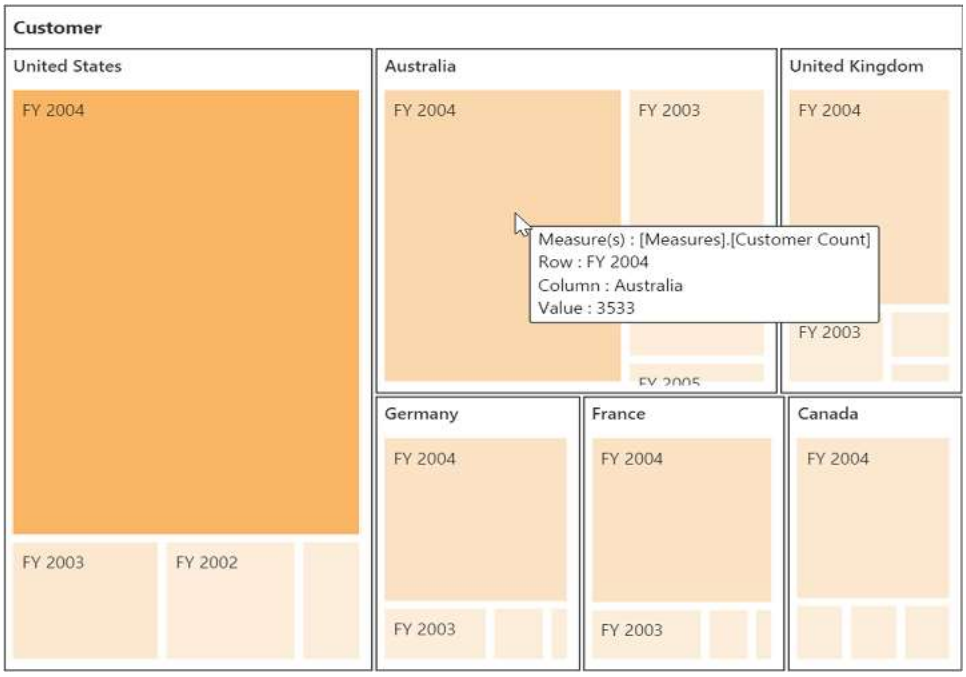
Note: By default, the legend is visible in PivotTreeMap.

Copyright © 2001 - 2020 Syncfusion Inc.

You can disable the legend by setting the property **showLegend** as **false**. The following code example shows how to disable the legend.

JS

```
@Html.EJ().Pivot().PivotTreeMap("PivotTreeMap1").DataSource(dataSource =>
dataSource.Rows(rows => { rows.FieldName("[Date].[Fiscal]").Add();
}).Columns(columns => { columns.FieldName("[Customer].[Customer
Geography]").Add(); }).Values(values => { values.Measures(measures => {
measures.FieldName("[Measures].[Customer Count]").Add();
}).Axis(AxisName.Column).Add();
}).Data("http://bi.syncfusion.com/olap/msmdpump.dll").Catalog("Adventure
Works DW 2008 SE").Cube("Adventure Works")).ClientSideEvents(oEve => {
oEve.RenderSuccess("showLegend"); })
<script type="text/javascript">
function showLegend(args) {
pivotTreeMap = $("#PivotTreeMap1TreeMapContainer").data("ejTreeMap");
pivotTreeMap.model.showLegend = false;
pivotTreeMap.refresh();
}
</script>
<! --Tooltip labels can be localized here-->
<script id="tooltipTemplate" type="application/jsrender">
<div style="background:White; color:black; font-size:12px; font-
weight:normal; border: 1px solid #4D4D4D; white-space: nowrap;border-
radius: 2px; margin-right: 25px; min-width: 110px;padding-right: 5px;
padding-left: 5px; padding-bottom: 2px ;width: auto; height: auto;">
<div>Measure(s) : {{:~Measures(#data)}}</div><div>Row :
{{:~Row(#data)}}</div><div>Column : {{:~Column(#data)}}</div><div>Value :
{{:~Value(#data)}}</div>
</div>
</script>
```



Localization

Localization and Globalization of Cube Info (Client Mode)

Content displayed within the PivotTreeMap control are obtained from the OLAP Cube. So following are the steps that needs to be done to get the localized and globalized Cube content.

- To get localized data from OLAP Cube, we need to set **"Locale Identifier"** in the connection string to a specific culture in the **"data"** property present inside **"DataSource"**.

ASPX-CS

```
//1036 refers to "fr-FR" culture.
<!--Create a tag which acts as a container for PivotTreeMap-->
@Html.EJ().Pivot().PivotTreeMap("PivotTreeMap1").DataSource(dataSource =>
dataSource.Rows(rows => { rows.FieldName("[Customer].[Customer
Geography]").Add(); }).Columns(columns => {
columns.FieldName("[Date].[Fiscal]").Add(); }).Values(values => {
values.Measures(measures => { measures.FieldName("[Measures].[Customer
Count]").Add(); }).Axis(AxisName.Column).Add(); })
.Data("http://bi.syncfusion.com/olap/msmdpump.dll;Locale
Identifier=1036;").Catalog("Adventure Works DW 2008 SE").Cube("Adventure
Works")).IsResponsive(true)
<! --Tooltip labels can be localized here-->
<script id="tooltipTemplate" type="application/jsrender">
<div style="background:White; color:black; font-size:12px; font-
weight:normal; border: 1px solid #4D4D4D; white-space: nowrap;border-
radius: 2px; margin-right: 25px; min-width: 110px;padding-right: 5px;
padding-left: 5px; padding-bottom: 2px ;width: auto; height: auto;">
<div>Measure(s) : {{:~Measures(#data)}}</div><div>Row :
{{:~Row(#data)}}</div><div>Column : {{:~Column(#data)}}</div><div>Value :
{{:~Value(#data)}}</div>
</div>
</script>
```

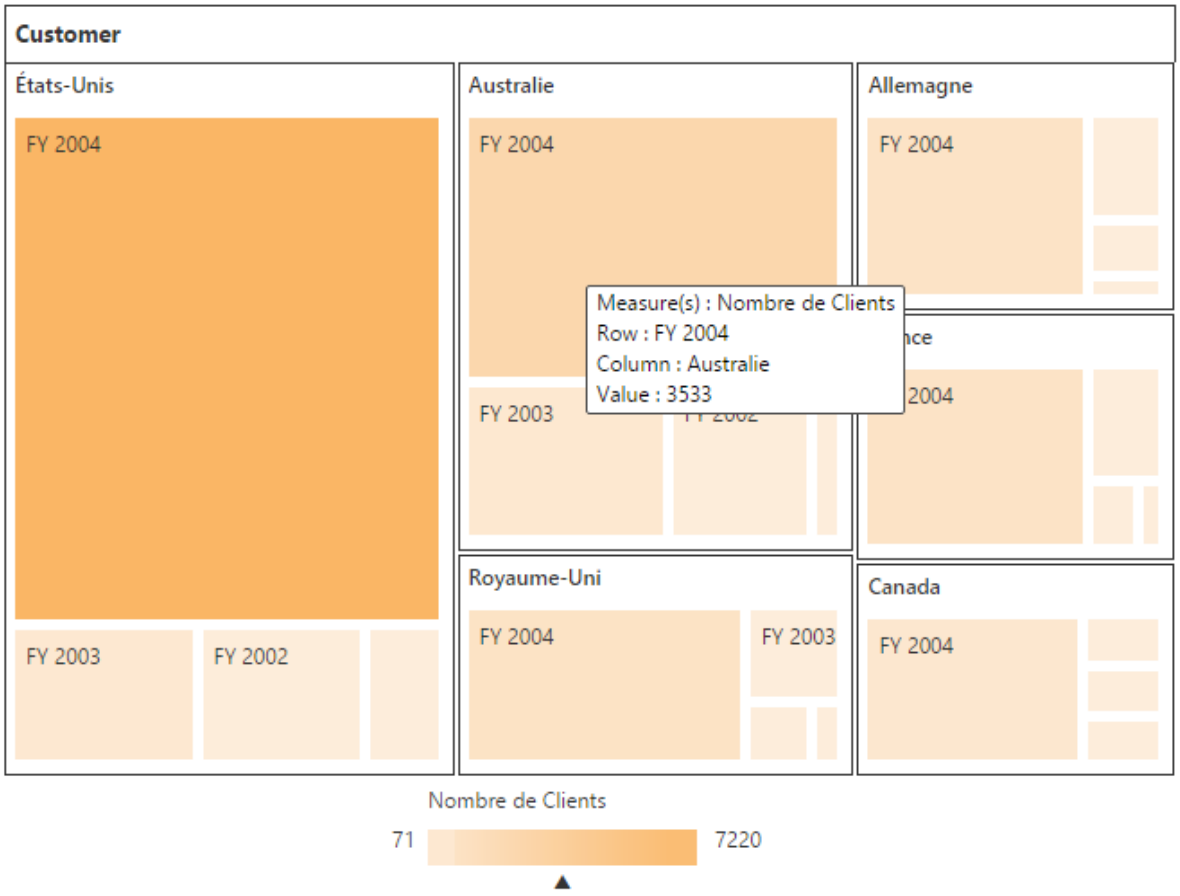
Localization and Globalization of Cube Info (Server Mode)

Content displayed within the PivotTreeMap control are obtained from the OLAP Cube. So following are the steps that needs to be done to get the localized and globalized Cube content.

- To get the localized string based on different cultures, from OLAP Cube, we need to set **“Locale Identifier”** in the connection string to a specific culture.
- To bind the globalized content in PivotTreeMap control, we need to set **“Culture”** and **“OverrideDefaultFormatStrings”** properties in "OlapDataManager" class to a specific culture.

C#

```
//1036 refers to “fr-FR” culture.
string connectionString = "Data Source=localhost; Initial
Catalog=Adventure Works DW; Locale Identifier=1036;";
DataManager = new OlapDataManager(connectionString);
DataManager.Culture = new System.Globalization.CultureInfo(1036);
DataManager.OverrideDefaultFormatStrings = true;
```



How to

Configure pivot tree map through the model properties

There comes a time when you want to set pivot tree map properties other than using PivotTreeMapPropertiesBuilder i.e., in the Controller side. At that time, you can pass PivotTreeMapProperties model instance as a parameter to the pivot tree map helper method.

We can set properties to pivot tree map control in server-side using the PivotTreeMapProperties class and it is used in the view page with the help of pivot tree map helper overload.

In addition to the id parameter of pivot tree map helper method, we can also pass PivotTreeMapProperties model as another parameter to the pivot tree map helper method.

The following code example explains how to render the pivot tree map control in relational mode.

The following code example which will explain to render the pivot tree map control.

RAZOR

```
@model Syncfusion.JavaScript.Models.PivotTreeMapProperties
@(Html.EJ().Pivot().PivotTreeMap("PivotTreeMap", Model))
```

C#

```
namespace PivotTreeMap
{
public class PivotTreeMapController: Controller
{
public ActionResult PivotTreeMapFeatures()
{
Syncfusion.JavaScript.Models.PivotTreeMapProperties pivottreemap = new
Syncfusion.JavaScript.Models.PivotTreeMapProperties();
PivotDataSource pivottreemapDS = new PivotDataSource();
pivottreemapDS.Data = "https://bi.syncfusion.com/olap/msmdpump.dll";
pivottreemapDS.Cube = "Adventure Works";
pivottreemapDS.Catalog = "Adventure Works DW 2008 SE";
List<Field> rows = new List<Field>();
rows.Add(new Field() { FieldName = "[Date].[Fiscal]" });
pivottreemapDS.Rows = rows;
List<Field> cols = new List<Field>();
cols.Add(new Field() { FieldName = "[Customer].[Customer Geography]" });
pivottreemapDS.Columns = cols;
List<MeasuresItems> measures = new List<MeasuresItems>();
measures.Add(new MeasuresItems() { FieldName = "[Measures].[Internet
Sales Amount]" });
List<Field> values = new List<Field>();
values.Add(new Field() { Measures = measures, Axis =
Syncfusion.JavaScript.AxisName.Column });
pivottreemapDS.Values = values;
pivottreemap.DataSource = pivottreemapDS;
return View(pivottreemap);
}
}
}
```

As a result of the previous code example, the pivot tree map will be displayed as shown below:

Copyright © 2001 - 2020 Syncfusion Inc.

PdfViewer

Overview

The PDF viewer for ASP .NET MVC is a visualization component for viewing and printing the PDF documents in web pages. It is powered by HTML5 or JavaScript and provides various customizations.

Key Features

- Uploads the PDF document into the server as byte array or stream and displays the same in the client.
- Views password protected or encrypted PDF documents.
- Allows customization of the default toolbar and creation of your own toolbar.
- Provides magnification tools and view modes for better viewing experience.
- Supports built-in themes for enhancing appearance.
- Supports responsive rendering while resizing the control/window.
- Supports text selection and search.
- Supports text markup annotations.
- Includes handwritten signatures in the PDF document.
- Prints the PDF document with the changes made.
- Downloads the PDF document with the changes made.
- Supports localization to adopt to the machines culture and language.
- Compatible with all the modern browsers that provides HTML5/CSS3/JavaScript support.

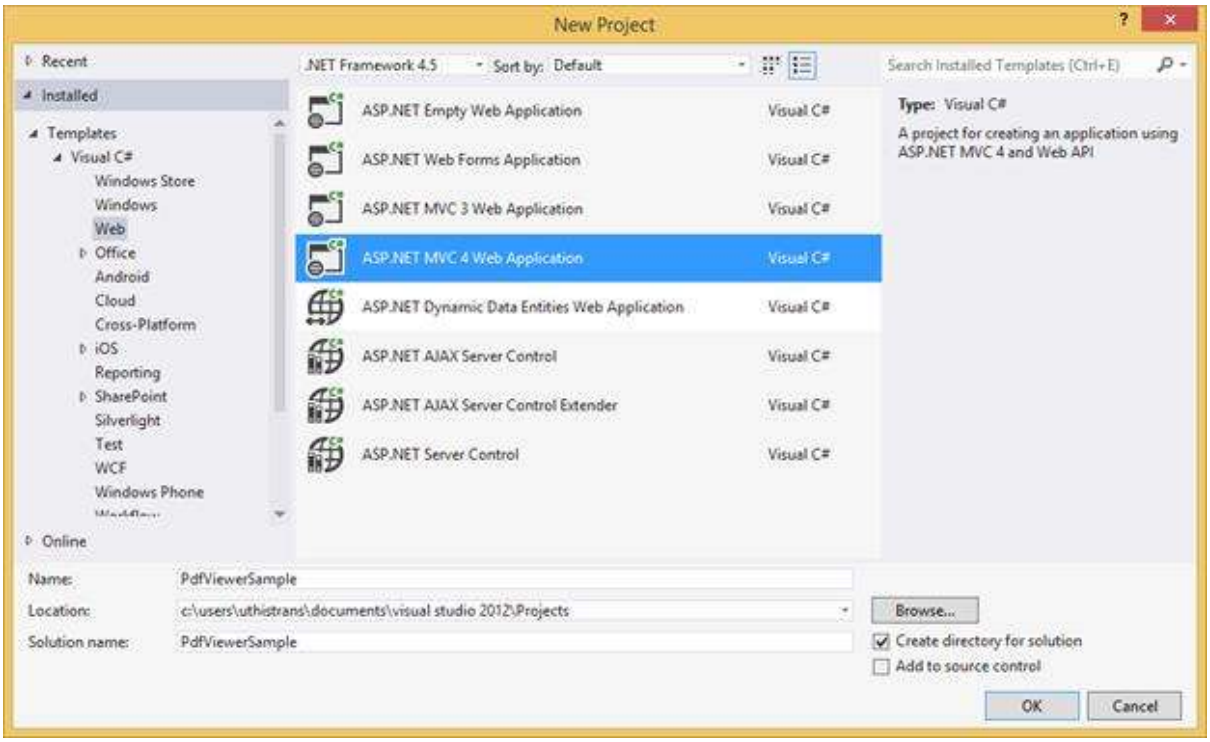
Getting Started

This section explains how to add and use a PDF viewer control in your web application with ASP.NET MVC.

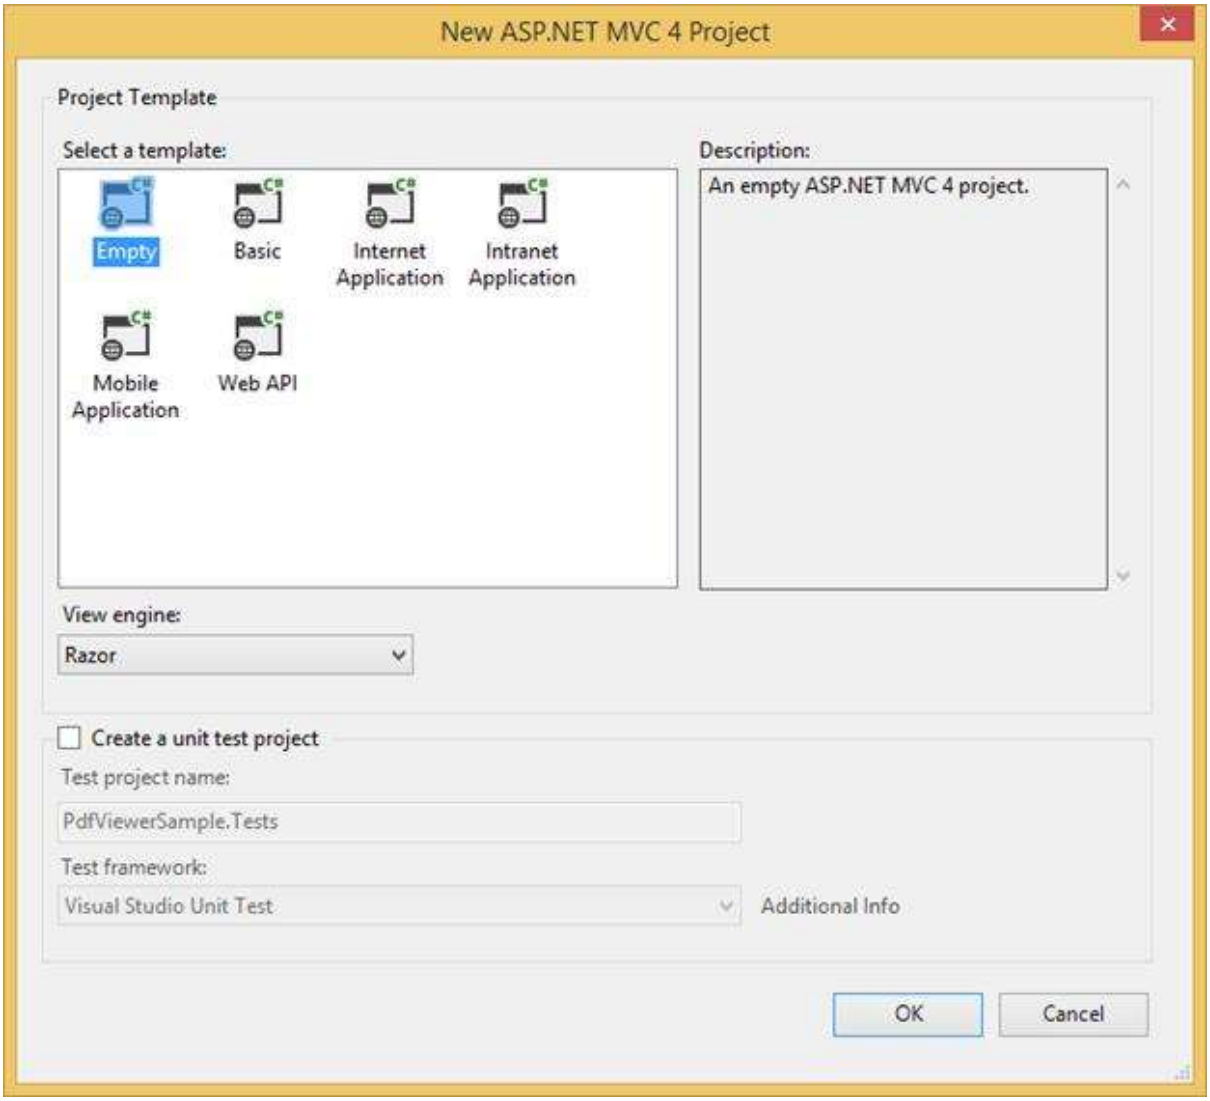
Create your first PDF viewer application in ASP.NET MVC

Open Visual Studio and create a new project by clicking New Project. Select the Web category and ASP.NET MVC4 Web Application template, and then click OK. The following screenshot displays the Project Creation Wizard in Visual Studio 2012:

Copyright © 2001 - 2020 Syncfusion Inc.

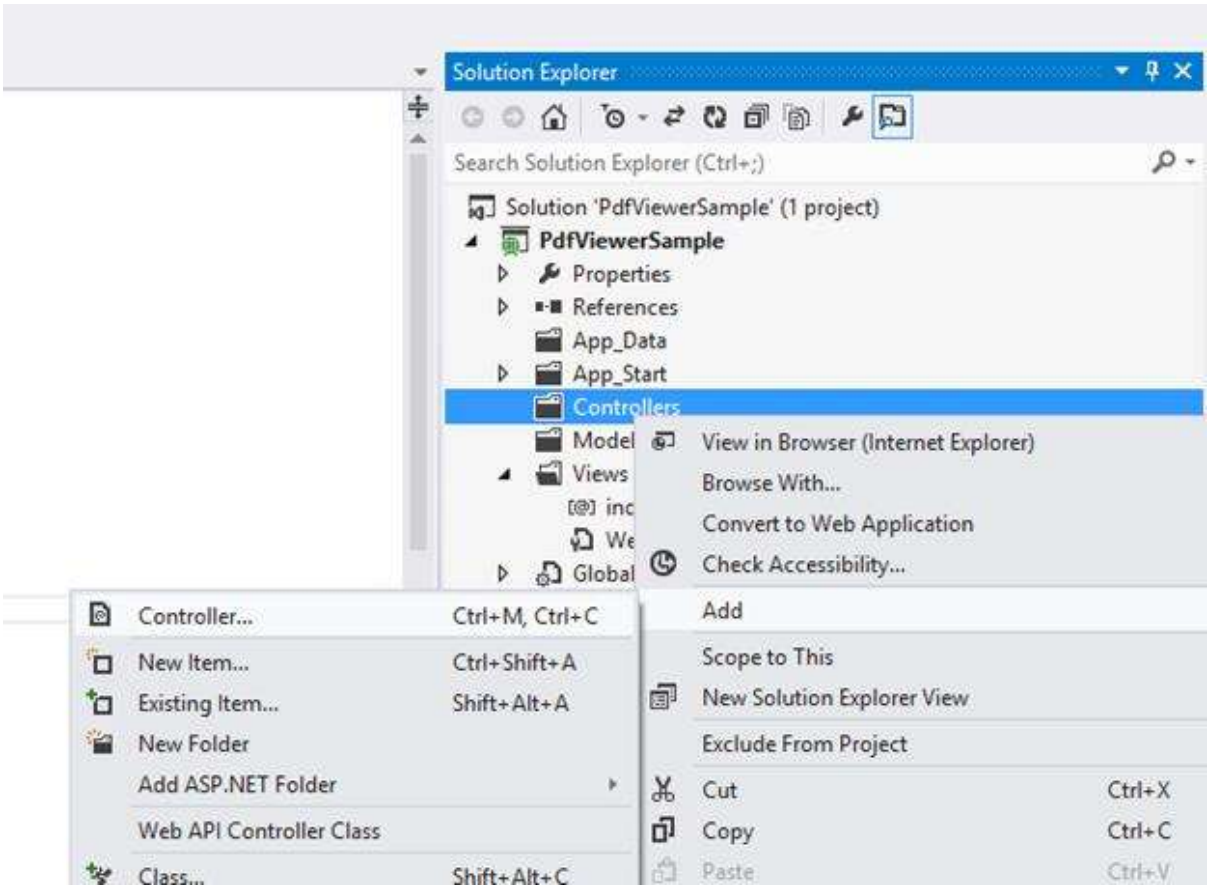


The following screenshot displays how to select the project template with razor view engine:

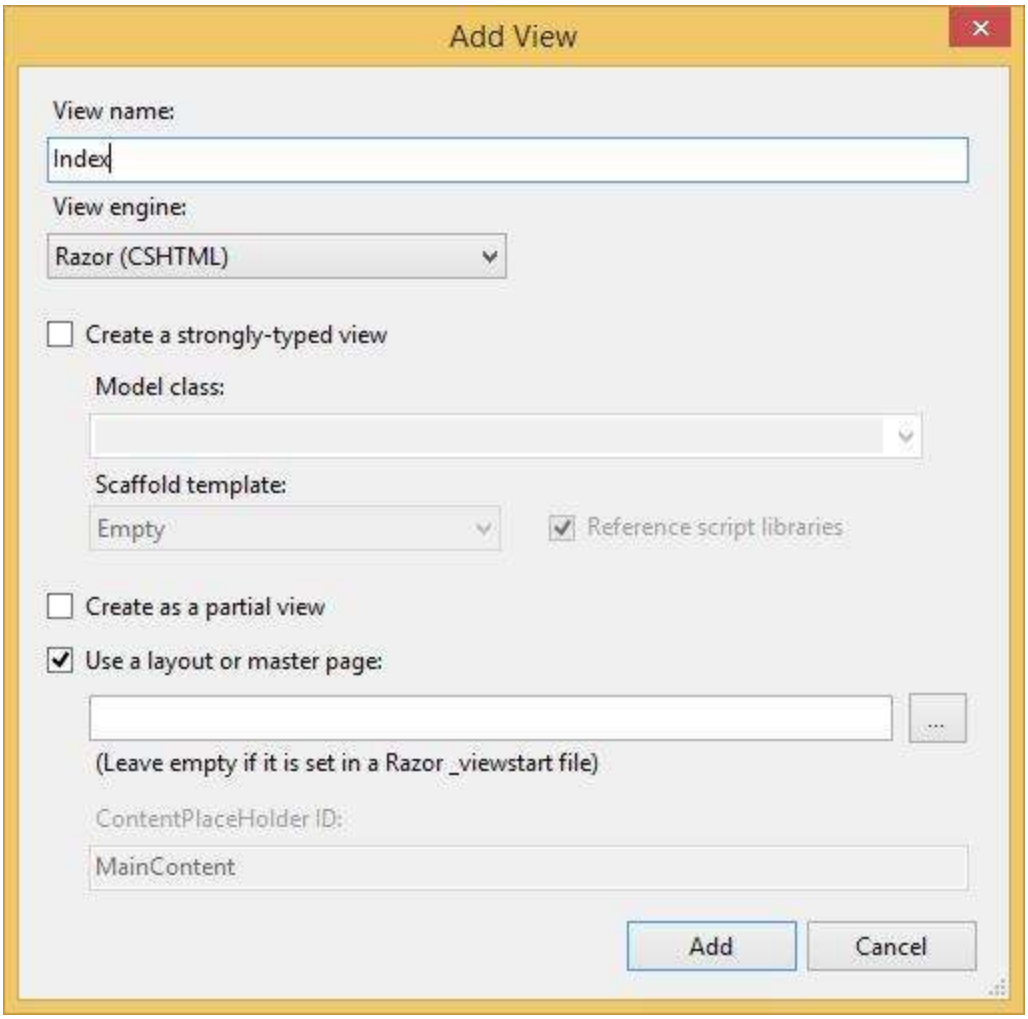


Add Controller and View page

Add new MVC controller in the Controllers folder and name it as **PdfSampleController.cs**



Create a new folder **PdfSample** in views and add new view **Index.cshtml** in it.



Modify RouteConfig.cs

Modify the routing to map to the **PdfSample** controller as follows.

C#

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Web;
using System.Web.Mvc;
using System.Web.Routing;
namespace PdfViewerSample
{
public class RouteConfig
{
public static void RegisterRoutes(RouteCollection routes)
{
routes.IgnoreRoute("{resource}.axd/{*pathInfo}");
routes.MapRoute(
name: "Default",
url: "{controller}/{action}/{id}",
defaults: new { controller = "PdfSample", action = "Index", id =
UrlParameter.Optional }
```

```
);
}
}
}
```

Modify WebApiConfig.cs

Modify the routing to map to the API controller of **PdfViewerSample** project as follows.

C#

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Web.Http;
namespace PdfViewerSample
{
public static class WebApiConfig
{
public static void Register(HttpConfiguration config)
{
config.Routes.MapHttpRoute(
name: "DefaultApi",
routeTemplate: "api/{controller}/{action}/{id}",
defaults: new { id = RouteParameter.Optional }
);
}
}
}
```

Configuring Global.asax.cs

The WebApiConfig.cs and RouteConfig.cs must be configured in the Application_Start() method of Global.asax.cs

C#

```
protected void Application_Start()
{
AreaRegistration.RegisterAllAreas();
WebApiConfig.Register(GlobalConfiguration.Configuration);
FilterConfig.RegisterGlobalFilters(GlobalFilters.Filters);
RouteConfig.RegisterRoutes(RouteTable.Routes);
BundleConfig.RegisterBundles(BundleTable.Bundles);
}
```

Add References, Scripts, Styles

Add References

Add reference to the following assemblies from NuGet package:

- System.Web.Http
- System. Web.Http.WebHost
- System.Net.Http.WebRequest
- System.Net.Http.Formatting

Copyright © 2001 - 2020 Syncfusion Inc.

Note: The System.Web.Routing and System.Net.Http assemblies are also required, which are referred by default when creating the project.

Add the following references that are necessary for the PDF viewer control and set the Copy Local property to **True**

- Syncfusion.Compression.Base
- Syncfusion.Pdf.Base
- Syncfusion.EJ
- Syncfusion.EJ.PdfViewer
- Syncfusion.EJ.MVC

Note: Starting with v16.2.0.x, if you reference Syncfusion assemblies from trial setup or from the NuGet feed, you also have to include a license key in your projects. Please refer to this link to know about registering Syncfusion license key in your ASP.NET MVC application to use our components.

Add Scripts and Styles

Find the scripts for the PDF viewer control and style sheets in any of the following locations:

Local Disk: Click here to know more about script and style sheets installed in local machine.

CDN Link: Click here to know more about script and style sheets available online.

NuGet Package: Click here to know more about script and style sheets available in NuGet package.

Note: For getting started, you can use the ej.web.all.min.js file, which encapsulates all the ej widgets and frameworks in a single file. In production, it is highly recommended to use custom script generator to create custom script file with required widgets and its dependencies to reduce the size of the script file.

Add the script files and CSS files in the <title> tag of View page.

HTML

```
<link href="https://cdn.syncfusion.com/16.1.0.24/js/web/flat-
azure/ej.web.all.min.css" rel="stylesheet" />
<script src="https://cdn.syncfusion.com/js/assets/external/jquery-
3.1.1.min.js"></script>
<script
src="https://cdn.syncfusion.com/16.1.0.24/js/web/ej.web.all.min.js"></scr
ipt>
```

Note: If the *Layout.cshtml is available, refer to the script files and CSS files in the* Layout.cshtml.

Modify Web.config

To render the PDF viewer in unobtrusive mode, refer to the **ej.unobtrusive.js** script file. Otherwise set **UnobtrusiveJavaScriptEnabled** to false in Web.config file. Add the following namespace in Web.config of Views.

XML

```
<add namespace="Syncfusion.EJ"/>
<add namespace="Syncfusion.MVC.EJ"/>
```

Copyright © 2001 - 2020 Syncfusion Inc.

Add Control in View page

Initializing the PDF viewer control

1.Setting ServiceUrl and PdfService

To initialize the PDF viewer control, use the ServiceUr property that is necessary to access the service from which the PDF document is loaded and processed for the control. The PdfService property can also be used to specify the location of the supporting PDF service.

JAVASCRIPT

```
@(Html.EJ().PdfViewer("pdfviewer").ServiceUrl("https://js.syncfusion.com/ejServices/api/PdfViewer").PdfService("Local"))
```

2.Provide Web API action methods

The Web API action methods must be available in the server (Web API controller) to load and process the PDF documents. The available API methods in the controller are Load, FileUpload, Download, and Unload. However, we can modify the name of the server action methods as used in the controller using the ServerActionSettings property in the PDF viewer control.

JAVASCRIPT

```
@(Html.EJ().PdfViewer("pdfviewer").ServiceUrl("https://js.syncfusion.com/ejServices/api/PdfViewer").ServerActionSettings(s=>s.Load("LoadAction").FileUpload("FileUploadAction").Download("DownloadAction")))
```

3.Load PDF documents from client side

The PDF documents can be loaded in the PDF viewer control using the load() method in the client side. The path of the PDF document and the base64 string of the document can be used to load the PDF document.

Note: If the name of the PDF document is only passed as parameter in the load() method, the PDF document must be available in the folder which is specified in the Load action method in the controller.

JAVASCRIPT

```
var pdfviewer=$("#pdfviewer").data("ejPdfViewer");
pdfviewer.load("HTTP Succinctly");
```

When the PDF document is loaded in the PDF viewer control, the documentLoad event will be triggered. We can define the event method using the DocumentLoaded property of the control.

HTML

```
@(Html.EJ().PdfViewer("pdfviewer").ServiceUrl("https://js.syncfusion.com/ejServices/api/PdfViewer").ClientSideEvents(e=>e.DocumentLoaded("documentLoaded")))
<script type="text/javascript">
function documentLoaded(args) {
alert("The document" +args.fileName + "is ready to view");
}
</script>
```

Copyright © 2001 - 2020 Syncfusion Inc.

4.Load the documents during control initialization

The PDF document can also be loaded during the PDF viewer control initialization using the DocumentPath property. The path of the PDF document and the base64 string of the document can be used to load the PDF document.

Note: If the name of the PDF document is only set in the DocumentPath property, the PDF document must be available in the folder which is specified in the Load action method in the controller

JAVASCRIPT

```
@(Html.EJ().PdfViewer("pdfviewer").ServiceUrl("https://js.syncfusion.com/ejServices/api/PdfViewer").DocumentPath("HTTP Succinctly"))
```

5.Unload the documents from PDF viewer control

The PDF document loaded in the PDF viewer control can be unloaded using the unload() method in the client side.

JAVASCRIPT

```
var pdfviewer=$("#pdfviewer").data("ejPdfViewer");
pdfviewer.unload();
```

When the PDF document is unloaded from the PDF viewer control, the documentUnload event will be triggered. You can define the event method using the DocumentUnloaded property of the control.

HTML

```
@(Html.EJ().PdfViewer("pdfviewer").ServiceUrl("https://js.syncfusion.com/ejServices/api/PdfViewer").ClientSideEvents(e=>e.DocumentUnloaded("documentUnloaded")))
<script type="text/javascript">
function documentUnloaded(args) {
alert("The document is unloaded from the PDF viewer control");
}
</script>
```

6.Events available in the PDF viewer control

Destroy

When the PDF viewer control is destroyed, the Destroy event will be triggered. You can define the event method using the Destroy property of the control.

HTML

```
@(Html.EJ().PdfViewer("pdfviewer").ServiceUrl("https://js.syncfusion.com/ejServices/api/PdfViewer").ClientSideEvents(e=>e.Destroy("destroyed")))
<script type="text/javascript">
function destroyed (args) {
alert("The PDF viewer control is destroyed.");
}
</script>
```

AjaxRequestFailure

Copyright © 2001 - 2020 Syncfusion Inc.

When the AJAX requests from the client to the API controller is failed, ajaxRequestFailure event will be triggered. You can define the event method using the AjaxRequestFailure property of the control.

HTML

```
@(Html.EJ().PdfViewer("pdfviewer").ServiceUrl("https://js.syncfusion.com/ejServices/api/PdfViewer").ClientSideEvents(e=>e.AjaxRequestFailure("ajaxFailureRequest")))
<script type="text/javascript">
function ajaxFailureRequest (args) {
alert("The AJAX request to the server is failed.");
}
</script>
```

HyperlinkClicked

When the hyperlinks available in the PDF document is clicked, the hyperlinkClick event will be triggered. You can define the event method using the HyperlinkClicked property of the control

HTML

```
@(Html.EJ().PdfViewer("pdfviewer").ServiceUrl("https://js.syncfusion.com/ejServices/api/PdfViewer").ClientSideEvents(e=>e.HyperlinkClicked("hyperlinkClick")))
<script type="text/javascript">
function hyperlinkClick (args) {
alert("The hyperlink in the PDF document is clicked.");
}
</script>
```

Updating the PDF Viewer size based on the parent element

updateViewerSize()

The PDF Viewer is resized based on the parent element size by using the updateViewerSize() method.

Note: PDF Viewer will be resized automatically when the browser window is resized, and if the isResponsive property is set to true.

JAVASCRIPT

```
var pdfviewer=$("#pdfviewer").data("ejPdfViewer");
pdfviewer.updateViewerSize();
```

Encrypting and decrypting the JSON data sent from server

setJSONData(jsonData)

In server-side

In the Web API controller, users can add and encrypt their data along with the PDF document page content obtained from ProcessPdf() and send it to the client-side for rendering in PDF Viewer.

Note: Data should be returned only as the serialized string (JsonConvert.SerializeObject)

C#

```
string data = "Encrypted Data";
//Create the JSON object
var json = new Object();
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
//Add additional/encrypted data to the JSON data
json = new { pdfData = helper.ProcessPdf(jsonResult), additionalData =
data, };
//Serialize the JSON data
string output = JsonConvert.SerializeObject(json);
//Return to the client
return output;
```

In client-side

In the client-side ajaxRequestSuccess event, you can get the encrypted responseData as argument. It must be decrypted and the original JSON data should be send to the setJSONData() for rendering the PDF document in PDF Viewer.

JAVASCRIPT

```
$(function () {
$("#viewer").ejPdfViewer({ serviceUrl: '../api/PdfViewer',
ajaxRequestSuccess: " onAjaxRequestSuccess " });
});
function onAjaxRequestSuccess(args) {
//Create PDF Viewer object
var pdfviewerObj = $("#viewer").data("ejPdfViewer");
//Parse JSON data to get the original data
var jsData = JSON.parse(args.responseData);
//Send the decrypted data for further rendering
pdfviewerObj.setJSONData(jsData["pdfData"]);
}
```

Note: Users can use their own encryption and decryption algorithm. The JSON data format should be formed as mentioned here

Displaying PDF document using Remote service

Add the following code snippet to Index.cshtml. Here, the PDF viewer uses hosted service in the remote machine to process the PDF.

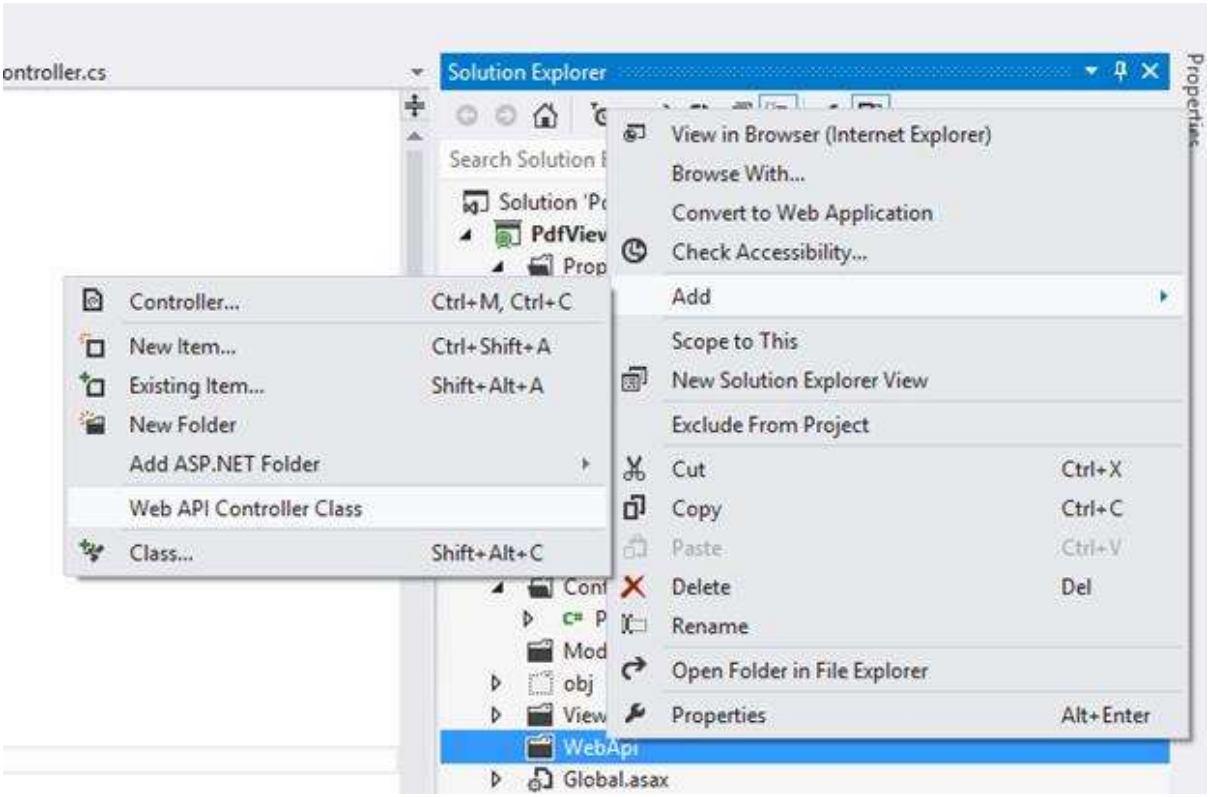
HTML

```
@using Syncfusion.JavaScript
@using Syncfusion.MVC.EJ
<!DOCTYPE html>
<html>
<head>
<meta name="viewport" content="width=device-width" />
<title>PDF viewer</title>
<link href="https://cdn.syncfusion.com/16.1.0.24/js/web/flat-
azure/ej.web.all.min.css" rel="stylesheet" />
<script src="https://cdn.syncfusion.com/js/assets/external/jquery-
3.1.1.min.js"></script>
<script
src="https://cdn.syncfusion.com/16.1.0.24/js/web/ej.web.all.min.js"></scr
ipt>
</head>
<body>
<div>
<div style="width:100%;height:780px;">
```

```
@(Html.EJ().PdfViewer("pdfviewer").ServiceUrl("https://js.syncfusion.com/
ejServices/api/PdfViewer"))
</div>
</div>
@(Html.EJ().ScriptManager())
</body>
</html>
```

Displaying PDF document using Web API

Add new folder **WebApi** in the solution and add new Web API Controller Class. Name it as **PdfViewerController** and click OK



Replace the below code in the PdfViewerController.cs

C#

```
using Newtonsoft.Json;
using Syncfusion.EJ.PdfViewer;
using System.Collections.Generic;
using System.IO;
using System.Web;
```

```
using System.Web.Http;
namespace PdfViewerSample.WebApi
{
public class PdfViewerController : ApiController
{
//Post action for processing the PDF documents.
public object Load(Dictionary<string, string> jsonResult)
{
PdfViewerHelper helper = new PdfViewerHelper();
if (jsonResult.ContainsKey("isInitialLoading"))
helper.Load(HttpContext.Current.Server.MapPath("~/App_Data/HTTP
Succinctly.pdf"));
return JsonConvert.SerializeObject(helper.ProcessPdf(jsonResult));
}
//Post action for processing the PDF documents when uploading to the
ejPdfviewer widget.
public object FileUpload(Dictionary<string, string> jsonResult)
{
PdfViewerHelper helper = new PdfViewerHelper();
if (jsonResult.ContainsKey("uploadedFile"))
{
var fileUrl = jsonResult["uploadedFile"];
byte[] byteArray = Convert.FromBase64String(fileUrl);
MemoryStream stream = new MemoryStream(byteArray);
helper.Load(stream);
}
return JsonConvert.SerializeObject(helper.ProcessPdf(jsonResult));
}
//Post action for downloading the PDF documents from the ejPdfviewer
widget.
public object Download(Dictionary<string, string> jsonResult)
{
PdfViewerHelper helper = new PdfViewerHelper();
return helper.GetDocumentData(jsonResult);
}
//Post action for unloading and disposing the PDF document resources in
server side from the ejPdfviewer widget.
public void Unload()
{
PdfViewerHelper helper = new PdfViewerHelper();
helper.UnLoad();
}
}
}
```

Note: Add the PDF document to be viewed in App_Data folder of the project.

Add the following code snippet to Index.cshtml. Here, the PDF viewer uses the Web API to process the PDF.

HTML

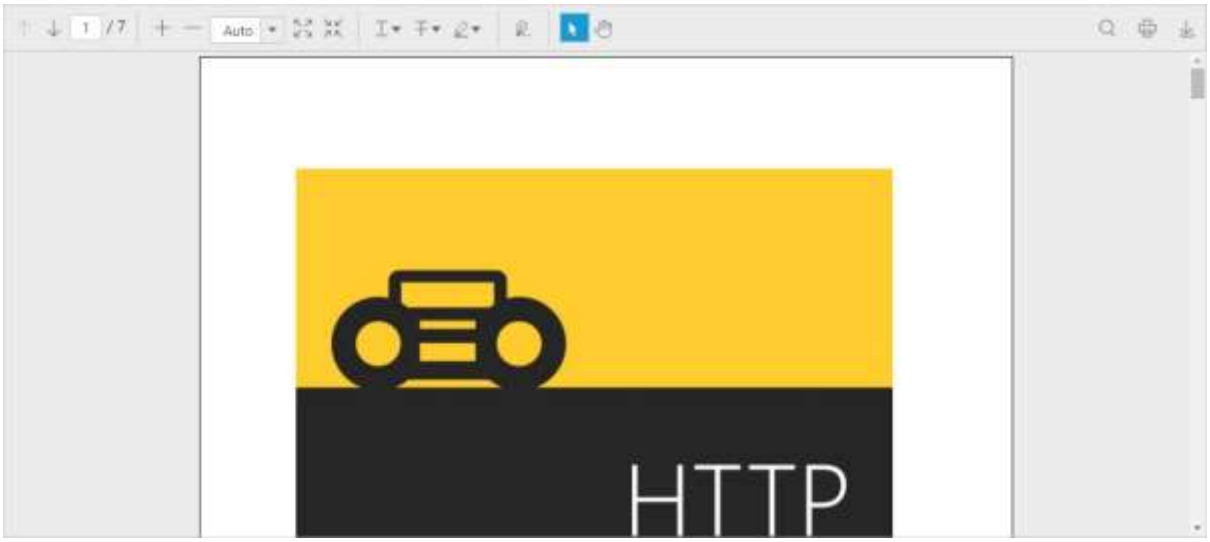
```
@using Syncfusion.JavaScript
@using Syncfusion.MVC.EJ
<!DOCTYPE html>
<html>
```

```
<head>
<meta name="viewport" content="width=device-width" />
<title>PDF viewer</title>
<link href="https://cdn.syncfusion.com/16.1.0.24/js/web/flat-
azure/ej.web.all.min.css" rel="stylesheet" />
<script src="https://cdn.syncfusion.com/js/assets/external/jquery-
3.1.1.min.js"></script>
<script
src="https://cdn.syncfusion.com/16.1.0.24/js/web/ej.web.all.min.js"></scr
ipt>
</head>
<body>
<div>
<div style="width:100%;height:780px;">
@(Html.EJ().PdfViewer("pdfviewer").ServiceUrl(VirtualPathUtility.ToAbsolu
te("~/api/PdfViewer")))
</div>
</div>
@(Html.EJ().ScriptManager())
</body>
</html>
```

Sample:

http://www.syncfusion.com/downloads/support/directtrac/general/ze/PdfViewer_GettingStarted-1550599436

Run the sample and you will see the PDF viewer control as in the below screenshot.



Toolbar Customization

Customizing default toolbar

The default toolbar is grouped into the following set of tools.

MagnificationTools	Contains ZoomIn, ZoomOut, Zoom, FitPage and FitWidth tools.
NavigationTools	Contains GoToNext and GoToLast tools.

Copyright © 2001 - 2020 Syncfusion Inc.

PrintTools	Contains print tool.
DownloadTool	Contains download tool.
TextSearchTool	Contains text search tool.
TextMarkupAnnotationTools	Contains text markup annotation tools.
SignatureTool	Contains signature tool.
SelectionTool	Contains selection tool.

The PDF viewer control has an option to show or hide these grouped items in the default toolbar. You can hide or display any of these tools by using the toolbarSettings property. The following code snippet describes how to show the magnification tools in the widget.

JAVASCRIPT

```
<div style="width:100%;height:780px;">
@(Html.EJ().PdfViewer("pdfviewer").ServiceUrl(VirtualPathUtility.ToAbsolu
te("~/api/PdfViewer"))
.ToolbarSettings(t=>t.Items(Syncfusion.JavaScript.PdfViewerEnums.ToolbarI
tems.MagnificationTools)))
</div>
```

The PDF viewer control also has an option to show or hide the complete default toolbar. You can achieve this by using the showToolbar(bool) method. The following code snippet describes how to hide the default toolbar in the widget.

JAVASCRIPT

```
<script>
$("#pdfviewer").data("ejPdfViewer").showToolbar(false);
</script>
```

Magnification tools

The magnification tools of the PDF viewer contain ZoomIn, ZoomOut, Zoom, FitPage, and FitWidth tools in the default toolbar. The PDF viewer control also has an option to show or hide the magnification tools in the default toolbar. You can achieve this by using the showMagnificationTools(bool) method. The following code snippet describes how to hide the magnification tools in the default toolbar in the widget.

JAVASCRIPT

```
<script>
$("#pdfviewer").data("ejPdfViewer").showMagnificationTools(false);
</script>
```

APIs available for Magnification tools

fitToPage()

Copyright © 2001 - 2020 Syncfusion Inc.

You can fit the page size of the PDF document loaded in the PDF viewer control using the fitToPage() method.

JAVASCRIPT

```
<script>
$("#pdfviewer").data("ejPdfViewer").fitToPage();
</script>
```

fitToWidth()

You can fit the page width of the PDF document loaded in the PDF viewer control using the fitToWidth() method.

JAVASCRIPT

```
<script>
$("#pdfviewer").data("ejPdfViewer").fitToWidth();
</script>
```

zoomIn()

You can zoom the PDF document page loaded in the PDF viewer control using zoomIn() method. The maximum zoom percentage is 400%.

JAVASCRIPT

```
<script>
$("#pdfviewer").data("ejPdfViewer").zoomIn();
</script>
```

zoomOut()

You can zoom out the PDF document page loaded in the PDF viewer control using the zoomOut() method. The minimum zoom percentage is 50%.

JAVASCRIPT

```
<script>
$("#pdfviewer").data("ejPdfViewer").zoomOut();
</script>
```

zoomTo(zoomValue)

The PDF document page loaded in the PDF viewer control can be zoomed to a specific value using the zoomTo(zoomValue) method.

JAVASCRIPT

```
<script>
$("#pdfviewer").data("ejPdfViewer").zoomTo(200);
</script>
```

zoomPercentage

Copyright © 2001 - 2020 Syncfusion Inc.

The zoomPercentage property of the PDF viewer control returns the current zoom value of the PDF document.

JAVASCRIPT

```
<script>
var pdfviewer = $("pdfviewer").data("ejPdfViewer");
var zoomValue = pdfviewer. zoomPercentage;
</script>
```

Navigation Tools

The navigation tools of the PDF viewer contain GoToNext, GoToPrevious, and current page number tools in the default toolbar. The PDF viewer control also has an option to show or hide the navigation tools in the default toolbar. You can achieve this by using the showPageNavigationTools(bool) method. The following code snippet describes how to hide the navigation tools in the default toolbar in the widget.

JAVASCRIPT

```
<script>
$("#pdfviewer").data("ejPdfViewer").showPageNavigationTools(false);
</script>
```

APIs available for Navigation Tools

goToPreviousPage()

The previous page of the PDF document from the current page can be navigated in the PDF viewer using goToPreviousPage() method.

JAVASCRIPT

```
<script>
$("#pdfviewer").data("ejPdfViewer").goToPreviousPage();
</script>
```

goToNextPage()

The next page of the PDF document from the current page can be navigated in the PDF viewer using the goToNextPage() method.

JAVASCRIPT

```
<script>
$("#pdfviewer").data("ejPdfViewer").goToNextPage();
</script>
```

goToFirstPage()

The first page of the PDF document can be navigated in the PDF viewer using the goToFirstPage() method.

JAVASCRIPT

```
<script>
$("#pdfviewer").data("ejPdfViewer").goToFirstPage();
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
</script>
```

goToLastPage()

The last page of the PDF document can be navigated in the PDF viewer using the goToLastPage() method.

JAVASCRIPT

```
<script>
$("#pdfviewer").data("ejPdfViewer").goToLastPage();
</script>
```

goToPage(pageNumber)

The specific page in the PDF document can be navigated using the goToPage(pageNumber) method. If the page is not available for the given pageNumber, the PDF viewer retains the existing page in view.

JAVASCRIPT

```
<script>
$("#pdfviewer").data("ejPdfViewer").goToPage(4);
</script>
```

Text Markup Annotation Tools

The text markup annotation tools of the PDF viewer contain strikeout, highlight, and underline tools in the default toolbar. The PDF viewer control also has an option to show or hide the text markup annotation tools in the default toolbar. You can achieve this by using the showTextMarkupAnnotationTools(bool) method. The following code snippet describes how to hide the text markup annotation tools in the default toolbar in the widget.

JAVASCRIPT

```
<script>
$("#pdfviewer").data("ejPdfViewer").showTextMarkupAnnotationTools(false);
</script>
```

Print Tool

The print tool of the PDF viewer contains an option to print the PDF document. When the print button is clicked, the changes made in the PDF document will be printed along with the document using the browser's default printer settings. The PDF viewer control provides the option to show or hide the print tool in the default toolbar. You can achieve this by using the showPrintTools(bool) method.

JAVASCRIPT

```
<script>
$("#pdfviewer").data("ejPdfViewer").showPrintTools(false);
</script>
```

The printing of the PDF document can be achieved in the client side by calling the print() method.

JAVASCRIPT

Copyright © 2001 - 2020 Syncfusion Inc.

```
<script>
$("#pdfviewer").data("ejPdfViewer").print();
</script>
```

Download Tool

The download tool of the PDF viewer contains an option to download the PDF document. When the download button is clicked, the changes made in the PDF document will be saved in a copy of the original PDF document and it will be downloaded in the browser. The PDF viewer control provides the option to show or hide the download tool in the default toolbar. You can achieve this by using the showDownloadTool(bool) method.

JAVASCRIPT

```
<script>
$("#pdfviewer").data("ejPdfViewer").showDownloadTool(false);
</script>
```

The PDF document can be downloaded in the client side by calling the download() method.

JAVASCRIPT

```
<script>
$("#pdfviewer").data("ejPdfViewer").download();
</script>
```

Signature tool

The signature tool of the PDF viewer contains an option to include handwritten signatures in the PDF document. The PDF viewer control provides the option to show or hide the signature tool in the default toolbar. You can achieve this by using the showSignatureTool(bool) method.

JAVASCRIPT

```
<script>
$("#pdfviewer").data("ejPdfViewer").showSignatureTool(false);
</script>
```

Selection tool

The selection tool of the PDF viewer control contains options for selection and panning interaction modes. The PDF viewer control provides the option to show or hide the selection tool in the default toolbar. You can achieve this by using the showSelectionTool(bool) method.

JAVASCRIPT

```
<script>
$("#pdfviewer").data("ejPdfViewer").showSelectionTool(false);
</script>
```

Text Search tool

The text search tool of the PDF viewer control is used to initiate and close the text search process in the PDF viewer control. The PDF viewer control provides the option to show or hide the text search tool in the default toolbar. You can achieve this by using the showTextSearchTool(bool) method.

Copyright © 2001 - 2020 Syncfusion Inc.

JAVASCRIPT

```
<script>
$("#pdfviewer").data("ejPdfViewer").showTextSearchTool(false);
</script>
```

APIs available for Text Search tool

searchText(targetText)

searchText(targetText) method allows us to search the target text in the PDF document and highlights the occurrences in the pages.

JAVASCRIPT

```
<script>
$("#pdfviewer").data("ejPdfViewer").searchText("name");
</script>
```

searchNext()

The next occurrences of the searched text from the current occurrence can be searched using the searchNext() method.

JAVASCRIPT

```
<script>
$("#pdfviewer").data("ejPdfViewer").searchNext();
</script>
```

SearchPrevious()

The previous occurrence of the searched text from the current occurrence can be searched using the searchPrevious() method.

JAVASCRIPT

```
<script>
$("#pdfviewer").data("ejPdfViewer").searchPrevious();
</script>
```

matchCase(enableMatchCase)

The target text in the PDF document can be searched with its casing using the matchCase(enableMatchCase) method.

JAVASCRIPT

```
<script>
$("#pdfviewer").data("ejPdfViewer").matchCase(true);
</script>
```

cancelSearchText()

The text search can be canceled and the highlighted occurrences from the PDF viewer can be removed using the cancelSearchText() method.

Copyright © 2001 - 2020 Syncfusion Inc.

JAVASCRIPT

```
<script>
$("#pdfviewer").data("ejPdfViewer").cancelSearchText();
</script>
```

Events in the PDF viewer control

BeforePrint

When the print option is clicked, the beforePrint event will be triggered before printing the PDF document from the PDF viewer control. We can define the event method using the BeforePrint property of the control.

JAVASCRIPT

```
@(Html.EJ().PdfViewer("pdfviewer").ServiceUrl("https://js.syncfusion.com/
ejServices/api/PdfViewer").ClientSideEvents(e=>e.BeforePrint("beforePrint
")))
<script type="text/javascript">
function beforePrint(args) {
alert("The PDF document is made ready for printing.");
}
</script>
```

AfterPrint

After the printing process is completed, the afterPrint event will be triggered. We can define the event method using the AfterPrint property of the control.

JAVASCRIPT

```
@(Html.EJ().PdfViewer("pdfviewer").ServiceUrl("https://js.syncfusion.com/
ejServices/api/PdfViewer").ClientSideEvents(e=>e.AfterPrint("afterPrint")
))
<script type="text/javascript">
function afterPrint (args) {
alert("Printing completed successfully");
}
</script>
```

ZoomChanged

When the zoom value of the PDF document is changed using the magnification tools, the zoomChange event will be triggered. We can define the event method using the ZoomChanged property of the control.

JAVASCRIPT

```
@(Html.EJ().PdfViewer("pdfviewer").ServiceUrl("https://js.syncfusion.com/
ejServices/api/PdfViewer").ClientSideEvents(e=>e.ZoomChanged("zoomChanged
")))
<script type="text/javascript">
function zoomChanged(args) {
alert("The magnification changes from " + args.previousZoomPercentage + "
to" + args.currentZoomPercentage);
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
}
</script>
```

PageClicked

When a page of the PDF document is clicked, the pageClick event will be triggered. We can define the event method using the PageClicked property of the control.

JAVASCRIPT

```
@(Html.EJ().PdfViewer("pdfviewer").ServiceUrl("https://js.syncfusion.com/ejServices/api/PdfViewer").ClientSideEvents(e=>e.PageClicked("pageClicked")))
<script type="text/javascript">
function pageClicked (args) {
alert("The page is clicked");
}
</script>
```

Adding Custom toolbar

The toolbar can be customized by hiding the existing toolbar.

The following code snippet shows how to create a customer toolbar by using the client side APIs

HTML

```
<body>
<div>
<div id="toolbarDiv" style="height:38px;width:100%;border:solid black 1px" class="toolbarclass " role="toolbar">
<div style="float:left; padding:5px;">
<div class="e-pdfviewer-icon e-pdfviewer-gotoprevious" id="viewer-previous" onclick="callClientSideMethod('previous')"></div>
<div class="e-pdfviewer-icon e-pdfviewer-gotonext" id="viewer-next" onclick="callClientSideMethod('next')"></div>
<input id="currentPage" class="e-pdfviewer-pagenumber e-pdfviewer-elementalignments" type="text" onkeypress="updatePageNumber(event)" />
<span id="totalPageCount" class="e-pdfviewer-labelpageno"></span>
<div class="e-pdfviewer-icon e-pdfviewer-zoomin" id="viewer-zoomin" onclick="callClientSideMethod('zoomin')"></div>
<div class="e-pdfviewer-icon e-pdfviewer-zoomout" id="viewer-zoomout" onclick="callClientSideMethod('zoomout')"></div>
<div class="e-pdfviewer-icon e-pdfviewer-fitwidth" id="viewer-fitwidth" onclick="callClientSideMethod('fitwidth')"></div>
<div class="e-pdfviewer-icon e-pdfviewer-fitpage" id="viewer-fitpage" onclick="callClientSideMethod('fitpage')"></div>
</div>
<div style="float:right; padding:5px;">
<div class="e-pdfviewer-icon e-pdfviewer-print" id="viewer-print" onclick="callClientSideMethod('print')"></div>
<div class="e-pdfviewer-icon e-pdfviewer-download" id="viewer-download" onclick="callClientSideMethod('download')"></div>
</div>
</div>
<div style="width:100%;height:780px;margin-top:3px">
```

```
@Html.EJ().PdfViewer("PdfViewer1").ServiceUrl(VirtualPathUtility.ToAbsolu
te("~/api/PdfViewer")).ClientSideEvents(e =>
e.DocumentLoaded("onDocumentLoad").PageChanged("pageChange"))
</div>
</div>
@(Html.EJ().ScriptManager())
<script type="text/javascript">
var currentPageNumber = 1;
$(function () {
var pdfviewer = $('#PdfViewer1').data('ejPdfViewer');
document.getElementById('currentPage').value = 1;
document.getElementById('totalPageCount').innerHTML = "/" +
pdfviewer.pageCount;
pdfviewer.showToolbar(false);
});
function onDocumentLoad() {
var _ejPdfViewer = $('#PdfViewer1').data('ejPdfViewer');
document.getElementById('totalPageCount').innerHTML = "/" +
_ejPdfViewer.pageCount;
}
function pageChange(args) {
currentPageNumber = args.currentPageNumber;
document.getElementById('currentPage').value = args.currentPageNumber;
}
function updatePageNumber(event) {
var _ejPdfViewer = $('#PdfViewer1').data("ejPdfViewer");
currentPageNumber = document.getElementById('currentPage').value;
if (event.which == 13) {
if (currentPageNumber > 0 && currentPageNumber <= _ejPdfViewer.pageCount)
{
_ejPdfViewer.goToPage(currentPageNumber);
} else {
currentPageNumber = _ejPdfViewer.currentPageNumber;
}
}
}
function callClientSideMethod(apiName) {
var _ejPdfViewer = $('#PdfViewer1').data("ejPdfViewer");
switch (apiName) {
case 'print':
_ejPdfViewer.print();
break;
case 'zoomin':
_ejPdfViewer.zoomIn();
break;
case 'zoomout':
_ejPdfViewer.zoomOut();
break;
case 'fitpage':
_ejPdfViewer.fitToPage();
break;
case 'fitwidth':
_ejPdfViewer.fitToWidth();
break;
case 'previous':
_ejPdfViewer.goToPreviousPage();
break;
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
case 'next':
_ejPdfViewer.goToNextPage();
break;
case 'download':
_ejPdfViewer.download();
break;
}
}
</script>
<style>
#totalPageCount {
float: none !important;
}
</style>
</body>
```

Note: Ensure the icon images available in the referred location for the custom toolbar.

Run the sample. You can view the PDF viewer with custom toolbar.

Sample:

http://www.syncfusion.com/downloads/support/directtrac/general/ze/PdfViewer_CustomToolbar-656684563

Localization

The text labels provided in the PDF viewer control can be localized using the collection of localized strings using ej.PdfViewer.Locale for different cultures. By default, the PDF viewer control is localized in "**en-US**" culture.

The different locale value for the PDF viewer control can be specified using the locale property.

JAVASCRIPT

```
@(Html.EJ().PdfViewer("pdfviewer").ServiceUrl(VirtualPathUtility.ToAbsolu
te("~/api/PdfViewer")).Locale("de-DE"))
```

The following table shows the default values for the components in the PDF viewer control in 'en-US' culture:

Component	Function	Keywords	Values
toolbar	first	headerText	First
		contentText	Go to the first page of the PDF document.
	previous	headerText	Previous
		contentText	Go to the previous page of the PDF document.
	next	headerText	Next

Copyright © 2001 - 2020 Syncfusion Inc.

		contentText	Go to the next page of the PDF document.
	last	headerText	Last
		contentText	Go to the last page of the PDF document.
	zoomIn	headerText	Zoom-In
		contentText	Zoom in to the PDF document.
	zoomOut	headerText	Zoom-Out
		contentText	Zoom out of the PDF document.
	pageIndex	headerText	Page Number
		contentText	Current page number in view.
	zoom	headerText	Zoom
		contentText	Zoom in or out of the PDF document.
	fitToWidth	headerText	Fit to Width
		contentText	Fit the PDF page to the width of the container.
	fitToPage	headerText	Fit to Page
		contentText	Fit the PDF page to the container.
	print	headerText	Print
		contentText	Print the PDF document.
	download	headerText	Download
		contentText	Download the PDF document.
	search	headerText	Search Text
		contentText	Search text in the PDF pages.
	highlight	headerText	Highlight Text
		contentText	Highlight text in the PDF pages.

Copyright © 2001 - 2020 Syncfusion Inc.

	strikeout	headerText	Strikethrough Text
		contentText	Strikethrough text in the PDF pages.
	underline	headerText	Underline Text
		contentText	Underline text in the PDF pages.
	signature	headerText	Signature
		contentText	Add or create the hand-written signature.
	select	headerText	Selection
		contentText	Selection tool for text.
	scroll	headerText	Panning
		contentText	Click to pan around the document.
contextMenu	copy	contentText	Copy
	googleSearch	contentText	Search Google
	openPopup	contentText	Open Pop-Up Note
	Delete	contentText	Delete
	properties	contentText	Properties
	Find	contentText	Find
	matchCase	contentText	Match Case
	auto	contentText	Auto
propertyWindow	underlineProperties	contentText	Underline Properties
	strikeOutProperties	contentText	StrikeOut Properties
	highlightProperties	contentText	Highlight Properties
	signatureProperties	contentText	Signature Properties
	appearance	contentText	Appearance
	general	contentText	General
	color	contentText	Color
	opacity	contentText	Opacity
	author	contentText	Author

Copyright © 2001 - 2020 Syncfusion Inc.

	subject	contentText	Subject
	modified	contentText	Modified
	ok	contentText	OK
	cancel	contentText	Cancel
	locked	contentText	Locked
signatureWindow	Signature	contentText	Add Signature
	Add	contentText	Add
	clear	contentText	Clear

The following code snippet illustrates you to change the localization to German culture "**de-DE**"

HTML

```
@using Syncfusion.JavaScript
@using Syncfusion.MVC.EJ
<div>
<div style="width:100%;height:780px;">
@(Html.EJ().PdfViewer("pdfviewer").ServiceUrl(VirtualPathUtility.ToAbsolu
te("~/api/PdfViewer")).Locale("de-DE"))
</div>
</div>
@(Html.EJ().ScriptManager())
<script type="text/javascript">
$(function () {
ej.PdfViewer.Locale["de-DE"] = {
toolbar: {
first: {
headerText: 'Erste',
contentText: 'Gehen Sie auf die erste Seite des PDF-Dokument.'
},
previous: {
headerText: 'Zurück',
contentText: 'Gehen Sie auf die vorherige Seite des PDF-Dokuments.'
},
next: {
headerText: 'Nächster',
contentText: 'Gehen Sie auf die nächste Seite des PDF-Dokuments.'
},
last: {
headerText: 'Letzte',
contentText: 'Gehen Sie auf die letzte Seite des PDF-Dokuments.'
},
zoomIn: {
headerText: 'Hineinzoomen',
contentText: 'Vergrößern Sie das PDF-Dokument.'
},
zoomOut: {

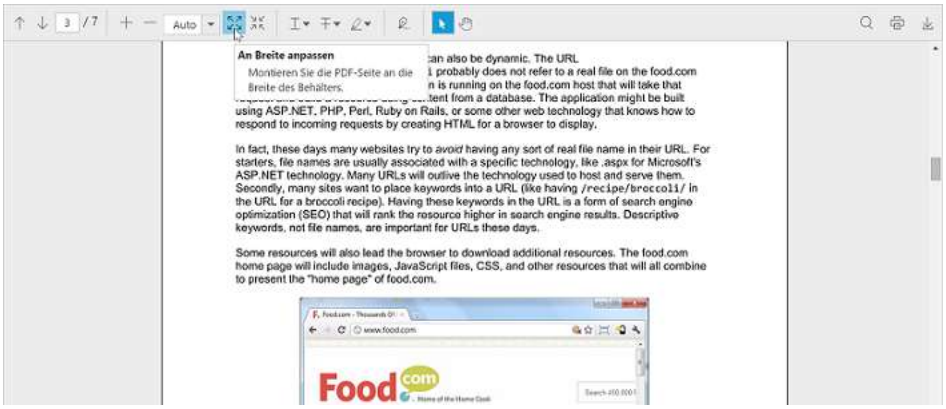
Sample

http://www.syncfusion.com/downloads/support/directtrac/general/ze/PdfViewer_Localization-1273554386

The following screenshot shows the PDF viewer with tooltip in German language.



Text Markup Annotation

The PDF viewer control supports adding text markup annotations in the PDF documents. The control also renders the existing text markup annotations from the PDF document when the document is loaded in it.

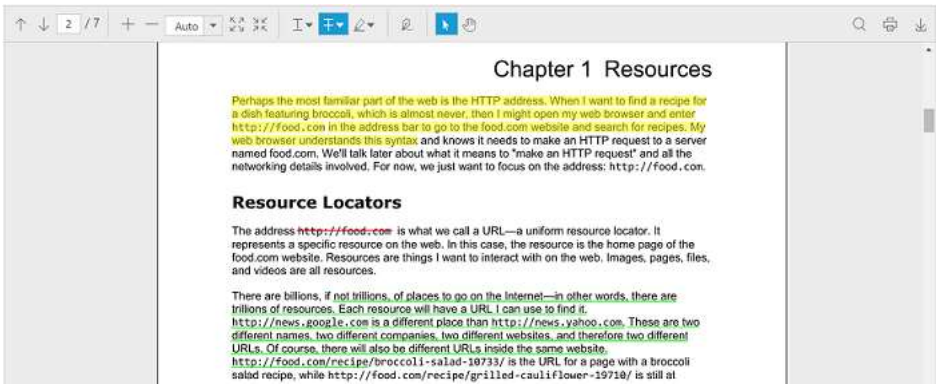
The text markup annotation tools in the default toolbar can be enabled or disabled using the toolbarSettings property.

The following code snippet describes how to show only the text markup annotation tools in the control.

JAVASCRIPT

```
(Html.EJ().PdfViewer("pdfviewer").ServiceUrl(VirtualPathUtility.ToAbsolute("~/api/PdfViewer")).ToolbarSettings(t =>
t.Items(Syncfusion.JavaScript.PdfViewerEnums.ToolbarItems.TextMarkupAnnotationTools)))
```

The following screenshot shows the PDF viewer with the PDF documents containing text markup annotations:



Enable or Disable the text markup annotations

The adding and modifying of the text markup annotations can be enabled or disabled using the EnableTextMarkupAnnotations property.

JAVASCRIPT

```
@(Html.EJ().PdfViewer("pdfviewer").ServiceUrl("https://js.syncfusion.com/ejServices/api/PdfViewer").EnableTextMarkupAnnotations(true))
```

The adding and modifying of the highlight annotations can be enabled or disabled using the EnableHighlightAnnotation property.

JAVASCRIPT

```
@(Html.EJ().PdfViewer("pdfviewer").ServiceUrl("https://js.syncfusion.com/ejServices/api/PdfViewer").EnableHighlightAnnotation(true))
```

The adding and modifying of the strikethrough annotations can be enabled or disabled using the EnableStrikethroughAnnotation property.

JAVASCRIPT

```
@(Html.EJ().PdfViewer("pdfviewer").ServiceUrl("https://js.syncfusion.com/ejServices/api/PdfViewer").EnableStrikethroughAnnotation(true))
```

The adding and modifying of the underline annotations can be enabled or disabled using the EnableUnderlineAnnotation property.

JAVASCRIPT

```
@(Html.EJ().PdfViewer("pdfviewer").ServiceUrl("https://js.syncfusion.com/ejServices/api/PdfViewer").EnableUnderlineAnnotation(true))
```

Copyright © 2001 - 2020 Syncfusion Inc.

Providing settings for text markup annotations

You can get or set the settings of the highlight annotations using the highlightSettings property. The highlightSettings property is used to set the color, opacity, author, subject, modifiedDate and isLocked properties of the highlight annotations.

JAVASCRIPT

```
$(function () {
$("#pdfviewer").ejPdfViewer({ highlightSettings: { color: "#ffff00",
author: "Guest", opacity: 0.5, subject: "highlight", modifiedDate: "2017-
03-27 12:00:51", isLocked: true} });
});
```

You can get or set the settings of the strikethrough annotations using the strikethroughSettings property. The strikethroughSettings property is used to set the color, opacity, author, subject, modifiedDate, and isLocked properties of the strikethrough annotations.

JAVASCRIPT

```
$(function () {
$("#pdfviewer").ejPdfViewer({ strikethroughSettings: { color: "#ff0000",
author: "Guest", opacity: 0.5, subject: "strikethrough", modifiedDate:
"2017-03-27 12:00:51", isLocked: true
} });
});
```

You can get or set the settings of the underline annotations using the underlineSettings property. The underlineSettings property is used to set the color, opacity, author, subject, modifiedDate, and isLocked properties of the underline annotations.

JAVASCRIPT

```
$(function () {
$("#pdfviewer").ejPdfViewer({ underlineSettings: { color: "#00ff00",
author: "Guest", opacity: 0.5, subject: "underline", modifiedDate: "2017-
03-27 12:00:51", isLocked: true
} });
});
```

Adding text markup annotations

The text markup annotations are added to the PDF document using the text markup annotation tools provided in the toolbar of the PDF viewer control.

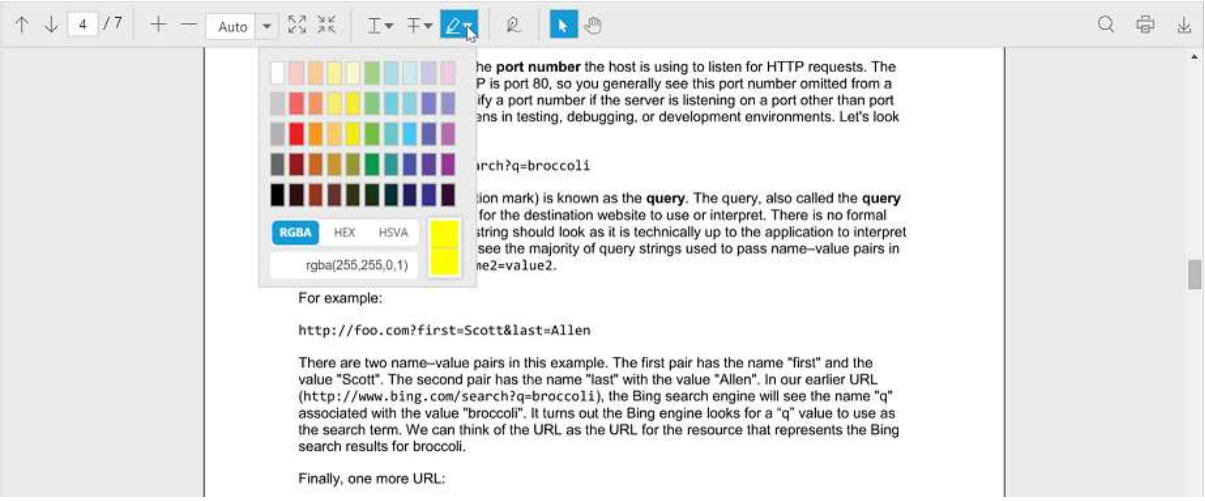
The annotations can be added to the PDF document from the client side using the annotationType property and addAnnotation method.

JAVASCRIPT

```
var pdfviewerObj = $("#pdfviewer").data("ejPdfViewer");
pdfviewerObj.addAnnotation(ej.PdfViewer.AnnotationType.Underline);
```

Copyright © 2001 - 2020 Syncfusion Inc.

The colorpicker control is provided in the text markup annotation tools to select the desired color for the text markup annotation to be added in the document.



When the text markup annotation is added in the PDF document, the annotationAdd event will be triggered in the control. The event method can be defined using the AnnotationAdd property of the control.

JAVASCRIPT

```
@(Html.EJ().PdfViewer("pdfviewer").ServiceUrl("https://js.syncfusion.com/ejServices/api/PdfViewer").ClientSideEvents(e=>e.AnnotationAdd("annotationAdded")))
function annotationAdded(args) {
alert("A text markup annotation is added in the PDF document");
}
```

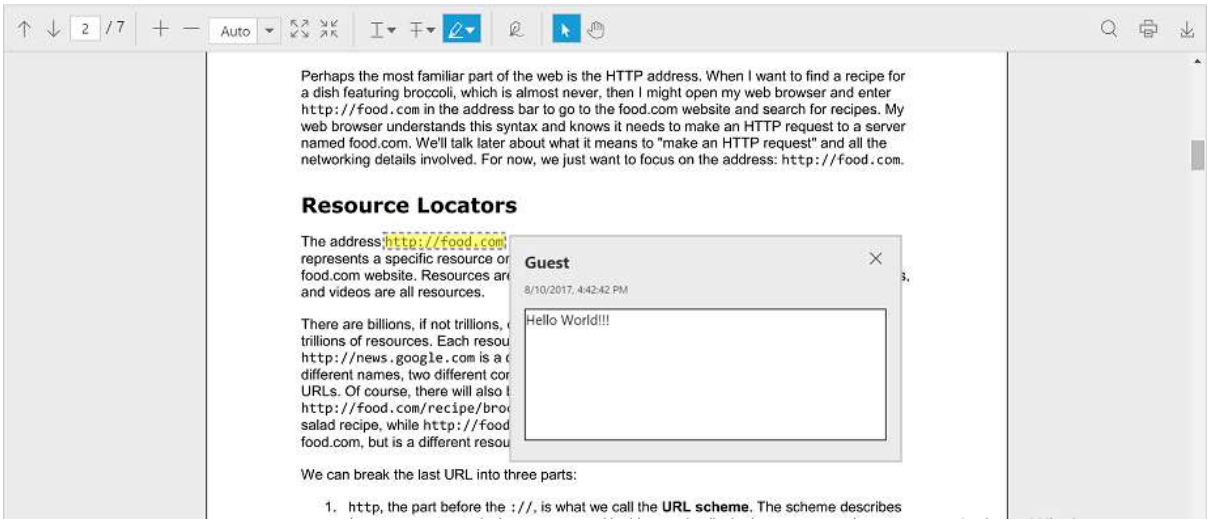
Adding notes to the text markup annotation

The notes can be added to the text markup annotations using the context menu in the PDF viewer control.

Right click the text markup annotation in the PDF document, the context menu will be opened in the PDF viewer control. You can select the option **Open Pop-up Note** to add the note to the annotation.

The following screenshot shows that the notes have been added to a text markup annotation in the PDF document:

Copyright © 2001 - 2020 Syncfusion Inc.



Editing the text markup annotation

The properties of the text markup annotations in the PDF document can be edited using the properties window provided in the PDF viewer control. The color, opacity, author, and subject of the text markup annotation can be modified. The properties of the text markup annotation can also be locked using the locked checkbox in the properties window.

Note: The isLocked property of the text markup annotation will lock the properties of the selected annotation. The property of the text markup annotation can be modified once the isLocked property is disabled.

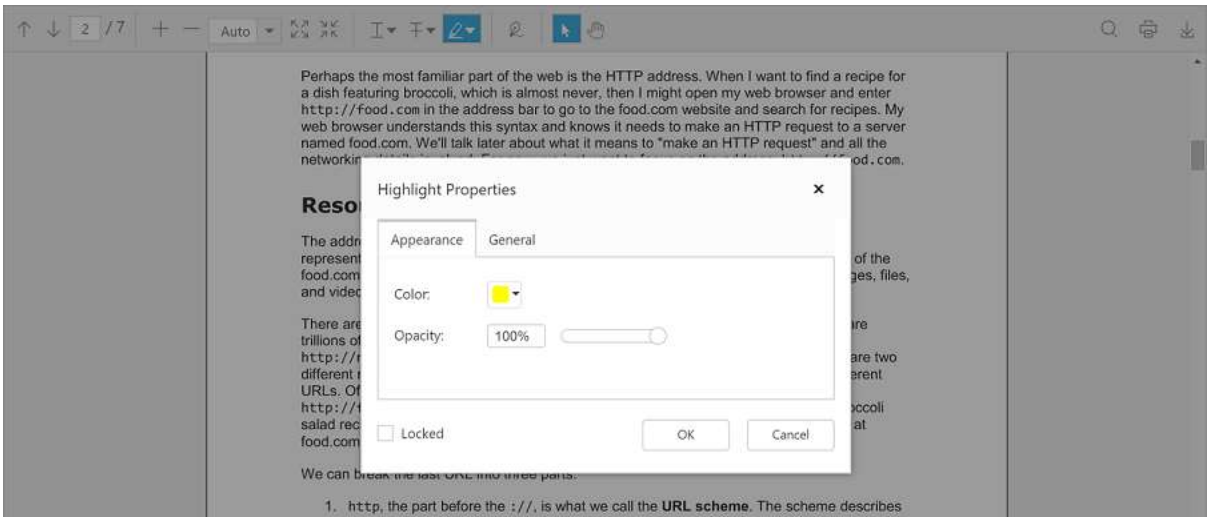
When a property of the text markup annotation is changed in the PDF viewer control, annotationPropertiesChange event will be triggered in the control. The event method can be defined using the AnnotationPropertiesChange property of the control.

JAVASCRIPT

```
@(Html.EJ().PdfViewer("pdfviewer").ServiceUrl("https://js.syncfusion.com/ejServices/api/PdfViewer").ClientSideEvents(e=>e.AnnotationPropertiesChange("annotationPropertiesChanged")))
function annotationPropertiesChanged(args) {
alert("The properties of a text markup annotation is modified in the PDF viewer");
}
```

The following screenshot shows the properties window used for editing the properties of a text markup annotation:

Copyright © 2001 - 2020 Syncfusion Inc.



The annotationDelete event will be triggered in the control when the text markup annotation in the PDF document is deleted. The event method can be defined using the AnnotationDelete property of the control.

JAVASCRIPT

```
@(Html.EJ().PdfViewer("pdfviewer").ServiceUrl("https://js.syncfusion.com/ejServices/api/PdfViewer").ClientSideEvents(e=>e.AnnotationDelete("annotationDeleted")))
function annotationDeleted (args) {
alert("A text markup annotation is deleted in the PDF document");
}
```

You can undo and redo the changes made to text markup annotations included in the PDF documents using the undo() and redo() methods.

JAVASCRIPT

```
function undoChanges() {
$("#pdfviewer").data("ejPdfViewer").undo();
}
function redoChanges() {
$("#pdfviewer").data("ejPdfViewer").redo();
}
```

Saving the text markup annotation

When the download tool is selected in the toolbar, the text markup annotations will be saved in the PDF document. This action will not affect the original document.

Printing the text markup annotation

When the print tool is selected in the toolbar, the PDF document will be printed along with the text markup annotations added to the pages. This action will not affect the original document.

Handwritten Signature

The PDF viewer supports adding handwritten signatures into the PDF document. The handwritten signature reduces the paper work of reviewing the content and verifies it digitally.

Copyright © 2001 - 2020 Syncfusion Inc.

The PDF viewer control has an option in the toolbarSettings property to enable or disable the signature button in the default toolbar.

The following code snippet describes how to disable the signature tool in the widget.

JAVASCRIPT

```
<div style="width:100%;height:780px;">
@(Html.EJ().PdfViewer("pdfviewer").ServiceUrl(VirtualPathUtility.ToAbsolu
te("~/api/PdfViewer"))
.ToolbarSettings(t=>t.Items(Syncfusion.JavaScript.PdfViewerEnums.ToolbarI
tems.SignatureTool)))
</div>
```

Enable or Disable handwritten signature

The adding of handwritten signature feature in the PDF document can be enabled or disabled using the EnableSignature property.

JAVASCRIPT

```
@(Html.EJ().PdfViewer("pdfviewer").ServiceUrl("https://js.syncfusion.com/
ejServices/api/PdfViewer").EnableSignature(true))
```

Providing settings for hand written signature

You can get or set the settings of the handwritten signature using the signatureSettings property. The signatureSettings property is used to set the color and opacity of the hand written signature.

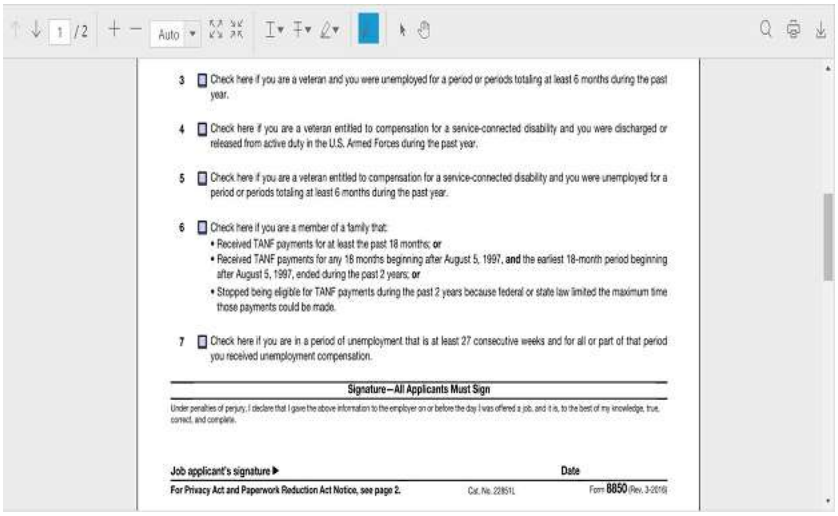
JAVASCRIPT

```
<script type="text/javascript">
$(function() {
$("#pdfviewer").ejPdfViewer({signatureSettings: { color: "#ff0000",
opacity: "0.5" } })
});
</script>
```

Adding signature in the PDF document

The handwritten signature can be added by drawing the signature content in the signature panel and clicking the button labeled ADD. The following screenshots are the pictorial representation of this.

Copyright © 2001 - 2020 Syncfusion Inc.



3 Check here if you are a veteran and you were unemployed for a period or periods totaling at least 6 months during the past year.
4 Check here if you are a veteran entitled to compensation for a service-connected disability and you were discharged or released from active duty in the U.S. Armed Forces during the past year.
5 Check here if you are a veteran entitled to compensation for a service-connected disability and you were unemployed for a period or periods totaling at least 6 months during the past year.
6 Check here if you are a member of a family that:
• Received TANF payments for at least the past 18 months; or
• Received TANF payments for any 18 months beginning after August 5, 1997, and the earliest 18-month period beginning after August 5, 1997, ended during the past 2 years; or
• Stopped being eligible for TANF payments during the past 2 years because federal or state law limited the maximum time those payments could be made.
7 Check here if you are in a period of unemployment that is at least 27 consecutive weeks and for all or part of that period you received unemployment compensation.
Signature—All Applicants Must Sign
Under penalties of perjury, I declare that I gave the above information to the employer on or before the day I was offered a job, and it is, to the best of my knowledge, true, correct, and complete.

When the handwritten signature is added in the PDF document, the signatureAdd event will be triggered in the control. The event method can be defined using the SignatureAdd property of the control.

JAVASCRIPT

```
@(Html.EJ().PdfViewer("pdfviewer").ServiceUrl("https://js.syncfusion.com/ejServices/api/PdfViewer").ClientSideEvents(e=>e.SignatureAdd("signatureAdded")))
<script type="text/javascript">
function signatureAdded (args) {
alert("A hand written signature is added in the PDF document");
}
</script>
```

Move, Resize and Delete the Handwritten Signature

The handwritten signature content can be moved to the specified location within the page bounds by using touch gestures, arrow keys, and mouse. We can also resize the handwritten signature content by maintaining the aspect ratio.

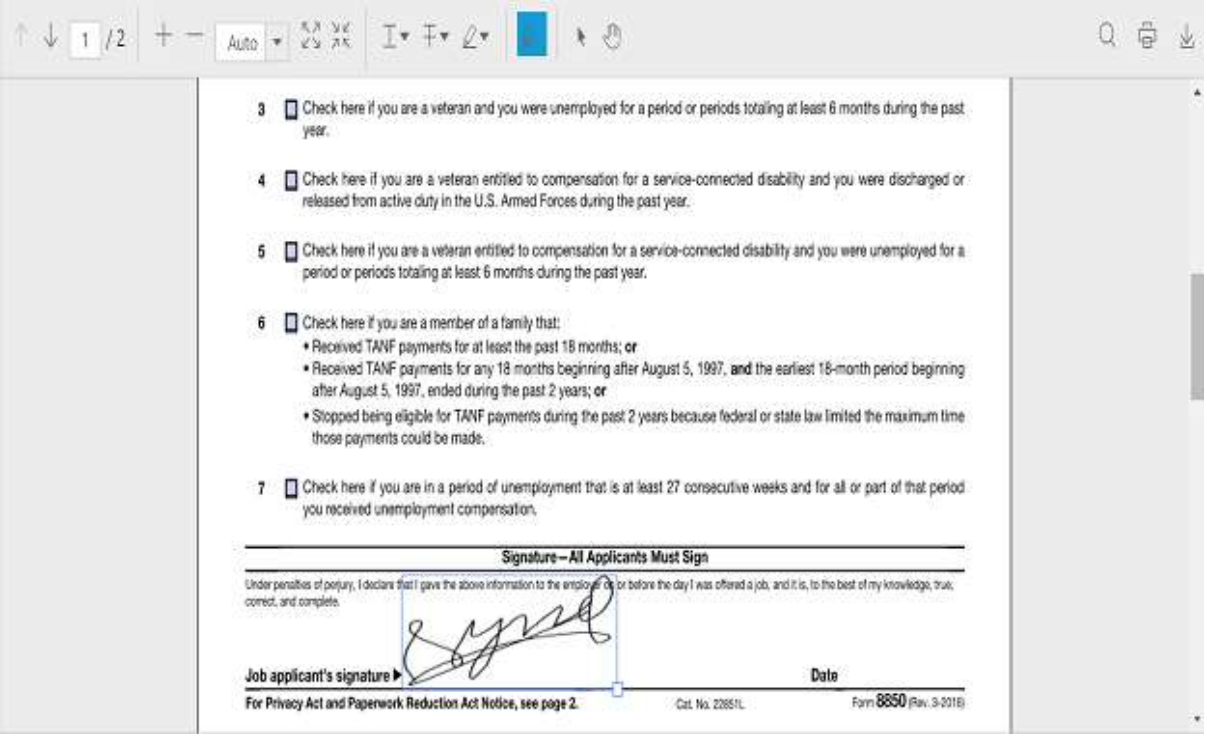
When the handwritten signature is resized in the PDF viewer control, the signatureResize event will be triggered in the control. The event method can be defined using the SignatureResize property of the control.

JAVASCRIPT

```
@(Html.EJ().PdfViewer("pdfviewer").ServiceUrl("https://js.syncfusion.com/ejServices/api/PdfViewer").ClientSideEvents(e=>e.SignatureResize("signatureResize")))
<script type="text/javascript">
function signatureResize (args) {
```

```
alert("A hand written signature is resized in the PDF viewer control");
}
</script>
```

The selected handwritten signature content can be deleted using the “Delete” option in the context menu or delete key. The following screenshots are the pictorial representation of this.



When the handwritten signature is deleted from the PDF document, the signatureDelete event will be triggered in the control. The event method can be defined using the SignatureDelete property of the control.

JAVASCRIPT

```
@(Html.EJ().PdfViewer("pdfviewer").ServiceUrl("https://js.syncfusion.com/ejServices/api/PdfViewer").ClientSideEvents(e=>e.SignatureDelete("signatureDelete")))
<script type="text/javascript">
function signatureDelete (args) {
alert("A hand written signature is removed from the PDF document");
}
</script>
```

You can undo and redo the changes made to the handwritten signatures included in the PDF document using the undo() and redo() methods.

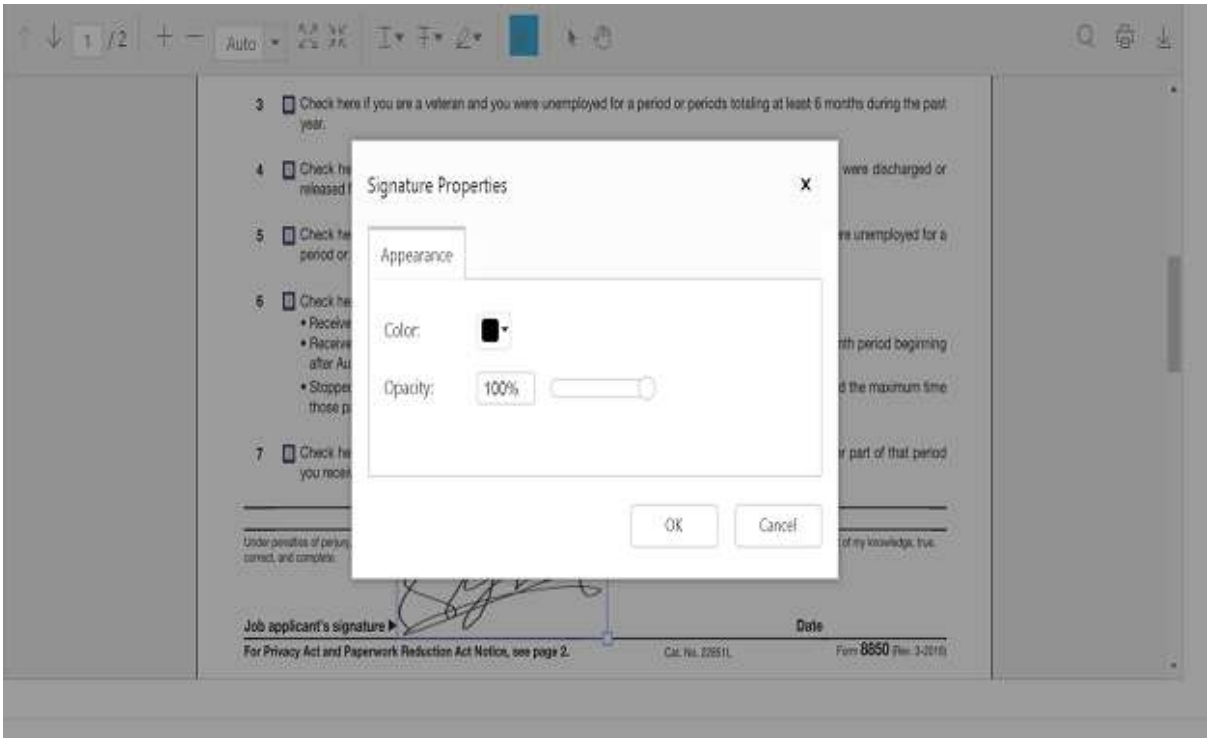
JAVASCRIPT

```
<script type="text/javascript">
function undoChanges() {
$("#pdfviewer").data("ejPdfViewer").undo();
}
```

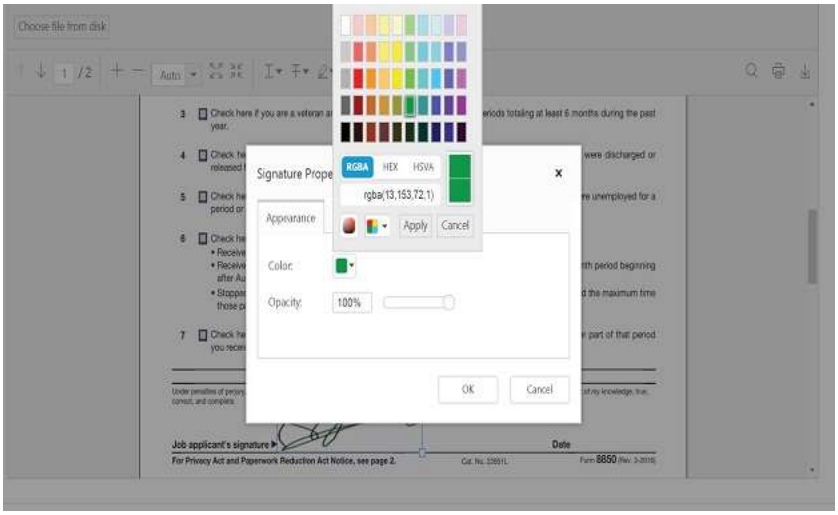
```
function redoChanges() {
$("#pdfviewer").data("ejPdfViewer").redo();
}
</script>
```

Changing properties of handwritten signature

The properties that is opacity and color of a handwritten signature can be modified by color palate and opacity slider, which is available in the “Properties” option in context menu. The following screenshots are the pictorial representation of this.

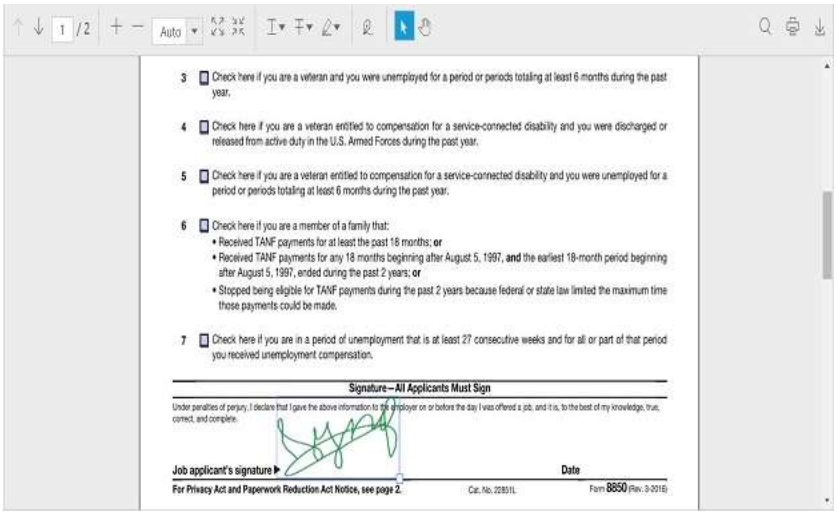


Select the desired color from the color palette and then click OK button.

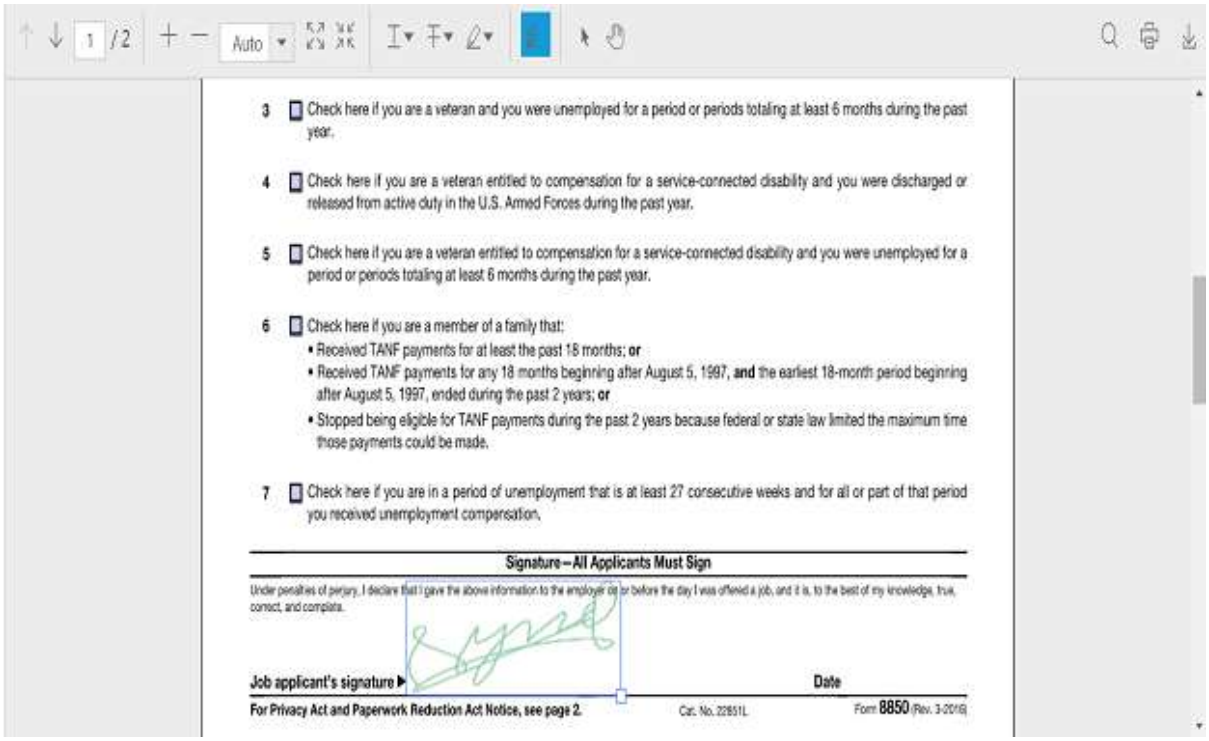


The selected color will be updated on the signature.

Copyright © 2001 - 2020 Syncfusion Inc.



You can also change the opacity of the added signature in the “properties” option.



When a property of the handwritten signature is changed in the PDF viewer control, the signaturePropertiesChange event will be triggered in the control. The event method can be defined using the SignaturePropertiesChange property of the control.

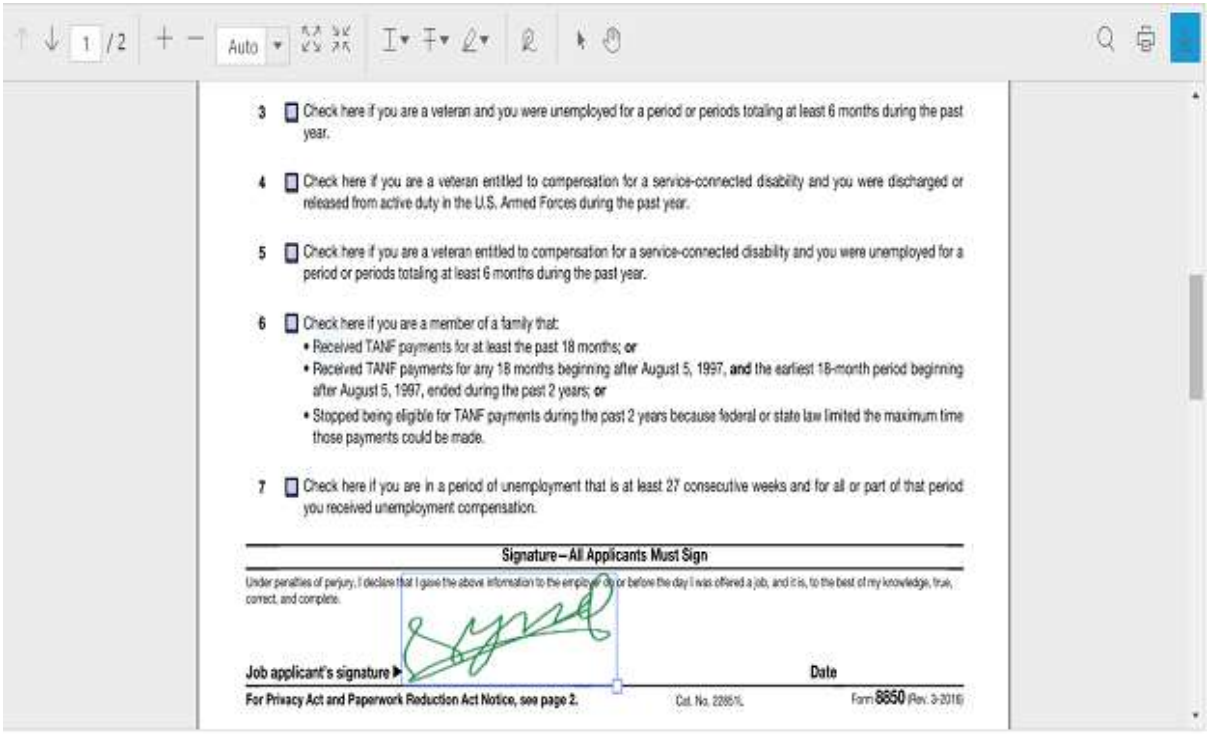
JAVASCRIPT

```
@(Html.EJ().PdfViewer("pdfviewer").ServiceUrl("https://js.syncfusion.com/ejServices/api/PdfViewer").ClientSideEvents(e=>e.SignaturePropertiesChange ("signaturePropertiesChanged")))
<script type="text/javascript">
function signaturePropertiesChanged(args) {
alert("A property of the hand written signature is changed in the PDF viewer control");
```

```
}
</script>
```

Saving the Signature

The added signature can be saved to the PDF document and can be downloaded by clicking the download button in the toolbar. This action will not affect the original document.



Printing the Signature

When the print button is clicked in the toolbar, the PDF document will be printed along with the signature added to the pages. This action will not affect the original document.

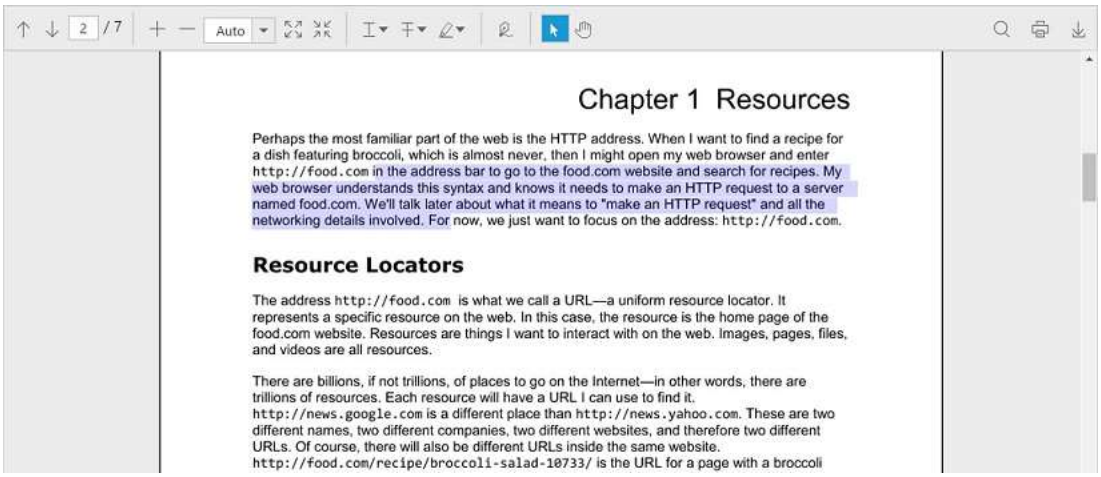
Interaction Mode

The PDF viewer control provides interaction modes for easy interaction with the PDF documents in the control. Selection mode and Panning mode are the two interaction modes.

Selection Mode

In this mode, the text selection can be performed in the PDF document loaded in the PDF viewer control. The panning and scrolling of the pages by touch cannot be performed in this mode.

Copyright © 2001 - 2020 Syncfusion Inc.



Enable or disable the Text selection

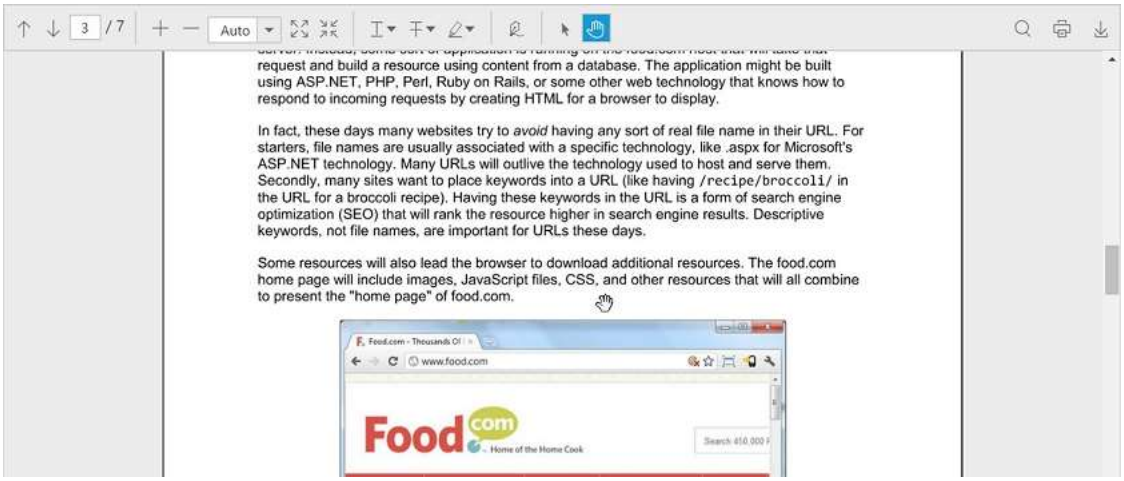
The text selection in the PDF viewer control can be enabled or disabled using the EnableTextSelection property.

JAVASCRIPT

```
@(Html.EJ().PdfViewer("pdfviewer").ServiceUrl("https://js.syncfusion.com/ejServices/api/PdfViewer").EnableTextSelection(true))
```

Panning Mode

In this mode, the panning and scrolling of the pages by touch can be performed in the PDF document loaded in the PDF viewer control, but the text selection cannot be performed.



Appearance

You can apply themes to the PDF viewer to match the themes of your application.

The following are the available built-in themes:

- Flat-azure
- Flat-lime
- Flat-lime-dark
- Flat-saffron

Copyright © 2001 - 2020 Syncfusion Inc.

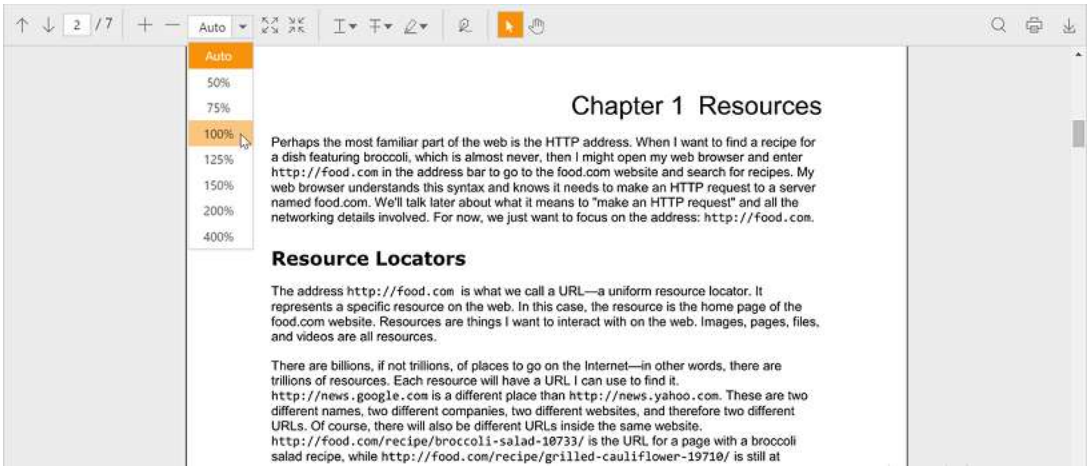
- Flat-saffron-dark
- Gradient-azure
- Gradient-azure-dark
- Gradient-lime
- Gradient-lime-dark
- Gradient-saffron
- Gradient-saffron-dark
- Bootstrap
- High-contrast-01
- High-contrast-02
- Material
- Office-365

By default, ‘flat-azure’ theme is applied to PDF viewer. You can change the theme by changing the stylesheet reference. Applying ‘gradient-saffron’ theme to PDF viewer is illustrated as follows.

JAVASCRIPT

```
<!—style sheet for 'gradient-saffron' theme.-->
<link href="https://cdn.syncfusion.com/16.1.0.24/js/web/gradient-saffron/ej.web.all.min.css" rel="stylesheet" />
<script src="https://cdn.syncfusion.com/js/assets/external/jquery-3.1.1.min.js"></script>
<script src="https://cdn.syncfusion.com/16.1.0.24/js/web/ej.web.all.min.js"></script>
```

The following screenshot shows the PDF viewer in ‘gradient-saffron’ theme:



Supported and Unsupported Elements

The supported and un-supported elements of the PDF viewer control are:

Features	Support
Text	Yes
Graphical Elements(lines, curves etc.,)	Yes

Fonts

PercentageTextBox

PercentageTextBox

Essential ASP.NET MVC PercentageTextBox is used to display only percentage values. It has Spin buttons to increase or decrease the values in the Text Box.

Key Features

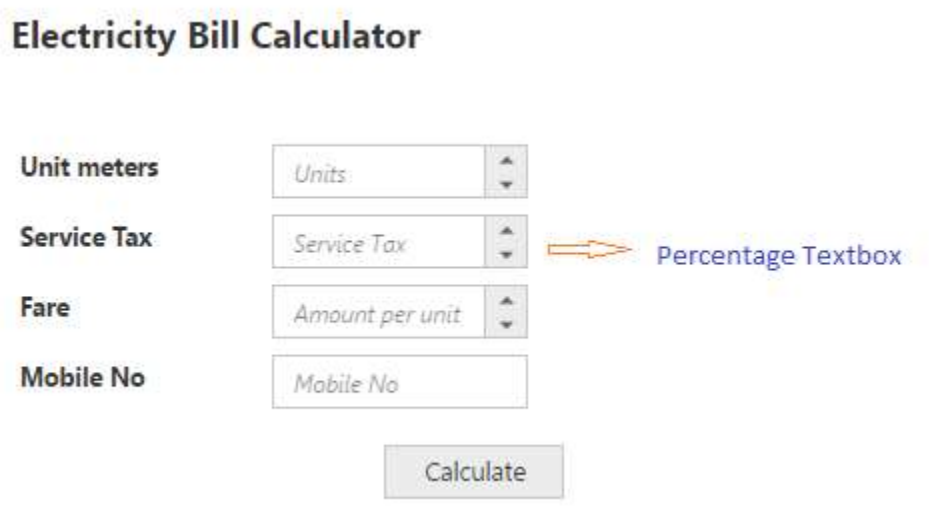
- Min and Max Values—Specifies value range for the textbox.
- Spin Buttons—Enable you to increase or decrease the current value in the textbox.
- Step Value—Enables you to increment or decrement the current value by step value.
- Globalization— EJ MVC PercentageTextBox has globalization support. It use ej.globalize.js to globalize the number format, and parse numbers according to the culture.
- Keyboard Navigation—You can interact with PercentageTextBox by using keyboard.
- RTL Support—Support for right to left alignment of textbox input.
- Decimal Values—You can configure the textbox to accept decimal values.
- Themes—PercentageTextBox consist of 17 built-in themes , and also support custom skins for creating user-defined themes.

Getting Started

This section explains briefly about how to create a EJMVC PercentageTextBox in ASP.NET MVC platform.

Create your first PercentageTextBox in MVC

From the following steps you can learn how to create and use PercentageTextBox in your application. Here we have showcased, a small Electric bill calculator application using EJMVC Editors widgets.The Essential ASP.NET MVC Editors control includes Numeric, Percentage, Currency and MaskEdit textbox controls. This guide helps you to use the wide range of Editors functionalities to complete this application.



Create Editors

ASP.NET MVC Editors renders built-in features like keyboard navigation, min and max range and flexible API's.

Copyright © 2001 - 2020 Syncfusion Inc.

1. Create a MVC Project and add necessary Dll's and Scripts. Refer MVC-Getting Started.
2. Add necessary helper elements to render the Editor components.

ASPX-CS

```
<div class="editors">
<div class="element-text" style="">Electricity Bill Calculator</div>
<br />
<table class="editors">
<tbody>
<tr>
<td>
<label>Unit meters</label>
</td>
<td>    @* NumericTextBox creation with watermark text *@
@Html.EJ().NumericTextbox("numeric").WatermarkText("Units")
</td>
</tr>
<tr>
<td>
<label>Service Tax</label>
</td>
<td>     @* PercentageTextBox creation with watermark text *@
@Html.EJ().PercentageTextbox("percent").WatermarkText("Tax")
</td>
</tr>
<tr>
<td>
<label>Fare</label>
</td>
<td>    @* CurrencyTextBox creation with watermark text *@
@Html.EJ().CurrencyTextbox("currency").WatermarkText("Amount per unit")
</td>
</tr>
<tr>
<td>
<label>Mobile No</label>
</td>
<td>    @* MaskEditTextBox creation with watermark text *@
@Html.EJ().MaskEdit("maskedit").WatermarkText("Phone number")
</td>
</tr>
</tbody></table>
<div class="pay-bill">
@Html.EJ().Button("btn").Size(ButtonSize.Small).Text("Calculate")
</div>
</div>
```

3. The following styles are added to arrange the Editors.

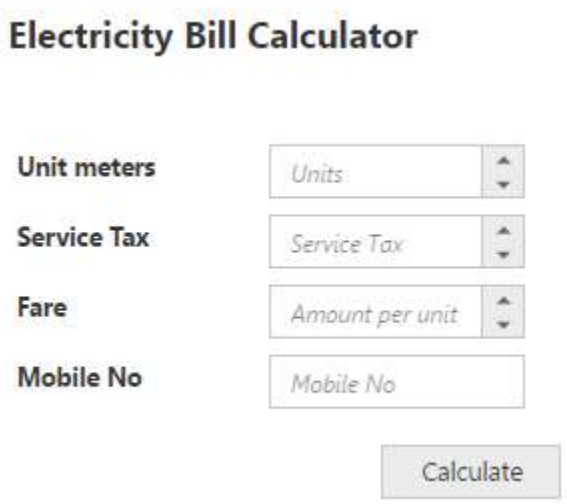
CSS

```
<style type="text/css" class="cssStyles">
.element-text
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
{
display: inline-block;
font-size: 20px;
font-weight: bolder;
height: 50px;
position: relative;
text-align: center;
top: -20px;
}
.editors
{
max-width: 400px;
border: 2px solid #DDDDDD;
}
.editors table
{
border:0px;
padding-left:50px;
}
.pay-bill
{
margin:15px 0px 10px 208px;
}
.editors label
{
display: block;
width: 130px;
}
</style>
```

4. Execute the code to render Editors as follows



PercentageTextBox with watermark text

Set MinValue, MaxValue and value in PercentageTextBox

You can set the “MinValue”,“MaxValue” and “Value” in Numeric, Percentage and Currency text boxes for maintaining the range in Editors widgets. In this scenario, you have to enter the values between the default ranges and enter the phone number in the MaskEdit widget by using the ”MaskFormat” property. By using DecimalPlaces property for CurrencyTextBox you can get decimal values. The following code example illustrates how to achieve this.

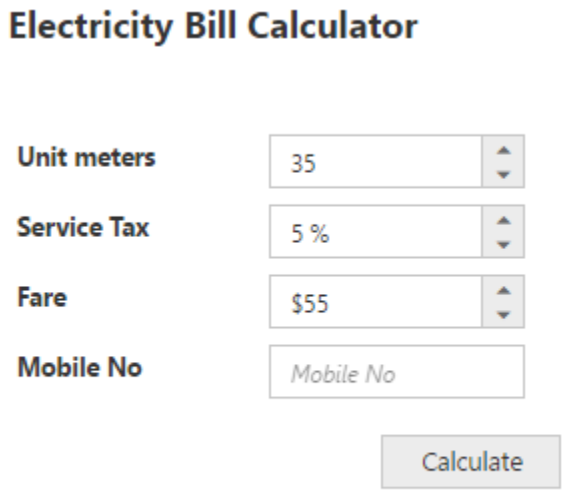
ASPX-CS

```
<div class="editors">
<div class="element-text" style="">Electricity Bill Calculator</div>
<br />
<table class="editors">
<tbody>
<tr>
<td>
<label>Unit meters</label>
</td>
<td>
@Html.EJ().NumericTextbox("numeric").WatermarkText("Units").MinValue(1).M
axValue(10000).Value("70")
</td>
</tr>
<tr>
<td>
<label>Service Tax</label>
</td>
<td>
@Html.EJ().PercentageTextbox("percent").WatermarkText("Tax").MinValue(5).
MaxValue(100).Value("15")
</td>
</tr>
<tr>
<td>
<label>Fare</label>
</td>
<td>
@Html.EJ().CurrencyTextbox("currency").WatermarkText("Amount per
unit").MinValue(0.00).MaxValue(100000.00).Value("350.00").DecimalPlaces(2
)
</td>
</tr>
<tr>
<td>
<label>Mobile No</label>
</td>
<td>
@Html.EJ().MaskEdit("maskedit").WatermarkText("Phone
number").MaskFormat("99-999-99999").Value("9090909090")
</td>
</tr>
</tbody>
</table>
<div class="pay-bill">
@Html.EJ().Button("btn").Size(ButtonSize.Small).Text("Calculate")
</div>
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
</div>
```

The following screenshot illustrates the output of the above code examples.



Setting the Strict Mode Option

You can set the “StrictMode” option to restrict entering values defined outside the range. The following code example illustrates how to set strict mode option.

ASPX-CS

```
<div class="editors">
<div class="element-text" style="">ElectricityBill Calculator</div><br />
<table class="editors">
<tbody>
<tr>
<td>
<label>Unit meters</label>
</td>
<td>
@Html.EJ().NumericTextbox("numeric").WatermarkText("Units").MinValue(1).M
axValue(10000).Value("70").EnableStrictMode(true)
</td>
</tr>
<tr>
<td>
<label>Service Tax</label>
</td>
<td>
@Html.EJ().PercentageTextbox("percent").WatermarkText("Tax").MinValue(5).
MaxValue(100).Value("15")
</td>
</tr>
<tr>
<td>
<label>Fare</label>
</td>
```

```
<td>
@Html.EJ().CurrencyTextbox("currency").WatermarkText("Amount per
unit").MinValue(0.00).MaxValue(100000.00).Value("350.00").DecimalPlaces(2
)
</td>
</tr>
<tr>
<td>
<label>Mobile No</label>
</td>
<td>
@Html.EJ().MaskEdit("maskedit").WatermarkText("Phone
number").MaskFormat("99-999-99999").Value("9090909090")
</td>
</tr>
</tbody>
</table>
<div class="pay-bill">
@Html.EJ().Button("btn").Size(ButtonSize.Small).Text("Calculate")
</div>
</div>
```

Run the above code example and you can see that it restricts entering a value exceeding the MinValue and MaxValue range mentioned in the Numeric textbox.

Set Calculation process with PercentageTextBox Widgets

You can use events to calculate the total and displays the value. You can achieve this with the help of Click event in the button widget. The calculation steps are written in the call back function of Click event button.

To customize the button, you can set the ContentType as TextAndImage to include the icon before the text and add the ClientSideEvents for click event.

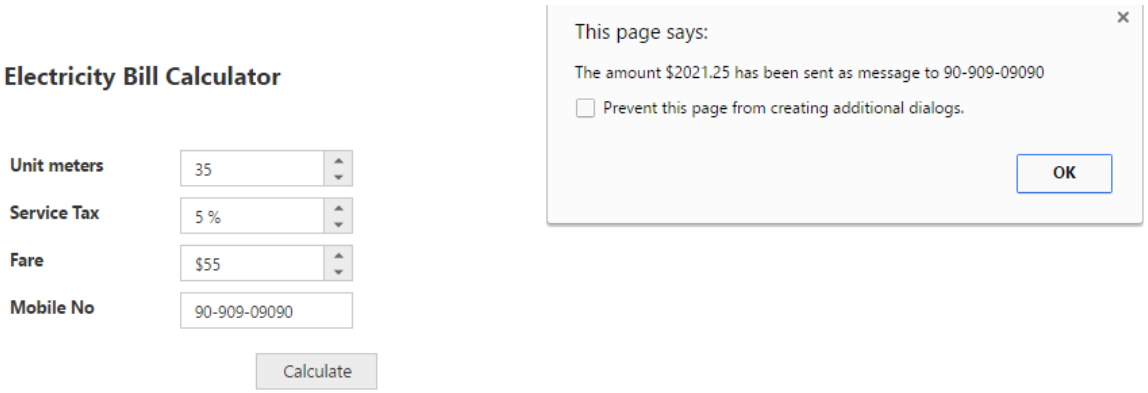
ASPX-CS

```
<div class="editors">
@* Please refer the table format for textboxes customization *@
<div class="pay-bill">
@Html.EJ().Button("btn").Size(ButtonSize.Small).Text("Calculate").ClientS
ideEvents(c=>c.Click("calculateBill"))
</div>
</div>
<script type="text/javascript">
function calculateBill() {
// Declares Necessary variable creation
var unitMeter, serviceTax, amountPerKm;
unitMeter = $("#numeric").data("ejNumericTextbox");// Object of Numeric
serviceTax = $("#percent").data("ejPercentageTextbox");// Object of
Percentage
amountPerKm = $("#currency").data("ejCurrencyTextbox"); // Object of
Currency
mobileNumber = $("#maskedit").data("ejMaskEdit"); // Object of MaskEdit
// This is used to calculate the Net amount
var netAmount = unitMeter.model.value * amountPerKm.model.value;
// This is used to calculate the service tax amount
var sTax = (netAmount * serviceTax.model.value) / 100;
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
// This shows the calculated amount for the units
alert("The amount $" + (netAmount + sTax) + " has been sent as message to
" + mobileNumber.model.value + ".");
}
</script>
```

Run the above code sample, fill the required Textbox fields and click the Calculate button. The values are displayed and an alert message is shown. The following screen shot illustrates the final output of the Electricity bill calculator.



- Behavior Settings
- Decimal Places
- Persistence Support

Behavior Settings

Decimal Places

DecimalPlaces property specifies number of values allowed after the decimal point.The default value of DecimalPlaces property is 0 i.e., by default you cannot specify decimal value in PercentageTextBox. We need to add this property to allow decimal values. To set the DecimalPlaces to “-1”, that allows the decimals without any limit in PercentageTextBox control.

Configure Decimal Places

In the View page add PercentageTextBox helper, and configure the DecimalPlaces property as follows.

ASPX-CS

```
@Html.EJ().PercentageTextbox("percent").DecimalPlaces(2).Value("22")
```

The output is as follows.

Persistence Support

PercentageTextBox provides state maintenance support. You can maintain the previous changes made in the control after a page loads.

Configure Persistence Support

In the View page add PercentageTextBox helper, and configure the EnablePersistence property as follows.

ASPX-CS

```
@Html.EJ().PercentageTextbox("percent").Value("22").EnablePersistence(tru
e)
```

Output of PercentageTextBox with EnablePersistence is as follows.

Strict Mode Support

PercentageTextBox allows you to use the strict mode option by setting the EnableStrictMode property. You can set the MinValue and MaxValue to the controls to enable strict mode functionality. Default value of this property is false. When the textbox value exceeds the MaxValue, it restricts the exceeded value and returns the MaxValue. Likewise when the textbox value goes below MinValue, it restricts the new value and returns the MinValue. When this property is enabled, it does not restrict the specified value and an error class is added to indicate wrong value is provided to the textbox.

Configure Strict Mode Support

In the View page add PercentageTextBox helper, and configure the EnableStrictMode property.

ASPX-CS

```
@Html.EJ().PercentageTextbox("percent").MinValue(-
5).MaxValue(3).EnableStrictMode(true).Value(10)
```

Copyright © 2001 - 2020 Syncfusion Inc.

Output when EnableStrictMode is “true” is as follows.

Enabled or Disabled

PercentageTextBox has an option to enable or disable its element. You can set the Enabled property as “false” to enable the Textbox controls.

Also you can enable/disable the **PercentageTextBox** by using enable and disable methods.

Configure Enabled or Disabled

In the View page add PercentageTextBox helper, and configure the Enabled property.

ASPX-CS

```
@Html.EJ().PercentageTextbox("percent").Value("2").Enabled(false)
```

Output when Enabled is “true” and when Enabled is “false”.

Adjusting Textbox Size

PercentageTextBox size can be modified by using the Height and Width properties.

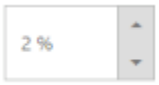
Configure Height and Width

In the View page add PercentageTextBox helper, and configure the Height and Width property.

ASPX-CS

```
@Html.EJ().PercentageTextbox("percent").Value("2").Width("100").Height("5
0")
```

Output of PercentageTextBox after setting “Height” and “Width” is as follows.



Increment Step

The IncrementStep property is used to increase or decrease the amount of value in the Percentage textbox.

Configure Increment Step

In the View page add PercentageTextBox helper, and configure the IncrementStep property.

ASPX-CS

```
@Html.EJ().PercentageTextbox("percent").IncrementStep(3).Value("1")
```

Output of Percentage textbox with IncrementStep is as follows.

Copyright © 2001 - 2020 Syncfusion Inc.

Define Name

When you have placed the PercentageTextBox in a form, the Name property is used to send the field value at form submission. The default value of the Name property is null.

Configure Name

In the View page add PercentageTextBox helper, and configure the Name property.

ASPX-CS

```
@Html.EJ().PercentageTextbox("percent").Name("Percentage")
```

Define Value

The value of PercentageTextBox can be assigned by using the Value property. The default value for Value property is null.

You can get the value of **PercentageTextBox** by using getValue method.

Configure Value

In the View page add PercentageTextBox helper, and configure the Value property.

ASPX-CS

```
@Html.EJ().PercentageTextbox("percent").Value("21")
```

Output of PercentageTextBox with the value property is as follows.

Define MaxValue and MinValue

MaxValue

The maximum limit value can be assigned to the PercentageTextBox by using the MaxValue property. The default value of MaxValue property is 1.7976931348623157e+308.

MinValue

The minimum limit value can be assigned to the PercentageTextBox by using the MinValue property. The default value of MinValue property is -1.7976931348623157e+308.

Configure MaxValue and MinValue

In the View page add PercentageTextBox helper, and configure the MinValue and MaxValue property. .

ASPX-CS

```
@Html.EJ().PercentageTextbox("percent").Value("3").MinValue(-
2).MaxValue(3)
```

Output of PercentageTextBox with MaxValue and MinValue is as follows.

Copyright © 2001 - 2020 Syncfusion Inc.

Read Only Support

PercentageTextBox supports read only option. When you enable the ReadOnly property to the control, the value cannot be changed in the PercentageTextBox. You can set the ReadOnly property as “true” to enable this option.

Configure Read Only

In the View page add PercentageTextBox helper, and configure the ReadOnly property.

ASPX-CS

```
@Html.EJ().PercentageTextbox("percentage").Value("2").ReadOnly(true)
```

Output of PercentageTextBox when ReadOnly is “true” is as follows. PercentageTextBox values cannot be edited or changed.

Appearance

Theme

PercentageTextBox control’s style and appearance can be controlled based on CSS classes. In order to apply styles you need to refer 2 files namely, ej.widgets.core.min.css and ej.theme.min.css. If the file ej.web.all.min.css is referred, then it is not necessary to include the files ej.widgets.core.min.css and ej.theme.min.css in your project, as ej.web.all.min.css is the combination of these two.

By default, there are 17 themes support available namely:

- bootstrap
- flat-azure
- flat-azure-dark
- fat-lime
- flat-lime-dark
- flat-saffron
- flat-saffron-dark
- gradient-azure
- gradient-azure-dark
- gradient-lime
- gradient-lime-dark
- gradient-saffron
- gradient-saffron-dark
- high-contrast-01
- high-contrast-02
- material
- office-365

CSS Class

The CSS can be customized by using the CssClass in the PercentageTextBox. You can customize the PercentageTextBox with CssClass property to appear like your desired control.

Copyright © 2001 - 2020 Syncfusion Inc.

Configure CSS Class

In the View page add PercentageTextBox helper, and configure the CssClass property.

ASPX-CS

```
@Html.EJ().PercentageTextbox("percentage").Value("2").CssClass("customCss
")
```

Customize the CSS properties in custom CSS class.

CSS

```
<style>
.customCss .e-box
{
border-color: #9d241b;
}
.customCss .e-input
{
background-color: #f6db8d;
}
.customCss .e-select
{
background-color: #ecf6ac;
border-color: #3c36e7;
}
</style>
```

Output of PercentageTextBox after applying CssClass is as follows.

Rounded Corner Support

PercentageTextBox provides you with rounded corner support whose appearance is different from normal textbox controls.

Configure Rounded Corner Support

In the View page add PercentageTextBox helper, and configure the ShowRoundedCorner property.

ASPX-CS

```
@Html.EJ().PercentageTextbox("percentage").Value("2").ShowRoundedCorner(t
rue)
```

Output of PercentageTextBox when ShowRoundedCorner is “true”.

Spin Button Support

PercentageTextBox provides you the option as to whether to display the spin button in the widget or remove it from the control by using showSpinButton property.

Configure Spin Button

In the View page add PercentageTextBox helper, and configure the ShowSpinButton property.

Copyright © 2001 - 2020 Syncfusion Inc.

ASPX-CS

```
@Html.EJ().PercentageTextbox("percentage").Value("2").ShowSpinButton(fals
e)
```

Output of PercentageTextBox when ShowSpinButton is “false”.

Water Mark Text Support

The PercentageTextBox provide water mark text support. You can display the initial value in the control by water mark.

Configure Water Mark Text

In the View page add PercentageTextBox helper, and configure the ShowSpinButton property.

ASPX-CS

```
@Html.EJ().PercentageTextbox("percentage").WatermarkText("Percentage")
```

Output of PercentageTextBox after applying WaterMarkText is as follows.

Globalization Support

Globalization is language support based on the culture in **Textboxes**. You can achieve the **Globalization** using “**locale”** property in **PercentageTextBox** .

The **PercentageTextBox** widget provides multi-language support using globalization. You can customize the **PercentageTextBox** with your own language style by using this feature. You can change the globalization by using the **locale** property. The default value for **locale** property is **en-US** in **PercentageTextBox** control.

More than 350 culture specific files are available to localize the value. To know more about EJ globalize support, please refer the below link

http://help.syncfusion.com/js/localization

Note: All the culture-specific script files are available within the below specified location, once you have installed Essential Studio in your machine, therefore it is not necessary to download these files explicitly.

'(installed location)\Syncfusion\Essential Studio\{{ site.releaseversion }}\JavaScript\assets\scripts\i18n'
For example, If you have installed the Essential Studio package within C:\Program Files (x86), then navigate to the below location, C:\Program Files (x86)\Syncfusion\Essential Studio\{{ site.releaseversion }}\JavaScript\assets\scripts\i18n

Refer the below German culture file in head section of HTML page after the reference of **ej.web.all.min.js** file.

JAVASCRIPT

Copyright © 2001 - 2020 Syncfusion Inc.

```
<script src="http://cdn.syncfusion.com/{{ site.releaseversion }}/js/i18n/ej.culture.de-DE.min.js"></script>
```

You can dynamically change the language based on their culture.

Configure Localization

The following example describes the way to use localization in PercentageTextBox.

ASPX-CS

```
@Html.EJ().PercentageTextbox("percentage").Value("21234").Locale("de-DE")
```

Output of PercentageTextBox with localization.

RTL Support

PercentageTextBox provides RTL (Right-To-Left) support. The alignment of PercentageTextBox can be changed from Left-To-Right into Right-To-Left.

Enable RTL

In the View page add PercentageTextBox helper, and configure the EnableRTL property.

ASPX-CS

```
@Html.EJ().PercentageTextbox("percentage").Value("22").EnableRTL(true)
```

Output of PercentageTextBox when EnableRTL is “true” is as follows.

Keyboard Interaction

With the keyboard navigation enabled in the PercentageTextBox control, it is possible to control the actions with the provided shortcut keys. Almost all the PercentageTextBox functionality that are done through mouse can be controlled with shortcut keys.

The various keyboard shortcuts available within the PercentageTextBox control are discussed in the following table.

Shortcut Key	Description
Access key + j	Focuses the control
Up	Increments the value
Down	Decrements the value
Tab	Focus the next element

Copyright © 2001 - 2020 Syncfusion Inc.

Configuring Keyboard Navigation

The following steps explain the implementation of keyboard interaction in PercentageTextBox.

In the View page add PercentageTextBox helper. Set the access key property to the PercentageTextBox for focusing the control while key is pressed. We need to use 'HtmlAttributes' property to add the "access key" attribute to the Editor elements. 'HtmlAttributes' property is used to add HTML attributes like, id, class etc.. to the components. We need to use IDictionary<string,object> to specify the HTML attributes.

ASPX-CS

```
@{IDictionary<string, object> percentAttribute = new Dictionary<string,
object>();
percentAttribute.Add("accesskey", "k");
}
@Html.EJ().PercentageTextbox("percentage").Name("percent").Value("22").Ht
mlAttributes(percentAttribute)
```

Run the above example and press Access key + j key to focus the PercentageTextBox widget. Perform provided functionality by using keyboard shortcuts.

PivotGrid

Overview

PivotGrid control is an easily configurable, presentation-quality business control that reads both OLAP and Relational datasource, allows to create multi-dimensional views for analysis and satisfying business user needs.

Some of the key feature available in PivotGrid are listed below:

1. Data Binding: Supports both OLAP and Relational datasource data binding in the same environment.
2. PivotTable Field List: Lists the entire datasource bound to PivotGrid and allows UI interaction such as filtering and drag drop operation of any measure, dimension, hierarchy, level and field at runtime.
3. Grouping Bar: Supports UI interaction at runtime through sorting, filtering and drag drop operation of the existing field items bound through report.
4. Grid Layout: Four different layouts such as normal, top summary, no summary and excel-like layout are supported.
5. Export: PivotGrid can be exported to Word, PDF, CSV and Excel documents.
6. PivotGrid control specific features such as hyperlink, cell selection, conditional formatting, RTL, globalization and localization are supported as well.

Getting Started

Getting Started

Important

Starting with v16.2.0.x, if you refer to Syncfusion assemblies from trial setup or from the NuGet feed, include a license key in your projects. Refer to this link to learn about registering Syncfusion license key in your ASP.NET Core application to use our components.

Creating a simple application with PivotGrid and Relational datasource (Client Mode)

This section covers the information that you need to know to populate a simple PivotGrid with Relational data completely on the client-side.

Project Initialization

Create a new **ASP.NET MVC Web Application** using Visual Studio IDE and name the project as **"PivotGridDemo"**.

Select the View engine as **'Razor'** and Project template as **'Internet Application'** and finally click **OK** button to create an application.

Now add the following dependency libraries as references into your MVC Web Application. In order to add them to your application, right-click on **References** in Solution Explorer and select Add Reference. Now in the **Reference Manager** dialog, under **Assemblies > Extension**, the following Syncfusion libraries will be found.

- Syncfusion.EJ
- Syncfusion.EJ.Export
- Syncfusion.EJ.Pivot
- Syncfusion.EJ.MVC

The version of Syncfusion libraries based on .NET Framework and MVC version are classified below. For example, version is illustrated as,

MVC Version	MVC Version of Syncfusion assembly	Base Version of Syncfusion assembly	System.Web.Mvc	System.Web.WebPages
MVC3	{{ site.mvc3releaseversion }}	{{ site.35esreleaseversion }}	3.0	1.0
MVC4	{{ site.mvc4releaseversion }}	{{ site.40esreleaseversion }}	4.0	2.0
MVC5	{{ site.mvc5releaseversion }}	{{ site.45esreleaseversion }}	5.0	3.0

Register the referred assemblies in "Web.config" files available inside Views folder and also at the root of the application.

XML

```
<compilation debug="true" targetFramework="4.0">
<assemblies>
……
……
```

```
<add assembly="Syncfusion.EJ, Version= {{ site.40esreleaseversion }},
Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.EJ.Pivot, Version= {{ site.40esreleaseversion
}}, Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.EJ.Exprot, Version= {{ site.40esreleaseversion
}}, Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.EJ.Mvc, Version= {{ site.40esreleaseversion }},
Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
</assemblies>
</compilation>
```

Register the required namespaces in "Web.config" files available inside Views folder and also at the root of the application

XML

```
<namespaces>
……
……
<add namespace="Syncfusion.MVC.EJ" />
<add namespace="Syncfusion.JavaScript" />
</namespaces>
```

Note: Registering assemblies and namespaces earlier helps to include the control in view page with the help of intellisense.

Set the **UnobtrusiveJavaScriptEnabled** property to false under **appSettings** tag in "Web.config" file at the root folder.

XML

```
<configuration>
……
……
<appSettings>
……
……
<add key="UnobtrusiveJavaScriptEnabled" value="false" />
</appSettings>
</configuration>
```

Scripts and CSS References

The scripts and style sheets that are mandatorily required to render PivotGrid control in a MVC Web Application are mentioned in an appropriate order below:

1. ej.web.all.min.css
2. jQuery-3.0.0.min.js
3. ej.web.all.min.js

Scripts and style sheets are referred under the head tag in _Layout.cshtml file which is found inside Views > Shared folder.

HTML

Copyright © 2001 - 2020 Syncfusion Inc.

```
<head>
<link href="http://cdn.syncfusion.com/{{ site.releaseversion
}}/js/web/flat-azure/ej.web.all.min.css" rel="stylesheet" type="text/css"
/>
<script src="http://cdn.syncfusion.com/js/assets/external/jquery-
3.0.0.min.js" type="text/javascript"></script>
<script src="http://cdn.syncfusion.com/{{ site.releaseversion
}}/js/web/ej.web.all.min.js" type="text/javascript"></script>
</head>
```

The script manager is initialized immediately after the RenderBody() function call in **_Layout.cshtml** file in-order to generate control related scripts.

ASPX-CS

```
<body>
……
……
@RenderBody()
@(Html.EJ().ScriptManager())
</body>
```

Initialize PivotGrid

Before initializing, empty the contents of "Index.cshtml" file under Views > Home folder and add the following codes.

HTML

```
@using Syncfusion.JavaScript;
<div>
@Html.EJ().Pivot().PivotGrid("PivotGrid1")
</div>
```

Populate PivotGrid With Data

Let us now see how to populate the PivotGrid control using a sample JSON data as shown below.

HTML

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").ClientSideEvents(clientSideEve
nts => clientSideEvents.Load("onLoad"))
<script type="text/javascript">
function onLoad(args) {
args.model.dataSource.data = [
{ Amount: 100, Country: "Canada", Date: "FY 2005", Product: "Bike",
Quantity: 2, State: "Alberta" },
{ Amount: 200, Country: "Canada", Date: "FY 2006", Product: "Van",
Quantity: 3, State: "British Columbia" },
{ Amount: 300, Country: "Canada", Date: "FY 2007", Product: "Car",
Quantity: 4, State: "Brunswick" },
{ Amount: 150, Country: "Canada", Date: "FY 2008", Product: "Bike",
Quantity: 3, State: "Manitoba" },
{ Amount: 200, Country: "Canada", Date: "FY 2006", Product: "Car",
Quantity: 4, State: "Ontario" },
{ Amount: 100, Country: "Canada", Date: "FY 2007", Product: "Van",
Quantity: 1, State: "Quebec" },
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
{ Amount: 200, Country: "France", Date: "FY 2005", Product: "Bike",
Quantity: 2, State: "Charente-Maritime" },
{ Amount: 250, Country: "France", Date: "FY 2006", Product: "Van",
Quantity: 4, State: "Essonne" },
{ Amount: 300, Country: "France", Date: "FY 2007", Product: "Car",
Quantity: 3, State: "Garonne (Haute)" },
{ Amount: 150, Country: "France", Date: "FY 2008", Product: "Van",
Quantity: 2, State: "Gers" },
{ Amount: 200, Country: "Germany", Date: "FY 2006", Product: "Van",
Quantity: 3, State: "Bayern" },
{ Amount: 250, Country: "Germany", Date: "FY 2007", Product: "Car",
Quantity: 3, State: "Brandenburg" },
{ Amount: 150, Country: "Germany", Date: "FY 2008", Product: "Car",
Quantity: 4, State: "Hamburg" },
{ Amount: 200, Country: "Germany", Date: "FY 2008", Product: "Bike",
Quantity: 4, State: "Hessen" },
{ Amount: 150, Country: "Germany", Date: "FY 2007", Product: "Van",
Quantity: 3, State: "Nordrhein-Westfalen" },
{ Amount: 100, Country: "Germany", Date: "FY 2005", Product: "Bike",
Quantity: 2, State: "Saarland" },
{ Amount: 150, Country: "United Kingdom", Date: "FY 2008", Product:
"Bike", Quantity: 5, State: "England" },
{ Amount: 250, Country: "United States", Date: "FY 2007", Product: "Car",
Quantity: 4, State: "Alabama" },
{ Amount: 200, Country: "United States", Date: "FY 2005", Product: "Van",
Quantity: 4, State: "California" },
{ Amount: 100, Country: "United States", Date: "FY 2006", Product:
"Bike", Quantity: 2, State: "Colorado" },
{ Amount: 150, Country: "United States", Date: "FY 2008", Product: "Car",
Quantity: 3, State: "New Mexico" },
{ Amount: 200, Country: "United States", Date: "FY 2005", Product:
"Bike", Quantity: 4, State: "New York" },
{ Amount: 250, Country: "United States", Date: "FY 2008", Product: "Car",
Quantity: 3, State: "North Carolina" },
{ Amount: 300, Country: "United States", Date: "FY 2007", Product: "Van",
Quantity: 4, State: "South Carolina" }
];
}
</script>
```

The JSON data is set to the **“data”** property present inside the **“DataSource”** object. **“DataSource”** object allows us to set both datasource as well as the fields that needs to be displayed in the row, column, value and filter section of the PivotGrid control.

HTML

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").ClientSideEvents(clientSideEve
nts => clientSideEvents.Load("onLoad")).DataSource(dataSource =>
dataSource.Rows(rows => {
rows.FieldName("Country").FieldCaption("Country").Add();}).Columns(column
s => { columns.FieldName("Product").FieldCaption("Product").Add();
}).Values(values => { values.FieldName("Amount").Add();}))
```

The above code will generate a simple PivotGrid with "Country" field in Row, "Product" field in Column, and "Amount" field in Value section.

Copyright © 2001 - 2020 Syncfusion Inc.

	Bike	Car	Van	Grand Total
	Amount	Amount	Amount	Amount
Canada	250	500	300	1050
France	200	300	400	900
Germany	300	400	350	1050
United Kingdom	150			150
United States	300	650	500	1450
Grand Total	1200	1850	1550	4600

Apply Sorting

You can sort a field either to ascending or descending order using the "sortOrder" property. Sorting is applicable only for Row and Column fields. By default, fields are arranged in ascending order.

HTML

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").ClientSideEvents(clientSideEve
nts => clientSideEvents.Load("onLoad")).DataSource(dataSource =>
dataSource.Rows(rows =>
{rows.FieldName("Country").FieldCaption("Country").SortOrder(SortOrder.As
cending).Add();}).Columns(columns => {
columns.FieldName("Product").FieldCaption("Product").Add();
}).Values(values => { values.FieldName("Amount").Add();}))
```

	Bike	Car	Van	Grand Total
	Amount	Amount	Amount	Amount
United States	300	650	500	1450
United Kingdom	150			150
Germany	300	400	350	1050
France	200	300	400	900
Canada	250	500	300	1050
Grand Total	1200	1850	1550	4600

Copyright © 2001 - 2020 Syncfusion Inc.

Sort Row/Column by Date

You can sort a field either in ascending or descending order according for date type by using the **SortOrder** property. Sorting is applicable only for Row and Column fields. By default, fields are arranged in ascending order.

Note: To apply sorting by date, you need to specify the Format and FormatString in the field.

ASPX-CS

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").ClientSideEvents(clientSideEve
nts => clientSideEvents.Load("onLoad")).DataSource(dataSource =>
dataSource.Rows(rows =>
{rows.FieldName("Date").FieldCaption("Date").Format("date").FormatString(
"dd-MM-yyyy").SortOrder(SortOrder.Descending).Add();}).Columns(columns =>
{
columns.FieldName("Day").FieldCaption("Day").Format("date").FormatString(
"ddd").SortOrder(SortOrder.Ascending).Add(); }).Values(values => {
values.FieldName("Amount").Add();}))
<script type="text/javascript">
function onLoad(args) {
args.model.dataSource.data = [
{ Amount: 100, Date: "5-1-2017", Day: "Wednesday" },
{ Amount: 200, Date: "1-2-2017", Day: "Sunday" },
{ Amount: 300, Date: "1-1-2018", Day: "Thursday" },
{ Amount: 150, Date: "5-1-2018", Day: "Wednesday" },
{ Amount: 200, Date: "1-2-2017", Day: "Thursday" },
{ Amount: 100, Date: "1-1-2018", Day: "Sunday" },
{ Amount: 200, Date: "5-1-2017", Day: "Wednesday" },
{ Amount: 250, Date: "1-2-2017", Day: "Sunday" }
//....
];
}
</script>
```

	Sunday	Wednesday	Thursday	Grand Total
	Amount	Amount	Amount	Amount
5-1-2018		150		150
1-1-2018	100		300	400
1-2-2017	450		200	650
5-1-2017		300		300
Grand Total	550	450	500	1500

Apply Filtering

Filtering option allows you to specify a set of values that either need to be displayed or hidden. Also filtering option is applicable only for Row, Column and Filter areas.

“FilterItems” object allow us to apply filtering to the fields using the following properties:

Copyright © 2001 - 2020 Syncfusion Inc.

- FilterType - indicates whether the values should be included or excluded.
- Values - specify an array of values that needs to be included or excluded within the particular field.

HTML

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").ClientSideEvents(clientSideEve
nts => clientSideEvents.Load("onLoad")).DataSource(dataSource =>
dataSource.Rows(rows => {
rows.FieldName("Country").FieldCaption("Country").FilterItems(filter => {
filter.FilterType(PivotFilterType.Exclude).Values(value => {
value.Add("United Kingdom"); }); }).Add(); }).Columns(columns => {
columns.FieldName("Product").FieldCaption("Product").Add();
}).Values(values => { values.FieldName("Amount").Add(); }))
```

	Bike	Car	Grand Total
	Amount	Amount	Amount
Canada	250	500	**750**
France	200	300	**500**
Germany	300	400	**700**
United States	300	650	**950**
Grand Total	**1050**	**1850**	**2900**

Apply Summary Types

Allows us to specify the required summary type that PivotGrid should use in its summary cells. **"Sum"** is the default summary type. Following are the summary types that are supported:

- Sum
- Average
- Count
- Min
- Max

HTML

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").ClientSideEvents(clientSideEve
nts => clientSideEvents.Load("onLoad")).DataSource(dataSource =>
dataSource.Rows(rows => {
rows.FieldName("Country").FieldCaption("Country").Add();
}).Columns(columns => {
columns.FieldName("Product").FieldCaption("Product").Add();
}).Values(values => {
values.FieldName("Amount").SummaryType(PivotSummaryType.Average).Add();
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
values.FieldName("Quantity").FieldCaption("Quantity").SummaryType(PivotSu
mmaryType.TotalSum).Add(); }))
```

	Bike		Car		Grand Total	
	Amount	Quantity	Amount	Quantity	Amount	Quantity
Canada	125	5	250	8	187.5	13
France	200	2	300	3	250	5
Germany	150	6	200	7	175	13
United States	150	6	212.5	10	181.25	16
Grand Total	156.25	19	240.63	28	198.44	47

Creating a simple application with PivotGrid and Relational datasource (Server Mode)

This section covers the information required to create a simple PivotGrid bound to Relational datasource.

Note: ASP.NET MVC Web Application will contain a service that transfers data to server-side, processes and returns back to client-side for control rendering and re-rendering. The service utilized for communication could be either WCF or WebAPI based on user requirement.

Project Initialization

Create a new **ASP.NET MVC Web Application** using Visual Studio IDE and name the project as **"PivotGridDemo"**.

Select the View engine as **'Razor'** and Project template as **'Internet Application'** and finally click **OK** button to create an application.

Now add the following dependency libraries as references into your MVC Web Application. In order to add them to your application, right-click on **References** in Solution Explorer and select Add Reference. Now in the **Reference Manager** dialog, under **Assemblies > Extension**, the following Syncfusion libraries will be found.

Note: If you have installed any version of Essential Studio, then the location of Syncfusion libraries is [system drive:\Program Files (x86)\Syncfusion\Essential Studio\{{ site.releaseversion }}\Assemblies].

- Syncfusion.Compression.Base
- Syncfusion.Linq.Base
- Syncfusion.Olap.Base
- Syncfusion.PivotAnalysis.Base
- System.Data.SqlServerCe (Version: 4.0.0.0)
- Syncfusion.XlsIO.Base
- Syncfusion.Pdf.Base
- Syncfusion.DocIO.Base
- Syncfusion.EJ
- Syncfusion.EJ.Export
- Syncfusion.EJ.Pivot

Copyright © 2001 - 2020 Syncfusion Inc.

- Syncfusion.EJ.MVC

The version of Syncfusion libraries based on .NET Framework and MVC version are classified below. For example, version is illustrated as,

MVC Version	MVC Version of Syncfusion assembly	Base Version of Syncfusion assembly	System.Web.Mvc	System.Web.WebPages
MVC3	{{ site.mvc3releaseversion }}	{{ site.35esreleaseversion }}	3.0	1.0
MVC4	{{ site.mvc4releaseversion }}	{{ site.40esreleaseversion }}	4.0	2.0
MVC5	{{ site.mvc5releaseversion }}	{{ site.45esreleaseversion }}	5.0	3.0

Register the referenced assemblies in "Web.config" files available inside Views folder and also at the root of the application.

XML

```
<compilation debug="true" targetFramework="4.5">
<assemblies>
……
……
<add assembly="Syncfusion.EJ, Version= {{ site.40esreleaseversion }},
Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.EJ.Pivot, Version= {{ site.40esreleaseversion
}}, Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.EJ.Export, Version= {{ site.40esreleaseversion
}}, Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.EJ.Mvc, Version= {{ site.40esreleaseversion }},
Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.Linq.Base, Version= {{ site.40esreleaseversion
}}, Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.Olap.Base, Version= {{ site.40esreleaseversion
}}, Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.Pdf.Base, Version= {{ site.40esreleaseversion
}}, Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.XlsIO.Base, Version= {{ site.40esreleaseversion
}}, Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.DocIO.Base, Version= {{ site.40esreleaseversion
}}, Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
</assemblies>
</compilation>
```

Register the required namespaces in "Web.config" files available inside Views folder and also at the root of the application

XML

```
<namespaces>
……
……
<add namespace="Syncfusion.MVC.EJ" />
<add namespace="Syncfusion.JavaScript" />
</namespaces>
```

Note: Registering assemblies and namespaces earlier helps to include the control in view page with the help of intellisense.

Set the **UnobtrusiveJavaScriptEnabled** property to false under **appSettings** tag in "Web.config" file at the root folder.

XML

```
<configuration>
……
……
<appSettings>
……
……
<add key="UnobtrusiveJavaScriptEnabled" value="false" />
</appSettings>
</configuration>
```

Scripts and CSS Initialization

The scripts and style sheets that are mandatorily required to render PivotGrid control in a MVC Web Application are mentioned in an appropriate order below:

1. ej.web.all.min.css
2. jQuery-3.0.0.min.js
3. ej.web.all.min.js

Click here here to know more about scripts and style sheets available online (CDN Link).

Scripts and style sheets are referred under the <head> tag in **_Layout.cshtml** file which is found inside **Views > Shared folder.**

HTML

```
<head>
<link href="http://cdn.syncfusion.com/{{ site.releaseversion
}}/js/web/flat-azure/ej.web.all.min.css" rel="stylesheet" type="text/css"
/>
<script src="http://cdn.syncfusion.com/js/assets/external/jquery-
3.0.0.min.js" type="text/javascript"></script>
<script src="http://cdn.syncfusion.com/{{ site.releaseversion
}}/js/web/ej.web.all.min.js" type="text/javascript"></script>
</head>
```

Copyright © 2001 - 2020 Syncfusion Inc.

The script manager is initialized immediately after the RenderBody() function call in **_Layout.cshtml** file in-order to generate control related scripts.

HTML

```
<body>
……
……
@RenderBody()
@(Html.EJ().ScriptManager())
</body>
```

Control Initialization

Before initializing, empty the contents of **Index.cshtml** file under **Views > Home** folder and add the following codes. Register the namespaces at the top of the page and then add the control.

HTML

```
@using Syncfusion.JavaScript;
<div>
@Html.EJ().Pivot().PivotGrid("PivotGrid1").Url(Url.Content("/Relational")
)
</div>
```

The **“Url”** property in PivotGrid control points the service endpoint, where data are processed and fetched in the form of JSON. The services used in PivotGrid control as endpoint are WCF and WebAPI.

Note: The above "Index.cshtml" contains WebAPI URL, which is "/Relational". If WCF service is used as endpoint, the URL would look like "/RelationalService.svc".

WebAPI

Adding a WebAPI Controller

To add a WebAPI controller in an existing MVC Web Application, right-click on the project in Solution Explorer and select **Add > New Item**. In the **Add New Item** window, select **WebAPI Controller Class** and name it as **“RelationalController.cs”**, click **Add**.

Now, WebAPI controller is added to the application successfully with the file **“RelationalController.cs”**.

Note: While adding WebAPI Controller Class, name it with the suffix ‘Controller’ which is mandatory. For example, in this demo the controller is named as “RelationalController”.

Next, remove all the existing methods such as "Get", "Post", "Put" and "Delete" present inside RelationalController.cs file.

C#

```
namespace PivotGridDemo
{
public class RelationalController: ApiController
{
}
}
```

Adding the List of Namespaces

Copyright © 2001 - 2020 Syncfusion Inc.

The following are the list of namespaces to be added on top of the main class inside RelationalController.cs file.

C#

```
using Syncfusion.JavaScript;
using Syncfusion.PivotAnalysis.Base;
using System;
using System.Collections.Generic;
using System.Data;
using System.Data.SqlServerCe;
using System.Linq;
using System.Text;
using System.Web;
using System.Web.Http;
using System.Web.Script.Serialization;
using OLAPUTILS = Syncfusion.JavaScript.Olap;
namespace PivotGridDemo
{
public class RelationalController : ApiController
{
}
}
```

Datasource Initialization

Now, the connection string to connect OLAP Cube, PivotGrid and JavaScriptSerializer instances are created immediately inside the main class in **RelationalController.cs** file.

C#

```
namespace PivotGridDemo {
.....
.....
internal class ProductSales {
public string Product {
get;
set;
}
public string Date {
get;
set;
}
public string Country {
get;
set;
}
public string State {
get;
set;
}
public int Quantity {
get;
set;
}
public double Amount {
get;
```

```
set;
}
public static ProductSalesCollection GetSalesData() {
/// Geography
string[] countries = new string[] {
"Australia",
"Canada",
"France",
"Germany",
"United Kingdom",
"United States"
};
string[] ausStates = new string[] {
"New South Wales",
"Queensland",
"South Australia",
"Tasmania",
"Victoria"
};
string[] canadaStates = new string[] {
"Alberta",
"British Columbia",
"Brunswick",
"Manitoba",
"Ontario",
"Quebec"
};
string[] franceStates = new string[] {
"Charente-Maritime",
"Essonne",
"Garonne (Haute)",
"Gers",
};
string[] germanyStates = new string[] {
"Bayern",
"Brandenburg",
"Hamburg",
"Hessen",
"Nordrhein-Westfalen",
"Saarland"
};
string[] ukStates = new string[] {
"England"
};
string[] ussStates = new string[] {
"New York",
"North Carolina",
"Alabama",
"California",
"Colorado",
"New Mexico",
"South Carolina"
};
/// Time
string[] dates = new string[] {
"FY 2005",
"FY 2006",
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
"FY 2007",
"FY 2008",
"FY 2009"
};
/// Products
string[] products = new string[] {
"Bike",
"Van",
"Car"
};
Random r = new Random(123345345);
int numberOfRecords = 2000;
ProductSalesCollection listOfProductSales = new ProductSalesCollection();
for (int i = 0; i < numberOfRecords; i++) {
ProductSales sales = new ProductSales();
sales.Country = countries[r.Next(1, countries.GetLength(0))];
sales.Quantity = r.Next(1, 12);
/// 1 percent discount for 1 quantity
double discount = (30000 * sales.Quantity) *
(double.Parse(sales.Quantity.ToString()) / 100);
sales.Amount = (30000 * sales.Quantity) - discount;
sales.Date = dates[r.Next(r.Next(dates.GetLength(0) + 1))];
sales.Product = products[r.Next(r.Next(products.GetLength(0) + 1))];
switch (sales.Product) {
case "Car":
{
sales.Date = "FY 2005";
break;
}
}
switch (sales.Country) {
case "Australia":
{
sales.State = ausStates[r.Next(ausStates.GetLength(0))];
break;
}
case "Canada":
{
sales.State = canadaStates[r.Next(canadaStates.GetLength(0))];
break;
}
case "France":
{
sales.State = franceStates[r.Next(franceStates.GetLength(0))];
break;
}
case "Germany":
{
sales.State = germanyStates[r.Next(germanyStates.GetLength(0))];
break;
}
case "United Kingdom":
{
sales.State = ukStates[r.Next(ukStates.GetLength(0))];
break;
}
case "United States":
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
{
sales.State = ussStates[r.Next(ussStates.GetLength(0))];
break;
}
}
listOfProductSales.Add(sales);
}
return listOfProductSales;
}
public override string ToString() {
return string.Format("{0}-{1}-{2}", this.Country, this.State,
this.Product);
}
public class ProductSalesCollection: List < ProductSales > {}
}
}
```

Service methods in WebAPI Controller

Define the service methods inside RelationalController class, found inside RelationalController.cs file, created while adding WebAPI Controller Class to the Application.

C#

```
namespace PivotGridDemo
{
public class RelationalController: ApiController
{
PivotGrid htmlHelper = new PivotGrid();
JavaScriptSerializer serializer = new JavaScriptSerializer();
Dictionary<string, object> dict = new Dictionary<string, object>();
static int cultureIDInfoval = 1033;
string connectionString = "Data
Source=https://bi.syncfusion.com/olap/msmdpump.dll; Initial
Catalog=Adventure Works DW 2008 SE;";
string conStringforDB = ""; //Enter appropriate connection string to
connect database for saving and loading operation of reports
[System.Web.Http.ActionName("InitializeGrid")]
[System.Web.Http.HttpPost]
public Dictionary<string, object> InitializeGrid(Dictionary<string,
object> jsonResult)
{
htmlHelper.PivotReport = BindDefaultData();
dict = htmlHelper.GetJsonData(jsonResult["action"].ToString(),
ProductSales.GetSalesData());
return dict;
}
[System.Web.Http.ActionName("FetchMembers")]
[System.Web.Http.HttpPost]
public Dictionary<string, object> FetchMembers(Dictionary<string, object>
jsonResult)
{
htmlHelper.PopulateData(jsonResult["currentReport"].ToString());

FieldHeader = "Product", TotalHeader = "Total" });
pivotSetting.PivotColumns.Add(new PivotItem { FieldMappingName =
"Country", FieldHeader = "Country", TotalHeader = "Total" });
pivotSetting.PivotCalculations.Add(new PivotComputationInfo {
CalculationName = "Amount", Description = "Amount", FieldHeader =
"Amount", FieldName = "Amount", Format = "C", SummaryType =
Syncfusion.PivotAnalysis.Base.SummaryType.DoubleTotalSum });
return pivotSetting;
}
}
.....
..... // Initialize the datasource
.....
}
```

Configure routing in WebAPIConfig Class

Open the "WebAPIConfig.cs" file found in **App_Start** folder. Then routing could be configured as shown in the following code example.

C#

```
public static class WebApiConfig
{
public static void Register(HttpConfiguration config)
{
config.Routes.MapHttpRoute(
name: "DefaultApi",
routeTemplate: "{controller}/{action}/{id}",
defaults: new { id = RouteParameter.Optional }
);
}
}
```

Copyright © 2001 - 2020 Syncfusion Inc.

Now, **PivotGrid** will be rendered with Sales Amount over a set of products across different customer geographic locations.

	Canada	France	Germany	United Kingdom	United States	Grand Total
	Amount	Amount	Amount	Amount	Amount	Amount
Bike	$51,651,000.00	$44,167,500.00	$49,383,900.00	$46,314,000.00	$44,398,800.00	**$235,915,200.00**
Car	$5,966,100.00	$5,774,100.00	$5,315,100.00	$5,860,500.00	$6,155,400.00	**$29,071,200.00**
Van	$14,252,400.00	$15,807,600.00	$11,985,000.00	$11,008,200.00	$14,601,600.00	**$67,654,800.00**
Grand Total	**$71,869,500.00**	**$65,749,200.00**	**$66,684,000.00**	**$63,182,700.00**	**$65,155,800.00**	**$332,641,200.00**

WCF

This section demonstrates the utilization of WCF service as endpoint binding Relational datasource to a simple PivotGrid. For more details on this topic, click here.

Getting Started

Important

Starting with v16.2.0.x, if you refer to Syncfusion assemblies from trial setup or from the NuGet feed, include a license key in your projects. Refer to this link to learn about registering Syncfusion license key in your ASP.NET Core application to use our components.

Creating a simple application with PivotGrid and OLAP datasource (Client Mode)

This section covers the information that you need to know to populate a simple PivotGrid with OLAP data completely on the client-side.

Project Initialization

Create a new **ASP.NET MVC Web Application** using Visual Studio IDE and name the project as **"PivotGridDemo"**.

Select the View engine as **'Razor'** and Project template as **'Internet Application'** and finally click **OK** button to create an application.

Now add the following dependency libraries as references into your MVC Web Application. In order to add them to your application, right-click on **References** in Solution Explorer and select Add Reference. Now in the **Reference Manager** dialog, under **Assemblies > Extension**, the following Syncfusion libraries will be found.

- Syncfusion.EJ
- Syncfusion.EJ.Export
- Syncfusion.EJ.Pivot
- Syncfusion.EJ.MVC

The version of Syncfusion libraries based on .NET Framework and MVC version are classified below. For example, version is illustrated as,

MVC Version	MVC Version of Syncfusion assembly	Base Version of Syncfusion assembly	System.Web.Mvc	System.Web.WebPages

Copyright © 2001 - 2020 Syncfusion Inc.

MVC3	{{ site.mvc3releaseversion }}	{{ site.35esreleaseversion }}	3.0	1.0
MVC4	{{ site.mvc4releaseversion }}	{{ site.40esreleaseversion }}	4.0	2.0
MVC5	{{ site.mvc5releaseversion }}	{{ site.45esreleaseversion }}	5.0	3.0

Register the referred assemblies in "Web.config" files available inside Views folder and also at the root of the application.

XML

```
<compilation debug="true" targetFramework="4.0">
<assemblies>
……
……
<add assembly="Syncfusion.EJ, Version= {{ site.40esreleaseversion }},
Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.EJ.Pivot, Version= {{ site.40esreleaseversion
}}, Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.EJ.Export, Version= {{ site.40esreleaseversion
}}, Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.EJ.Mvc, Version= {{ site.40esreleaseversion }},
Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
</assemblies>
</compilation>
```

Register the required namespaces in "Web.config" files available inside Views folder and also at the root of the application

XML

```
<namespaces>
……
……
<add namespace="Syncfusion.MVC.EJ" />
<add namespace="Syncfusion.JavaScript" />
</namespaces>
```

Note: Registering assemblies and namespaces earlier helps to include the control in view page with the help of intellisense.

Set the **UnobtrusiveJavaScriptEnabled** property to false under **appSettings** tag in "Web.config" file at the root folder.

XML

```
<configuration>
……
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
……
<appSettings>
……
……
<add key="UnobtrusiveJavaScriptEnabled" value="false" />
</appSettings>
</configuration>
```

Scripts and CSS References

The scripts and style sheets that are mandatorily required to render PivotGrid control in a MVC Web Application are mentioned in an appropriate order below:

1. ej.web.all.min.css
2. jQuery-3.0.0.min.js
3. ej.web.all.min.js

Scripts and style sheets are referred under the head tag in _Layout.cshtml file which is found inside Views > Shared folder.

HTML

```
<head>
<link href="http://cdn.syncfusion.com/{{ site.releaseversion
}}/js/web/flat-azure/ej.web.all.min.css" rel="stylesheet" type="text/css"
/>
<script src="http://cdn.syncfusion.com/js/assets/external/jquery-
3.0.0.min.js" type="text/javascript"></script>
<script src="http://cdn.syncfusion.com/{{ site.releaseversion
}}/js/web/ej.web.all.min.js" type="text/javascript"></script>
</head>
```

The script manager is initialized immediately after the RenderBody() function call in **_Layout.cshtml** file in-order to generate control related scripts.

ASPX-CS

```
<body>
……
……
@RenderBody()
@(Html.EJ().ScriptManager())
</body>
```

Initialize PivotGrid

Before initializing, empty the contents of "Index.cshtml" file under Views > Home folder and add the following codes.

HTML

```
@using Syncfusion.JavaScript;
<div>
@Html.EJ().Pivot().PivotGrid("PivotGrid1")
</div>
```

Copyright © 2001 - 2020 Syncfusion Inc.

Populate PivotGrid With DataSource

Initializes the OLAP datasource for PivotGrid control as shown below.

HTML

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").DataSource(dataSource =>
dataSource.Rows(rows=>{rows.FieldName("[Date].[Fiscal]").Add();}).Columns
(columns=>{columns.FieldName("[Customer].[Customer
Geography]").Add();}).Values(values => { values.Measures(measures => {
measures.FieldName("[Measures].[Internet Sales Amount]").Add();
}).Axis(AxisName.Column).Add();}).Data("https://bi.syncfusion.com/olap/ms
mdpump.dll").Catalog("Adventure Works DW 2008 SE").Cube("Adventure
Works"))
```

The above code will generate a simple PivotGrid with "Fiscal" field in Row, "Customer Geography" field in Column and "Internet Sales Amount" field in Value section.

	Australia	Canada	France	Germany	United Kingdom	United States	Total
	Internet Sales Amount						
FY 2002	$2,568,701.39	$573,100.97	$414,245.32	$513,353.17	$550,507.33	$2,452,176.07	**$7,072,084.24**
FY 2003	$2,099,585.43	$305,010.69	$633,399.70	$593,247.24	$696,594.97	$1,434,296.26	**$5,762,134.30**
FY 2004	$4,383,479.54	$1,088,879.50	$1,592,880.75	$1,784,107.09	$2,140,388.50	$5,483,882.67	**$16,473,618.05**
FY 2005	$9,234.23	$10,853.70	$3,491.95	$3,604.83	$4,221.41	$19,434.51	**$50,840.63**
Total	**$9,061,000.58**	**$1,977,844.86**	**$2,644,017.71**	**$2,894,312.34**	**$3,391,712.21**	**$9,389,789.51**	**$29,358,677.22**

Creating a simple application with PivotGrid and OLAP datasource (Server Mode)

This section covers the information required to create a simple PivotGrid bound to OLAP datasource.

Note: ASP.NET MVC Web Application will contain a service that transfers data to server-side, processes and returns back to client-side for control rendering and re-rendering. The service utilized for communication could be either WCF or WebAPI based on user requirement.

Project Initialization

Create a new **ASP.NET MVC Web Application** using Visual Studio IDE and name the project as **"PivotGridDemo"**.

Select the View engine as **'Razor'** and Project template as **'Internet Application'** and finally click **OK** button to create an application.

Now add the following dependency libraries as references into your MVC Web Application. In order to add them to your application, right-click on **References** in Solution Explorer and select **Add Reference**. Now in the **Reference Manager** dialog, under **Assemblies > Extension**, the following Syncfusion libraries will be found.

Note: If you have installed any version of SQL Server Analysis Service (SSAS) or Microsoft ADOMD.NET utility, then the location of Microsoft.AnalysisServices.AdomdClient library is [system drive:\Program Files (x86)\Microsoft.NET\ADOMD.NET]. And if you have installed any version of Essential Studio, then

Copyright © 2001 - 2020 Syncfusion Inc.

the location of Syncfusion libraries is [system drive:\Program Files (x86)\Syncfusion\Essential Studio\{{ site.releaseversion }}\Assemblies].

- Microsoft.AnalysisServices.AdomdClient
- Syncfusion.Compression.Base
- Syncfusion.Linq.Base
- Syncfusion.Olap.Base
- Syncfusion.PivotAnalysis.Base
- System.Data.SqlServerCe (Version: 4.0.0.0)
- Syncfusion.XlsIO.Base
- Syncfusion.Pdf.Base
- Syncfusion.DocIO.Base
- Syncfusion.EJ
- Syncfusion.EJ.Export
- Syncfusion.EJ.Pivot
- Syncfusion.EJ.MVC

The version of Syncfusion libraries based on .NET Framework and MVC version are classified below. For example, version is illustrated as,

MVC Version	MVC Version of Syncfusion assembly	Base Version of Syncfusion assembly	System.Web.Mvc	System.Web.WebPages
MVC3	{{ site.mvc3releaseversion }}	{{ site.35esreleaseversion }}	3.0	1.0
MVC4	{{ site.mvc4releaseversion }}	{{ site.40esreleaseversion }}	4.0	2.0
MVC5	{{ site.mvc5releaseversion }}	{{ site.45esreleaseversion }}	5.0	3.0

Register the referenced assemblies in "Web.config" files available inside Views folder and also at the root of the application.

XML

```
<compilation debug="true" targetFramework="4.0">
<assemblies>
……
……
<add assembly="Syncfusion.EJ, Version= {{ site.40esreleaseversion }}, Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.EJ.Pivot, Version= {{ site.40esreleaseversion }}, Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.EJ.Export, Version= {{ site.40esreleaseversion }}, Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
<add assembly="Syncfusion.EJ.Mvc, Version= {{ site.40esreleaseversion }},
Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.Linq.Base, Version= {{ site.40esreleaseversion
}}, Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.Olap.Base, Version= {{ site.40esreleaseversion
}}, Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.Compression.Base, Version= {{
site.40esreleaseversion }}, Culture=neutral,
PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.PivotAnalysis.Base, Version= {{
site.40esreleaseversion }}, Culture=neutral,
PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.Pdf.Base, Version= {{ site.40esreleaseversion
}}, Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.XlsIO.Base, Version= {{ site.40esreleaseversion
}}, Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
<add assembly="Syncfusion.DocIO.Base, Version= {{ site.40esreleaseversion
}}, Culture=neutral, PublicKeyToken=3d67ed1f87d44c89" />
</assemblies>
</compilation>
```

Register the required namespaces in "Web.config" files available inside Views folder and also at the root of the application

XML

```
<namespaces>
……
……
<add namespace="Syncfusion.MVC.EJ" />
<add namespace="Syncfusion.JavaScript" />
</namespaces>
```

Note: Registering assemblies and namespaces earlier helps to include the control in view page with the help of intellisense.

Set the **UnobtrusiveJavaScriptEnabled** property to false under **appSettings** tag in "Web.config" file at the root folder.

XML

```
<configuration>
……
……
<appSettings>
……
……
<add key="UnobtrusiveJavaScriptEnabled" value="false" />
</appSettings>
</configuration>
```

Scripts and CSS Initialization

The scripts and style sheets that are mandatorily required to render PivotGrid control in a MVC Web Application are mentioned in an appropriate order below:

Copyright © 2001 - 2020 Syncfusion Inc.

1. ej.web.all.min.css
2. jQuery-3.0.0.min.js
3. ej.web.all.min.js

Click here here to know more about scripts and style sheets available online (CDN Link).

Scripts and style sheets are referred under the **head** tag in **_Layout.cshtml** file which is found inside **Views > Shared folder.**

HTML

```
<head>
<link href="http://cdn.syncfusion.com/{{ site.releaseversion
}}/js/web/flat-azure/ej.web.all.min.css" rel="stylesheet" type="text/css"
/>
<script src="http://cdn.syncfusion.com/js/assets/external/jquery-
3.0.0.min.js" type="text/javascript"></script>
<script src="http://cdn.syncfusion.com/{{ site.releaseversion
}}/js/web/ej.web.all.min.js" type="text/javascript"></script>
</head>
```

The script manager is initialized immediately after the RenderBody() function call in **_Layout.cshtml** file in-order to generate control related scripts.

HTML

```
<body>
……
……
@RenderBody()
@(Html.EJ().ScriptManager())
</body>
```

Control Initialization

Before initializing, empty the contents of **Index.cshtml** file under **Views > Home** folder and add the following codes. Register the namespaces at the top of the page and then add the control.

HTML

```
@using Syncfusion.JavaScript;
<div>
@Html.EJ().Pivot().PivotGrid("PivotGrid1").Url(Url.Content("/Olap"))
</div>
```

The **“Url”** property in PivotGrid control points the service endpoint, where data are processed and fetched in the form of JSON. The services used in PivotGrid control as endpoint are WCF and WebAPI.

Note: The above "Index.cshtml" contains WebAPI URL, which is "/Olap". If WCF service is used as endpoint, the URL would look like "/OlapService.svc".

WebAPI

Adding a WebAPI Controller

Copyright © 2001 - 2020 Syncfusion Inc.

To add a WebAPI controller in an existing Web Application, right-click on the project in Solution Explorer and select **Add > New Item**. In the **Add New Item** window, select **WebAPI Controller Class** and name it as OlapController.cs, click Add.

Now, WebAPI controller is added to the application successfully with the file **"OlapController.cs"**.

Note: While adding WebAPI Controller Class, name it with the suffix 'Controller' that is mandatory. For example, in this demo the controller is named as **"OlapController"**.

Next, remove all the existing methods such as "Get", "Post", "Put" and "Delete" present inside OlapController.cs file.

C#

```
namespace PivotGridDemo
{
public class OlapController: ApiController
{
}
}
```

Adding the List of Namespaces

The following are the list of namespaces to be added on top of the main class inside OlapController.cs file.

C#

```
using Syncfusion.Olap.Manager;
using Syncfusion.Olap.Reports;
using System;
using System.Collections.Generic;
using System.Configuration;
using System.Linq;
using System.Web.Http;
using System.Web.Script.Serialization;
using Syncfusion.JavaScript.Olap;
using System.Web;
using System.Data.SqlServerCe;
using OLAPUTILS = Syncfusion.JavaScript.Olap;
using System.Data;
using System.Text;
namespace PivotGridDemo
{
public class OlapController: ApiController
{
}
}
```

Datasource Initialization

Now, the connection string to connect OLAP Cube, PivotGrid and JavaScriptSerializer instances are created immediately inside the main class in OlapController.cs file.

C#

```
namespace PivotGridDemo
```

```
{
public class OlapController: ApiController
{
Syncfusion.JavaScript.PivotGrid htmlHelper = new
Syncfusion.JavaScript.PivotGrid();
string connectionString = "Data
Source=https://bi.syncfusion.com/olap/msmdpump.dll; Initial
Catalog=Adventure Works DW 2008 SE;";
JavaScriptSerializer serializer = new JavaScriptSerializer();
string conStringforDB = ""; //Enter appropriate connection string to
connect database for saving and loading operation of reports
//Other codes
}
}
```

Service methods in WebAPI Controller

Define the service methods inside OlapController class, found inside OlapController.cs file, created while adding WebAPI Controller Class to the Application.

C#

```
namespace PivotGridDemo
{
public class OlapController: ApiController
{
Syncfusion.JavaScript.PivotGrid htmlHelper = new
Syncfusion.JavaScript.PivotGrid();
string connectionString = "Data
Source=https://bi.syncfusion.com/olap/msmdpump.dll; Initial
Catalog=Adventure Works DW 2008 SE;";
static int cultureIDInfoval = 1033;
JavaScriptSerializer serializer = new JavaScriptSerializer();
string conStringforDB = ""; //Enter appropriate connection string to
connect database for saving and loading operation of reports
[System.Web.Http.ActionName("InitializeGrid")]

return olapReport;
}
}
}
```

Configure routing in WebAPIConfig Class

Open the "WebAPIConfig.cs" file found in **App_Start** folder. Then routing could be configured as shown in the following code example.

C#

```
public static class WebApiConfig
{
public static void Register(HttpConfiguration config)
{
config.Routes.MapHttpRoute(
name: "DefaultApi",
routeTemplate: "{controller}/{action}/{id}",
defaults: new { id = RouteParameter.Optional }
);
}
}
```

Now, **PivotGrid** is rendered with Customer Count over a period of fiscal years across different customer geographic locations.

	Australia	Canada	France	Germany	United Kingdom	United States	Total
	Internet Sales Amount						
FY 2002	$2,568,701.39	$573,100.97	$414,245.32	$513,353.17	$550,507.33	$2,452,176.07	**$7,072,084.24**
FY 2003	$2,099,585.43	$305,010.69	$633,399.70	$593,247.24	$696,594.97	$1,434,296.26	**$5,762,134.30**
FY 2004	$4,383,479.54	$1,088,879.50	$1,592,880.75	$1,784,107.09	$2,140,388.50	$5,483,882.67	**$16,473,618.05**
FY 2005	$9,234.23	$10,853.70	$3,491.95	$3,604.83	$4,221.41	$19,434.51	**$50,840.63**
Total	**$9,061,000.58**	**$1,977,844.86**	**$2,644,017.71**	**$2,894,312.34**	**$3,391,712.21**	**$9,389,789.51**	**$29,358,677.22**

WCF

This section demonstrates the utilization of WCF service as endpoint binding OLAP datasource to a simple PivotGrid. For more details on this topic, click here.

Data Binding

Data Binding

Binding PivotGrid to Collection

This section demonstrates binding of a collection to the PivotGrid control as datasource. For more information on this datasource refer the following links.

If you are using WebAPI controller, refer the "Datasource Initialization" section under the following link.

If you are using WCF Service, refer the "Datasource Initialization" section below.

Copyright © 2001 - 2020 Syncfusion Inc.

WCF

Adding a WCF Service

To add a WCF service in an existing MVC Application, right-click on the project in Solution Explorer and select **Add > New Item**. In the **Add New Item** window, select WCF Service and name it as RelationalService.svc, click **Add.**

Now, WCF service is added into the application successfully that comprises of the following files. The utilization of these files is explained in the immediate sections

- RelationalService.svc
- RelationalService.svc.cs
- IRelationalService.cs

Configuring WCF Service Class

Remove the **"DoWork"** method present inside both RelationalService.svc.cs and IRelationalService.cs files. Next, add **"AspNetCompatibilityRequirements"** attribute on top of main class present inside the RelationalService.svc.cs file and set **"RequirementsMode"** value to **"Allowed"**.

C#

```
namespace PivotGridDemo
{
[AspNetCompatibilityRequirements(RequirementsMode =
AspNetCompatibilityRequirementsMode.Allowed)]
public class RelationalService : IRelationalService
{
}
}
```

List of Dependency Libraries

Next you need to add the below mentioned dependency libraries into your Web Application. These libraries could be found in GAC (Global Assembly Cache) as well.

To add them to your Web Application, right-click on **References** in Solution Explorer and select **Add Reference**. Now in the **Reference Manager** dialog, under **Assemblies > Extension**, the following Syncfusion libraries are found.

Note: If you have installed any version of Essential Studio, then the location of Syncfusion libraries is [system drive:\Program Files (x86)\Syncfusion\Essential Studio\{{ site.releaseversion }}\Assemblies].

- Syncfusion.Compression.Base
- Syncfusion.Linq.Base
- Syncfusion.Olap.Base
- Syncfusion.PivotAnalysis.Base
- System.Data.SqlServerCe (Version: 4.0.0.0)
- Syncfusion.XlsIO.Base
- Syncfusion.Pdf.Base
- Syncfusion.DocIO.Base
- Syncfusion.EJ

Copyright © 2001 - 2020 Syncfusion Inc.

- Syncfusion.EJ.Export
- Syncfusion.EJ.Pivot
- Syncfusion.EJ.MVC

List of Namespaces

Following are the list of namespaces to be added on top of the main class inside RelationalService.svc.cs file.

C#

```
using Syncfusion.JavaScript;
using Syncfusion.PivotAnalysis.Base;
using System;
using System.Collections.Generic;
using System.Data;
using System.ServiceModel.Activation;
using System.Data.SqlServerCe;
using System.Linq;
using System.Text;
using System.Web;
using System.Web.Http;
using System.Web.Script.Serialization;
using OLAPUTILS = Syncfusion.JavaScript.Olap;
namespace PivotGridDemo
{
[AspNetCompatibilityRequirements(RequirementsMode =
AspNetCompatibilityRequirementsMode.Allowed)]
public class RelationalService : IRelationalService
{
}
}
```

Datasource Initialization

Now the connection string to connect OLAP Cube, PivotGrid and JavaScriptSerializer instances are created immediately inside the main class in RelationalService.svc.cs file.

C#

```
namespace PivotGridDemo
{
[AspNetCompatibilityRequirements(RequirementsMode =
AspNetCompatibilityRequirementsMode.Allowed)]
public class RelationalService : IRelationalService
{
……
……
}
internal class ProductSales
{
public string Product { get; set; }
public string Date { get; set; }
public string Country { get; set; }
public string State { get; set; }
public int Quantity { get; set; }
```

```

Service methods in WCF Service

First, declare the service methods inside **IRelationalService** interface, found in IRelationalService.cs file created while adding WCF Service to the Application.

C#

```
namespace PivotGridDemo
{
[ServiceContract]
public interface IRelationalService
{
[OperationContract]
Dictionary<string, object> InitializeGrid(string action);
[OperationContract]
Dictionary<string, object> FetchMembers(string action, string headerTag,
string sortedHeaders, string currentReport);
[OperationContract]
Dictionary<string, object> Filtering(string action, string filterParams,
string sortedHeaders, string currentReport);
[OperationContract]
```

```
Dictionary<string, object> NodeStateModified(string action, string
headerTag, string dropAxis, string sortedHeaders, string filterParams,
string currentReport);
[OperationContract]
Dictionary<string, object> NodeDropped(string action, string dropAxis,
string headerTag, string sortedHeaders, string filterParams, string
currentReport);
[OperationContract]
Dictionary<string, object> Sorting(string action, string sortedHeaders,
string currentReport);
[OperationContract]
void Export(System.IO.Stream stream);
[OperationContract]
Dictionary<string, object> DeferUpdate(string action, string
filterParams, string sortedHeaders, string currentReport);
[OperationContract]
Dictionary<string, object> CalculatedField(string action, string
headerTag, string currentReport);
[OperationContract]
Dictionary<string, object> CellEditing(string action, string index,
string valueHeaders, string summaryValues, string currentReport);
[OperationContract]
Dictionary<string, object> SaveReport(string reportName, string
operationalMode, string olapReport, string clientReports);
[OperationContract]
Dictionary<string, object> LoadReportFromDB(string reportName, string
operationalMode, string olapReport, string clientReports);
}
}
```

Then, elaborate the service methods inside the main class, found in RelationalService.svc.cs file.

C#

```
namespace PivotGridDemo
{
[AspNetCompatibilityRequirements(RequirementsMode =
AspNetCompatibilityRequirementsMode.Allowed)]
public class RelationalService: IRelationalService
{
PivotGrid htmlHelper = new PivotGrid();
JavaScriptSerializer serializer = new JavaScriptSerializer();
Dictionary<string, object> dict = new Dictionary<string, object>();
static int cultureIDInfoval = 1033;
string connectionString = "Data
Source=https://bi.syncfusion.com/olap/msmdpump.dll; Initial
Catalog=Adventure Works DW 2008 SE;";
string conStringforDB = ""; //Enter appropriate connection string to
connect database for saving and loading operation of reports
public Dictionary<string, object> InitializeGrid(string action)
{
htmlHelper.PivotReport = BindDefaultData();
dict = htmlHelper.GetJsonData(action, ProductSales.GetSalesData());
return dict;
}
```

{
byte[] reportString = new byte[2 * 1024];
PivotReport report = new PivotReport();
var reports = "";
string mode = operationalMode;
Dictionary<string, object> dictionary = new Dictionary<string, object>();
if (mode == "serverMode" && !string.IsNullOrEmpty(clientReports))
{
reports = clientReports;
}
else
{
```

```
foreach (DataRow row in GetDataTable().Rows)
{
if ((row.ItemArray[0] as string).Equals(reportName))
{
if (mode == "clientMode")
{
reportString = (row.ItemArray[1] as byte[]);
dictionary.Add("report", Encoding.UTF8.GetString(reportString));
break;
}
else if (mode == "serverMode")
{
reports = OLAPUTILS.Utils.CompressData(row.ItemArray[1] as byte[]);
break;
}
}
}
}
if (reports != "")
{
report = htmlHelper.DeserializedReports(reports);
htmlHelper.PivotReport = report;
dictionary = htmlHelper.GetJsonData("loadOperation",
ProductSales.GetSalesData(), "Load Report", reportName);
}
return dictionary;
}
private DataTable GetDataTable()
{
SqlCeConnection con = new SqlCeConnection() { ConnectionString =
conStringforDB };
con.Open();
DataSet dSet = new DataSet();
new SqlCeDataAdapter("Select * from ReportsTable", con).Fill(dSet);
con.Close();
return dSet.Tables[0];
}
public Dictionary<string, object> DeferUpdate(string action, string
filterParams, string sortedHeaders, string currentReport)
{
htmlHelper.PopulateData(currentReport);
dict = htmlHelper.GetJsonData(action, ProductSales.GetSalesData(), null,
null, null, sortedHeaders, filterParams);
return dict;
}
public Dictionary<string, object> CellEditing(string action, string
index, string valueHeaders, string summaryValues, string currentReport)
{
htmlHelper.PopulateData(currentReport);
dict = htmlHelper.GetJsonData(action, ProductSales.GetSalesData(), index,
summaryValues, valueHeaders);
return dict;
}
private PivotReport BindDefaultData()
{
PivotReport pivotSetting = new PivotReport();
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
pivotSetting.PivotRows.Add(new PivotItem { FieldMappingName = "Product",
FieldHeader = "Product", TotalHeader = "Total" });
pivotSetting.PivotColumns.Add(new PivotItem { FieldMappingName =
"Country", FieldHeader = "Country", TotalHeader = "Total" });
pivotSetting.PivotCalculations.Add(new PivotComputationInfo {
CalculationName = "Amount", Description = "Amount", FieldHeader =
"Amount", FieldName = "Amount", Format = "C", SummaryType =
Syncfusion.PivotAnalysis.Base.SummaryType.DoubleTotalSum });
return pivotSetting;
}
}
.....
..... // Initialize the datasource
.....
}
```

Configuring Web Configuration File

The services could be exposed through the properties, binding, contract and address by using an endpoint.

- Contract: This property indicates that the contract of the endpoint is exposing. Here you are referring to IRelationalService contract and hence it is PivotGridDemo.IRelationalService.
- Binding: In your application, you use webHttpBinding to post and receive the requests and responses between the client-end and the service.
- BehaviorConfiguration: This property contains the name of the behavior to be used in the endpoint

The endpointBehaviors are illustrated as follows

XML

```
<system.serviceModel>
……
……
<services>
<service name="PivotGridDemo.RelationalService">
<endpoint address=""
behaviorConfiguration="PivotGridDemo.RelationalServiceAspNetAjaxBehavior"
binding="webHttpBinding" contract="PivotGridDemo.IRelationalService" />
</service>
</services>
</system.serviceModel>
```

The endpointBehaviors contain all the behaviors for an endpoint. You can link each endpoint to the respective behavior only by using this name property.

XML

```
<system.serviceModel>
<behaviors>
<endpointBehaviors>
<behavior name="PivotGridDemo.RelationalServiceAspNetAjaxBehavior">
<enableWebScript />
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
</behavior>
</endpointBehaviors>
</behaviors>
……
……
</system.serviceModel>
```

Note: In this example, **"PivotGridDemo"** indicates the name and root namespace of the Web Application created in Visual Studio IDE and "RelationalService" indicates the name of the WCF service created.

Configuring routing file

Routing configuration needs to be done in RouteConfig.cs file found under **AppStart** folder. The configuration would allow picking appropriate WCF service without any issues.

C#

```
public static void RegisterRoutes(RouteCollection routes) {
routes.IgnoreRoute("{resource}.axd/{*pathInfo}");
//NOTE: In the following highlighted lines _wcf_ is just the folder name
inside which service files(*.svc) are present.
routes.IgnoreRoute("{resource}.svc/{*pathInfo}");
routes.IgnoreRoute("{resource}.svc");
routes.MapRoute(
name: "Default",
url: "{controller}/{action}/{id}",
defaults: new {
controller = "Home", action = "Index", id = UrlParameter.Optional
},
namespaces: new [] {
"PivotGridDemo.Controllers"
}
);
}
```

Now, **PivotGrid** will be rendered with Sales Amount over a set of products across different customer geographic locations.

	Canada	France	Germany	United Kingdom	United States	Grand Total
	Amount	Amount	Amount	Amount	Amount	Amount
Bike	$51,651,000.00	$44,167,500.00	$49,383,900.00	$46,314,000.00	$44,398,800.00	**$235,915,200.00**
Car	$5,966,100.00	$5,774,100.00	$5,315,100.00	$5,860,500.00	$6,155,400.00	**$29,071,200.00**
Van	$14,252,400.00	$15,807,600.00	$11,985,000.00	$11,008,200.00	$14,601,600.00	**$67,654,800.00**
Grand Total	**$71,869,500.00**	**$65,749,200.00**	**$66,684,000.00**	**$63,182,700.00**	**$65,155,800.00**	**$332,641,200.00**

Data Binding

Binding PivotGrid to Offline Cube

To connect an OLAP Cube available in local machine, set the physical path of the Cube in the connection string. The following code example illustrates the same.

C#

```
string connectionString = @"DataSource= system
drive:\OfflineCube\Adventure_Works_Ext.cub; Provider = MSOLAP;";
OlapDataManager DataManager = new OlapDataManager(connectionString);
```

Binding PivotGrid to Cube in local SQL Server

To connect an OLAP Cube available in SQL Server Analysis Service in local machine, set the server name and database name in the connection string. When you have any credentials to connect your Cube, then set the “User ID” and “Password” attributes accordingly. The following code example illustrates the same.

C#

```
string connectionString = "Data source=localhost; Initial
Catalog=Adventure Works DW;";
OlapDataManager DataManager = new OlapDataManager(connectionString);
```

Binding PivotGrid to Cube in online SQL Server

To connect an OLAP Cube available in SQL Server Analysis Service in online server through **XML/A**, set the host server link and database name in the connection string. When you have any credentials to connect your Cube, then set the “User ID” and “Password” attributes accordingly. The following code example illustrates the same.

C#

```
static string connectionString = "Data
Source=https://bi.syncfusion.com/olap/msmdpump.dll; Initial
Catalog=Adventure Works DW 2008 SE;";
OlapDataManager DataManager = new OlapDataManager(connectionString);
```

Binding PivotGrid to Cube in online Mondrian Server

To connect an OLAP Cube available in Mondrian Server through **XML/A**, set the host server link and database name in the connection string. When you have any credentials to connect your Cube, then set the “User ID” and “Password” attributes accordingly. The following code example illustrates the same.

C#

```
string connectionString = @"Data Source =
https://localhost:8080/mondrian/xmla; Initial Catalog =FoodMart;";
OlapDataManager DataManager = new OlapDataManager(connectionString);
DataManager.DataProvider.ProviderName =
Syncfusion.Olap.DataProvider.Providers.Mondrian;
```

Copyright © 2001 - 2020 Syncfusion Inc.

Binding PivotGrid to Cube in online ActivePivot Server

To connect an OLAP Cube available in ActivePivot Server through **XML/A**, set the host server link and database name in the connection string. When you have any credentials to connect your Cube, then set the “User ID” and “Password” attributes accordingly. The following code example illustrates the same.

C#

```
string connectionString=@"Data Source =
https://localhost:8080/cva_s/xmla; Initial Catalog = CVAS;";
OlapDataManager DataManager = new OlapDataManager(connectionString);
DataManager.DataProvider.ProviderName=Syncfusion.Olap.DataProvider.Provid
ers.ActivePivot;
```

WCF

Adding a WCF Service

To add a WCF service in an existing MVC web application, right-click on project in Solution Explorer and select **Add > New Item**. In the **Add New Item** window, select WCF Service and name it as **OlapService.svc**, click Add.

Now, WCF service is added into your application successfully and it comprises of the following files. The utilization of these files is explained in the immediate sections.

- OlapService.svc
- OlapService.svc.cs
- IOlapService.svc.cs

Configuring WCF Service Class

Remove the **“DoWork”** method present inside both OlapService.svc.cs and IOlapService.cs files. Next, add **“AspNetCompatibilityRequirements”** attribute on top of main class present inside OlapService.svc.cs file and set **“RequirementsMode”** value to **“Allowed”**.

C#

```
namespace PivotGridDemo
{
[AspNetCompatibilityRequirements(RequirementsMode =
AspNetCompatibilityRequirementsMode.Allowed)]
public class OlapService: IOlapService
{
}
}
```

List of Dependency Libraries

Next you need to add the below mentioned dependency libraries into your Web Application. These libraries could be found in GAC (Global Assembly Cache) as well.

To add them to your Web Application, right-click on **References** in Solution Explorer and select **Add Reference**. Now in the **Reference Manager** dialog, under **Assemblies > Extension**, the following Syncfusion libraries are found.

Copyright © 2001 - 2020 Syncfusion Inc.

Note: If you have installed any version of SQL Server Analysis Service (SSAS) or Microsoft ADOMD.NET utility, then the location of Microsoft.AnalysisServices.AdomdClient library is [system drive:\Program Files (x86)\Microsoft.NET\ADOMD.NET]. And if you have installed any version of Essential Studio, then the location of Syncfusion libraries is [system drive:\Program Files (x86)\Syncfusion\Essential Studio\{{ site.releaseversion }}\Assemblies].

- Microsoft.AnalysisServices.AdomdClient
- Syncfusion.Compression.Base
- Syncfusion.Linq.Base
- Syncfusion.Olap.Base
- Syncfusion.PivotAnalysis.Base
- System.Data.SqlServerCe (Version: 4.0.0.0)
- Syncfusion.XlsIO.Base
- Syncfusion.Pdf.Base
- Syncfusion.DocIO.Base
- Syncfusion.EJ
- Syncfusion.EJ.Export
- Syncfusion.EJ.Pivot
- Syncfusion.EJ.MVC

List of Namespaces

Following are the list of namespaces to be added on top of the main class inside OlapService.svc.cs file.

C#

```
using System;
using System.Web;
using System.Collections.Generic;
using System.Linq;
using System.ServiceModel;
using System.Text;
using System.ServiceModel.Activation;
using System.Web.Script.Serialization;
using Syncfusion.Olap.Manager;
using Syncfusion.Olap.Reports;
using Syncfusion.JavaScript.Olap;
using System.Data.SqlServerCe;
using System.Data;
using OLAPUTILS = Syncfusion.JavaScript.Olap;
namespace PivotGridDemo
{
[AspNetCompatibilityRequirements(RequirementsMode =
AspNetCompatibilityRequirementsMode.Allowed)]
public class OlapService: IOlapService
{
}
}
```

Datasource Initialization

Now, the connection string to connect OLAP Cube, PivotGrid and JavaScriptSerializer instances are created immediately inside the main class in OlapService.svc.cs file.

C#

```
namespace PivotGridDemo
{
[AspNetCompatibilityRequirements(RequirementsMode =
AspNetCompatibilityRequirementsMode.Allowed)]
public class OlapService: IOlapService
{
Syncfusion.JavaScript.PivotGrid htmlHelper = new
Syncfusion.JavaScript.PivotGrid();
string connectionString = "Data
Source=https://bi.syncfusion.com/olap/msmdpump.dll; Initial
Catalog=Adventure Works DW 2008 SE;";
JavaScriptSerializer serializer = new JavaScriptSerializer();
string conStringforDB = ""; //Enter appropriate connection string to
connect database for saving and loading operation of reports
public Dictionary<string, object> InitializeGrid(string action, string
gridLayout, bool enablePivotFieldList, object customObject)
public Dictionary<string, object> InitializeGrid(string action, string
gridLayout, bool enablePivotFieldList, object customObject)
//Other codes
}
}
```

Service methods in WCF Service

First, define the service methods inside **IOlapService** interface, found in IOlapService.cs file, created while adding WCF Service to your Web Application.

C#

```
namespace PivotGridDemo
{
[ServiceContract]
public interface IOlapService
{
[OperationContract]
Dictionary<string, object> InitializeGrid(string action, string
gridLayout, bool enablePivotFieldList, object customObject);
[OperationContract]
Dictionary<string, object> DrillGrid(string action, string cellPosition,
string currentReport, string headerInfo, string layout, object
customObject);
[OperationContract]
Dictionary<string, object> Paging(string action, string pagingInfo,
string currentReport, string gridLayout, object customObject);
[OperationContract]
Dictionary<string, object> NodeDropped(string action, string dropType,
string nodeInfo, string filterParams, string gridLayout, string
currentReport);
[OperationContract]
Dictionary<string, object> RemoveButton(string action, string headerInfo,
string gridLayout, string currentReport);
[OperationContract]
Dictionary<string, object> FetchMembers(string action, string headerTag,
string currentReport);
[OperationContract]
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
Dictionary<string, object> Filtering(string action, string filterParams,
string gridLayout, string currentReport);
[OperationContract]
Dictionary<string, object> MemberExpanded(string action, bool
checkedStatus, string parentNode, string tag, string cubeName, string
currentReport);
[OperationContract]
void Export(System.IO.Stream stream);
[OperationContract]
Dictionary<string, object> DeferUpdate(string action, string
filterParams, string currentReport);
[OperationContract]
Dictionary<string, object> SaveReport(string reportName, string
operationalMode, string olapReport, string clientReports);
[OperationContract]
Dictionary<string, object> LoadReportFromDB(string action, string
gridLayout, bool enablePivotFieldList, object customObject, string
reportName, string operationalMode, string olapReport, string
clientReports);
}
}
```

Secondly, elaborate the service methods inside the main class, found in OlapService.svc.cs file.

C#

```
namespace PivotGridDemo
{
[AspNetCompatibilityRequirements(RequirementsMode =
AspNetCompatibilityRequirementsMode.Allowed)]
public class OlapService: IOlapService
{
Syncfusion.JavaScript.PivotGrid htmlHelper = new
Syncfusion.JavaScript.PivotGrid();
public static int cultureIDInfoval = 1033;
string connectionString = "Data
Source=https://bi.syncfusion.com/olap/msmdpump.dll; Initial
Catalog=Adventure Works DW 2008 SE;";
JavaScriptSerializer serializer = new JavaScriptSerializer();
string conStringforDB = ""; //Enter appropriate connection string to
connect database for saving and loading operation of reports
public Dictionary<string, object> InitializeGrid(string action, string
gridLayout, bool enablePivotFieldList, object customObject)
public Dictionary<string, object> InitializeGrid(string action, string
gridLayout, bool enablePivotFieldList, object customObject)
{
OlapDataManager DataManager = null;
DataManager = new OlapDataManager(connectionString);
DataManager.SetCurrentReport(CreateOlapReport());
return htmlHelper.GetJsonData(action, DataManager, gridLayout,
enablePivotFieldList);
}
public Dictionary<string, object> DrillGrid(string action, string
cellPosition, string currentReport, string headerInfo, string layout,
object customObject)
{
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
OlapDataManager DataManager = new OlapDataManager(connectionString);
DataManager = new OlapDataManager(connectionString);
DataManager.SetCurrentReport(Utils.DeserializeOlapReport(currentReport));
return htmlHelper.GetJsonData(action, connectionString, DataManager,
cellPosition, headerInfo, layout);
}
public Dictionary<string, object> NodeDropped(string action, string
dropType, string nodeInfo, string filterParams, string gridLayout, string
currentReport)
{
OlapDataManager DataManager = new OlapDataManager(connectionString);
DataManager.SetCurrentReport(Utils.DeserializeOlapReport(currentReport));
return htmlHelper.GetJsonData(action, DataManager, dropType, nodeInfo,
filterParams, gridLayout, true);
}
public Dictionary<string, object> Filtering(string action, string
filterParams, string gridLayout, string currentReport)
{
OlapDataManager DataManager = new OlapDataManager(connectionString);
DataManager.SetCurrentReport(Utils.DeserializeOlapReport(currentReport));
return htmlHelper.GetJsonData(action, connectionString, DataManager,
null, filterParams, gridLayout);
}
public Dictionary<string, object> FetchMembers(string action, string
headerTag, string currentReport)
{
OlapDataManager DataManager = new OlapDataManager(connectionString);
DataManager.SetCurrentReport(Utils.DeserializeOlapReport(currentReport));
return htmlHelper.GetJsonData(action, DataManager, null, headerTag);
}
public Dictionary<string, object> Paging(string action, string
pagingInfo, string currentReport, string gridLayout, object customObject)
{
OlapDataManager DataManager = new OlapDataManager(connectionString);
DataManager.SetCurrentReport(htmlHelper.SetPaging(currentReport,
pagingInfo));
return htmlHelper.GetJsonData(action, DataManager, gridLayout);
}
public Dictionary<string, object> RemoveButton(string action, string
headerInfo, string gridLayout, string currentReport)
{
OlapDataManager DataManager = new OlapDataManager(connectionString);
DataManager.SetCurrentReport(Utils.DeserializeOlapReport(currentReport));
return htmlHelper.GetJsonData(action, connectionString, DataManager,
null, headerInfo, gridLayout);
}
public Dictionary<string, object> MemberExpanded(string action, bool
checkedStatus, string parentNode, string tag, string cubeName, string
currentReport)
{
OlapDataManager DataManager = new OlapDataManager(connectionString);
if (!string.IsNullOrEmpty(currentReport))
DataManager.SetCurrentReport(Utils.DeserializeOlapReport(currentReport));
return htmlHelper.GetJsonData(action, DataManager, checkedStatus,
parentNode, tag, cubeName);
}
public void Export(System.IO.Stream stream)
```

```
{
System.IO.StreamReader sReader = new System.IO.StreamReader(stream);

```

Configuring Web Configuration File

You can expose services through the properties, binding, contract and address by using an endpoint.

- Contract: This property indicates that the contract of the endpoint is exposing. Here you are referring to IOlapService contract and hence it is PivotGridDemo.IOlapService.
- Binding: In your application, you use webHttpBinding to post and receive the requests and responses between the client-end and the service.
- behaviorConfiguration: This property contains the name of the behavior to be used in the endpoint.

The endpointBehaviors are illustrated as follows.

XML

```
<system.serviceModel>
……
……
<services>
<service name="PivotGridDemo.OlapService">
<endpoint address=""
behaviorConfiguration="PivotGridDemo.OlapServiceAspNetAjaxBehavior"
binding="webHttpBinding" contract="PivotGridDemo.IOlapService" />
</service>
</services>
</system.serviceModel>
```

Copyright © 2001 - 2020 Syncfusion Inc.

The endpointBehaviors contain all the behaviors for an endpoint. You can link each endpoint to the respective behavior only by using this name property.

XML

```
<system.serviceModel>
<behaviors>
<endpointBehaviors>
<behavior name="PivotGridDemo.OlapServiceAspNetAjaxBehavior">
<enableWebScript /> </behavior>
</endpointBehaviors>
</behaviors>
……
……
</system.serviceModel>
```

Configuring routing file

Routing configuration needs to be done in RouteConfig.cs file found under **AppStart** folder. The configuration would allow picking appropriate WCF service without any issues.

C#

```
public static void RegisterRoutes(RouteCollection routes) {
routes.IgnoreRoute("{resource}.axd/{*pathInfo}");
//NOTE: In the following highlighted lines _wcf_ is just the folder name
inside which service files(*.svc) are present.
routes.IgnoreRoute("{resource}.svc/{*pathInfo}");
routes.IgnoreRoute("{resource}.svc");
routes.MapRoute(
name: "Default",
url: "{controller}/{action}/{id}",
defaults: new {
controller = "Home", action = "Index", id = UrlParameter.Optional
},
namespaces: new [] {
"PivotGridDemo.Controllers"
}
);
}
```

Note: In this example, **"PivotGridDemo"** indicates the name and root namespace of the Web Application created in Visual Studio IDE and "OlapService" indicates the name of the WCF service created.

Now, **PivotGrid** will be rendered with Internet Sales Amount over a period of fiscal years across different customer geographic locations.

Relational

Grouping Bar

Initialization

Grouping Bar allows user to dynamically alter the report by filter, sort and remove operations in the PivotGrid control. Based on the Relational datasource and report bound to the PivotGrid control, Grouping Bar will be automatically populated. You can enable Grouping Bar option in PivotGrid by setting the `EnableGroupingBar` property to true.

Client Mode

ASPX-CS

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").EnableGroupingBar(true).Client
SideEvents(clientSideEvents =>
clientSideEvents.Load("onLoad")).DataSource(dataSource =>
dataSource.Rows(rows => {
rows.FieldName("Country").FieldCaption("Country").Add();
rows.FieldName("State").FieldCaption("State").Add(); }).Columns(columns
=> { columns.FieldName("Product").FieldCaption("Product").Add();
}).Values(values => { values.FieldName("Amount").Add();
values.FieldName("Quantity").Add(); }).Filters(filters => {
filters.FieldName("Date").FieldCaption("Date").Add(); }))
<script type="text/javascript">
function onLoad(args) {
args.model.dataSource.data = pivot_dataset;//Array of data
}
</script>
```

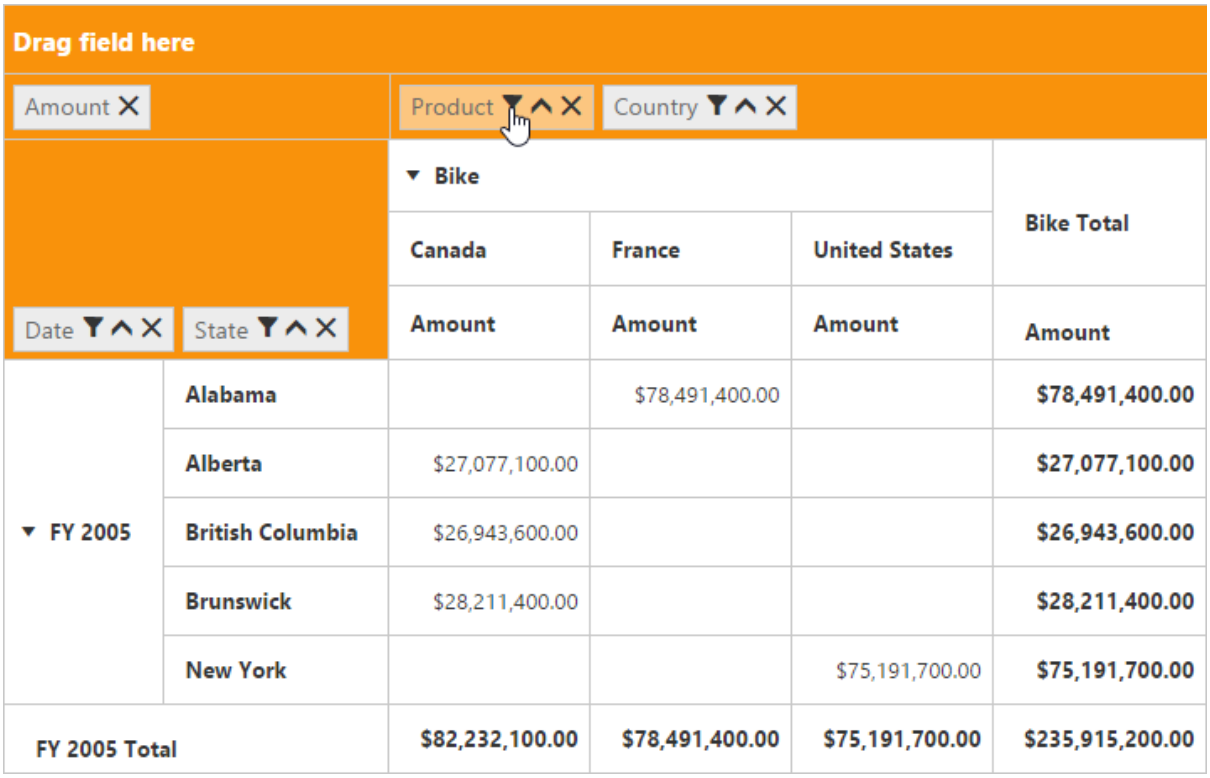
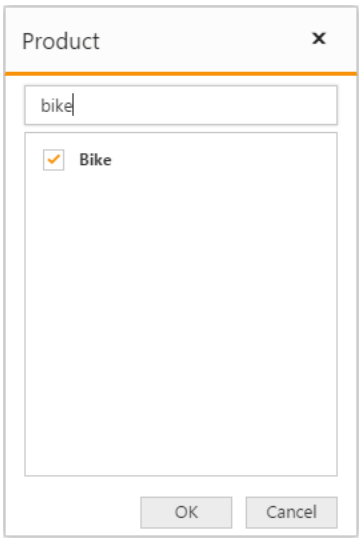
Searching Values

Search option available in Grouping Bar allows you to search a specific value that needs to be filtered from the list of values inside the filter pop-up window.

Copyright © 2001 - 2020 Syncfusion Inc.

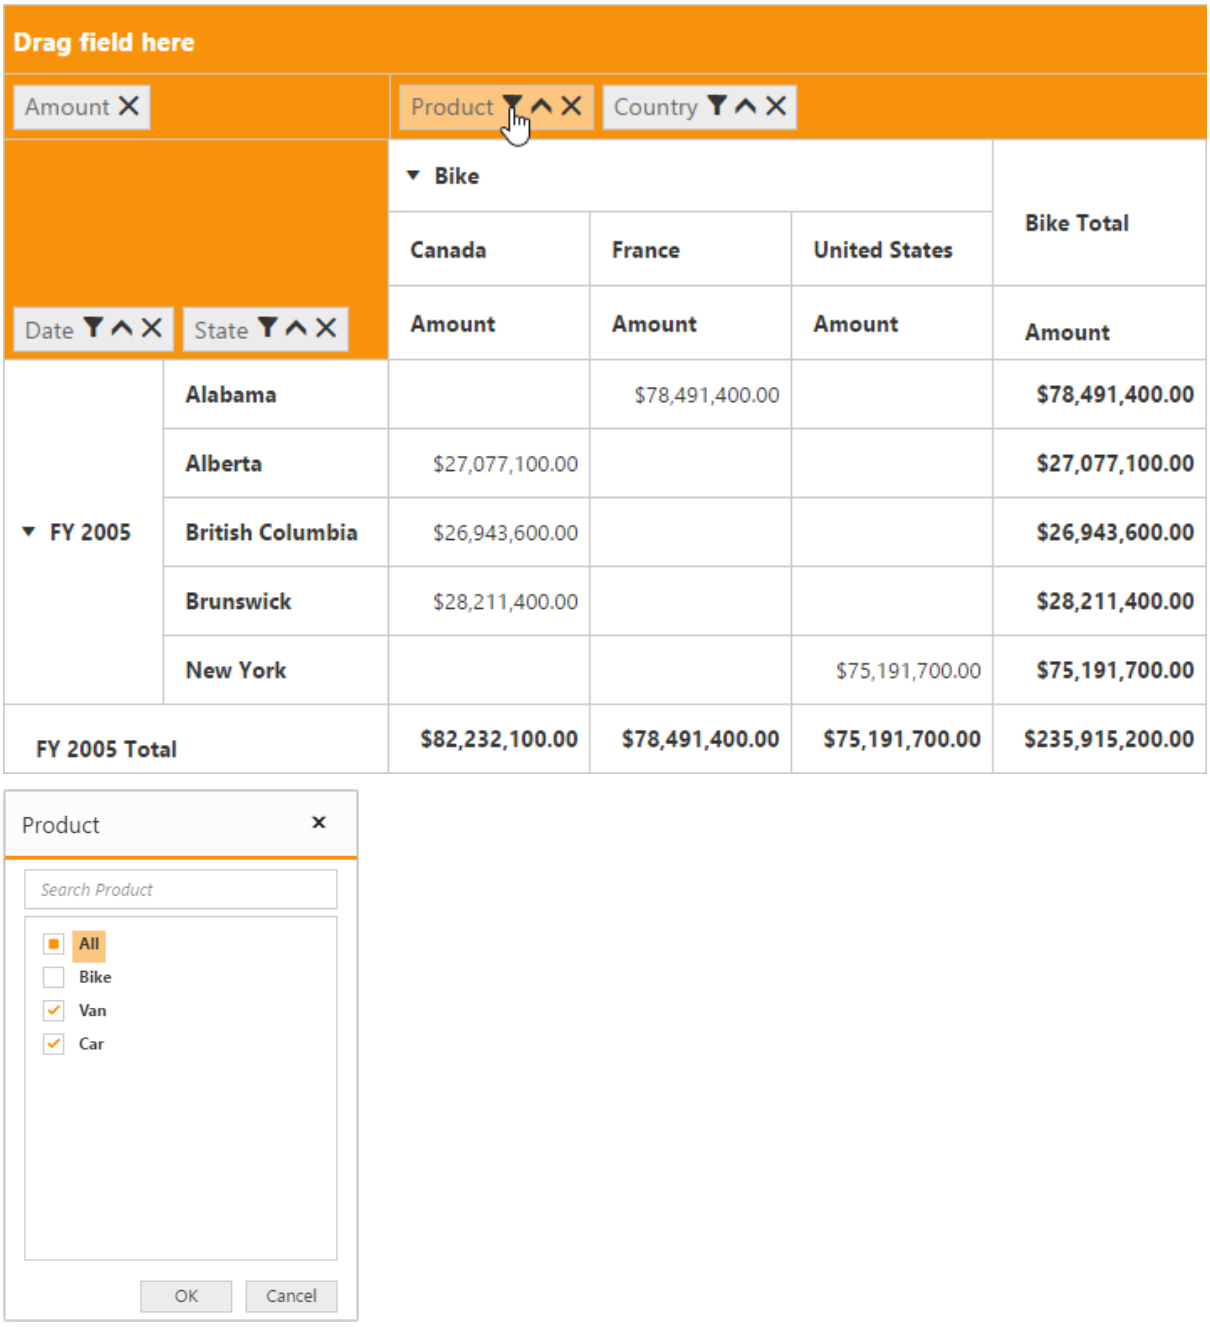




Filtering Values

Filtering option available in Grouping Bar allows you to select a specific set of values that needs to be displayed in the PivotGrid control. At least one value needed to be in checked state while filtering otherwise “Ok” button will be disabled.

Copyright © 2001 - 2020 Syncfusion Inc.



Sorting Values

Sorting option available in Grouping Bar allows you to arrange headers either in ascending or descending order. Sorting option is applicable for fields available only in Row and Column region. By default, headers are sorted in ascending order. Regarding sorting indicator, up arrow denotes ascending order and down arrow denotes descending order.

PivotTable Field List

Initialization

Field List, also known as Pivot Schema Designer, allows user to add, rearrange, filter and remove fields to show data in PivotGrid exactly the way they want.

Copyright © 2001 - 2020 Syncfusion Inc.

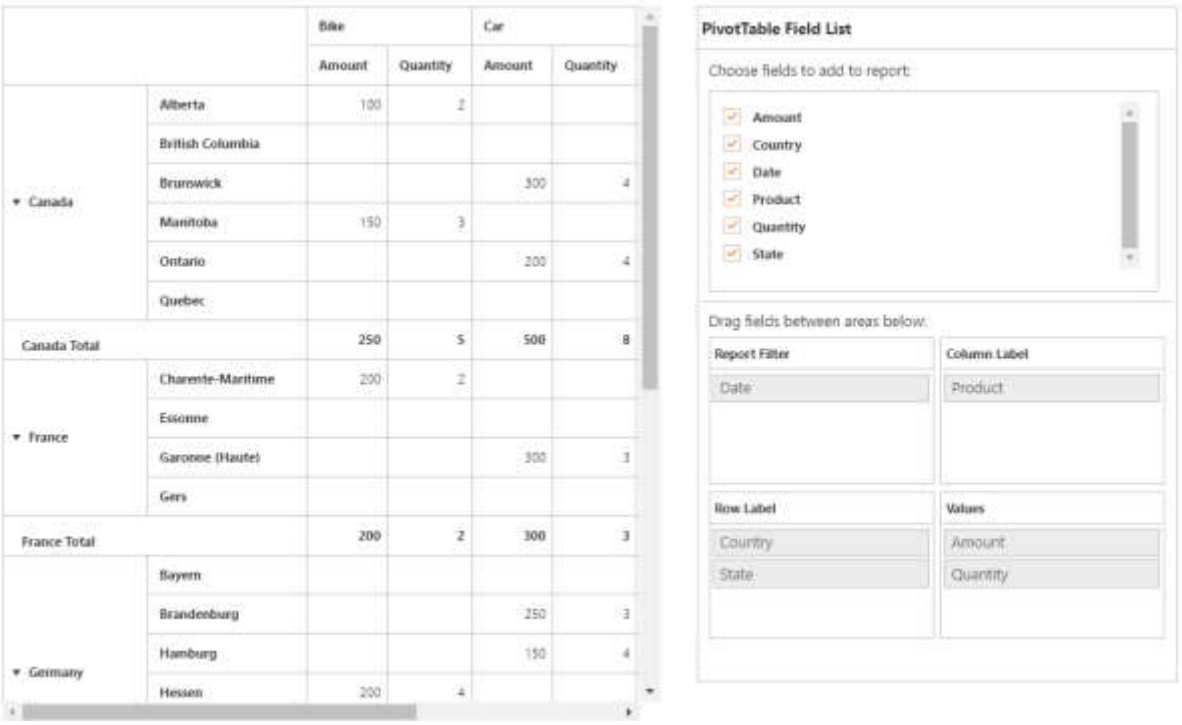
Based on the datasource, Relational, bound to the PivotGrid control, PivotTable Field List will be automatically populated with Cube Information or Field Names. PivotTable Field List provides an Excel like appearance and behavior.

In-order to initialize PivotTable Field List, first you need to define a “div” tag with an appropriate “id” attribute which acts as a container for the control. Then you need to initialize the PivotTable Field List by using the **“PivotSchemaDesigner”** method.

Client Mode

ASPX-CS

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").ClientSideEvents(clientSideEve
nts =>
clientSideEvents.Load("onLoad").RenderSuccess("loadSchemaDesigner")).Data
Source(dataSource => dataSource.Rows(rows => {
rows.FieldName("Country").FieldCaption("Country").Add();
rows.FieldName("State").FieldCaption("State").Add(); }).Columns(columns
=> { columns.FieldName("Product").FieldCaption("Product").Add();
}).Values(values => { values.FieldName("Amount").Add();
values.FieldName("Quantity").Add(); }))
@Html.EJ().Pivot().PivotSchemaDesigner("PivotSchemaDesigner")
<script type="text/javascript">
function onLoad(args) {
args.model.dataSource.data = pivot_dataset;//Array of data
}
function loadSchemaDesigner(args) {
$("#PivotSchemaDesigner").ejPivotSchemaDesigner({ pivotControl: this,
layout: ej.PivotSchemaDesigner.Layouts.Excel });
args.model.renderSuccess = null;
}
</script>
```



Server Mode

ASPX-CS

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").Url(Url.Content("/RelationalSe
rvice")).ClientSideEvents(events =>
events.AfterServiceInvoke("OnAfterServiceInvoke"))
@Html.EJ().Pivot().PivotSchemaDesigner("PivotSchemaDesigner").Layout(Pivo
tSchemaDesignerLayout.Excel)
<script type="text/javascript">

Layout

The top portion of the layout shows Field or Cube items in a categorized way. They can be dynamically added into the report either by drag and drop option or through simple check box selection.

On item(s) selection they will be placed in Row section by default except numeric based item(s) or measures, which will alone be placed in the Value section by default.

The bottom portion of the layout is segregated as below.

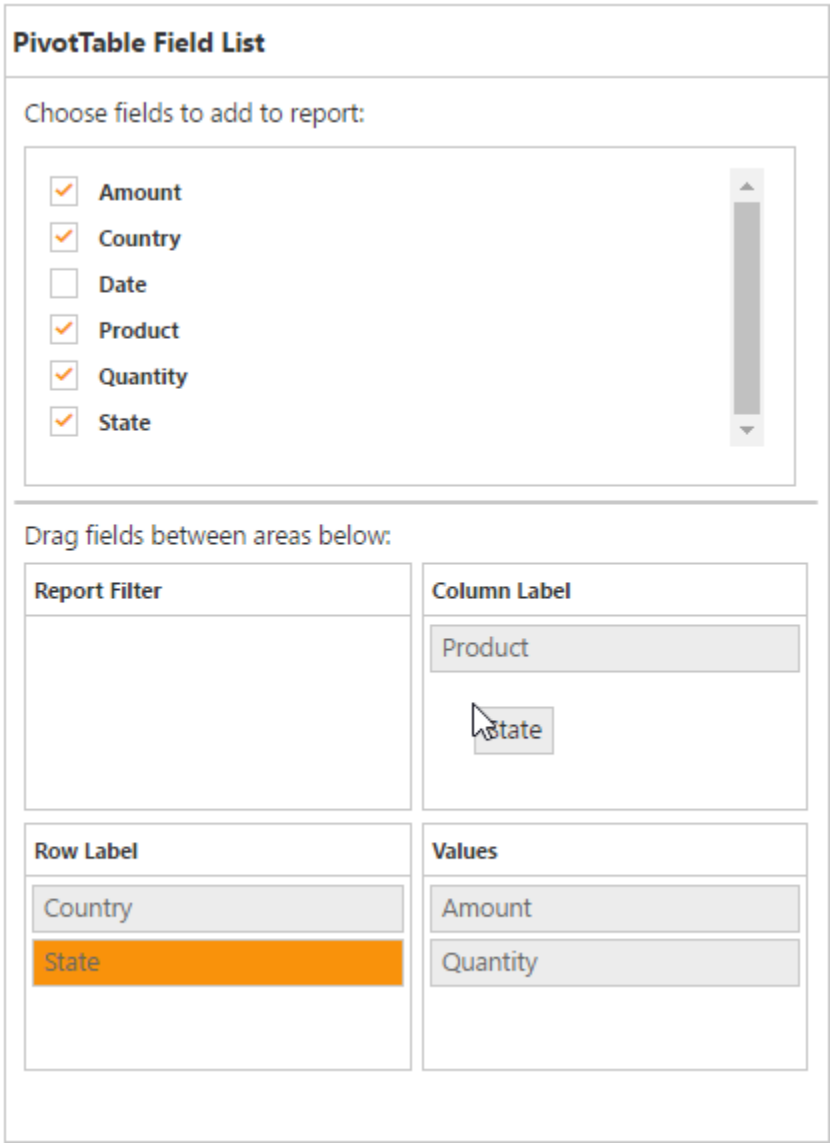
Copyright © 2001 - 2020 Syncfusion Inc.

- Report Filter: Exclusively designed to filter an item(s) placed in this particular position of the layout.
- Value Section: The value label usually displays the numeric value item(s) present in the report.
- Column Section: It is used to display item(s) as column header and values in the PivotGrid control.
- Row Section: It is used to display item(s) as row header and values in the PivotGrid control.

UI Interactions

By Drag and Drop

You can alter the report on fly through drag-and-drop operation. You can drag any item from Field List and drop into column, row, value or filter section available at the bottom of the Field List.



By Drag and Drop to Grid Headers

You can also drag and drop elements from field list to grid headers.

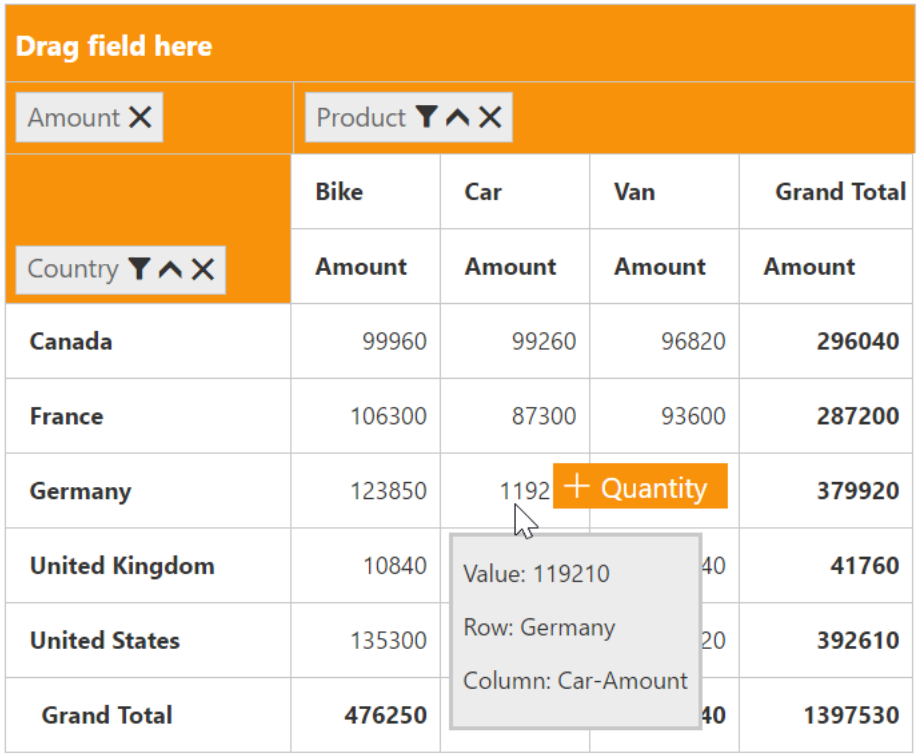
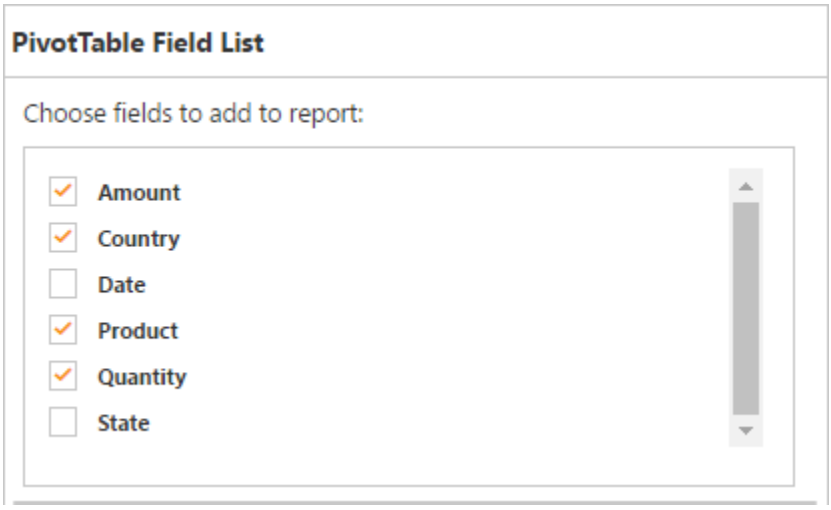
Copyright © 2001 - 2020 Syncfusion Inc.



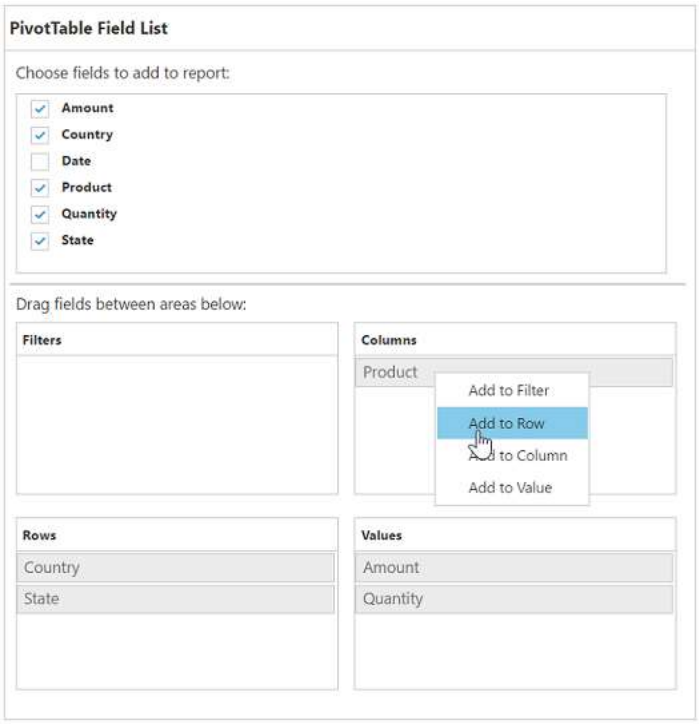
By Treeview Selection

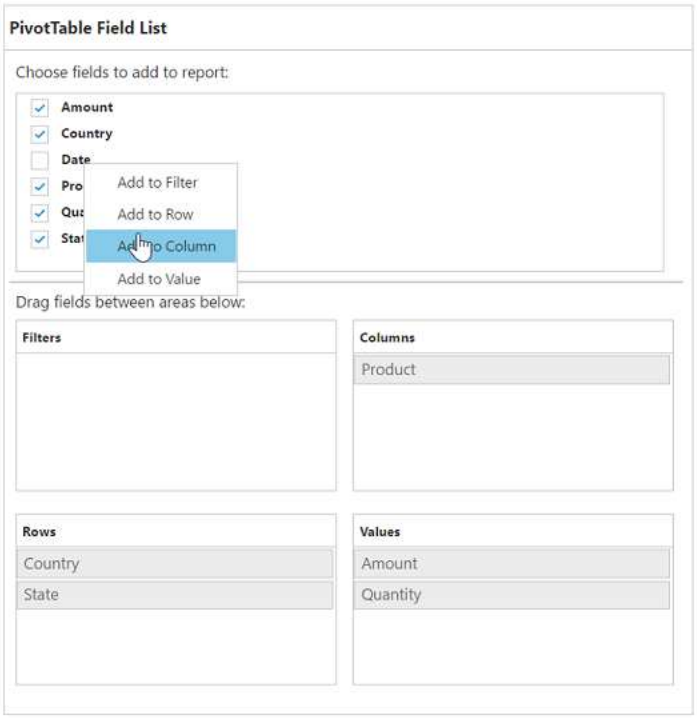
You can also alter the report on fly through check and uncheck option as an alternate. By default, fields will be added to the Row Axis when checked.



By Context Menu

You can also alter the report by using context menu.

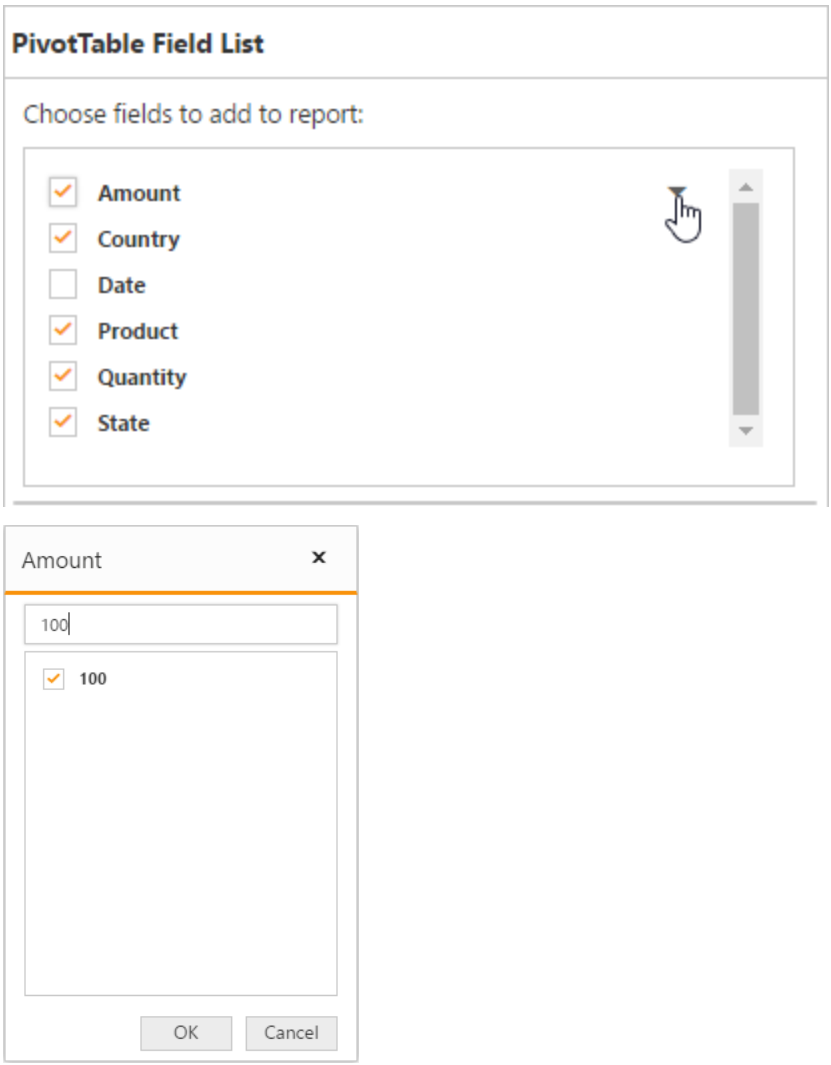




Searching Values

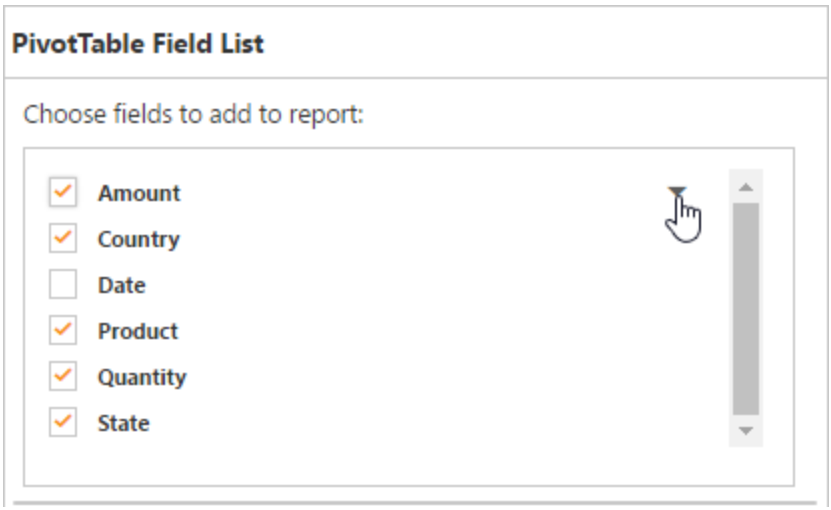
Search option available in Field List allows you to search a specific value that needs to be filtered from the list of values inside the filter pop-up window.

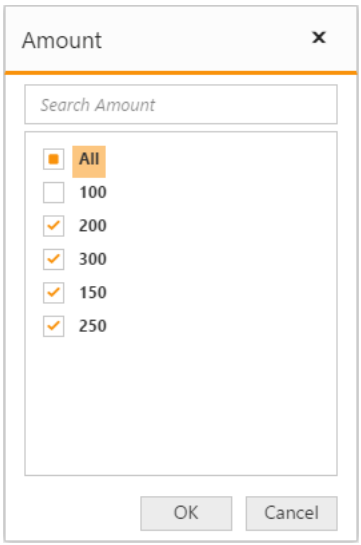
Copyright © 2001 - 2020 Syncfusion Inc.



Filtering

Values can be filtered by checking/unchecking the check box besides them, inside the filter pop-up window. At least one value needed to be checked state while filtering otherwise “Ok” button will be disabled.





Format Strings

Information: This feature is applicable only for Relational data source at Client Mode.

Formatted numeric values like n (number with decimal points), c (currency or accounting) and p (percentage) can be displayed with desired decimal places using FormatString option.

Note: This is applicable only when the Format option is set.

ASPX-CS

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").ClientSideEvents(clientSideEve
nts => clientSideEvents.Load("onLoad")).DataSource(dataSource =>
dataSource.Rows(rows => {
rows.FieldName("Country").FieldCaption("Country").Add();
rows.FieldName("State").FieldCaption("State").Add(); }).Columns(columns
=> { columns.FieldName("Product").FieldCaption("Product").Add();
}).Values(values => {
values.FieldName("Amount").Format("currency").Add().FormatString("{0:c0}"
); }))
```

Grand Total	$1,200	$1,850	$1,550	$4,600

The following table describes the result of applying some commonly used format strings on numeric values.

Label Value	Label Format property value	Result	Description
1000	n1	1000.0	The Number is rounded to 1 decimal place
1000	n2	1000.00	The Number is rounded to 2 decimal place
1000	n3	1000.000	The Number is rounded to 3 decimal place
0.01	p1	1.0%	The Number is converted to percentage with 1 decimal place
0.01	p2	1.00%	The Number is converted to percentage with 2 decimal place
0.01	p3	1.000%	The Number is converted to percentage with 3 decimal place
1000	c1	$1,000.0	The Currency symbol is appended to number and number is rounded to 1 decimal place
1000	c2	$1,000.00	The Currency symbol is appended to number and number is rounded to 2 decimal place
1.0	d2	01	The number is rounded with 2 whole number place
1.0	d3	001	The number is rounded with 3 whole number place

The following table describes some common results on applying standard format sets to date format using FormatString option.

Format Pattern	Description	Result
d	The day of the month between 1 and 31. Â	"1" Â to "31"

Copyright © 2001 - 2020 Syncfusion Inc.

dd	The day of the month with leading zero if required.	"01" to "31"
ddd	Abbreviated day name.	"Mon" to "Sun"
dddd	The full day name	"Monday" to "Sunday"
M	The month of the year between 1 - 12	"1" to "12"
MM	The month of the year with leading zero if required	"01" to "12"
MMM	Abbreviated month name	"Jan" to "Dec"
MMMM	The full month name	"January" to "December"
yy	The year as a two-digit number	"99" or "08"
yyyy	The full four digit year	"1999" or "2008"
MM/dd/yyyy	The Date is displayed in "month/date/year" format	"04/09/1900"
d M, y	The Date is displayed in "date month, year" format	"7 9, 0"
d MM, y	The Date is displayed in "date month, year" format	"7 09, 0"
dddd, d MMMM, yy	The Date is displayed in "day, date month, year" format	"Tuesday, 7 September, 00"
yyyy-MM-dd	The Date is displayed in "year-month-date"(UTC) format	"1900-09-06"

Summary Type

Information: This feature is applicable only for Relational datasource only at Client Mode.

Allow us to specify the required summary type that PivotGrid should use in its summary cells. “Sum” is the default summary type. Following summary types that are supported:

- Sum
- Average
- Count
- Min

Copyright © 2001 - 2020 Syncfusion Inc.

- Max

ASPX-CS

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").ClientSideEvents(clientSideEve
nts => clientSideEvents.Load("onLoad")).DataSource(dataSource =>
dataSource.Rows(rows => {
rows.FieldName("Country").FieldCaption("Country").Add();
}).Columns(columns => {
columns.FieldName("Product").FieldCaption("Product").Add();
}).Values(values => {
values.FieldName("Amount").SummaryType(PivotAnalysisSummaryType.Average).
Add();
values.FieldName("Quantity").FieldCaption("Quantity").SummaryType(PivotAn
alysisSummaryType.TotalSum).Add(); }))
<script type="text/javascript">
function onLoad(args) {
args.model.dataSource.data = pivot_dataset; // Datasource
}
</script>
```

	Bike		Car		Grand Total	
	Amount	Quantity	Amount	Quantity	Amount	Quantity
Canada	125	5	250	8	187.5	13
France	200	2	300	3	250	5
Germany	150	6	200	7	175	13
United States	150	6	212.5	10	181.25	16
Grand Total	156.25	19	240.63	28	198.44	47

State persistence

Expand and collapse state of row and column headers are maintained during every UI interaction.

Value Sorting

Information: This feature is applicable for Relational datasource.

Value Sorting allows to sort columns and rows based on value fields.

The headers of the column to be sorted is given in the 'HeaderText' property under 'ValueSortSettings' in field wise order separated by a string. The string which is used to separate the headers is given in the property 'HeaderDelimiters'.

Also you can sort column by clicking the column header. On clicking the same header once again will reverse the sorting direction.

JS

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").DataSource(dataSource =>
dataSource.Rows(rows => {
rows.FieldName("Country").FieldCaption("Country").Add();
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
}).Columns(columns => {
columns.FieldName("Product").FieldCaption("Product").Add();
}).Values(values => { values.FieldName("Amount").Add();
values.FieldName("Quantity").Add();
})).ValueSortSettings(valuesortsettings=>valuesortsettings.HeaderText("Bi
ke##Quantity").HeaderDelimiters("##").SortOrder(SortOrder.Descending))
```

Grand Total	476250	5204	454540	5162	466740	4883	1397530	15249

Calculated Field

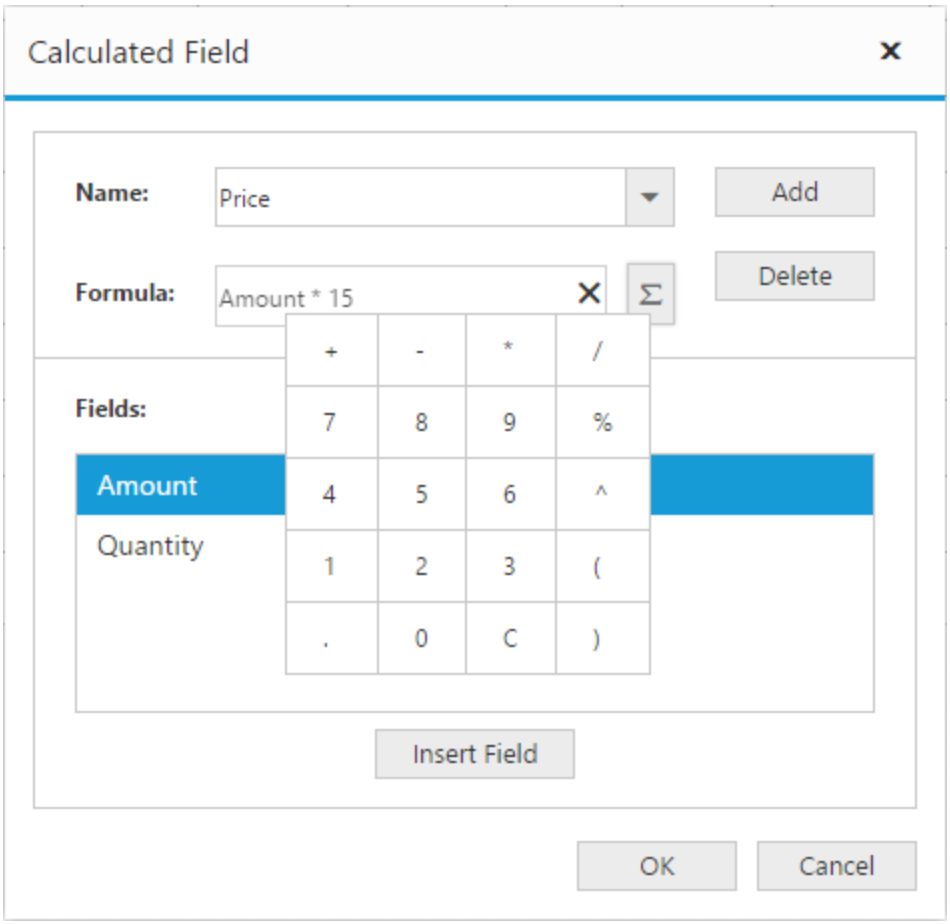
Note: This feature is applicable only for Relational data source.

PivotGrid provides support to insert a new calculated field based on the existing Pivot Fields either through Calculated Field dialog or code behind.

Through UI

To insert a new calculated Field, open the Calculated Field dialog using the Grouping Bar context menu. We can define "Name" for the new Calculated Field and "Formula" can be entered by inserting required fields through Fields section. For inserting numbers and operators, you can use formula pop-up as shown in the below screen-shot.

Copyright © 2001 - 2020 Syncfusion Inc.



Click **Add** for adding the respective Calculated Field and **OK** to populate the PivotGrid control.

Through Code-behind

For client mode, Calculated Field can be created at code-behind by defining formula based on the existing Pivot Fields in the PivotGrid. To indicate a field as a calculated field we need to set `IsCalculatedField` property to true and `Formula` property to set the expression.

ASPX-CS

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").EnableGroupingBar(true).DataSo
urce(dataSource => dataSource.Values(values => {
values.FieldName("Amount").Add();
values.FieldName("Price").FieldCaption("Price").IsCalculatedField(true).F
ormula("Amount * 15").Add(); }))
```

For server mode, we need to set **CalculationType** property to **CalculationType.Formula** and **Formula** property to set the expression for the PivotComputation item in the PivotReport.

C#

```
private PivotReport BindDefaultData()
{
PivotReport pivotSetting = new PivotReport();
pivotSetting.PivotRows.Add(new PivotItem { FieldMappingName = "Country",
FieldHeader = "Country", TotalHeader = "Total" });
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
pivotSetting.PivotColumns.Add(new PivotItem { FieldMappingName =
"Product", FieldHeader = "Product", TotalHeader = "Total" });
pivotSetting.PivotCalculations.Add(new PivotComputationInfo {
CalculationName = "Amount", Description = "Amount", FieldHeader =
"Amount", FieldName = "Amount", SummaryType =
Syncfusion.PivotAnalysis.Base.SummaryType.DoubleTotalSum });
pivotSetting.PivotCalculations.Add(new PivotComputationInfo  {
CalculationName = "Price",
FieldHeader = "Price",
FieldName = "Price",
CalculationType = CalculationType.Formula,
Formula = "Amount * 10 + 12"
});
return pivotSetting;
}
```

Drag field here

Amount ✕ Price ✕ Product ▼ ∧ ✕

Grand Total	1200	18000	1850	27750	1550	23250	4600	69000

Cell Editing

Information: This feature is applicable only for Relational data source.

Cell editing allows you to edit and alter the values in PivotGrid. The summary values will be recreated based on the edited values. By selecting multiple cells (like in cell selection feature), you can edit multiple cells at the same time.

You can enable cell editing option in PivotGrid by setting the EnableCellEditing property to true.

ASPX-CS

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").EnableCellEditing(false).DataS
ource(.....)
```

Copyright © 2001 - 2020 Syncfusion Inc.

	FY 2005	FY 2006	FY 2007	FY 2008	Grand Total

Defer Update

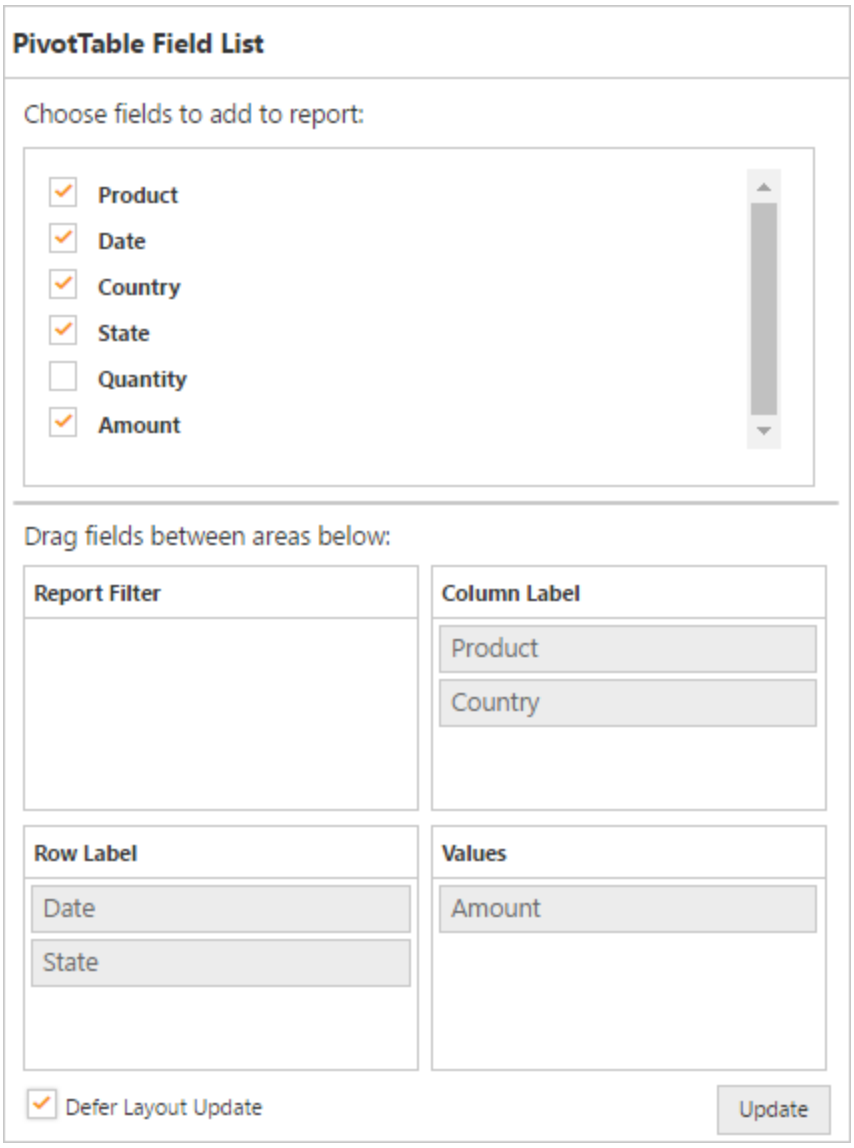
Information: This feature is applicable for Relational datasource only at Server Mode.

Defer Update support allows you to refresh the control only on-demand and not during every UI interaction.

ASPX-CS

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").Url(Url.Content("/RelationalSe
rvice")).ClientSideEvents(events =>
events.AfterServiceInvoke("OnAfterServiceInvoke"))
@Html.EJ().Pivot().PivotSchemaDesigner("PivotSchemaDesigner").Layout(Pivo
tSchemaDesignerLayout.Excel)
<script type="text/javascript">
OnAfterServiceInvoke = function(evt) {
if (evt.action == "initialize") {
var PivotSchemaDesigner =
$("#PivotSchemaDesigner").data('ejPivotSchemaDesigner');
if (PivotSchemaDesigner.model.pivotControl == null) {
PivotSchemaDesigner.model.pivotControl = this;
PivotSchemaDesigner.model.enableWrapper = true;
PivotSchemaDesigner.model.layout = "excel";
PivotSchemaDesigner._load();
}
}
}
</script>
```

Copyright © 2001 - 2020 Syncfusion Inc.



Sub Total Hiding

Note: This feature is applicable only for Relational data source.

You can hide the **Sub Total** for respective fields in rows and columns by setting the ShowSubTotal property to false.

Client Mode

ASPX-CS

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").DataSource(dataSource =>
dataSource.Rows(rows => {
rows.FieldName("Date").FieldCaption("Date").ShowSubTotal(false).Add();
rows.FieldName("Product").FieldCaption("Product").Add();
}).Columns(columns => {
columns.FieldName("Country").FieldCaption("Country").Add();
columns.FieldName("State").FieldCaption("State").Add(); }).Values(values
=> { values.FieldName("Amount").Add();
values.FieldName("Quantity").Add(); }))
```

Copyright © 2001 - 2020 Syncfusion Inc.

Server Mode

C#

```
private PivotReport BindDefaultData()
{
PivotReport pivotSetting = new PivotReport();
pivotSetting.PivotRows.Add(new PivotItem { FieldMappingName = "Date",
FieldHeader = "Date", TotalHeader = "Total", ShowSubTotal = false });
pivotSetting.PivotRows.Add(new PivotItem { FieldMappingName = "Product",
FieldHeader = "Product", TotalHeader = "Total", ShowSubTotal = true });
pivotSetting.PivotColumns.Add(new PivotItem { FieldMappingName =
"Country", FieldHeader = "Country", TotalHeader = "Total", ShowSubTotal =
false });
pivotSetting.PivotCalculations.Add(new PivotComputationInfo {
CalculationName = "Amount", Description = "Amount", FieldHeader =
"Amount", FieldName = "Amount", Format = "C", SummaryType =
Syncfusion.PivotAnalysis.Base.SummaryType.DoubleTotalSum });
return pivotSetting;
}
```

Exporting

The PivotGrid control can be exported to the following file formats.

- Excel
- Word
- PDF
- CSV

The PivotGrid control can be exported by invoking **“exportPivotGrid”** method, with an appropriate export option as parameter.

JSON Export

Information: By default JSON export mode will be applied for server and client mode.

ASPX-CS

```
//If you want to render PivotGrid in Client Mode.
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").ClientSideEvents(clientSideEve
nts => clientSideEvents.Load("onLoad")).DataSource(dataSource =>
dataSource.Rows(rows => {
rows.FieldName("Country").FieldCaption("Country").Add();
}).Columns(columns => {
columns.FieldName("Product").FieldCaption("Product").Add();
}).Values(values => { values.FieldName("Amount").Add(); }))
//If you want to render PivotGrid in Server Mode.
@Html.EJ().Pivot().PivotGrid("PivotGrid1").Url(Url.Content("../Relational
Service"))
@Html.EJ().Button("Button1").ClientSideEvents(clientSideEvents => {
clientSideEvents.Click("exportBtnClick"); }).Text("Export")
<script type="text/javascript">
function exportBtnClick(args) {
var pGridObj = $('#PivotGrid1').data("ejPivotGrid");
pGridObj.exportPivotGrid("ExcelExport","fileName");
}
</script>
```

To achieve exporting, we need to add **“Syncfusion.EJ.Export”** dependency library into the application.

When PivotGrid is rendered, a method needs to be added in MVC controller file of the application and we need to import **“Syncfusion.EJ.Export”** namespace in the controller file.

C#

```
//...
using Syncfusion.EJ.Export;
public void ExcelExport()
{
PivotGridExcelExport pGrid = new PivotGridExcelExport();
string args =
System.Web.HttpContext.Current.Request.Form.GetValues(0)[0];
string fileName = "Sample";
pGrid.ExportToExcel(fileName, args,
System.Web.HttpContext.Current.Response);
}
```

Excel Export

User can export the contents of PivotGrid to an Excel document for future archival, references and analysis purposes.

To achieve Excel export, the controller method name **“ExcelExport”** and file name is sent as the parameter.

JS

```
<script type="text/javascript">
function exportBtnClick(args)
{
var pGridObj = $('#PivotGrid1').data("ejPivotGrid");
pGridObj.exportPivotGrid("ExcelExport","fileName");
}
</script>
```

Copyright © 2001 - 2020 Syncfusion Inc.

Following method needs to be added in MVC controller file of the application.

C#

```
//...
using Syncfusion.EJ.Export;
public void ExcelExport()
{
PivotGridExcelExport pGrid = new PivotGridExcelExport();
string args =
System.Web.HttpContext.Current.Request.Form.GetValues(0)[0];
string fileName = "Sample";
pGrid.ExportToExcel(fileName, args,
System.Web.HttpContext.Current.Response);
}
```

Word Export

User can export the contents of PivotGrid to a Word document for future archival, references and analysis purposes.

To achieve Word export, controller method name **"WordExport"** and file name is sent as the parameter.

JS

```
<script type="text/javascript">
function exportBtnClick(args)
{
var pGridObj = $('#PivotGrid1').data("ejPivotGrid");
pGridObj.exportPivotGrid("WordExport","fileName");
}
</script>
```

Following method needs to be added in MVC controller file of the application.

C#

```
//...
using Syncfusion.EJ.Export;
public void WordExport()
{
PivotGridWordExport pGrid = new PivotGridWordExport();
string args =
System.Web.HttpContext.Current.Request.Form.GetValues(0)[0];
string fileName = "Sample";
pGrid.ExportToWord(fileName, args,
System.Web.HttpContext.Current.Response);
}
```

PDF Export

User can export the contents of PivotGrid to a PDF document for future archival, references and analysis purposes.

To achieve Word export, controller method name **"PDFExport"** and file name is sent as the parameter.

JS

Copyright © 2001 - 2020 Syncfusion Inc.

```
<script type="text/javascript">
function exportBtnClick(args)
{
var pGridObj = $('#PivotGrid1').data("ejPivotGrid");
pGridObj.exportPivotGrid("PDFExport","fileName");
}
</script>
```

Following method needs to be added in MVC controller file of the application.

C#

```
//...
using Syncfusion.EJ.Export;
public void PDFExport()
{
PivotGridPDFExport pGrid = new PivotGridPDFExport();
string args =
System.Web.HttpContext.Current.Request.Form.GetValues(0)[0];
string fileName = "Sample";
pGrid.ExportToPDF(fileName, args,
System.Web.HttpContext.Current.Response);
}
```

CSV Export

User can export the contents of PivotGrid to a CSV document for future archival, references and analysis purposes.

To achieve CSV export, controller method name **"CSVExport"** and file name is sent as the parameter.

JS

```
<script type="text/javascript">
function exportBtnClick(args)
{
var pGridObj = $('#PivotGrid1').data("ejPivotGrid");
pGridObj.exportPivotGrid("CSVExport","fileName");
}
</script>
```

Following method needs to be added in MVC controller file of the application.

C#

```
//...
using Syncfusion.EJ.Export;
public void CSVExport()
{
PivotGridCSVExport pGrid = new PivotGridCSVExport();
string args =
System.Web.HttpContext.Current.Request.Form.GetValues(0)[0];
string fileName = "Sample";
pGrid.ExportToCSV(fileName, args,
System.Web.HttpContext.Current.Response);
}
```

Copyright © 2001 - 2020 Syncfusion Inc.

Customize the export document name

For customizing file name, we need to send file name as parameter to the **“exportPivotGrid”** method along with method name.

JS

```
function exportBtnClick(args)
{
var pGridObj = $('#PivotGrid1').data("ejPivotGrid");
pGridObj.exportPivotGrid("ExcelExport","fileName");
}
```

PivotEngine Export

Information: This feature is applicable only at server mode operation.

In order to perform exporting with the use of PivotEngine available in server-side, the 'exportMode' property obtained in the “BeforeExport” event is set to the value "ej.PivotGrid.ExportMode.PivotEngine" as shown below.

ASPX-CS

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").Url(Url.Content("../Relational
Service")).ClientSideEvents(clientSideEvents =>
clientSideEvents.BeforeExport("Export"))
@Html.EJ().Button("Button1").ClientSideEvents(clientSideEvents => {
clientSideEvents.Click("exportBtnClick"); }).Text("Export")
<script type="text/javascript">
function exportBtnClick(args) {
var pGridObj = $('#PivotGrid1').data("ejPivotGrid");
pGridObj.exportPivotGrid(ej.PivotGrid.ExportOptions.Excel);
}
function Export(args) {
args.exportMode = ej.PivotGrid.ExportMode.PivotEngine;
}
</script>
```

When PivotGrid is rendered in server mode, a service method needs to be added in WCF/WebAPI for server side operations.

For WebAPI controller, the below method needs to be added.

C#

```
//...
using Syncfusion.Compression.Base;
using Syncfusion.XlsIO;
using Syncfusion.DocIO.Base;
using Syncfusion.Pdf.Base;
[System.Web.Http.ActionName("Export")]
[System.Web.Http.HttpPost]
public void Export()
{
string args = HttpContext.Current.Request.Form.GetValues(0)[0];
Dictionary<string, string> gridParams =
serializer.Deserialize<Dictionary<string, string>>(args);
htmlHelper.PopulateData(gridParams["currentReport"]);
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
string fileName = "Sample";
htmlHelper.ExportPivotGrid(ProductSales.GetSalesData(), args, fileName,
HttpContext.Current.Response);
}
```

For WCF service, the below method needs to be added.

C#

```
//...
using Syncfusion.Compression.Base;
using Syncfusion.XlsIO;
using Syncfusion.DocIO.Base;
using Syncfusion.Pdf.Base;
public void Export(System.IO.Stream stream)
{
System.IO.StreamReader sReader = new System.IO.StreamReader(stream);
string args =
System.Web.HttpContext.Current.Server.UrlDecode(sReader.ReadToEnd()).Remo
ve(0, 5);
Dictionary<string, string> gridParams =
serializer.Deserialize<Dictionary<string, string>>(args);
htmlHelper.PopulateData(gridParams["currentReport"]);
string fileName = "Sample";
htmlHelper.ExportPivotGrid(ProductSales.GetSalesData(), args, fileName,
System.Web.HttpContext.Current.Response);
}
```

Excel Export

User can export the contents of PivotGrid to an Excel document for future archival, references and analysis purposes.

To achieve Excel export, we need to add the following dependency libraries into the application.

- Syncfusion.Compression.Base
- Syncfusion.XlsIO.Base

For Excel export, **“ej.PivotGrid.ExportOptions.Excel”** enumeration value is sent as the parameter.

JS

```
function exportBtnClick(args)
{
var pGridObj = $('#PivotGrid1').data("ejPivotGrid");
//Setting export option as Excel in the exportPivotGrid method for
ServerMode
pGridObj.exportPivotGrid(ej.PivotGrid.ExportOptions.Excel);
}
```

Word Export

User can export the contents of PivotGrid to a Word document for future archival, references and analysis purposes.

To achieve Word export, we need to add the following dependency libraries into the application.

Copyright © 2001 - 2020 Syncfusion Inc.

- Syncfusion.Compression.Base
- Syncfusion.DocIO.Base

For Word export, **“ej.PivotGrid.ExportOptions.Word”** enumeration value is sent as the parameter.

JS

```
function exportBtnClick(args)
{
var pGridObj = $('#PivotGrid1').data("ejPivotGrid");
//Setting export option as Word in the exportPivotGrid method
pGridObj.exportPivotGrid(ej.PivotGrid.ExportOptions.Word);
}
```

PDF Export

User can export the contents of PivotGrid to a PDF document for future archival, references and analysis purposes.

To achieve PDF export, we need to add the following dependency libraries into the application.

- Syncfusion.Compression.Base
- Syncfusion.Pdf.Base

For PDF export, **“ej.PivotGrid.ExportOptions.PDF”** enumeration value is sent as the parameter.

JS

```
function exportBtnClick(args)
{
var pGridObj = $('#PivotGrid1').data("ejPivotGrid");
//Setting export option as PDF in the exportPivotGrid method
pGridObj.exportPivotGrid(ej.PivotGrid.ExportOptions.PDF);
}
```

CSV Export

User can export contents of PivotGrid to a CSV document for future archival, references and analysis purposes.

For CSV export, **“ej.PivotGrid.ExportOptions.CSV”** enumeration value is sent as the parameter.

JS

```
function exportBtnClick(args)
{
var pGridObj = $('#PivotGrid1').data("ejPivotGrid");
//Setting export option as CSV in the exportPivotGrid method
pGridObj.exportPivotGrid(ej.PivotGrid.ExportOptions.CSV);
}
```

File format selection

Information: This option is applicable only for PivotGrid when exporting to Excel document.

You can set the option for exporting the control to Excel document either in *.xls* or *.xlsx* format, using `fileFormat` property inside the `BeforeExport` event.

Copyright © 2001 - 2020 Syncfusion Inc.

Note: By default excel document will be exported to ".xls" format using PivotEngine export.

ASPX-CS

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").Url(Url.Content("../Relational
Service")).ClientSideEvents(clientSideEvents =>
clientSideEvents.BeforeExport("Export"))
@Html.EJ().Button("Button1").ClientSideEvents(clientSideEvents => {
clientSideEvents.Click("exportBtnClick"); }).Text("Export")
<script type="text/javascript">
function exportBtnClick(args) {
var pGridObj = $('#PivotGrid1').data("ejPivotGrid");
pGridObj.exportPivotGrid(ej.PivotGrid.ExportOptions.Excel);
}
function Export(args) {
args.exportMode = ej.PivotGrid.ExportMode.PivotEngine;
args.fileFormat = ".xlsx"; //you can set the excel sheet format here
}
</script>
```

Customize the export document name

For customizing name in WebAPI controller, below code snippet is used.

C#

```
//...
using Syncfusion.Compression.Base;
using Syncfusion.XlsIO;
using Syncfusion.DocIO.Base;
using Syncfusion.Pdf.Base;
[System.Web.Http.ActionName("Export")]
[System.Web.Http.HttpPost]
public void Export()
{
string args = HttpContext.Current.Request.Form.GetValues(0)[0];
Dictionary<string, string> gridParams =
serializer.Deserialize<Dictionary<string, string>>(args);
htmlHelper.PopulateData(gridParams["currentReport"]);
string fileName = " File name is customized here ";
htmlHelper.ExportPivotGrid(ProductSales.GetSalesData(), args, fileName,
HttpContext.Current.Response);
}
```

For customizing name in WCF Service, below code snippet is used.

C#

```
//...
using Syncfusion.Compression.Base;
using Syncfusion.XlsIO;
using Syncfusion.DocIO.Base;
using Syncfusion.Pdf.Base;
public void Export(System.IO.Stream stream)
{
System.IO.StreamReader sReader = new System.IO.StreamReader(stream);
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
string args =
System.Web.HttpContext.Current.Server.UrlDecode(sReader.ReadToEnd()).Remo
ve(0, 5);
Dictionary<string, string> gridParams =
serializer.Deserialize<Dictionary<string, string>>(args);
htmlHelper.PopulateData(gridParams["currentReport"]);
string fileName = " File name is customized here ";
htmlHelper.ExportPivotGrid(ProductSales.GetSalesData(), args, fileName,
System.Web.HttpContext.Current.Response);
}
```

Exporting Customization

You can add title and description to the exporting document by using the title and description properties respectively obtained in the BeforeExport event. Similarly, you can enable or disable styling on the exported document by using the exportWithStyle property.

ASPX-CS

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").ClientSideEvents(clientSideEve
nts => clientSideEvents.BeforeExport("Exporting"))
@Html.EJ().Button("Button1").ClientSideEvents(clientSideEvents => {
clientSideEvents.Click("exportBtnClick"); }).Text("Export")
<script type="text/javascript">
function exportBtnClick(args) {
var pGridObj = $('#PivotGrid1').data("ejPivotGrid");
//JSON Export
pGridObj.exportPivotGrid("ExcelExport","fileName");
//PivotEngine Export
pGridObj.exportPivotGrid(ej.PivotGrid.ExportOptions.Excel);
}
function Exporting(args) {
args.title = "PivotGrid";
args.description = "Displays both OLAP and Relational datasource in
tabular format";
args.exportWithStyle = true;   // by default it sets as true. It improves
performance on exporting huge data when it sets as false.
}
</script>
```

You can also edit the exporting document with the use of a server-side event for required exporting option.

C#

```
//...
using Syncfusion.EJ.Export;
using Syncfusion.Compression.Base;
using Syncfusion.XlsIO;
using Syncfusion.DocIO.Base;
using Syncfusion.Pdf.Base;
//Following methods needs to be added in MVC controller file of the
application for JSON export
public void ExcelExport()
{
PivotGridExcelExport pGrid = new PivotGridExcelExport();
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
string args =
System.Web.HttpContext.Current.Request.Form.GetValues(0)[0];
string fileName = "Sample";
pGrid.ExcelExport += pGrid_ExcelExport;
pGrid.ExportToExcel(fileName, args,
System.Web.HttpContext.Current.Response);
}
void pGrid_ExcelExport(object sender, Syncfusion.XlsIO.IWorkbook
workBook)
{
//You can customize exporting document here.
}
public void PDFExport()
{
PivotGridPDFExport pGrid = new PivotGridPDFExport();
string args =
System.Web.HttpContext.Current.Request.Form.GetValues(0)[0];
string fileName = "Sample";
pGrid.AddPDFHeaderFooter += pGrid_AddPDFHeaderFooter;
pGrid.PDFExport += pGrid_PDFExport;
pGrid.ExportToPDF(fileName, args,
System.Web.HttpContext.Current.Response);
}
void pGrid_PDFExport(object sender, Syncfusion.Pdf.PdfDocument pdfDoc)
{
//You can customize exporting document here.
}
void pGrid_AddPDFHeaderFooter(object sender, Syncfusion.Pdf.PdfDocument
pdfDoc)
{
//You can add header/footer information to the PDF document.
}
public void CSVExport()
{
PivotGridCSVExport pGrid = new PivotGridCSVExport();
string args =
System.Web.HttpContext.Current.Request.Form.GetValues(0)[0];
string fileName = "Sample";
pGrid.CSVExport += pGrid_CSVExport;
pGrid.ExportToCSV(fileName, args,
System.Web.HttpContext.Current.Response);
}
void pGrid_CSVExport(object sender, string csvString)
{
//You can customize exporting document here.
}
public void WordExport()
{
PivotGridWordExport pGrid = new PivotGridWordExport();
string args =
System.Web.HttpContext.Current.Request.Form.GetValues(0)[0];
string fileName = "Sample";
pGrid.WordExport += pGrid_WordExport;
pGrid.ExportToWord(fileName, args,
System.Web.HttpContext.Current.Response);
}
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
void pGrid_WordExport(object sender, Syncfusion.DocIO.DLS.WordDocument
document)
{
//You can customize exporting document here.
}
//Following service methods needs to be added in WEBAPI controller file
for PivotEngine export
[System.Web.Http.ActionName("Export")]
[System.Web.Http.HttpPost]
public void Export()
{
string args = HttpContext.Current.Request.Form.GetValues(0)[0];
Dictionary<string, string> gridParams =
serializer.Deserialize<Dictionary<string, string>>(args);
htmlHelper.PopulateData(gridParams["currentReport"]);
htmlHelper.ExcelExport += htmlHelper_ExcelExport;
htmlHelper.WordExport += htmlHelper_WordExport;
htmlHelper.AddPDFHeaderFooter += htmlHelper_AddPDFHeaderFooter;
htmlHelper.PDFExport += htmlHelper_PDFExport;
htmlHelper.CSVExport += htmlHelper_CSVExport;
string fileName = "Sample";
htmlHelper.ExportPivotGrid(ProductSales.GetSalesData(), args, fileName,
System.Web.HttpContext.Current.Response);
}
void htmlHelper_ExcelExport(object sender, Syncfusion.XlsIO.IWorkbook
workBook)
{
//You can customize exporting document here.
}
void htmlHelper_WordExport(object sender,
Syncfusion.DocIO.DLS.WordDocument document)
{
//You can customize exporting document here.
}
void htmlHelper_AddPDFHeaderFooter(object sender,
Syncfusion.Pdf.PdfDocument pdfDoc)
{
//You can add header/footer information to the PDF document.
}
void htmlHelper_PDFExport(object sender, Syncfusion.Pdf.PdfDocument
pdfDoc)
{
//You can customize exporting document here.
}
void htmlHelper_CSVExport(object sender, string csvString)
{
//You can customize exporting document here.
}
```

Exporting complete data on Paging

When paging is enabled, you can export the complete data by enabling the `EnableCompleteDataExport` property. It is supported in both types of JSON and PivotEngine export and it is applicable for all kinds of exporting formats available in PivotGrid.

ASPX-CS

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").EnableCompleteDataExport(true)
```

The below screenshot shows the PivotGrid control exported to Excel document.

	Bike		Car		Van		Grand Total	
	Amount	Quantity	Amount	Quantity	Amount	Quantity	Amount	Quantity

Collapse by default

Information: This feature is applicable only for Relational datasource.

Allows you to collapse all members displayed in the grid. You can enable collapsing all members by default in the PivotGrid by setting the EnableCollapseByDefault(/api/js/ejpivotgrid#members: enablecollapsebydefault) property to true.

ASPX-CS

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").EnableCollapseByDefault(true)
```

	Bike	Car	Van	Grand Total
	Quantity	Quantity	Quantity	Quantity
▸ Canada	5	8	4	17
▸ France	2	3	6	11
▸ Germany	6	7	6	19
▸ United Kingdom	5			5
▸ United States	6	10	8	24
Grand Total	24	28	24	76

Group by date

Information: This feature is applicable for Relational datasource alone (in Client Mode).

Allows the user to categorize the date type field and showcase them based on year, quarter, month and day formats.

ASPX-CS

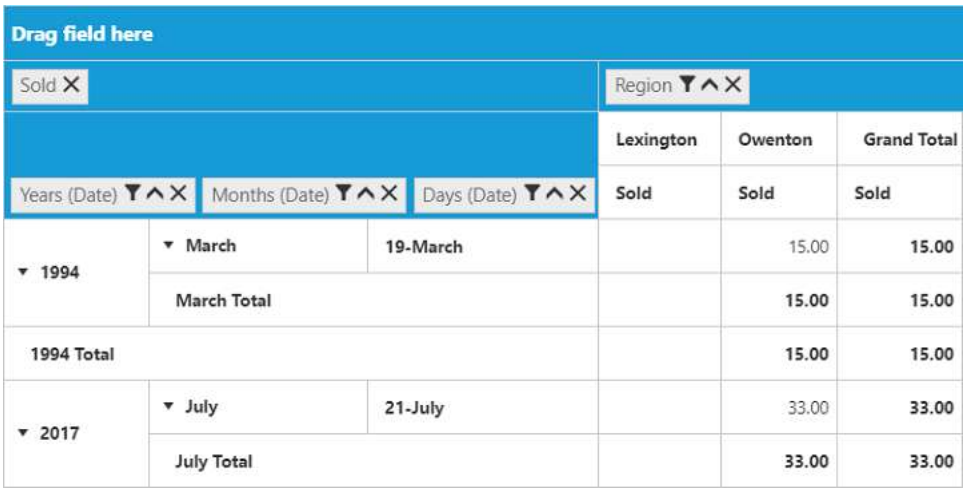
```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").ClientSideEvents(clientSideEve
nts => clientSideEvents.Load("onLoad")).DataSource(dataSource =>
dataSource.Rows(rows => {
rows.FieldName("Country").FieldCaption("Country").Add();
rows.FieldName("State").FieldCaption("State").Add(); }).Columns(columns
=> {
columns.FieldName("Date").FieldCaption("Date").Format("date").FormatStrin
g("yyyy-MMM-ddd").Delimiter("-").GroupByDate(groupByDate => {
groupByDate.Interval(groupinterval => { groupinterval.Add("yyyy");
groupinterval.Add("MMM-dd"); }); }).Add(); }).Values(values => {
values.FieldName("Product").Add(); values.FieldName("Quantity").Add();
}))
```

The properties associated with group by date option is,

- Format - To set the data type format.
- FormatString - Specifies the structure of the date format.

Copyright © 2001 - 2020 Syncfusion Inc.

- Delimiter - Specifies the separator of the date values.
- GroupByDate.Interval - Specifies the pattern in which date type to be displayed.



OLAP

KPI

Key Performance Indicators (KPI) are business metric that help to figure out the progress of an enterprise in meeting its business goals.

The different indicators available in KPI are:

- KPI Value: A physical measure or a calculated measure.
- KPI Goal: Defines the target for the measure.
- KPI Status: Evaluates the current status of the value compared to the goal.
- KPI Trend: Evaluate the current trend of the value compared to the goal.

The **“KpiElements”** class in OLAP Base library holds the KPI name and when its object is added to an OlapReport, you can view the resultant information in PivotGrid.

Client Mode

ASPX-CS

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").DataSource(dataSource =>
dataSource.Rows(rows => { rows.FieldName("[Date].[Fiscal]").Add();
}).Columns(columns => { columns.FieldName("[Product].[Product
Categories]").Add(); }).Values(values => { values.Measures(measures => {
measures.FieldName("[Measures].[Internet Sales Amount]").Add();
measures.FieldName("[Measures].[Growth in Customer Base Trend]").Add();
}).Axis(AxisName.Column).Add();
}).Data("https://bi.syncfusion.com/olap/msmdpump.dll").Catalog("Adventure
Works DW 2008 SE").Cube("Adventure Works"))
```

Total	$109,809,274.20			$12,551,366.25

Named Set

Named set is a multidimensional expression (MDX) that returns a set of dimension members, which can be created by combining cube data, arithmetic operators, numbers and functions.

Client Mode

You can bind the Named Sets in PivotGrid by setting it's unique name in the `FieldName` property either in row or column axis and `IsNamedSets` Boolean property to "true".

ASPX-CS

Copyright © 2001 - 2020 Syncfusion Inc.

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").DataSource(dataSource =>
dataSource.Rows(rows => { rows.FieldName("[Date].[Fiscal]").Add();
}).Columns(columns => { columns.FieldName("[Core Product
Group]").IsNamedSets(true).Add(); }).Values(values => {
values.Measures(measures => { measures.FieldName("[Measures].[Internet
Sales Amount]").Add(); }).Axis(AxisName.Column).Add();
}).Data("https://bi.syncfusion.com/olap/msmdpump.dll").Catalog("Adventure
Works DW 2008 SE").Cube("Adventure Works"))
```

Server Mode

You can add Named Sets in the PivotGrid by using "NamedSetElement" Class in the OlapReport.

C#

```
OlapReport olapReport = new OlapReport();
olapReport.Name = "Customer Report";
olapReport.CurrentCubeName = "Adventure Works";
DimensionElement dimensionElementRow = new DimensionElement();
dimensionElementRow.Name = "Date";
dimensionElementRow.AddLevel("Fiscal", "Fiscal Year");
MeasureElements measureElementColumn = new MeasureElements();
measureElementColumn.Elements.Add(new MeasureElement {
Name = "Internet Sales Amount"
});
NamedSetElement dimensionElementColumn = new NamedSetElement();
dimensionElementColumn.Name = "Core Product Group";
olapReport.CategoricalElements.Add(dimensionElementColumn);
olapReport.CategoricalElements.Add(measureElementColumn);
olapReport.SeriesElements.Add(dimensionElementRow);
```

Grouping Bar

Initialization

Grouping Bar allows user to dynamically alter the report by filter and remove operations in the PivotGrid control. Based on the OLAP datasource and report bound to the PivotGrid control, Grouping Bar will be automatically populated. You can enable Grouping Bar option in PivotGrid by setting the `EnableGroupingBar` property to true.

Client Mode

ASPX-CS

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").EnableGroupingBar(true).DataSo
urce(dataSource =>
dataSource.Rows(rows=>{rows.FieldName("[Date].[Fiscal]").Add();}).Columns
(columns=>{columns.FieldName("[Customer].[Customer
Geography]").Add();}).Values(values => { values.Measures(measures => {
measures.FieldName("[Measures].[Internet Sales Amount]").Add();
}).Axis(AxisName.Column).Add();}).Data("https://bi.syncfusion.com/olap/ms
mdpump.dll").Catalog("Adventure Works DW 2008 SE").Cube("Adventure
Works"))
```

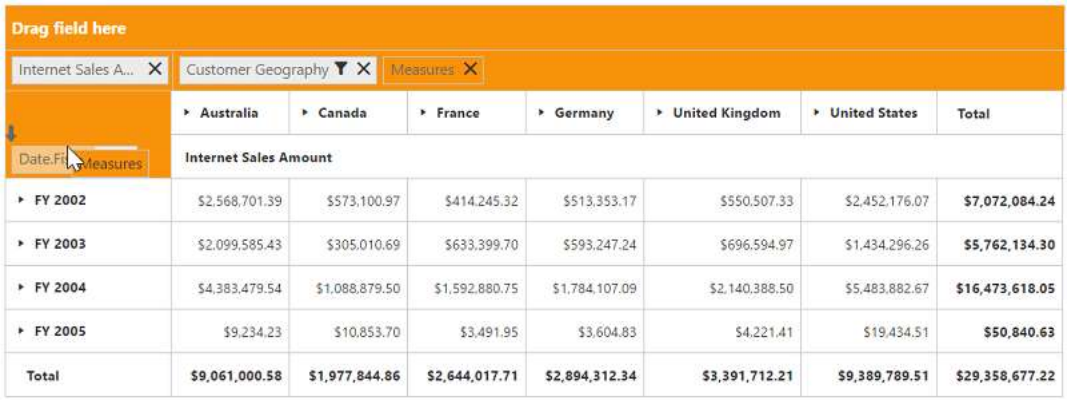
ASPX-CS

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").Url(Url.Content("/OLAPService")).EnableGroupingBar(true)
```

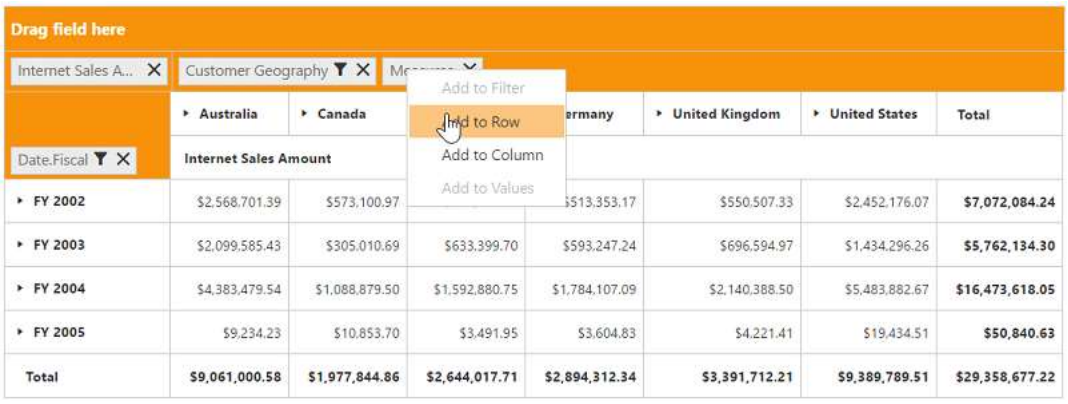
Drag and Drop

You can alter the report on fly through drag-and-drop operation.



Context Menu

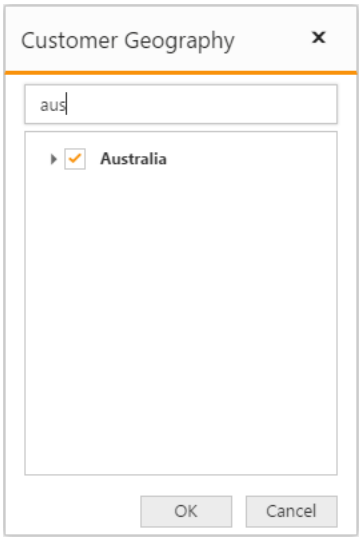
You can also alter the report by using context menu.



Copyright © 2001 - 2020 Syncfusion Inc.

Searching Values

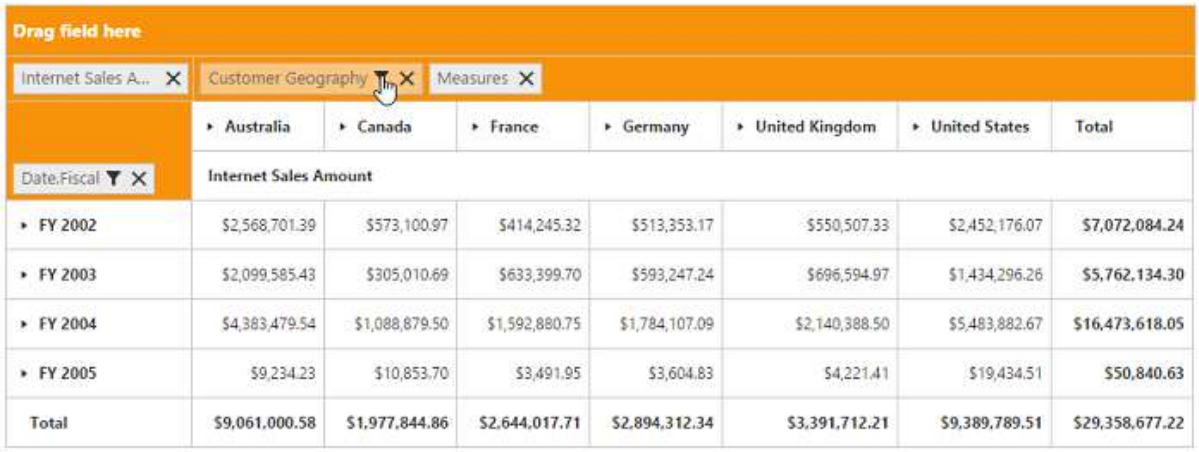
Search option available in Grouping Bar allows you to search a specific value that needs to be filtered from the list of values inside the filter pop-up window.

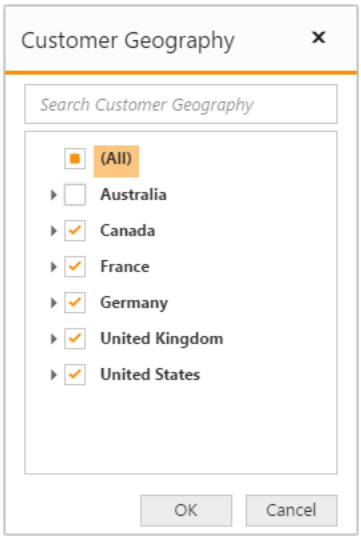


Filtering Values

Filtering option available in Grouping Bar allows you to select a specific set of values that needs to be displayed in the PivotGrid control. At least one value needed to be in checked state while filtering otherwise “Ok” button will be disabled.

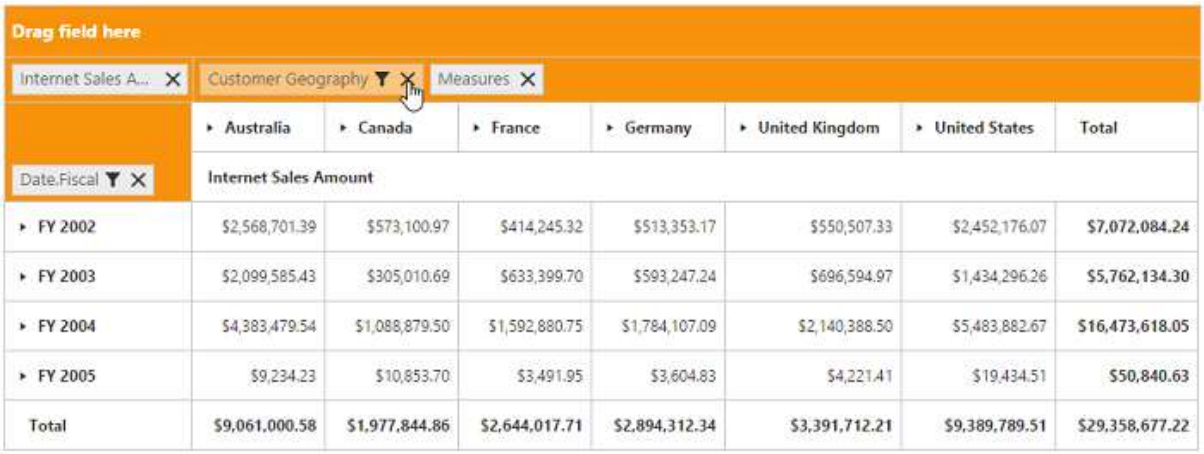
Copyright © 2001 - 2020 Syncfusion Inc.



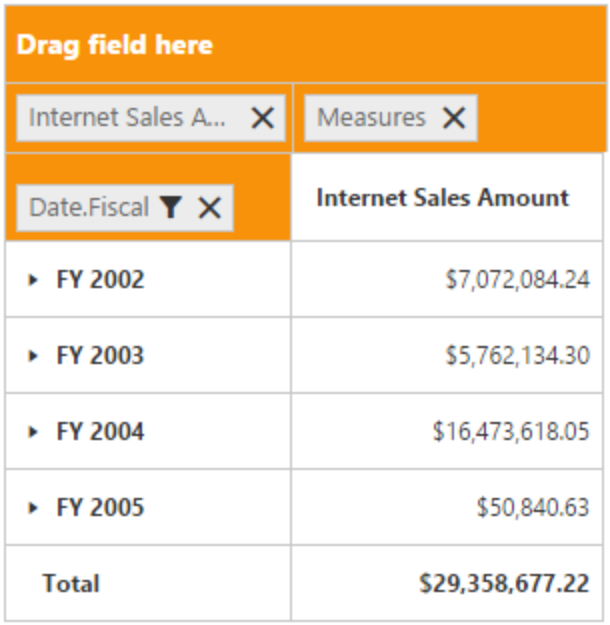


Removing Field

Remove option available in the Grouping Bar allows you to completely remove a specific field from the PivotGrid control. Remove operation can be either achieved by clicking remove icon available inside each field or by dragging and dropping field out of Grouping Bar region.



Copyright © 2001 - 2020 Syncfusion Inc.



PivotTable Field List

Initialization

Field List, also known as Pivot Schema Designer, allows user to add, rearrange, filter and remove fields to show data in PivotGrid exactly the way they want.

Based on the datasource, OLAP, bound to the PivotGrid control, PivotTable Field List will be automatically populated with Cube Information or Field Names. PivotTable Field List provides an Excel like appearance and behavior.

In-order to initialize PivotTable Field List, first you need to define a “div” tag with an appropriate “id” attribute which acts as a container for the control. Then you need to initialize the PivotTable Field List by using the **“PivotSchemaDesigner”** method.

Client Mode

ASPX-CS

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").ClientSideEvents(clientSideEve

United Kingdom	$550,507.33	$696,594.97	$2,140,388.50	$4,221.41	$3,391,712.21
United States	$2,452,176.07	$1,434,296.26	$5,483,882.67	$19,434.51	$9,389,789.51
Total	$7,072,084.24	$5,762,134.30	$16,473,618.05	$50,840.63	$29,358,677.22

Layout

The top portion of the layout shows Field or Cube items in a categorized way. They can be dynamically added into the report either by drag and drop option or through simple check box selection.

On item(s) selection they will be placed in Row section by default except numeric based item(s) or measures, which will alone be placed in the Value section by default.

The bottom portion of the layout is segregated as below.

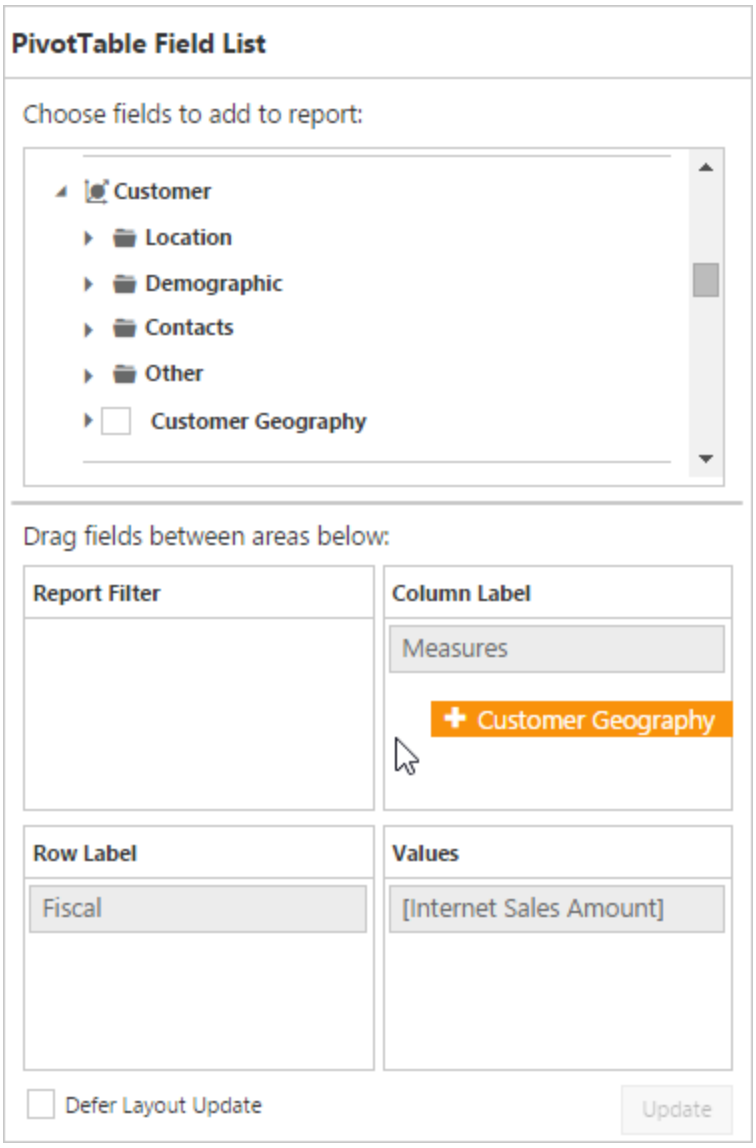
- Report Filter: Exclusively designed to filter an item(s) placed in this particular position of the layout.
- Value Section: The value label usually displays the numeric value item(s) present in the report.
- Column Section: It is used to display item(s) as column header and values in the PivotGrid control.
- Row Section: It is used to display item(s) as row header and values in the PivotGrid control.

UI Interactions

By Drag and Drop

You can alter the report on fly through drag-and-drop operation. You can drag any item from Field List and drop into column, row, value or filter section available at the bottom of the Field List.

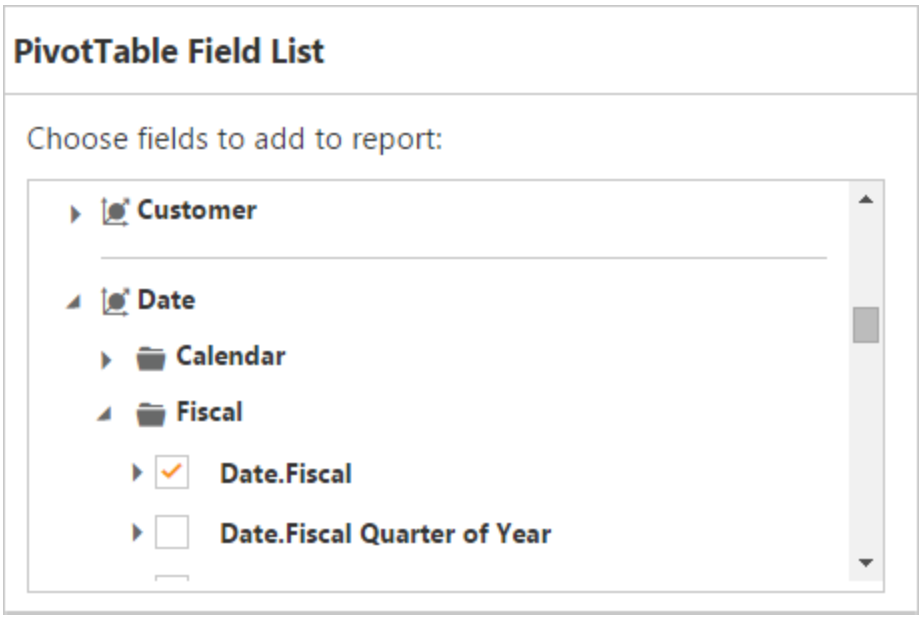
Copyright © 2001 - 2020 Syncfusion Inc.



By Treeview Selection

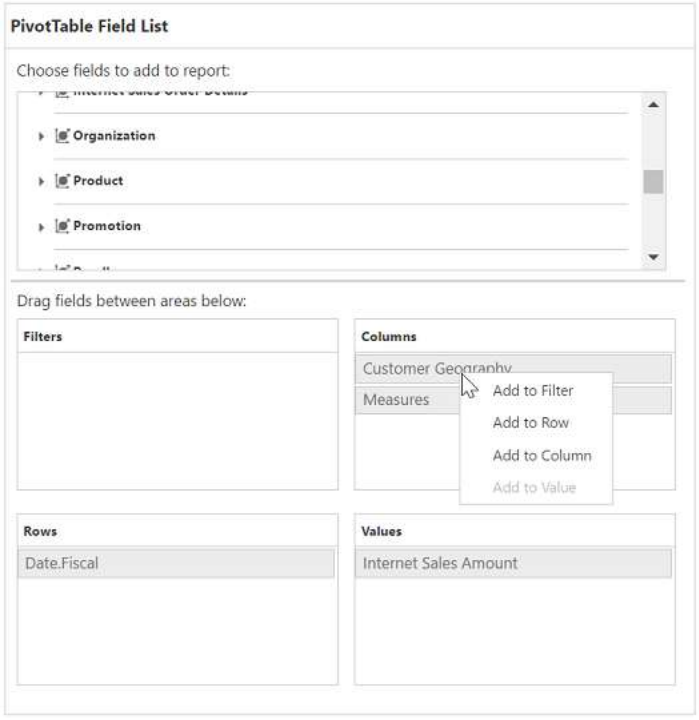
You can also alter the report on fly through check and uncheck option as an alternate. By default, fields will be added to the Row Label when checked.

Copyright © 2001 - 2020 Syncfusion Inc.

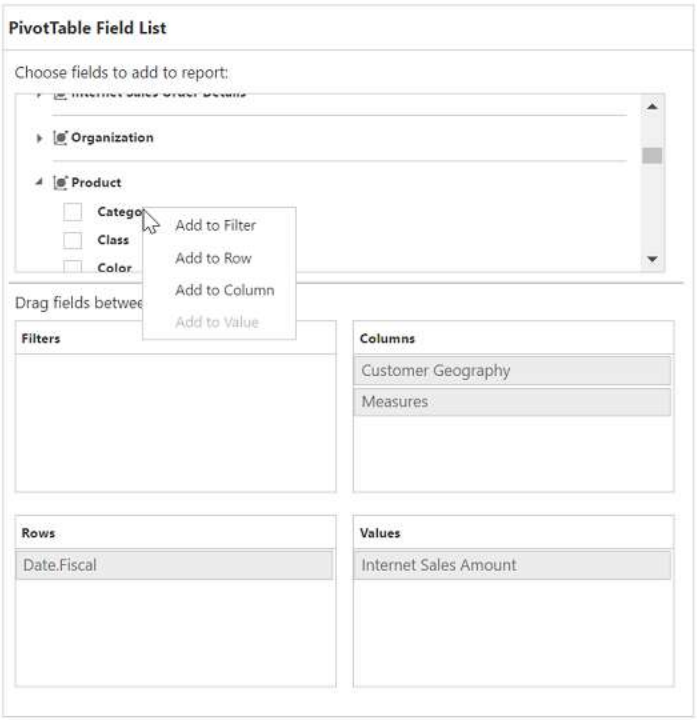


By Context Menu

You can also alter the report by using context menu.

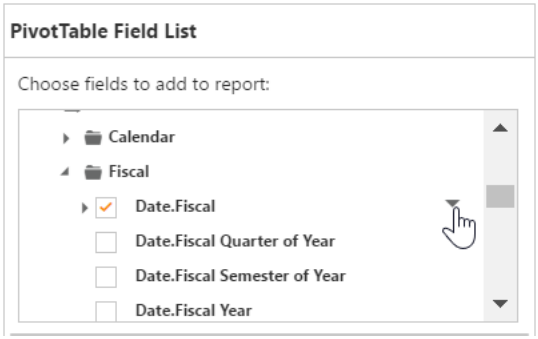


Copyright © 2001 - 2020 Syncfusion Inc.



Searching Values

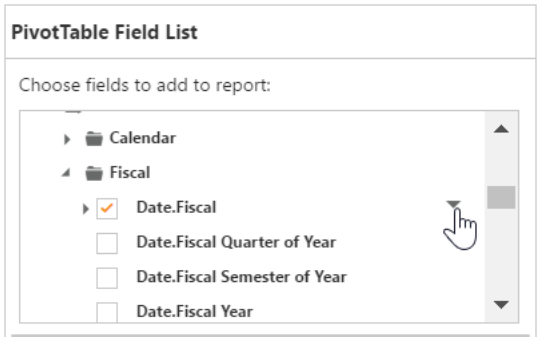
Search option available in Field List allows you to search a specific value that needs to be filtered from the list of values inside the filter pop-up window.



Copyright © 2001 - 2020 Syncfusion Inc.

Filtering

Values can be filtered by checking/unchecking the check box besides them, inside the filter pop-up window. At least one value needed to be checked state while filtering otherwise “Ok” button will be disabled.



Write-back

Information: This feature is applicable only for OLAP datasource only at Server Mode.

Copyright © 2001 - 2020 Syncfusion Inc.

We can now edit the values in PivotGrid and update a write enabled Cube at the back-end (SSAS) dynamically at runtime.

Note: Write-back is only supported for measures that use the **SUM** aggregation.

ASPX-CS

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").Url(Url.Content("/OLAPService"
)).EnableCellEditing(true)
```

C#

```
public Dictionary < string, object > WriteBack(string action, string
value, string rowUniqueName, string columnUniqueName, string
currentReport) {
OlapDataManager DataManager = new OlapDataManager(connectionString);
DataManager.SetCurrentReport(Syncfusion.JavaScript.Olap.Utils.Deserialize
OlapReport(currentReport));
return htmlHelper.GetJsonData(action, DataManager, value, rowUniqueName,
columnUniqueName);
}
```

	January	February	March	April	May
	Sales Amount Quota				
2005	1407017.22969963	1274053.85346841	1410559.62348303	1365055.33601641	1410557.18055029

Total	**8459808.0168754**	**6417205.0564744**	**8472265.92945609**	**8190478.79206778**	**8463343.08326104**

Defer Update

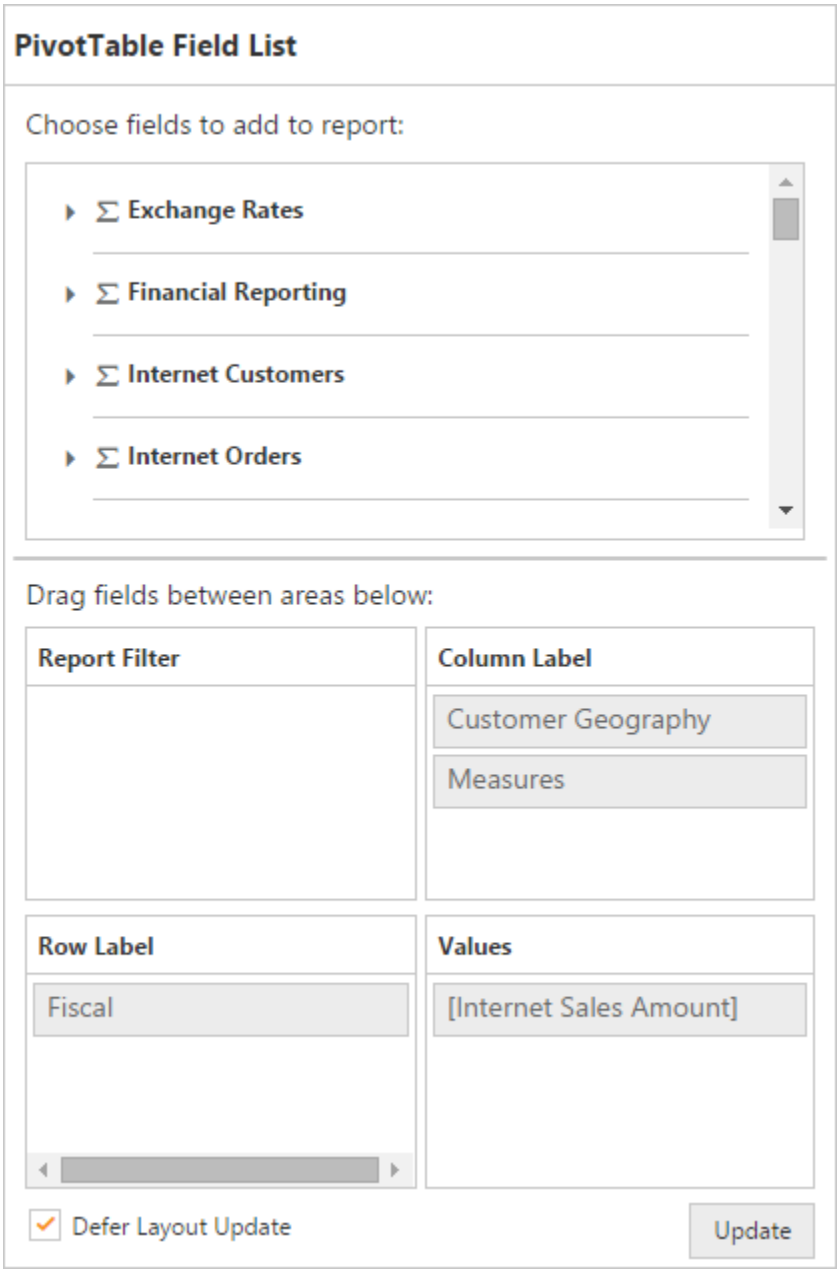
Information: This feature is applicable for OLAP datasource only at Server Mode.

Defer Update support allows you to refresh the control only on-demand and not during every UI interaction.

ASPX-CS

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").Url(Url.Content("/OLAPService"
)).ClientSideEvents(events =>
events.AfterServiceInvoke("OnAfterServiceInvoke"))
@Html.EJ().Pivot().PivotSchemaDesigner("PivotSchemaDesigner").Layout(Pivo
tSchemaDesignerLayout.Excel)
<script type="text/javascript">
OnAfterServiceInvoke = function(evt) {
if (evt.action == "initialize") {
```

```
var PivotSchemaDesigner =
$("#PivotSchemaDesigner").data('ejPivotSchemaDesigner');
if (PivotSchemaDesigner.model.pivotControl == null) {
PivotSchemaDesigner.model.pivotControl = this;
PivotSchemaDesigner.model.enableWrapper = true;
PivotSchemaDesigner.model.layout = "excel";
PivotSchemaDesigner._load();
}
}
}
</script>
```



Exporting

The PivotGrid control can be exported to the following file formats.

- Excel
- Word
- PDF
- CSV

The PivotGrid control can be exported by invoking **"exportPivotGrid"** method, with an appropriate export option as parameter.

JSON Export

Information: By default JSON export mode will be applied for server and client mode.

ASPX-CS

```
//For PivotGrid in Client Mode.
@Html.EJ().Pivot().PivotGrid("PivotGrid1").DataSource(dataSource =>
dataSource.Rows(rows=>{rows.FieldName("[Date].[Fiscal]").Add();}).Columns
(columns=>{columns.FieldName("[Customer].[Customer
Geography]").Add();}).Values(values => { values.Measures(measures => {
measures.FieldName("[Measures].[Internet Sales Amount]").Add();
}).Axis(AxisName.Column).Add();})
.Data("https://bi.syncfusion.com/olap/msmdpump.dll").Catalog("Adventure
Works DW 2008 SE").Cube("Adventure Works"))
//For PivotGrid in Server Mode.
@Html.EJ().Pivot().PivotGrid("PivotGrid1").Url(Url.Content("../OLAPServic
e"))
@Html.EJ().Button("Button1").ClientSideEvents(clientSideEvents => {
clientSideEvents.Click("exportBtnClick"); }).Text("Export")
<script type="text/javascript">
function exportBtnClick(args) {
var pGridObj = $('#PivotGrid1').data("ejPivotGrid");
pGridObj.exportPivotGrid("ExcelExport","fileName");
}
</script>
```

To achieve exporting, we need to add **"Syncfusion.EJ.Export"** dependency library into the application.

When PivotGrid is rendered, a method needs to be added in MVC controller file of the application and we need to import **"Syncfusion.EJ.Export"** namespace in the controller file.

C#

```
//...
using Syncfusion.EJ.Export;
public void ExcelExport()
{
PivotGridExcelExport pGrid = new PivotGridExcelExport();
string args =
System.Web.HttpContext.Current.Request.Form.GetValues(0)[0];
string fileName = "Sample";
pGrid.ExportToExcel(fileName, args,
System.Web.HttpContext.Current.Response);
}
```

Copyright © 2001 - 2020 Syncfusion Inc.

Excel Export

User can export the contents of PivotGrid to an Excel document for future archival, references and analysis purposes.

To achieve Excel export, the controller method name **"ExcelExport"** and file name is sent as the parameter.

JS

```
<script type="text/javascript">
function exportBtnClick(args)
{
var pGridObj = $('#PivotGrid1').data("ejPivotGrid");
pGridObj.exportPivotGrid("ExcelExport","fileName");
}
</script>
```

Following method needs to be added in MVC controller file of the application.

C#

```
//...
using Syncfusion.EJ.Export;
public void ExcelExport()
{
PivotGridExcelExport pGrid = new PivotGridExcelExport();
string args =
System.Web.HttpContext.Current.Request.Form.GetValues(0)[0];
string fileName = "Sample";
pGrid.ExportToExcel(fileName, args,
System.Web.HttpContext.Current.Response);
}
```

Word Export

User can export the contents of PivotGrid to a Word document for future archival, references and analysis purposes.

To achieve Word export, controller method name **"WordExport"** and file name is sent as the parameter.

JS

```
<script type="text/javascript">
function exportBtnClick(args)
{
var pGridObj = $('#PivotGrid1').data("ejPivotGrid");
pGridObj.exportPivotGrid("WordExport","fileName");
}
</script>
```

Following method needs to be added in MVC controller file of the application.

C#

```
//...
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
using Syncfusion.EJ.Export;
public void WordExport()
{
PivotGridWordExport pGrid = new PivotGridWordExport();
string args =
System.Web.HttpContext.Current.Request.Form.GetValues(0)[0];
string fileName = "Sample";
pGrid.ExportToWord(fileName, args,
System.Web.HttpContext.Current.Response);
}
```

PDF Export

User can export contents of the PivotGrid to PDF document for future archival, references and analysis purposes.

To achieve Word export, controller method name **"PDFExport"** and file name is sent as the parameter.

JS

```
<script type="text/javascript">
function exportBtnClick(args)
{
var pGridObj = $('#PivotGrid1').data("ejPivotGrid");
pGridObj.exportPivotGrid("PDFExport","fileName");
}
</script>
```

Following method needs to be added in MVC controller file of the application.

C#

```
//...
using Syncfusion.EJ.Export;
public void PDFExport()
{
PivotGridPDFExport pGrid = new PivotGridPDFExport();
string args =
System.Web.HttpContext.Current.Request.Form.GetValues(0)[0];
string fileName = "Sample";
pGrid.ExportToPDF(fileName, args,
System.Web.HttpContext.Current.Response);
}
```

CSV Export

User can export the contents of PivotGrid to a CSV document for future archival, references and analysis purposes.

To achieve CSV export, controller method name **"CSVExport"** and file name is sent as the parameter.

JS

```
<script type="text/javascript">
function exportBtnClick(args)
{
var pGridObj = $('#PivotGrid1').data("ejPivotGrid");
pGridObj.exportPivotGrid("CSVExport","fileName");
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
}
</script>
```

Following method needs to be added in MVC controller file of the application.

C#

```
//...
using Syncfusion.EJ.Export;
public void CSVExport()
{
PivotGridCSVExport pGrid = new PivotGridCSVExport();
string args =
System.Web.HttpContext.Current.Request.Form.GetValues(0)[0];
string fileName = "Sample";
pGrid.ExportToCSV(fileName, args,
System.Web.HttpContext.Current.Response);
}
```

Customize the export document name

For customizing file name, we need to send file name as parameter to the **"exportPivotGrid"** method along with method name.

JS

```
function exportBtnClick(args)
{
var pGridObj = $('#PivotGrid1').data("ejPivotGrid");
pGridObj.exportPivotGrid("ExcelExport","fileName");
}
```

PivotEngine Export

Information: This feature is applicable only at server mode operation.

In order to perform exporting with the use of PivotEngine available in server-side, the 'exportMode' property obtained in the "BeforeExport" event is set to the value "ej.PivotGrid.ExportMode.PivotEngine" as shown below.

ASPX-CS

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").Url(Url.Content("../OLAPServic
e")).ClientSideEvents(clientSideEvents =>
clientSideEvents.BeforeExport("Export"))
@Html.EJ().Button("Button1").ClientSideEvents(clientSideEvents => {
clientSideEvents.Click("exportBtnClick"); }).Text("Export")
<script type="text/javascript">
function exportBtnClick(args) {
var pGridObj = $('#PivotGrid1').data("ejPivotGrid");
pGridObj.exportPivotGrid(ej.PivotGrid.ExportOptions.Excel);;
}
function Export(args) {
args.exportMode = ej.PivotGrid.ExportMode.PivotEngine;
}
</script>
```

Copyright © 2001 - 2020 Syncfusion Inc.

A service method needs to be added in WCF/WebAPI for server side operations.

For WebAPI controller, the below method needs to be added.

C#

```
//...
using Syncfusion.Compression.Base;
using Syncfusion.XlsIO;
using Syncfusion.DocIO.Base;
using Syncfusion.Pdf.Base;
[System.Web.Http.ActionName("Export")]
[System.Web.Http.HttpPost]
public void Export()
{
string args = HttpContext.Current.Request.Form.GetValues(0)[0];
OlapDataManager DataManager = new OlapDataManager(connectionString);
string fileName = "Sample";
htmlHelper.ExportPivotGrid(DataManager, args, fileName,
System.Web.HttpContext.Current.Response);
}
```

For WCF service, the below method needs to be added.

C#

```
//...
using Syncfusion.Compression.Base;
using Syncfusion.XlsIO;
using Syncfusion.DocIO.Base;
using Syncfusion.Pdf.Base;
public void Export(System.IO.Stream stream)
{
System.IO.StreamReader sReader = new System.IO.StreamReader(stream);
string args =
System.Web.HttpContext.Current.Server.UrlDecode(sReader.ReadToEnd()).Remo
ve(0, 5);
OlapDataManager DataManager = new OlapDataManager(connectionString);
string fileName = "Sample";
htmlHelper.ExportPivotGrid(DataManager, args, fileName,
System.Web.HttpContext.Current.Response);
}
```

Excel Export

User can export the contents of PivotGrid to an Excel document for future archival, references and analysis purposes.

To achieve Excel export, we need to add the following dependency libraries into the application.

- Syncfusion.Compression.Base
- Syncfusion.XlsIO.Base

For Excel export, **“ej.PivotGrid.ExportOptions.Excel”** enumeration value is sent as the parameter.

JS

Copyright © 2001 - 2020 Syncfusion Inc.

```
function exportBtnClick(args)
{
var pGridObj = $('#PivotGrid1').data("ejPivotGrid");
//Setting export option as Excel in the exportPivotGrid method for
ServerMode
pGridObj.exportPivotGrid(ej.PivotGrid.ExportOptions.Excel);
}
```

Word Export

User can export the contents of PivotGrid to a Word document for future archival, references and analysis purposes.

To achieve Word export, we need to add the following dependency libraries into the application.

- Syncfusion.Compression.Base
- Syncfusion.DocIO.Base

For Word export, **“ej.PivotGrid.ExportOptions.Word”** enumeration value is sent as the parameter.

JS

```
function exportBtnClick(args)
{
var pGridObj = $('#PivotGrid1').data("ejPivotGrid");
//Setting export option as Word in the exportPivotGrid method
pGridObj.exportPivotGrid(ej.PivotGrid.ExportOptions.Word);
}
```

PDF Export

User can export the contents of PivotGrid to a PDF document for future archival, references and analysis purposes.

To achieve PDF export, we need to add the following dependency libraries into the application.

- Syncfusion.Compression.Base
- Syncfusion.Pdf.Base

For PDF export, **“ej.PivotGrid.ExportOptions.PDF”** enumeration value is sent as the parameter.

JS

```
function exportBtnClick(args)
{
var pGridObj = $('#PivotGrid1').data("ejPivotGrid");
//Setting export option as PDF in the exportPivotGrid method
pGridObj.exportPivotGrid(ej.PivotGrid.ExportOptions.PDF);
}
```

CSV Export

User can export the contents of PivotGrid to a CSV document for future archival, references and analysis purposes.

For CSV export, **“ej.PivotGrid.ExportOptions.CSV”** enumeration value is sent as the parameter.

Copyright © 2001 - 2020 Syncfusion Inc.

JS

```
function exportBtnClick(args)
{
var pGridObj = $('#PivotGrid1').data("ejPivotGrid");
//Setting export option as CSV in the exportPivotGrid method
pGridObj.exportPivotGrid(ej.PivotGrid.ExportOptions.CSV);
}
```

File format selection

Information: This option is applicable only for PivotGrid when exporting to Excel document.

You can set the option for exporting the control to Excel document either in *.xls* or *.xlsx* format, using `fileFormat` property inside the `BeforeExport` event.

Note: By default excel document will be exported to ".xls" format using PivotEngine export.

ASPX-CS

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").Url(Url.Content("../Relational
Service")).ClientSideEvents(clientSideEvents =>
clientSideEvents.BeforeExport("Export"))
@Html.EJ().Button("Button1").ClientSideEvents(clientSideEvents => {
clientSideEvents.Click("exportBtnClick"); }).Text("Export")
<script type="text/javascript">
function exportBtnClick(args) {
var pGridObj = $('#PivotGrid1').data("ejPivotGrid");
pGridObj.exportPivotGrid(ej.PivotGrid.ExportOptions.Excel);
}
function Export(args) {
args.exportMode = ej.PivotGrid.ExportMode.PivotEngine;
args.fileFormat = ".xlsx"; //you can set the excel sheet format here
}
</script>
```

Customize the export document name

For customizing name in WebAPI controller, below code snippet is used.

C#

```
//...
using Syncfusion.Compression.Base;
using Syncfusion.XlsIO;
using Syncfusion.DocIO.Base;
using Syncfusion.Pdf.Base;
[System.Web.Http.ActionName("Export")]
[System.Web.Http.HttpPost]
public void Export() {
string args = HttpContext.Current.Request.Form.GetValues(0)[0];
OlapDataManager DataManager = new OlapDataManager(connectionString);
string fileName = " File name is customized here ";
htmlHelper.ExportPivotGrid(DataManager, args, fileName,
System.Web.HttpContext.Current.Response);
}
```

Copyright © 2001 - 2020 Syncfusion Inc.

For customizing name in WCF Service, below code snippet is used.

C#

```
//...
using Syncfusion.Compression.Base;
using Syncfusion.XlsIO;
using Syncfusion.DocIO.Base;
using Syncfusion.Pdf.Base;
public void Export(System.IO.Stream stream) {
System.IO.StreamReader sReader = new System.IO.StreamReader(stream);
string args =
System.Web.HttpContext.Current.Server.UrlDecode(sReader.ReadToEnd()).Remo
ve(0, 5);;
OlapDataManager DataManager = new OlapDataManager(connectionString);
string fileName = " File name is customized here ";
htmlHelper.ExportPivotGrid(DataManager, args, fileName,
System.Web.HttpContext.Current.Response);
}
```

Exporting Customization

You can add title and description to the exporting document by using the title and description properties respectively obtained in the BeforeExport event. Similarly, you can enable or disable styling on the exported document by using the exportWithStyle property.

ASPX-CS

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").ClientSideEvents(clientSideEve
nts => clientSideEvents.BeforeExport("Exporting"))
@Html.EJ().Button("Button1").ClientSideEvents(clientSideEvents => {
clientSideEvents.Click("exportBtnClick"); }).Text("Export")
<script type="text/javascript">
function exportBtnClick(args) {
var pGridObj = $('#PivotGrid1').data("ejPivotGrid");
//JSON Export
pGridObj.exportPivotGrid("ExcelExport","fileName");
//PivotEngine Export
pGridObj.exportPivotGrid(ej.PivotGrid.ExportOptions.Excel);
}
function Exporting(args) {
args.title = "PivotGrid";
args.description = "Displays both OLAP and Relational datasource in
tabular format";
args.exportWithStyle = true;   // by default it sets as true. It improves
performance on exporting huge data when it sets as false.
}
</script>
```

You can also edit the exporting document with the use of a server side event for required exporting option.

C#

```
//...
using Syncfusion.EJ.Export;
using Syncfusion.Compression.Base;
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
using Syncfusion.XlsIO;
using Syncfusion.DocIO.Base;
using Syncfusion.Pdf.Base;
//Following methods needs to be added in MVC controller file of the
application for JSON export
public void ExcelExport()
{
PivotGridExcelExport pGrid = new PivotGridExcelExport();
string args =
System.Web.HttpContext.Current.Request.Form.GetValues(0)[0];
string fileName = "Sample";
pGrid.ExcelExport += pGrid_ExcelExport;
pGrid.ExportToExcel(fileName, args,
System.Web.HttpContext.Current.Response);
}

Exporting complete data on Paging

When paging is enabled, you can export the complete data by enabling the EnableCompleteDataExport property. It is supported in both types of JSON and PivotEngine export and it is applicable for all kinds of exporting formats available in PivotGrid.

ASPX-CS

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").EnableCompleteDataExport(true)
```

The below screenshot shows the PivotGrid control exported to Excel document.

	Australia	Canada	France	Germany	United Kingdom	United States	Total
	Internet Sales Amount						
FY 2002	$2,568,701.39	$573,100.97	$414,245.32	$513,353.17	$550,507.33	$2,452,176.07	$7,072,084.24

Note: Grand total can be hidden while exporting the document.

Common

PivotGrid: Elements

Hyperlink

The PivotGrid control supports hyperlink option to link data for each individual cell. Hyperlink can be enabled separately for row header, column header, value and summary cells. Following are the respective properties:

- **EnableColumnHeaderHyperlink** - Enables hyperlink for column headers.
- **EnableRowHeaderHyperlink** - Enables hyperlink for row headers.
- **EnableSummaryCellHyperlink** - Enables hyperlink for summary cell.
- **EnableValueCellHyperlink** - Enables hyperlink for value cell.

Also hyperlink option provides separate events for row header, column header, value and summary cells as mentioned below.

- **ColumnHeaderHyperlinkClick** - Returns column header information through event on hyperlink click.
- **RowHeaderHyperlinkClick** - Returns row header information through event on hyperlink click.
- **SummaryCellHyperlinkClick** - Returns summary cell information through event on hyperlink click.
- **ValueCellHyperlinkClick** - Returns value cell information through event on hyperlink click.

ASPX-CS

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").ClientSideEvents(events =>
events.ValueCellHyperlinkClick("CellClickEvent").RowHeaderHyperlinkClick(
"CellClickEvent").ColumnHeaderHyperlinkClick("CellClickEvent").SummaryCel
lHyperlinkClick("CellClickEvent")).HyperlinkSettings(hypLink =>
```

Selection

You can select a particular range of value cells from PivotGrid and manipulate/display them. Cell selection is applicable only for value cells and you can enable this functionality by setting EnableCellSelection property to true.

The **"CellSelection"** event would be triggered as soon as the selection process is over, that is, when the mouse left click is released. The event argument contains a collection of JSON records and header values, which contains information about the selected cells.

ASPX-CS

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").EnableCellSelection(true).Clie
ntSideEvents(events => events.CellSelection("valueCellClick"))
<script type="text/javascript">
valueCellClick = function(evt) {
// The event lets you to perform required operation with the selected set
of cells. The details of the selected range can be obtained in the
parameter of the event.
cellvalue = evt.JSONRecords;
rowheaders = evt.rowHeader;
colheaders = evt.columnHeader;
}
</script>
```

Cell Context

Cell context allows user to perform any custom operation on cell right-click. For example, you can create and display context menu on cell right-click.

Cell context is enabled by setting the EnableCellContext property to true. The **"cellContext"** event would be raised as soon as right-click is done providing cell information through event argument.

ASPX-CS

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").EnableCellContext(true).Client
SideEvents(events=>events.CellContext("cell_RightClick"))
<script type="text/javascript">
cell_RightClick = function(evt) {
//Write your Cell Context code here
}
</script>
```

Conditional Formatting

Conditional formatting allows user to highlight particular cells with certain color, font-style, font-family etc. based on the condition they have met. It is enabled by setting EnableConditionalFormatting property to true and the formatting dialog is launched when **"createConditionalDialog"** method is invoked.

ASPX-CS

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").EnableConditionalFormatting(tr
ue)
@Html.EJ().Button("Button1").Size(ButtonSize.Normal).Text("Conditional").
ShowRoundedCorner(true).ClientSideEvents(events =>
events.Click("btnClick"))
<script type="text/javascript">
function btnClick(e) {
var pivotGridObj = $('#PivotGrid1').data("ejPivotGrid");
if (pivotGridObj.model.enableConditionalFormatting) {
pivotGridObj.createConditionalDialog();
}
}
</script>
```

Export

We can export the PivotGrid with highlighted particular cells along with its formatting styles.

LIMITATIONS FOR WORD:

The following border styles are not supported

- Solid
- Groove
- Ridge

LIMITATIONS FOR PDF:

Border styles are not applicable.

LIMITATIONS FOR EXCEL:

The following border styles are alone supported

- Dashed
- Dotted
- Double

Also border size is not supported.

Number format

Information: This feature is applicable only for all modes.

Allows us to specify the required number format that PivotGrid should use in its values by setting the Format option. Following number formats that are supported:

- number
- decimal
- currency
- percentage
- date
- time
- scientific
- accounting
- fraction
- string

Relational

Client Mode

ASPX-CS

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").ClientSideEvents(clientSideEve
nts => clientSideEvents.Load("onLoad")).DataSource(dataSource =>
dataSource.Rows(rows => {
rows.FieldName("Country").FieldCaption("Country").Add();
rows.FieldName("State").FieldCaption("State").Add(); }).Columns(columns
=> { columns.FieldName("Product").FieldCaption("Product").Add();
}).Values(values => {
values.FieldName("Amount").Format("currency").Add();
values.FieldName("Quantity").Format("decimal").Add(); }))
```

Server Mode

You can set Number Format through the Format property. You should specify the format to the property as per the MS standard notation.

```
private PivotReport BindDefaultData()

{

PivotReport pivotSetting = new PivotReport();

pivotSetting.PivotRows.Add(new PivotItem { FieldMappingName = "Product", FieldHeader = "Product", TotalHeader = "Total" });

pivotSetting.PivotColumns.Add(new PivotItem { FieldMappingName = "Country", FieldHeader = "Country", TotalHeader = "Total" });

//specify the format here

pivotSetting.PivotCalculations.Add(new PivotComputationInfo { CalculationName = "Amount", Description = "Amount", FieldHeader = "Amount", FieldName = "Amount", Format = "E", SummaryType = Syncfusion.PivotAnalysis.Base.SummaryType.DoubleTotalSum });

return pivotSetting;

}
```

Server Mode

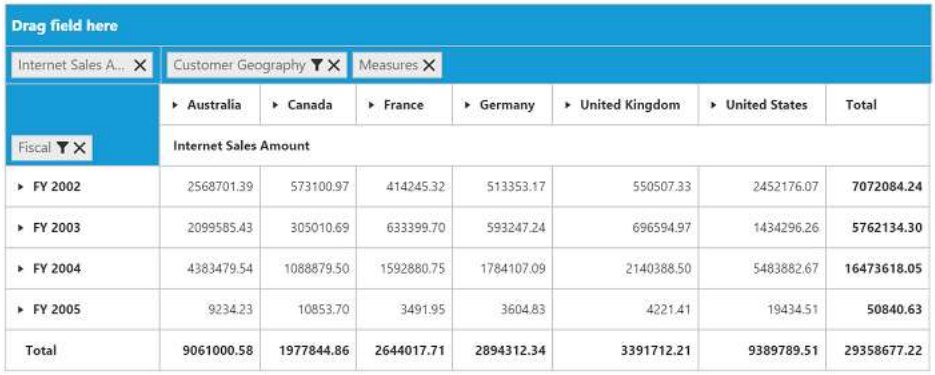
OLAP server mode supports the following Number Formats in addition to the above mentioned formats.

- General
- RoundTrip
- FixedPoint
- HexaDecimal

Note: You can set the number format through the Format property.

```
private OlapReport CreateOlapReport()
{
OlapReport olapReport = new OlapReport();
olapReport.CurrentCubeName = "Adventure Works";
```

```
MeasureElements measureElement = new MeasureElements();
measureElement.Elements.Add(new MeasureElement { UniqueName = "[Measures].[Internet Sales Amount]", Format = NumberFormat.FixedPoint }); //Specify the format here
DimensionElement dimensionElementRow = new DimensionElement();
dimensionElementRow.Name = "Date";
dimensionElementRow.AddLevel("Fiscal", "Fiscal Year");
DimensionElement dimensionElementColumn = new DimensionElement();
dimensionElementColumn.Name = "Customer";
dimensionElementColumn.AddLevel("Customer Geography", "Country");
olapReport.SeriesElements.Add(dimensionElementRow);
olapReport.CategoricalElements.Add(dimensionElementColumn);
olapReport.CategoricalElements.Add(measureElement);
return olapReport;
}
```



Save and Load Report

Allows you to save the current report of PivotGrid and render the control with the saved report later. We can save and load the report in two ways:

- Database
- Local Storage

Save Report to Database

By using current report name, storage option and url, we can save the current report of PivotGrid to database.

ASPX-CS

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").DataSource(.....)
@Html.EJ().Button("Button1").Size(ButtonSize.Normal).Text("Save").ShowRoundedCorner(true).ClientSideEvents(events => events.Click("saveReport"))
<script>
function saveReport(){
url = "../RelationalService",
```

```
name = "report",
storage = "db",
pGridObj.saveReport(name, storage, url);
}
</script>
```

A Service method needs to be added in WCF/WebAPI for storing current report of PivotGrid to database.

For WebAPI controller, the below method needs to be added.

C#

```
[System.Web.Http.ActionName("SaveReport")]
[System.Web.Http.HttpPost]
public Dictionary<string, object> SaveReport(Dictionary<string, object>
jsonResult)
{
string mode = jsonResult["operationalMode"].ToString();
bool isDuplicate = true;
SqlCeConnection con = new SqlCeConnection() { ConnectionString = "Enter
appropriate connection string to connect with database" };
con.Open();
SqlCeCommand cmd1 = null;
foreach (DataRow row in GetDataTable().Rows)
{
if ((row.ItemArray[0] as
string).Equals(jsonResult["reportName"].ToString()))
{
isDuplicate = false;
cmd1 = new SqlCeCommand("update ReportsTable set Report=@Reports where
ReportName like @ReportName", con);
}
}
if (isDuplicate)
{
cmd1 = new SqlCeCommand("insert into ReportsTable
Values(@ReportName,@Reports)", con);
}
cmd1.Parameters.Add("@ReportName", jsonResult["reportName"].ToString());
if (mode == "clientMode")
cmd1.Parameters.Add("@Reports",
Encoding.UTF8.GetBytes(jsonResult["clientReports"].ToString()).ToArray())
;
else if (mode == "serverMode")
cmd1.Parameters.Add("@Reports",
OLAPUTILS.Utils.GetReportStream(jsonResult["clientReports"].ToString()).T
oArray());
cmd1.ExecuteNonQuery();
con.Close();
return null;
}
```

For WCF service, the below method needs to be added.

C#

```
public Dictionary<string, object> SaveReport(string reportName, string
operationalMode, string olapReport, string clientReports)
{
string mode = operationalMode;
bool isDuplicate = true;
SqlCeConnection con = new SqlCeConnection() { ConnectionString = "Enter
appropriate connection string to connect with database" };
con.Open();
SqlCeCommand cmd1 = null;
foreach (DataRow row in GetDataTable().Rows)
{
if ((row.ItemArray[0] as string).Equals(reportName))
{
isDuplicate = false;
cmd1 = new SqlCeCommand("update ReportsTable set Report=@Reports where
ReportName like @ReportName", con);
}
}
if (isDuplicate)
{
cmd1 = new SqlCeCommand("insert into ReportsTable
Values(@ReportName,@Reports)", con);
}
cmd1.Parameters.Add("@ReportName", reportName);
//cmd1.Parameters.Add("@Reports",
OLAPUTILS.Utils.GetReportStream(clientReports).ToArray());
if (mode == "serverMode")
cmd1.Parameters.Add("@Reports",
OLAPUTILS.Utils.GetReportStream(clientReports).ToArray());
else if (mode == "clientMode")
cmd1.Parameters.Add("@Reports",
Encoding.UTF8.GetBytes(clientReports).ToArray());
cmd1.ExecuteNonQuery();
con.Close();
return null;
}
```

Save Report to Local Storage

To save the current report of PivotGrid to local storage, we need to call the SaveReport method in PivotGrid.

ASPX-CS

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").DataSource(.....).ClientSideEv
ents(events => events.SaveReport("saveToLocal"))
@Html.EJ().Button("Button1").Size(ButtonSize.Normal).Text("save To
Local").ShowRoundedCorner(true).ClientSideEvents(events =>
events.Click("saveLocal"))
<script>
function saveLocal(){
url = "",
name = "report",
storage = "local",
pGridObj.saveReport(name, storage, url);
}
function saveToLocal(args){
```

```
localStorage.setItem("report", JSON.stringify(args.report));
}
</script>
```

Load Report from Database

By using the stored report name, database name and url, we can load the saved report of PivotGrid from database.

HTML

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").DataSource(.....)
@Html.EJ().Button("Button1").Size(ButtonSize.Normal).Text("Load
DB").ShowRoundedCorner(true).ClientSideEvents(events =>
events.Click("loadDB"))
<script>
function loadDB(){
url = "../RelationalService",
name = "report",
storage = "db",
pGridObj.loadReport(name, storage, url);
}
</script>
```

Service methods need to be added in WCF/WebAPI for loading the stored report in database.

Relational

For WebAPI controller, the below methods need to be added.

C#

```
[System.Web.Http.ActionName("LoadReportFromDB")]
[System.Web.Http.HttpPost]
public Dictionary<string, object> LoadReportFromDB(Dictionary<string,
object> jsonResult)
{
byte[] reportString = new byte[2 * 1024];
PivotReport report = new PivotReport();
var reports = "";
string mode = jsonResult["operationalMode"].ToString();
Dictionary<string, object> dictionary = new Dictionary<string, object>();
if (mode == "serverMode" && jsonResult.ContainsKey("clientReports"))
{
reports = jsonResult["clientReports"].ToString();
}
else
{
foreach (DataRow row in GetDataTable().Rows)
{
if ((row.ItemArray[0] as
string).Equals(jsonResult["reportName"].ToString()))
{
if (mode == "clientMode")
{
reportString = (row.ItemArray[1] as byte[]);
dictionary.Add("report", Encoding.UTF8.GetString(reportString));
break;
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
}
else if (mode == "serverMode")
{
reports = OLAPUTILS.Utils.CompressData(row.ItemArray[1] as byte[]);
break;
}
}
}
}
if (reports != "")
{
report = htmlHelper.DeserializedReports(reports);
htmlHelper.PivotReport = report;
dictionary = htmlHelper.GetJsonData("loadOperation",
ProductSales.GetSalesData(), "Load Report",
jsonResult["reportName"].ToString());
}
return dictionary;
}
private DataTable GetDataTable()
{
SqlCeConnection con = new SqlCeConnection() { ConnectionString = "Enter
appropriate connection string to connect with database" };
con.Open();
DataSet dSet = new DataSet();
new SqlCeDataAdapter("Select * from ReportsTable", con).Fill(dSet);
con.Close();
return dSet.Tables[0];
}
```

For WCF service, the below methods need to be added.

C#

```
public Dictionary<string, object> LoadReportFromDB(string reportName,
string operationalMode, string olapReport, string clientReports)
{
byte[] reportString = new byte[2 * 1024];
PivotReport report = new PivotReport();
var reports = "";
string mode = operationalMode;
Dictionary<string, object> dictionary = new Dictionary<string, object>();
if (mode == "serverMode" && !string.IsNullOrEmpty(clientReports))
{
reports = clientReports;
}
else
{
foreach (DataRow row in GetDataTable().Rows)
{
if ((row.ItemArray[0] as string).Equals(reportName))
{
if (mode == "clientMode")
{
reportString = (row.ItemArray[1] as byte[]);
dictionary.Add("report", Encoding.UTF8.GetString(reportString));
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
break;
}
else if (mode == "serverMode")
{
reports = OLAPUTILS.Utils.CompressData(row.ItemArray[1] as byte[]);
break;
}
}
}
}
if (reports != "")
{
report = htmlHelper.DeserializedReports(reports);
htmlHelper.PivotReport = report;
dictionary = htmlHelper.GetJsonData("loadOperation",
ProductSales.GetSalesData(), "Load Report", reportName);
}
return dictionary;
}
private DataTable GetDataTable()
{
SqlCeConnection con = new SqlCeConnection() { ConnectionString = "Enter
appropriate connection string to connect with database"  };
con.Open();
DataSet dSet = new DataSet();
new SqlCeDataAdapter("Select * from ReportsTable", con).Fill(dSet);
con.Close();
return dSet.Tables[0];
}
```

OLAP

For WebAPI controller, the below methods need to be added.

C#

```
[System.Web.Http.ActionName("LoadReportFromDB")]
[System.Web.Http.HttpPost]
public Dictionary<string, object> LoadReportFromDB(Dictionary<string,
object> jsonResult)
{
string mode = jsonResult["operationalMode"].ToString();
byte[] reportString = new byte[4 * 1024];
var reports = "";
Dictionary<string, object> dictionary = new Dictionary<string, object>();
if (mode == "serverMode" && jsonResult.ContainsKey("clientReports"))
{
reports = jsonResult["clientReports"].ToString();
}
else
{
foreach (DataRow row in GetDataTable().Rows)
{
if ((row.ItemArray[0] as
string).Equals(jsonResult["reportName"].ToString()))
{
if (mode == "clientMode")
```

```
{
reportString = row.ItemArray[1] as byte[];
dictionary.Add("report", Encoding.UTF8.GetString(reportString));
break;
}
else if (mode == "serverMode")
{
reports = OLAPUTILS.Utils.CompressData(row.ItemArray[1] as byte[]);
break;
}
}
}
}
if (reports != "")
{
OlapDataManager DataManager = new OlapDataManager(connectionString);
dynamic customData =
serializer.Deserialize<dynamic>(jsonResult["customObject"].ToString());
var cultureIDInfo = new System.Globalization.CultureInfo(("en-US")).LCID;
if (customData is Dictionary<string, object> &&
customData.ContainsKey("Language"))
{
cultureIDInfo = new
System.Globalization.CultureInfo((customData["Language"])).LCID;
}
connectionString = connectionString.Replace("" + cultureIDInfoval + "",
"" + cultureIDInfo + "");
cultureIDInfoval = cultureIDInfo;
DataManager.Culture = new
System.Globalization.CultureInfo((cultureIDInfo));
DataManager.SetCurrentReport(OLAPUTILS.Utils.DeserializeOlapReport(report
s));
DataManager.OverrideDefaultFormatStrings = true;
dictionary = htmlHelper.GetJsonData(jsonResult["action"].ToString(),
DataManager, jsonResult["gridLayout"].ToString(),
Convert.ToBoolean(jsonResult["enablePivotFieldList"].ToString()));
}
return dictionary;
}
private DataTable GetDataTable()
{
SqlCeConnection con = new SqlCeConnection() { ConnectionString = "Enter
appropriate connection string to connect with database"  };
con.Open();
DataSet dSet = new DataSet();
new SqlCeDataAdapter("Select * from ReportsTable", con).Fill(dSet);
con.Close();
return dSet.Tables[0];
}
```

For WCF service, the below methods need to be added.

C#

```
public Dictionary<string, object> LoadReportFromDB(string action, string
layout, bool enablePivotFieldList, object customObject, string
```

```
reportName, string operationalMode, string olapReport, string
clientReports)
{
string mode = operationalMode;
var reports = "";
byte[] reportString = new byte[4 * 1024];
Dictionary<string, object> dictionary = new Dictionary<string, object>();
if (mode == "serverMode" && !string.IsNullOrEmpty(clientReports))
{
reports = clientReports;
}
else
{
foreach (DataRow row in GetDataTable().Rows)
{
if ((row.ItemArray[0] as string).Equals(reportName))
{
if (mode == "clientMode")
{
reportString = row.ItemArray[1] as byte[];
dictionary.Add("report", Encoding.UTF8.GetString(reportString));
break;
}
else if (mode == "serverMode")
{
reports = OLAPUTILS.Utils.CompressData(row.ItemArray[1] as byte[]);
break;
}
}
}
}
if (reports != "")
{
OlapDataManager DataManager = new OlapDataManager(connectionString);
dynamic customData =
serializer.Deserialize<dynamic>(customObject.ToString());
var cultureIDInfo = new System.Globalization.CultureInfo(("en-US")).LCID;

{
cultureIDInfo = new
System.Globalization.CultureInfo((customData["Language"])).LCID;
}
connectionString = connectionString.Replace("" + cultureIDInfoval + "",
"" + cultureIDInfo + "");
cultureIDInfoval = cultureIDInfo;
DataManager.Culture = new
System.Globalization.CultureInfo((cultureIDInfo));
DataManager.SetCurrentReport(OLAPUTILS.Utils.DeserializeOlapReport(report
s));
DataManager.OverrideDefaultFormatStrings = true;
dictionary = htmlHelper.GetJsonData(action, DataManager, layout,
enablePivotFieldList);
}
return dictionary;
}
private DataTable GetDataTable()
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
{
SqlCeConnection con = new SqlCeConnection() { ConnectionString = "Enter
appropriate connection string to connect with database" };
con.Open();
DataSet dSet = new DataSet();
new SqlCeDataAdapter("Select * from ReportsTable", con).Fill(dSet);
con.Close();
return dSet.Tables[0];
}
```

Load Report from Local Storage

To load the stored report of PivotGrid from local storage, we need to call the LoadReport method in PivotGrid.

HTML

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").DataSource(.....).ClientSideEv
ents(events => events.LoadReport("loadFromLocal"))
@Html.EJ().Button("Button1").Size(ButtonSize.Normal).Text("Load").ShowRou
ndedCorner(true).ClientSideEvents(events => events.Click("loadReport"))
<script>
function loadReport(){
url = "",
name = "report",
storage = "local",
pGridObj.loadReport(name, storage, url);
}
function loadFromLocal(args){
args.targetControl.model.dataSource =
JSON.parse(localStorage.getItem("report"));
}
</script>
```

Save and Load XML Report

Information: This feature is applicable only for the relational datasource at Server Mode alone.

This support allows you to save the current report of PivotGrid as XML and render the control with the saved XML report later.

Note: The following dependency libraries should be added to your web application.

- Syncfusion.PivotAnalysis.Wpf
- Syncfusion.Grid.Wpf

Save XML Report

By using the 'saveXMLReport' method, you can save the current report of PivotGrid as XML file.

ASPX-CS

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").Url(Url.Content("~/api/Relatio
nalGrid"))
@Html.EJ().Button("Button1").Size(ButtonSize.Normal).Text("Save").ShowRou
ndedCorner(true).ClientSideEvents(events => events.Click("saveReport"))
<script>
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
function saveReport() {
pGridObj = $('#PivotGrid1').data("ejPivotGrid");
url = "../api/RelationalGrid/XmlExport";
pGridObj.saveXMLReport("XML", url); // YOu can specify XML file name here
}
</script>
```

The service method should be added in WebAPI for exporting the current report as XML.

For **WebAPI controller**, the following method should be added.

Note: The following namespaces should be added on the top of the main class in WebAPI controller file.

- using System.IO;
- using System.Xml;
- using System.Xml.Serialization;
- using Syncfusion.Windows.Controls.PivotGrid;

C#

```
PivotGrid htmlHelper = new PivotGrid();
[System.Web.Http.ActionName("XmlExport")]
[System.Web.Http.HttpPost]
public void XmlExport()
{
string clientReport = HttpContext.Current.Request.Form.GetValues(0)[0];
string fileName = HttpContext.Current.Request.Form.GetValues(1)[0];
htmlHelper.ExportToXml(clientReport, fileName,
HttpContext.Current.Response);
}
```

Load XML Report

You can load the XML report in PivotGrid by using the following methods.

ASPX-CS

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").Url(Url.Content("~/api/Relatio
nalGrid"))
```

The service methods should be added in WebAPI for loading the stored XML report.

For **WebAPI controller**, the following methods should be added.

C#

```
PivotGrid htmlHelper = new PivotGrid();
JavaScriptSerializer serializer = new JavaScriptSerializer();
Dictionary<string, bool> clientSideAPI = new Dictionary<string, bool>();
Syncfusion.Windows.Controls.PivotGrid.PivotGridSerializer xmlSerializer =
new Syncfusion.Windows.Controls.PivotGrid.PivotGridSerializer();
string filePath = HttpContext.Current.Server.MapPath(".").Split(new
string[] { "\\api" }, StringSplitOptions.None)[0] + "\\pivot.xml";
[System.Web.Http.ActionName("XmlImport")]
[System.Web.Http.HttpPost]
public Dictionary<string, object> XmlImport()
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
{

var ser = serializer.Serialize(clientSideAPI);
dict = htmlHelper.GetJsonData("xmlImport", ProductSales.GetSalesData(),
ser, null);
return dict;
}
```

Grid Layout

Normal Layout

A layout in which summary cells are positioned at the bottom of each parent member and their child members appear next to them. Normal layout is the default layout in PivotGrid control. The enumeration property `Layout` needs to be set to **“PivotGridLayout.Normal”** in-order to view PivotGrid in normal layout.

Copyright © 2001 - 2020 Syncfusion Inc.

ASPX-CS

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").Layout(PivotGridLayout.Normal)
.Url(Url.Content("/OLAPService"))
```

Grand Total Hiding

Grand Total Hiding can be classified into three categories.

- Row Grand Total Hiding
- Column Grand Total Hiding
- Both

Row Grand Total Hiding

You can hide the **Grand Total** in row alone by setting the property EnableRowGrandTotal to false.

ASPX-CS

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").EnableRowGrandTotal(false).Dat
aSource(.....)
```

		Canada		France		Germany		United Kingdom		United States		Grand Total

Advanced Filtering and Sorting

It allows to filter and sort the field members in PivotGrid.

Client Mode

In client mode, you can enable Advanced Filtering and Sorting option in PivotGrid by setting the EnableAdvancedFilter property under DataSource to true.

HTML

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").DataSource(dataSource =>
dataSource.EnableAdvancedFilter(true))
```

Server Mode

In server mode, you can enable the Advanced Filtering and Sorting option in PivotGrid by setting the EnableAdvancedFilter property to true.

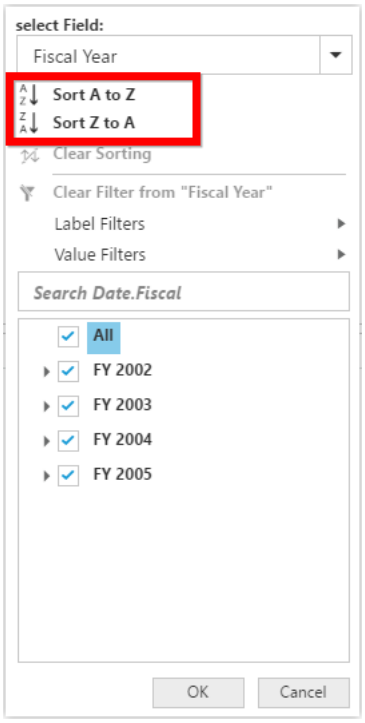
HTML

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").EnableAdvancedFilter(true)
```

Sorting

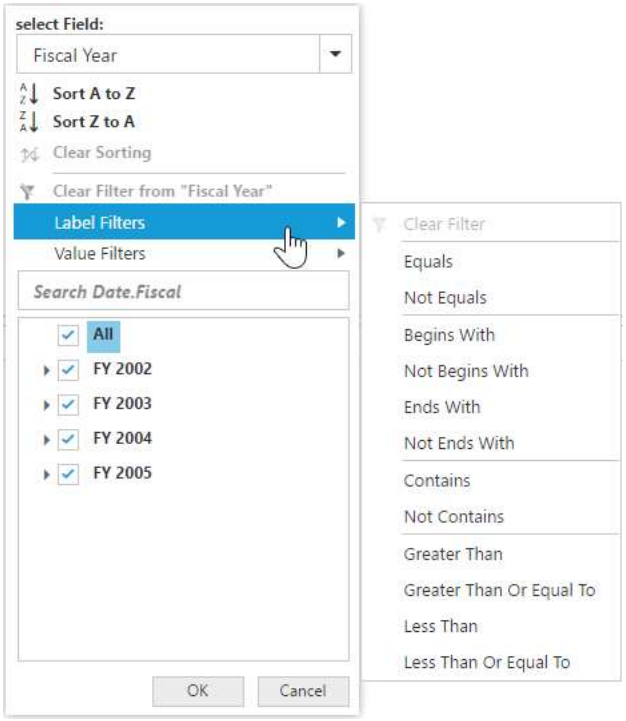
Sorting provides an option to sort the members of a field either in ascending or descending order.

Copyright © 2001 - 2020 Syncfusion Inc.



Label Filtering

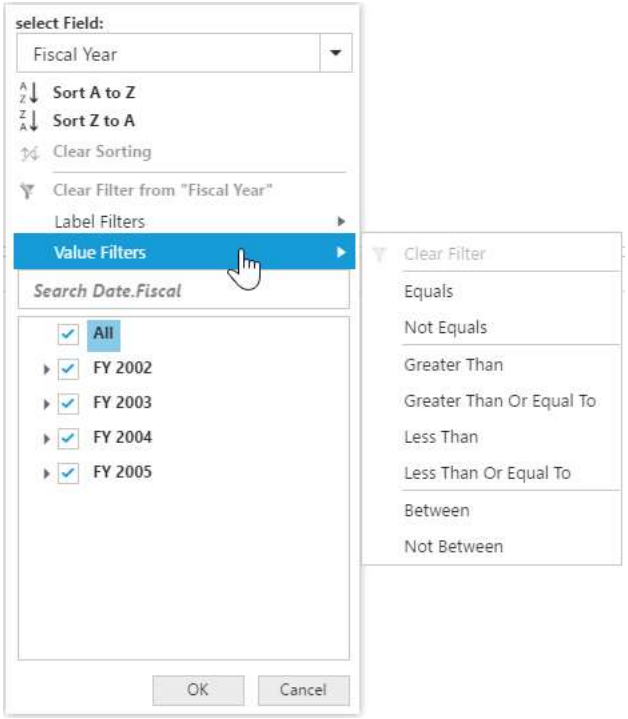
Label filtering provides an option to filter the members of a field purely based on their caption.

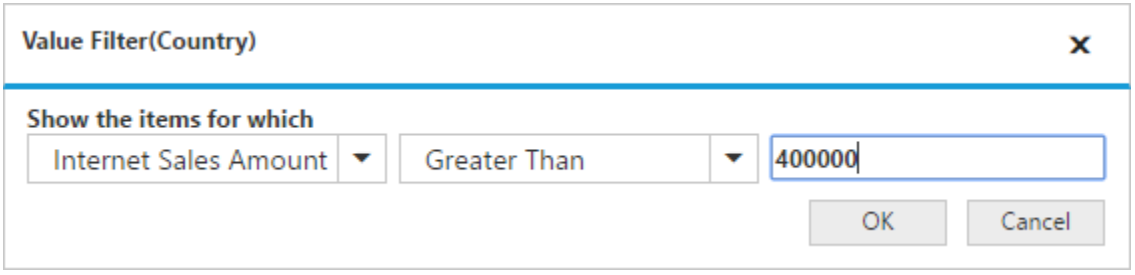


Copyright © 2001 - 2020 Syncfusion Inc.

Value Filtering

Value filtering provides an option to filter members based on the total values of the appropriate measure between the members of the level.





Paging

Pager

Paging helps to improve the rendering performance of the PivotGrid control by dividing large amount of data into sections and displaying one section at a time. You can enable Paging option in PivotGrid by setting the `EnablePaging` property to true. You can provide the page size and current page details for each axis in `PagerOptions` property.

Copyright © 2001 - 2020 Syncfusion Inc.

In-order to initialize a **Pager**, first you need to define a **div** tag with an appropriate **id** attribute which acts as a container for the widget. Then you need to initialize the widget using **ejPivotPager** method.

Inside the **ejPivotPager** method, the enumeration property mode needs to be set to **ej.PivotPager.Mode.Both** in-order to display both categorical pager and series pager. The other enumerations such as **ej.PivotPager.Mode.Categorical** and **ej.PivotPager.Mode.Series** will display only categorical pager and series pager respectively.

ASPX-CS

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").DataSource(dataSource =>
dataSource.PagerOptions(pagerOptions => {
pagerOptions.CategoricalPageSize(3).SeriesPageSize(3).CategoricalCurrentP
age(1).SeriesCurrentPage(1); })).EnablePaging(true)
@Html.EJ().Pivot().PivotPager("Pager1").Mode(PivotPagerMode.Both).TargetC
ontrolID("PivotGrid1")
```

Following are the navigation options available in Pager.

- Move First - Navigates to the first page.
- Move Last - Navigates to the last page.
- Move Previous - Navigates to the previous page from the current page.
- Move Next - Navigates to the next page from the current page.
- Numeric Box - Navigates to the desired page by entering an appropriate page number in numeric value.

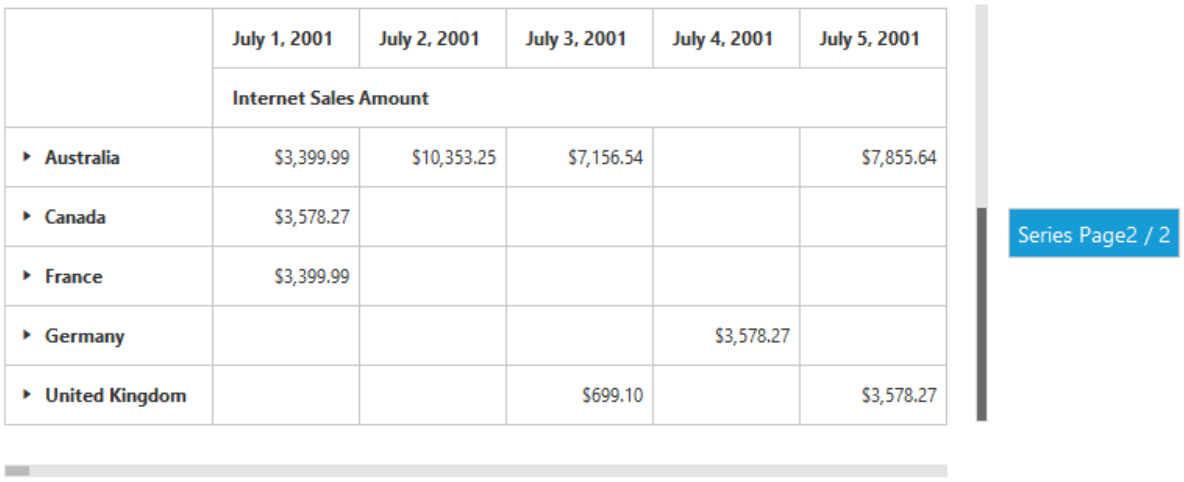
▸ Canada	$3,399.99				
▸ France					
▸ Germany					

Virtual Scrolling

Virtual Scrolling is a technique that allows user to view the PivotGrid information page by page with the use of vertical and horizontal scrollbar. You can enable Virtual Scrolling option in PivotGrid by setting the EnableVirtualScrolling property to true. You can provide the page size and current page details for each axis in PagerOptions property.

ASPX-CS

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").DataSource(dataSource =>
dataSource.PagerOptions(pagerOptions => {
pagerOptions.CategoricalPageSize(3).SeriesPageSize(3).CategoricalCurrentP
age(1).SeriesCurrentPage(1); })).EnableVirtualScrolling(true)
```



Page Settings

The properties associated to paging are:

- EnablePaging – This property is used to enable/disable paging in PivotClient control.
- PagerOptions.CategoricalPageSize - Specifies the number of categorical columns to be displayed within a page of the PivotClient control.
- PagerOptions.SeriesPageSize - Specifies the number of series rows to be displayed within a page of the PivotClient control.
- PagerOptions.CategoricalCurrentPage - Sets the current page of the categorical axis in PivotClient control.
- PagerOptions.SeriesCurrentPage - Sets the current page of the series axis in PivotClient control.

For client mode, page setting for categorical and series axes are mandatorily needed to be set in data source property by using the following properties.

ASPX-CS

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").DataSource(dataSource =>
dataSource.PagerOptions(pagerOptions => {
pagerOptions.CategoricalPageSize(3).SeriesPageSize(3).CategoricalCurrentP
age(1).SeriesCurrentPage(1); })).EnablePaging(true)
```

For server mode, the page settings for categorical and series axes are done only through report object, created inside WebAPI or WCF file.

For Relational data source

C#

```
PivotReport pivotReport = new PivotReport();
pivotReport.PagerOptions.SeriesPageSize = 4;
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
pivotReport.PagerOptions.CategoricalPageSize = 5;
pivotReport.PagerOptions.SeriesCurrentPage = 1;
pivotReport.PagerOptions.CategoricalCurrentPage = 1;
```

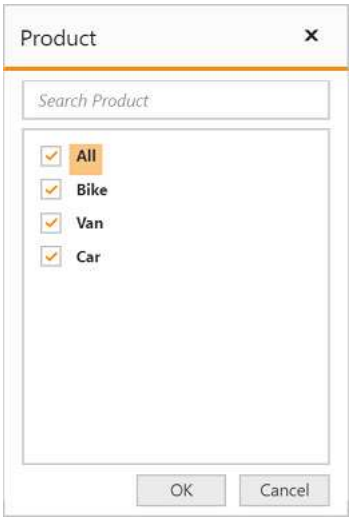
For OLAP data source

C#

```
OlapReport olapReport = new OlapReport();
olapReport.CurrentCubeName = "Adventure Works";
olapReport.EnablePaging = true;
olapReport.PagerOptions.SeriesPageSize = 4;
olapReport.PagerOptions.CategoricalPageSize = 5;
olapReport.PagerOptions.CategoricalCurrentPage = 1;
olapReport.PagerOptions.SeriesCurrentPage = 1;
```

Member Editor

Member editor is a dialog that displays the members of the current field in a tree view structure, which can be opened by clicking the filter icon available in the grouping bar. It helps to search, filter, and sort the field members available in the pivot grid control.



Member editor - Paging

Member editor paging helps to improve the rendering performance of the dialog by dividing large amount of data into sections and displaying them.

You can enable member editor paging and set member editor page size in PivotGrid control by setting the EnableMemberEditorPaging and MemberEditorPageSize properties.

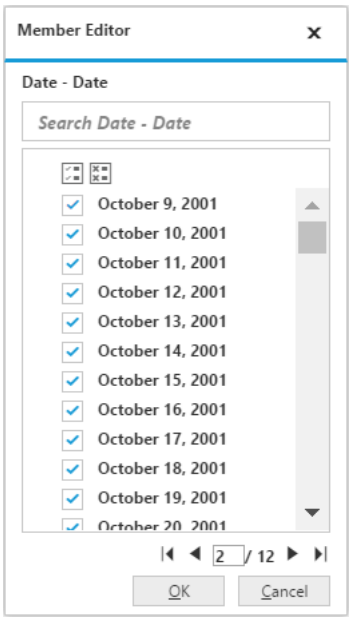
ASPX-CS

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").EnableMemberEditorPaging(true)
.MemberEditorPageSize(100)
```

Following are the navigation option available in Member Editor Pager.

- Move First - Navigates to the first page.

- Move Previous - Navigates to the previous page from the current page.
- Move Next - Navigates to the next page from the current page.
- Move Last - Navigates to the last page.
- Numeric Box - Navigates to the desired page by entering an appropriate page number in numeric value.



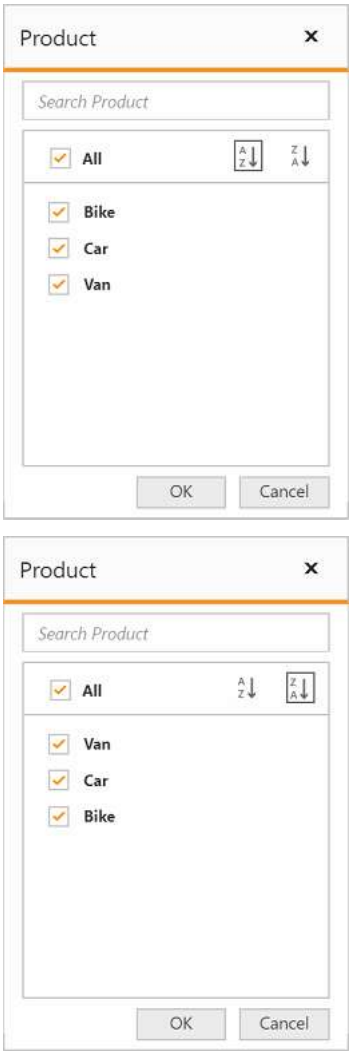
Member editor - Sorting

The sorting support in member editor helps you to sort the field members either in ascending or descending order.

You can enable the member editor sorting in the pivot grid control by setting the EnableMemberEditorSorting property.

ASPX-CS

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").EnableMemberEditorSorting(true
)
```



Frozen Header

Allows you to freeze the header of the Grid so that it will be always visible when scrolling the content with a large number of rows or columns providing a precise view.

ASPX-CS

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").DataSource(.....).FrozenHeader
Settings(frohead => frohead.EnableFrozenHeaders(true))
```

Copyright © 2001 - 2020 Syncfusion Inc.

We can also freeze the row/column headers individually by setting the below properties.

ASPX-CS

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").DataSource(.....).FrozenHeader
Settings(frohead => frohead.EnableFrozenRowHeaders(true))  //To Freeze
the Row headers
```

ASPX-CS

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").DataSource(.....).FrozenHeader
Settings(frohead => frohead.EnableFrozenColumnHeaders(true))  //To Freeze
the Column headers
```

Drill Through

Drill-through retrieves the raw items that are used to create a specific cell. To enable drill-through support, set EnableDrillThrough property to true. Raw items are obtained through the [DrillThrough] event, using which user can bind them to an external widget for precise view.

OLAP

Note: Drill-through is supported in PivotGrid only when we configure and enable drill-through action at the Cube.

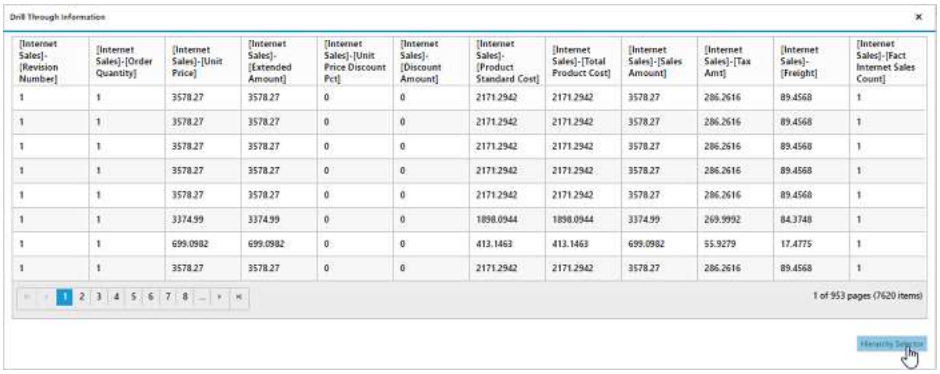
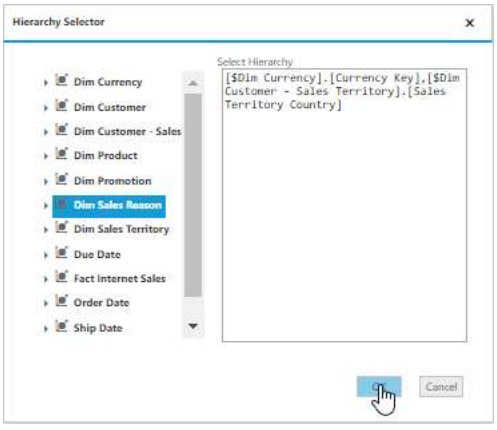
Value: 2644017.71430033
Row: 2006
Column: France-Sales Amount

On clicking any value cell, the "Drill Through Information" dialog will be opened. It consists of a Grid with data which are associated with the measure values of clicked value cell. In this example, the measure behind the respective cell is “Sales Amount” and the values of the dimensions which are associated with this measure are alone displayed in the Grid.



On clicking the "Hierarchy Selector" button which is displayed below the Grid, the Hierarchy Selector dialog will be opened. It consists of the dimensions which are associated with the measure of the clicked value cell. In this example, the measure behind the respective cell is “Sales Amount” and the dimensions associated with this measure are alone displayed in the dialog.



By dragging and dropping the respective hierarchies and finally clicking “OK”, drill through MDX query will be framed and executed internally and provides back the raw items through "DrillThrough" event. In

Copyright © 2001 - 2020 Syncfusion Inc.

this example, we have bound the raw items obtained to our ejGrid widget. Please refer the code sample and screen-shot below.

Client Mode

ASPX-CS

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").DataSource(.....).EnableDrillT
hrough(true).ClientSideEvents(events =>
events.DrillThrough("drilledData"))
<script type="text/javascript">
function drilledData(args) {
$(".e-dialog, .e-clientDialog, .e-tableDlg").remove();
gridData = JSON.parse(args.data);
var dialogContent = ej.buildTag("div#" + this._id + "_tableDlg.tableDlg",
$("<div id=\"Grid1\"></div>"))[0].outerHTML;
var dialogFooter = ej.buildTag("div", ej.buildTag("button#btnOK.e-
dialogBtnOK", "Hierarchy Selector")[0].outerHTML, { "float": "right",
"margin": "-5px 0 6px" })[0].outerHTML
ejDialog = ej.buildTag("div#clientDialog.e-clientDialog", dialogContent +
dialogFooter, { "opacity": "1" }).attr("title", "Drill Through
Information")[0].outerHTML;
$(ejDialog).appendTo("#" + this._id);
$("#btnOK").ejButton().css({ margin: "30px 0 20px 0" });
$("#Grid1").ejGrid({
dataSource: gridData,
allowPaging: true,
allowTextWrap: true,
pageSettings: { pageSize: 8 }
});
this.element.find(".e-clientDialog").ejDialog({ width: "70%", content:
"#" + this._id, enableResize: false, close:
ej.proxy(ej.Pivot.closePreventPanel, this) });
var pivotGrid = $("#" + this._id).data("ejPivotGrid");
$("#btnOK").click(function () {
ej.Pivot.openHierarchySelector(pivotGrid);
});
}
</script>
```

Server Mode

ASPX-CS

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").Url(Url.Content("/OLAPService"
)).EnableDrillThrough(true).ClientSideEvents(events =>
events.DrillThrough("drilledData"))
<script type="text/javascript">
function drilledData(args) {
$(".e-dialog, .e-clientDialog, .e-tableDlg").remove();
gridData = ej.isNullOrUndefined(args.data.d) ?
JSON.parse(args.data.DrillDataTable) : JSON.parse(args.data.d[1].Value);
var dialogContent = ej.buildTag("div#" + this._id + "_tableDlg.e-
tableDlg", $("<div id=\"Grid1\"></div>"))[0].outerHTML;
var dialogFooter = ej.buildTag("div", ej.buildTag("button#btnOK.e-
dialogBtnOK", "Hierarchy Selector")[0].outerHTML, { "float": "right",
"margin": "-5px 0 6px" })[0].outerHTML
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
ejDialog = ej.buildTag("div#clientDialog.e-clientDialog", dialogContent +
dialogFooter, { "opacity": "1" }).attr("title", "Drill Through
Information")[0].outerHTML;
$(ejDialog).appendTo("#" + this._id);
$("#btnOK").ejButton().css({ margin: "30px 0 20px 0" });
$("#Grid1").ejGrid({
dataSource: gridData,
allowPaging: true,
allowTextWrap: true,
pageSettings: { pageSize: 8 }
});
this.element.find(".e-clientDialog").ejDialog({ width: "70%", content:
"#" + this._id, enableResize: false, close:
ej.proxy(ej.Pivot.closePreventPanel, this) });
var pivotGrid = this;
$("#btnOK").click(function () {
$(".e-dialog, .e-clientDialog, .tableDlg").remove();
if (pivotGrid.model.operationalMode ==
ej.PivotGrid.OperationalMode.ServerMode) {
pivotGrid._waitingPopup.show()
pivotGrid.doAjaxPost("POST", pivotGrid.model.url + "/" +
pivotGrid.model.serviceMethodSettings.drillThroughHierarchies,
JSON.stringify({ "currentReport":
JSON.parse(pivotGrid.getOlapReport()).Report, "layout":
pivotGrid.model.layout, "cellPos": "", "customObject":
JSON.stringify(pivotGrid.model.customObject) }), function (args) {
ej.Pivot.openHierarchySelector(pivotGrid, args);
})
}
});
}
</script>
```

When PivotGrid is rendered in server mode, below service methods need to be added in WCF/WebAPI for drill through operation.

For WebAPI controller, the below methods need to be added.

C#

```
[System.Web.Http.ActionName("DrillThroughHierarchies")]
[System.Web.Http.HttpPost]
public string DrillThroughHierarchies(Dictionary<string, object>
jsonResult)
{
OlapDataManager DataManager = new OlapDataManager(connectionString);
DataManager.SetCurrentReport(OLAPUTILS.Utils.DeserializeOlapReport(jsonRe
sult["currentReport"].ToString()));
return htmlHelper.DrillthroughHierarchies(DataManager,
jsonResult["layout"].ToString(), jsonResult["cellPos"].ToString());
}
[System.Web.Http.ActionName("DrillThroughDataTable")]
[System.Web.Http.HttpPost]
public Dictionary<string, object>
DrillThroughDataTable(Dictionary<string, object> jsonResult)
{
```

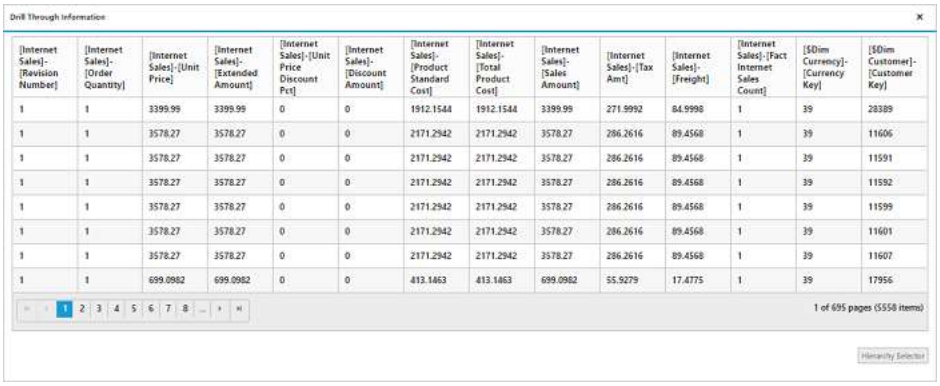
Copyright © 2001 - 2020 Syncfusion Inc.

```
OlapDataManager DataManager = new OlapDataManager(connectionString);
DataManager.SetCurrentReport(OLAPUTILS.Utils.DeserializeOlapReport(jsonRe
sult["currentReport"].ToString()));
return htmlHelper.DrillthroughDataTable(DataManager,
jsonResult["layout"].ToString(), jsonResult["cellPos"].ToString(),
jsonResult["selector"].ToString());
}
```

For WCF service, the below methods need to be added.

C#

```
public string DrillThroughHierarchies(string currentReport, string
layout, string cellPos)
{
OlapDataManager DataManager = new OlapDataManager(connectionString);
DataManager.SetCurrentReport(OLAPUTILS.Utils.DeserializeOlapReport(curren
tReport));
return htmlHelper.DrillthroughHierarchies(DataManager, layout, cellPos);
}
public Dictionary<string, object> DrillThroughDataTable(string
currentReport, string layout, string cellPos, string selector)
{
OlapDataManager DataManager = new OlapDataManager(connectionString);
DataManager.SetCurrentReport(OLAPUTILS.Utils.DeserializeOlapReport(curren
tReport));
return htmlHelper.DrillthroughDataTable(DataManager, layout, cellPos,
selector);
}
```



Relational

To enable drill-through support, set EnableDrillThrough property to true. Raw items are obtained through the DrillThrough event.

ASPX-CS

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").DataSource(.....).EnableDrillT
hrough(true).ClientSideEvents(events => events.DrillThrough("drillData"))
<script type="text/javascript">
function drillData(args) {
gridData = args.selectedData;
var dialogContent = ej.buildTag("div#Grid", { height: "50px"
})[0].outerHTML;
```

```
ejDialog = ej.buildTag("div#clientDialog.e-clientDialog", dialogContent,
{ "opacity": "1", "overflow": "auto" }).attr("title", "Drill Through
Information")[0].outerHTML;
$(ejDialog).appendTo("#" + this._id);
this.element.find(".e-clientDialog").ejDialog({ width: "70%", height:
"100%", content: "#" + this._id, enableResize: false, close:
ej.proxy(ej.Pivot.closePreventPanel, this) });
$("#Grid").ejGrid({
dataSource: gridData,
});
}
</script>
```

Resizing Column

Allows the user to change the column width by holding and dragging the column border using the mouse pointer.

Column Width Based on Size

The property EnableColumnResizing adjusts the width of each column based on size of the widget.

ASPX-CS

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").EnableColumnResizing(true).Dat
aSource(.....)
```

Column Width Based on Text

The ResizeColumnsToFit property automatically adjusts the width of each column based on the maximum content length available in the respective column.

ASPX-CS

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").ResizeColumnsToFit(true).DataS
ource(.....)
![Column resizing in ASP NET MVC pivot grid control](Column-
Resizing_images/columnresizing.png)
```

Styling

By default, PivotGrid supports **17** different themes.

- default-theme
- flat-azure-dark

Copyright © 2001 - 2020 Syncfusion Inc.

- fat-lime
- flat-lime-dark
- flat-saffron
- flat-saffron-dark
- gradient-azure
- gradient-azure-dark
- gradient-lime
- gradient-lime-dark
- gradient-saffron
- gradient-saffron-dark
- bootstrap-theme
- high-contrast-01
- high-contrast-02
- material
- office-365

You can also customize the appearance of the following component manually.

- PivotGrid
- Grouping Bar
- PivotTable Field List

To change the appearance of PivotGrid, apply the below customized CSS.

CSS

```
.e-pivotgrid table {
color: #565656;
background-color: White;
}
.e-pivotgrid th,
.e-pivotgrid td {
border: solid 1px;
border-color: #c4c4c4;
}
.e-pivotgrid .value {
background-color: White;
}
.e-pivotgrid .summary {
background-color: aqua !important;
color: #565656;
}
.e-pivotgrid .colheader, .e-pivotgrid .rowheader {
color: #5c5c5c;
background: white;
background-repeat: repeat;
}
.e-pivotgrid .colheader:hover, .e-pivotgrid .rowheader:hover {
color: white;
background: #91aa29;
background-repeat: repeat;
}
```

To change the appearance of PivotTable Field List, apply the below customized CSS.

CSS

```
.e-pivotschemadesigner, .e-pivotschemadesigner .e-fieldTable {
background-color: white;
color: black;
}
.e-pivotschemadesigner .e-treeview .e-active {
background: white;
}
.e-pivotschemadesigner .e-chkbox-wrap .e-chk-image.e-stop, .e-chkbox-wrap
.e-chk-image.e-checkmark {
color:green
}
.e-pivotschemadesigner .subheadText, .e-pivotschemadesigner .centerHead,
.e-pivotschemadesigner .e-schemaFieldTree.e-treeview .e-text{
color: black;
}
.e-pivotschemadesigner .e-pivotButton .e-pvtBtn {
background: green;
color: white;
}
```

You can also customize the appearance of the Pivot component using our Theme Studio utility. To know more about Theme Studio click here.

Localization and Globalization

Localization in PivotGrid

You can localize the PivotGrid controls text with a collection of localized strings using **"ej.PivotGrid.Locale"** for different cultures. By default, the PivotGrid control is localized in **"en-US"** culture.

ASPX-CS

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").Locale("fr-
FR").ClientSideEvents(events =>
events.AfterServiceInvoke("OnAfterServiceInvoke") ...)
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
@Html.EJ().Pivot().PivotSchemaDesigner("PivotSchemaDesigner1").Layout(Piv
otSchemaDesignerLayout.Excel)
@Html.EJ().Pivot().PivotPager("Pager1").Mode(PivotPagerMode.Both).Locale(
"fr-FR").TargetControlID("PivotGrid1")
< script type = "text/javascript" >
function OnAfterServiceInvoke(args) {
if (args.action == "initialize")
$("#PivotSchemaDesigner1").ejPivotSchemaDesigner({
pivotControl: this,
layout: ej.PivotSchemaDesigner.Layouts.Excel,
locale: "fr-FR"
});
}
ej.PivotSchemaDesigner.Locale["fr-FR"] = {
ClearFilter: "Effacer le filtre",
SelectField:"sélectionnez Champ",
Measures: "Mesures",
Warning: "Avertissement",
....
....
};
ej.PivotGrid.Locale["fr-FR"] = {
Sort:"Tri",
SelectField: "sélectionnez Champ",
LabelFilterLabel:"Afficher les éléments pour lesquels l'étiquette",
ValueFilterLabel:"Afficher les éléments pour lesquels",
...
...
};
ej.PivotPager.Locale["fr-FR"] = {
SeriesPage: "Série Page",
CategoricalPage: "Catégorique Page"
};
< /script>
```

The following table lists the default keywords in French culture for PivotGrid.

Localization and Globalization of Cube Info (Client Mode)

Content displayed within the PivotGrid control are obtained from the OLAP Cube. So following are the steps that needs to be done to get the localized and globalized Cube content.

- To get localized data from OLAP Cube, we need to set **"Locale Identifier"** in the connection string to a specific culture in the **"Data"** property present inside **"DataSource"**.
- To bind the globalized content in PivotGrid control, we need to set **"Locale"** property to a specific culture and want to refer specific culture file in the sample.

Note: Culture files are present under **"[installed drive]:\Users\[user name]\AppData\Local\Syncfusion\EssentialStudio\X.X.X.X\MVC\Samples\web\Scripts\cultures".**

ASPX-CS

```
//1036 refers to "fr-FR" culture.
@Html.EJ().Pivot().PivotGrid("PivotGrid1").DataSource(dataSource =>
dataSource.Rows(rows=>{rows.FieldName("[Date].[Fiscal]").Add();}).Columns
(columns=>{columns.FieldName("[Customer].[Customer
Geography]").Add();}).Values(values => { values.Measures(measures => {
measures.FieldName("[Measures].[Internet Sales Amount]").Add();
}).Axis(AxisName.Column).Add();})
.Data("https://bi.syncfusion.com/olap/msmdpump.dll;Locale
Identifier=1036;"").Catalog("Adventure Works DW 2008 SE").Cube("Adventure
Works"))
```

Localization and Globalization of Cube Info (Server Mode)

Content displayed within the PivotGrid control are obtained from the OLAP Cube. So following are the steps that needs to be done to get the localized and globalized Cube content.

- To get the localized string based on different cultures, from OLAP Cube, you need to set **"Locale Identifier"** in the connection string to a specific culture.
- To bind the globalized content in PivotGrid control, you need to set **"Culture"** and OverrideDefaultFormatStrings properties in OlapDataManager class to a specific culture.

C#

```
//1036 refers to "fr-FR" culture.
string connectionString = "Data Source=localhost; Initial
Catalog=Adventure Works DW; Locale Identifier=1036;";
DataManager = new OlapDataManager(connectionString);
DataManager.Culture = new System.Globalization.CultureInfo(1036);
DataManager.OverrideDefaultFormatStrings = true;
```

Localization and Globalization of Relational Info (Client Mode)

Content displayed within the PivotGrid control are obtained from the Relational datasource. So following are the steps that needs to done to get localized as well as globalized content.

- To get the localized content, the Relational datasource must have localized headers in them which will be directly applied to PivotGrid.
- To globalize the values appear in PivotGrid , we need to set **“Format”** and **“Locale”** property to a specific culture and want to refer specific culture file in the sample.

Note: Culture files are present under **“[installed drive]:\Users\[user name]\AppData\Local\Syncfusion\EssentialStudio\X.X.X.X\MVC\Samples\web\Scripts\cultures”.**

ASPX-CS

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").ClientSideEvents(clientSideEve
nts => clientSideEvents.Load("onLoad")).DataSource(dataSource =>
dataSource.Rows(rows => {
rows.FieldName("Country").FieldCaption("Country").Add();
}).Columns(columns => {
columns.FieldName("Product").FieldCaption("Product").Add();
}).Values(values => {
values.FieldName("Amount").Format("currency").Add(); }))
```

Localization and Globalization of Relational Info (Server Mode)

Content displayed within the PivotGrid control are obtained from the Relational datasource. So following are the steps that needs to done to get localized as well as globalized content.

- To get the localized content, the Relational datasource must have localized headers in them which will be directly applied to PivotGrid.
- **“Format”** settings in PivotComputationInfo class would globalize the values appear in PivotGrid.

C#

```
PivotReport pivotSetting = new PivotReport();
//...
pivotSetting.PivotCalculations.Add(new PivotComputationInfo {
CalculationName = "Amount", Description = "Amount", FieldHeader =
"Amount", FieldName = "Amount", Format = "E", SummaryType =
Syncfusion.PivotAnalysis.Base.SummaryType.DoubleTotalSum
});
//...
```

Responsive

PivotGrid and PivotTable Field list control supports responsive rendering based on the target device (desktop and tablet) resolution. It supports resolution upto 1024x600. You can enable responsiveness in PivotGrid by setting IsResponsive property to true.

On resizing the browser, the PivotTable Field list will get collapse and an icon will appear on the left-hand side of the browser. User can toggle its view and perform UI interaction.

ASPX-CS

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").Url(Url.Content("/OLAPService"
)).IsResponsive(true)
```

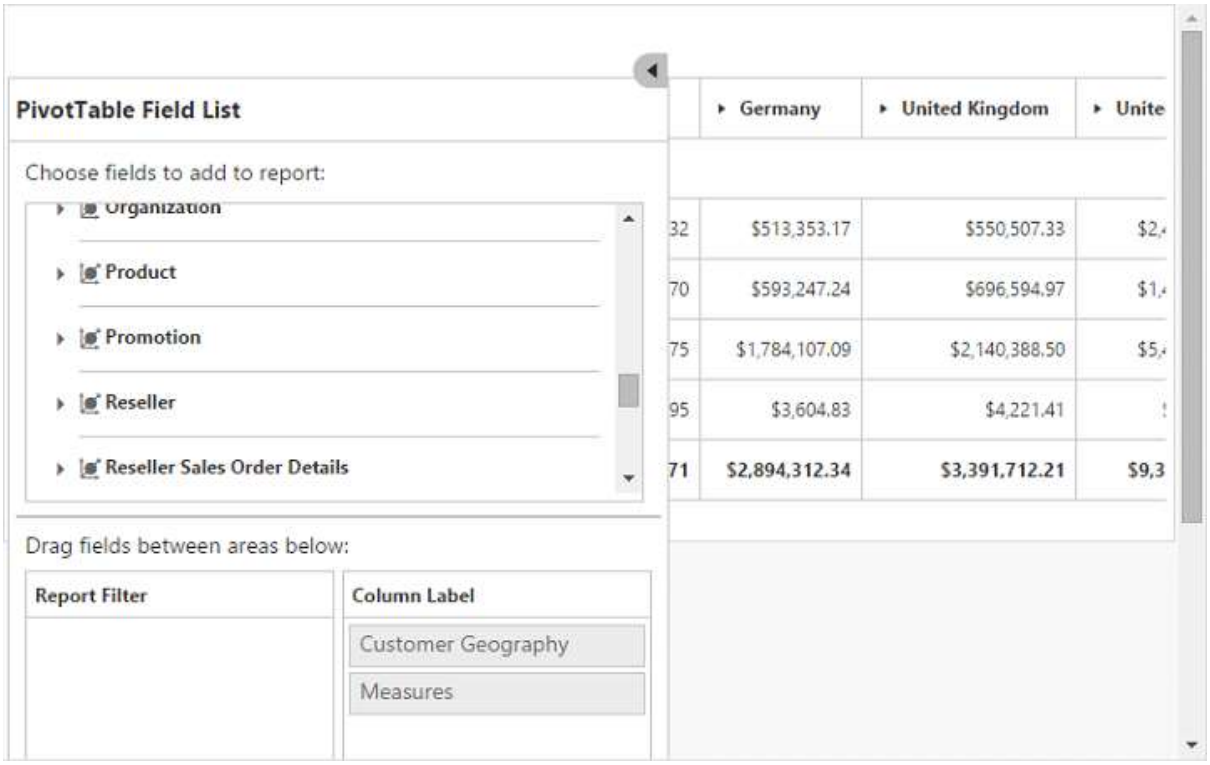
Responsive PivotTable Field List - Collapsed



Responsive PivotTable Field List - Expanded

ToolTip

Allows you to display the details of the cell on hovering value cells. By default, tooltip is enabled. You can disable tooltip in PivotGrid by setting the EnableToolTip property to false.

ASPX-CS

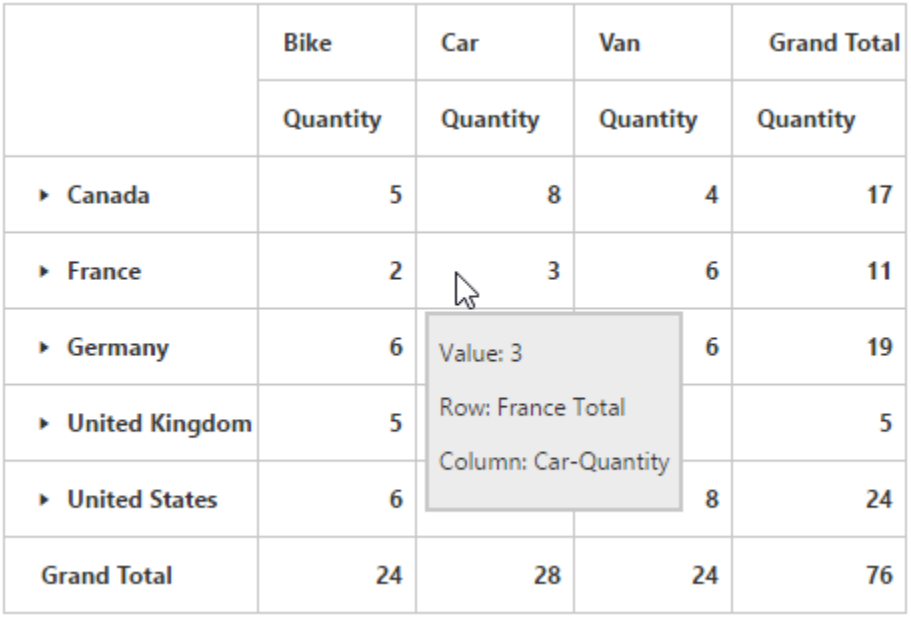
```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").EnableToolTip(false)
```

ToolTip Animation

The PivotGrid provides option to animate tooltip displayed in the grid. The animation enhances the appearance of tooltip by displaying it slowly. You can enable animation in tooltip by setting EnableToolTipAnimation property to true.

ASPX-CS

```
@Html.EJ().Pivot().PivotGrid("PivotGrid1").EnableToolTipAnimation(true)
```



How to

Configure pivot grid through the model properties

There comes a time when you want to set pivot grid properties other than using PivotGridPropertiesBuilder i.e., in the Controller side. At that time, you can pass PivotGridProperties model instance as a parameter to the pivot grid helper method.

We can set properties to pivot grid control in server-side using the PivotGridProperties class and it is used in the view page with the help of pivot grid helper overload.

In addition to the id parameter of pivot grid helper method, we can also pass PivotGridProperties model as another parameter to the pivot grid helper method.

Relational

The following code example explains how to render the pivot grid control in relational mode.

Copyright © 2001 - 2020 Syncfusion Inc.

RAZOR

```
@model Syncfusion.JavaScript.Models.PivotGridProperties
@(Html.EJ().Pivot().PivotGrid("PivotGrid", Model))
<script type="text/javascript">
function load(args) {
args.model.dataSource.data = pivot_dataset;
}
</script>
```

C#

```
namespace PivotGrid
{
public class PivotGridController: Controller
{
public ActionResult PivotGridFeatures()
{
Syncfusion.JavaScript.Models.PivotGridProperties pivotgrid = new
Syncfusion.JavaScript.Models.PivotGridProperties();
PivotDataSource pivotgridDS = new PivotDataSource();
List<Field> rows = new List<Field>();
rows.Add(new Field() { FieldName = "Country", FieldCaption = "Country"
});
rows.Add(new Field() { FieldName = "State", FieldCaption = "State" });
pivotgridDS.Rows = rows;
List<Field> cols = new List<Field>();
cols.Add(new Field() { FieldName = "Product", FieldCaption = "Product"
});
pivotgridDS.Columns = cols;
pivotgrid.Load = "load";
List<Field> values = new List<Field>();
values.Add(new Field() { FieldName = "Amount" });
pivotgridDS.Values = values;
pivotgrid.DataSource = pivotgridDS;
return View(pivotgrid);
}
}
}
```

As a result of the previous code example, the pivot grid will be displayed as shown below:

Copyright © 2001 - 2020 Syncfusion Inc.

	Bike	Car	Van	Grand Total
	Amount	Amount	Amount	Amount
Canada	250	500	300	1050
France	200	300	400	900
Germany	300	400	350	1050
United Kingdom	150			150
United States	300	650	500	1450
Grand Total	1200	1850	1550	4600

OLAP

The following code example explains how to render the pivot grid control in OLAP mode.

RAZOR

```
@model Syncfusion.JavaScript.Models.PivotGridProperties
@(Html.EJ().Pivot().PivotGrid("PivotGrid", Model))
```

C#

```
namespace PivotGrid
{
public class PivotGridController: Controller
{
public ActionResult PivotGridFeatures()
{
Syncfusion.JavaScript.Models.PivotGridProperties pivotgrid = new
Syncfusion.JavaScript.Models.PivotGridProperties();
PivotDataSource pivotgridDS = new PivotDataSource();
pivotgridDS.Data = "https://bi.syncfusion.com/olap/msmdpump.dll";
pivotgridDS.Cube = "Adventure Works";
pivotgridDS.Catalog = "Adventure Works DW 2008 SE";
List<Field> rows = new List<Field>();
rows.Add(new Field() { FieldName = "[Date].[Fiscal]" });
pivotgridDS.Rows = rows;
List<Field> cols = new List<Field>();
cols.Add(new Field() { FieldName = "[Customer].[Customer Geography]" });
pivotgridDS.Columns = cols;
List<MeasuresItems> measures = new List<MeasuresItems>();
measures.Add(new MeasuresItems() { FieldName = "[Measures].[Internet
Sales Amount]" });
List<Field> values = new List<Field>();
values.Add(new Field() { Measures = measures, Axis =
Syncfusion.JavaScript.AxisName.Column });
pivotgridDS.Values = values;
pivotgrid.DataSource = pivotgridDS;
```

```
return View(pivotgrid);
}
}
}
```

As a result of the previous code example, the pivot grid will be displayed as shown below:

	Australia	Canada	France	Germany	United Kingdom	United States	Total
	Internet Sales Amount						
FY 2002	$2,568,701.39	$573,100.97	$414,245.32	$513,353.17	$550,507.33	$2,452,176.07	$7,072,084.24
FY 2003	$2,099,585.43	$305,010.69	$633,399.70	$593,247.24	$696,594.97	$1,434,296.26	$5,762,134.30
FY 2004	$4,383,479.54	$1,088,879.50	$1,592,880.75	$1,784,107.09	$2,140,388.50	$5,483,882.67	$16,473,618.05
FY 2005	$9,234.23	$10,853.70	$3,491.95	$3,604.83	$4,221.41	$19,434.51	$50,840.63
Total	$9,061,000.58	$1,977,844.86	$2,644,017.71	$2,894,312.34	$3,391,712.21	$9,389,789.51	$29,358,677.22

ProgressBar

Progress Bar

Essential ProgressBar control is a graphical control element used to visualize the changing status of an extended operation. It is available in ASP.NET MVC product. ProgressBar provides an interactive way to display the progression of the task. You can configure the item size, orientation and the display text on the ProgressBar control.

Key Features

Some important features of ProgressBar are as follows:

- Value support— you can set a numeric value for the ProgressBar status.
- Percentage support— you can set a percentage value for the control.
- CustomText— ProgressBar control allows you to set the text value that is to be displayed inside the control.
- StateMaintenance— the progress value is maintained even after the page is refreshed to resume the current progress of the operation.
- Range – to set the minimum and maximum values of the ProgressBar control
- Theme—ProgressBar control consists of 12 built-in themes (6 – metro and 6 – gradient effects), and also supports custom skins to set user-defined themes.

Getting Started

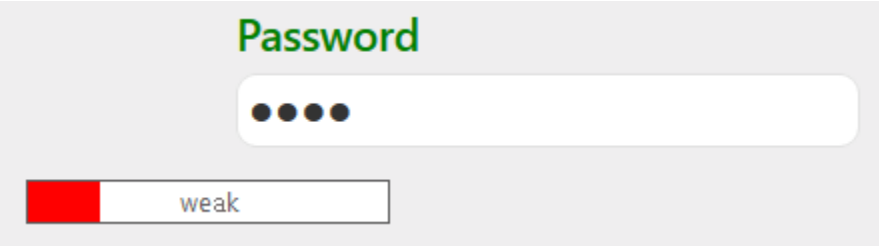
This section briefly describes how to create a Progress Bar control using ASP.NET MVC and learn its features.

Create your first Progress Bar in MVC

ASP.NET MVCProgress Bar control provides support to display a Progress Bar that allows you to change the process of the ProgressBar animations and flexible APIs. Using the following guidelines, you can create the ProgressBar to validate the Password strength.

Copyright © 2001 - 2020 Syncfusion Inc.

The following screenshot illustrates the functionality of a Progress Bar and displays the final result of the Password Strength Validation for your password using Progress Bar.



Progress Bar

Create a Textbox and Progress Bar

ASP.NET MVC Progress Bar control indicates the current progress of an operation like uploading a document through a simple interface. You can easily create the Progress bar control using simple HTML helpers as follows.

1. Create an MVC Project and add necessary assemblies, scripts and styles to it.

Refer MVC-Getting Started.

2. Add the following code to the corresponding view page to render Progress Bar.

ASPX-CS

```
<div class="start" >
<label for="start">Password</label>
<input type="password" id="password"/>
@Html.EJ().ProgressBar("progressBar").Value(20).Height("20px").Width("180
px")
</div>
```

3. Add the following styles to show the Progress Bar and Textbox.

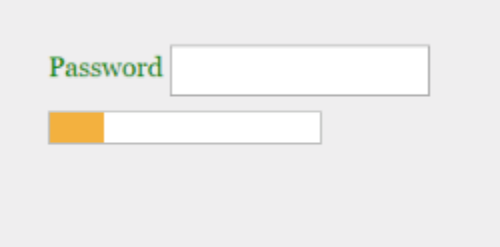
CSS

```
<style>
.start
{
margin-left: 105px;
color: green;
font-size: 18px;
}
.control
{
margin-bottom: 5px;
margin-left: 230px;
}
#progressBar
{
margin-top: 10px;
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
}
</style>
```

4. Execute the above code to render the following output.



Find the Strength of the Password

In this scenario, the advancement of the Progress Bar is changed according to the length and special characters present in the text of the password field. This is achieved by binding the change in the properties of your control and by checking the length of the password field.

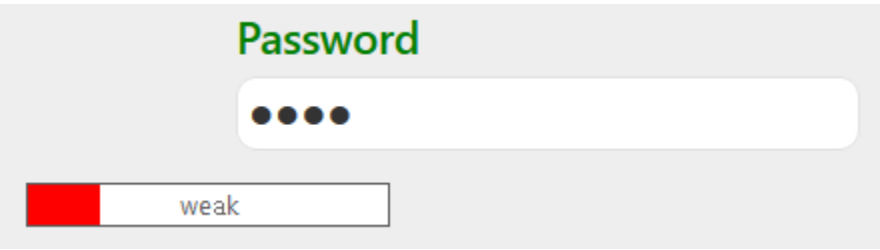
JS

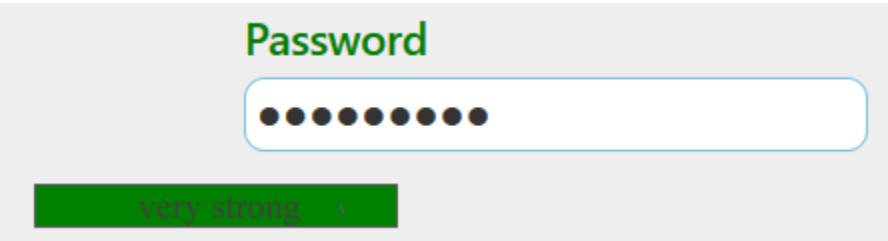
```
<script>
var progressObj, k = 10, i = 0;
$(document).keydown(function() {
i = $("#password").val().length;
if (i < 4)
{
progress2();
$('.e-progress').css({ background: 'red' });
}
else if (i > 4 && i < 7)
{
progress1();
$('.e-progress').css({ background: 'yellow' });
}
else if (i > 7)
{
var password = $("#password").val();
if (/^[a-zA-Z0-9- ]*$/.test(password) == false)
{
progress();
$('.e-progress').css({ background: 'green' });
}
}
});
$(function ()
{
progressObj = $("#progressBar").data("ejProgressBar");
});
function progress()
{
progressObj.option("text", " very strong");
progressObj.option("percentage", k + 90);
}
function progress1()
```

```
{
progressObj.option("text", "strong");
progressObj.option("percentage", k + 50);
}
function progress2()
{
progressObj.option("percentage", k + 10);
progressObj.option("text", "weak");
}
</script>
```

- The progress() function changes the text inside the Progress Bar to Very Strong and percentage to 100, and it is invoked when the length of the text is more than 7 and the text contains a symbol in it. Then it shows the Progress Bar in violet color.
- The progress1() function changes the text inside the Progress Bar to Strong and percentage to 60, and it is invoked when the length of the text is more than 4. Then it shows the Progress Bar in green color
- The progress 2() function changes the text inside the Progress Bar to Weak and percentage to 30, and it is invoked when the length of the text is less than 4. Then it shows the ProgressBar in red color.

The following screenshot displays a Progress Bar control for the above scenario.





Define value

Value

The Value for the ProgressBar is set by using ‘Value’ property. The Value should be between the minimum (min) and the maximum (max) values (number) of the ProgressBar. By default, the MinValue is 0 and the MaxValue is 100 in ProgressBar, and the ‘Value’ is set to 0(number).

Copyright © 2001 - 2020 Syncfusion Inc.

The following steps explain you on how to set the Value for the ProgressBar widget.

1. In the VIEW page, add a helper element to render the ProgressBar widget.

ASPX-CS

```
// Add the following code example to the corresponding CSHTML page to
render the ProgressBar control with customized value.
@Html.EJ().ProgressBar("progressbar").MinValue(40).MaxValue(80).Value(60)
.Height("20").Width("500")
<script>
var progress;
$(document).ready(function ()
{
progress = $("#progressbar").data("ejProgressBar");
progress.setModel({ text: progress.getValue()});
});
</script>
```

The following screenshot displays the output for the above code.

Percentage

The ProgressBar value is set in Percentage by using the 'Percentage' property. The value should be between the min and max values (number) of the ProgressBar. By default, the MinValue is 0 and the MaxValue is 100 in ProgressBar, and percentage is set to 0 (number).

The following steps explain you on how to set the value in Percentage for the ProgressBar widget.

1. In the VIEW page, add a helper element to render the ProgressBar widget.

ASPX-CS

```
// Add the following code example to the corresponding CSHTML page to
render the ProgressBar control with customized percentage.
@Html.EJ().ProgressBar("progressbar").MinValue(40).MaxValue(80).Percentag
e(60).Height("20").Width("500")
<script>
var progress;
$(document).ready(function ()
{
progress = $("#progressbar").data("ejProgressBar");
progress.setModel({ text: progress.getPercentage() + " %"});
});
</script>
```

The following screenshot displays the output.

Copyright © 2001 - 2020 Syncfusion Inc.

Percentage in Progress Bar

Setting Range

The range of the ProgressBar is set by using minimum and maximum values. The Minimum value specifies the value where the ProgressBar shows the process to have started. The Maximum value specifies the value where the process is completed. You can set the range by using the 'MinValue' and 'MaxValue' property.

1. In the VIEW page, add a helper element to render the ProgressBar widget.

ASPX-CS

```
// Add the following code example to the corresponding CSHTML page to
render the ProgressBar control with customized range.
@Html.EJ().ProgressBar("progressbar").MinValue(40).MaxValue(80).Value(80)
.Height("20").Width("500")
<script>
var progress;
$(document).ready(function ()
{
progress = $("#progressbar").data("ejProgressBar");
progress.setModel({ text: progress.getPercentage() + " %" });
});
</script>
```

The following screenshot displays the output.

Appearance and Styling

Adjusting ProgressBar size

ProgressBar widget provides the ability to change or adjust the ProgressBar size. The 'Height' and 'Width' properties in the ProgressBar widget allows you to set the maximum height and maximum width for the ProgressBar. The value set to this property is string or Number type.

The following steps explain you on how to adjust the ProgressBar size.

1. In the VIEW page, add a helper element to render the ProgressBar widget

ASPX-CS

```
// Add the following code example to the corresponding CSHTML page to
render the ProgressBar control with customized size.
@Html.EJ().ProgressBar("progressbar").Value(40).Height("40").Width("400")
```

```
<script>
var progress;
$(document).ready(function ()
{
progress = $("#progressbar").data("ejProgressBar");
progress.setModel({ text: progress.getValue() + " %"});
});
</script>
```

The following screenshot displays the output.

Custom text

Custom text is displayed when the ProgressBar shows different levels of progress in the ProgressBar. Support for Custom Text to mention the percentage or any other message inside the ProgressBar is possible.

The following steps explain the configuration of the Custom Text for the ProgressBar widget.

1. In the VIEW page, add a helper element to render the ProgressBar widget.

ASPX-CS

```
// Add the following code example to the corresponding CSHTML page to
render the ProgressBar control with customized text.
@Html.EJ().ProgressBar("progressbar").Text("loading").Value(40).Height("2
0").Width("500")
```

The following screenshot displays the output.

Theme

The ProgressBar widget style and appearance are controlled based on CSS classes. In order to apply Theme to the ProgressBar widget, you can refer two files, namely, ej.widgets.core.min.css and ej.theme.min.css. When the file ej.widgets.all.min.css is referred, then it is not necessary to include the files ej.widgets.core.min.css and ej.theme.min.css in your project, as ej.widgets.all.min.css is the combination of these both.

By default, there are 12 themes' support available for the ProgressBar widget namely,

- Default-theme
- Flat-azure-dark
- Fat-lime
- Flat-lime-dark

Copyright © 2001 - 2020 Syncfusion Inc.

- Flat-saffron
- Flat-saffron-dark
- Gradient-azure
- Gradient-azure-dark
- Gradient-lime
- Gradient-lime-dark
- Gradient-saffron
- Gradient-saffron-dark

CSS class

To apply custom styles to the ProgressBar widget, you can specify the CssClass property. The specified CSS name is added in the root of the ProgressBar widget.

The following code example is used to render the ProgressBar widget with customized style.

1. In the VIEW page, add a helper element to render the ProgressBar widget.

ASPX-CS

```
// Add the following code example to the corresponding CSHTML page to
render the ProgressBar control with customized style.
@Html.EJ().ProgressBar("progressbar").Value(70).Height("20").Width("500")
.CssClass("custom")
```

JS

```
<script>
var progress;
$(document).ready(function ()
{
progress = $("#progressbar").data("ejProgressBar");
progress.setModel({ text: progress.getValue() + " %"});
});
```

2. Add the following styles to render the ProgressBar with customized style.

CSS

```
<style type="text/css">
.custom .e-progress
{
background-color:gray;
}
</style>
```

The following screenshot displays the output.

Copyright © 2001 - 2020 Syncfusion Inc.

Enabling the ProgressBar

The ProgressBar is enabled by using the 'Enabled' Property. When this property is set to 'false', it disables the ProgressBar widget. By default, 'Enabled' property is set to 'true' in the ProgressBar widget.

The following steps explain how to disable the ProgressBar widget when 'Enabled' property is set to 'false'.

1. In the VIEW page, add a helper element to render the ProgressBar widget.

ASPX-CS

```
// Add the following code example to the corresponding CSHTML page to
disable the ProgressBar control.
@Html.EJ().ProgressBar("progressbar").Value(70).Height("20").Width("500")
.Enabled(false)
<script>
var progress;
$(document).ready(function ()
{
progress = $("#progressbar").data("ejProgressBar");
progress.setModel({ text: progress.getValue() + " %"});
});
</script>
```

The following screenshot displays the output for the above code.

Disabled Progress Bar

State Maintenance

Save current model value to cookies for State Maintenance. While refreshing the ProgressBar widget, page retains the model value applied from browser cookies. By default, the 'EnablePersistence' property is set to 'false' in the ProgressBar.

The following steps explain the State Maintenance in the ProgressBar control.

1. In the VIEW page, add a helper element to render the ProgressBar widget.

ASPX-CS

```
// Add the following code example to the corresponding CSHTML page to
enable the state maintenance in the ProgressBar control.
@Html.EJ().ProgressBar("progressbar").Value(70).Height("20").Width("500")
.EnablePersistence(true)
<script>
var progress;
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
$(document).ready(function ()
{
progress = $("#progressbar").data("ejProgressBar");
progress.setModel({ text: progress.getValue() + " %"});
});
</script>
```

The following screenshot displays the output.

RTL Support

Right-to-left starts from the right of the page and continues to the left. By default, this option is set to 'false' in the ProgressBar control. The EnableRTL option allows the ProgressBar control to display it in the right to left direction.

The following steps explain how to enable the RTL property of the ProgressBar control.

1. In the VIEW page, add a helper element to render the ProgressBar widget.

ASPX-CS

```
// Add the following code example to the corresponding CSHTML page to
render ProgressBar control to display it in the right-to-left direction.
@Html.EJ().ProgressBar("progressbar").Value(70).Height("20").Width("500")
.EnableRTL(true)
<script>
var progress;
$(document).ready(function ()
{
progress = $("#progressbar").data("ejProgressBar");
progress.setModel({ text: progress.getValue() + " %"});
});
</script>
```

The following screenshot displays the output.

How To

Render ProgressBar from code behind

ProgressBar can be rendered from the code behind by initializing the required properties in controller and passing those properties via ViewData or Model to the client side

Copyright © 2001 - 2020 Syncfusion Inc.

The following code illustrates the rendering of ProgressBar using ProgressBar properties from code behind.

RAZOR

```
@{Html.EJ().ProgressBar("progress", Model).Render();}
```

C#

```
public ActionResult Index()
{
ProgressBarProperties Obj = new ProgressBarProperties();
Obj.Text = "Loading...";
Obj.Value = 60;
return View(Obj);
}
```

RadialMenu

RadialMenu

Essential ASP.NET MVC Radial Menu control is a context that represents the menu items are arranged in a circular order with a centric button element in it. By default, only the center button is visible. The **Radial Menu** displays the root level menu item with rotational animation effects on clicking the center menu button. You can close it either by clicking anywhere in the document or by clicking the center button where the root level items are displayed.

Key Features

- **Nested Menu**: Supports to render the multiple level of sub menu items.
- **Image Customization**: Enables to customize images for all levels of menu item.
- **Item Customization**: Supports to customize Radial Menu items with badges and slider settings.
- **Dimension**: Allows to customize Radial Menu radius and position.

Getting Started

Creating your first RadialMenu in MVC application

1. Create an MVC Project and add necessary assemblies, scripts and CSS files given in MVC-Getting Started Documentation.
2. Add RadialMenu control using the helper from EJ namespace.

HTML

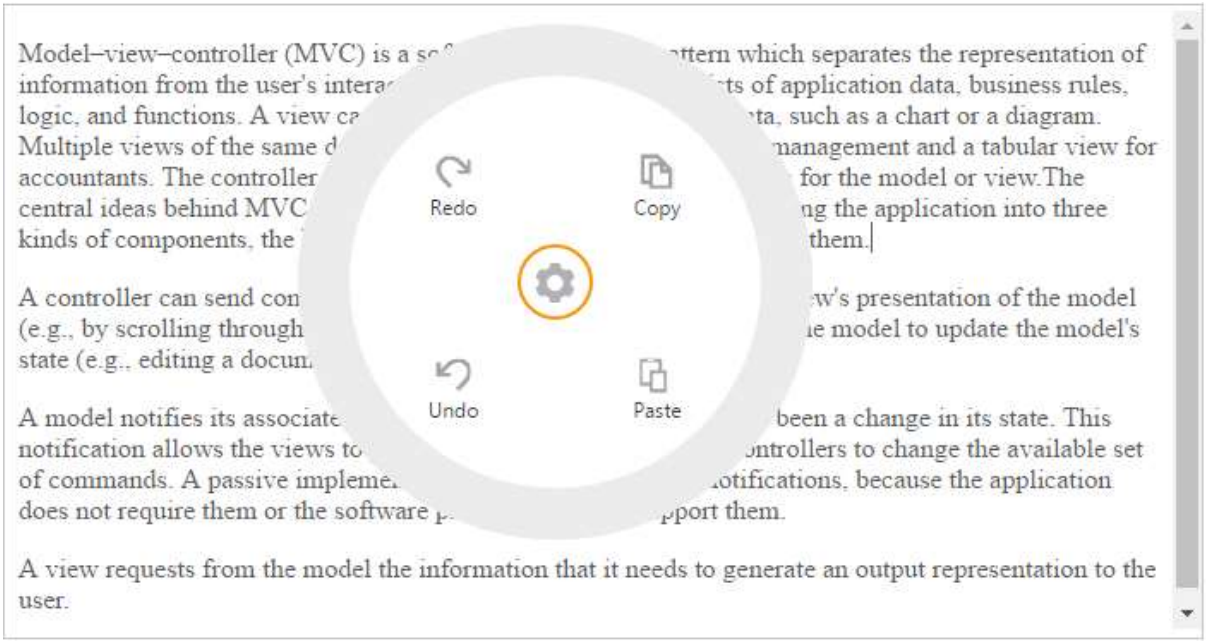
```
@Html.EJ().RadialMenu("RadialMenu1")
```

3. Execute the code and get a empty RadialMenu control as below

Copyright © 2001 - 2020 Syncfusion Inc.

Create a Simple RadialMenu with RTE content

RadialMenu can be rendered using ul li element or div element.



Create a simple Radial Menu

The following steps guide you to add a **Radial Menu** control.

Create a MVC Project and add the necessary DLL and scripts with the help of the given MVC Getting Started documentation.

Add the following code snippet in corresponding View page to render the RadialMenu.

You can set the images for each item by giving the image **url** with the **ImageURL** attribute in the RadialMenuItems and text with **Text** attribute. Refer the following code example.Initialize **Radial Menu** control and set its target content as follows.

RAZOR

```
@Html.EJ().RadialMenu("defaultRadialMenu").ImageClass("e-
radial").TargetElementId("radialtarget1").Items(items
=>
{
items.Add().ImageURL(Url.Content("mvc.syncfusion.com/demos/web/Images/Rad
ialMenu/copy.png")).Text("Copy");
items.Add().ImageURL(Url.Content("mvc.syncfusion.com/demos/web/Images/Rad
ialMenu/paste.png")).Text("Paste");
items.Add().ImageURL(Url.Content("mvc.syncfusion.com/demos/web/Images/Rad
ialMenu/redo.png")).Text("Redo");
items.Add().ImageURL(Url.Content("mvc.syncfusion.com/demos/web/Images/Rad
ialMenu/undo.png")).Text("Undo");
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
})
```

Refer to the following code example to add target content to the **Radial Menu**.

HTML

```
<div id="contentDiv">
<div id="radialtarget1" class="content-container-fluid">
<div class="row">
<div class="cols-sample-area">
<textarea id="rteSample1" rows="10" cols="70" style="height: 440px">
<p>Model-view-controller (MVC) is a software architecture pattern which
separates the representation of information from the user's interaction
with it.
The model consists of application data, business rules, logic, and
functions. A view can be any output representation of data, such as a
chart or a diagram.
Multiple views of the same data are possible, such as a bar chart for
management and a tabular view for accountants.
The controller mediates input, converting it to commands for the model or
view.The central ideas behind MVC are code reusable and in addition to
dividing the application into three kinds of components, the MVC design
defines the interactions between them.</p>
<p>A controller can send commands to its associated view to change the
view's presentation of the model (e.g., by scrolling through a document).
It can also send commands to the model to update the model's state (e.g.,
editing a document).</p>
<p>A model notifies its associated views and controllers when there has
been a change in its state. This notification allows the views to produce
updated output, and the controllers to change the available set of
commands. A passive implementation of MVC omits these notifications,
because the application does not require them or the software platform
does not support them.</p>
<p>A view requests from the model the information that it needs to
generate an output representation to the user.</p>
</textarea>
@{
Html.EJ().RTE("rteSample1").Width("100%").MinWidth("10px").ShowContextMen
u(false).ClientSideEvents(clientSideEvent =>
clientSideEvent.Create("rteCreate").Change("rteChange").Select("radialSho
w")).ShowToolbar(false).Render();
}
</div>
</div>
</div>
</div>
```

Add the following styles in your code.

CSS

```
<style type="text/css" class="cssStyles">
.e-radialmenu .e-radial
{
background-image:
url("mvc.syncfusion.com/demos/web/Images/RadialMenu/settings.png");
```

Copyright © 2001 - 2020 Syncfusion Inc.

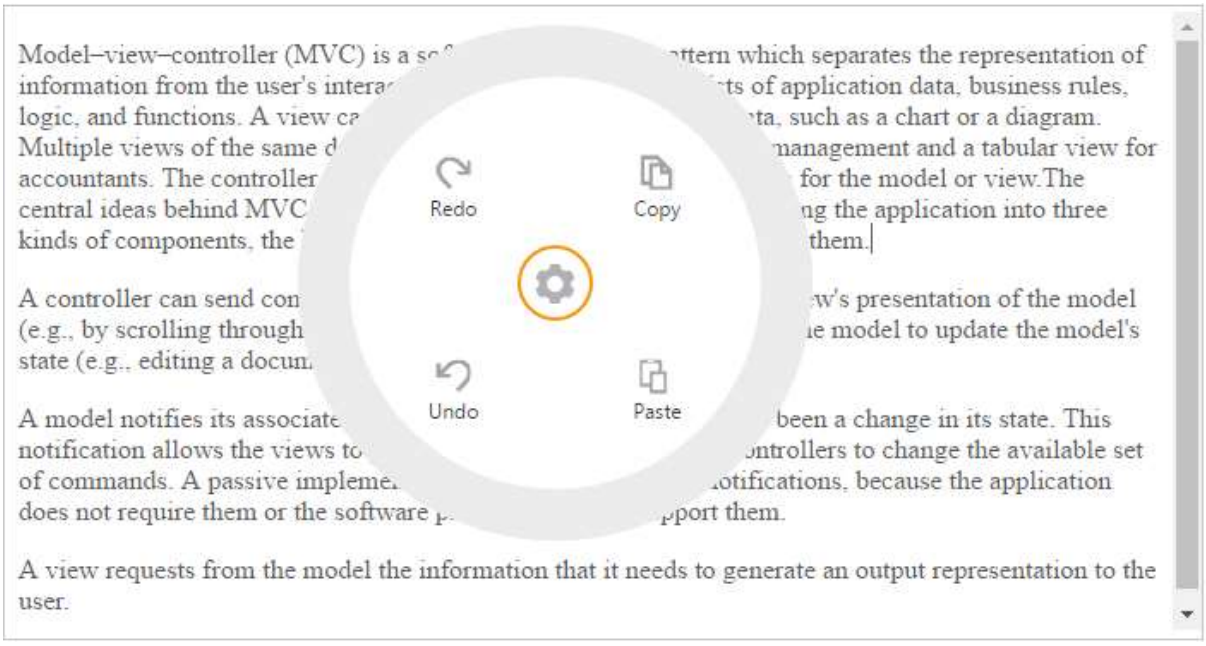
```
}
#rteSample1
{
width: 100%;
}
</style>
```

You can display the **Radial Menu** by performing desired action on the target content while selecting the text inside the target. Therefore, call the **radialShow** method in the select action of the content. Refer the following code example and add it to the script.

JAVASCRIPT

```
function radialShow(e) {
var target = $("#radialRarget1"), radialRadius = 150, radialDiameter = 2
* radialRadius,
// To get Iframe positions
iframeY = target.offset().top + e.event.clientY, iframeX =
target.offset().left + e.event.clientX,
// To set Radial Menu position within target
x = iframeX > target.width() - radialRadius ? target.width() -
radialDiameter : (iframeX > radialRadius ? iframeX - radialRadius : 0),
y = iframeY > target.height() - radialRadius ? target.height() -
radialDiameter : (iframeY > radialRadius ? iframeY - radialRadius : 0);
radialElement.ejRadialMenu("setPosition", x, y);
}
```

Run the above code and select any text inside the target. The settings icon is displayed. Click that icon to render the following output.



RadialMenu Dependencies

The external script dependencies of the RadialMenu component are,

- jQuery 1.7.1 and later versions.

And the internal script dependencies of the RadialMenu widget are:

FileÂ	Description / Usage
ej.core.min.js	Must be referred always before using all the JS controls.
ej.data.min.js	Used to handle data operation and should be used while binding data to JS controls.
ej.touch.min.js	For providing touch support
ej.radialmenu.min.js	This is main source file specific for rendering RadialMenu

Dimension

You can customize **Radial Menu** dimension by using **Radius** and **Position** properties.

Radius

You can customize the **Radial Menu** size by using the **Radius** property. By default, the **Radial Menu** Radius is set as 150px. Refer to the following code example.

RAZOR

```
@Html.EJ().RadialMenu("defaultRadialMenu").ImageClass("e-
radial").TargetElementId("radialtarget1").Items(items
=>
{
items.Add().ImageURL(Url.Content("mvc.syncfusion.com/demos/web/Images/Rad
ialMenu/font.png")).Text("Bold");
items.Add().ImageURL(Url.Content("mvc.syncfusion.com/demos/web/Images/Rad
ialMenu/f1.png")).Text("Italic");
items.Add().ImageURL(Url.Content("mvc.syncfusion.com/demos/web/Images/Rad
ialMenu/align.png")).Text("Align");
items.Add().ImageURL(Url.Content("mvc.syncfusion.com/demos/web/Images/Rad
ialMenu/sort.png")).Text("Sort");
}).Radius(150).Render();
```

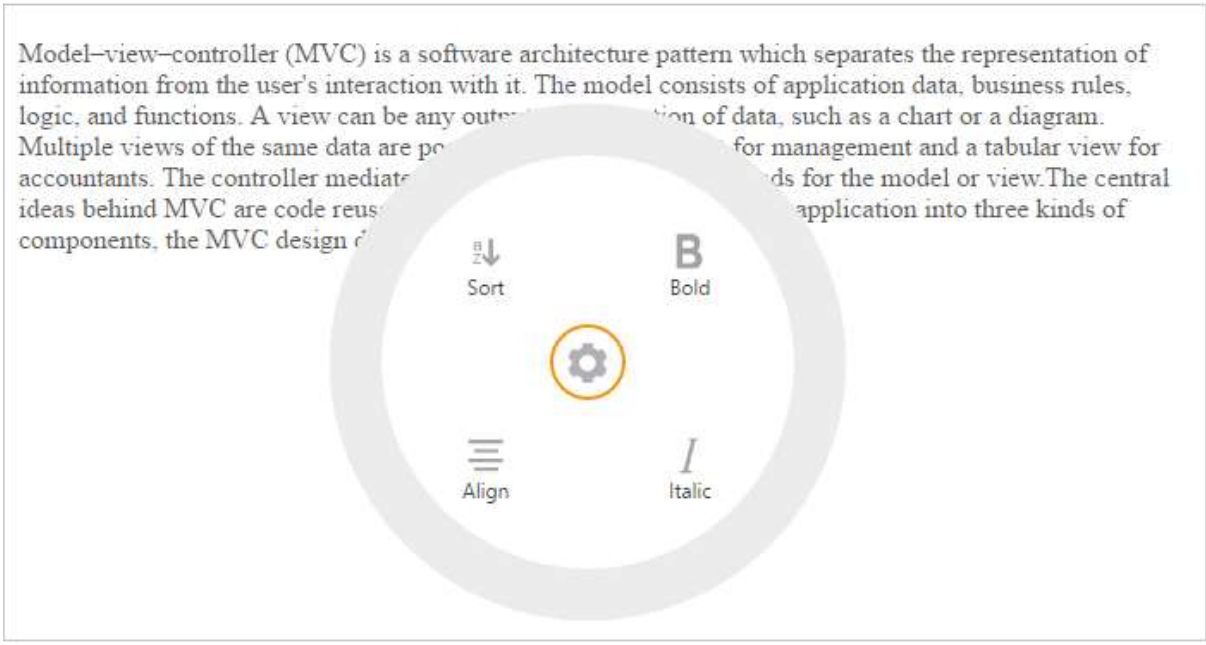
Add the following script in your code.

JAVASCRIPT

```
function radialShow(e) {
var target = $("#radialRarget2"), radialRadius = 150, radialDiameter = 2
* radialRadius,
// To get Iframe positions
iframeY = target.offset().top + e.event.clientY, iframeX =
target.offset().left + e.event.clientX,
// To set Radial Menu position within target
x = iframeX > target.width() - radialRadius ? target.width() -
radialDiameter : (iframeX > radialRadius ? iframeX - radialRadius : 0),
y = iframeY > target.height() - radialRadius ? target.height() -
radialDiameter : (iframeY > radialRadius ? iframeY - radialRadius : 0);
radialElement.ejRadialMenu("setPosition", x, y);
}
```

Copyright © 2001 - 2020 Syncfusion Inc.

The following screenshot illustrates the **Radial Menu** while clicking on the settings icon.



Position

To display the **Radial Menu** in the web page in a specific area, we can use the **Position** property. By default, the **Radial Menu** Position is set as null.

Refer to the following code example.

RAZOR

```
@Html.EJ().RadialMenu("defaultRadialMenu").ImageClass("e-
radial").TargetElementId("radialtarget1").Items(items
=>
{
items.Add().ImageURL(Url.Content("mvc.syncfusion.com/demos/web/Images/Rad
ialMenu/copy.png")).Text("Copy");
items.Add().ImageURL(Url.Content("mvc.syncfusion.com/demos/web/Images/Rad
ialMenu/paste.png")).Text("Paste");
items.Add().ImageURL(Url.Content("mvc.syncfusion.com/demos/web/Images/Rad
ialMenu/redo.png")).Text("Redo");
items.Add().ImageURL(Url.Content("mvc.syncfusion.com/demos/web/Images/Rad
ialMenu/undo.png")).Text("Undo");
}).Radius(150).Render();
```

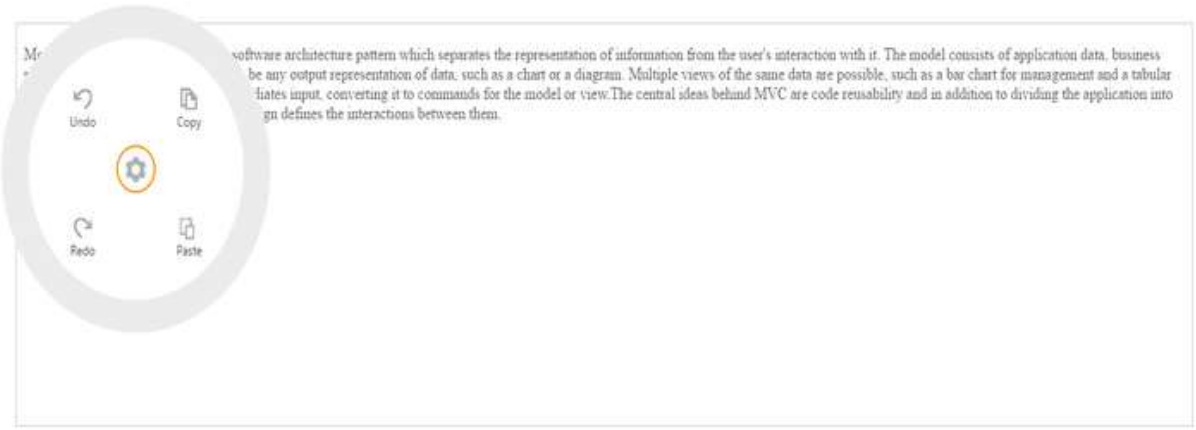
Add the following script in your code.

JAVASCRIPT

```
function radialShow(e) {
var target = $("#radialTarget2"), radialRadius = 150, radialDiameter = 2
* radialRadius,
// To get Iframe positions
iframeY = target.offset().top + e.event.clientY, iframeX =
target.offset().left + e.event.clientX,
```

```
// To set Radial Menu position within target
x = iframeX > target.width() - radialRadius ? target.width() -
radialDiameter : (iframeX > radialRadius ? iframeX - radialRadius : 0),
y = iframeY > target.height() - radialRadius ? target.height() -
radialDiameter : (iframeY > radialRadius ? iframeY - radialRadius : 0);
radialElement.ejRadialMenu("setPosition", x, y);
}
```

The following screenshot illustrates the output while selecting the text in the page.



Item Customization

You can customize individual **Radial Menu** items by using the items properties.

Adding image and text to RadialMenu items

The **ImageUrl** property specifies the URL of the image for the items. **Text** attribute is used to specify the item text. Refer to the following code example.

You can add the page content in RTE control by referring this section.

RAZOR

```
@Html.EJ().RadialMenu("defaultRadialMenu").ImageClass("e-
radial").TargetElementId("radialTarget1").Items(items
=>
{
items.Add().ImageURL(Url.Content("mvc.syncfusion.com/demos/web/Images/Rad
ialMenu/copy.png")).Text("Copy");
items.Add().ImageURL(Url.Content("mvc.syncfusion.com/demos/web/Images/Rad
ialMenu/paste.png")).Text("Paste");
items.Add().ImageURL(Url.Content("mvc.syncfusion.com/demos/web/Images/Rad
ialMenu/redo.png")).Text("Redo");
items.Add().ImageURL(Url.Content("mvc.syncfusion.com/demos/web/Images/Rad
ialMenu/undo.png")).Text("Undo");
})
```

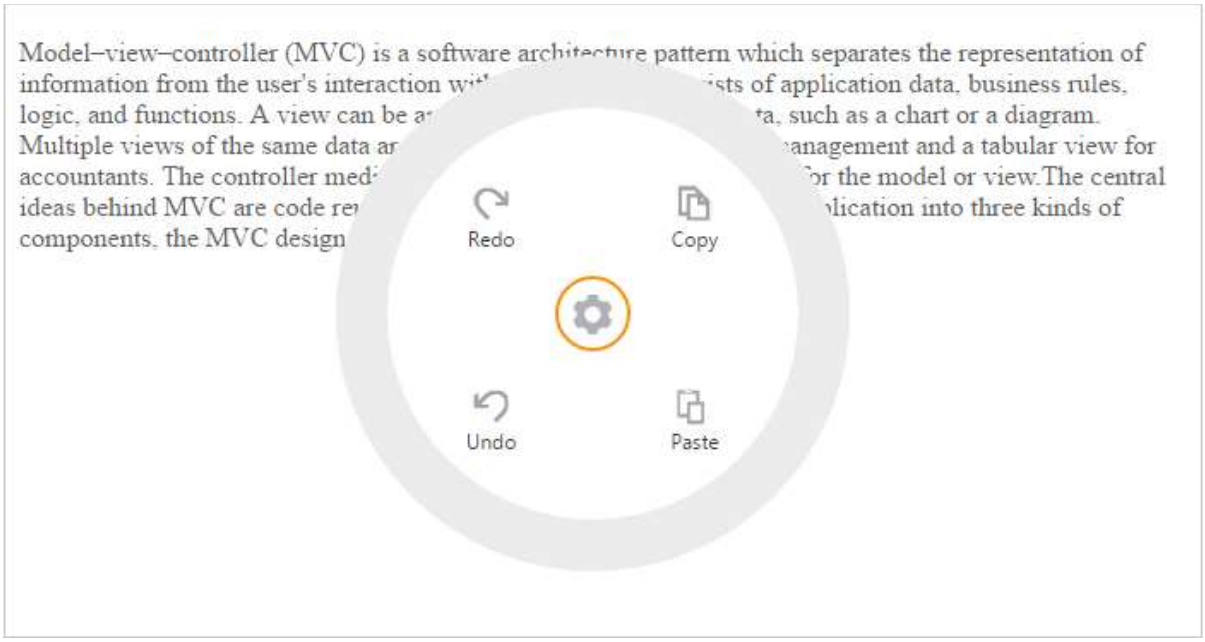
You can display the **Radial Menu** by performing desired action on the target content while selecting the text inside the target. Therefore, call the **radialShow** method in the select action of the content. Refer the following code example and add it to the script.

JAVASCRIPT

Copyright © 2001 - 2020 Syncfusion Inc.

```
function radialShow(e) {
var target = $("#radialtarget2"), radialRadius = 150, radialDiameter = 2
* radialRadius,
// To get Iframe positions
iframeY = target.offset().top + e.event.clientY, iframeX =
target.offset().left + e.event.clientX,
// To set Radial Menu position within target
x = iframeX > target.width() - radialRadius ? target.width() -
radialDiameter : (iframeX > radialRadius ? iframeX - radialRadius : 0),
y = iframeY > target.height() - radialRadius ? target.height() -
radialDiameter : (iframeY > radialRadius ? iframeY - radialRadius : 0);
radialElement.ejRadialMenu("setPosition", x, y);
}
```

The following screenshot illustrates the output.



Adding events to Radial Menu items

You can specify the click event to corresponding image/text of **Radial Menu** items for performing some specific action. You need to handle the click event in script manually for each item click.

You can add the page content in RTE control by referring to this section

RAZOR

```
@{
Html.EJ().RadialMenu("nestedRadialMenu").ImageClass("imageClass").BackIma
geClass("backImageClass").TargetElementId("radialtarget2").Items(items =>
{
items.Add().Text("Copy").ImageURL(Url.Content("mvc.syncfusion.com/demos/w
eb/Images/RadialMenu/copy.png")).Click("Bold");
items.Add().Text("Font").ImageURL(Url.Content("mvc.syncfusion.com/demos/w
eb/Images/RadialMenu/font.png"));
items.Add().Text("List").ImageURL(Url.Content("mvc.syncfusion.com/demos/w
eb/Images/RadialMenu/list.png")).Children(children =>
{
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
children.Add().ImageURL(Url.Content("mvc.syncfusion.com/demos/web/Images/
RadialMenu/list.png")).Text("List");
children.Add().ImageURL(Url.Content("mvc.syncfusion.com/demos/web/Images/
RadialMenu/l5.png")).Text("List");
});
items.Add().Text("Bold").ImageURL(Url.Content("mvc.syncfusion.com/demos/w
eb/Images/RadialMenu/font.png")).Click("bold").Children(children =>
{
children.Add().ImageURL(Url.Content("mvc.syncfusion.com/demos/web/Images/
RadialMenu/f1.png")).Text("Italic").Click("italic");
children.Add().ImageURL(Url.Content("mvc.syncfusion.com/demos/web/Images/
RadialMenu/font.png")).Text("Bold").Click("bold");
});
items.Add().Text("Paste).ImageURL(Url.Content("mvc.syncfusion.com/demos/w
eb/Images/RadialMenu/paste.png"));
items.Add().Enabled(false).ImageURL(Url.Content("mvc.syncfusion.com/demos
/web/Images/RadialMenu/undo.png")).Children(children =>
{
children.Add().Enabled(false).ImageURL(Url.Content("mvc.syncfusion.com/de
mos/web/Images/RadialMenu/undo.png"));
children.Add().Enabled(false).ImageURL(Url.Content("mvc.syncfusion.com/de
mos/web/Images/RadialMenu/redo.png"));
});
items.Add().Text("Alignment").ImageURL(Url.Content("mvc.syncfusion.com/de
mos/web/Images/RadialMenu/align.png")).Children(children =>
{
children.Add().ImageURL(Url.Content("mvc.syncfusion.com/demos/web/Images/
RadialMenu/a1.png")).Text("Left");
children.Add().ImageURL(Url.Content("mvc.syncfusion.com/demos/web/Images/
RadialMenu/a2.png")).Text("Right");
});
}).Render();
}
```

Add the following script in your code.

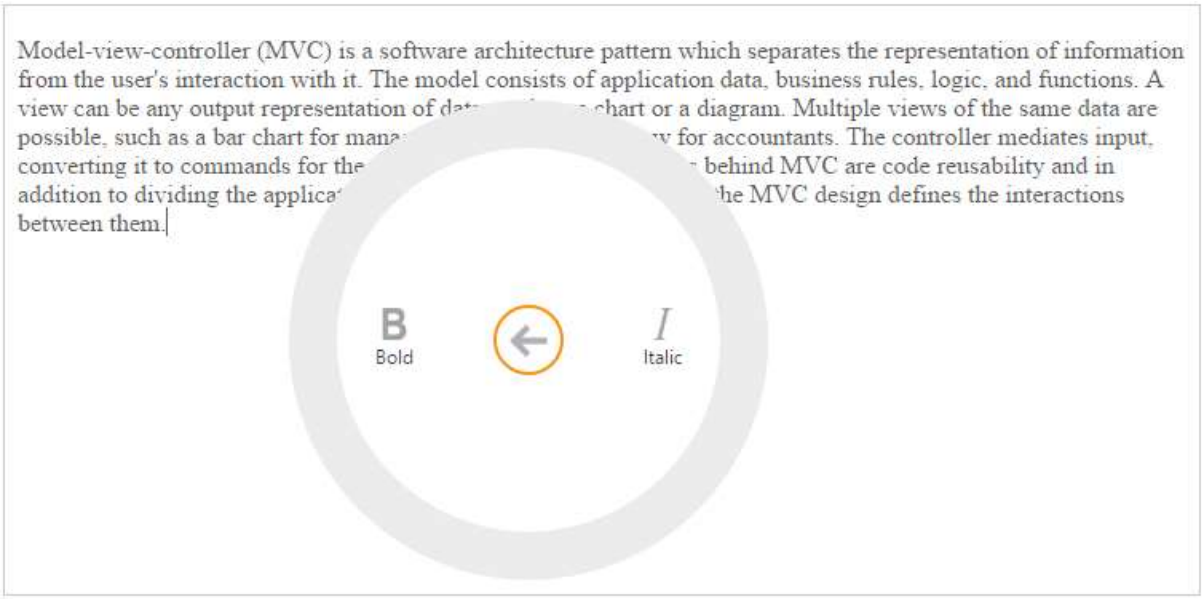
JAVASCRIPT

```
function radialShow(e) {
var target = $("#radialtarget2"), radialRadius = 150, radialDiameter = 2
* radialRadius,
// To get Iframe positions
iframeY = target.offset().top + e.event.clientY, iframeX =
target.offset().left + e.event.clientX,
// To set Radial Menu position within target
x = iframeX > target.width() - radialRadius ? target.width() -
radialDiameter : (iframeX > radialRadius ? iframeX - radialRadius : 0),
y = iframeY > target.height() - radialRadius ? target.height() -
radialDiameter : (iframeY > radialRadius ? iframeY - radialRadius : 0);
radialElement.ejRadialMenu("setPosition", x, y);
}
function italic(e) {
rteObj.executeCommand("italic");
}
function bold(e) {
rteObj.executeCommand("bold");
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
}
function copy(e) {
rteObj.executeCommand("copy");
}
```

The following screenshot illustrates the output.



Badge Customization in Radial Menu Items

You can specify set badges for the items by using badge settings in radial menu. You can set value for badge and enable badge with default value.

The **Enabled** property to enable or disable badges. **Value** attribute is to set the badge value.

RAZOR

```
@Html.EJ().RadialMenu("defaultRadialMenu").ImageClass("e-
radial").TargetElementId("radialRarget1").Items(items
=>
{
items.Add().ImageURL(Url.Content("mvc.syncfusion.com/demos/web/Images/Rad
ialMenu/copy.png")).Text("Copy").Badge(badge =>
badge.Enabled(true).Value(2));
items.Add().ImageURL(Url.Content("mvc.syncfusion.com/demos/web/Images/Rad
ialMenu/paste.png")).Text("Paste");
items.Add().ImageURL(Url.Content("mvc.syncfusion.com/demos/web/Images/Rad
ialMenu/redo.png")).Text("Redo");
items.Add().ImageURL(Url.Content("mvc.syncfusion.com/demos/web/Images/Rad
ialMenu/undo.png")).Text("Undo");
})
```

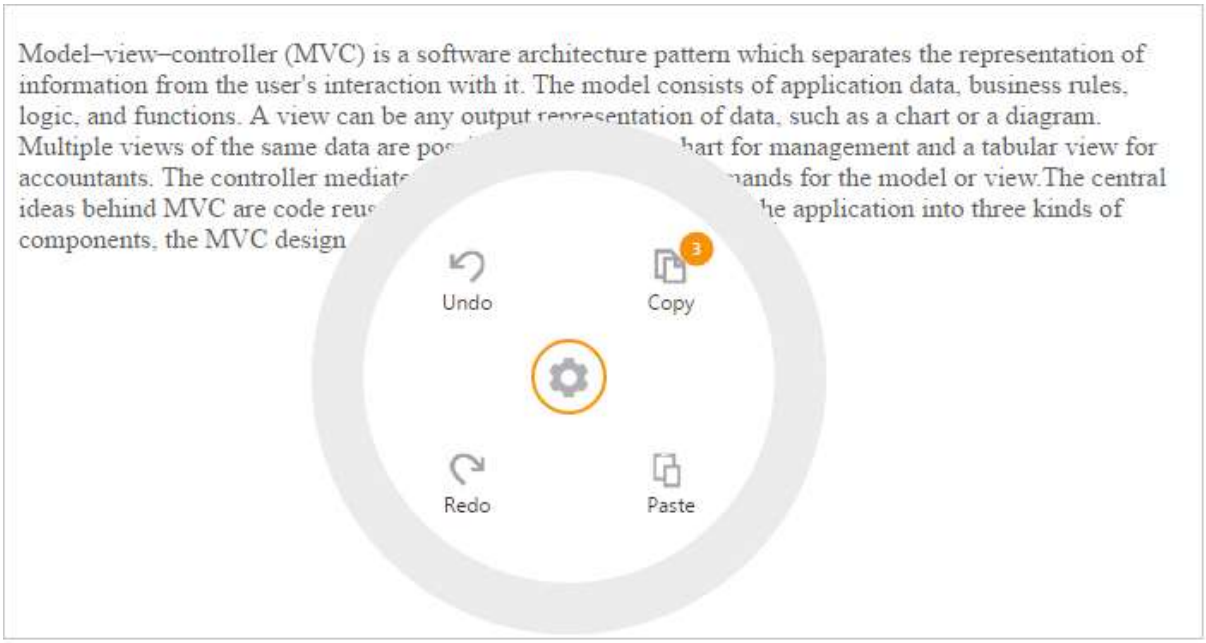
Add the following script in your code.

JAVASCRIPT

```
function radialShow(e) {
```

```
var target = $("#radialtarget2"), radialRadius = 150, radialDiameter = 2
* radialRadius,
// To get Iframe positions
iframeY = target.offset().top + e.event.clientY, iframeX =
target.offset().left + e.event.clientX,
// To set Radial Menu position within target
x = iframeX > target.width() - radialRadius ? target.width() -
radialDiameter : (iframeX > radialRadius ? iframeX - radialRadius : 0),
y = iframeY > target.height() - radialRadius ? target.height() -
radialDiameter : (iframeY > radialRadius ? iframeY - radialRadius : 0);
radialElement.ejRadialMenu("setPosition", x, y);
}
```

The following screenshot illustrates the output.



Slider Customization in Radial Menu Items

You can customize the Radial Menu with slider settings.The **data-ej-type** property specifies the type of radial menu item, where you can set the type for RadialMenu item.

You can customize the **Radial Menu** slider settings by using the **Ticks**, **StrokeWidth** and **LabelSpace** properties. The **Ticks** property specifies the slider ticks for radial menu item.**StrokeWidth** attribute is used to specify the slider's stroke width value.**LabelSpace** attribute is used to specify the value of slider label space.

Refer to the following code example.

You can add SliderSettings in radial menu items by referring this section.

RAZOR

```
@{
Html.EJ().RadialMenu("nestedRadialMenu").ImageClass("imageClass").BackIma
geClass("backImageClass").TargetElementId("radialTarget2").Items(items =>
{
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
items.Add().Text("Copy").ImageURL(Url.Content("mvc.syncfusion.com/demos/web/Images/RadialMenu/copy.png")).Click("Bold");
items.Add().Text("Font").ImageURL(Url.Content("mvc.syncfusion.com/demos/web/Images/RadialMenu/font.png").Type(MenuItemType.Slider).SliderSettings(slider => slider.StrokeWidth(1).Ticks(new List<double> { 0, 2, 4, 6, 8, 10, 12, 14 })));
items.Add().Text("List").ImageURL(Url.Content("mvc.syncfusion.com/demos/web/Images/RadialMenu/list.png")).Children(children =>
{
children.Add().ImageURL(Url.Content("mvc.syncfusion.com/demos/web/Images/RadialMenu/list.png")).Text("List");
children.Add().ImageURL(Url.Content("mvc.syncfusion.com/demos/web/Images/RadialMenu/l5.png")).Text("List");
});
items.Add().Text("Bold").ImageURL(Url.Content("mvc.syncfusion.com/demos/web/Images/RadialMenu/font.png")).Click("bold").Children(children =>
{
children.Add().ImageURL(Url.Content("mvc.syncfusion.com/demos/web/Images/RadialMenu/f1.png")).Text("Italic").Click("italic");
children.Add().ImageURL(Url.Content("mvc.syncfusion.com/demos/web/Images/RadialMenu/font.png")).Text("Bold").Click("bold");
});
items.Add().Text("Paste).ImageURL(Url.Content("mvc.syncfusion.com/demos/web/Images/RadialMenu/paste.png"));
items.Add().Enabled(false).ImageURL(Url.Content("mvc.syncfusion.com/demos/web/Images/RadialMenu/undo.png")).Children(children =>
{
children.Add().Enabled(false).ImageURL(Url.Content("mvc.syncfusion.com/demos/web/Images/RadialMenu/undo.png"));
children.Add().Enabled(false).ImageURL(Url.Content("mvc.syncfusion.com/demos/web/Images/RadialMenu/redo.png"));
});
items.Add().Text("Alignment").ImageURL(Url.Content("mvc.syncfusion.com/demos/web/Images/RadialMenu/align.png")).Children(children =>
{
children.Add().ImageURL(Url.Content("mvc.syncfusion.com/demos/web/Images/RadialMenu/a1.png")).Text("Left");
children.Add().ImageURL(Url.Content("mvc.syncfusion.com/demos/web/Images/RadialMenu/a2.png")).Text("Right");
});
}).Render();
}
```

Add the following script in your code.

JAVASCRIPT

```
function radialShow(e) {
var target = $("#radialtarget2"), radialRadius = 150, radialDiameter = 2 * radialRadius,
// To get Iframe positions
iframeY = target.offset().top + e.event.clientY, iframeX = target.offset().left + e.event.clientX,
// To set Radial Menu position within target
x = iframeX > target.width() - radialRadius ? target.width() - radialDiameter : (iframeX > radialRadius ? iframeX - radialRadius : 0),
```

Copyright © 2001 - 2020 Syncfusion Inc.

```
y = iframeY > target.height() - radialRadius ? target.height() -
radialDiameter : (iframeY > radialRadius ? iframeY - radialRadius : 0);
radialElement.ejRadialMenu("setPosition", x, y);
}
```

The following screenshot illustrates the output.

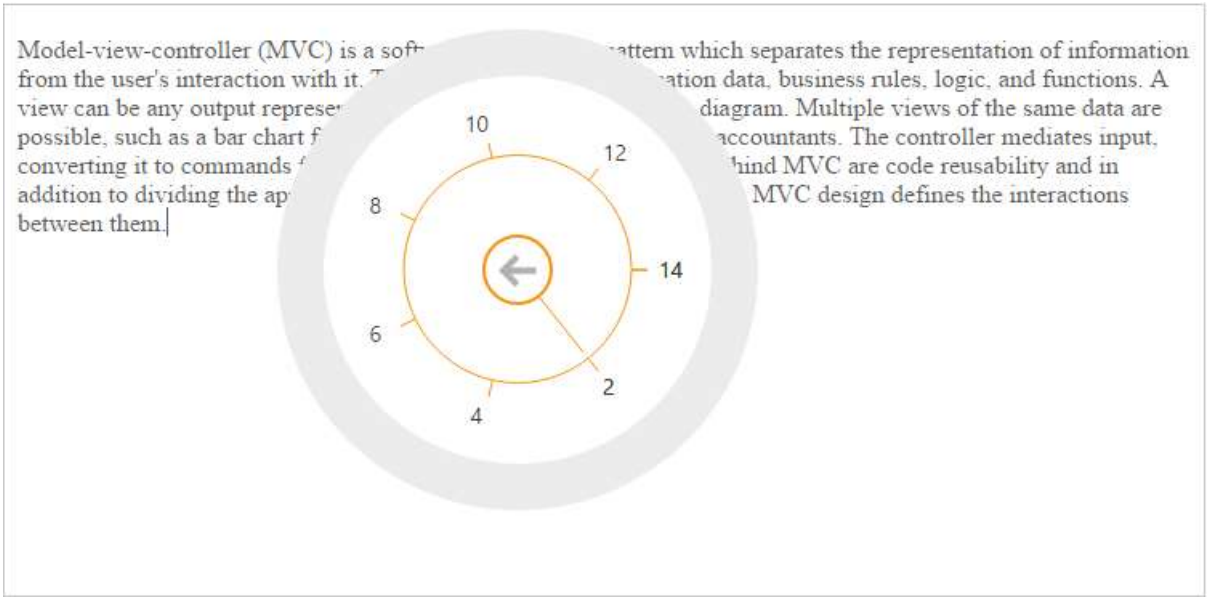


Image Customization

You can customize the **Radial Menu's** Center and Back images by using the **ImageClass** and **BackImageClass** properties. Every menu item can be added with image using **url** property. By using this **ImageClass** attribute, you can customize the **Radial Menu** center image.

Sub-Items are also supported in the **Radial Menu**. To navigate Sub-Items, click the arrows in the outer ring and it displays the corresponding sub-items group. Clicking the center button when a sub-items group is shown, displays the items on the previous level. Nested **Radial Menu** has the second level back button. In this case, you can use the **BackImageClass** attribute to change your second level back button. **BackImageClass** is used to customize the **nestedRadialmenu** back image. Refer to the following code example.

You can add the page content with text-area by referring to this section.

RAZOR

```
@{
Html.EJ().RadialMenu("nestedRadialMenu").ImageClass("image-
class").BackImageClass("back-
image").TargetElementId("radialTarget2").Items(items =>
{
items.Add().Text("Copy").ImageURL(Url.Content("mvc.syncfusion.com/demos/w
eb/Images/RadialMenu/copy.png"));
items.Add().Text("Font").ImageURL(Url.Content("mvc.syncfusion.com/demos/w
eb/Images/RadialMenu/font.png")).Children(children =>
{
children.Add().ImageURL(Url.Content("mvc.syncfusion.com/demos/web/Images/
RadialMenu/f1.png")).Text("Italic");
```

```
children.Add().ImageURL(Url.Content("mvc.syncfusion.com/demos/web/Images/
RadialMenu/font.png")).Text("Bold");
});
items.Add().Text("Table").ImageURL(Url.Content("mvc.syncfusion.com/demos/
web/Images/RadialMenu/table.png"));
items.Add().Text("List").ImageURL(Url.Content("mvc.syncfusion.com/demos/w
eb/Images/RadialMenu/list.png")).Children(children =>
{
children.Add().ImageURL(Url.Content("mvc.syncfusion.com/demos/web/Images/
RadialMenu/l1.png")).Text("List");
children.Add().ImageURL(Url.Content("mvc.syncfusion.com/demos/web/Images/
RadialMenu/l2.png")).Text("List");
children.Add().ImageURL(Url.Content("mvc.syncfusion.com/demos/web/Images/
RadialMenu/l3.png")).Text("List");
children.Add().ImageURL(Url.Content("mvc.syncfusion.com/demos/web/Images/
RadialMenu/l4.png")).Text("List");
children.Add().ImageURL(Url.Content("mvc.syncfusion.com/demos/web/Images/
RadialMenu/l5.png")).Text("List");
});
items.Add().Text("Paste").ImageURL(Url.Content("mvc.syncfusion.com/demos/
web/Images/RadialMenu/paste.png")).Children(children =>
{
children.Add().ImageURL(Url.Content("mvc.syncfusion.com/demos/web/Images/
RadialMenu/c1.png")).Text("Paste");
children.Add().ImageURL(Url.Content("mvc.syncfusion.com/demos/web/Images/
RadialMenu/c2.png")).Text("Paste");
});
items.Add().Text("Sort").ImageURL(Url.Content("mvc.syncfusion.com/demos/w
eb/Images/RadialMenu/sort.png")).Children(children =>
{
children.Add().ImageURL(Url.Content("mvc.syncfusion.com/demos/web/Images/
RadialMenu/s1.png")).Text("Sort");
children.Add().ImageURL(Url.Content("mvc.syncfusion.com/demos/web/Images/
RadialMenu/s2.png")).Text("Sort");
});
items.Add().Text("Alignment").ImageURL(Url.Content("mvc.syncfusion.com/de
mos/web/Images/RadialMenu/align.png")).Children(children =>
{
children.Add().Text("Left").ImageURL(Url.Content("mvc.syncfusion.com/demo
s/web/Images/RadialMenu/a1.png")).Click("left");
children.Add().Text("Right").ImageURL(Url.Content("mvc.syncfusion.com/dem
os/web/Images/RadialMenu/a2.png")).Click("right");
});
items.Add().Text("Draw").ImageURL(Url.Content("mvc.syncfusion.com/demos/w
eb/Images/RadialMenu/draw.png"));
}).Render();
}
```

Add the following script in your code.

JAVASCRIPT

```
function radialShow(e) {
var target = $("#radialTarget2"), radialRadius = 150, radialDiameter = 2
* radialRadius,
// To get Iframe positions
```

Copyright © 2001 - 2020 Syncfusion Inc.

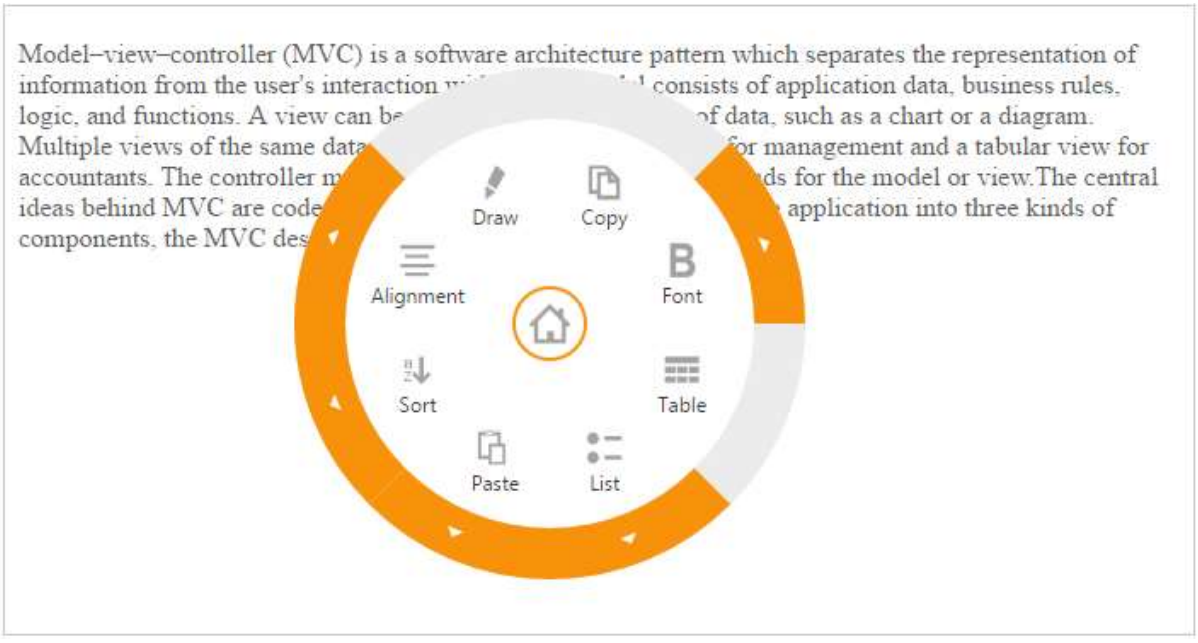
```
iframeY = target.offset().top + e.event.clientY, iframeX =
target.offset().left + e.event.clientX,
// To set Radial Menu position within target
x = iframeX > target.width() - radialRadius ? target.width() -
radialDiameter : (iframeX > radialRadius ? iframeX - radialRadius : 0),
y = iframeY > target.height() - radialRadius ? target.height() -
radialDiameter : (iframeY > radialRadius ? iframeY - radialRadius : 0);
radialElement.ejRadialMenu("setPosition", x, y);
}
```

Add the following styles in your code.

CSS

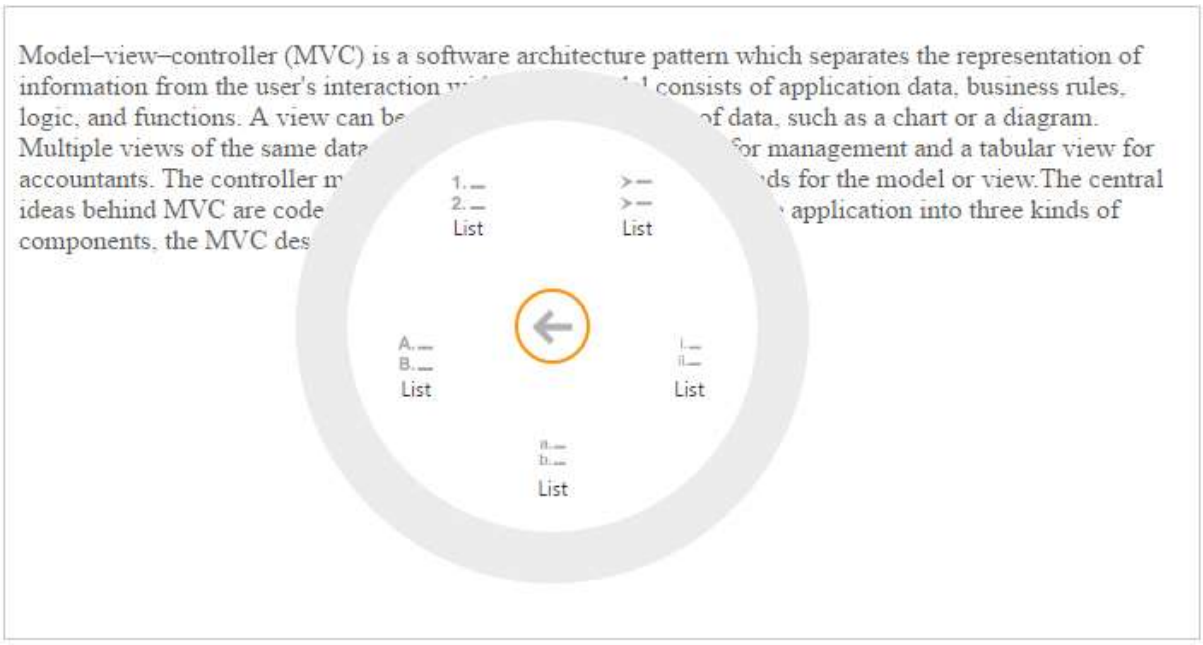
```
<style type="text/css" class="cssStyles">
.e-radialmenu .image-class
{
background-image:
url("mvc.syncfusion.com/demos/web/Images/RadialMenu/main.png");
}
.e-radialmenu .back-image
{
background-image:
url("mvc.syncfusion.com/demos/web/Images/RadialMenu/Back_button.png");
}
</style>
```

The following screenshot illustrates the output.



Radial Menu - Image Customization – Main menu

When you click the arrow, it navigates to the child item as illustrated in the following screenshot.



Radial Menu- Image Customization – Child menu

Appearance and Styling

You can customize RadialMenu control style and the appearance by using available themes or cssClass property.

Theme

In order to apply styles to the RadialMenu control, refer these 2 files namely, ej.widgets.core.min.css and ej.theme.min.css. When you refer ej.web.all.min.css file, it is not necessary to include the files ej.widgets.core.min.css and ej.theme.min.css in your project, as ej.web.all.min.css is the combination of these two.

By default, there are 13 theme support available for RadialMenu component, namely:

- flat-azure
- flat-azure-dark
- fat-lime
- flat-lime-dark
- flat-saffron
- flat-saffron-dark
- gradient-azure
- gradient-azure-dark
- gradient-lime
- gradient-lime-dark
- gradient-saffron
- gradient-saffron-dark
- bootstrap

CSS Class

RadialMenu component's appearance can only be customized using its CSS classes. Define CSS class, as per requirement and assign the class name to cssClass property.

Copyright © 2001 - 2020 Syncfusion Inc.

Configure RadialMenu using CSS class

Define CSS class to customize the RadialMenu control.

CSS

```
<style type="text/css">
/* Customize the radialmenu */
.e-radialmenu .e-default, .e-radialmenu .e-outerdefault.customCss
{
fill:#f00;
}
</style>
```

In the HTML page, define the li items for RadialMenu component.

RAZOR

```
@Html.EJ().RadialMenu("defaultRadialMenu").ImageClass("e-
radial").CssClass("customCss").TargetElementId("radialtarget1").Items(ite
ms
=>
{
items.Add().ImageURL(Url.Content("mvc.syncfusion.com/demos/web/Images/Rad
ialMenu/copy.png")).Text("Copy");
items.Add().ImageURL(Url.Content("mvc.syncfusion.com/demos/web/Images/Rad
ialMenu/paste.png")).Text("Paste");
items.Add().ImageURL(Url.Content("mvc.syncfusion.com/demos/web/Images/Rad
ialMenu/redo.png")).Text("Redo");
items.Add().ImageURL(Url.Content("mvc.syncfusion.com/demos/web/Images/Rad
ialMenu/undo.png")).Text("Undo");
})
```

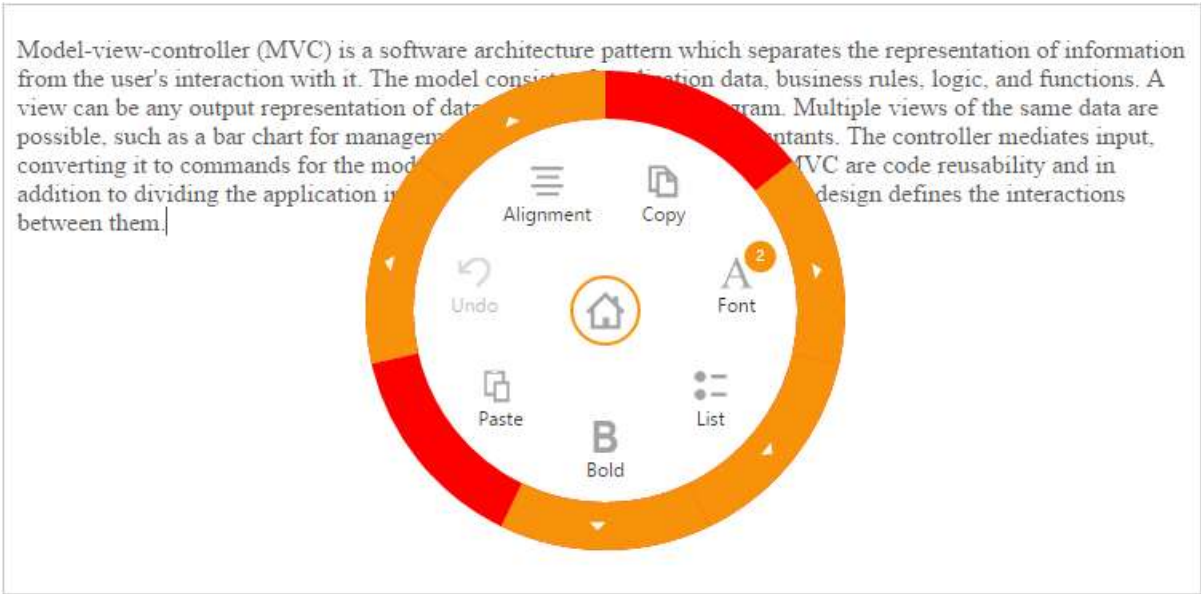
Customize **Radial Menu** control with cssClass in script as follows.

JAVASCRIPT

```
function radialShow(e) {
var target = $("#radialtarget1"), radialRadius = 150, radialDiameter = 2
* radialRadius,
// To get Iframe positions
iframeY = target.offset().top + e.event.clientY, iframeX =
target.offset().left + e.event.clientX,
// To set Radial Menu position within target
x = iframeX > target.width() - radialRadius ? target.width() -
radialDiameter : (iframeX > radialRadius ? iframeX - radialRadius : 0),
y = iframeY > target.height() - radialRadius ? target.height() -
radialDiameter : (iframeY > radialRadius ? iframeY - radialRadius : 0);
radialElement.ejRadialMenu("setPosition", x, y);
}
```

Output of RadialMenu configured based on CSS class is as follow,

Copyright © 2001 - 2020 Syncfusion Inc.



Template Support

Template support for RadialMenu items will allow you to use any type of \<svg\> Permitted tags inside our template. Here for example, using this template support you can use the SVG icons in Radial Menu instead of image tags. To use SVG icons in RadialMenu, you need to use PrependTo property.

Add SVG to item Icon

Using SVG icon will optimize the icons quality and to reduce space occupation by normal images and SVG images are Scalable and Zoomable. Define the text element for SVG with x and y position and code for rendering the font icons. Assign the SVG element ID to PrependTo property.

Please refer the following code to render the SVG icon in RadialMenu,

RAZOR

```
<div id="contentDiv">
<div id="radialTarget1" class="content-container-fluid">
<div class="row">
