Show desired chart types in the dropdown menu

By default, all chart types are displayed in the dropdown menu included in the toolbar. However, based on the request for an application, we may need to show selective chart types on our own. This can be achieved using the chartTypes property. To know more about supporting chart types, click here.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview id="pivotview" ref="pivotview"
:dataSourceSettings="dataSourceSettings"  :height="height"
:showToolbar="showToolbar"  :toolbar="toolbar"
:displayOption="displayOption" :chartTypes="chartTypes"> </ejs-pivotview>
    </div>
</template>

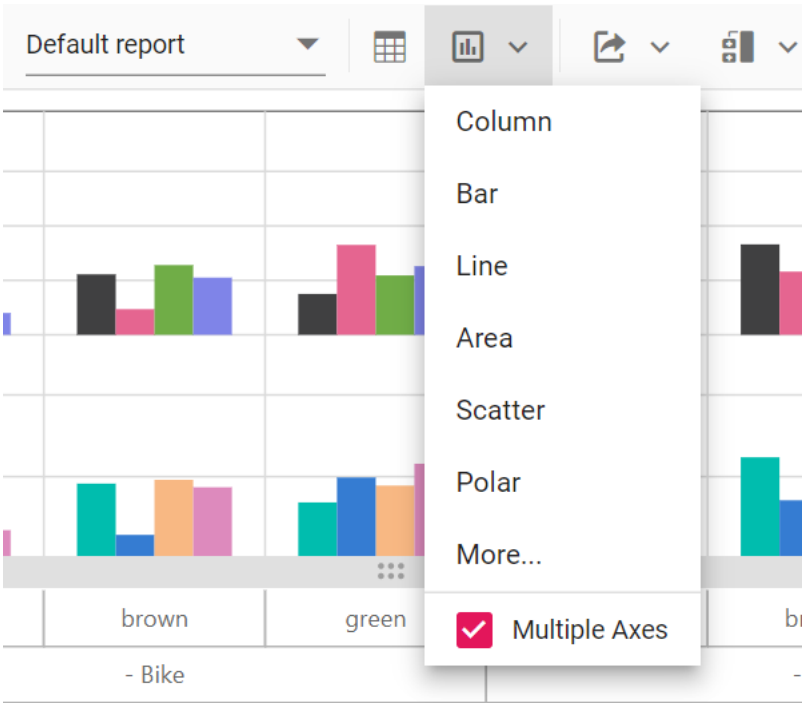
{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs246" %}

Switch the chart to multiple axes

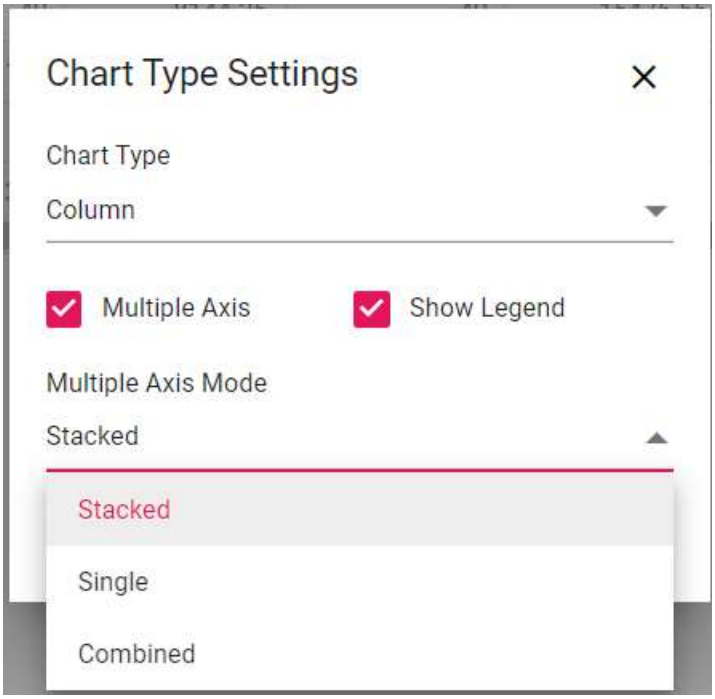
In the chart, the user can switch from single axis to multiple axes with the help of the built-in checkbox available inside the chart type dropdown menu in the toolbar. For more information refer here.

Copyright © 2001 -2024 Syncfusion Inc.



<!-- markdownlint-disable MD009 -->

There are three modes available in **Multiple Axis** option: Stacked, Single and Combined. The modes can be changed using “Multiple Axis Mode” drop-down list which appears while clicking the **More...** option.

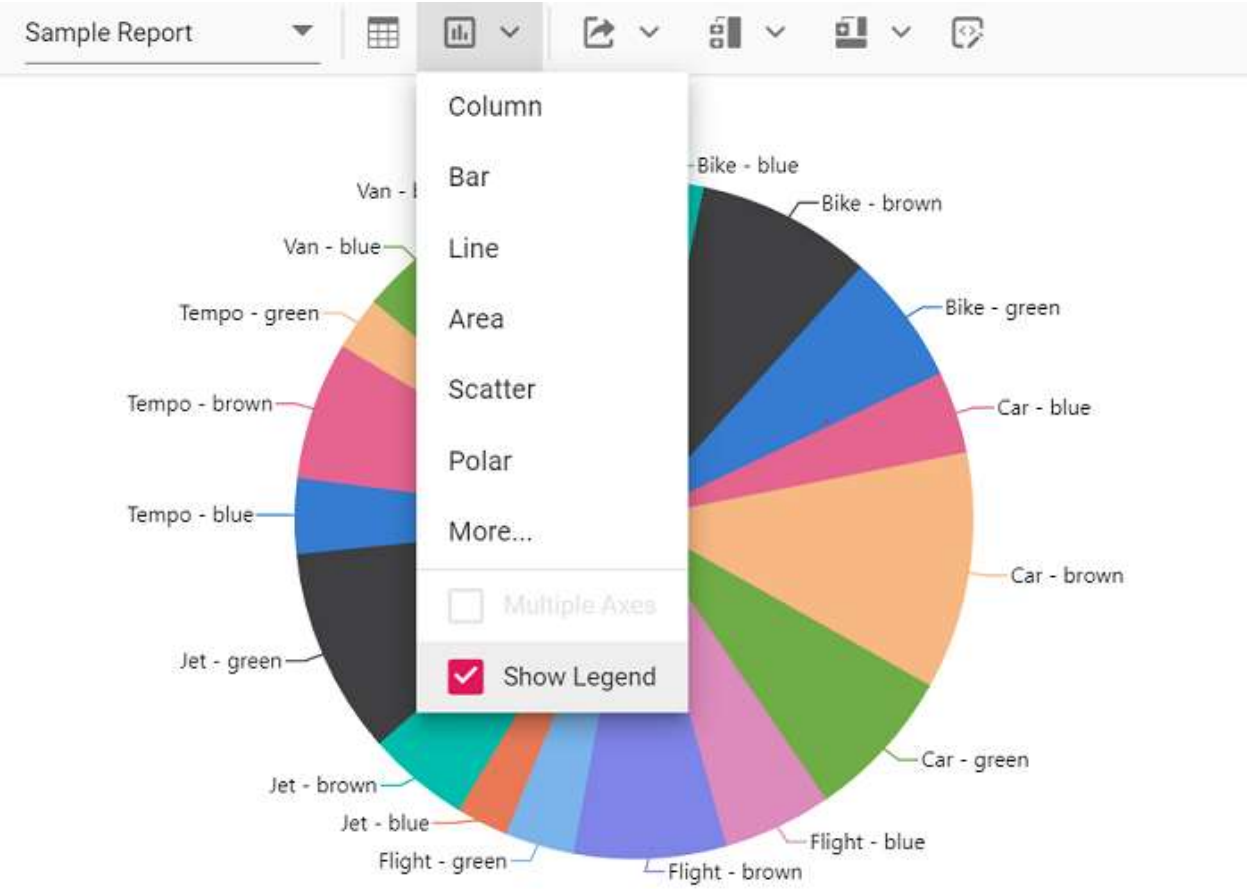


Show or hide legend

In the chart, legend can be shown or hidden dynamically with the help of the built-in option available in the chart type drop-down menu.

Copyright © 2001 -2024 Syncfusion Inc.

By default, the legend is not be visible for the accumulation chart types like pie, doughnut, pyramid, and funnel. Users can enable or disable using the built-in checkbox option.



Adding custom option to the toolbar

In addition to the existing built-in toolbar items, new toolbar item(s) may also be included. This can be achieved by using the toolbarRender event. The action of the new toolbar item(s) can also be defined within this event.

The new toolbar item(s) can be added to the desired position in the toolbar using the splice option.

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs247" %}

In the above topic, we have seen how to add an icon as one of the toolbar item in toolbar panel. In the next topic, we are going to see how to frame the entire toolbar panel and how to add a custom control in it.

Toolbar Template

It allows to customize the toolbar panel by using template option. It allows any custom control to be used as one of the toolbar item inside the toolbar panel. It can be achieved by two ways,

Here, the entire toolbar panel can be framed in HTML elements that are appended at the top of the pivot table. The **id** of the HTML element needs to be set in the toolbarTemplate property in-order to map it to the pivot table.

APP.VUE

```
<template>
    <div id="app">
    <div id="template" >
    <div>
     <ejs-button id="expandall" :isPrimary="isPrimary" cssClass='e-flat' v-
on:click.native="expandAll">EXPAND ALL</ejs-button>
      <ejs-button id="collapseall" :isPrimary="isPrimary" cssClass='e-flat'
v-on:click.native="collapseAll">COLLAPSE ALL</ejs-button>
      </div>
       </div>
        <ejs-pivotview id="pivotview" ref="pivotview"
:dataSourceSettings="dataSourceSettings" :gridSettings="gridSettings"
:height="height" :showToolbar="showToolbar"
:toolbarTemplate="toolbarTemplate"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { ButtonPlugin, ChangeEventArgs } from '@syncfusion/ej2-vue-buttons';
import {
  PivotViewPlugin,
  IDataSet,
  Toolbar,
} from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
Vue.use(ButtonPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 350,
```

```
      gridSettings: { columnWidth: 140 },
      showToolbar: true,
      toolbarTemplate: '#template',
      isPrimary:true
    };
  },
  methods: {
    expandAll: function(args) {
      let pivotGridObj =
document.getElementById('pivotview').ej2_instances[0];
      pivotGridObj.dataSourceSettings.expandAll=true;
    },
    collapseAll: function(args) {
      let pivotGridObj =
document.getElementById('pivotview').ej2_instances[0];
      pivotGridObj.dataSourceSettings.expandAll=false;
    }
  },
  provide: {
    pivotview: [
      Toolbar,
    ]
  }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs248" %}

Another option allows to frame a custom toolbar item using HTML elements and include in the toolbar panel at the desired position. The custom toolbar items can be declared as control **instance** or element **id** in the toolbar property in pivot table.

APP.VUE

```
<template>
    <div id="app">
     <ejs-button id="enablertl" :isPrimary="isPrimary" cssClass='e-flat' v-
on:click.native="enableRtl">ENABLE RTL</ejs-button>
      <ejs-button id="disablertl" :isPrimary="isPrimary" cssClass='e-flat'
v-on:click.native="disableRtl">DISABLE RTL</ejs-button>
        <ejs-pivotview id="pivotview" ref="pivotview"
:dataSourceSettings="dataSourceSettings" :gridSettings="gridSettings"
:height="height" :showToolbar="showToolbar" :toolbar="toolbar"> </ejs-
pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { ButtonPlugin, ChangeEventArgs } from '@syncfusion/ej2-vue-buttons';
import {
  PivotViewPlugin,
  IDataSet,
  Toolbar,
```

```
} from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
Vue.use(ButtonPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 350,
      gridSettings: { columnWidth: 140 },
      showToolbar: true,
      toolbar: [{template:'#enablertl'}, {template:'#disablertl'}],
      isPrimary:true
    };
  },
  methods: {
    enableRtl: function(args) {
      let pivotGridObj =
document.getElementById('pivotview').ej2_instances[0];
      pivotGridObj.enableRtl=true;
    },
    disableRtl: function(args) {
      let pivotGridObj =
document.getElementById('pivotview').ej2_instances[0];
      pivotGridObj.enableRtl=false;
    }
  },
  provide: {
    pivotview: [
      Toolbar,
    ]
  }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs249" %}

Note: For both options, the actions for the toolbar template items can be defined in the event toolbarClick. Also, if the toolbar item is a custom control then its built-in events can also be accessed.

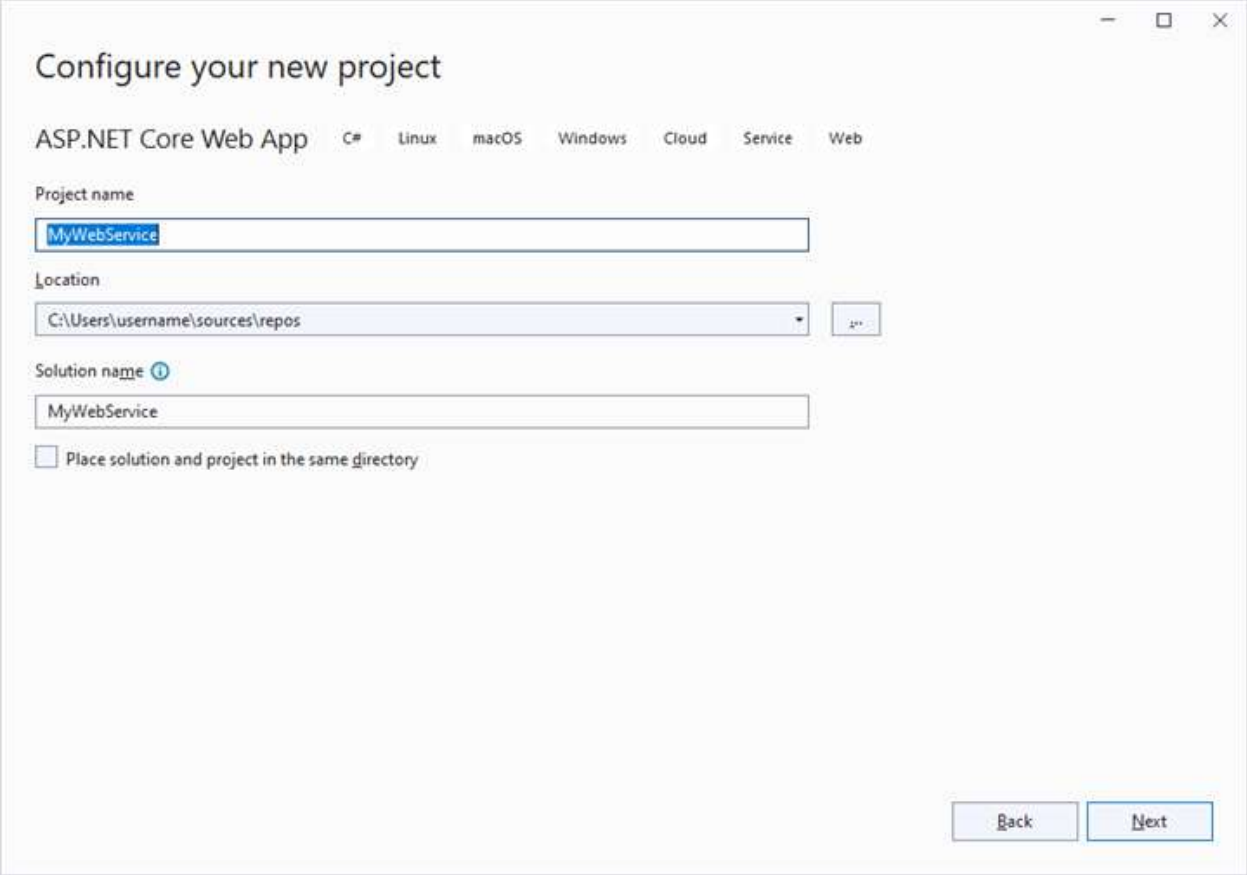
Save and load reports to a SQL database

SQL Server is a relational database management system (RDBMS) that can be used to store and manage large amounts of data. In this topic, we will see how to save, save as, rename, load, delete, and add reports between a SQL Server database and a Vue Pivot Table at runtime.

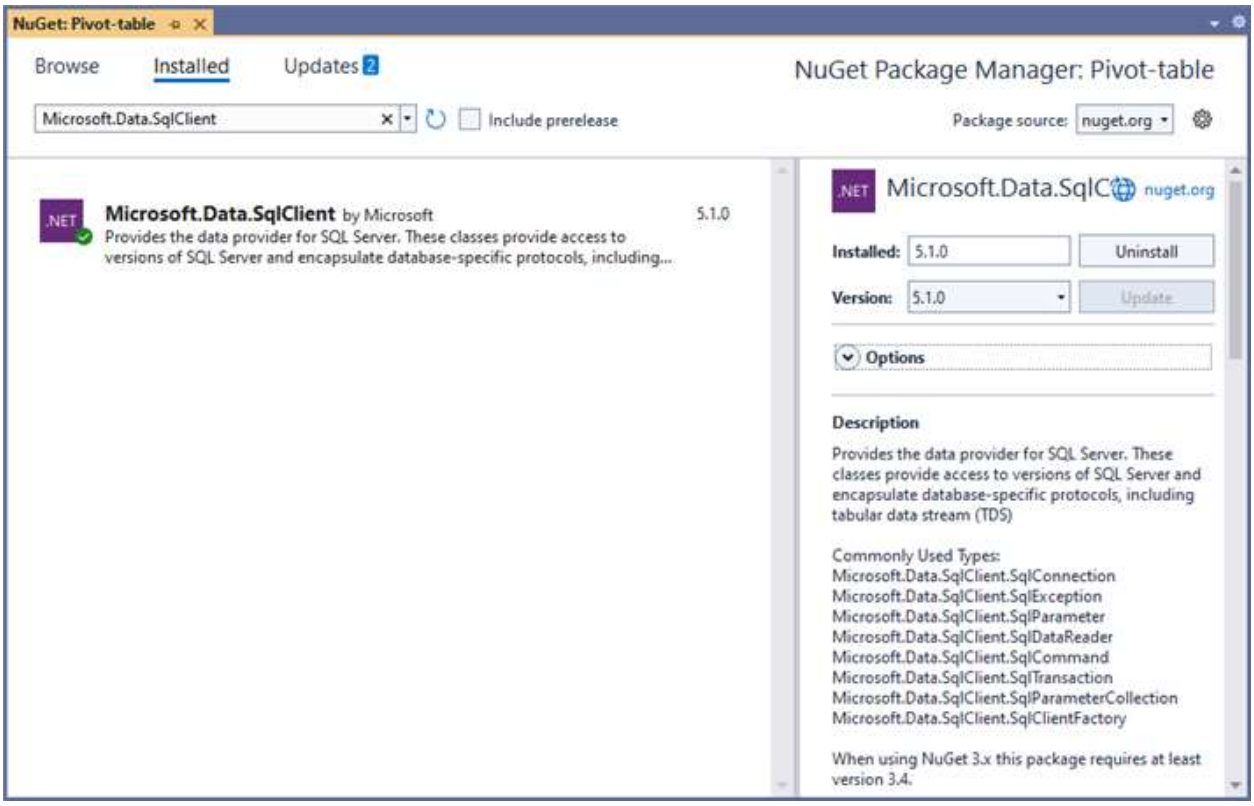
Create a Web API service to connect to a SQL Server database

1. Open Visual Studio and create an ASP.NET Core Web App project type, naming it **MyWebService**. To create an ASP.NET Core Web application, follow the document link.



2. To connect a SQL Server database using the Microsoft SqlClient in our application, we need to install the Microsoft.Data.SqlClient NuGet package. To do so, open the NuGet package manager of the project solution, search for the package **Microsoft.Data.SqlClient** and install it.

Copyright © 2001 -2024 Syncfusion Inc.



3. Under the **Controllers** folder, create a Web API controller (aka, PivotController.cs) file that aids in data communication with the Pivot Table.

4. In the Web API Controller (aka, PivotController), the **OpenConnection** method is used to connect to the SQL database. The **GetDataTable** method then processes the specified SQL query string, retrieves data from the database, and converts it into a **DataTable** using **SqlCommand** and **SqlDataAdapter**. This **DataTable** can be used to retrieve saved reports and modify them further as shown in the code block below.

[PivotController.cs]

`csharp

```
using Microsoft.AspNetCore.Mvc;
using Microsoft.Data.SqlClient;
using System.Data;
namespace MyWebService.Controllers
{
[ApiController]
[Route("[controller]")]
public class PivotController : ControllerBase
{
[HttpPost]
```

```
[Route("Pivot/SaveReport")]
public void SaveReport([FromBody] Dictionary<string, string> reportArgs)
{
SaveReportToDB(reportArgs["reportName"], reportArgs["report"]);
}
[HttpPost]
[Route("Pivot/FetchReport")]
public IActionResult FetchReport()
{
return Ok((FetchReportListFromDB()));
}
[HttpPost]
[Route("Pivot/LoadReport")]
public IActionResult LoadReport([FromBody] Dictionary<string, string> reportArgs)
{
return Ok((LoadReportFromDB(reportArgs["reportName"])));
}
[HttpPost]

SqlDataAdapter da = new SqlDataAdapter(cmd);
DataTable dt = new DataTable();
da.Fill(dt);
return dt;
}
}
}
`
```

5. When you run the app, it will be hosted at https://localhost:44313. You can use the hosted URL to save and load reports in the SQL database from the Pivot Table.

Further, let us explore more on how to save, load, rename, delete, and add reports using the built-in toolbar options via Web API controller (aka, PivotController) one-by-one.

Saving a report

When you select the **“Save a report”** option from the toolbar, the saveReport event is triggered. In this event, an AJAX request is made to the Web API controller's **SaveReport** method, passing the name of the current report and the current report, which you can use to check and save in the SQL database.

For example, the report shown in the following code snippet will be passed to the **SaveReport** method along with the report name **“Sample Report”** and saved in the SQL database.

[App.vue]

`

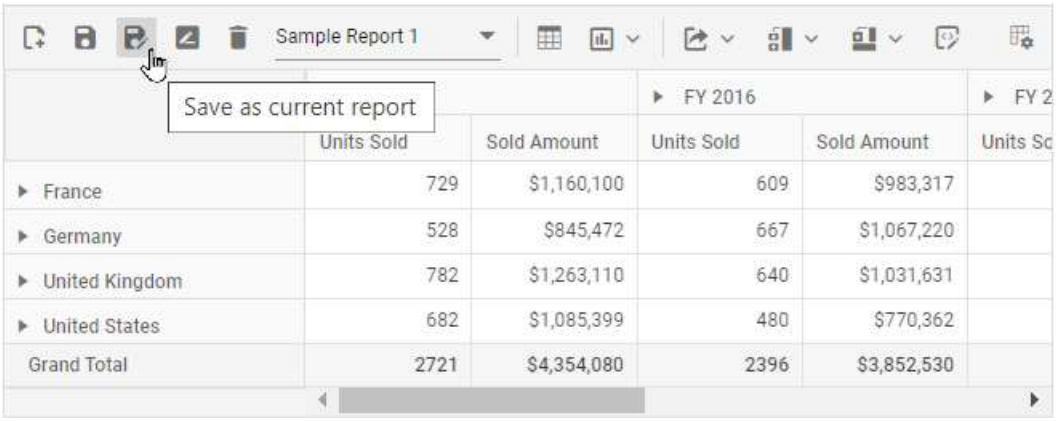
In the meantime, you can save a duplicate of the current report to the SQL Server database with a different name by selecting **"Save as current report"** from the toolbar. The saveReport event will then be triggered with the new report name **"Sample Report 1"** and the current report. You can save them to the SQL Server database after passing them to the Web API service, as mentioned above.



Loading a report

When you select the dropdown menu item from the toolbar, the loadReport event is triggered. In this event, an AJAX request is made to the **LoadReport** method of the Web API controller, passing the name of the selected report. The method uses this information to search for the report in the SQL database, fetch it, and load it into the pivot table.

For example, if the report name **"Sample Report 1"** is selected from a dropdown menu and passed, the **LoadReport** method will use that name to search for the report in the SQL database, retrieve it, and then load it into the pivot table.

Renaming a report

When you select the **“Rename a current report”** option from the toolbar, the renameReport event is triggered. In this event, an AJAX request is made to the **RenameReport** method of the Web API controller, passing the current and new report names, where you can use the current report name to identify the report and resave it with the new report name in the SQL database.

For example, if we rename the current report from **“Sample Report 1”** to **“Sample Report 2”**, both **“Sample Report 1”** and **“Sample Report 2”** will be passed to the **RenameReport** method, which will rename the current report with the new report name **“Sample Report 2”** in the SQL database.

Deleting a report

When you select the **“Delete a current report”** option from the toolbar, the removeReport event is triggered. In this event, an AJAX request is made to the **RemoveReport** method of the Web API controller, passing the current report name to identify and delete the appropriate report from the SQL database.

Note: * If the current report **n** from the pivot table is deleted, the pivot table will automatically load the last report from the report list.

* When a report is removed from a pivot table with only one report, the SQL database refreshes; however, the pivot table will continue to show the removed report until a new report is added to the pivot table.

For example, if we delete the current report **“Sample Report 2”** from the pivot table, the current report name **“Sample Report 2”** is passed to the **RemoveReport** method, which allows you to identify and delete the report from the SQL database.

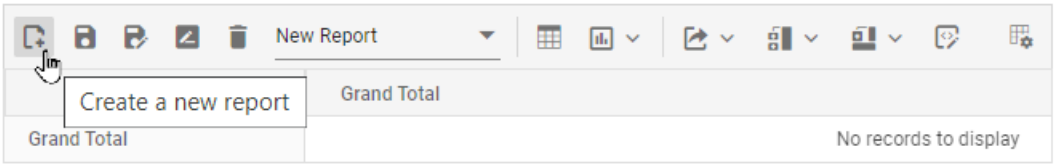
Adding a report

When you select the **"Create a new report"** option from the toolbar, the newReport event is triggered, followed by the saveReport event. To save this new report to the SQL database, use the saveReport event triggered later, and then follow the save report briefing in the preceding topic.



Limitations with respect to report manipulation

Below points need to be considered when saving the report to SQL Server database.

- **Data source**: Both raw data and aggregated data won't be saved and loaded from the database.
- **Hyperlinks**: Option to link external facts via pivot table cells won't be saved and loaded from the database.
- The pivot table should always load reports from the SQL database based on the data source that is currently bound to it.

In this GitHub repository, you can find our Vue Pivot Table sample and ASP.NET Core Web Application to save and load reports from SQL Server database.

Events

FetchReport

The event fetchReport is triggered when dropdown list is clicked in the toolbar in-order to retrieve and populate saved reports. It has following parameter - `reportName`. This event allows user to fetch the report names from local storage and populate the dropdown list.

LoadReport

The event loadReport is triggered when a report is selected from the dropdown list in the toolbar. It has following parameters - `report` and `reportName`. This event allows user to load the selected report to the pivot table.

NewReport

The event newReport is triggered when the new report icon is clicked in the toolbar. It has following parameter - `report`. This event allows user to create new report and add to the report list.

RenameReport

The event renameReport is triggered when rename report icon is clicked in the toolbar. It has following parameters - `rename`, `report` and `reportName`. This event allows user to rename the selected report from the report list.

RemoveReport

The event removeReport is triggered when remove report icon is clicked in the toolbar. It has following parameters - `report` and `reportName`. This event allows user to remove the selected report from the report list.

SaveReport

The event saveReport is triggered when save report icon is clicked in the toolbar. It has following parameters - `report` and `reportName`. This event allows user to save the altered report to the report list.

ToolbarRender

The toolbarRender event is triggered when the toolbar is rendered. It has the `customToolbar` parameter. This event helps to customize the built-in toolbar items and to include new toolbar item(s).

BeforeExport

The pivot table (or) pivot chart can be exported as a pdf, excel, csv etc., document using the toolbar options. And, you can customize the export settings for exporting document by using the beforeExport event in the toolbar.

For example, you can add the header and footer for the pdf document by setting the header and footer properties for the pdfExportProperties in the beforeExport event.

ActionBegin

The event actionBegin triggers when the UI actions such as switching between pivot table and pivot chart, changing chart types, conditional formatting, exporting, etc. that are present in toolbar UI begin. This allows user to identify the current action being performed at runtime. It has the following parameters:

- dataSourceSettings: It holds the current data source settings such as input data source, rows, columns, values, filters, format settings and so on.
- actionName: It holds the name of the current action began. The following are the UI actions and their names:

| Action | Action Name |

|------|------------|

| New report | Add new report |

| Save report | Save current report |

| Save as report | Save as current report |

| Rename report | Rename current report |

Copyright © 2001 -2024 Syncfusion Inc.

| Remove report | Remove current report |

| Report change | Report change |

| Conditional Formatting | Open conditional formatting dialog |

| Number Formatting | Open number formatting dialog |

| Export menu | PDF export, Excel export, CSV export |

| Show Fieldlist | Open field list |

| Show Table | Show table view |

| Chart menu | Show chart view |

| Sub-totals menu | Hide sub-totals, Show row sub-totals, Show column sub-totals, Show sub-totals |

| Grand totals menu | Hide grand totals, Show row grand totals, Show column grand totals, Show grand totals |

- cancel: It allows user to restrict the current action.

In the below sample, toolbar UI actions such as add new report and save current report can be restricted by setting the **args.cancel** option to **true** in the actionBegin event.

ActionComplete

The event actionComplete triggers when the UI actions such as as switching between pivot table and pivot chart, changing chart types, conditional formatting, exporting, etc. that are present in toolbar UI, is completed. This allows user to identify the current UI actions being completed at runtime. It has the following parameters:

- dataSourceSettings: It holds the current data source settings such as input data source, rows, columns, values, filters, format settings and so on.
- actionName: It holds the name of the current action completed. The following are the UI actions and their names:

Action	Action Name
New report	New report added
Save report	Report saved
Save as report	Report re-saved
Rename report	Report renamed
Remove report	Report removed
Report change	Report changed
Conditional Formatting	Conditionally formatted
Number Formatting	Number formatted
Export menu	PDF exported, Excel exported, CSV exported
Show Fieldlist	Field list closed
Show Table	Table view shown
Sub-totals menu	Sub-totals hidden, Row sub-totals shown, Column sub-totals shown, Sub-totals shown
Grand totals menu	Grant totals hidden, Row grand totals shown, Column grand totals shown, Grand totals shown

Copyright © 2001 -2024 Syncfusion Inc.

- actionInfo: It holds the unique information about the current UI action. For example, while adding new report, the event argument contains information such as report name and the action name.

Tool tip in Vue Pivotview component

The tooltip can be enabled or disabled by setting the showTooltip property to **true** or **false**. By default, tooltip is enabled in the pivot table.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :height="height"
:dataSourceSettings="dataSourceSettings" :showTooltip="showTooltip"> </ejs-
pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin } from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        enableSorting: true,
        drilledMembers: [{ name: 'Year', items: ['FY 2015'] }, { name:
'Country', items: ['France'] }],
```

```
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 350,
      showTooltip: false
    }
  }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs256" %}

Tooltip Template

User can design their own tooltip by setting the property tooltipTemplate with own HTML elements. The property accepts both HTML string and ID attribute. The following place holders are available to display its dynamic values inside the HTML elements.

${rowHeaders} – Row headers of the selected value cell.

${columnHeaders} – Column headers of the selected value cell.

${rowFields} – Row fields of the selected value cell.

${columnFields} – Column fields of the selected value cell.

${valueField} – Field name of the selected value cell.

${aggregateType} – Aggregate type of the selected value cell.

${value} - Formatted value of the selected value cell.

The tooltip customization is common for both pivot table and pivot chart or it can be done individually as well. To customize the pivot table tooltip, the above procedure needs to be followed. To customize the pivot chart tooltip alone use template property of tooltip under chartSettings.

In the below sample, the pivot table and pivot chart shows customized tooltip layouts.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:displayOption="displayOption" :chartSettings="chartSettings"
:toolbar="toolbar" :showToolbar="showToolbar"
:tooltipTemplate="tooltipTemplate"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";

Css customization in Vue Pivotview component

Hiding Axis

The visibility of row, column, value and filter axis in Field List and Grouping Bar can be changed using custom CSS setting. To do so, please refer the code sample below:

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview id="PivotTable" :height="height"
:dataSourceSettings="dataSourceSettings" :showGroupingBar="showGroupingBar"
:showFieldList="showFieldList"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, GroupingBar, FieldList } from "@syncfusion/ej2-
vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        enableSorting: true,
        drilledMembers: [{ name: 'Year', items: ['FY 2015'] }, { name:
'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 350,
      showGroupingBar: true,
      showFieldList: true
    }
  },
  provide: {
    pivotview: [GroupingBar,FieldList]
  }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
/* csslint ignore:start */
#PivotTable .e-group-columns {
  display: none;
}
#PivotTable .e-group-filters {
```

```
  height: 71px !important;
}
#PivotTable_PivotFieldList_Wrapper .e-field-list-columns{
  display: none;
}
#PivotTable_PivotFieldList_Wrapper .e-field-list-values{
  margin-top: 0px;
  height: 338px;
}
.e-pivotfieldlist-wrapper .e-values {
  height: 310px !important;
}
/* Hiding row axis in grouping bar */
/* #PivotView .e-group-rows {
    display: none;
} */
/* Hiding row axis in field list */
/* .e-pivotfieldlist-wrapper .e-field-list-rows {
    display: none;
} */
/* Hiding value axis in grouping bar */
/* #PivotView .e-group-values {
    display: none;
} */
/* Hiding value axis in field list */
/* .e-pivotfieldlist-wrapper .e-field-list-values {
    display: none;
} */
/* Hiding filter axis in grouping bar */
/* #PivotView .e-group-filters {
    display: none;
} */
/* Hiding filter axis in field list */
/* .e-pivotfieldlist-wrapper .e-field-list-filters {
    display: none;
} */
/* csslint ignore:end */
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs16" %}

Text Alignment

The alignment of text inside row headers, column headers, value cells and summary cells can be changed using custom CSS setting. To do so, please refer the code sample below:

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview id="pivotview" :height="height"
:dataSourceSettings="dataSourceSettings" :showGroupingBar="showGroupingBar"
:showFieldList="showFieldList"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
```

Copyright © 2001 -2024 Syncfusion Inc.

```
import { PivotViewPlugin, GroupingBar, FieldList } from "@syncfusion/ej2-
vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        enableSorting: true,
        drilledMembers: [{ name: 'Year', items: ['FY 2015'] }, { name:
'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 350,
      showGroupingBar: true,
      showFieldList: true
    }
  },
  provide: {
    pivotview: [GroupingBar,FieldList]
  }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
/* csslint ignore:start */
.e-pivotview .e-valuescontent {
  text-align: center !important;
}
/* csslint ignore:end */
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs17" %}

Customize header, value and summary cell style

The elements in pivot table like header cell, value cell and summary cell style can be customized using built-in CSS names. To do so, please refer the code sample below:

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview id="PivotTable" :height="height"
:dataSourceSettings="dataSourceSettings" :showGroupingBar="showGroupingBar"
:showFieldList="showFieldList"> </ejs-pivotview>
    </div>
</template>
<script>
```

```
import Vue from "vue";
import { PivotViewPlugin, GroupingBar, FieldList } from "@syncfusion/ej2-
vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        drilledMembers: [{ name: 'Year', items: ['FY 2015'] }, { name:
'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 350,
      showGroupingBar: true,
      showFieldList: true
    }
  },
  provide: {
    pivotview: [GroupingBar,FieldList]
  }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
/* csslint ignore:start */
.e-pivotview .e-headercell {
  background-color: thistle !important;
}
.e-pivotview .e-rowsheader {
  background-color: skyblue !important;
}
.e-pivotview .e-valuescontent:not(.e-gtot) {
  background-color: pink !important;
}
.e-pivotview .e-gtot {
  background-color: greenYellow !important;
}
/* csslint ignore:end */
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs18" %}

Printing and Exporting

Print in Vue Pivotview component

The rendered pivot table can be printed directly from the browser by invoking the print method from the grid's instance. The below sample code illustrates the print option being invoked by an external button click.

Copyright © 2001 -2024 Syncfusion Inc.

APP.VUE

```
<template>
    <div id="app">
        <ejs-button id="print-btn" :isPrimary="isPrimary" v-
on:click.native="btnClick" >Print</ejs-button>
        <ejs-pivotview id="pivotview"
:dataSourceSettings="dataSourceSettings" :height="height" >
        </ejs-pivotview>
</div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin } from "@syncfusion/ej2-vue-pivotview";
import { ButtonPlugin } from "@syncfusion/ej2-vue-buttons";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
Vue.use(ButtonPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        rows: [{ name: 'Country' }, { name: 'Products' }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Amount', caption: 'Sold Amount' }, { name: 'Sold',
caption: 'Units Sold' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
      },
      height: 350,
      isPrimary: true
    }
  },
  methods: {
    btnClick: function(args) {
      let pivotGridObj =
document.getElementById('pivotview').ej2_instances[0];
      pivotGridObj.grid.print();
    }
  }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs270" %}

Similarly, to print the pivot chart, use the print method from the chart's instance. The below sample code illustrates the print option being invoked by an external button click.

To use pivot chart, you need to inject the PivotChart module in the pivot table.

To display the pivot chart, set the displayOption property to either **Chart** or **Both**.

Excel export in Vue Pivotview component

The Excel export allows pivot table data to export as Excel document. To enable Excel export in the pivot table, set the allowExcelExport as **true**. You need to use the excelExport method for Excel exporting.

APP.VUE

```
<template>
    <div id="app">
        <ejs-button id="export-btn" :isPrimary="isPrimary" v-
on:click.native="btnClick">Excel Export</ejs-button>
        <ejs-pivotview id="pivotview" :height="height"
:dataSourceSettings="dataSourceSettings"
:allowExcelExport="allowExcelExport"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin } from "@syncfusion/ej2-vue-pivotview";
import { ButtonPlugin, ChangeEventArgs} from "@syncfusion/ej2-vue-buttons";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
Vue.use(ButtonPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 320,
      allowExcelExport: true,
      isPrimary: true
    }
  },
  methods: {
    btnClick: function(args) {
      let pivotGridObj =
document.getElementById('pivotview').ej2_instances[0];
      pivotGridObj.excelExport();
    }
  }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";

Multiple pivot table exporting

The Excel export provides an option to export multiple pivot table data in the same Excel file.

Same WorkSheet

The Excel export provides support to export multiple pivot tables in same sheet. To export in same sheet, define multipleExport.type as AppendToSheet in ExcelExportProperties. It has an option to provide blank rows between pivot tables and these blank row(s) count can be defined using themultipleExport.blankRows property.

By default, multipleExport.blankRows value is 5 between pivot tables within the same sheet.

APP.VUE

```
<template>
    <div id="app">
        <ejs-button id="export-btn" :isPrimary="isPrimary" v-
on:click.native="btnClick">Excel Export</ejs-button>
        <ejs-pivotview id="pivotview" :height="height"
:dataSourceSettings="dataSourceSettings"
:allowExcelExport="allowExcelExport"> </ejs-pivotview>
        <ejs-pivotview id="pivotview2" :height="height"
:dataSourceSettings="dataSourceSettings"
:allowExcelExport="allowExcelExport"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin } from "@syncfusion/ej2-vue-pivotview";
import { ButtonPlugin, ChangeEventArgs} from "@syncfusion/ej2-vue-buttons";
import { ExcelExportProperties } from '@syncfusion/ej2-grids';
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
Vue.use(ButtonPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 320,
      allowExcelExport: true,
      isPrimary: true
    }
  },
  methods: {
    btnClick: function(args) {
      let pivotGridObj =
document.getElementById('pivotview').ej2_instances[0];
```

```
      let pivotGridObj2 =
document.getElementById('pivotview2').ej2_instances[0];
      let excelExportProperties: ExcelExportProperties = {
          multipleExport: { type: 'AppendToSheet', blankRows: 2 }
      };
      let firstGridExport: Promise<any> =
pivotGridObj.grid.excelExport(excelExportProperties, true);
      firstGridExport.then((fData: any) => {
          pivotGridObj2.excelExport(excelExportProperties, false, fData);
      });
    }
  }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";

import { ButtonPlugin, ChangeEventArgs} from "@syncfusion/ej2-vue-buttons";
import { ExcelExportProperties } from '@syncfusion/ej2-grids';
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
Vue.use(ButtonPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
```

```
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 320,
      allowExcelExport: true,
      isPrimary: true
    }
  },
  methods: {
    btnClick: function(args) {
      let pivotGridObj =
document.getElementById('pivotview').ej2_instances[0];
      let pivotGridObj2 =
document.getElementById('pivotview2').ej2_instances[0];
      let excelExportProperties: ExcelExportProperties = {
          multipleExport: { type: 'NewSheet' }
      };
      let firstGridExport: Promise<any> =
pivotGridObj.grid.excelExport(excelExportProperties, true);
      firstGridExport.then((fData: any) => {
          pivotGridObj2.excelExport(excelExportProperties, false, fData);
      });
    }
  }
}
</script>
<style>

Changing the pivot table style while exporting

The Excel export provides an option to change colors for headers, caption and records in pivot table before exporting. In-order to apply colors, define **theme** settings in **excelExportProperties** object and pass it as a parameter to the excelExport method.

By default, material theme is applied to exported Excel document.

APP.VUE

```
<template>

</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs53" %}

CSV Export

Also, the Excel export allows pivot table data to be exported in CSV file format. To export pivot table in CSV file format, you need to use the csvExport method.

APP.VUE

```
<template>
    <div id="app">
        <ejs-button id="export-btn" :isPrimary="isPrimary" v-
on:click.native="btnClick">Excel Export</ejs-button>
        <ejs-pivotview id="pivotview" :height="height"
:dataSourceSettings="dataSourceSettings"
:allowExcelExport="allowExcelExport"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin } from "@syncfusion/ej2-vue-pivotview";
import { ButtonPlugin, ChangeEventArgs} from "@syncfusion/ej2-vue-buttons";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
Vue.use(ButtonPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
```

```
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 320,
      allowExcelExport: true,
      isPrimary: true
    }
  },
  methods: {
    btnClick: function(args) {
      let pivotGridObj =
document.getElementById('pivotview').ej2_instances[0];
      pivotGridObj.csvExport();
    }
  }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs54" %}

Virtual Scroll Data

You can export the pivot table virtual scroll data as Excel/CSV document by using PivotEngine export without any performance degradation. To enable PivotEngine export in the pivot table, set the allowExcelExport as **true**. You need to use the exportToExcel method for PivotEngine export.

To use PivotEngine export, You need to inject the ExcelExport module in pivot table.

PivotEngine export will be performed while enabling virtual scrolling by default.

Export all pages

The pivot engine exports the entire virtual data of the pivot table (i.e. the data that contains all of the records used to render the complete pivot table) as an Excel/CSV document. To export just the current viewport of the pivot table, set the exportAllPages property to **false**. To use the pivot engine export, add the ExcelExport module into the pivot table.

By default, the pivot engine export will be performed while virtual scrolling is enabled.

Events

ExcelQueryCellInfo

The event excelQueryCellInfo triggers while framing each row and value cell during Excel export. It allows the user to customize the cell value, style etc. of the current cell. It has the following parameters:

- value - It holds the cell value.
- column - It holds column information for the current cell.
- data - It holds the entire row data across the current cell.
- style - It holds the style properties for the cell.

APP.VUE

```
<template>
    <div id="app">

ExportComplete

The event exportComplete is triggered after the pivot table data has been exported to an Excel/CSV document. You can use this event to acquire blob stream data for further customization and processing at your end by passing the isBlob parameter as **true** when using the excelExport method. It has the following parameters:

- type - It holds the current export type such as PDF, Excel, and CSV.
- promise - It holds the promise object for blob data.

Pdf export in Vue Pivotview component

PDF export allows exporting pivot table data as PDF document. To enable PDF export in the pivot table, set the allowPdfExport as **true**. You need to use the pdfExport method for PDF exporting.

APP.VUE

```
<template>
    <div id="app">
        <ejs-button id="export-btn" :isPrimary="isPrimary" v-
on:click.native="btnClick">PDF Export</ejs-button>
        <ejs-pivotview id="pivotview" :height="height"
:dataSourceSettings="dataSourceSettings" :allowPdfExport="allowPdfExport">
</ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin } from "@syncfusion/ej2-vue-pivotview";
import { ButtonPlugin, ChangeEventArgs} from "@syncfusion/ej2-vue-buttons";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
Vue.use(ButtonPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 320,
      allowPdfExport: true,
      isPrimary: true
    }
  },
  methods: {
    btnClick: function(args) {
      let pivotGridObj =
document.getElementById('pivotview').ej2_instances[0];
      pivotGridObj.pdfExport();
    }
  }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

Multiple pivot table exporting

PDF export provides an option for exporting multiple pivot tables to same file. In this exported document, each pivot table will be exported to new page of document in same file.

APP.VUE

```
<template>
    <div id="app">
        <ejs-button id="export-btn" :isPrimary="isPrimary" v-
on:click.native="btnClick">PDF Export</ejs-button>
        <ejs-pivotview id="pivotview" :height="height"
:dataSourceSettings="dataSourceSettings" :allowPdfExport="allowPdfExport">
</ejs-pivotview>
        <ejs-pivotview id="pivotview2" :height="height"
:dataSourceSettings="dataSourceSettings" :allowPdfExport="allowPdfExport">
</ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin } from "@syncfusion/ej2-vue-pivotview";
import { ButtonPlugin, ChangeEventArgs} from "@syncfusion/ej2-vue-buttons";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
Vue.use(ButtonPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 320,
      allowPdfExport: true,
      isPrimary: true
    }
  },
  methods: {
    btnClick: function(args) {
      let pivotGridObj =
document.getElementById('pivotview').ej2_instances[0];
      let pivotGridObj2 =
document.getElementById('pivotview2').ej2_instances[0];
      let firstGridPdfExport: Promise<Object> =
pivotGridObj.grid.pdfExport({}, true);
      firstGridPdfExport.then((pdfData: Object) => {
          pivotGridObj2.pdfExport({}, false, pdfData);
      });
    }
  }
```

Export table and chart into the same document

When the displayOption is set to **Both**, you can export both the table and the chart into the same PDF document. To achieve this, use the pdfExport method and set the exportBothTableAndChart parameter to **true**.

APP.VUE

```
<template>
    <div id="app">
        <ejs-button id="export-btn" :isPrimary="isPrimary" v-
on:click.native="btnClick">PDF Export</ejs-button>
        <ejs-pivotview id="pivotview" :height="height"
:dataSourceSettings="dataSourceSettings" :allowPdfExport="allowPdfExport"
        :displayOption="displayOption" :chartSettings="chartSettings">
</ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, PDFExport } from "@syncfusion/ej2-vue-pivotview";
import { ButtonPlugin, ChangeEventArgs} from "@syncfusion/ej2-vue-buttons";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
Vue.use(ButtonPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 320,
      allowPdfExport: true,
      isPrimary: true,
      displayOption: { view: 'Both', primary: 'Table' },
      chartSettings: {
        value: 'Amount', enableExport: true, chartSeries: { type: 'Column' }
```

```
      }
    }
  },
  provide: {
    pivotview: [
      PDFExport
    ]
  },
  methods: {
    btnClick: function(args) {
      let pivotGridObj =
document.getElementById('pivotview').ej2_instances[0];
      pivotGridObj.pdfExport(null, false, null, false, true);
    }
  }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs162" %}

Customization during PDF export

PDF export provides option to customize mapping of pivot table to the exported PDF document.

To add header and footer while exporting

You can customize text, page number, line, page size and changing orientation in header and footer of the exported document.

To add a text in header/footer

You can add text either in header or footer of the exported PDF document like in the below code example.

`ts

let pdfExportProperties: PdfExportProperties = {

header: {

fromTop: 0,

height: 130,

contents: [

{

type: 'Text',

value: "Northwind Traders",

position: { x: 0, y: 50 },

style: { textBrushColor: '#000000', fontSize: 13 }

},

]

```
}
}
```

To draw a line in header/footer

You can add line either in header or footer of the exported PDF document like in the below code example.

Supported line styles:

- dash
- dot
- dashdot
- dashdotdot
- solid

```ts
let pdfExportProperties: PdfExportProperties = {
header: {
fromTop: 0,
height: 130,
contents: [
{
type: 'Line',
style: { penColor: '#000080', penSize: 2, dashStyle: 'Solid' },
points: { x1: 0, y1: 4, x2: 685, y2: 4 }
}
]
}
}
```

Add page number in header/footer

You can add page number either in header or footer of exported PDF document like in the below code example.

Supported page number types:

- LowerLatin - a, b, c,
- UpperLatin - A, B, C,
- LowerRoman - i, ii, iii,
- UpperRoman - I, II, III,
- Number - 1,2,3.

Copyright © 2001 -2024 Syncfusion Inc.

`ts

let pdfExportProperties: PdfExportProperties = {

header: {

fromTop: 0,

height: 130,

contents: [

{

type: 'PageNumber',

pageNumberType: 'Arabic',

format: 'Page {$current} of {$total}', //optional

position: { x: 0, y: 25 },

style: { textBrushColor: '#ffff80', fontSize: 15, hAlign: 'Center' }

}

]

}

}

`

The below code illustrates the PDF export customization options.

APP.VUE

```
<template>
    <div id="app">
        <ejs-button id="export-btn" :isPrimary="isPrimary" v-
on:click.native="btnClick">PDF Export</ejs-button>
        <ejs-pivotview id="pivotview" :height="height"
:dataSourceSettings="dataSourceSettings" :allowPdfExport="allowPdfExport">
</ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin } from "@syncfusion/ej2-vue-pivotview";
import { PdfExportProperties } from '@syncfusion/ej2-grids';
import { ButtonPlugin, ChangeEventArgs} from "@syncfusion/ej2-vue-buttons";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
Vue.use(ButtonPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
```

```
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 320,
      allowPdfExport: true,
      isPrimary: true
    }
  },
  methods: {
    btnClick: function(args) {
      let pivotGridObj =
document.getElementById('pivotview').ej2_instances[0];
      let pdfExportProperties: PdfExportProperties = {
        header: {
            fromTop: 0,
            height: 130,
            contents: [
                {
                    type: 'Text',
                    value: "Pivot Table",
                    position: { x: 0, y: 50 },
                    style: { textBrushColor: '#000000', fontSize: 13,
dashStyle:'Solid',hAlign:'Center' }
                }
            ]
        },
        footer: {
            fromBottom: 160,
            height: 150,
            contents: [
                {
                    type: 'PageNumber',
                    pageNumberType: 'Arabic',
                    format: 'Page {$current} of {$total}',
                    position: { x: 0, y: 25 },
                    style: { textBrushColor: '#02007a', fontSize: 15 }
                }
            ]
        }
    };
    pivotGridObj.pdfExport(pdfExportProperties);
    }
  }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs163" %}

Add an image in header/footer

You can add image (Base64 string) either in header or footer of the exported PDF document like in the below code example.

`ts

let pdfExportProperties: PdfExportProperties = {

header: {

fromTop: 0,

height: 130,

contents: [

{

type: 'Image',

src: image,

position: { x: 20, y: 10 },

size: { height: 100, width: 100 },

}

]

}

}

`

The below code illustrates the PDF export customization options.

APP.VUE

```
<template>
  <div id="app">
    <ejs-button id="export-btn" :isPrimary="isPrimary" v-
on:click.native="btnClick">PDF Export</ejs-button>
    <ejs-pivotview id="pivotview" :height="height"
:dataSourceSettings="dataSourceSettings" :allowPdfExport="allowPdfExport">
</ejs-pivotview>
  </div>
</template>
<script>
  import Vue from "vue";
  import { PivotViewPlugin } from "@syncfusion/ej2-vue-pivotview";
  import { PdfExportProperties } from '@syncfusion/ej2-grids';
  import { ButtonPlugin, ChangeEventArgs} from "@syncfusion/ej2-vue-
buttons";
  import { pivotData } from './pivotData.js';
  Vue.use(PivotViewPlugin);
  Vue.use(ButtonPlugin);
  export default {
    data () {
      return {
        dataSourceSettings: {
```

```
            dataSource: pivotData,
            expandAll: false,
            drilledMembers: [{ name: 'Country', items: ['France'] }],
            columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
            values: [{ name: 'Sold', caption: 'Units Sold' }, { name:
'Amount', caption: 'Sold Amount' }],
            rows: [{ name: 'Country' }, { name: 'Products' }],
            formatSettings: [{ name: 'Amount', format: 'C0' }],
            filters: []
          },
          height: 320,
          allowPdfExport: true,
          isPrimary: true
        }
      },
      methods: {
        btnClick: function(args) {
          let pivotGridObj =
document.getElementById('pivotview').ej2_instances[0];
          let pdfExportProperties: PdfExportProperties = {
            header: {
              fromTop: 0,
              height: 130,
              contents: [
                {
                  type: 'Image',
                  src: image,
                  position: { x: 20, y: 10 },
                  size: { height: 100, width: 100 },
                }
              ]
            }
          };
          pivotGridObj.pdfExport(pdfExportProperties);
        }
      }
    }

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs166" %}

Changing document width and height while exporting

Before exporting, you can change the height and width of the PDF document. To achieve this, use the **height** and **width** properties in the beforeExport event.

This option is only available if enableVirtualization is set to **true**. In addition, the VirtualScroll and PDFExport modules must be injected into the pivot table.

APP.VUE

```
<template>
    <div id="app">
        <ejs-button id="export-btn" :isPrimary="isPrimary" v-
on:click.native="btnClick">PDF Export</ejs-button>
        <ejs-pivotview id="pivotview" :height="height"
:dataSourceSettings="dataSourceSettings" :allowPdfExport="allowPdfExport"
:enableVirtualization="enableVirtualization" :beforeExport="beforeExport">
</ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, PDFExport, BeforeExportEventArgs, VirtualScroll }
from "@syncfusion/ej2-vue-pivotview";
import { ButtonPlugin, ChangeEventArgs} from "@syncfusion/ej2-vue-buttons";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
Vue.use(ButtonPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 320,
      allowPdfExport: true,

</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs168" %}

Changing the table's column width and row height while exporting

You can change the column width and row height in the PDF document during the pivot table export by using the onPdfCellRender event. Within this event, the args.column.width property allows you to change the width of specific columns.

As shown in the code example below, the **“Unit Sold”** column under **“FY 2015”** is changed to a width of **60** pixels.

APP.VUE

<script>
import Vue from "vue";
import { PivotViewPlugin, PDFExport, PdfCellRenderArgs, VirtualScroll } from
"@syncfusion/ej2-vue-pivotview";
import { ButtonPlugin, ChangeEventArgs} from "@syncfusion/ej2-vue-buttons";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
Vue.use(ButtonPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 320,
      allowPdfExport: true,
      isPrimary: true,
      enableVirtualization: true,
    }
  },
  methods: {
    onPdfCellRender: function (args: PdfCellRenderArgs) {
      if (args.pivotCell && args.pivotCell.valueSort &&
args.pivotCell.valueSort.levelName === 'FY 2015.Units Sold') {
        args.column.width = 60
    }
    },
    btnClick: function (args) {
      let pivotGridObj =
document.getElementById('pivotview').ej2_instances[0];
      pivotGridObj.pdfExport({}, false, null, false, true);
    }
  },
  provide: {
    pivotview: [
      PDFExport,
      VirtualScroll
    ]
```

```
  },
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs272" %}

Similarly, you can change the height of specific rows in the PDF document by using the args.cell.height property in the onPdfCellRender event.

As shown in the code example below, the **“Mountain Bikes”** row under **“France”** is changed to a height of **30** pixels.

APP.VUE

```
<template>
    <div id="app">
        <ejs-button id="export-btn" :isPrimary="isPrimary" v-
on:click.native="btnClick">PDF Export</ejs-button>
        <ejs-pivotview id="pivotview" :height="height"
:dataSourceSettings="dataSourceSettings" :allowPdfExport="allowPdfExport"
        :enableVirtualization="enableVirtualization"
:onPdfCellRender="onPdfCellRender"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, PDFExport, PdfCellRenderArgs, VirtualScroll } from
"@syncfusion/ej2-vue-pivotview";
import { ButtonPlugin, ChangeEventArgs} from "@syncfusion/ej2-vue-buttons";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
Vue.use(ButtonPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 320,
      allowPdfExport: true,
      isPrimary: true,
      enableVirtualization: true,
    }
  },
```

```
  methods: {
    onPdfCellRender: function (args: PdfCellRenderArgs) {
      if (args.pivotCell && args.pivotCell.valueSort &&
args.pivotCell.valueSort.levelName === 'France.Mountain Bikes') {
        args.cell.height = 30
      }
    },
    btnClick: function (args) {
      let pivotGridObj =
document.getElementById('pivotview').ej2_instances[0];
      pivotGridObj.pdfExport({}, false, null, false, true);
    }
  },
  provide: {
    pivotview: [
      PDFExport,
      VirtualScroll
    ]
  },
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs273" %}

This option is only available if enableVirtualization is set to **true**. In addition, the VirtualScroll and PDFExport modules must be injected into the pivot table.

Changing the pivot table style while exporting

The PDF export provides an option to change colors for headers, caption and records in pivot table before exporting. In-order to apply colors, define **theme** settings in **pdfExportProperties** object and pass it as a parameter to the pdfExport method.

By default, material theme is applied to exported PDF document.

APP.VUE

<!-- markdownlint-disable MD009 -->

Changing default font while exporting

By default, the pivot table uses "Helvetica" font in the exported document. But it can be changed using the theme property in pdfExportProperties.

The available built-in fonts are,

- Helvetica
- TimesRoman
- Courier
- Symbol
- ZapfDingbats

`ts

import { PdfStandardFont, PdfFontFamily, PdfFontStyle } from '@syncfusion/ej2-pdf-export';

...

let pdfExportProperties: PdfExportProperties = {

theme: {

header: {font: new PdfStandardFont(PdfFontFamily.TimesRoman, 11, PdfFontStyle.Bold) },

caption: { font: new PdfStandardFont(PdfFontFamily.TimesRoman, 9) },

record: { font: new PdfStandardFont(PdfFontFamily.TimesRoman, 10) }

}

};

`

Adding custom font while exporting

In addition to existing built-in fonts, custom fonts can also be used. The custom font should be in **Base64** format and mention it in **PdfTrueTypeFont** class. In the following example, we have used **Advent Pro** font family that supports **Hungarian** language.

APP.VUE

```
<template>
    <div id="app">
        <ejs-button id="export-btn" :isPrimary="isPrimary" v-
on:click.native="btnClick">PDF Export</ejs-button>
        <ejs-pivotview id="pivotview" :height="height"
:dataSourceSettings="dataSourceSettings" :allowPdfExport="allowPdfExport">
</ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin } from "@syncfusion/ej2-vue-pivotview";
import { PdfExportProperties } from '@syncfusion/ej2-grids';
import { ButtonPlugin, ChangeEventArgs} from "@syncfusion/ej2-vue-buttons";
import { pivotData, base64AlgeriaFont } from './pivotData.js';
import { PdfTrueTypeFont } from '@syncfusion/ej2-pdf-export';
Vue.use(PivotViewPlugin);
Vue.use(ButtonPlugin);
export default {
  data () {
    return {
```

```
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 320,
      allowPdfExport: true,
      isPrimary: true
    }
  },
  methods: {
    btnClick: function(args) {
      let pivotGridObj =
document.getElementById('pivotview').ej2_instances[0];
      let pdfExportProperties: PdfExportProperties = {
        theme: {
            header: {font:  new PdfTrueTypeFont(base64AlgeriaFont, 11) },
            caption: { font: new PdfTrueTypeFont(base64AlgeriaFont, 9) },
            record: { font: new PdfTrueTypeFont(base64AlgeriaFont, 10) }
        }
      };
      pivotGridObj.pdfExport(pdfExportProperties);
    }
  }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs170" %}

The non-English alphabets can also be exported properly by setting its appropriate font.

Virtual Scroll Data

You can export the pivot table virtual scroll data as PDF document by using PivotEngine export without any performance degradation. To enable PivotEngine export in the pivot table, set the allowPdfExport as **true**. You need to use the exportToPDF method for PivotEngine export.

To use PivotEngine export, You need to inject the PDFExport module in pivot table.

PivotEngine export will be performed while enabling virtual scrolling by default

APP.VUE

```

Repeat row headers

Repeat row headers on each page can be achieved using PivotEngine export option. To disable repeat row headers, you need to set `allowRepeatHeader` to **false** in beforeExport event. You need to use the `exportToPDF` method for PivotEngine export.

To use PivotEngine export, You need to inject the `PDFExport` module in pivot table.

By default, repeat row headers is enabled in the PivotEngine export.

APP.VUE

```
<template>

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs172" %}

Export all pages

The pivot engine exports the entire virtual data of the pivot table (i.e. the data that contains all of the records used to render the complete pivot table) as a PDF document. To export just the current viewport of the pivot table, set the exportAllPages property to **false**. To use the pivot engine export, add the PDFExport module into the pivot table.

By default, the pivot engine export will be performed while virtual scrolling is enabled.

Events

PdfQueryCellInfo

The event pdfQueryCellInfo triggers on framing each row and value cell during PDF export. It allows the user to customize the cell value, style etc. of the current cell. It has the following parameters:

- value - It holds the cell value.
- column - It holds column information for the current cell.
- data - It holds the entire row data across the current cell.
- style - It holds the style properties for the cell.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:height="height" :gridSettings="gridSettings"
:allowPdfExport="allowPdfExport"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin } from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
```

</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs174" %}

PdfHeaderQueryCellInfo

The event pdfHeaderQueryCellInfo triggers on framing each column header cell during PDF export. It allows the user to customize the cell value, style etc. of the current cell. It has the following parameters:

- cell - It holds the current rendering cell information.
- style - It holds the style properties for the cell.

APP.VUE

```
<template>

</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs175" %}

ExportComplete

The event exportComplete is triggered after the pivot table data has been exported to an PDF document. You can use this event to acquire blob stream data for further customization and processing at your end by passing the isBlob parameter as **true** when using the pdfExport method. It has the following parameters:

- type - It holds the current export type such as PDF, Excel, and CSV.
- promise - It holds the promise object for blob data.

Globalization and localization in Vue Pivotview component

Globalization is the combination of Internationalization and localization. You can adapt the component to various languages by parsing and formatting the date or number (Internationalization) & adding culture specific customization and translation to the text (Localization).

Internationalization

Internationalization library provides support for formatting and parsing the number, date, and time by using the official Unicode CLDR JSON data and also provides the loadCldr method to load the culture specific CLDR JSON data.

By default, all the Essential JS 2 component are specific to English culture ('en-US'). If you want to go with the different culture other than English, follow the below steps.

- Install the CLDR-Data package by using the below command (it installs the CLDR JSON data). For more information about CLDR-Data, refer to this link.

`

npm install cldr-data --save

`

Once the package installed, you can find the culture specific JSON data under the location /node_modules/cldr-data.

- Now import the installed CLDR JSON data into the App.vue file. To import JSON data we need to install the JSON plugin loader. Here we have used the SystemJS JSON plugin loader.

`

npm install systemjs-plugin-json --save-dev

`

- Once installed, configure the system.config.js configuration settings as like below to map the

systemjs-plugin-json loader.

`ts

```
System.config({
paths: {
'syncfusion:': './node_modules/@syncfusion/'
},
map: {
app: 'app',
//Syncfusion packages mapping
"@syncfusion/ej2-base": "syncfusion:ej2-base/dist/ej2-base.umd.min.js",
"@syncfusion/ej2-data": "syncfusion:ej2-data/dist/ej2-data.umd.min.js",
"@syncfusion/ej2-inputs": "syncfusion:ej2-inputs/dist/ej2-inputs.umd.min.js",
"@syncfusion/ej2-buttons": "syncfusion:ej2-buttons/dist/ej2-buttons.umd.min.js",
"@syncfusion/ej2-splitbuttons": "syncfusion:ej2-splitbuttons/dist/ej2-splitbuttons.umd.min.js",
"@syncfusion/ej2-popups": "syncfusion:ej2-popups/dist/ej2-popups.umd.min.js",
"@syncfusion/ej2-navigations": "syncfusion:ej2-navigations/dist/ej2-navigations.umd.min.js",
"@syncfusion/ej2-grids": "syncfusion:ej2-grids/dist/ej2-grids.umd.min.js",
"@syncfusion/ej2-dropdowns": "syncfusion:ej2-dropdowns/dist/ej2-dropdowns.umd.min.js",
"@syncfusion/ej2-calendars": "syncfusion:ej2-calendars/dist/ej2-calendars.umd.min.js",
"@syncfusion/ej2-lists": "syncfusion:ej2-lists/dist/ej2-lists.umd.min.js",
"@syncfusion/ej2-excel-export": "syncfusion:ej2-excel-export/dist/ej2-excel-export.umd.min.js",
"@syncfusion/ej2-pdf-export": "syncfusion:ej2-pdf-export/dist/ej2-pdf-export.umd.min.js",
"@syncfusion/ej2-file-utils": "syncfusion:ej2-file-utils/dist/ej2-file-utils.umd.min.js",
"@syncfusion/ej2-compression": "syncfusion:ej2-compression/dist/ej2-compression.umd.min.js",
"@syncfusion/ej2-pivotview": "syncfusion:ej2-pivotview/dist/ej2-pivotview.umd.min.js",
"@syncfusion/ej2-vue-base": "syncfusion:ej2-vue-base/dist/ej2-vue-base.umd.min.js",
"@syncfusion/ej2-vue-pivotview": "syncfusion:ej2-vue-pivotview/dist/ej2-vue-pivotview.umd.min.js",
"@syncfusion/ej2-vue-buttons": "syncfusion:ej2-vue-buttons/dist/ej2-vue-buttons.umd.min.js",
},
meta: {
'*.json': { loader: 'plugin-json' }
},
packages: {
'app': { main: 'app', defaultExtension: 'js' },
'cldr-data': { main: 'index.js', defaultExtension: 'js' }
```

Copyright © 2001 -2024 Syncfusion Inc.

}

});

System.import('app');

`

- Now import the required culture from the installed location to App.vue file, like the below code snippets.

`ts

//import the loadCldr from ej2-base

import { loadCldr} from '@syncfusion/ej2-base';

loadCldr(

require('cldr-data/supplemental/numberingSystems.json'),

require('cldr-data/main/fr-CH/ca-gregorian.json'),

require('cldr-data/main/fr-CH/numbers.json'));

require('cldr-data/main/fr-CH/timeZoneNames.json'));

`

The Internationalization library is used to globalize number, date, and time values in pivot table component using the dataSourceSettings.formatSettings option.

- Set the culture by using the locale property.

APP.VUE

```

            'warning': 'Warnung',
            'ok': 'OK',
            'allFields': 'Alle Felder',
            'noMatches': 'Keine Treffer'
        }
    }
});
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        filterSettings: [{ name: 'Country', type: 'exclude', items: ['United
States'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C2', useGrouping: false,
```

```
                minimumSignificantDigits: 1, maximumSignificantDigits: 3,
currency: 'EUR' }],
        filters: []
      },
      height: 350,
      showFieldList: true,
      locale: 'de-DE'
    }
  },
  provide: {
       pivotview: [FieldList]
    }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs95" %}

* In the above sample, Amount field is formatted by NumberFormatOptions. For date formats, the value strings are formatted by DateFormatOptions.

* By default, locale value is en-US. If you want to change the en-US culture to a different culture, you have to change the locale accordingly.

* Also, you will find more details about support format string for number formats and data formats here.

<!-- markdownlint-disable MD009 -->

Decimal separators

The decimal separators of pivot table values varies based on the culture applied to the component. The culture can be set by calling the method setCulture with appropriate culture string as its parameter.

The following example demonstrates the decimal separators in Deutsch culture.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:height="height" :showFieldList="showFieldList" :locale="locale"> </ejs-
pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { loadCldr, L10n, setCulture, setCurrencyCode, Ajax } from
'@syncfusion/ej2-base';
import * as currencies from './currencies.json';
import * as cagregorian from './ca-gregorian.json';
import * as numbers from './numbers.json';
import * as timeZoneNames from './timeZoneNames.json';
import * as numberingSystems from './numberingSystems.json';
import { PivotViewPlugin, FieldList } from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs96" %}

Localization

The Localization library allows you to localize default text content of the pivot table. The pivot table component has static text on some features (like drop area text, pivot field list title, etc...) that can be changed to other cultures (Arabic, Deutsch, French, etc.) by defining the

`locale` value and translation object.

The following list of properties and its values are used in the pivot table.

Locale keywords |Text

staticFieldList | Pivot Field List

fieldList | Field List

dropFilterPrompt | Drop filter here

dropColPrompt | Drop column here

dropRowPrompt | Drop row here

dropValPrompt | Drop value here

addPrompt | Add field here

adaptiveFieldHeader | Choose field

centerHeader | Drag fields between axes below:

add | add

drag | Drag

filter | Filter

filtered | Filtered

sort | Sort

Copyright © 2001 -2024 Syncfusion Inc.

remove | Remove

filters | Filters

rows | Rows

columns | Columns

values | Values

calculatedField | Calculated Field

createCalculatedField | Create Calculated Field

fieldName | Enter the field name

error | Error

invalidFormula | Invalid formula.

dropText | Example: ("Sum(Order*Count)" + "Sum(In*Stock)") * 250

dropTextMobile | Add fields and edit formula here.

dropAction | Calculated field cannot be place in any other region except value axis.

search | Search

close | Close

cancel | Cancel

delete | Delete

alert | Alert

warning | Warning

ok | OK

sum | Sum

average | Average

count | Count

min | Min

max | Max

allFields | All Fields

formula | Formula

fieldExist | A field already exists in this name. Please enter a different name.

confirmText | A calculation field already exists in this name. Do you want to replace it?

noMatches | No matches

format | Summaries values by

edit | Edit

clear | Clear

Copyright © 2001 -2024 Syncfusion Inc.

formulaField | Drag and drop fields to formula

dragField | Drag field to formula

Loading Translations

To load translation object in an application, use load function of the L10n class.

The following example demonstrates the pivot table in Deutsch culture.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:height="height" :showFieldList="showFieldList" :locale="locale"> </ejs-
pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { L10n } from '@syncfusion/ej2-base';
import { PivotViewPlugin, FieldList } from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
L10n.load({
    'de-DE': {
        'pivotview': {
            'grandTotal': 'Gesamtsumme',
            'total': 'Insgesamt',
            'value': 'Wert',
            'noValue': 'Kein Wert',
            'row': 'Zeile',
            'column': 'Spalte',
            'collapse': 'Zusammenbruch',
            'expand': 'Erweitern'
        },
        "pivotfieldlist": {
            'fieldList': 'Feld Liste',

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs97" %}

Right-to-left (RTL)

RTL provides an option to switch the text direction and layout of the pivot table component from right to left. It improves the user experiences and accessibility for users who use right-to-left languages (Arabic, Farsi, Urdu, etc...). To enable RTL pivot table, set the `enableRtl` property to **true**.

Accessibility in Vue Pivotview component

The pivot table component followed the accessibility guidelines and standards, including ADA, Section 508, WCAG 2.2 standards, and WCAG roles that are commonly used to evaluate accessibility.

The accessibility compliance for the pivot table component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| WCAG 2.2 Support | <img src="https://cdn.syncfusion.com/content/images/documentation/partial.png" alt="Intermediate"> |

| Section 508 Support | <img src="https://cdn.syncfusion.com/content/images/documentation/partial.png" alt="Intermediate"> |

| Screen Reader Support | <img src="https://cdn.syncfusion.com/content/images/documentation/full.png" alt="Yes"> |

| Right-To-Left Support | <img src="https://cdn.syncfusion.com/content/images/documentation/full.png" alt="Yes"> |

| Color Contrast | <img src="https://cdn.syncfusion.com/content/images/documentation/full.png" alt="Yes"> |

| Mobile Device Support | <img src="https://cdn.syncfusion.com/content/images/documentation/full.png" alt="Yes"> |

| Keyboard Navigation Support | <img src="https://cdn.syncfusion.com/content/images/documentation/full.png" alt="Yes"> |

Copyright © 2001 -2024 Syncfusion Inc.

| Accessibility Checker Validation | <img src="https://cdn.syncfusion.com/content/images/documentation/full.png" alt="Yes"> |

| Axe-core Accessibility Validation | <img src="https://cdn.syncfusion.com/content/images/documentation/full.png" alt="Yes"> |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<img src="https://cdn.syncfusion.com/content/images/documentation/full.png" alt="Yes"> - All features of the component meet the requirement.

<img src="https://cdn.syncfusion.com/content/images/documentation/partial.png" alt="Intermediate"> - Some features of the component do not meet the requirement.

<img src="https://cdn.syncfusion.com/content/images/documentation/not-supported.png" alt="No"> - The component does not meet the requirement.

WAI-ARIA attributes

WAI-ARIA (Accessibility Initiative – Accessible Rich Internet Applications) defines a way to increase the accessibility of web pages, dynamic content, and user interface components developed with Ajax, HTML, JavaScript,and related technologies. ARIA provides additional semantics to describe the role, state, and functionality of web components. The following ARIA attributes are used in the pivot table component:

| Attributes | Purpose |

| --- | --- |

| `role=grid` | Attribute added to identify the grid component element within the pivot table element. |

| `role=region` | Attribute added to identify the chart component element within the pivot table element. |

| `role=button` | This attribute is added to the pager navigation buttons as well as the buttons in the dialog popup such as field list, calculated field, member editor, conditional formatting of pivot table component to indicate that it is a clickable element. |

| `role=table` | This attribute is added to each conditional formatting style container element to denote it as a table. |

| `role=tableItems` | This attribute is added to the container element that appears inside the number formatting popup to indicate it as a table. |

| `aria-disabled` | The buttons within the dialog popups, such as field list, calculated field and member editor, will be disabled based on their usability. To indicate its disabled state, we will add this attribute with the values `true`. By default, the attribute value is set to `false`. |

| `aria-label` | This attribute is added to label elements that are placed inside the pager, member editor popup, and calculated field popup to identify them as label elements. |

Copyright © 2001 -2024 Syncfusion Inc.

| aria-selected | This attribute is added to the selected treeview item in the calculated field popup with the value as true to denote that it is a selected element. |

| aria-colspan | This attribute is added to the th elements in the e-table, which represent the column span value. |

| aria-rowspan | This attribute is added to the th elements in the e-table, which represent the row span value. |

| data-type | This attribute is added to the treeview item in the calculated field popup, as well as the buttons in the grouping bar and field list. It represents the aggregate type for the specified field. |

| data-caption | This attribute is added to the treeview item in the calculated field popup, as well as the buttons in the grouping bar and field list. It represents the caption for the specified field. |

| data-basefield | This attribute is added to the treeview item in the calculated field popup, as well as the buttons in the grouping bar and field list. It denotes the base field for the specified field, which is used to display the values for aggregation types such as **DifferenceFrom**, **PercentageOfDifferenceFrom**, and **PercentageOfParentTotal**. |

| data-baseitem | This attribute is added to the treeview item in the calculated field popup, as well as the buttons in the grouping bar and field list. It denotes the base item for the specified field, which is used to display the values for aggregation types such as **DifferenceFrom**, **PercentageOfDifferenceFrom**, and **PercentageOfParentTotal**. |

| data-field | This attribute is added to the treeview item in the calculated field popup. It denotes the name of the specified field. |

| data-membertype | This attribute is added to the treeview item in the calculated field popup. It denotes the member type of the selected OLAP calculated field. |

| data-hierarchy | This attribute is added to the treeview item in the calculated field popup. It denotes the parent hierarchy unique name of the selected OLAP calculated field. |

| data-formula | This attribute is added to the treeview item in the calculated field popup. It denotes the formula used for the specified calculated field. |

| data-formatString | This attribute is added to the treeview item in the calculated field popup. It denotes the format string used for the specified calculated field. |

| data-customformatstring | This attribute is added to the treeview item in the calculated field popup. It denotes the custom format string used for the specified calculated field. |

Keyboard interaction

The pivot table component followed the keyboard interaction guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Message component.

| **Press** | **To do this** |

| --- | --- |

| Tab / Shift + Tab | To focus the close icon in the message. |

| Enter / Space | Closes the focused close icon's message. |

Copyright © 2001 -2024 Syncfusion Inc.

Pivot Table

| **Press** | **To do this** |

| --- | --- |

| Tab | Moves the cell focus right side. If no cells are focused, it moves to the next active element in the browser page. |

| Shift + Tab | Moves the cell focus left side. If no cells are focused, it moves to the previous active element in the browser page. |

| DownArrow | Moves the cell focus downwards. If the selection is enabled in the pivot table, then it will move downwards to select next row or column or individual cell. |

| UpArrow | Moves the cell focus upwards. If the selection is enabled in the pivot table, then it will move upwards to select previous row or column or individual cell. |

| LeftArrow | Moves the cell focus left side. If the selection is enabled in the pivot table, then it will move left side to select previous row or column or individual cell. |

| RightArrow | Moves the cell focus right side. If the selection is enabled in the pivot table, then it will move right side to select next row or column or individual cell. |

| Shift + DownArrow | Extends the cell selection downwards. |

| Shift + UpArrow | Extends the cell selection selection upwards. |

| Shift + LeftArrow | Extends the cell selection to the left side. |

| Shift + RightArrow | Extends the cell selection to the right side. |

| Ctrl + A | Selects all cells. |

| Esc | Deselects all cells. If the current active element is a context menu, then the context menu popup will be closed. |

| Home | Goes to the first cell in the current row. |

| End | Goes to the last cell in the current row. |

| Ctrl + Home | Goes to the first cell in the table. |

| Ctrl + End | Goes to the last cell in the table. |

| Enter | If the current cell is an expand/collapse cell, it performs expand/collapse operation (drill operation). If the current row/column header is in value sort state, it performs value sorting. If the current cell is in selection state, it moves to the next row, column or individual cell. If drill-through or editing is enabled in the pivot table, the drill-through dialog will be opened based on the selected value cell. If the current active element is a context menu popup, menu selection will be performed. |

| Shift + Enter | If value sorting is enabled in the pivot table and the current cell is a header with respect to its value axis, it performs value sorting to either ascending or descending order. If the current cell is in selection state, it moves to the previous row, column or individual cell. |

| Ctrl + Enter | If hyperlink is enabled in the current cell, it performs hyperlink selection. |

Copyright © 2001 -2024 Syncfusion Inc.

| Shift + F10 or Menu | If context menu is enabled in the pivot table, the context menu popup will be opened in the current cell. |

Field List

| **Press** | **To do this** |

| --- | --- |

| Shift + Ctrl + F | If the popup field list is enabled in either the pivot table or the pivot chart, the field list dialog will be opened. |

| Tab | Moves to the next active element in the field list. If no active elements present, it moves to the next active element in the browser page. |

| Shift + Tab | Moves to the previous active element in the field list. If no active elements present, it moves to the previous active element in the browser page. |

| Shift + F | If the current active element is a field's button and if it has a filter icon, the filter dialog will open to perform filtering. |

| Shift + S | If the current active element is a field's button and if it has a sort icon, the sorting will be performed to the selected field. |

| Shift + E | If the current active element is a calculated field's button and if it has an edit icon, the calculated field dialog will be opened to perform editing the selected calculated field. |

| Enter | Performs the selection operation of the current active element. If the current active element is a field's button and it has a dropdown icon, the aggregation menu will open to perform calculations using aggregation options to the selected value field. |

| Delete | If the current active element is a field's button, the selected field will be removed from the current report. |

| DownArrow | If the current active element is a tree node, it moves to the next node. |

| UpArrow | If the current active element is a tree node, it moves to the previous node. |

| LeftArrow | If the current active element is a tree node, it collapses the current node. |

| RightArrow | If the current active element is a tree node, it expands the current node. |

| Home | If the current active element is a tree node, it goes to the first node. |

| End | If the current active element is a tree node, it goes to the last node. |

| Space | If the current active element is a tree node or a checkbox element, it will be either checked or unchecked. |

| Esc or Escape | Closes the popup field list dialog. |

Grouping Bar

| **Press** | **To do this** |

| --- | --- |

| Tab | Moves to the next active element (field's button) in the grouping bar. If no active elements present, it moves to the next active element in the browser page. |

Copyright © 2001 -2024 Syncfusion Inc.

| Shift + Tab | Moves to the previous active element (field's button) in the grouping bar. If no active elements present, it moves to the previous active element in the browser page. |

| Shift + F | If the current active element is a field's button and if it has a filter icon, the filter dialog will be opened to perform filtering. |

| Shift + S | If the current active element is a field's button and if it has a sort icon, the sorting will be performed to the selected field. |

| Shift + E | If the current active element is a calculated field's button and if it has an edit icon, the calculated field dialog will be opened to perform editing the selected calculated field. |

| Enter | Performs the selection operation of the current active element. If the current active element is a field's button and if it has a dropdown icon, the aggregation menu will be opened to perform calculations using aggregation options to the selected value field. |

| Delete | If the current active element is a field's button, the selected field will be removed from the current report. |

| DownArrow | If the current active element is a dropdown list, the next item will be selected. |

| UpArrow | If the current active element is a dropdown list, the previous item will be selected. |

| Home | If the current active element is a dropdown list, the first item will be selected. |

| End | If the current active element is a dropdown list, the last item will be selected. |

| Alt + Down | If the current active element is a dropdown list, the popup will be opened. |

| Alt + Down | If the current active element is a dropdown list, the popup will be closed. |

| Esc or Escape | Closes the dropdown list.

Filter Dialog

| **Press** | **To do this** |

| --- | --- |

| Shift + F | If the current active element is a field's button and if it has a filter icon in either the field list or grouping bar UI, the filter dialog will be opened to perform filtering. |

| Tab | Moves to the next active element in the filter dialog. If no active elements present, it moves to the next active element in the browser page. |

| Shift + Tab | Moves to the previous active element in the filter dialog. If no active elements present, it moves to the previous active element in the browser page. |

| DownArrow | If the current active element is a tree node, it moves to the next node. |

| UpArrow | If the current active element is a tree node, it moves to the previous node. |

| LeftArrow | If the current active element is a tree node, it collapses the current node. If the current active element is a tab, it moves focus to the previous tab element. |

Copyright © 2001 -2024 Syncfusion Inc.

| RightArrow | If the current active element is a tree node, it expands the current node. If the current active element is a tab, it moves focus to the next tab element. |

| Home | If the current active element is a tree node, it goes to the first node. |

| End | If the current active element is a tree node, it goes to the last node. |

| Space | If the current active element is a tree node or a checkbox element, it will be either checked or unchecked. |

| Alt + Down | If the current active element is a DropDownList or DatePicker or DateTimePicker, the popup will be opened. |

| Alt + Up | If the current active element is a DropDownList or DatePicker or DateTimePicker, the popup will be closed. |

| Enter | Performs the selection operation of the current active element. If the current active element is a tab, the current tab element will be selected. If the current active element is a tree node, the current node will be either checked or unchecked. If the current active element is DropDownList, the focus item will be selected, and the popup list will close when it is open. Otherwise, toggles the popup list. |

| Esc or Escape | Closes the filter dialog. |

Calculated Field Dialog

| **Press** | **To do this** |

| --- | --- |

| Shift + E | If the current active element is a field's button and if it has an edit icon in either the field list or grouping bar UI, the calculated field dialog will be opened to perform editing the selected calculated field. |

| Tab | Moves to the next active element in the calculated field dialog. If no active elements present, it moves to the next active element in the browser page. |

| Shift + Tab | Moves to the previous active element in the calculated field dialog. If no active elements present, it moves to the previous active element in the browser page. |

| DownArrow | If the current active element is a tree node, it moves to the next node. |

| UpArrow | If the current active element is a tree node, it moves to the previous node. |

| LeftArrow | If the current active element is a tree node, it collapses the current node. |

| RightArrow | If the current active element is a tree node, it expands the current node. If the current active element is a tree node and has a menu icon, the aggregation menu will be opened to select appropriate aggregation type to the selected field. |

| Home | If the current active element is a tree node, it goes to the first node. |

| End | If the current active element is a tree node, it goes to the last node. |

Copyright © 2001 -2024 Syncfusion Inc.

| Enter | Performs the selection operation of the current active element. If the current active element is a tree node, it copies the selected field name/formula to the formula text area to perform calculations. |

| Esc or Escape | Closes the calculated field dialog. |

Formatting Dialog

| **Press** | **To do this** |

| --- | --- |

| Tab | Moves to the next active element in the formatting dialog. If no active elements present, it moves to the next active element in the browser page. |

| Shift + Tab | Moves to the previous active element in the formatting dialog. If no active elements present, it moves to the previous active element in the browser page. |

| DownArrow | If the current active element is a DropDownList, the next item will be selected. |

| UpArrow | If the current active element is a DropDownList, the previous item will be selected. |

| Home | If the current active element is a DropDownList, the first item will be selected. |

| End | If the current active element is a DropDownList, the last item will be selected. |

| Alt + Down | If the current active element is a DropDownList or ColorPicker, the popup will be opened. |

| Alt + Down | If the current active element is a DropDownList or ColorPicker, the popup will be closed. |

| Enter | Performs the selection operation of the current active element. |

| Esc or Escape | Closes the formatting dialog. |

Toolbar

| **Press** | **To do this** |

| --- | --- |

| Tab | Moves to the next active option in the toolbar. If no active elements present, it moves to the next active element in the browser page. |

| Shift + Tab | Moves to the previous active option in the toolbar. If no active elements present, it moves to the previous active element in the browser page. |

| Enter | Performs the selection operation of the current active element. |

Drill-Through Dialog

| **Press** | **To do this** |

| --- | --- |

Copyright © 2001 -2024 Syncfusion Inc.

| Tab | Moves to the next active element in the drill-through dialog. If the current active element is a Grid cell, it moves the cell focus to right side. If no active elements present, then it moves to the next active element in the browser page. |

| Shift + Tab | Moves to the previous active element in the drill-through dialog. If the current active element is a Grid cell, it moves the cell focus to left side, If no active elements present, then it moves to the previous active element in the browser page. |

| DownArrow | Moves the row/cell focus downwards. |

| UpArrow | Moves the row/cell focus upwards. |

| LeftArrow | Moves the cell focus left side. |

| RightArrow | Moves the cell focus right side. |

| Home | Goes to the first cell in the current row. |

| End | Goes to the last cell in the current row. |

| Ctrl + Home | Goes to the first cell in the table. |

| Ctrl + End | Goes to the last cell in the table. |

| Enter | Performs the selection operation of the current active element. |

| Esc or Escape | If the cell is in selected state, the it deselects all rows/cells. If the row/cell is in edit state, it cancels the current entries in the row/cell. If the current active element is not a row/cell, it closes the drill-through dialog. |

| F2 | Initiate editing a row/cell in the data grid. |

| Insert | Adds a new row/cell in the data grid. |

| Delete | Removes the selected row in the data grid. |

Some commonly used applicable key combinations and their relative functionalities in all dialogs are listed below.

| **Press** | **To do this** |

| --- | --- |

| Tab | Moves to the next active element in the dialog. If either no active elements present in the dialog or an overlay is not present in the dialog, it moves to the next active element in the browser page. |

| Shift + Tab | Moves to the previous active element in the dialog. If either no active elements present in the dialog or an overlay is not present in the dialog, it moves to the previous active element in the browser page. |

| Space | If the current active element is a tree node or a checkbox element, it will be either checked or unchecked. |

| Enter | When the Dialog button or any input (except text area) is in focus state, when pressing the Enter key, the click event associated with the primary button or button will be triggered.

Copyright © 2001 -2024 Syncfusion Inc.

The Enter key will not be worked, when the dialog content contains any text area with initial focus. |

| Esc or Escape | Closes the dialog. |

Ensuring accessibility

The pivot table component's accessibility levels are ensured through an accessibility-checker and axe-core software tools during automated testing.

The accessibility compliance of the pivot table component is shown in the following sample. Open the sample in a new window to evaluate the accessibility of the pivot table component with accessibility tools.

How To

<!-- markdownlint-disable MD009 -->

Switching older themes style in Vue Pivotview component

From Volume 1, 2020 onwards Syncfusion has revised the theming and layout of the Pivot Table. So, to inherit the older theme style and layout please do the necessary changes in CSS and pivot table height.

CSS Selectors

In current theme, the cells can be differentiated by their background colors. To avoid it, you need to override its background colors via simple CSS coding within your application. The below CSS selectors allow to achieve the same for material, fabric, bootstrap and bootstrap v4 themes.

```
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<!-- Codes here... -->
<style>
.e-pivotview .e-rowsheader,
.e-pivotview .e-columnsheader,
.e-pivotview .e-gtot,
.e-pivotview .e-content,
.e-pivotview .e-gridheader,
.e-pivotview .e-headercell {
background-color:#fff !important;
}
</style>
</head>
<body>
</body>
</html>
```

Meanwhile for high contrast theme, we need to set the following CSS.

```
<!DOCTYPE html>
```

<html xmlns="http://www.w3.org/1999/xhtml">

<head>

<!-- Codes here... -->

<style>

.e-pivotview .e-rowsheader,

.e-pivotview .e-columnsheader,

.e-pivotview .e-gtot,

.e-pivotview .e-content,

.e-pivotview .e-gridheader,

.e-pivotview .e-headercell {

background-color:#000 !important;

}

</style>

</head>

<body>

</body>

</html>

`

Adjusting Row Height

In current theme, to make the component compact we have reduced the height of each pivot table rows. But user can reset the height of the pivot table using the rowHeight property in gridSettings. In older theme, the property was set to 36 pixels for desktop layout and 48 pixels for mobile layout. So reset the rowHeight accordingly to visualize the older theme style.

In the below code sample, we replicate the older theme style.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:height="height" :gridSettings="gridSettings"> </ejs-pivotview>
    </div>
</template>
<script>

        background-color:#fff !important;
    }
/* csslint ignore:end */
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs142" %}

Customize number date and time values in Vue Pivotview component

You can format the number, date, and time values for each field using formatSettings option under dataSourceSettings. It can be configured through code behind, during initial rendering.

Number formatting

For numbers, the formatting settings required to apply through code behind are:

- name: It allows to set the field name.
- format: It allows to set the format of the respective field.

Also, you can customize the applied number format by setting the NumberFormatOptions options in formatSettings itself.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:height="height"> </ejs-pivotview>
    </div>
</template>
```

```
<script>
import Vue from "vue";
import { PivotViewPlugin } from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        formatSettings: [{ name: 'Amount', format: 'C2', useGrouping: false,
                minimumSignificantDigits: 1, maximumSignificantDigits: 3 }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        filters: []
      },
      height: 350
    }
  }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs135" %}

Date and Time formatting

For date and time, the formatting settings required to apply through code behind are:

- name: It allows to set the field name.
- format: It allows to set the format of the respective field.
- type: It allows to set the type of format to be used for the respective field.

Also, you can customize the applied date format by setting DateFormatOptions options in formatSettings itself.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:height="height"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin } from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
```

```
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        formatSettings: [{ name: 'Year', format: 'dd/MM/yyyy-hh:mm', type:
'date' }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        filters: []
      },
      height: 350
    }
  }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs136" %}

Limitations of date formatting

As per Firefox and Edge browsers standards, most of the date and time formats used in data source aren't supported. For example: Apr-2000, Apr-01-2000, 01-03-2000, 2000-Apr-01 etc... are not supported. Meanwhile ISO formats will be supported across all browsers.

Customize the icons for pivot grid in Vue Pivotview component

You can customize the pivot button icons in the pivot table by overriding the class **.pivot-button** with a custom property content as mentioned below.

`

PivotView_PivotFieldList .e-icons.e-toggle-field-list::before {
content: '\e337';

}

`

In the below sample, pivot table is rendered with a customized pivot button icons.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview id="pivotview"
:dataSourceSettings="dataSourceSettings" :height="height"
:showFieldList="showFieldList"> </ejs-pivotview>
    </div>
</template>
<script>
```

```
import Vue from "vue";
import { PivotViewPlugin, FieldList } from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: [],
        calculatedFieldSettings: [{ name: 'Total', formula:
'"Sum(Amount)"+"Sum(Sold)"' }]
      },
      showFieldList: true,
      height: 350
    }
  },
  provide: {
    pivotview: [FieldList]
  }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
/* csslint ignore:start */
#PivotView_PivotFieldList_Wrapper .e-pivot-button .e-icons.e-dropdown-
icon::before,
#PivotView .e-pivot-button .e-icons.e-dropdown-icon::before {
    content: "\e941";
}
#PivotView_PivotFieldList_Wrapper .e-pivot-button .e-icons.e-pv-
filtered::before,
#PivotView .e-pivot-button .e-icons.e-pv-filtered::before {
    content: "\e974";
}
#PivotView_PivotFieldList_Wrapper .e-pivot-button .e-icons.e-pv-
filter::before,
#PivotView .e-pivot-button .e-icons.e-pv-filter::before {
    content: '\e202';
}
#PivotView_PivotFieldList .e-icons.e-toggle-field-list::before {
    content: '\e337';
}
#PivotView_PivotFieldList_Wrapper .e-pivot-button .e-icons.e-sort::before,
#PivotView .e-pivot-button .e-icons.e-sort::before {
    content: '\e306';
}
#PivotView_PivotFieldList_Wrapper .e-pivot-button .e-icons.e-remove::before,
#PivotView .e-pivot-button .e-icons.e-remove::before {
```

```
    content: '\e201';
}
/* csslint ignore:end */
</style>
```

Configure data grid options on editing mode in Vue Pivotview component

You can access the data grid options such as sort, group, filter on editing mode using the beginDrillThrough event in the pivot table. The event occurs in every value cell on double click and provides the data grid information before display the drill through grid pop-up.

Grid features are segregated into individual feature-wise modules. For example, to use sorting feature, you should inject Sort using the Grid.Inject(Sort) section.

APP.VUE

```

Hide empty headers in Vue Pivotview component

If the raw data for a particular field is not defined, it will be shown as 'Undefined' in the pivot table headers. You can hide those headers by setting the showHeaderWhenEmpty property to **false** in the pivot table.

For example, if the raw data for the field 'Country' is defined as **“United Kingdom”** and **“State”** is not defined means, it will be shown as **“United Kingdom >> Undefined”** in the header section. Here, you can hide those 'Undefined' header using the showHeaderWhenEmpty property.

By default, this property is set as **true**.

Chart based on pivot table selection in Vue Pivotview component

The cell selection support is enabled using the allowSelection property and its type and mode are configured using the selectionSettings property. The cellSelected event gets fired on every selection operation performed in the pivot table. This event returns the selected cell informations, like row header name, column header name, measure name, and value. Based on this information, the chart control will be plotted.

APP.VUE

Drill through grid cell edit type in Vue Pivotview component

Using the drillThrough event in the pivot table, you can define the edit type of a particular column in the grid present inside the drill-through dialog. To do so, check the column name in the drillThrough event and then specify the edit type of that column using the gridColumns.editType event argument.

The gridColumns.editType property must be set based on the column's data type. For example, the string data type will not be applicable for the numeric text box edit type.

- NumericTextBox control for integer, double, and decimal data types.
- TextBox control for string data type.
- DropDownList control to show all unique values related to that field.
- CheckBox control for boolean data type.
- DatePicker control for date data type.
- DateTimePicker control for date time data type.

In the below example, the data type of the `Country` column is set to `DropDownList`.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:height="height" :editSettings="editSettings"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, DrillThrough, DrillThroughEventArgs } from
"@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],

Show field list when pivot table empty in Vue Pivotview component

When there are no fields in a pivot table's row, column, value, and filter axes, a field list can still be displayed. To do so, use the dataBound event and call the onShowFieldList method as shown below.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:height="height" :showFieldList="showFieldList" :dataBound="ondataBound">
</ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, FieldList } from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        allowLabelFilter: true,
        allowValueFilter: true,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 350,
      showFieldList: true
    }
  },
  methods: {
    ondataBound: function() {
     let pivotGridObj =
document.getElementById('pivotview').ej2_instances[0];
     pivotGridObj.pivotFieldListModule.dialogRenderer.fieldListDialog.target
= document.body;
     if (pivotGridObj && pivotGridObj.dataSourceSettings.values.length ===
0) {
        (pivotGridObj.pivotFieldListModule.dialogRenderer as
any).onShowFieldList();
     }
    }
  },
  provide: {
        pivotview: [FieldList]
    }
}
</script>
```

```
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs140" %}

Apply custom style to pivot cells in Vue Pivotview component

The queryCellInfo event in gridSettings can be used to apply custom style to row and value cells, and the headerCellInfo event in gridSettings can be used to apply custom styles to column cells.

In the following example, a custom style has been applied to the column header **"Sold Amount"** under **"FY 2016"** via the headerCellInfo event and to the row header **"Germany"** and its aggregated value via the queryCellInfo event by adding the **"e-custom"** class to the cell element.

APP.VUE

```
<template>
  <div id="app">
    <ejs-pivotview id="pivotview" :dataSourceSettings="dataSourceSettings"
:height="height" :gridSettings="gridSettings" >
    </ejs-pivotview>
</div>
</template >
<script>
import Vue from "vue";
import { PivotViewPlugin } from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        rows: [{ name: 'Country' }, { name: 'Products' }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Amount', caption: 'Sold Amount' }, { name: 'Sold',
caption: 'Units Sold' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
      },
      height: 350,
      gridSettings: {
        queryCellInfo: function (args) {
            let colIndex = Number(args.cell.getAttribute('data-colindex'));
            let cells = args.data[colIndex] ? args.data[colIndex] : {};
            // Here by using 'actualText' option, a custom class can be
added to the specific row header and its value to apply custom style.
            if (cells.actualText === 'Germany') {
                args.cell.classList.add('e-custom');
            } else if (cells.actualText === 'Amount' &&
                cells.columnHeaders === 'FY 2016' && cells.rowHeaders ===
'Germany') {
                args.cell.classList.add('e-custom');
            }
        },
```

```
        headerCellInfo: function (args) {
            let customAttributes = args.cell.column.customAttributes;
            // Here custom class can be added to the specific column header
by using unique level name, to apply custom style.
            if (args.node.classList.contains('e-columnsheader') &&
customAttributes &&
                customAttributes.cell.valueSort.levelName === 'FY 2016.Sold
Amount') {
                args.node.classList.add('e-custom');
            }
        }
       },
    }
  }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs262" %}

Note: The **dot(.)** character in **FY 2016.Sold Amount** is used by default to identify the header levels in the pivot table's row and column. It can be changed by setting the headerDelimiter in the valueSortSettings property to any other delimiter instead of the default separator.

Show tooltip for row and column headers in Vue Pivotview component

You can create and display the tooltip for each row and column header(s) in the pivot table by using an external tooltip component via the dataBound event.

APP.VUE

```
<template>
  <div id="app">
    <ejs-pivotview id="pivotview" :dataSourceSettings="dataSourceSettings"
:height="height" :showFieldList="showFieldList"
        :dataBound="dataBound" > </ejs-pivotview>
</div>
</template >
<script>
import Vue from "vue";
import { PivotViewPlugin, FieldList } from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
let headerTooltip;
function beforeRender(args) {
    if (args.target.parentElement.querySelector('.e-rowsheader')) {
        // Here you can set custom content for row header(s) tooltip from
its cell information.
        var index = Number(args.target.getAttributeNode('index').value);
        var colIndex = Number(args.target.getAttributeNode('data-
colindex').value);
        var cell = pivotTableObj.engineModule.pivotValues[index][colIndex];
        var valueText = cell.valueSort ? cell.valueSort : '';
        if (cell.formattedText !== 'Grand Total') {
            this.content =
```

```
            '<div>' +
            'FieldName: ' +
            valueText.axis +
            '</br>' +
            'Text: ' +
            cell.formattedText +
            '</div>';
        } else {
            this.content =
            '<div>' +
            'FieldName: ' +
            valueText.uniqueName +
            '</br>' +
            'Text: ' +
            cell.formattedText +
            '</div>';
        }
    } else {
        // Here you can set custom content for column header(s) tooltip from
its cell information.
        if (args.target.querySelector('.e-cellvalue')) {
            this.content = args.target.querySelector('.e-
cellvalue').innerText;
        } else if (args.target.querySelector('.e-headertext')) {
            this.content = args.target.querySelector('.e-
headertext').innerText;
        } else if (args.target.querySelector('.e-stackedheadercelldiv')) {
            this.content = args.target.querySelector('.e-
stackedheadercelldiv').innerText;
        } else {
            this.content = '';
        }
    }
}
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        rows: [{ name: 'Country' }, { name: 'Products' }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{name:'Amount', caption:'Sold Amount'}, {name:'Sold',
caption:'Units Sold'}],
        formatSettings: [{name:'Amount', format:'C0'}],
      },
      height: 350,
      showFieldList: true
    }
  },
  methods: {
    dataBound: function () {
        let pivotGridObj =
document.getElementById('pivotview').ej2_instances[0];
        if (!headerTooltip) {
            headerTooltip = new ej.popups.Tooltip({
```

```
                target: 'td.e-rowsheader,th.e-columnsheader', beforeRender:
beforeRender
            });
            headerTooltip.appendTo(pivotGridObj.element);
        }
    },
  }
  provide: {
    pivotview: [FieldList]
    }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs263" %}

Hide specific columns in Vue Pivotview component

By using the columnRender event in the gridSettings, you can hide specific column(s) in the pivot table. In the example below, the **"Units Sold"** column under **"FY 2016"** is hidden by setting its **visible** property to **false** via the columnRender event.

Note: The **dot(.)** character in **FY 2016.Units Sold** is used by default to identify the header levels in the pivot table's row and column. It can be changed by setting the headerCellInfo in the queryCellInfo property to any other delimiter instead of the default separator.

APP.VUE

```
<template>
  <div id="app">
    <ejs-pivotview id="pivotview" :dataSourceSettings="dataSourceSettings"
:height="height"
        :gridSettings="gridSettings" ></ejs-pivotview>
</div>
</template >
<script>
import Vue from "vue";
import { PivotViewPlugin } from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        rows: [{ name: 'Country' }, { name: 'Products' }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{name:'Amount', caption:'Sold Amount'}, {name:'Sold',
caption:'Units Sold'}],
        formatSettings: [{name:'Amount', format:'C0'}],
      },
      height: 350,
      gridSettings: {
```

```
        columnRender: function(args){
            for (var i = 1; i < args.columns.length; i++) {
                if (args.stackedColumns[i].customAttributes &&

args.stackedColumns[i].customAttributes.cell.valueSort.levelName === 'FY
2016.Units Sold') {
                    args.stackedColumns[i].visible = false;
                }
            }
        }
      },
    }
  },
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

Export table and chart into the same document using toolbar in vue Pivotview component

Even if the displayOption.view property is set to **Both** in the pivot table, you can only export either the table or the chart to the PDF document based on the current value set in the displayOption.primary property. But, to export both the table and the chart to the same PDF document, use the pdfExport method during the actionBegin event invoke.

In the following example, the built-in export action can be restricted by setting the args.cancel option to **true** in the actionBegin event, and both the table and the chart can be exported by calling the pdfExport method and setting the exportBothTableAndChart argument to **true**.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview id="pivotview"
:dataSourceSettings="dataSourceSettings" :height="height"
        :showToolbar="showToolbar" :allowPdfExport="allowPdfExport"
:displayOption="displayOption"
        :showFieldList="showFieldList" :toolbar="toolbar"
:actionBegin="actionBegin"
        :enableVirtualization="enableVirtualization"> </ejs-pivotview>
</div>
</template >
<script>
import Vue from "vue";
import { PivotViewPlugin, Toolbar, FieldList, PDFExport } from
"@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
```

```
        dataSource: pivotData,
        expandAll: false,
        rows: [{ name: 'Country' }, { name: 'Products' }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Amount', caption: 'Sold Amount' }, { name: 'Sold',
caption: 'Units Sold' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
      },
      height: 350,
      displayOption: { view:'Both' },
      toolbar: ['Grid', 'Chart', 'Export', 'FieldList'],
      showFieldList: true,
      showToolbar: true,
      allowPdfExport: true,
      enableVirtualization: true
    }
  },
  methods: {
    actionBegin: function (args) {
      let pivotGridObj =
document.getElementById('pivotview').ej2_instances[0];
      if (args.actionName == 'PDF export') {
          args.cancel = true;
          pivotGridObj.pdfExport({}, false, null, false, true);
      }

Add custom aggregation type to the menu in Vue Pivotview component

By using the dataBound event, you can add your own custom aggregate type(s) to the pivot table's aggregate menu.

In the following example, we have added the aggregation types **CustomAggregateType 1** and **CustomAggregateType 2** to the aggregate menu. The calculation for those aggregated types can be done using the aggregateCellInfo event.

APP.VUE

```
<template>
  <div id="app">
    <ejs-pivotview id="pivotview" :dataSourceSettings="dataSourceSettings"
:height="height" :dataBound="ondataBound"
```

```
        :aggregateCellInfo="aggregateCell" :showFieldList="showFieldList" >
</ejs-pivotview>
</div>
</template >
<script>
import Vue from "vue";
import { PivotViewPlugin, FieldList} from "@syncfusion/ej2-vue-pivotview";
import { L10n } from '@syncfusion/ej2-base';
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
L10n.load({
     'en-US': {
          pivotview: {
               CustomAggregateType1: 'Custom Aggregate Type 1',
               CustomAggregateType2: 'Custom Aggregate Type 2',
          },
          pivotfieldlist: {
               CustomAggregateType1: 'Custom Aggregate Type 1',
               CustomAggregateType2: 'Custom Aggregate Type 2',
          }
     }
});
let SummaryType = [
    'Sum',

Convert complex JSON to flat JSON and assign it to the pivot table in Vue Pivotview component

By default, flat JSON can only bind to the pivot table. However, you can connect complex JSON to the pivot table by converting it to flat JSON via code-behind and binding it to the pivot table using the dataSource property in the load event.

In the following example, the **complexToFlatJson()** method is used to convert complex JSON to flat JSON and bind it to the pivot table using the dataSource property, then modifying the field names in the rows and columns based on the converted flat JSON under dataSourceSettings in the load event.

APP.VUE

```
<template>
     <div id="app">
          <ejs-pivotview id="pivotview" ref="pivotview"
:dataSourceSettings="dataSourceSettings"
        :load="load" :height="height" :showFieldList="showFieldList" >
</ejs-pivotview>
</div>
</template >
<script>
import Vue from "vue";
import { PivotViewPlugin, FieldList } from "@syncfusion/ej2-vue-pivotview";
Vue.use(PivotViewPlugin);
var parentProp = {};
var dataSource;
function complexToFlatJson(data) {
    var flatArray = [];
    var flatObject = {};
    for (var index = 0; index < data.length; index++) {
        for (var prop in data[index]) {
            var value = data[index][prop];
            if (Array.isArray(value)) {
                for (var i = 0; i < value.length; i++) {
```

```
                    var childProp = [];
                    for (var inProp in value[i]) {
                        flatObject[inProp] = value[i][inProp];
                        var object = {
                            name: inProp,
                        };
                        childProp.push(object);
                    }
                    parentProp[prop] = childProp;
                }
            }

Load desired report from the report list as default in vue Pivotview component

By default, the pivot table is displayed with the report bound at the code-behind. To load a desired report from the previously saved report collection during initial rendering, set the desired report name in the dataBound event, along with the additional report-based customization code shown below.

APP.VUE

Display string value to pivot table values in vue Pivotview component

End user can display string value to the pivot table's value cell by using the aggregateCellInfo event.

In the following example, each cell value of the **Sold** field's actual value has been assigned from its combination data sets obtained from the args.cellSets in the aggregateCellInfo event.

APP.VUE

```
<template>
  <div id="app">
    <ejs-pivotview id="pivotview" :dataSourceSettings="dataSourceSettings"
:height="height"
        :aggregateCellInfo="aggregateCell" :showFieldList="showFieldList" >
</ejs-pivotview>
</div>
</template >
<script>
import Vue from "vue";
import { PivotViewPlugin, FieldList } from "@syncfusion/ej2-vue-pivotview";
```

```
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
function secondsToHms(d) {
     d = Number(d);
     var h = Math.floor(d / 3600);
     var m = Math.floor((d % 3600) / 60);
     var s = Math.floor((d % 3600) % 60);
     return (
          ('0' + h).slice(-2) + ':' + ('0' + m).slice(-2) + ':' + ('0' +
s).slice(-2)
     );
}
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        rows: [{ name: 'Country' }, { name: 'Products' }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Amount', caption: 'Sold Amount' }, { name: 'Sold',
caption: 'Units Sold' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
      },
      height: 350,
      showFieldList: true
    }
  },
  methods: {
    aggregateCell:function(args) {
      if (args.fieldName === 'Sold') {
          args.value = secondsToHms(args.value);
    }
  }
  },
  provide: {
    pivotview: [FieldList]
  }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs267" %}

Predefined Dialogs

Getting Started with the Vue Predefined dialogs Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using Vue-CLI and integrating the Syncfusion Vue Predefined dialogs component

Prerequisites

System requirements for Syncfusion Vue UI components

Dependencies

The list of dependencies required to use the predefined dialogs in your application is given below:

```
|-- @syncfusion/ej2-vue-popups
|-- @syncfusion/ej2-vue-base
|-- @syncfusion/ej2-vue-buttons
|-- @syncfusion/ej2-popups
|-- @syncfusion/ej2-base
|-- @syncfusion/ej2-buttons
```

Setting up the Vue 2 project

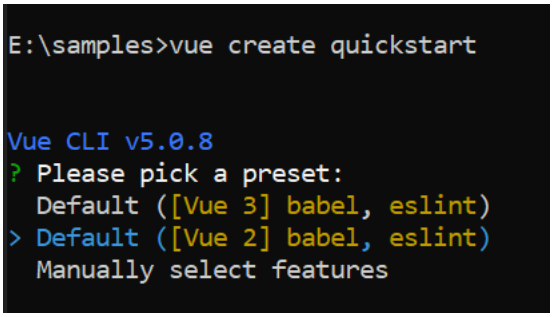
To generate a Vue 2 project using Vue-CLI, use the vue create command. Follow these steps to install Vue CLI and create a new project:

```bash
npm install -g @vue/cli
vue create quickstart
cd quickstart
npm run serve
```

or

```bash
yarn global add @vue/cli
vue create quickstart
cd quickstart
yarn run serve
```

When creating a new project, choose the option `Default ([Vue 2] babel, eslint)` from the menu.



Once the quickstart project is set up with default settings, proceed to add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion packages are available at npmjs.com. To use Vue components, install the required npm package.

This article uses the Vue Predefined dialogs component as an example. Install the @syncfusion/ej2-vue-popups package by running the following command:

`bash

npm install @syncfusion/ej2-vue-popups --save

`

or

`bash

yarn add @syncfusion/ej2-vue-popups

`

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, the Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the predefined dialogs component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-popups/styles/material.css";
</style>
```

The Custom Resource Generator (CRG) is an online web tool, which can be used to generate the custom script and styles for a set of specific components.

This web tool is useful to combine the required component scripts and styles in a single file.

Add Syncfusion Vue component

Follow the below steps to add the Vue Predefined dialogs component:

1\. First, import and register the Predefined dialogs component in the script section of the **src/App.vue** file.

~/SRC/APP.VUE

```
<script>
import { DialogUtility } from "@syncfusion/ej2-vue-popups";
import { ButtonComponent } from "@syncfusion/ej2-vue-buttons";
export default {
```

Copyright © 2001 -2024 Syncfusion Inc.

```
components: {
'ejs-button': ButtonComponent
}
}
</script>
```

2\. In the template section, define the Predefined dialogs component.

~/SRC/APP.VUE

```
<template>
<div>
<div class="predefinedDialogs">
<ejs-button id="alertDlgBtn" v-on:click.native="alertBtnClick" cssClass="e-danger">Alert</ejs-button>
<span id="statusText"></span>
</div>
</div>
</template>
```

Creating Vue sample

Add the following code to the App.vue file in src directory.

`

<template>

<ejs-button id="alertDlgBtn" v-on:click.native="alertBtnClick" cssClass="e-danger">Alert</ejs-button>

</template>

<style>

@import "../node_modules/@syncfusion/ej2-base/styles/material.css";

@import "../node_modules/@syncfusion/ej2-vue-buttons/styles/material.css";

@import "../node_modules/@syncfusion/ej2-vue-popups/styles/material.css";

statusText {

font-size: 16px;

margin-top: 20px;

}

.predefinedDialogs {

height: 100%;

Copyright © 2001 -2024 Syncfusion Inc.

```
min-height: 350px;
}
</style>
<script>
import { DialogUtility } from "@syncfusion/ej2-vue-popups";
import { ButtonComponent } from "@syncfusion/ej2-vue-buttons";
export default {
components: {
'ejs-button': ButtonComponent
},
data: function () {
return {};
},
methods: {
alertBtnClick: function () {
document.getElementById("statusText").style.display = "none";
DialogUtility.alert({
title: "Low battery",
content: "10% of battery remaining",
});
},
},
}
</script>
`
```

Show alert dialog

An alert dialog box used to display an errors, warnings, and information alerts that needs user awareness. This can be achieved by using the DialogUtility.alert method. The alert dialog is displayed along with the OK button. When user clicks on OK button, alert dialog will get closed.

In the below code example, alert dialog displayed on button click action.

Now run the npm run dev command in the console, it will build your application and open in the browser.

~/SRC/APP.VUE

```
<template>
  <div class="predefinedDialogs">
```

```
    <ejs-button id="alertDlgBtn" v-on:click.native="alertBtnClick"
cssClass="e-danger">Alert</ejs-button>
    <span id="statusText"></span>
  </div>
</template>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-popups/styles/material.css";
#statusText {
  font-size: 16px;
  margin-top: 20px;
}
.predefinedDialogs {
  height: 100%;
  min-height: 350px;
}
</style>
<script>
import { DialogUtility } from "@syncfusion/ej2-vue-popups";
import { ButtonComponent } from "@syncfusion/ej2-vue-buttons";
let dialogObj = undefined;
export default {
  components: {
    'ejs-button': ButtonComponent
  },
  data: function () {
    return {};
  },
  methods: {
    alertBtnClick: function () {
      document.getElementById("statusText").style.display = "none";
      dialogObj = DialogUtility.alert({
        title: "Low battery",
        content: "10% of battery remaining",
        okButton: { click: this.alertOkAction },
        position: { X: "center", Y: "center" },
      });
    },
    alertOkAction: function () {
      dialogObj.hide();
      document.getElementById("statusText").innerHTML =
        "The user closed the Alert dialog.";
      document.getElementById("statusText").style.display = "block";
    },
  },
}
</script>
```

{% previewsample "page.domainurl/code-snippet/predefined-dialogs/alert-dialog-cs1" %}

Show confirm dialog

A confirm dialog box used to displays a specified message along with the OK and Cancel buttons. This can be achieved by using the DialogUtility.confirm method. It is used to get approval from the user,

Copyright © 2001 -2024 Syncfusion Inc.

and it appears before any critical action. After get approval from the user the dialog will disappear automatically.

In the below code example, the confirm dialog displayed on OK and Cancel button click action.

~/SRC/APP.VUE

```
<template>
  <div class="predefinedDialogs">
    <ejs-button id="confirmDlgBtn"  v-on:click.native="confirmBtnClick"
cssClass = "e-success">Confirm</ejs-button>
    <span id="statusText"></span>
  </div>
</template>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-popups/styles/material.css";
#statusText {
  font-size: 16px;
  margin-top: 20px;
}
.predefinedDialogs {
  height: 100%;
  min-height: 350px;
}
</style>
<script>
import { DialogUtility } from "@syncfusion/ej2-vue-popups";
import { ButtonComponent } from "@syncfusion/ej2-vue-buttons";
let dialogObj = undefined;
export default {
  components: {
    'ejs-button': ButtonComponent
  },
  data: function () {
    return {};
  },
  methods: {
    confirmBtnClick: function () {
        document.getElementById("statusText").style.display="none";
        dialogObj = DialogUtility.confirm({
            title: " Delete multiple items",
            content: "Are you sure you want to permanently delete these
items?",
            okButton: { click:this.confirmOkAction},
            cancelButton: { click:this.confirmCancelAction},
        });
      },
      confirmOkAction:function () {
          dialogObj.hide();
          document.getElementById("statusText").innerHTML="The user
confirmed the dialog box";
          document.getElementById("statusText").style.display="block";
      },
      confirmCancelAction:function(){
          dialogObj.hide();
```

```
            document.getElementById("statusText").innerHTML="The user canceled
the dialog box.";
            document.getElementById("statusText").style.display="block";
        }
    },
}
</script>
```

{% previewsample "page.domainurl/code-snippet/predefined-dialogs/confirm-dialog-cs1" %}

Show Prompt dialog

A prompt dialog is used to get the input from the user. When the user clicks the OK button the input value from the dialog is returned. If the user clicks the Cancel button the null value is returned. After getting the input from the user the dialog will disappear automatically.

In the below code example, the confirm dialog displayed on OK and Cancel button click action.

~/SRC/APP.VUE

```
<template>
  <div class="predefinedDialogs">
    <ejs-button id="promptDlgBtn"  v-on:click.native="promptBtnClick"
:isPrimary="true">Prompt</ejs-button>
    <span id="statusText"></span>
  </div>
</template>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-popups/styles/material.css";
#statusText {
  font-size: 16px;
  margin-top: 20px;
}
.predefinedDialogs {
  height: 100%;
  min-height: 350px;
}
</style>
<script>
import { DialogUtility } from "@syncfusion/ej2-vue-popups";
import { ButtonComponent } from "@syncfusion/ej2-vue-buttons";
let dialogObj = undefined;
let value ;
export default {
  components: {
    'ejs-button': ButtonComponent
  },
  data: function () {
    return {};
  },
  methods: {
     promptBtnClick: function () {
            document.getElementById("statusText").style.display="none";
            dialogObj = DialogUtility.confirm({
                title: "Join chat group",
```

```
                content:'<P>Enter your name:</p><input id= "inputEle"
type="text" name="Required" class="e-input" placeholder="Type here.." />',
                okButton: { click:this.promptOkAction },
                cancelButton: { click:this.promptCancelAction},
                position: { X: 'center', Y: 'center' }
            });
        },
    promptOkAction:function () {
        value = document.getElementById("inputEle").value;
        if(value ==""){
            dialogObj.hide();
            document.getElementById("statusText").innerHTML="The user's
input is returned as\" \"";
            document.getElementById("statusText").style.display="block";
        }
        else{
            dialogObj.hide();
            document.getElementById("statusText").innerHTML="The user's
input is returned as" +" "+ value;
            document.getElementById("statusText").style.display="block";
        }
        },
        promptCancelAction:function () {
            dialogObj.hide ();
            document.getElementById("statusText").innerHTML ="The user
canceled the prompt dialog";
            document.getElementById("statusText").style.display="block";
        }
  },
}
</script>
```

{% previewsample "page.domainurl/code-snippet/predefined-dialogs/prompt-dialog-cs1" %}

Getting Started with the Vue Predefined Dialogs Component in Vue 3

This article provides a step-by-step guide for setting up a Vite project with a JavaScript environment and integrating the Syncfusion Vue Predefined Dialogs component using the Composition API / Options API.

The Composition API is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

The Options API is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

Prerequisites

System requirements for Syncfusion Vue UI components

Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using Vite. To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

`bash

Copyright © 2001 -2024 Syncfusion Inc.

npm create vite@latest

`

or

`bash

yarn create vite

`

Using one of the above commands will lead you to set up additional configurations for the project as below:

1.Define the project name: We can specify the name of the project directly. Let's specify the name of the project as my-project for this article.

`bash

? Project name: » my-project

`

2.Select Vue as the framework. It will create a Vue 3 project.

`bash

? Select a framework: » - Use arrow-keys. Return to submit.

Vanilla

Vue

React

Preact

Lit

Svelte

Others

`

3.Choose JavaScript as the framework variant to build this Vite project using JavaScript and Vue.

`bash

? Select a variant: » - Use arrow-keys. Return to submit.

JavaScript

TypeScript

Customize with create-vue ↗

Nuxt ↗

`

4.Upon completing the aforementioned steps to create the my-project, run the following command to install its dependencies:

`bash

cd my-project

npm install

`

or

`bash

cd my-project

yarn install

`

Now that my-project is ready to run with default settings, let's add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion Vue component packages are available at npmjs.com. To use Syncfusion Vue components in the project, install the corresponding npm package.

To use the Vue Predefined Dialogs component in the project, the @syncfusion/ej2-vue-popups package needs to be installed using the following command:

`bash

npm install @syncfusion/ej2-vue-popups --save

`

or

`bash

yarn add @syncfusion/ej2-vue-popups

`

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the Predefined Dialogs component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-popups/styles/material.css";
</style>
```

Copyright © 2001 -2024 Syncfusion Inc.

The order of importing CSS styles should be in line with its dependency graph.

Adding Syncfusion Vue3 Predefined Dialogs in the application

You have completed all the necessary configurations needed for rendering the Syncfusion Vue component. Now, you are going to add the Predefined Dialogs using following steps.

- Import the DialogUtility in the `

~/SRC/APP.VUE

```
<script>
import { DialogUtility } from "@syncfusion/ej2-vue-popups";
</script>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<div class="predefinedDialogs">
<button id="alertDlgBtn" @click="alertBtnClick" class="e-
danger">Alert</button>
</div>
</template>
<script>
import { DialogUtility } from "@syncfusion/ej2-vue-popups";
export default {
setup() {
const alertBtnClick = () => {
DialogUtility.alert({
title: "Low battery",
content: "10% of battery remaining",
});
};
return {
alertBtnClick
};
}
};
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-popups/styles/material.css";
.predefinedDialogs {
height: 100%;
min-height: 350px;
}
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<div class="predefinedDialogs">
<button id="alertDlgBtn" @click="alertBtnClick" class="e-
danger">Alert</button>
</div>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
</template>
<script>
import { DialogUtility } from "@syncfusion/ej2-vue-popups";
export default {
data() {
return {};
},
methods: {
alertBtnClick() {
DialogUtility.alert({
title: "Low battery",
content: "10% of battery remaining",
});
},
},
};
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-popups/styles/material.css";
.predefinedDialogs {
height: 100%;
min-height: 350px;
}
</style>
```

Run the project

To run the project, use the following command:

`bash

npm run dev

`

or

`bash

yarn run dev

`

web server will be initiated, open the quick start app in the browser at port localhost:8080.

Draggable in Vue Predefined dialogs component

The predefined dialogs supports dragging within its target container by grabbing the dialog header, which allows the user to reposition the dialog dynamically by using isDraggable property.

Alert drag

APP.VUE

```
<template>
  <div class="predefinedDialogs">
      <ejs-button id="alertDlgBtn" v-on:click.native="alertBtnClick"
cssClass="e-danger">Alert</ejs-button>
  </div>
</template>
<style>
```

```
    @import "../../node_modules/@syncfusion/ej2-vue-
popups/styles/material.css";
.predefinedDialogs {
  height: 100%;
  min-height: 350px;
}
</style>
<script>
import Vue from "vue";
import { DialogUtility } from "@syncfusion/ej2-vue-popups";
import { ButtonPlugin } from "@syncfusion/ej2-vue-buttons";
Vue.use(ButtonPlugin);
Vue.use(DialogUtility);
export default {
  data: function () {
    return {};
  },
  methods: {
    alertBtnClick: function () {
      DialogUtility.alert({
        title: 'Low battery',
        width: '250px',
        isDraggable: true,
        content: '10% of battery remaining',
      });
    }
  },
}
</script>
```

{% previewsample "page.domainurl/code-snippet/predefined-dialogs/alert-drag-cs1" %}

Confirm drag

APP.VUE

```
<template>
  <div class="predefinedDialogs">
    <ejs-button id="confirmDlgBtn" v-on:click.native="confirmBtnClick"
cssClass = "e-success">Confirm</ejs-button>
  </div>
</template>
<style>
    @import "../../node_modules/@syncfusion/ej2-vue-
popups/styles/material.css";
.predefinedDialogs {
  height: 100%;
  min-height: 350px;
}
</style>
<script>
import Vue from "vue";
import { DialogUtility } from "@syncfusion/ej2-vue-popups";
import { ButtonPlugin } from "@syncfusion/ej2-vue-buttons";
Vue.use(ButtonPlugin);
Vue.use(DialogUtility);
export default {
```

Copyright © 2001 -2024 Syncfusion Inc.

```
  data: function () {
    return {};
  },
  methods: {
    confirmBtnClick: function () {
      DialogUtility.confirm({
        title: 'Delete multiple items',
        content: "Are you sure you want to permanently delete these items?",
        width: '300px',
        isDraggable:true
      });
    },
  },
}
</script>
```

{% previewsample "page.domainurl/code-snippet/predefined-dialogs/confirm-drag-cs1" %}

Prompt drag

APP.VUE

```
<template>
  <div class="predefinedDialogs">
      <ejs-button id="promptDlgBtn" v-on:click.native="promptBtnClick"
:isPrimary="true">Prompt</ejs-button>
  </div>
</template>
<style>
    @import "../../node_modules/@syncfusion/ej2-vue-
popups/styles/material.css";
.predefinedDialogs {
  height: 100%;
  min-height: 350px;
}
</style>
<script>
import Vue from "vue";
import { DialogUtility } from "@syncfusion/ej2-vue-popups";
import { ButtonPlugin } from "@syncfusion/ej2-vue-buttons";
Vue.use(ButtonPlugin);
Vue.use(DialogUtility);
export default {
  data: function () {
    return {};
  },
  methods: {
     promptBtnClick: function () {
       DialogUtility.confirm({
        title: 'Join chat group',
        width:'250px',
        isDraggable:true,
        content: '<p>Enter your name: </p><input id= "inputEle" type="text"
name="Required" class="e-input" placeholder="Type here.." />'
      });
    },
  },
```

```
}
</script>
```

{% previewsample "page.domainurl/code-snippet/predefined-dialogs/prompt-drag-cs1" %}

Animation in Vue Predefined dialogs component

The predefined dialogs can be animated during the open and close actions. Also, user can customize animation's delay, duration and effect of animation by using the animationSettings property.

In the below sample, Zoom effect is enabled. So, The Dialog will open with ZoomIn and close with ZoomOut effects.

Alert animation

APP.VUE

```
<template>
    <div class="predefinedDialogs">
        <ejs-button id="alertDlgBtn"  v-on:click.native="alertBtnClick"
cssClass="e-danger">Alert</ejs-button>
    </div>
</template>
<style>
    @import "../../node_modules/@syncfusion/ej2-vue-
popups/styles/material.css";
.predefinedDialogs {
  height: 100%;
  min-height: 350px;
}
</style>
<script>
import Vue from "vue";
import { DialogUtility } from "@syncfusion/ej2-vue-popups";
import { ButtonPlugin } from "@syncfusion/ej2-vue-buttons";
Vue.use(ButtonPlugin);
Vue.use(DialogUtility);
let dialogObj = undefined;
export default {
  data: function () {
    return {};
  },
  methods: {
    alertBtnClick: function () {
      dialogObj = DialogUtility.alert({
          title: 'Low battery',
          width: '250px',
          animationSettings: { effect: 'Zoom' },
          content: '10% of battery remaining'
      });
    }
  },
}
</script>
```

{% previewsample "page.domainurl/code-snippet/predefined-dialogs/alert-animation-cs1" %}

Copyright © 2001 -2024 Syncfusion Inc.

Confirm animation

APP.VUE

```
<template>
    <div class="predefinedDialogs">
        <ejs-button id="confirmDlgBtn"  v-on:click.native="confirmBtnClick"
cssClass = "e-success">Confirm</ejs-button>
    </div>
</template>
<style>

Position in Vue Predefined dialogs component

Customize the dialog position by using the position property. The position can be represented with specific X and Y values.

- The PositionDataModel.X can be configured with a left, center, right or offset value. By default, the value is set as center.
- The PositionDataModel.Y can be configured with a top, center, bottom or offset value. By default, the value is set as center.

    },
  },
}
</script>
```

{% previewsample "page.domainurl/code-snippet/predefined-dialogs/prompt-dimension-cs1" %}

Max-width and max-height

To have a restricted max-width and max-height dialog dimension, you need to specify the max-width, max-height CSS properties for the component's container element by using the cssClass property. The max-height value is calculated in source level and set to the dialog. so, need to override the max-height property.

Use the following code to customize the max-width and max-height for alert dialog:

APP.VUE

```
<template>
  <div class="predefinedDialogs">
    <ejs-button id="alertDlgBtn" v-on:click.native="alertBtnClick"
cssClass="e-danger">Alert</ejs-button>
  </div>
</template>
<style>
    @import "../../node_modules/@syncfusion/ej2-vue-
popups/styles/material.css";
.predefinedDialogs {
  height: 100%;
  min-height: 350px;
}
 .e-alert-dialog.customClass {
    max-width: 350px;
    max-height: 250px !important;
}
</style>
<script>
import Vue from "vue";
import { DialogUtility } from "@syncfusion/ej2-vue-popups";
import { ButtonPlugin } from "@syncfusion/ej2-vue-buttons";
Vue.use(ButtonPlugin);
Vue.use(DialogUtility);
```

Copyright © 2001 -2024 Syncfusion Inc.

```
export default {
  data: function () {
    return {};
  },
  methods: {
    alertBtnClick: function () {
      DialogUtility.alert({
       title: 'About syncfusion succinctly series',
        content: 'In the Succinctly series, Syncfusion created a robust,
free library of more than 130 technical e-books formatted for PDF, Kindle,
and EPUB.Each title in the Succinctly series is written by a carefully
chosen expert and provides essential content in about 100 pages. The
Succinctly series was born in 2012 out of a desire to provide concise
technical e-books for software developers.',
        cssClass : 'customClass'
      });
    },
  },
}
</script>
```

{% previewsample "page.domainurl/code-snippet/predefined-dialogs/maxWidth-maxHeight-cs1" %}

Min-width and min-height

To have a restricted min-width and min-height dialog dimension, you need to specify the min-width, min-height CSS properties for the component's container element by using the cssClass property.

Use the following code to customize the min-width and min-height for alert dialog:

APP.VUE

```
<template>
  <div class="predefinedDialogs">
    <ejs-button id="alertDlgBtn" v-on:click.native="alertBtnClick"
cssClass="e-danger">Alert</ejs-button>
  </div>
</template>
<style>
    @import "../../node_modules/@syncfusion/ej2-vue-
popups/styles/material.css";
.predefinedDialogs {
  height: 100%;
  min-height: 350px;
}
.e-dialog.customClass {
  min-width: 300px;
  min-height: 200px;
}
</style>
<script>
import Vue from "vue";
import { DialogUtility } from "@syncfusion/ej2-vue-popups";
import { ButtonPlugin } from "@syncfusion/ej2-vue-buttons";
Vue.use(ButtonPlugin);
Vue.use(DialogUtility);
export default {
```

Copyright © 2001 -2024 Syncfusion Inc.

```
  data: function () {
    return {};
  },
  methods: {
    alertBtnClick: function () {
      DialogUtility.alert({
        title: "About syncfusion succinctly series",
        content: "The succinctly series was born in 2012.",
        cssClass: "customClass",
      });
    },
  },
}
</script>
```

{% previewsample "page.domainurl/code-snippet/predefined-dialogs/minWidth-minHeight-cs1" %}

Customization in Vue Predefined dialogs component

You can customize the predefined dialogs buttons by using below properties.

- okButton - Use this property to customize **OK** button text.
- cancelButton - Use this property to customize **Cancel** button text.

Use the following code snippet for **alert**, **confirm** and **prompt** to customize the predefined dialogs action buttons.

For alert dialog , customized the default dialog button content as Dismiss by using the text property.

For confirm dialog, customized the default dialog buttons content as Yes and No by using the text property and also customized the dialog button icons by using icon property.

For prompt dialog , customized the default dialog buttons content as Connect and Close by using text property.

Alert action button

APP.VUE

```
<template>

Show or hide dialog close button

When rendering the predefined dialogs through utility methods, You can close the dialog using the following ways. The default values of closeOnEscape and showCloseIcon is false.

- By pressing the escape key if the closeOnEscape property is enabled.
- By clicking the close button if the showCloseIcon property is enabled.

You can also manually close the Dialogs by creating an instance to the dialog and call the hide method.

Use the following code for **alert**, **confirm** and **prompt** to demonstrates the different ways of hiding the utility dialog.

Alert dialog close button

APP.VUE

```
<template>
  <div class="predefinedDialogs">
  <ejs-button id="alertDlgBtn" v-on:click.native="alertBtnClick"
cssClass="e-danger">Alert</ejs-button>
  </div>
</template>
<style>

        content:'<p>Enter your name: </p><input id= "inputEle" type="text"
name="Required" class="e-input" placeholder="Type here.." />',
        showCloseIcon: true,
        closeOnEscape: true
      });
    },
  },
}
</script>
```

{% previewsample "page.domainurl/code-snippet/predefined-dialogs/prompt-close-btn-cs1" %}

Customize dialog content

You can load custom content in predefined dialogs using the content property.

Use the following code to customize the dialog content to render the custom TextBox component inside the prompt dialog to get the username from the user.

APP.VUE

```
<template>
  <div class="predefinedDialogs">
    <ejs-button id="confirmDlgBtn" v-on:click.native="confirmBtnClick"
cssClass="e-success">Confirm </ejs-button>
  </div>
</template>
<style>
  @import "../../node_modules/@syncfusion/ej2-vue-
popups/styles/material.css";
.predefinedDialogs {
  height: 100%;
  min-height: 350px;
}
</style>
<script>
import Vue from "vue";
import { DialogUtility } from "@syncfusion/ej2-vue-popups";
```

```
import { ButtonPlugin } from "@syncfusion/ej2-vue-buttons";
Vue.use(ButtonPlugin);
Vue.use(DialogUtility);
export default ( {
  data: function () {
    return {};
  },
  methods: {
    confirmBtnClick: function () {
      DialogUtility.confirm({
        title: "Join chat group",
        content: '<p>Enter your name: </p><input class="e-input"/>',
        width: "350px",
      });
    },
  },
});
</script>
```

ProgressBar

Getting Started with the Vue Progressbar Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using Vue-CLI and integrating the Syncfusion Vue Progressbar component

Prerequisites

System requirements for Syncfusion Vue UI components

Dependencies

Below is the list of minimum dependencies required to use the progressbar component.

`javascript

|-- @syncfusion/ej2-vue-progressbar

|-- @syncfusion/ej2-base

|-- @syncfusion/ej2-data: "*"

|-- @syncfusion/ej2-svg-base

`

Setting up the Vue 2 project

To generate a Vue 2 project using Vue-CLI, use the vue create command. Follow these steps to install Vue CLI and create a new project:

`bash

npm install -g @vue/cli

vue create quickstart

cd quickstart

npm run serve

Copyright © 2001 -2024 Syncfusion Inc.

`

or

`bash

yarn global add @vue/cli

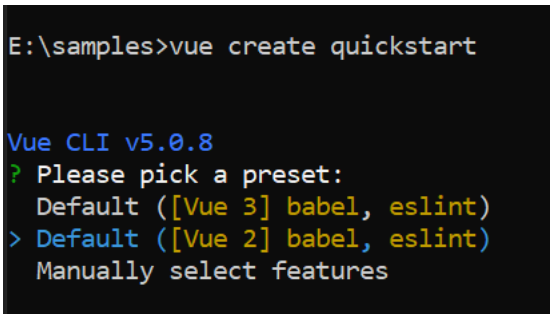
vue create quickstart

cd quickstart

yarn run serve

`

When creating a new project, choose the option Default ([Vue 2] babel, eslint) from the menu.



Once the quickstart project is set up with default settings, proceed to add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion packages are available at npmjs.com. To use Vue components, install the required npm package.

This article uses the Vue Progressbar component as an example. Install the @syncfusion/ej2-vue-progressbar package by running the following command:

`bash

npm install @syncfusion/ej2-vue-progressbar --save

`

or

`bash

yarn add @syncfusion/ej2-vue-progressbar

`

The **--save** will instruct NPM to include the chart package inside of the dependencies section of the package.json.

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

Copyright © 2001 -2024 Syncfusion Inc.

The progressbar has different themes. They are:

- Material
- Fabric
- Bootstrap
- High Contrast

import chart component CSS as given below in <style> section of the App.vue file.

~/SRC/APP.VUE

```
<style>
<!-- Material theme used for this sample -->
@import "../node_modules/@syncfusion/ej2-vue-
progressbar/styles/material.css";
</style>
```

Add Syncfusion Vue component

Follow the below steps to add the Vue Progressbar component:

1\. First, import and register the Progressbar component in the script section of the **src/App.vue** file.

~/SRC/APP.VUE

```
<script>
import { ProgressBarComponent } from '@syncfuion/ej2-vue-charts';
export default {
components: {
'ejs-progressbar': ProgressBarComponent
}
}
</script>
```

2\. In the template section, define the Progressbar component with the animation and value property.

~/SRC/APP.VUE

```
<template>
<div>
<div id='loader'>LOADING....</div>
<div id="container">
<div class="row linear-parent">
<div id="percentage" class="linear-progress">
<ejs-progressbar
id="percentage"
type='Circular'
:value='value'
:animation="animation"
>
</ejs-progressbar>
</div>
</div>
</div>
</div>
</template>
```

Copyright © 2001 -2024 Syncfusion Inc.

3\. Declare the value for the animation and value properties in the script section.

~/SRC/APP.VUE

```
<script>
data: function() {
return {
value : 100,
animation: {
enable: true,
duration: 2000,
delay: 0
},
};
}
</script>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

~/SRC/APP.VUE

```
<template>
<div>
<div id='loader'>LOADING....</div>
<div id="container">
<div class="row linear-parent">
<div id="percentage" class="linear-progress">
<ejs-progressbar
id="percentage"
type='Circular'
:value='value'
:animation="animation"
>
</ejs-progressbar>
</div>
</div>
</div>
</div>
</template>
<script>
import { ProgressBarComponent } from "@syncfusion/ej2-vue-progressbar";
export default {
components: {
'ejs-progressbar': ProgressBarComponent
},
data: function() {
return {
value : 100,
animation: {
enable: true,
duration: 2000,
delay: 0
},
};
},
```

Copyright © 2001 -2024 Syncfusion Inc.

```
provide: {},
methods: {}
}
</script>
<style>
#loader {
color: #008cff;
height: 40px;
left: 45%;
position: absolute;
top: 45%;
width: 30%;
}
#container {
display: -webkit-box;
}
</style>
```

Run the project

To run the project, use the following command:

`bash

npm run serve

`

or

`bash

yarn run serve

`

Module Injection

Progressbar component are segregated into individual feature-wise modules. In order to use a particular feature, you need to inject its feature service in the AppModule. feature service name and description as follows.

- ProgressAnnotation - Inject this provider to use Annotation.

This module should be injected to the provide section as follows,

`javascript

import { ProgressBarComponent, ProgressAnnotationService } from "@syncfusion/ej2-vue-charts";

export default {

components: {

'ejs-progressbar': ProgressbarComponent

},

provide: {

Copyright © 2001 -2024 Syncfusion Inc.

progressbar: [ProgressAnnotationService]

}

};

`

Getting Started with the Vue Progress Bar Component in Vue 3

This article provides a step-by-step guide for setting up a Vite project with a JavaScript environment and integrating the Syncfusion Vue Progress Bar component using the Composition API / Options API.

The Composition API is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

The Options API is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

Prerequisites

System requirements for Syncfusion Vue UI components

Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using Vite. To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

`bash

npm create vite@latest

`

or

`bash

yarn create vite

`

Using one of the above commands will lead you to set up additional configurations for the project as below:

1.Define the project name: We can specify the name of the project directly. Let's specify the name of the project as my-project for this article.

`bash

? Project name: » my-project

`

2.Select Vue as the framework. It will create a Vue 3 project.

`bash

? Select a framework: » - Use arrow-keys. Return to submit.

Vanilla

Copyright © 2001 -2024 Syncfusion Inc.

Vue

React

Preact

Lit

Svelte

Others

`

3.Choose JavaScript as the framework variant to build this Vite project using JavaScript and Vue.

`bash

? Select a variant: » - Use arrow-keys. Return to submit.

JavaScript

TypeScript

Customize with create-vue ↗

Nuxt ↗

`

4.Upon completing the aforementioned steps to create the my-project, run the following command to install its dependencies:

`bash

cd my-project

npm install

`

or

`bash

cd my-project

yarn install

`

Now that my-project is ready to run with default settings, let's add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion Vue component packages are available at npmjs.com. To use Syncfusion Vue components in the project, install the corresponding npm package.

This article uses the Vue Progress Bar component as an example. To use the Vue Progress Bar component in the project, the @syncfusion/ej2-vue-progressbar package needs to be installed using the following command:

`bash

Copyright © 2001 -2024 Syncfusion Inc.

npm install @syncfusion/ej2-vue-progressbar --save

`

or

`bash

yarn add @syncfusion/ej2-vue-progressbar

`

Add Syncfusion Vue component

Follow the below steps to add the Vue Progress Bar component using Composition API or Options API:

1.First, import and register the Progress Bar component and its child directives in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { ProgressBarComponent as EjsProgressbar } from "@syncfusion/ej2-vue-progressbar";
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { ProgressBarComponent } from "@syncfusion/ej2-vue-progressbar";
//Component registration
export default {
name: "App",
components: {
"ejs-progressbar": ProgressBarComponent
}
}
</script>
```

2.In the template section, define the Progress Bar component with the [dataSource] property.

~/SRC/APP.VUE

```
<template>
<ejs-progressbar id="percentage" :type='type'
:showProgressValue='showProgressValue' :value='value'
:animation="animation">
</ejs-progressbar>
</template>
```

3.Declare the values for the dataSource property in the script section.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
const type = 'Circular';
```

Copyright © 2001 -2024 Syncfusion Inc.

```
const showProgressValue = 'true';
const value = 100;
const animation = {
enable: true,
duration: 2000,
delay: 0
};
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
data() {
return {
type: 'Circular',
showProgressValue: 'true',
value: 100,
animation: {
enable: true,
duration: 2000,
delay: 0
}
};
}
</script>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<ejs-progressbar id="percentage" :type='type'
:showProgressValue='showProgressValue' :value='value'
:animation="animation">
</ejs-progressbar>
</template>
<script setup>
import { ProgressBarComponent as EjsProgressbar } from "@syncfusion/ej2-vue-progressbar";
const type = 'Circular';
const showProgressValue = 'true';
const value = 100;
const animation = {
enable: true,
duration: 2000,
delay: 0
};
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<ejs-progressbar id="percentage" :type='type'
:showProgressValue='showProgressValue' :value='value'
:animation="animation">
```

Copyright © 2001 -2024 Syncfusion Inc.

```
</ejs-progressbar>
</template>
<script>
import { ProgressBarComponent } from "@syncfusion/ej2-vue-progressbar";
//Component registration
export default {
name: "App",
components: {
"ejs-progressbar": ProgressBarComponent
},
data() {
return {
type: 'Circular',
showProgressValue: 'true',
value: 100,
animation: {
enable: true,
duration: 2000,
delay: 0
}
};
},
};
</script>
```

Run the project

To run the project, use the following command:

`bash

npm run dev

`

or

`bash

yarn run dev

`

The output will appear as follows:

Sample: vue-3-progressbar-getting-started.

For migrating from Vue 2 to Vue 3, refer to the migration documentation.

Copyright © 2001 -2024 Syncfusion Inc.

Types in Vue Progressbar component

Visualize progress in different shapes (rectangle, circle, and semi-circle) to give a unique appearance to your app design.

Linear

Set **type** to Linear to get the linear progress bar. It also support secondary progress and different mode of progress.

App.vue

`

```
<template>
<div id='loader'>LOADING....</div>
<div id='container'>
<div class="row linear-parent">
<div id="determinate" class="linear-progress">
<ejs-progressbar
id='determinate'
type='Linear'
height='60'
:value='value1'
:animation='animation'

</ejs-progressbar>
</div>
<div id="indeterminate" class="linear-progress">
<ejs-progressbar
id='indeterminate'
type='Linear'
height='60'
:value='value2'
:isIndeterminate='isIndeterminate'

</ejs-progressbar>
```

```
</div>
<div id="buffer" class="linear-progress">
<ejs-progressbar
id='buffer'
type='Linear'
height='60'
:value='value3'
:secondaryProgress='secondaryProgress'
:animation=' animation'

</ejs-progressbar>
</div>
<div id="segment" class="linear-progress">
<ejs-progressbar
id='segment'
type='Linear'
height='60'
:value='value4'
:segmentCount='count'
:animation='animation'

</ejs-progressbar>
</div>
</div>
</div>
</template>
<script>
import Vue from "vue";
import { Browser } from "@syncfusion/ej2-base";
import { ProgressBarPlugin } from "@syncfusion/ej2-vue-progressbar";
Vue.use(ProgressBarPlugin);
export default Vue.extend({
data: function() {
```

Copyright © 2001 -2024 Syncfusion Inc.

```
return {
value1:100,
value2:20,
value3:40,
value4:100,
isIndeterminate:true,
secondaryProgress:60,
animation: {
enable: true,
duration: 2000,
delay: 0
},
};
},
provide: {},
methods: {}
});
</script>
<style>
loader {
color: #008cff;
height: 40px;
left: 45%;
position: absolute;
top: 45%;
width: 30%;
}
container {
display: -webkit-box;
}
</style>
`
```

Copyright © 2001 -2024 Syncfusion Inc.

Circular

Set **type** to Circular to get the circular progress bar. It also support secondary progress and different mode of progress.

App.vue

`

```
<template>
<div id='loader'>LOADING....</div>
<div id='container'>
<div class="row linear-parent">
<div id="determinate" class="linear-progress">
<ejs-progressbar
id='determinate'
type='Circular'
height='60'
:value='value1'
:animation='animation'

</ejs-progressbar>
</div>
<div id="indeterminate" class="linear-progress">
<ejs-progressbar
id='indeterminate'
type='Circular'
height='60'
:value='value2'
:isIndeterminate='isIndeterminate'

</ejs-progressbar>
</div>
<div id="buffer" class="linear-progress">
<ejs-progressbar
id='buffer'
type='Circular'
height='60'
```

Copyright © 2001 -2024 Syncfusion Inc.

```
:value='value3'
:secondaryProgress='secondaryProgress'
:animation=' animation'

</ejs-progressbar>
</div>
<div id="segment" class="linear-progress">
<ejs-progressbar
id='segment'
type='Circular'
height='60'
:value='value4'
:segmentCount='count'
:animation='animation'

</ejs-progressbar>
</div>
</div>
</div>
</template>
<script>
import Vue from "vue";
import { Browser } from "@syncfusion/ej2-base";
import { ProgressBarPlugin } from "@syncfusion/ej2-vue-progressbar";
Vue.use(ProgressBarPlugin);
export default Vue.extend({
data: function() {
return {
value1:100,
value2:20,
value3:40,
value4:100,
isIndeterminate:true,
```

Copyright © 2001 -2024 Syncfusion Inc.

```
secondaryProgress:60,
animation: {
enable: true,
duration: 2000,
delay: 0
},
};
},
provide: {},
methods: {}
});
</script>
<style>
loader {
color: #008cff;
height: 40px;
left: 45%;
position: absolute;
top: 45%;
width: 30%;
}
container {
display: -webkit-box;
}
</style>
`
```

Tooltip in Vue Progressbar component

Tooltip

The tooltip for the progress bar is used to represent the progress value. During the initial load, it can be enabled by using the enable property. The showTooltipOnHover property can show the tooltip on mouseover.

App.vue

```
`
<template>
```

```
<div id='loader'>LOADING....</div>
<div id='container'>
<div class="row linear-parent">
<div id="determinate" class="linear-progress">
<ejs-progressbar
id='determinate'
type='Linear'
height='60'
:value='value1'
:animation='animation'
:tooltip='tooltip'
</div>
</div>
</div>
</template>
<script>
import Vue from "vue";
import { Browser } from "@syncfusion/ej2-base";
import { ProgressBarPlugin } from "@syncfusion/ej2-vue-progressbar";
Vue.use(ProgressBarPlugin);
export default Vue.extend({
data: function() {
return {
value1:100,
animation: {
enable: true,
duration: 2000,
delay: 0
},
tooltip: {
enable: true,
showTooltipOnHover: true
}
```

Copyright © 2001 -2024 Syncfusion Inc.

};

},

provide: {},

methods: {}

});

</script>

<style>

loader {

color: #008cff;

height: 40px;

left: 45%;

position: absolute;

top: 45%;

width: 30%;

}

container {

display: -webkit-box;

}

</style>

`

Format

By default, the tooltip shows information about progress. In addition to that, show more information in the tooltip using the format property.

App.vue

`

<template>

LOADING....

<ejs-progressbar

id='determinate'

type='Linear'

height='60'

Copyright © 2001 -2024 Syncfusion Inc.

```
:value='value1'
:animation='animation'
:tooltip='tooltip'
</div>
</div>
</div>
</template>
<script>
import Vue from "vue";
import { Browser } from "@syncfusion/ej2-base";
import { ProgressBarPlugin } from "@syncfusion/ej2-vue-progressbar";
Vue.use(ProgressBarPlugin);
export default Vue.extend({
data: function() {
return {
value1:100,
animation: {
enable: true,
duration: 2000,
delay: 0
},
tooltip: {
enable: true,
format: "Progress: ${value}"
}
};
},
provide: {},
methods: {}
});
</script>
<style>
```

Copyright © 2001 -2024 Syncfusion Inc.

loader {

color: #008cff;

height: 40px;

left: 45%;

position: absolute;

top: 45%;

width: 30%;

}

container {

display: -webkit-box;

}

</style>

`

Customization

The fill and border properties are used to customize the background color and border of the tooltip respectively. The textStyle property in the tooltip is used to customize the font of the tooltip text.

App.vue

`

<template>

LOADING....

<ejs-progressbar

id='determinate'

type='Linear'

height='60'

:value='value1'

:animation='animation'

:tooltip='tooltip'

</template>

Copyright © 2001 -2024 Syncfusion Inc.

```
<script>
import Vue from "vue";
import { Browser } from "@syncfusion/ej2-base";
import { ProgressBarPlugin } from "@syncfusion/ej2-vue-progressbar";
Vue.use(ProgressBarPlugin);
export default Vue.extend({
data: function() {
return {
value1:100,
animation: {
enable: true,
duration: 2000,
delay: 0
},
tooltip: {
enable: true,
format: "Progress: ${value}"
}
};
},
provide: {},
methods: {}
});
</script>
<style>
```

loader {

```
color: #008cff;
height: 40px;
left: 45%;
position: absolute;
top: 45%;
width: 30%;
}
```

Copyright © 2001 -2024 Syncfusion Inc.

container {

```
display: -webkit-box;
}
</style>
`
```

States in Vue Progressbar component

Visualize progress in different modes.

Determinate

This is the default state. You can use it when the progress estimation is known.

App.vue

```
`
<template>
<div id='loader'>LOADING....</div>
<div id='container'>
<div class="row linear-parent">
<div id="percentage" class="linear-progress">
<ejs-progressbar
id='percentage'
type='Linear'
height='60'
:value='value'

</ejs-progressbar>
</div>
</div>
</div>
</template>
<script>
import Vue from "vue";
import { Browser } from "@syncfusion/ej2-base";
import { ProgressBarPlugin } from "@syncfusion/ej2-vue-progressbar";
Vue.use(ProgressBarPlugin);
export default Vue.extend({
data: function() {
```

Copyright © 2001 -2024 Syncfusion Inc.

```
return {
value:100
};
},
provide: {},
methods: {}
});
</script>
<style>
loader {
color: #008cff;
height: 40px;
left: 45%;
position: absolute;
top: 45%;
width: 30%;
}
container {
display: -webkit-box;
}
</style>
`
```

Indeterminate

By enabling the **IsIndeterminate** property, the state of the progress bar can be changed to indeterminate when the progress cannot be estimated or is not being calculated. It can be combined with determinate mode to know that the application is estimating progress before the actual progress starts.

App.vue

```
`
<template>
<div id='loader'>LOADING....</div>
<div id='container'>
<div class="row linear-parent">
<div id="percentage" class="linear-progress">
<ejs-progressbar
```

Copyright © 2001 -2024 Syncfusion Inc.

```
id='percentage'
type='Linear'
height='60'
:value='value'
:isIndeterminate='isIndeterminate'

</ejs-progressbar>
</div>
</div>
</div>
</template>
<script>
import Vue from "vue";
import { Browser } from "@syncfusion/ej2-base";
import { ProgressBarPlugin } from "@syncfusion/ej2-vue-progressbar";
Vue.use(ProgressBarPlugin);
export default Vue.extend({
data: function() {
return {
value:20,
isIndeterminate:true
};
},
provide: {},
methods: {}
});
</script>
<style>
```

loader {

```
color: #008cff;
height: 40px;
left: 45%;
position: absolute;
```

Copyright © 2001 -2024 Syncfusion Inc.

top: 45%;

width: 30%;

}

container {
display: -webkit-box;

}

</style>

`

Buffer

You can use a secondary progress indicator when the primary progress depends on the secondary progress. This will allow users to visualize both primary and secondary progress simultaneously.

App.vue

`

<template>

LOADING....

<ejs-progressbar

id='percentage'

type='Linear'

height='60'

:value='value'

:secondaryProgress='secondaryProgress'

</ejs-progressbar>

</template>

<script>

import Vue from "vue";

import { Browser } from "@syncfusion/ej2-base";

import { ProgressBarPlugin } from "@syncfusion/ej2-vue-progressbar";

Copyright © 2001 -2024 Syncfusion Inc.

```
Vue.use(ProgressBarPlugin);
export default Vue.extend({
data: function() {
return {
value:40,
secondaryProgress:60
};
},
provide: {},
methods: {}
});
</script>
<style>
loader {
color: #008cff;
height: 40px;
left: 45%;
position: absolute;
top: 45%;
width: 30%;
}
container {
display: -webkit-box;
}
</style>
`
```

Customization in Vue Progressbar component

Segments

We can divide a progress bar into multiple segments using a segmentCount to visualize the progress of multiple sequential tasks.

App.vue

```
`
<template>
<div id='loader'>LOADING....</div>
```

```
<div id='container'>
<div class="row linear-parent">
<div id="percentage" class="linear-progress">
<ejs-progressbar
id='percentage'
type='Circular'
height='60'
:segmentCount='segmentCount'
:value='value'
:animation='animation'

</ejs-progressbar>
</div>
</div>
</div>
</template>
<script>
import Vue from "vue";
import { Browser } from "@syncfusion/ej2-base";
import { ProgressBarPlugin } from "@syncfusion/ej2-vue-progressbar";
Vue.use(ProgressBarPlugin);
export default Vue.extend({
data: function() {
return {
segmentCount:8,
value:100,
animation: {
enable: true,
duration: 2000,
delay: 0
},
};
},
```

Copyright © 2001 -2024 Syncfusion Inc.

provide: {},

methods: {}

});

</script>

<style>

loader {
color: #008cff;

height: 40px;

left: 45%;

position: absolute;

top: 45%;

width: 30%;

}

container {
display: -webkit-box;

}

</style>

s

`

Thickness

Customize the thickness of the track using trackThickness, progress using progressThickness and secondary progress using secondaryProgressThickness to render the progress bar with different appearances.

App.vue

`

<template>

LOADING....

<ejs-progressbar

id='percentage'

type='Linear'

height='60'

Copyright © 2001 -2024 Syncfusion Inc.

```
width='90%'
:trackThickness='trackThickness'
:secondaryProgressThickness='secondaryProgressThickness'
:progressThickness='progressThickness'
:value='value'
:animation='animation'

</ejs-progressbar>
</div>
</div>
</div>
</template>
<script>
import Vue from "vue";
import { Browser } from "@syncfusion/ej2-base";
import { ProgressBarPlugin } from "@syncfusion/ej2-vue-progressbar";
Vue.use(ProgressBarPlugin);
export default Vue.extend({
data: function() {
return {
animation: {
enable: true,
duration: 2000,
delay: 0
},
trackThickness:24,
secondaryProgressThickness: 20,
progressThickness:24,
value:100
};
},
provide: {},
methods: {}
```

```
});
</script>
<style>
loader {
color: #008cff;
height: 40px;
left: 45%;
position: absolute;
top: 45%;
width: 30%;
}
container {
display: -webkit-box;
}
</style>
`
```

Radius

The radius of the progress bar can be customized using `radius` property and corner can be customized by **cornerRadius** property.

`App.vue`

```
`
<template>
<div id='loader'>LOADING....</div>
<div id='container'>
<div class="row linear-parent">
<div id="percentage" class="linear-progress">
<ejs-progressbar
id='percentage'
type='Circular'
height='160px'
width='160px'
trackColor='#FFD939'
radius='100%'
progressColor='white'
```

Copyright © 2001 -2024 Syncfusion Inc.

```
cornerRadius='Round'
:trackThickness='trackThickness'
:progressThickness='progressThickness'
:value='value'
:animation='animation'>
</ejs-progressbar>
</div>
</div>
</div>
</template>
<script>
import Vue from "vue";
import { Browser } from "@syncfusion/ej2-base";
import { ProgressBarPlugin } from "@syncfusion/ej2-vue-progressbar";
Vue.use(ProgressBarPlugin);
export default Vue.extend({
data: function() {
return {
animation: {
enable: true,
duration: 2000,
delay: 0
},
trackThickness:80,
progressThickness:10,
value:60
};
},
provide: {},
methods: {}
});
</script>
<style>
```

```
loader {
color: #008cff;
height: 40px;
left: 45%;
position: absolute;
top: 45%;
width: 30%;
}
container {
display: -webkit-box;
}
</style>
`
```

InnerRadius

The inner radius of the progress bar can be customized using innerRadius property.

App.vue

```
`
<template>
<div id='loader'>LOADING....</div>
<div id='container'>
<div class="row linear-parent">
<div id="percentage" class="linear-progress">
<ejs-progressbar
id='percentage'
type='Circular'
height='160px'
width='160px'
trackColor='#FFD939'
radius='100%'
innerRadius='80%'
progressColor='white'
cornerRadius='Round'
:trackThickness='trackThickness'
:progressThickness='progressThickness'
```

Copyright © 2001 -2024 Syncfusion Inc.

```
:value='value'
:animation='animation'>
</ejs-progressbar>
</div>
</div>
</div>
</template>
<script>
import Vue from "vue";
import { Browser } from "@syncfusion/ej2-base";
import { ProgressBarPlugin } from "@syncfusion/ej2-vue-progressbar";
Vue.use(ProgressBarPlugin);
export default Vue.extend({
data: function() {
return {
animation: {
enable: true,
duration: 2000,
delay: 0
},
trackThickness:80,
progressThickness:10,
value:60
};
},
provide: {},
methods: {}
});
</script>
<style>
```

loader {

```
color: #008cff;
height: 40px;
```

Copyright © 2001 -2024 Syncfusion Inc.

```
left: 45%;
position: absolute;
top: 45%;
width: 30%;
}
container {
display: -webkit-box;
}
</style>
`
```

Progress color and track color

Customize the color of progress, secondary progress, and track by using the progressColor, secondaryProgressColor, and trackColor properties.

App.vue

```
`
<template>
<div id='loader'>LOADING....</div>
<div id='container'>
<div class="row linear-parent">
<div id="percentage" class="linear-progress">
<ejs-progressbar
id='percentage'
type='Linear'
height='60'
width='90%'
:trackThickness='trackThickness'
:progressThickness='progressThickness'
:secondaryProgress = '90'
:secondaryProgressColor='secondaryProgressColor'
:value='value'
progressColor='#E3165B'
trackColor='#F8C7D8'
:animation='animation'
```

Copyright © 2001 -2024 Syncfusion Inc.

```
</ejs-progressbar>
</div>
</div>
</div>
</template>
<script>
import Vue from "vue";
import { Browser } from "@syncfusion/ej2-base";
import { ProgressBarPlugin } from "@syncfusion/ej2-vue-progressbar";
Vue.use(ProgressBarPlugin);
export default Vue.extend({
data: function() {
return {
animation: {
enable: true,
duration: 2000,
delay: 0
},
trackThickness:24,
progressThickness:24,
secondaryProgressColor: 'green',
value:70
};
},
provide: {},
methods: {}
});
</script>
<style>
```

loader {

```
color: #008cff;
height: 40px;
left: 45%;
```

Copyright © 2001 -2024 Syncfusion Inc.

position: absolute;

top: 45%;

width: 30%;

}

container {
display: -webkit-box;

}

</style>

`

Annotation in Vue Progressbar component

Annotation

In the circular progress bar, you can add any view to the center using the **Content** property in annotation.

For example, you can include add, start, or pause button to control the progress. You can also add an image that indicates the actual task in progress or add custom text that conveys how far the task is completed.

App.vue

`

<template>

LOADING....

<ejs-progressbar

id='percentage'

type='Circular'

:trackThickness='trackThickness'

:progressThickness='progressThickness'

<e-progressbar-annotations>

<e-progressbar-annotation

:content="content"

</e-progressbar-annotation>

</e-progressbar-annotations>

Copyright © 2001 -2024 Syncfusion Inc.

```
</ejs-progressbar>
</div>
</div>
</div>
</template>
<script>
import Vue from "vue";
import { Browser } from "@syncfusion/ej2-base";
import { ProgressBarPlugin, ProgressAnnotation } from "@syncfusion/ej2-vue-progressbar";
Vue.use(ProgressBarPlugin);
export default Vue.extend({
data: function() {
return {
trackThickness:10,
progressThickness:10,
content: '<div id="point1" style="font-size:20px;font-
weight:bold;color:#ffffff;fill:#ffffff"><span>60%span><div>'
};
},
provide: {
progressbar: [ProgressAnnotation]
},
methods: {}
});
</script>
<style>

container {

```
display: -webkit-box;
}
</style>
`
```

Label

You can show the progress value in both linear and cicular progress bar using **showProgressValue** property.

App.vue

```
`
<template>
<div id='loader'>LOADING....</div>
<div id='container'>
<div class="row linear-parent">
<div id="percentage" class="linear-progress">
<ejs-progressbar
id='percentage'
type='Linear'
:trackThickness='trackThickness'
:progressThickness='progressThickness'
:value='value'
:labelStyle='labelStyle'
:textRender='textRender'
:showProgressValue='showProgressValue'
:animation='animation'

</ejs-progressbar>
</div>
</div>
</div>
</template>
<script>
import Vue from "vue";
import { Browser } from "@syncfusion/ej2-base";
```

```
import { ProgressBarPlugin } from "@syncfusion/ej2-vue-progressbar";
Vue.use(ProgressBarPlugin);
export default Vue.extend({
data: function() {
return {
trackThickness:24,
progressThickness:24,
value:50,
animation: {
enable: true,
duration: 2000,
delay: 0
},
labelStyle: {
color: '#FFFFFF'
},
showProgressValue: true
};
},
provide: {},
methods: {
textRender: function(args) {
args.text = '50';
}
}
});
</script>
<style>
```

loader {

```
color: #008cff;
height: 40px;
left: 45%;
position: absolute;
```

Copyright © 2001 -2024 Syncfusion Inc.

top: 45%;

width: 30%;

}

container {
display: -webkit-box;

}

</style>

`

Animation in Vue Progressbar component

<!-- markdownlint-disable MD033 -->

Progress Bar support to animate the progress by using animation property. Enable the animation by setting **enable** property and also you can control the speed by using **duration** property.

App.vue

`

<template>

LOADING....

<ejs-progressbar

id="percentage"

type='Circular'

:value='value'

:animation="animation"

</ejs-progressbar>

</template>

<script>

import Vue from "vue";

import { Browser } from "@syncfusion/ej2-base";

import { ProgressBarPlugin } from "@syncfusion/ej2-vue-progressbar";

Copyright © 2001 -2024 Syncfusion Inc.

```
Vue.use(ProgressBarPlugin);
export default Vue.extend({
data: function() {
return {
value : 100,
animation: {
enable: true,
duration: 2000,
delay: 0
},
};
},
provide: {},
methods: {}
});
</script>
<style>
loader {
color: #008cff;
height: 40px;
left: 45%;
position: absolute;
top: 45%;
width: 30%;
}
container {
display: -webkit-box;
}
</style>
`
```

Range in Vue Progressbar component

<!-- markdownlint-disable MD033 -->

Range represents the entire span of the ProgressBar and can be defined using the `minimum` and `maximum` properties.

App.vue

```
<template>
<div id='loader'>LOADING....</div>
<div id='container'>
<div class="row linear-parent">
<div id="percentage" class="linear-progress">
<ejs-progressbar
id='percentage'
type='Linear'
:minimum='minimum'
:maximum='maximum'
:trackThickness='trackThickness'
:progressThickness='progressThickness'
:value='value'
:labelStyle='labelStyle'
:showProgressValue='showProgressValue'
:animation='animation'

</ejs-progressbar>
</div>
</div>
</div>
</template>
<script>
import Vue from "vue";
import { Browser } from "@syncfusion/ej2-base";
import { ProgressBarPlugin } from "@syncfusion/ej2-vue-progressbar";
Vue.use(ProgressBarPlugin);
export default Vue.extend({
data: function() {
return {
trackThickness:24,
```

Copyright © 2001 -2024 Syncfusion Inc.

```
progressThickness:24,
minimum:10,
maximum:90,
value:90,
animation: {
enable: true,
duration: 2000,
delay: 0
},
labelStyle: {
color: '#FFFFFF'
},
showProgressValue: true
};
},
provide: {},
methods: {}
});
</script>
<style>
loader {
color: #008cff;
height: 40px;
left: 45%;
position: absolute;
top: 45%;
width: 30%;
}
container {
display: -webkit-box;
}
</style>
`
```

Events in Vue Progressbar component

Value Change

<!-- markdownlint-disable MD033 -->

valueChanged event is triggered when the progress value is changed.

App.vue

`

```
<template>
<div id='loader'>LOADING....</div>
<div id='container'>
<div class="row linear-parent">
<div id="percentage" class="linear-progress">
<ejs-progressbar
refs=event
id='percentage'
type='Linear'
:trackThickness='trackThickness'
:progressThickness='progressThickness'
:value='value'
:labelStyle='labelStyle'
:valueChanged='valueChanged'
:showProgressValue='showProgressValue'
:animation='animation'

</ejs-progressbar>
</div>
<button id="reLoad" @click="onClick()">ValueChanged</button>
</div>
</div>
</template>
<script>
import Vue from "vue";
import { Browser } from "@syncfusion/ej2-base";
import { ProgressBarPlugin } from "@syncfusion/ej2-vue-progressbar";
```

Copyright © 2001 -2024 Syncfusion Inc.

```
Vue.use(ProgressBarPlugin);
export default Vue.extend({
data: function() {
return {
trackThickness:24,
progressThickness:24,
value:90,
animation: {
enable: true,
duration: 2000,
delay: 0
},
labelStyle: {
color: '#FFFFFF'
},
showProgressValue: true
};
},
provide: {},
methods: {
valueChanged: function(args) {
args.progressColor = '#2BB20E';
},
onClick: ()=> {
this.refs.event.value = 50;
}
}
});
</script>
<style>
```

loader {

```
color: #008cff;
height: 40px;
```

Copyright © 2001 -2024 Syncfusion Inc.

```
left: 45%;
position: absolute;
top: 45%;
width: 30%;
}
```

container {

```
display: -webkit-box;
}
</style>
`
```

ProgressCompleted

ProgressCompleted event is triggers when the ProgressBar attains the maximum value.

App.vue

```
`
<template>
<div id='loader'>LOADING....</div>
<div id='container'>
<div class="row linear-parent">
<div id="percentage" class="linear-progress">
<ejs-progressbar
id='percentage'
type='Linear'
:trackThickness='trackThickness'
:progressThickness='progressThickness'
:value='value'
:labelStyle='labelStyle'
:ProgressCompleted='ProgressCompleted'
:showProgressValue='showProgressValue'
:animation='animation'

</ejs-progressbar>
</div>
</div>
</div>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
</template>
<script>
import Vue from "vue";
import { Browser } from "@syncfusion/ej2-base";
import { ProgressBarPlugin } from "@syncfusion/ej2-vue-progressbar";
Vue.use(ProgressBarPlugin);
export default Vue.extend({
data: function() {
return {
trackThickness:24,
progressThickness:24,
value:90,
animation: {
enable: true,
duration: 2000,
delay: 0
},
labelStyle: {
color: '#FFFFFF'
},
showProgressValue: true
};
},
provide: {},
methods: {
ProgressCompleted: function(args) {
args.progressColor = '#2BB20E';
}
}
});
</script>
<style>
```

</style>

`

Accessibility in Vue Progress bar component

The Progress bar component followed the accessibility guidelines and standards, including ADA, Section 508, WCAG 2.2 standards, and WCAG roles that are commonly used to evaluate accessibility.

The accessibility compliance for the Progress bar component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| WCAG 2.2 Support | <img src="https://cdn.syncfusion.com/content/images/documentation/full.png" alt="Yes"> |

| Section 508 Support | <img src="https://cdn.syncfusion.com/content/images/documentation/full.png" alt="Yes"> |

| Screen Reader Support | <img src="https://cdn.syncfusion.com/content/images/documentation/full.png" alt="Yes"> |

| Right-To-Left Support | <img src="https://cdn.syncfusion.com/content/images/documentation/full.png" alt="Yes"> |

| Color Contrast | <img src="https://cdn.syncfusion.com/content/images/documentation/full.png" alt="Yes"> |

| Mobile Device Support | <img src="https://cdn.syncfusion.com/content/images/documentation/full.png" alt="Yes"> |

| Keyboard Navigation Support | <img src="https://cdn.syncfusion.com/content/images/documentation/full.png" alt="Yes"> |

| Accessibility Checker Validation | <img src="https://cdn.syncfusion.com/content/images/documentation/full.png" alt="Yes"> |

| Axe-core Accessibility Validation | <img src="https://cdn.syncfusion.com/content/images/documentation/full.png" alt="Yes"> |

Copyright © 2001 -2024 Syncfusion Inc.

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<img src="https://cdn.syncfusion.com/content/images/documentation/full.png" alt="Yes"> - All features of the component meet the requirement.

<img src="https://cdn.syncfusion.com/content/images/documentation/partial.png" alt="Intermediate"> - Some features of the component do not meet the requirement.

<img src="https://cdn.syncfusion.com/content/images/documentation/not-supported.png" alt="No"> - The component does not meet the requirement.

WAI-ARIA attributes

The Progress bar component followed the WAI-ARIA patterns to meet the accessibility. The following ARIA attributes are used in the Progress bar component:

- progressbar (role)
- aria-valuemin (attribute)
- aria-valuemax (attribute)
- aria-valuenow (attribute)
- aria-label (attribute)

Keyboard interaction

The Progress bar component followed the keyboard interaction guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Progress bar component.

| **Press** | **To do this** |

| --- | --- |

| Tab | Moves the focus to the Progress bar element. |

| Ctrl + P | Prints the Progress bar. |

Ensuring accessibility

The Progress bar component's accessibility levels are ensured through an accessibility-checker and axe-core software tools during automated testing.

The accessibility compliance of the Progress bar component is shown in the following sample. Open the sample in a new window to evaluate the accessibility of the Progress bar component with accessibility tools.

{% previewsample "https://ej2.syncfusion.com/accessibility/progress-bar.html" %}

ProgressButton

Getting Started with the Vue Progress button Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using Vue-CLI and integrating the Syncfusion Vue Progress button component using the Composition API / Options API.

Prerequisites

System requirements for Syncfusion Vue UI components

Dependencies

The list of dependencies required to use the ProgressButton component in your application is given as follows:

`js

|-- @syncfusion/ej2-vue-splitbuttons

|-- @syncfusion/ej2-vue-base

|-- @syncfusion/ej2-base

|-- @syncfusion/ej2-splitbuttons

|-- @syncfusion/ej2-popups

|-- @syncfusion/ej2-buttons

`

Setting up the Vue 2 project

To generate a Vue 2 project using Vue-CLI, use the vue create command. Follow these steps to install Vue CLI and create a new project:

`bash

npm install -g @vue/cli

vue create quickstart

cd quickstart

npm run serve

`

or

`bash

yarn global add @vue/cli

vue create quickstart

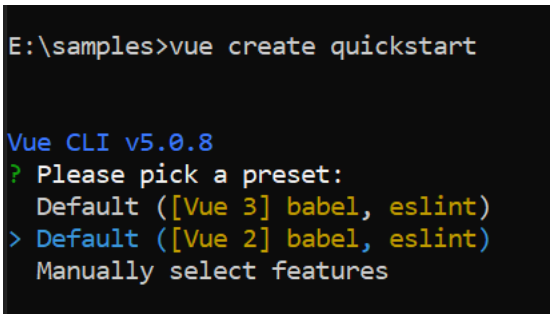
cd quickstart

yarn run serve

Copyright © 2001 -2024 Syncfusion Inc.

`

When creating a new project, choose the option Default ([Vue 2] babel, eslint) from the menu.



Once the quickstart project is set up with default settings, proceed to add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion packages are available at npmjs.com. To use Vue components, install the required npm package.

This article uses the Vue Progress button component as an example. Install the @syncfusion/ej2-vue-splitbuttons package by running the following command:

`bash

npm install @syncfusion/ej2-vue-splitbuttons --save

`

or

`bash

yarn add @syncfusion/ej2-vue-splitbuttons

`

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, the Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the Progress button component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
</style>
```

Copyright © 2001 -2024 Syncfusion Inc.

Add Syncfusion Vue component

Follow the below steps to add the Vue Progress button component using Composition API or Options API:

1\. First, import and register the Progress button component in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { ProgressButtonComponent as EjsProgressbutton } from
"@syncfusion/ej2-vue-splitbuttons";
</script>
```

COMPOSITION API (~/SRC/APP.VUE)

```
<script>
import { ProgressButtonComponent } from "@syncfusion/ej2-vue-splitbuttons";
export default {
components: {
'ejs-progressbutton': ProgressButtonComponent
}
}
</script>
```

2\. In the template section, define the Progress button component with the content property.

~/SRC/APP.VUE

```
<template>
<ejs-progressbutton content="Spin Left"></ejs-progressbutton>
</template>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
 <ejs-progressbutton content="Spin Left"></ejs-progressbutton>
</template>
<script setup>
import { ProgressButtonComponent as EjsProgressbutton } from
"@syncfusion/ej2-vue-splitbuttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
</script>
<style>
  @import '../node_modules/@syncfusion/ej2-base/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-
splitbuttons/styles/material.css';
</style>
```

Copyright © 2001 -2024 Syncfusion Inc.

OPTIONS API (~/SRC/APP.VUE)

```
<template>
 <ejs-progressbutton content="Spin Left"></ejs-progressbutton>
</template>
<script>
import { ProgressButtonComponent } from "@syncfusion/ej2-vue-splitbuttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
export default {
  components: {
    'ejs-progressbutton': ProgressButtonComponent
  }
}
</script>
<style>
  @import '../node_modules/@syncfusion/ej2-base/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-
splitbuttons/styles/material.css';
</style>
```

Run the project

To run the project, use the following command:

`bash

npm run serve

`

or

`bash

yarn run serve

`

{% previewsample "page.domainurl/code-snippet/progress-button/default-cs2" %}

ProgressButton supports different styles, types and sizes like Button. In addition, it also supports top and bottom icon positions.

Enable progress in button

You can enable the background filler UI by setting the enableProgress property to true.

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
 <ejs-progressbutton content="Spin Left"  :enableProgress="true"></ejs-
progressbutton>
</template>
<script setup>
import { ProgressButtonComponent as EjsProgressbutton } from
"@syncfusion/ej2-vue-splitbuttons";
import { enableRipple } from '@syncfusion/ej2-base';
```

Copyright © 2001 -2024 Syncfusion Inc.

```
enableRipple(true);
</script>
<style>
  @import '../node_modules/@syncfusion/ej2-base/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-
splitbuttons/styles/material.css';
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
 <ejs-progressbutton content="Spin Left"  :enableProgress="true"></ejs-
progressbutton>
</template>
<script>
import { ProgressButtonComponent } from "@syncfusion/ej2-vue-splitbuttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
export default {
  components: {
    'ejs-progressbutton': ProgressButtonComponent
  }
}
</script>
<style>
  @import '../node_modules/@syncfusion/ej2-base/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-
splitbuttons/styles/material.css';
</style>
```

{% previewsample "page.domainurl/code-snippet/progress-button/default-cs3" %}

Getting Started with the Vue ProgressButton Component in Vue 3

This article provides a step-by-step guide for setting up a Vite project with a JavaScript environment and integrating the Syncfusion Vue ProgressButton component using the Composition API / Options API.

The Composition API is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

The Options API is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

Prerequisites

System requirements for Syncfusion Vue UI components

Copyright © 2001 -2024 Syncfusion Inc.

Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using Vite. To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

`bash

npm create vite@latest

`

or

`bash

yarn create vite

`

Using one of the above commands will lead you to set up additional configurations for the project as below:

1.Define the project name: We can specify the name of the project directly. Let's specify the name of the project as `my-project` for this article.

`bash

? Project name: » my-project

`

2.Select `Vue` as the framework. It will create a Vue 3 project.

`bash

? Select a framework: » - Use arrow-keys. Return to submit.

Vanilla

Vue

React

Preact

Lit

Svelte

Others

`

3.Choose `JavaScript` as the framework variant to build this Vite project using JavaScript and Vue.

`bash

? Select a variant: » - Use arrow-keys. Return to submit.

JavaScript

TypeScript

Customize with create-vue ↗

Copyright © 2001 -2024 Syncfusion Inc.

Nuxt ↗

`

4.Upon completing the aforementioned steps to create the my-project, run the following command to install its dependencies:

`bash

cd my-project

npm install

`

or

`bash

cd my-project

yarn install

`

Now that my-project is ready to run with default settings, let's add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion Vue component packages are available at npmjs.com. To use Syncfusion Vue components in the project, install the corresponding npm package.

This article uses the Vue ProgressButton component as an example. To use the Vue ProgressButton component in the project, the @syncfusion/ej2-vue-splitbuttons package needs to be installed using the following command:

`bash

npm install @syncfusion/ej2-vue-splitbuttons --save

`

or

`bash

yarn add @syncfusion/ej2-vue-splitbuttons

`

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the ProgressButton component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

Copyright © 2001 -2024 Syncfusion Inc.

```
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
</style>
```

The order of importing CSS styles should be in line with its dependency graph.

Add Syncfusion Vue component

Follow the below steps to add the Vue ProgressButton component using Composition API or Options API:

1.First, import and register the ProgressButton component and its child directives in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { ProgressButtonComponent as EjsProgressbutton } from
"@syncfusion/ej2-vue-splitbuttons";
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { ProgressButtonComponent } from "@syncfusion/ej2-vue-splitbuttons";
//Component registration
export default {
name: "App",
components: {
"ejs-progressbutton": ProgressButtonComponent
}
}
</script>
```

2.In the template section, define the ProgressButton component with the content property.

~/SRC/APP.VUE

```
<template>
<ejs-progressbutton content="content"></ejs-progressbutton>
</template>
```

3.Declare the values for the content property in the script section.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
const content = "Spin Left";
</script>
```

Copyright © 2001 -2024 Syncfusion Inc.

OPTIONS API (~/SRC/APP.VUE)

```
<script>
data() {
return {
content = "Spin Left";
};
}
</script>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<ejs-progressbutton content="content"></ejs-progressbutton>
</template>
<script setup>
import { ProgressButtonComponent as EjsProgressbutton } from
"@syncfusion/ej2-vue-splitbuttons";
const content = "Spin Left";
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<ejs-progressbutton content="Spin Left"></ejs-progressbutton>
</template>
<script>
import { ProgressButtonComponent } from "@syncfusion/ej2-vue-splitbuttons";
export default {
name: "App",
components: {
"ejs-progressbutton": ProgressButtonComponent
},
// Bound properties declarations
data() {
return {
content = "Spin Left";
};
}
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
</style>
```

Copyright © 2001 -2024 Syncfusion Inc.

Run the project

To run the project, use the following command:

`bash

npm run dev

`

or

`bash

yarn run dev

`

The output will appear as follows:

Sample: vue-3-progressbutton-getting-started.

For migrating from Vue 2 to Vue 3, refer to the migration documentation.

Spinner and progress in Vue Progress button component

Change spinner position

Spinner position can be changed by modifying the position property ofspinSettingsModel. By default, the spinner is positioned at the left of the ProgressButton. You can position it at the left, right, top, bottom, or center of the text content.

Change spinner size

Spinner size can be changed by modifying the width property of spinSettingsModel. In this demo, the width is set to 20 to change the spinner size.

Spinner template

You can use custom spinner by specifying the template property of spinSettingsModel with custom styles.

The following sample demonstrates the above functionalities of the spinner.

APP.VUE

```
<template>
 <ejs-progressbutton content="Submit"  :spinSettings="spinSettings" ></ejs-
progressbutton>
</template>
<script>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
import Vue from 'vue';
import { ProgressButtonPlugin } from "@syncfusion/ej2-vue-splitbuttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(ProgressButtonPlugin);
export default {
    data () {
        return {
            spinSettings: { position: 'Right', width: 20, template: '<div
class="template"></div>' }
        };
    }
}
</script>
<style>
  @import '../node_modules/@syncfusion/ej2-base/styles/material.css';
  @import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-
splitbuttons/styles/material.css";
  @keyframes custom-rolling {
    0% {
      -webkit-transform: rotate(0deg);
      transform: rotate(0deg);
    }
    100% {
      -webkit-transform: rotate(360deg);
      transform: rotate(360deg);
    }
  }
  .template {
    border: 2px solid green;
    border-style: dotted;
    border-radius: 50%;
    border-top-color: transparent;
    border-bottom-color: transparent;
    height: 16px;
    width: 16px;
  }
  .template {
    -webkit-animation: custom-rolling 1.3s linear infinite;
    animation: custom-rolling 1.3s linear infinite;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/progress-button/default-cs6" %}

Progress

Content animation

The content of the ProgressButton can be animated during progress using the effect property of animationSettingsModel. You can also set custom duration and timing function using the duration and easing properties. The possible `effect` values are `None`, `SlideLeft`, `SlideRight`, `SlideUp`, `SlideDown`, `ZoomIn`, and `ZoomOut`.

APP.VUE

Copyright © 2001 -2024 Syncfusion Inc.

```
<template>
 <ejs-progressbutton content="Slide Left" :enableProgress="true"
:animationSettings="animationSettings" :spinSettings="spinSettings"></ejs-
progressbutton>
</template>
<script>
import Vue from 'vue';
import { ProgressButtonPlugin } from "@syncfusion/ej2-vue-splitbuttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(ProgressButtonPlugin);
export default {
    data () {
        return {
            animationSettings: { effect:'SlideLeft', duration: 500, easing:
'linear' },
            spinSettings: { position: 'Center' }
        };
    }
}
</script>
<style>
  @import '../node_modules/@syncfusion/ej2-base/styles/material.css';
  @import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-
splitbuttons/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/progress-button/default-cs7" %}

Change step of the ProgressButton

The progress can be visualized at the specified interval by changing the step property in the begin event of the ProgressButton. In this demo, the step property is set to 20 to show progress at every 20% increment.

APP.VUE

```
<template>
 <ejs-progressbutton content='Progress Step' :enableProgress="true"
cssClass="e-hide-spinner" :begin="begin"></ejs-progressbutton>
</template>
<script>
import Vue from 'vue';
import { ProgressButtonPlugin} from "@syncfusion/ej2-vue-splitbuttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(ProgressButtonPlugin);
export default {
    methods: {
    begin: function(args) {
        args.step = 20;
    }
  }
}
</script>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
<style>
  @import '../node_modules/@syncfusion/ej2-base/styles/material.css';
  @import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-
splitbuttons/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/progress-button/default-cs8" %}

The class e-hide-spinner hides the spinner in the ProgressButton, For more information, see hide spinner section.

Change progress dynamically

The progress can be changed dynamically by modifying the percent property in the ProgressButton events. In this demo, on 40% completion of progress, the percent property is set to 90 to show dynamic change of the progress.

APP.VUE

```
<template>
<ejs-progressbutton :content="content" ref="progressbutton"
:enableProgress="true" duration=15000 :begin="begin" :end="end"
:progress="progress" cssClass="cssClass"></ejs-progressbutton>
</template>
<script>
import Vue from 'vue';
import { ProgressButtonPlugin } from "@syncfusion/ej2-vue-splitbuttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(ProgressButtonPlugin);
 export default {
    methods: {
    begin: function(args) {
        this.$refs.progressbutton.content = 'Progress ' + args.percent +
'%';
    },
    progress: function(args) {
       this.$refs.progressbutton.content = 'Progress ' + args.percent + '%';
       if(args.percent === 40) {
            args.percent = 90
        }
    },
    end: function(args) {
        this.$refs.progressbutton.content = 'Progress ' + args.percent +
'%';
    }
  },
  data () {
        return {
           content: "Progress Step",
           cssClass:   "e-hide-spinner"
    };
  }
}
</script>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
<style>
  @import '../node_modules/@syncfusion/ej2-base/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-
splitbuttons/styles/material.css';
</style>
```

{% previewsample "page.domainurl/code-snippet/progress-button/default-cs9" %}

The method dataBind applies the property changes immediately to the component.

Start and stop methods

You can pause and resume the progress using the stop and start methods, respectively. In this demo, clicking the ProgressButton will pause and resume the progress.

APP.VUE

```
<template>
<ejs-progressbutton  ref="progressBtn" :content="content" :iconCss="iconCss"
:enableProgress="true" :cssClass="cssClass" v-on:click.native="clickHanlder"
:end="end"></ejs-progressbutton>
</template>
<script>
import Vue from 'vue';
import { ProgressButtonPlugin } from "@syncfusion/ej2-vue-splitbuttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(ProgressButtonPlugin);
var vue = export default {
 methods: {
    clickHanlder: function(event) {
        if(vue.content === 'Download') {
            vue.content = 'Pause';
            vue.iconCss = 'e-btn-sb-icon e-pause';
        }
        // clicking on ProgressButton will stop the progress when the text
content is 'Pause'
        else if(vue.content === 'Pause') {
            vue.content = 'Resume';
            vue.iconCss = 'e-btn-sb-icon e-play';
            this.$refs.progressBtn.stop();
        }
        // clicking on ProgressButton will start the progress when the text
content is 'Resume'
        else if(vue.content === 'Resume') {
            vue.content = 'Pause';
            vue.iconCss = 'e-btn-sb-icon e-pause';
            this.$refs.progressBtn.start();
        }
    },
    end: function(args) {
      vue.content = 'Download';
      vue.iconCss = 'e-btn-sb-icon e-download';
    }
  },
```

Copyright © 2001 -2024 Syncfusion Inc.

```
    data () {
        return {
            content: "Download",
            cssClass: "e-hide-spinner",

Accessibility in Vue Progress button component

The Progress button component followed the accessibility guidelines and standards, including ADA, Section 508, WCAG 2.2 standards, and WCAG roles that are commonly used to evaluate accessibility.

The accessibility compliance for the Progress button component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| WCAG 2.2 Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Section 508 Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Screen Reader Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Right-To-Left Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

Copyright © 2001 -2024 Syncfusion Inc.

| Color Contrast | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Mobile Device Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Keyboard Navigation Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Accessibility Checker Validation | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Axe-core Accessibility Validation | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> - All features of the component meet the requirement.

<img src="https://cdn.syncfusion.com/content/images/landing-page/intermediate.png" alt="Intermediate"> - Some features of the component do not meet the requirement.

<img src="https://cdn.syncfusion.com/content/images/landing-page/no.png" alt="No"> - The component does not meet the requirement.

WAI-ARIA attributes

The Progress button component followed the WAI-ARIA patterns to meet the accessibility. The following ARIA attributes are used in the Progress button component:

| Attributes | Purpose |

| --- | --- |

| aria-label | Provides an accessible name for the icon only Progress button. |

| aria-disabled | Indicates that the element is perceivable but disabled, so it is not editable or otherwise operable. |

Keyboard interaction

The Progress button component followed the [keyboard interaction] guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Progress button component.

| **Press** | **To do this** |

| --- | --- |

| Enter / Space | Starts the progress. |

Copyright © 2001 -2024 Syncfusion Inc.

Ensuring accessibility

The Progress button component's accessibility levels are ensured through an accessibility-checker and axe-core software tools during automated testing.

The accessibility compliance of the Progress button component is shown in the following sample. Open the sample in a new window to evaluate the accessibility of the Progress button component with accessibility tools.

{% previewsample "page.domainurl/code-snippet/progress-button/default-cs1" %}

- Accessibility in Syncfusion Vue components

Style and appearance in Vue Progress button component

To modify the ProgressButton appearance, you need to override the default CSS of ProgressButton component. Please find the list of CSS classes and its corresponding section in ProgressButton. Also, you have an option to create your own custom theme for the controls using our Theme Studio.

CSS Class | Purpose of Class

|.e-progress-btn|To customize the progress button

|.e-progress-btn:hover|To customize the progress button on hover

|.e-progress-btn:focus|To customize the progress button on focus

|.e-progress-btn .e-spinner-pane .e-spinner-inner svg .e-path-circle|To customize the progress button spinner

How To

Change the text content and styles of the progressbutton during progress in Vue Progress button component

You can change the text content and styles of the ProgressButton during progress by changing the text content and the cssClass property at the begin and end events.

APP.VUE

```
<template>
 <ejs-progressbutton ref="progressbutton" :content="content"  duration=4000

{% previewsample "page.domainurl/code-snippet/progress-button/custom-progress-cs1" %}

Customize progress using cssclass in Vue Progress button component

You can customize the background filler UI using the cssClass property.

- Adding e-vertical to cssClass shows vertical progress.
- Adding e-progress-top to cssClass shows progress at the top.

You can also show reverse progress by adding custom class to the cssClass property.

APP.VUE

```
<template>
 <div>
 <ejs-progressbutton content='Vertical Progress' :enableProgress="true"
cssClass='e-hide-spinner e-vertical' duration=4000></ejs-progressbutton>
 <ejs-progressbutton content='Progress Top' :enableProgress="true"
cssClass='e-hide-spinner e-progress-top' duration=4000></ejs-progressbutton>
 <ejs-progressbutton content='Reverse Progress' :enableProgress="true"
cssClass='e-hide-spinner e-reverse-progress' duration=4000></ejs-
progressbutton>
 </div>
</template>
<script>
import Vue from 'vue';
import { ProgressButtonPlugin } from "@syncfusion/ej2-vue-splitbuttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(ProgressButtonPlugin);
export default {}
</script>
```

    right: 0;
    left: auto;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/progress-button/custom-progress-cs2" %}

Hide spinner in Vue Progress button component

You can hide spinner in the ProgressButton by setting the e-hide-spinner property to cssClass.

APP.VUE

```
<template>
<ejs-progressbutton content="Progress" :enableProgress="true" cssClass='e-
hide-spinner'></ejs-progressbutton>
</template>
<script>
import Vue from 'vue';
import { ProgressButtonPlugin } from "@syncfusion/ej2-vue-splitbuttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(ProgressButtonPlugin);
export default {}
</script>
<style>
  @import '../node_modules/@syncfusion/ej2-base/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-
splitbuttons/styles/material.css';
</style>
```

Trace events of progress button in Vue Progress button component

The ProgressButton component triggers events based on its actions. The events can be used as extension points to perform custom operations.

The events available in ProgressButton are fail, begin, progress, and end.

APP.VUE

```
<template>
 <div id='container'>
        <div class="control-section">
            <div class="progress-btn-section">
                <ejs-progressbutton content='Progress'
:enableProgress="true" :begin="begin" :end="end" :progress="progress"
:fail="fail"></ejs-progressbutton>
            </div>
            <div class="property-section">
                <table id="propertyTable" title="Event trace">
                    <tbody>
                        <th>Event trace:-</th>
                        <tr>
                            <td></td>
                        </tr>
                    </tbody>
                </table>
            </div>

QueryBuilder

Getting Started with the Vue Query builder Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using Vue-CLI and integrating the Syncfusion Vue Query builder component.

Prerequisites

System requirements for Syncfusion Vue UI components

Dependencies

The list of dependencies required to use the Query Builder component in your application is given below:

`js

|-- @syncfusion/ej2-vue-querybuilder

|-- @syncfusion/ej2-base

|-- @syncfusion/ej2-vue-base

|-- @syncfusion/ej2-querybuilder

Copyright © 2001 -2024 Syncfusion Inc.

|-- @syncfusion/ej2-datamanager

|-- @syncfusion/ej2-dropdowns

|-- @syncfusion/ej2-calenders

|-- @syncfusion/ej2-inputs

`

Setting up the Vue 2 project

To generate a Vue 2 project using Vue-CLI, use the vue create command. Follow these steps to install Vue CLI and create a new project:

`bash

npm install -g @vue/cli

vue create quickstart

cd quickstart

npm run serve

`

or

`bash

yarn global add @vue/cli

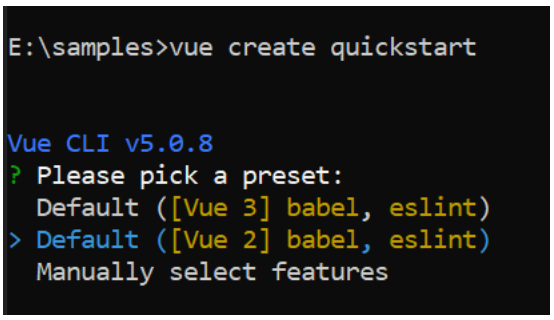
vue create quickstart

cd quickstart

yarn run serve

`

When creating a new project, choose the option Default ([Vue 2] babel, eslint) from the menu.



Once the quickstart project is set up with default settings, proceed to add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion packages are available at npmjs.com. To use Vue components, install the required npm package.

This article uses the Vue Query builder component as an example. Install the @syncfusion/ej2-vue-querybuilder package by running the following command:

`bash

npm install @syncfusion/ej2-vue-querybuilder --save

`

or

`bash

yarn add @syncfusion/ej2-vue-querybuilder

`

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, the Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the Query builder component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-dropdowns/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-lists/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-calendars/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
querybuilder/styles/material.css";
</style>
```

Note: If you want to refer the combined component styles, please make use of our CRG (Custom Resource Generator) in your application.

Add Syncfusion Vue component

Follow the below steps to add the Vue Query builder component:

1\. First, import and register the Query builder component in the script section of the **src/App.vue** file.

~/SRC/APP.VUE

```
<script>
import { QueryBuilderComponent, ColumnDirective, ColumnsDirective } from
"@syncfusion/ej2-vue-querybuilder";
export default {
components: {
'ejs-querybuilder': QueryBuilderComponent,
'e-column': ColumnDirective,
```

Copyright © 2001 -2024 Syncfusion Inc.

```
'e-columns': ColumnsDirective
}
}
</script>
```

2\. In the template section, define the Query builder component with the values property.

~/SRC/APP.VUE

```
<template>
<div class="control-section">
<div class="col-lg-12 querybuilder-control">
<ejs-querybuilder width="70%">
<e-columns>
<e-column field='EmployeeID' label='Employee ID' type='number' />
<e-column field='FirstName' label='First Name' type='string' />
<e-column field='TitleOfCourtesy' label='Title Of Courtesy' type='boolean'
:values="values" />
<e-column field='Title' label='Title' type='string' />
<e-column field='HireDate' label='Hire Date' type='date' format='dd/MM/yyyy'
/>
<e-column field='Country' label='Country' type='string' />
<e-column field='City' label='City' type='string' />
</e-columns>
</ejs-querybuilder>
</div>
</div>
</template>
```

3\. Declare the value for the values property in the script section.

~/SRC/APP.VUE

```
<script>
data: function() {
return {
values: ['Mr.', 'Mrs.']
};
}
</script>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

~/SRC/APP.VUE

```
<template>
    <div class="control-section">
        <div class="col-lg-12 querybuilder-control">
            <ejs-querybuilder width="70%">
                <e-columns>
                    <e-column field='EmployeeID' label='Employee ID'
type='number' />
                    <e-column field='FirstName' label='First Name'
type='string' />
                    <e-column field='TitleOfCourtesy' label='Title Of
Courtesy' type='boolean' :values="values"/>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
                    <e-column field='Title' label='Title' type='string' />
                    <e-column field='HireDate' label='Hire Date' type='date'
format='dd/MM/yyyy' />
                    <e-column field='Country' label='Country' type='string'
/>
                    <e-column field='City' label='City' type='string' />
                </e-columns>
            </ejs-querybuilder>
        </div>
    </div>
</template>
<script>
import { QueryBuilderComponent, ColumnDirective, ColumnsDirective } from
"@syncfusion/ej2-vue-querybuilder";
export default {
    components: {
        'ejs-querybuilder': QueryBuilderComponent,
        'e-column': ColumnDirective,
        'e-columns': ColumnsDirective
    },
    data: function() {
        return {
            values: ['Mr.', 'Mrs.']
        };
    }
}
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
    @import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
    @import "../node_modules/@syncfusion/ej2-
splitbuttons/styles/material.css";
    @import "../node_modules/@syncfusion/ej2-dropdowns/styles/material.css";
    @import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
    @import "../node_modules/@syncfusion/ej2-lists/styles/material.css";
    @import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
    @import "../node_modules/@syncfusion/ej2-calendars/styles/material.css";
    @import "../node_modules/@syncfusion/ej2-vue-
querybuilder/styles/material.css";
    .e-query-builder {
        margin: 0 auto;
    }
</style>
```

Run the project

To run the project, use the following command:

`bash

npm run serve

`

or

`bash

yarn run serve

`

{% previewsample "page.domainurl/code-snippet/query-builder/default-cs10" %}

Rendering with rule

Add the EJ2 Vue Query Builder using <ejs-querybuilder> to the <template> section of the App.vue file in src directory.

~/SRC/APP.VUE

```
<template>
<div class="control-section">
<div class="col-lg-12 querybuilder-control">
<ejs-querybuilder :dataSource="dataSource" :rule="importRules" width="70%">
<e-columns>
<e-column field='EmployeeID' label='Employee ID' type='number' />
<e-column field='FirstName' label='First Name' type='string' />
<e-column field='TitleOfCourtesy' label='Title Of Courtesy' type='boolean'
:values="values" />
<e-column field='Title' label='Title' type='string' />
<e-column field='HireDate' label='Hire Date' type='date' format='dd/MM/yyyy'
/>
<e-column field='Country' label='Country' type='string' />
<e-column field='City' label='City' type='string' />
</e-columns>
</ejs-querybuilder>
</div>
</div>
</template>
<style>
.e-query-builder {
margin: 0 auto;
}
</style>
<script>
import { QueryBuilderComponent, ColumnDirective, ColumnsDirective } from
"@syncfusion/ej2-vue-querybuilder";
export default {
components: {
'ejs-querybuilder': QueryBuilderComponent,
'e-column': ColumnDirective,
'e-columns': ColumnsDirective
},
data: function() {
return {
dataSource: employeeData,
values: ['Mr.', 'Mrs.'],
importRules: {
'condition': 'and',
'rules': [{
'label': 'Employee ID',
'field': 'EmployeeID',
'type': 'number',
'operator': 'equal',
'value': 1
```

Copyright © 2001 -2024 Syncfusion Inc.

```
},
{
'label': 'Title',
'field': 'Title',
'type': 'string',
'operator': 'equal',
'value': 'Sales Manager'
}]
}
};
}
}
var employeeData = [{
'EmployeeID': 1,
'FirstName': 'Nancy',
'Title': 'Sales Representative',
'TitleOfCourtesy': 'Ms.',
'HireDate': '22/07/2001',
'City': 'Seattle',
'Country': 'USA'
},
{
'EmployeeID': 2,
'FirstName': 'Andrew',
'Title': 'Vice President',
'TitleOfCourtesy': 'Dr.',
'HireDate': '21/04/2003',
'City': 'Tacoma',
'Country': 'USA'
},
{
'EmployeeID': 3,
'FirstName': 'Janet',
'Title': 'Sales Representative',
'TitleOfCourtesy': 'Ms.',
'HireDate': '22/07/2001',
'City': 'Kirkland',
'Country': 'USA'
}];
</script>
```

The following example shows a basic Query builder.

~/SRC/APP.VUE

```
<template>
    <div class="control-section">
        <div class="col-lg-12 querybuilder-control">
            <ejs-querybuilder width="70%" :dataSource="dataSource"
:rule="importRules">
                <e-columns>
                    <e-column field='EmployeeID' label='Employee ID'
type='number' />
                    <e-column field='FirstName' label='First Name'
type='string' />
```

Copyright © 2001 -2024 Syncfusion Inc.

```
                    <e-column field='TitleOfCourtesy' label='Title Of
Courtesy' type='boolean' :values="values"/>
                    <e-column field='Title' label='Title' type='string' />
                    <e-column field='HireDate' label='Hire Date' type='date'
format='dd/MM/yyyy' />
                    <e-column field='Country' label='Country' type='string'
/>
                    <e-column field='City' label='City' type='string' />
                </e-columns>
            </ejs-querybuilder>
        </div>
    </div>
</template>
<script>
import { QueryBuilderComponent, ColumnDirective, ColumnsDirective } from
"@syncfusion/ej2-vue-querybuilder";
export default {
    components: {
        'ejs-querybuilder': QueryBuilderComponent,
        'e-column': ColumnDirective,
        'e-columns': ColumnsDirective
    },
    data: function() {
        return {
            dataSource: employeeData,
            values: ['Mr.', 'Mrs.'],
            importRules: {
                'condition': 'and',
                'rules': [{
                    'label': 'Employee ID',
                    'field': 'EmployeeID',

    }
</style>
```

{% previewsample "page.domainurl/code-snippet/query-builder/default-cs11" %}

You can also explore our Vue Query Builder example that shows how to render the Query Builder in Vue.

Columns in Vue Query builder component

The column definitions are used as the dataSource schema in the Query Builder. This plays a vital role in rendering column values. The query builder operations such as create or delete conditions and create or delete group they are performed based on the column definitions. The field property of the columns is necessary to map the data source values in the query builder columns.

If the column field is not specified in the dataSource, the column values will be empty.

Auto generation

The columns are automatically generated when the columns declaration is empty or undefined while initializing the query builder. All the columns in the dataSource are bound as the query builder columns.

APP.VUE

```
<template>
    <div class="control-section">
        <div class="col-lg-12 querybuilder-control">
            <ejs-querybuilder width="70%" :dataSource="dataSource">
```

```
            </ejs-querybuilder>

{% previewsample "page.domainurl/code-snippet/query-builder/default-cs1" %}

When columns are auto-generated, the column type will be determined from the first record of the dataSource.

Labels

By default, the column label is displayed from the column field value. To override the default label, you have to define the label value.

Operators

The operator for a column can be defined in the operators property.

The available operators and its supported data types are:

| Operators | Description | Supported Types |

| ---------- | ---------- | ---------- |

| startswith | Checks whether the value begins with the specified value. | String |

| endswith | Checks whether the value ends with the specified value. | String |

| contains | Checks whether the value contains the specified value. | String |

| equal | Checks whether the value is equal to the specified value. | String Number Date Boolean |

| notequal | Checks whether the value is not equal to the specified value. | String Number Date Boolean |

| greaterthan | Checks whether the value is greater than the specified value. | Date Number |

| greaterthanorequal | Checks whether a value is greater than or equal to the specified value. | Date Number |

| lessthan | Checks whether the value is less than the specified value.| Date Number |

| lessthanorequal | Checks whether the value is less than or equal to the specified value. | Date Number |

| between | Checks whether the value is between the two-specific value. | Date Number |

| notbetween | Checks whether the value is not between the two-specific value. | Date Number |

| in | Checks whether the value is one of the specific values. | String Number |

| notin | Checks whether the value is not in the specific values. | String Number |

Step

The Query Builder allows you to set the step values to the number fields. So that you can easily access the numeric textbox. Use the step property, to set the step value for number values.

Format

The Query Builder formats date and number values. Use the format property to format date and number values.

{% previewsample "page.domainurl/code-snippet/query-builder/default-cs2" %}

Validations

Validation allows you to validate the conditions and it display errors for invalid fields while using the validateFields method. To enable validation in the query builder , set the allowValidation to true. Column fields are validated after setting allowValidation as to true. So, you should manually configure the validation for Operator and, Value fields through validation.

Data binding in Vue Query builder component

The Query Builder uses DataManager, which supports both RESTful JSON data services binding and local JavaScript object array binding. The dataSource property can be assigned either with the instance of DataManager or JavaScript object array collection. It supports two kinds of data binding method:

- Local data
- Remote data

Local data

To bind local data to the query builder, you can assign the dataSource property with a JavaScript object array. The local data source can also be provided as an instance of the DataManager.

APP.VUE

```
<template>
    <div class="control-section">
        <div class="col-lg-12 querybuilder-control">
            <ejs-querybuilder width="70%" :dataSource="dataSource"
:rule="importRules">
                <e-columns>
                    <e-column field='EmployeeID' label='Employee ID'
type='number' />
                    <e-column field='FirstName' label='First Name'
type='string' />
                    <e-column field='TitleOfCourtesy' label='Title Of
Courtesy' type='boolean' :values="values"/>
                    <e-column field='Title' label='Title' type='string' />
                    <e-column field='HireDate' label='Hire Date' type='date'
format='dd/MM/yyyy' />
                    <e-column field='Country' label='Country' type='string'
/>
                    <e-column field='City' label='City' type='string' />
                </e-columns>
            </ejs-querybuilder>
        </div>
    </div>
</template>
<script>
import Vue from "vue";
import { QueryBuilderPlugin } from "@syncfusion/ej2-vue-querybuilder";
Vue.use(QueryBuilderPlugin);
export default {
    data: function() {
        return {
            dataSource: employeeData,
            values: ['Mr.', 'Mrs.'],
            importRules: {
                'condition': 'and',
                'rules': [{

{% previewsample "page.domainurl/code-snippet/query-builder/default-cs4" %}

By default, DataManager uses JsonAdaptor for local data-binding.

Remote data

To bind remote data to the query builder, assign service data as an instance of DataManager to the dataSource property. To interact with remote data source, provide the endpoint url.

APP.VUE

```
<template>
    <div class="control-section">
        <div class="col-lg-12 querybuilder-control">
            <ejs-querybuilder width="70%" :dataSource="data"
:rule="importRules">
                <e-columns>
                    <e-column field='EmployeeID' label='Employee ID'
type='number' />
                    <e-column field='FirstName' label='First Name'
type='string' />
                    <e-column field='TitleOfCourtesy' label='Title Of
Courtesy' type='boolean' :values="values"/>
                    <e-column field='Title' label='Title' type='string' />
                    <e-column field='HireDate' label='Hire Date' type='date'
format='dd/MM/yyyy' />
                    <e-column field='Country' label='Country' type='string'
/>
                    <e-column field='City' label='City' type='string' />
                </e-columns>
            </ejs-querybuilder>
        </div>
    </div>
</template>
<script>
import Vue from "vue";
import { QueryBuilderPlugin } from "@syncfusion/ej2-vue-querybuilder";
import { DataManager, ODataAdaptor } from "@syncfusion/ej2-data";
Vue.use(QueryBuilderPlugin);
export default {
   data(){
        return {
            values: ['Mr.', 'Mrs.'],
            data: new DataManager({
            url:
"https://services.syncfusion.com/js/production/api/Employees/";
            adaptor: new ODataAdaptor(),
          }),
          importRules: {
                'condition': 'and',
                'rules': [{
                    'label': 'Employee ID',
                    'field': 'EmployeeID',
                    'type': 'number',
                    'operator': 'equal',
                    'value': 1
                },
                {
```

```
                    'label': 'Title',
                    'field': 'Title',
                    'type': 'string',
                    'operator': 'equal',
                    'value': 'Sales Manager'
                }]
            }
        };
    };
}
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-vue-
querybuilder/styles/material.css";
    .e-query-builder {
        margin: 0 auto;
    }
</style>
```

{% previewsample "page.domainurl/code-snippet/query-builder/default-cs5" %}

By default, DataManager uses ODataAdaptor for remote data-binding.

Binding with OData services

OData is a standardized protocol for creating and consuming data. You can retrieve data from OData service using the DataManager. Refer to the following code example for remote Data binding using OData service.

APP.VUE

```
<template>
    <div class="control-section">
        <div class="col-lg-12 querybuilder-control">
            <ejs-querybuilder width="70%" :dataSource="data"
:rule="importRules">
                <e-columns>
                    <e-column field='EmployeeID' label='Employee ID'
type='number' />
                    <e-column field='FirstName' label='First Name'
type='string' />
                    <e-column field='TitleOfCourtesy' label='Title Of
Courtesy' type='boolean' :values="values"/>
                    <e-column field='Title' label='Title' type='string' />

Binding with OData v4 services

The ODataV4 is an improved version of OData protocols, and the DataManager can also retrieve and consume OData v4 services. For more details on OData v4 services, refer to the odata documentation. To bind OData v4 service, use the ODataV4Adaptor.

APP.VUE

Web API

You can use WebApiAdaptor to bind query builder with Web API created using OData endpoint.

`

```
<template>
<div class="control-section">
<div class="col-lg-12 querybuilder-control">
<ejs-querybuilder width="70%" :dataSource="data" :rule="importRules">
<e-columns>
<e-column field='EmployeeID' label='Employee ID' type='number' />
<e-column field='FirstName' label='First Name' type='string' />
<e-column field='TitleOfCourtesy' label='Title Of Courtesy' type='boolean' :values="values"/>
<e-column field='Title' label='Title' type='string' />
<e-column field='HireDate' label='Hire Date' type='date' format='dd/MM/yyyy' />
<e-column field='Country' label='Country' type='string' />
<e-column field='City' label='City' type='string' />
</e-columns>
</ejs-querybuilder>
</div>
</div>
</template>
<script>
import Vue from "vue";
import { QueryBuilderPlugin } from "@syncfusion/ej2-vue-querybuilder";
import { DataManager, WebApiAdaptor } from "@syncfusion/ej2-data";
Vue.use(QueryBuilderPlugin);
export default {
data: function() {
return {
values: ['Mr.', 'Mrs.'],
data: new DataManager({
```

Copyright © 2001 -2024 Syncfusion Inc.

```
url: 'api/OrderAPI',
adaptor: new WebApiAdaptor(),
crossDomain: true
}),
importRules: {
'condition': 'and',
'rules': [{
'label': 'Employee ID',
'field': 'EmployeeID',
'type': 'number',
'operator': 'equal',
'value': 1
},
{
'label': 'Title',
'field': 'Title',
'type': 'string',
'operator': 'equal',
'value': 'Sales Manager'
}]
}
};
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-querybuilder/styles/material.css";
.e-query-builder {
margin: 0 auto;
}
</style>
`
```

Copyright © 2001 -2024 Syncfusion Inc.

Data Manager

You can use the created conditions in DataManager through the getPredicate method. This method creates predicates which is used as conditions in DataManager.

Install Syncfusion Buttons packages using below command.

`bash

npm install @syncfusion/ej2-vue-buttons --save

`

APP.VUE

```
<template>
    <div class="control-section">

Complex Data Binding

Complex Data Binding allows you to create subfield for columns. To implement complex data binding, either bind the complex data in nested columns or specify complex data source and separator must be given in querybuilder.

In the following sample, complex data was bound in nested columns.

APP.VUE

```
<template>
<div class="control-section">
<div>
    <table>
        <tr>
            <td> <ejs-button id="reset" class="e-control e-danger e-btn e-
small"  v-on:click.native='onReset'>Reset</ejs-button> </td>
            <td> <ejs-button id="rule" class="e-control e-success e-btn e-
small"  v-on:click.native='onSetsqlRules'>SetSqlRules</ejs-button> </td>
            <td> <ejs-button id="sql" class="e-control e-success e-btn e-
small"  v-on:click.native='onSetrules' >SetRules</ejs-button> </td>
        </tr>
    </table>
</div>
 <ejs-querybuilder id="querybuilder" ref="querybuilder" :rule="importRules"
separator =".". enableNotCondition = true>
                <e-columns>
                    <e-column field="Employee" label="Employee"
:columns='columns1'/>
                    <e-column field="Name" label="Name" :columns="columns2"
/>
                    <e-column field='Country' label='Country'
:columns="columns3"/>
                </e-columns>
</ejs-querybuilder>
</div>
</template>
<script>
```

```
import Vue from "vue";

Filtering in Vue Query builder component

Query Builder allows you to create or delete conditions and groups. You can use showButtons to enable/disable these buttons.

You can create or delete conditions by interacting through the user interface and methods.

- Use the addRules, and deleteRules methods to create/delete conditions.
- Use addGroups, and deleteGroups methods to create/delete groups.

Install Syncfusion Buttons packages using below command.

`bash

npm install @syncfusion/ej2-vue-buttons --save

`

APP.VUE

```

Templates in Vue Query builder component

Templates allows users to define customized header and own user interface for columns.

Header Template

Header Template allows to define your own user interface for Header, which includes creating or deleting rules and groups and to customize the AND/OR condition and NOT condition options. To implement header template, you can create the user interface as vue component and assign the values when requestType is header-template-create in actionBegin event.

In the following sample dropdown, splitbutton and button are used as the custom components in the header.

APP.VUE

```
<template>
    <div class="control-section">
            <ejs-querybuilder id="querybuilder" ref="querybuilder"
:dataSource="dataSource" :rule="importRules"
:headerTemplate="headerTemplate" enableNotCondition = true>
                <e-columns>
                    <e-column field="EmployeeID" label="Employee ID"
type="number"/>
                    <e-column field="FirstName" label="First Name"
type="string"/>
                    <e-column field="Age" label="Age" type="number" />
                    <e-column field='City' label='City' type='string' />
                    <e-column field='Country' label='Country' type='string'
/>
                </e-columns>
            </ejs-querybuilder>
            </div>
  </template>

Column Template

Template allows you to define your own input widgets for columns. To implement template, you can define the following functions

- create: Creates the custom component.
- write: Wire events for the custom component.
- Destroy: Destroy the custom component.

In the following sample, dropdown is used as the custom component in the PaymentMode column.

APP.VUE

```
<template>
    <div class="control-section">
        <div class="col-lg-12 querybuilder-control">
            <ejs-querybuilder ref="querybuilder" :dataSource="dataSource"
:rule="importRules" width="70%">
                <e-columns>
```

```
                    <e-column field='Category' label='Category'
type='string' />

Using Template

Template allows you to define your own input widgets for columns. To implement template, you can create the user interface as vue component.

APP.VUE

```
<template>
    <div class="control-section">
            <ejs-querybuilder  id="querybuilder" ref="querybuilder"
:rule="importRules" width="100%" >
                <e-columns>
                    <e-column field='Category' label='Category'
type='string'/>
                    <e-column field='PaymentMode' label='Payment Mode'
type='string' :operators="customOperators" :template='paymentTemplate' />
                    <e-column field='TransactionType' label='Transaction
Type' type='string' :operators="customOperators"
:template='transactionTemplate' />
                    <e-column field='Description' label='Description'
type='string' />
                    <e-column field='Date' label='Date' type='date' />
                    <e-column field='Amount' label='Amount' type='number' />
                </e-columns>
            </ejs-querybuilder>
    </div>
</template>
<script>
import Vue from "vue";
import { QueryBuilderPlugin } from "@syncfusion/ej2-vue-querybuilder";

{% previewsample "page.domainurl/code-snippet/query-builder/template-cs1" %}

Rule Template

Rule Template allows to define your own user interface for columns. To implement ruleTemplate, you can create the user interface as vue component and assign the values through actionBegin event.

In the following sample, dropdown and slider are used as the custom component and applied greaterthanorequal operator to Age column.

APP.VUE

```
<template>
    <div class="control-section">
        <div id="listbox-selection">
            <ejs-querybuilder id="querybuilder" ref="querybuilder"
:actionBegin="actionBegin" :dataSource="dataSource" :rule="importRules">
                <e-columns>
                    <e-column field="EmployeeID" label="Employee ID"
type="number"/>
                    <e-column field="FirstName" label="First Name"
type="string"/>
                    <e-column field="LastName" label="LastName"
type="string"/>
                    <e-column field="Age" label="Age" type="number"
:ruleTemplate='ageTemplate'/>
                    <e-column field='City' label='City' type='string' />
                    <e-column field='Country' label='Country' type='string'
/>
                </e-columns>
            </ejs-querybuilder>
        </div>
    </div>
</template>
<script>
```

Model binding in Vue Query builder component

Model binding allows to bind properties for the components used in field, operator, and value columns. To implement model binding, assign fieldModel, operatorModel, and valueModel properties in QueryBuilder.

APP.VUE

```
<template>
    <div class="control-section">
            <ejs-querybuilder id="querybuilder" ref="querybuilder"

Import export in Vue Query builder component

Importing allows you to view or edit the predefined conditions which is available in JSON or SQL. You can import the conditions either initial rendering or post rendering.

Initial rendering

To apply conditions initially, you can define the rule Here, you can import structured JSON object by defining the rule property.

APP.VUE

```
<template>
    <div class="control-section">
        <div class="col-lg-12 querybuilder-control">
            <ejs-querybuilder width="70%" :dataSource="dataSource"
:rule="importRules">
                <e-columns>
                  <e-column field="TaskID" label="Task ID"
type="number"></e-column>
                  <e-column field="Name" label="Name" type="string"></e-
column>
                  <e-column field="Category" label="Category"
type="string"></e-column>
                  <e-column field="SerialNo" label="SerialNo"
type="string"></e-column>
                  <e-column field="InvoiceNo" label="InvoiceNo"
type="string"></e-column>
                  <e-column field="Status" label="Status" type="string"></e-
column>
```

```
                </e-columns>
            </ejs-querybuilder>
        </div>
    </div>
</template>
<script>
import Vue from "vue";
import { QueryBuilderPlugin } from "@syncfusion/ej2-vue-querybuilder";
Vue.use(QueryBuilderPlugin);

Exporting

Exporting allows you to save or maintain the created conditions through the Query Builder. You can export the defined conditions by the following ways.

Exporting to JSON

You can export the defined conditions to structured JSON object through the getRules method.

Exporting to SQL

You can export the defined conditions to SQL query through the getSqlFromRules method.

Install Syncfusion Popup packages using below command.

`bash

npm install @syncfusion/ej2-vue-popups --save

`

Global local in Vue Query builder component

The Localization library allows you to localize default text content of the Query Builder. The Query Builder component has static text that can be changed to other cultures (Arabic, Deutsch, French, etc.) by defining the locale value and translation object.

The following list of properties and its values are used in the Query Builder.

| Locale key words | Text |

| ---------- | ---------- |

| AddGroup | Add Group |

| AddCondition | Add Condition |

| DeleteRule | Remove this condition |

| DeleteGroup | Delete group |

| Edit | EDIT |

| SelectField | Select a field |

| SelectOperator | Select operator |

| StartsWith | Starts With|

| EndsWith | Ends With |

| Contains | Contains |

| Equal | Equal |

| NotEqual | Not Equal |

| LessThan | Less Than |

| LessThanOrEqual | Less Than Or Equal |

| GreaterThan | Greater Than |

| GreaterThanOrEqual | Greater Than Or Equal |

| Between | Between |

| NotBetween | Not Between|

| In | In |

| NotIn | Not In |

| Remove | REMOVE |

| ValidationMessage | This field is required |

Copyright © 2001 -2024 Syncfusion Inc.

| SummaryViewTitle | Summary View |

| OtherFields | Other Fields |

| AND | AND |

| OR | OR |

| SelectValue | Enter Value |

| IsEmpty | Is Empty |

| IsNotEmpty | Is Not Empty |

| IsNull | Is Null |

| IsNotNull | Is Not Null |

| True | True |

| False | False |

Style and appearance in Vue Query builder component

To modify the QueryBuilder appearance, you need to override the default CSS of QueryBuilder component. Please find the list of CSS classes and its corresponding section in QueryBuilder component. Also, you have an option to create your own custom theme for the controls using our Theme Studio.

CSS Class | Purpose of Class

|.e-group-header .e-btn|To customize the condition button in querybuilder

|.e-group-body .e-rule-container|To customize the querybuilder rule container

|.e-group-container .e-group-header .e-dropdown-btn|To customize the querybuilder Add group/condition button

|.e-query-builder .e-group-header .e-deletegroup|To customize the querybuilder Delete group button

|.e-query-builder .e-rule-field .e-rule-value-delete .e-rule-delete|To customize the querybuilder Delete condition button

|.e-query-builder .e-rule-list > ::after,.e-query-builder .e-rule-list > ::before|To customize the querybuilder group joining line

|.e-query-builder .e-rule-container.e-joined-rule|To customize the querybuilder condition joining line

Accessibility in Vue Query Builder component

The Query Builder component followed the accessibility guidelines and standards, including ADA, Section 508, WCAG 2.2 standards, and WCAG roles that are commonly used to evaluate accessibility.

Copyright © 2001 -2024 Syncfusion Inc.

The accessibility compliance for the Query Builder component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| WCAG 2.2 Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Section 508 Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Screen Reader Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Right-To-Left Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Color Contrast | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Mobile Device Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Keyboard Navigation Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Accessibility Checker Validation | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Axe-core Accessibility Validation | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> - All features of the component meet the requirement.

<img src="https://cdn.syncfusion.com/content/images/landing-page/intermediate.png" alt="Intermediate"> - Some features of the component do not meet the requirement.

<img src="https://cdn.syncfusion.com/content/images/landing-page/no.png" alt="No"> - The component does not meet the requirement.

WAI-ARIA attributes

WAI-ARIA (Accessibility Initiative – Accessible Rich Internet Applications) defines a way to increase the accessibility of web pages, dynamic content, and user interface components developed with Ajax, HTML, JavaScript, and related technologies. ARIA provides additional semantics to describe the role, state, and functionality of web components.

Copyright © 2001 -2024 Syncfusion Inc.

The following list of ARIA attributes is used in Query Builder.

| Attributes | Purpose |

| --- | --- |

| role | Indicates the query builder component. |

Keyboard interaction

The Query Builder component followed the keyboard interaction guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Query Builder component.

| **Press** | **To do this** |

| --- | --- |

| Tab / Shift + Tab | To focus the next item in the rule. |

Ensuring accessibility

The Query Builder component's accessibility levels are ensured through an accessibility-checker and axe-core software tools during automated testing.

The accessibility compliance of the Query Builder component is shown in the following sample. Open the sample in a new window to evaluate the accessibility of the Query Builder component with accessibility tools.

{% previewsample "page.domainurl/code-snippet/query-builder/default-cs1" %}

How To

Display mode in Vue Query builder component

Display options allow you to view the Query Builder in Vertically or Horizontally. For this, you should use the displayMode property.

{% previewsample "page.domainurl/code-snippet/query-builder/default-cs13" %}

The default view the query builder component is Horizontal.

The default view the query builder component in Vertical.

Sort columns in Vue Query builder component

SortDirection allows you to sort the columns bounded to the Query Builder to view the columns by ascending or descending order. You should set the sortDirection property to sort the fields.

APP.VUE

```
<template>
    <div class="control-section">
        <div class="col-lg-12 querybuilder-control">
            <ejs-querybuilder width="70%" :dataSource="dataSource"
:rule="importRules" sortDirection="Ascending">
                <e-columns>
                  <e-column field="TaskID" label="Task ID"
type="number"></e-column>
                  <e-column field="Name" label="Name" type="string"></e-
column>
                  <e-column field="Category" label="Category"
type="string"></e-column>

{% previewsample "page.domainurl/code-snippet/query-builder/default-cs14" %}

You can use this property in the mobile mode to restrict the nested group creation.

State persistence in Vue Query builder component

State persistence allows you to maintain the current state in the browser's localStorage even if the browser is refreshed or if you move to the next page within the browser. State persistence stores the Query Builder's rule object in the local storage when the enablePersistence is defined to true.

APP.VUE

```
<template>
    <div class="control-section">
        <div class="col-lg-12 querybuilder-control">
            <ejs-querybuilder width="70%" :dataSource="dataSource"

Rtl in Vue Query builder component

RTL provides an option to switch the text direction and layout of the Query Builder component from right to left. It improves the user experiences and accessibility for users who use right-to-left languages (Arabic, Farsi, Urdu, etc.). To enable RTL, set the [enableRtl] (https://ej2.syncfusion.com/vue/documentation/right-to-left/) to true.

APP.VUE

```
<template>
    <div class="control-section">
        <div class="col-lg-12 querybuilder-control">
            <ejs-querybuilder width="70%" :dataSource="dataSource"

        'type': 'number',
        'operator': 'notequal',
        'value': '5'
    },
    {
        'condition': 'or',
        'rules': [{
            'label': 'Title Of Courtesy',
                'field': 'TitleOfCourtesy',
                'type': 'string',
                'operator': 'equal',
                'value': 'Mr.'
        },
        {
            'label': 'Country',
            'field': 'Country',
            'type': 'string',
            'operator': 'equal',
            'value': 'USA'
        },
        {
        'condition': 'and',
            'rules': [{
                'label': 'City',
                'field': 'City',
                'type': 'string',
                'operator': 'equal',
                'value': 'London'
            }]
        }]
    }]
}
    };
}
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-vue-
querybuilder/styles/material.css";
    .e-query-builder {
        margin: 0 auto;
    }
</style>
```

{% previewsample "page.domainurl/code-snippet/query-builder/default-cs18" %}

RadioButton

Getting Started with the Vue Radio button Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using Vue-CLI and integrating the Syncfusion Vue Radio button component using the Composition API / Options API.

Prerequisites

System requirements for Syncfusion Vue UI components

Dependencies

The following list of dependencies are required to use the RadioButton component in your application.

```
|-- @syncfusion/ej2-vue-buttons
|-- @syncfusion/ej2-base
|-- @syncfusion/ej2-buttons
|-- @syncfusion/ej2-vue-base
```

Setting up the Vue 2 project

To generate a Vue 2 project using Vue-CLI, use the vue create command. Follow these steps to install Vue CLI and create a new project:

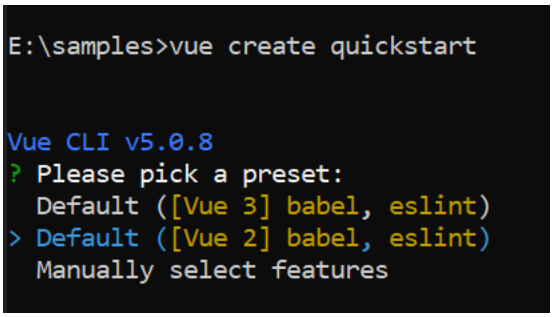
```bash
npm install -g @vue/cli
vue create quickstart
cd quickstart
npm run serve
```

or

```bash
yarn global add @vue/cli
vue create quickstart
cd quickstart
yarn run serve
```

When creating a new project, choose the option `Default ([Vue 2] babel, eslint)` from the menu.

Copyright © 2001 -2024 Syncfusion Inc.



Once the quickstart project is set up with default settings, proceed to add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion packages are available at npmjs.com. To use Vue components, install the required npm package.

This article uses the Vue Radio button component as an example. Install the @syncfusion/ej2-vue-buttons package by running the following command:

`bash

npm install @syncfusion/ej2-vue-buttons --save

`

or

`bash

yarn add @syncfusion/ej2-vue-buttons

`

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, the Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the Radio button component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
</style>
```

Add Syncfusion Vue component

Follow the below steps to add the Vue Radio button component using Composition API or Options API:

1\. First, import and register the Radio button component in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { RadioButtonComponent as EjsRadiobutton } from "@syncfusion/ej2-vue-buttons";
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { RadioButtonComponent } from "@syncfusion/ej2-vue-buttons";
export default {
components: {
'ejs-radiobutton': RadioButtonComponent
}
}
</script>
```

2\. In the template section, define the Radio button component with the label property.

~/SRC/APP.VUE

```
<template>
<ejs-radiobutton label='Default'></ejs-radiobutton>
</template>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<ul>
<li><ejs-radiobutton label='Option 1' name='default'></ejs-radiobutton></li>
<li><ejs-radiobutton label='Option 2' name='default' checked=true></ejs-radiobutton></li>
</ul>
</template>
<script setup>
import { RadioButtonComponent as EjsRadiobutton } from "@syncfusion/ej2-vue-buttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
.e-radio-wrapper {
  margin-top: 18px;
}
li {
  list-style: none;
```

Copyright © 2001 -2024 Syncfusion Inc.

```
}
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<ul>
<li><ejs-radiobutton label='Option 1' name='default'></ejs-radiobutton></li>
<li><ejs-radiobutton label='Option 2' name='default' checked=true></ejs-
radiobutton></li>
</ul>
</template>
<script>
import { RadioButtonComponent } from "@syncfusion/ej2-vue-buttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
export default {
    components: {
        'ejs-radiobutton': RadioButtonComponent
    }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
.e-radio-wrapper {
  margin-top: 18px;
}
li {
  list-style: none;
}
</style>
```

Run the project

To run the project, use the following command:

`bash

npm run serve

`

or

`bash

yarn run serve

`

{% previewsample "page.domainurl/code-snippet/radio-button/default-cs3" %}

Change the RadioButton state

The Essential JS 2 RadioButton contains 2 states visually, they are as follows:

- Checked
- Unchecked

Copyright © 2001 -2024 Syncfusion Inc.

The RadioButton checked property is used to handle the checked and unchecked state. In the checked state an inner circle will be added to the visualization of RadioButton.

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<ul>
<li><ejs-radiobutton label='Option 1' name='default' checked=true></ejs-
radiobutton></li>
<li><ejs-radiobutton label='Option 2' name='default'></ejs-radiobutton></li>
</ul>
</template>
<script setup>
import { RadioButtonComponent as EjsRadiobutton } from "@syncfusion/ej2-vue-
buttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
.e-radio-wrapper {
  margin-top: 18px;
}
li {
  list-style: none;
}
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<ul>
<li><ejs-radiobutton label='Option 1' name='default' checked=true></ejs-
radiobutton></li>
<li><ejs-radiobutton label='Option 2' name='default'></ejs-radiobutton></li>
</ul>
</template>
<script>
import { RadioButtonComponent } from "@syncfusion/ej2-vue-buttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
export default {
  components: {
    'ejs-radiobutton': RadioButtonComponent
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
.e-radio-wrapper {
  margin-top: 18px;
}
li {
  list-style: none;
```

Copyright © 2001 -2024 Syncfusion Inc.

```
}
</style>
```

Getting Started with the Vue RadioButton Component in Vue 3

This article provides a step-by-step guide for setting up a Vite project with a JavaScript environment and integrating the Syncfusion Vue RadioButton component using the Composition API / Options API.

The Composition API is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

The Options API is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

Prerequisites

System requirements for Syncfusion Vue UI components

Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using Vite. To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

`bash

npm create vite@latest

`

or

`bash

yarn create vite

`

Using one of the above commands will lead you to set up additional configurations for the project as below:

1.Define the project name: We can specify the name of the project directly. Let's specify the name of the project as my-project for this article.

`bash

? Project name: » my-project

`

2.Select Vue as the framework. It will create a Vue 3 project.

`bash

? Select a framework: » - Use arrow-keys. Return to submit.

Vanilla

Vue

Copyright © 2001 -2024 Syncfusion Inc.

React

Preact

Lit

Svelte

Others

`

3.Choose JavaScript as the framework variant to build this Vite project using JavaScript and Vue.

`bash

? Select a variant: » - Use arrow-keys. Return to submit.

JavaScript

TypeScript

Customize with create-vue ↗

Nuxt ↗

`

4.Upon completing the aforementioned steps to create the my-project, run the following command to install its dependencies:

`bash

cd my-project

npm install

`

or

`bash

cd my-project

yarn install

`

Now that my-project is ready to run with default settings, let's add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion Vue component packages are available at npmjs.com. To use Syncfusion Vue components in the project, install the corresponding npm package.

This article uses the Vue RadioButton component as an example. To use the Vue RadioButton component in the project, the @syncfusion/ej2-vue-buttons package needs to be installed using the following command:

`bash

npm install @syncfusion/ej2-vue-buttons --save

Copyright © 2001 -2024 Syncfusion Inc.

`

or

`bash

yarn add @syncfusion/ej2-vue-buttons

`

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the RadioButton component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-buttons/styles/material.css";
</style>
```

The order of importing CSS styles should be in line with its dependency graph.

Add Syncfusion Vue component

Follow the below steps to add the Vue RadioButton component using Composition API or Options API:

1.First, import and register the RadioButton component and its child directives in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { RadioButtonComponent as EjsRadiobutton } from "@syncfusion/ej2-vue-buttons";
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { RadioButtonComponent } from "@syncfusion/ej2-vue-buttons";
//Component registration
export default {
name: "App",
components: {
"ejs-radiobutton": RadioButtonComponent
}
}
</script>
```

Copyright © 2001 -2024 Syncfusion Inc.

2.In the template section, define the RadioButton component with the label property and name property and checked definitions.

~/SRC/APP.VUE

```
<template>
<ul>
<li><ejs-radiobutton label='Label1' name='name'></ejs-radiobutton></li>
<li><ejs-radiobutton label='Label2' name='name' checked="isChecked"></ejs-
radiobutton></li>
</ul>
</template>
```

3.Declare the values for the label, name, checked property in the script section.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
const Label1 = "Option 1";
const Label2 = "Option 2";
const name = "default";
bool isChecked = true;
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
data() {
return {
Label1 = "Option 1";
Label2 = "Option 2";
name = "default";
isChecked = true;
};
}
</script>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<ul>
<li><ejs-radiobutton label='Label1' name='name'></ejs-radiobutton></li>
<li><ejs-radiobutton label='Label2' name='name' checked=isChecked></ejs-
radiobutton></li>
</ul>
</template>
<script setup>
import { RadioButtonComponent as EjsRadiobutton } from "@syncfusion/ej2-vue-
buttons";
const Label1 = "Option 1";
const Label2 = "Option 2";
const name = "default";
bool isChecked = true;
</script>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-buttons/styles/material.css";
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<ul>
<li><ejs-radiobutton label='Label1' name='name'></ejs-radiobutton></li>
<li><ejs-radiobutton label='Label2' name='name' checked=isChecked></ejs-
radiobutton></li>
</ul>
</template>
<script>
import { RadioButtonComponent } from "@syncfusion/ej2-vue-buttons";
// Component registration
export default {
name: "App",
// Declaring component and its directives
components: {
"ejs-radiobutton": RadioButtonComponent
},
// Bound properties declarations
data() {
return {
Label1 = "Option 1";
Label2 = "Option 2";
name = "default";
isChecked = true;
};
}
};
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-buttons/styles/material.css";
</style>
```

Run the project

To run the project, use the following command:

`bash

npm run dev

`

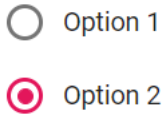
or

`bash

yarn run dev

`

The output will appear as follows:



Sample: vue-3-radio-button-getting-started.

For migrating from Vue 2 to Vue 3, refer to the migration documentation.

- Getting Started with Vue UI Components using Options API and TypeScript

Label and size in Vue Radio button component

This section explains the different sizes and labels.

Label

RadioButton caption can be defined by using the label property. This reduces the manual addition of label for RadioButton. You can customize the label position before or after the RadioButton through the labelPosition property.

APP.VUE

```
<template>
<ul>
<li> <ejs-radiobutton label="Left Side Label" name="position"
labelPosition="Before"></ejs-radiobutton></li>
<li> <ejs-radiobutton label="Right Side Label" name="position"
checked="true"></ejs-radiobutton></li>
</ul>
</template>
<script>
import Vue from 'vue';
import { RadioButtonPlugin } from '@syncfusion/ej2-vue-buttons';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(RadioButtonPlugin);
export default {}
</script>
<style>
  @import '../node_modules/@syncfusion/ej2-base/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
.e-radio-wrapper {
  margin-top: 18px;
}
li {
  list-style: none;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/radio-button/default-cs9" %}

Copyright © 2001 -2024 Syncfusion Inc.

Size

The different RadioButton sizes available are default and small. To reduce the size of default RadioButton to small, set the cssClass property to e-small.

APP.VUE

```
<template>
<ul>
<li> <ejs-radiobutton label="Small" name="size" checked="true" cssClass="e-small"></ejs-radiobutton></li>
<li> <ejs-radiobutton label="Default" name="size"></ejs-radiobutton></li>
</ul>
</template>
<script>
import Vue from 'vue';
import { RadioButtonPlugin } from '@syncfusion/ej2-vue-buttons';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(RadioButtonPlugin);
export default {}
</script>
<style>
  @import '../node_modules/@syncfusion/ej2-base/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
.e-radio-wrapper {
  margin-top: 18px;
}
li {
  list-style: none;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/radio-button/default-cs10" %}

Accessibility in Vue Radio button component

The Radio button component followed the accessibility guidelines and standards, including ADA, Section 508, WCAG 2.2 standards, and WCAG roles that are commonly used to evaluate accessibility.

The accessibility compliance for the Radio button component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| WCAG 2.2 Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Section 508 Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Screen Reader Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

Copyright © 2001 -2024 Syncfusion Inc.

| Right-To-Left Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Color Contrast | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Mobile Device Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Keyboard Navigation Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Accessibility Checker Validation | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Axe-core Accessibility Validation | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> - All features of the component meet the requirement.

<img src="https://cdn.syncfusion.com/content/images/landing-page/intermediate.png" alt="Intermediate"> - Some features of the component do not meet the requirement.

<img src="https://cdn.syncfusion.com/content/images/landing-page/no.png" alt="No"> - The component does not meet the requirement.

WAI-ARIA attributes

The Radio button component followed the WAI-ARIA patterns to meet the accessibility. The following ARIA attributes are used in the Radio button component:

| Attributes | Purpose |

| --- | --- |

| aria-disabled | Indicates that the element is perceivable but disabled, so it is not editable or otherwise operable. |

Keyboard interaction

The Radio button component followed the keyboard interaction guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Radio button component.

| **Press** | **To do this** |

| --- | --- |

| UP/Left arrow | Move and select the previous options. |

| Down/Right arrow | Move and select the next options. |

Ensuring accessibility

The Radio button component component's accessibility levels are ensured through an accessibility-checker and axe-core software tools during automated testing.

The accessibility compliance of the Radio button component is shown in the following sample. Open the [sample](https://ej2.syncfusion.com/accessibility/Radio button.html) in a new window to evaluate the accessibility of the Radio button component with accessibility tools.

{% previewsample "page.domainurl/code-snippet/radio-button/default-cs2" %}

- Accessibility in Syncfusion Vue components

Style and appearance in Vue Radio button component

To modify the RadioButton appearance, you need to override the default CSS of RadioButton component. Please find the list of CSS classes and its corresponding section in RadioButton. Also, you have an option to create your own custom theme for the controls using our Theme Studio.

CSS Class | Purpose of Class

|.e-radio-wrapper|To customize the radio button wrapper

|.e-radio + label:hover::before|To customize the radiobutton on hover

|.e-radio:checked + label::after, e-radio:checked + label::before |To customize the checked radiobutton

|.e-radio:checked:focus + label::before, .e-radio:checked + label:hover::before |To customize the checked radiobutton on hover

How To

Customize radiobutton appearance in Vue Radio button component

You can customize the appearance of the RadioButton component by using the CSS rules. Define own CSS rules according to your requirement and assign the class name to the cssClass property.

The background and border color of the RadioButton is customized through the custom classes to create the primary, success, info, warning, and danger type of RadioButton.

APP.VUE

```
<template>
<ul>
<li> <ejs-radiobutton label="Primary" name="custom" cssClass="e-
primary"></ejs-radiobutton></li>
<li> <ejs-radiobutton label="Success" name="custom" cssClass="e-
success"></ejs-radiobutton></li>
<li> <ejs-radiobutton label="Info" name="custom" cssClass="e-info"
checked="true"></ejs-radiobutton></li>
<li> <ejs-radiobutton label="Warning" name="custom" cssClass="e-
warning"></ejs-radiobutton></li>
<li> <ejs-radiobutton label="Danger" name="custom" cssClass="e-
danger"></ejs-radiobutton></li>
</ul>
</template>
```

.e-danger .e-radio:checked:focus + label::after, .e-danger .e-radio:checked
+ label:hover::after { /* csslint allow: adjoining-classes */
  background-color: #ba330a;
  border-color: #ba330a;
}
.e-danger .e-radio:checked + label::before {
  border-color: #d84315;
}
.e-danger .e-radio:checked:focus + label::before, .e-danger .e-radio:checked
+ label:hover::before {
  border-color: #ba330a;
}
.e-danger .e-radio + label:hover::before {
  border-color: #b1afaf
}
</style>
```

{% previewsample "page.domainurl/code-snippet/radio-button/default-cs5" %}

Name and value in form submit in Vue Radio button component

The name attribute of the RadioButton is used to group RadioButton. When the RadioButton are grouped in form, the checked items value attribute will be post to server on form submit that can be retrieved through the name. The disabled RadioButton value will not be sent to the server on form submit.

In the following code snippet, Credit and Debit card is in checked state. Now, the value that is in checked state will be sent on form submit.

APP.VUE

```
<template>
<form>
```

```
<ul>
<li> <ejs-radiobutton label="Credit/Debit Card" name="payment"
value="credit/debit" checked="true"></ejs-radiobutton></li>
<li> <ejs-radiobutton label="Net Banking" name="payment"
value="netbanking"></ejs-radiobutton></li>
<li> <ejs-radiobutton label="Cash on Delivery" name="payment"
value="cashondelivery"></ejs-radiobutton></li>
<li> <ejs-radiobutton label="Others" name="payment" value="payment"></ejs-
radiobutton></li>
<li> <ejs-button isPrimary="true" >Submit</ejs-button></li>
</ul>
</form>
</template>
<script>
import Vue from 'vue';
import { RadioButtonPlugin, ButtonPlugin } from '@syncfusion/ej2-vue-
buttons';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(RadioButtonPlugin);
Vue.use(ButtonPlugin);
export default {}
</script>
<style>
  @import '../node_modules/@syncfusion/ej2-base/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
.e-radio-wrapper {
  margin-top: 18px;
}
button {
  margin: 20px 0 0 5px;
}
li {
  list-style: none;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/radio-button/default-cs6" %}

Right to left in Vue Radio button component

RadioButton component has RTL support. This can be achieved by setting enableRtl as true.

The following example illustrates how to enable right-to-left support in RadioButton component.

APP.VUE

```
<template>
<ul>
<li><ejs-radiobutton label='Option 1' name='default' enableRtl="true"></ejs-
radiobutton></li>
<li><ejs-radiobutton label='Option 2' name='default' enableRtl="true"
checked=true></ejs-radiobutton></li>
</ul>
</template>
<script>
import Vue from 'vue';
import { RadioButtonPlugin } from "@syncfusion/ej2-vue-buttons";
```

Copyright © 2001 -2024 Syncfusion Inc.

```
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(RadioButtonPlugin);
export default {}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
.e-radio-wrapper {
  margin-top: 18px;
}
li {
  list-style: none;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/radio-button/default-cs7" %}

Set the disabled state in Vue Radio button component

RadioButton component can be enabled/disabled by giving disabled property. To disable RadioButton component, the disabled property can be set as true.

The following example illustrates how to disable a radio button and the selected one is displayed using change event.

APP.VUE

```
<template>
<ul>
<li><div id="text">Selected: Option 1</div></li>
<li> <ejs-radiobutton label="Option 1" name="default" checked="true"
:change="onChange" ></ejs-radiobutton></li>
<li> <ejs-radiobutton label="Option 2" name="default" disabled="true"
:change="onChange"></ejs-radiobutton></li>
<li> <ejs-radiobutton label="Option 3" name="default"
:change="onChange"></ejs-radiobutton></li>
</ul>
</template>
<script>
import Vue from 'vue';
import { RadioButtonPlugin } from '@syncfusion/ej2-vue-buttons';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(RadioButtonPlugin);
export default {
  methods: {
    onChange: function(args) {
      document.getElementById('text').innerText = 'Selected : ' +
args.event.target.ej2_instances[0].label;
    }
  }
};
</script>
<style>
  @import '../node_modules/@syncfusion/ej2-base/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';;
```

Copyright © 2001 -2024 Syncfusion Inc.

```
.e-radio-wrapper {
  margin-top: 18px;
}
li {
  list-style: none;
}
#text {
  font-size: 16px;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/radio-button/default-cs8" %}

Range Navigator

Getting Started with the Vue Range navigator Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using Vue-CLI and integrating the Syncfusion Vue Range navigator component

Prerequisites

System requirements for Syncfusion Vue UI components

Dependencies

Below is the list of minimum dependencies required to use the range navigator component.

`javascript

|-- @syncfusion/ej2-vue-charts

|-- @syncfusion/ej2-base

|-- @syncfusion/ej2-data

|-- @syncfusion/ej2-pdf-export

|-- @syncfusion/ej2-file-utils

|-- @syncfusion/ej2-compression

|-- @syncfusion/ej2-navigations

|-- @syncfusion/ej2-calendars

|-- @syncfusion/ej2-vue-base

|-- @syncfusion/ej2-svg-base

`

Setting up the Vue 2 project

To generate a Vue 2 project using Vue-CLI, use the vue create command. Follow these steps to install Vue CLI and create a new project:

`bash

npm install -g @vue/cli

vue create quickstart

Copyright © 2001 -2024 Syncfusion Inc.

cd quickstart

npm run serve

`

or

`bash

yarn global add @vue/cli

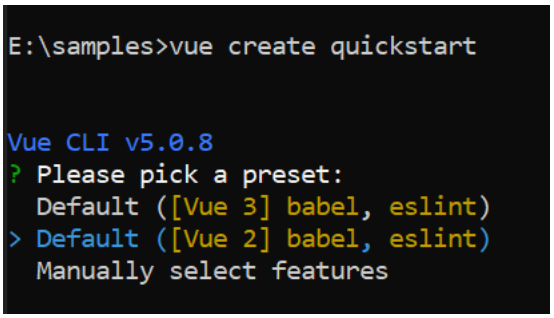
vue create quickstart

cd quickstart

yarn run serve

`

When creating a new project, choose the option Default ([Vue 2] babel, eslint) from the menu.



Once the quickstart project is set up with default settings, proceed to add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion packages are available at npmjs.com. To use Vue components, install the required npm package.

This article uses the Vue Range navigator component as an example. Install the @syncfusion/ej2-vue-charts package by running the following command:

`bash

npm install @syncfusion/ej2-vue-charts --save

`

or

`bash

yarn add @syncfusion/ej2-vue-charts

`

The **--save** will instruct NPM to include the range navigator package inside of the dependencies section of the package.json.

Copyright © 2001 -2024 Syncfusion Inc.

Add Syncfusion Vue component

Follow the below steps to add the Vue Message component:

1\. First, import and register the Message component in the script section of the **src/App.vue** file.

~/SRC/APP.VUE

```
<script>
import { RangeNavigatorComponent } from '@syncfusion/ej2-vue-charts';
export default {
components: {
'ejs-rangenavigator': RangeNavigatorComponent
}
}
</script>
```

2\. In the template section, define Range navigator component.

~/SRC/APP.VUE

```
<template>
<div id="app">
<ejs-rangenavigator></ejs-rangenavigator>
</div>
</template>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

~/SRC/APP.VUE

```
<template>
  <div id="app">
      <ejs-rangenavigator></ejs-rangenavigator>
  </div>
</template>
<script>
import { RangeNavigatorComponent } from '@syncfusion/ej2-vue-charts';
export default {
  components: {
    'ejs-rangenavigator': RangeNavigatorComponent
  },
  data () {
    return {
    }
  }
}
</script>
```

Run the project

To run the project, use the following command:

`bash

npm run serve

`

Copyright © 2001 -2024 Syncfusion Inc.

or

`bash

yarn run serve

`

{% previewsample "page.domainurl/code-snippet/rangenavigator/getting-started-cs9" %}

Module Injection

To create range navigator with additional features, inject the required modules. The following modules are used to extend rangenavigator's basic functionality.

•AreaSeries - Inject this module to use area series.

•DateTime - Inject this module to use date time axis.

•RangeTooltip - Inject this module to show the tooltip.

These modules should be injected to the provide section as follows,

`javascript

import { RangeNavigatorComponent, AreaSeries, DateTime, RangeTooltip } from "@syncfusion/ej2-vue-charts";

export default {

components: {

'ejs-rangenavigator': RangeNavigatorComponent

},

provide: {

rangeNavigator: [AreaSeries, DateTime, RangeTooltip]

}

};

</script>

`

Populate Range Navigator with Data

Now, we are going to provide data to the range navigator. Add a series object to the range navigator by using series property. Now map the field names x and y in the JSON data to the xName and yName properties of the series, then set the JSON data to dataSource property. Since the JSON contains Datetime data, set the valueType range Navigator to Category. By default, the axis valueType is Numeric.

~/SRC/APP.VUE

```
<template>
    <div id="app">
        <ejs-rangenavigator :valueType='valueType' :value='value'
:labelFormat='labelFormat'>
            <e-rangenavigator-series-collection>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
                <e-rangenavigator-series :dataSource='data' type='Area'
xName='x' yName='y' width=2>
                </e-rangenavigator-series>
            </e-rangenavigator-series-collection>
        </ejs-rangenavigator>
    </div>
</template>
<script>
import { RangeNavigatorComponent, RangenavigatorSeriesDirective,
RangenavigatorSeriesCollectionDirective, AreaSeries, DateTime } from
"@syncfusion/ej2-vue-charts";
import { bitCoinData } from "./default_data.js";
export default {
  components: {
    'ejs-rangenavigator': RangeNavigatorComponent,
    'e-rangenavigator-series': RangenavigatorSeriesDirective,
    'e-rangenavigator-series-collection':
RangenavigatorSeriesCollectionDirective
  },
  data() {
    return {
     valueType: 'DateTime',
     value: [new Date('2017-09-01'), new Date('2018-02-01')],
     labelFormat: 'MMM-yy',
     data: bitCoinData
    };
  },
  provide: {
    rangeNavigator: [DateTime, AreaSeries]
  }
};
</script>
```

{% previewsample "page.domainurl/code-snippet/rangenavigator/getting-started-cs10" %}

Enable Tooltip

The tooltip is useful to show the selected data. You can enable tooltip by setting the `enable` property as true in tooltip object and by injecting `RangeTooltip` module using `provide` method.

~/SRC/APP.VUE

```
<template>
    <div id="app">
        <ejs-rangenavigator :valueType='valueType' :value='value'
:labelFormat='labelFormat' :tooltip='tooltip'>
            <e-rangenavigator-series-collection>
                <e-rangenavigator-series :dataSource='data' type='Area'
xName='x' yName='y' width=2>
                </e-rangenavigator-series>
            </e-rangenavigator-series-collection>
        </ejs-rangenavigator>
    </div>
</template>
<script>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
import { RangeNavigatorComponent,
RangenavigatorSeriesDirective,RangenavigatorSeriesCollectionDirective,
AreaSeries, DateTime, RangeTooltip } from "@syncfusion/ej2-vue-charts";
import { bitCoinData } from "./default_data.js";
export default {
  components: {
    'ejs-rangenavigator': RangeNavigatorComponent,
    'e-rangenavigator-series': RangenavigatorSeriesDirective,
    'e-rangenavigator-series-collection':
RangenavigatorSeriesCollectionDirective
  },
  data() {
    return {
     valueType: 'DateTime',
     value: [new Date('2017-09-01'), new Date('2018-02-01')],
     tooltip: { enable: true, displayMode: "Always", format: "MM/dd/yyyy" },
     labelFormat: 'MMM-yy',
     data: bitCoinData
    };
  },
  provide: {
    rangeNavigator: [DateTime, AreaSeries, RangeTooltip]
  }
};
</script>
```

{% previewsample "page.domainurl/code-snippet/rangenavigator/getting-started-cs11" %}

Getting Started with the Vue Range Navigator Component in Vue 3

This article provides a step-by-step guide for setting up a Vite project with a JavaScript environment and integrating the Syncfusion Vue Range Navigator component using the Composition API / Options API.

The Composition API is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

The Options API is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

Prerequisites

System requirements for Syncfusion Vue UI components

Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using Vite. To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

`bash

npm create vite@latest

`

or

`bash

yarn create vite

`

Using one of the above commands will lead you to set up additional configurations for the project as below:

1.Define the project name: We can specify the name of the project directly. Let's specify the name of the project as my-project for this article.

`bash

? Project name: » my-project

`

2.Select Vue as the framework. It will create a Vue 3 project.

`bash

? Select a framework: » - Use arrow-keys. Return to submit.

Vanilla

Vue

React

Preact

Lit

Svelte

Others

`

3.Choose JavaScript as the framework variant to build this Vite project using JavaScript and Vue.

`bash

? Select a variant: » - Use arrow-keys. Return to submit.

JavaScript

TypeScript

Customize with create-vue ↗

Nuxt ↗

`

4.Upon completing the aforementioned steps to create the my-project, run the following command to install its dependencies:

`bash

cd my-project

npm install

`

Copyright © 2001 -2024 Syncfusion Inc.

or

`bash

cd my-project

yarn install

`

Now that my-project is ready to run with default settings, let's add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion Vue component packages are available at npmjs.com. To use Syncfusion Vue components in the project, install the corresponding npm package.

This article uses the Vue Range Navigator component as an example. To use the Vue Range Navigator component in the project, the @syncfusion/ej2-vue-charts package needs to be installed using the following command:

`bash

npm install @syncfusion/ej2-vue-charts --save

`

or

`bash

yarn add @syncfusion/ej2-vue-charts

`

Add Syncfusion Vue component

Follow the below steps to add the Vue Range Navigator component using Composition API or Options API:

1.First, import and register the Range Navigator component and its child directives in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { RangeNavigatorComponent as EjsRangenavigator, StepLineSeries,
DateTime, RangenavigatorSeriesCollectionDirective as
ERangenavigatorSeriesCollection, RangenavigatorSeriesDirective as
ERangenavigatorSeries} from "@syncfusion/ej2-vue-charts";
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { RangeNavigatorComponent, StepLineSeries, DateTime,
RangenavigatorSeriesCollectionDirective,
RangenavigatorSeriesDirective } from "@syncfusion/ej2-vue-charts";
//Component registration
```

Copyright © 2001 -2024 Syncfusion Inc.

```
export default {
name: "App",
components: {
"ejs-rangenavigator": RangeNavigatorComponent,
"e-rangenavigator-series-collection":
RangenavigatorSeriesCollectionDirective,
"e-rangenavigator-series":  RangenavigatorSeriesDirective
}
}
</script>
```

2.In the template section, define the Range Navigator component with the dataSource property.

~/SRC/APP.VUE

```
<template>
<ejs-rangenavigator :valueType='valueType' :value='value'
:labelFormat='labelFormat'>
<e-rangenavigator-series-collection>
<e-rangenavigator-series :dataSource='data' type='StepLine' xName='Date'
yName='Close' width=2>
</e-rangenavigator-series>
</e-rangenavigator-series-collection>
</ejs-rangenavigator>
</template>
```

3.Declare the values for the dataSource property in the script section.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
const data = [
{ Date: new Date("2005-01-01"), Close: 21 },
{ Date: new Date("2006-01-01"), Close: 24 },
{ Date: new Date("2007-01-01"), Close: 36 },
{ Date: new Date("2008-01-01"), Close: 38 },
{ Date: new Date("2009-01-01"), Close: 54 },
{ Date: new Date("2010-01-01"), Close: 57 },
{ Date: new Date("2011-01-01"), Close: 62 }
];
const valueType = 'DateTime';
const value = [new Date("2008-01-01"), new Date("2010-01-01")];
const labelFormat = 'MMM-yy';
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
data() {
return {
data: [
{ Date: new Date("2005-01-01"), Close: 21 },
{ Date: new Date("2006-01-01"), Close: 24 },
{ Date: new Date("2007-01-01"), Close: 36 },
{ Date: new Date("2008-01-01"), Close: 38 },
```

Copyright © 2001 -2024 Syncfusion Inc.

```
{ Date: new Date("2009-01-01"), Close: 54 },
{ Date: new Date("2010-01-01"), Close: 57 },
{ Date: new Date("2011-01-01"), Close: 62 }
],
valueType: 'DateTime',
value: [new Date("2008-01-01"), new Date("2010-01-01")],
labelFormat: 'MMM-yy'
};
}
</script>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<ejs-rangenavigator :valueType='valueType' :value='value'
:labelFormat='labelFormat'>
<e-rangenavigator-series-collection>
<e-rangenavigator-series :dataSource='data' type='StepLine' xName='Date'
yName='Close' width=2>
</e-rangenavigator-series>
</e-rangenavigator-series-collection>
</ejs-rangenavigator>
</template>
<script setup>
import { provide } from 'vue';
import { RangeNavigatorComponent as EjsRangenavigator, StepLineSeries,
DateTime, RangenavigatorSeriesCollectionDirective as
ERangenavigatorSeriesCollection, RangenavigatorSeriesDirective as
ERangenavigatorSeries} from "@syncfusion/ej2-vue-charts";
const data = [
{ Date: new Date("2005-01-01"), Close: 21 },
{ Date: new Date("2006-01-01"), Close: 24 },
{ Date: new Date("2007-01-01"), Close: 36 },
{ Date: new Date("2008-01-01"), Close: 38 },
{ Date: new Date("2009-01-01"), Close: 54 },
{ Date: new Date("2010-01-01"), Close: 57 },
{ Date: new Date("2011-01-01"), Close: 62 }
];
const valueType = 'DateTime';
const value = [new Date("2008-01-01"), new Date("2010-01-01")];
const labelFormat = 'MMM-yy';
const rangeNavigator = [ DateTime, StepLineSeries ];
provide('rangeNavigator', rangeNavigator);
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<ejs-rangenavigator :valueType='valueType' :value='value'
:labelFormat='labelFormat'>
<e-rangenavigator-series-collection>
<e-rangenavigator-series :dataSource='data' type='StepLine' xName='Date'
yName='Close' width=2>
</e-rangenavigator-series>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
</e-rangenavigator-series-collection>
</ejs-rangenavigator>
</template>
<script>
import { RangeNavigatorComponent, StepLineSeries, DateTime,
RangenavigatorSeriesCollectionDirective,
RangenavigatorSeriesDirective } from "@syncfusion/ej2-vue-charts";
//Component registration
export default {
name: "App",
components: {
"ejs-rangenavigator": RangeNavigatorComponent,
"e-rangenavigator-series-collection":
RangenavigatorSeriesCollectionDirective,
"e-rangenavigator-series":  RangenavigatorSeriesDirective
},
data() {
return {
data: [
{ Date: new Date("2005-01-01"), Close: 21 },
{ Date: new Date("2006-01-01"), Close: 24 },
{ Date: new Date("2007-01-01"), Close: 36 },
{ Date: new Date("2008-01-01"), Close: 38 },
{ Date: new Date("2009-01-01"), Close: 54 },
{ Date: new Date("2010-01-01"), Close: 57 },
{ Date: new Date("2011-01-01"), Close: 62 }
],
valueType: 'DateTime',
value: [new Date("2008-01-01"), new Date("2010-01-01")],
labelFormat: 'MMM-yy'
};
},
provide: {
rangeNavigator: [ DateTime, StepLineSeries ]
},
};
</script>
```

Run the project

To run the project, use the following command:

`bash

npm run dev

`

or

`bash

yarn run dev

`

The output will appear as follows:

Copyright © 2001 -2024 Syncfusion Inc.

Sample: vue-3-range-navigator-getting-started.

For migrating from Vue 2 to Vue 3, refer to the migration documentation.

Selecting range in Vue Range navigator component

The Range Selector's left and right thumbs are used to indicate the selected range in the large collection of data. A range can be selected in the following ways:

- By dragging the thumbs.
- By tapping on the labels.
- By setting the start and the end through the value property.

APP.VUE

```
<template>
    <div id="app">
        <ejs-rangenavigator :valueType='valueType' :value='value'
:labelFormat='labelFormat'>
            <e-rangenavigator-series-collection>
                <e-rangenavigator-series :dataSource='data' type='Area'
xName='x' yName='y' width=2>
                </e-rangenavigator-series>
            </e-rangenavigator-series-collection>
        </ejs-rangenavigator>
    </div>
</template>
<script>
import Vue from "vue";
import { RangeNavigatorPlugin, AreaSeries, DateTime } from "@syncfusion/ej2-
vue-charts";
import { bitCoinData } from "./default_data.js";
Vue.use(RangeNavigatorPlugin);
export default {
  data() {
    return {
     valueType: 'DateTime',
     value: [new Date('2017-09-01'), new Date('2018-02-01')],
     labelFormat: 'MMM-yy',
     data: bitCoinData
    };
  },
  provide: {
    rangeNavigator: [DateTime, AreaSeries]
```

Copyright © 2001 -2024 Syncfusion Inc.

```
   }
};
</script>
```

{% previewsample "page.domainurl/code-snippet/rangenavigator/getting-started-cs25" %}

Lightweight in Vue Range navigator component

By default, when the dataSource for series is empty, a lightweight Range Selector will be shown without Chart.

APP.VUE

```
<template>
    <div id="app">
      <ejs-rangenavigator :valueType='valueType'
:intervalType='intervalType'
        :value='value' :labelFormat='labelFormat' :dataSource='dataSource'
        xName='x' yName='y'>
      </ejs-rangenavigator>
    </div>
</template>
<script>
import Vue from "vue";
import { RangeNavigatorPlugin, AreaSeries, DateTime } from "@syncfusion/ej2-vue-charts";
import { GetDateTimeData  } from "./default_data.js";
Vue.use(RangeNavigatorPlugin);
export default {
  data() {
    return {
     valueType: "DateTime",
      intervalType: "Months",
      labelFormat: "MMM",
      value: [new Date('2018-06-01'), new Date('2018-07-01')],
      dataSource: GetDateTimeData(new Date('2018-01-01'), new Date('2019-01-01')),
    };
  },
  provide: {
    rangeNavigator: [DateTime, AreaSeries]
  }
};
</script>
```

Series types in Vue Range navigator component

To render the data, the Range Selector supports three types of series.

<!-- markdownlint-disable MD036 -->

Copyright © 2001 -2024 Syncfusion Inc.

Line

<!-- markdownlint-disable MD036 -->

To render a line series, set the seriestype to Line, and inject the LineSeries module using the RangeNavigator.Inject(LineSeries) method. To render a line series, use series type as **Line** and inject the LineSeries module using RangeNavigator.Inject(LineSeries) method. By default, the line series is rendered in the Range Selector.

APP.VUE

```
<template>
    <div id="app">
        <ejs-rangenavigator :valueType='valueType' :value='value'
:labelFormat='labelFormat' :tooltip='tooltip'>
            <e-rangenavigator-series-collection>
                <e-rangenavigator-series :dataSource='data' type='Line'
xName='x' yName='y' width=2>
                </e-rangenavigator-series>
            </e-rangenavigator-series-collection>
        </ejs-rangenavigator>
    </div>
</template>
<script>
import Vue from "vue";
import { RangeNavigatorPlugin, LineSeries, DateTime, RangeTooltip } from
"@syncfusion/ej2-vue-charts";
import { bitCoinData } from "./default_data.js";
Vue.use(RangeNavigatorPlugin);
export default {
  data() {
    return {
     valueType: 'DateTime',
     value: [new Date('2017-09-01'), new Date('2018-02-01')],
     tooltip: { enable: true },
     labelFormat: 'MMM-yy',
     data: bitCoinData
    };
  },
  provide: {
    rangeNavigator: [DateTime, LineSeries, RangeTooltip]
  }
};
</script>
```

{% previewsample "page.domainurl/code-snippet/rangenavigator/getting-started-cs26" %}

Area

To render a step line series, use series type as Area and inject AreaSeries module using RangeNavigator.Inject(AreaSeries) method. To render an area series, use series type as **Area** and inject AreaSeries module using RangeNavigator.Inject(AreaSeries) method.

APP.VUE

```
<template>
    <div id="app">
```

```
        <ejs-rangenavigator :valueType='valueType' :value='value'
:labelFormat='labelFormat' :tooltip='tooltip'>
            <e-rangenavigator-series-collection>
                <e-rangenavigator-series :dataSource='data' type='Area'
xName='x' yName='y' width=2>
                </e-rangenavigator-series>
            </e-rangenavigator-series-collection>
        </ejs-rangenavigator>
    </div>
</template>
<script>
import Vue from "vue";
import { RangeNavigatorPlugin, AreaSeries, DateTime, RangeTooltip } from

```
import { bitCoinData } from "./default_data.js";
Vue.use(RangeNavigatorPlugin);
export default {
  data() {
    return {
     valueType: 'DateTime',
     value: [new Date('2017-09-01'), new Date('2018-02-01')],
     tooltip: { enable: true },
     labelFormat: 'MMM-yy',
     data: bitCoinData
    };
  },
  provide: {
    rangeNavigator: [DateTime, StepLineSeries, RangeTooltip]
  }
};
</script>
```

{% previewsample "page.domainurl/code-snippet/rangenavigator/getting-started-cs28" %}

Period selector in Vue Range navigator component

The period selector allows to select a range with specified periods.

Periods

An array of objects that allows the users to specify pre-defined time intervals. The interval property specifies the count value of the button, and the text property specifies the text to be displayed on the button. The intervaltype property allows the users to customize the interval type, and it supports the following types:

- Auto
- Years
- Quarter
- Months
- Weeks
- Days
- Hours
- Minutes
- Seconds

APP.VUE

```
<template>
    <div id="app">
        <ejs-rangenavigator :valueType='valueType' :value='value'
:labelFormat='labelFormat'
        :periodSelectorSettings='periodSelectorSettingsTop' >
            <e-rangenavigator-series-collection>
                <e-rangenavigator-series :dataSource='data' type='Area'
xName='x' yName='y' width=2>
                </e-rangenavigator-series>
            </e-rangenavigator-series-collection>
        </ejs-rangenavigator>
    </div>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
</template>
<script>
import Vue from "vue";
import { RangeNavigatorPlugin, AreaSeries, DateTime, PeriodSelector } from
"@syncfusion/ej2-vue-charts";
import { bitCoinData } from "./default_data.js";
Vue.use(RangeNavigatorPlugin);
export default {
  data() {
    return {
     valueType: 'DateTime',
      periodSelectorSettingsTop: {
        periods: [
          { text: "1M", interval: 1, intervalType: "Months" },
          { text: "3M", interval: 3, intervalType: "Months" },
          { text: "6M", interval: 6, intervalType: "Months" },
          { text: "1Y", interval: 1, intervalType: "Years" },
          { text: "2Y", interval: 2, intervalType: "Years", selected: true
},
          { text: "ALL" }
        ],
        position: "Top"
       },
     value: [new Date('2017-09-01'), new Date('2018-02-01')],
     labelFormat: 'MMM-yy',
     data: bitCoinData
    };
  },
  provide: {
    rangeNavigator: [DateTime, AreaSeries, PeriodSelector]
  }
};
</script>
```

{% previewsample "page.domainurl/code-snippet/rangenavigator/getting-started-cs20" %}

To use the period selector feature, inject the PeriodSelector module using the RangeNavigator.Inject(PeriodSelector) method.

Positioning period selector

The position property allows the users to position the period selector at the **Top** or **Bottom**.

APP.VUE

```
<template>
    <div id="app">
        <ejs-rangenavigator :valueType='valueType' :value='value'
:labelFormat='labelFormat'
        :periodSelectorSettings='periodSelectorSettingsTop' >
            <e-rangenavigator-series-collection>
                <e-rangenavigator-series :dataSource='data' type='Area'
xName='x' yName='y' width=2>
                </e-rangenavigator-series>
            </e-rangenavigator-series-collection>
        </ejs-rangenavigator>
    </div>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
</template>
<script>
import Vue from "vue";
import { RangeNavigatorPlugin, AreaSeries, DateTime, PeriodSelector } from
"@syncfusion/ej2-vue-charts";
import { bitCoinData } from "./default_data.js";
Vue.use(RangeNavigatorPlugin);
export default {
  data() {
    return {
     valueType: 'DateTime',
      periodSelectorSettingsTop: {
        periods: [
          { text: "1M", interval: 1, intervalType: "Months" },
          { text: "3M", interval: 3, intervalType: "Months" },
          { text: "6M", interval: 6, intervalType: "Months" },
          { text: "1Y", interval: 1, intervalType: "Years" },
          { text: "2Y", interval: 2, intervalType: "Years", selected: true
},
          { text: "ALL" }
        ],
        position: "Bottom"
       },
     value: [new Date('2017-09-01'), new Date('2018-02-01')],
     labelFormat: 'MMM-yy',
     data: bitCoinData
    };
  },
  provide: {
    rangeNavigator: [DateTime, AreaSeries, PeriodSelector]
  }
};
</script>
```

{% previewsample "page.domainurl/code-snippet/rangenavigator/getting-started-cs21" %}

Height

The height property allows the users to specify the height of the period selector. The default value of the height property is **43px**.

APP.VUE

```
<template>
    <div id="app">
        <ejs-rangenavigator :valueType='valueType' :value='value'
:labelFormat='labelFormat'
        :periodSelectorSettings='periodSelectorSettingsTop' >
            <e-rangenavigator-series-collection>
                <e-rangenavigator-series :dataSource='data' type='Area'
xName='x' yName='y' width=2>
                </e-rangenavigator-series>
            </e-rangenavigator-series-collection>
        </ejs-rangenavigator>
    </div>
</template>
<script>
```

```
import Vue from "vue";
import { RangeNavigatorPlugin, AreaSeries, DateTime, PeriodSelector } from
"@syncfusion/ej2-vue-charts";
import { bitCoinData } from "./default_data.js";
Vue.use(RangeNavigatorPlugin);
export default {
  data() {
    return {
     valueType: 'DateTime',
      periodSelectorSettingsTop: {
        periods: [
          { text: "1M", interval: 1, intervalType: "Months" },
          { text: "3M", interval: 3, intervalType: "Months" },
          { text: "6M", interval: 6, intervalType: "Months" },
          { text: "1Y", interval: 1, intervalType: "Years" },
          { text: "2Y", interval: 2, intervalType: "Years", selected: true
},
          { text: "ALL" }
        ],
        position: "Top",
        height: 65
      },
     value: [new Date('2017-09-01'), new Date('2018-02-01')],
     labelFormat: 'MMM-yy',
     data: bitCoinData
    };
  },
  provide: {
    rangeNavigator: [DateTime, AreaSeries, PeriodSelector]
  }
};
</script>
```

{% previewsample "page.domainurl/code-snippet/rangenavigator/getting-started-cs22" %}

Visibility of range navigator

The disableRangeSelector property allows the users to display only the period selector and not the Range Selector.

APP.VUE

```
<template>
    <div id="app">
    <ejs-rangenavigator valueType='DateTime'
        labelPosition='Outside' :dataSource='data' xName='x' yName='Close'
        :periodSelectorSettings='periodSelectorSettingsTop'
disableRangeSelector=true>
       </ejs-rangenavigator>
    </div>
</template>
<script>
import Vue from "vue";

Labels in Vue Range navigator component

Multilevel labels

The multi-level labels for the Range Selector can be enabled by setting the enableGrouping property to **true**. This is restricted to the DateTime axis alone.

APP.VUE

```
<template>
    <div id="app">
      <ejs-rangenavigator :valueType='valueType'
:intervalType='intervalType' enableGrouping=true
        :value='value' :dataSource='dataSource'
        xName='x' yName='y'>
      </ejs-rangenavigator>
    </div>
</template>
<script>
import Vue from "vue";
import { RangeNavigatorPlugin, AreaSeries, DateTime } from "@syncfusion/ej2-
vue-charts";
import { GetDateTimeData  } from "./default_data.js";
Vue.use(RangeNavigatorPlugin);
export default {
  data() {
```

Copyright © 2001 -2024 Syncfusion Inc.

```
    let points = [];
    let value = 0;
    let point = {};
    for (let j = 1; j < 1090; j++) {
      value += Math.random() * 10 - 5;
      value = value < 0 ? Math.abs(value) : value;
      point = { x: new Date(2000, 0, j), y: value, z: value + 10 };
      points.push(point);
    }
    return {
     valueType: "DateTime",
      intervalType: "Quarter",
      value: [new Date('2001-01-01'), new Date('2002-01-01')],
      dataSource: points,
    };
  },
  provide: {
    rangeNavigator: [DateTime, AreaSeries]
  }
};
</script>
```

{% previewsample "page.domainurl/code-snippet/rangenavigator/getting-started-cs14" %}

Grouping

The multi-level labels can be grouped using the groupBy property with the following interval types:

- Auto
- Years
- Quarter
- Months
- Weeks
- Days
- Hours
- Minutes
- Seconds

APP.VUE

```
<template>
    <div id="app">
      <ejs-rangenavigator :valueType='valueType'
:intervalType='intervalType' enableGrouping=true groupBy='Years'
        :value='value' :dataSource='dataSource'
        xName='x' yName='y'>
      </ejs-rangenavigator>
    </div>
</template>
<script>

Grid tick in Vue Range navigator component

Grid line customization

The gridlines indicate axis divisions by drawing the chart plot. Gridlines include helpful cues to the user, particularly for large or complicated charts. The width, color, and dashArray of the major gridlines can be customized by using the majorGridLines setting.

APP.VUE

```
<template>
    <div id="app">
    <ejs-rangenavigator :value='value' labelPosition ='Outside'
:tooltip='tooltip' :majorGridLines='majorGridLines' >
            <e-rangenavigator-series-collection >
                <e-rangenavigator-series :dataSource='data' xName='xData'
type='Line' yName='yData' ></e-rangenavigator-series>
            </e-rangenavigator-series-collection>
        </ejs-rangenavigator>
    </div>
</template>
<script>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
import Vue from "vue";
import { RangeNavigatorPlugin, AreaSeries, DateTime } from "@syncfusion/ej2-vue-charts";
import {  sl } from "./default_data.js";
Vue.use(RangeNavigatorPlugin);
export default {
  data() {
    return {
    majorGridLines:{
        width: 4,
        color: 'blue',
        dashArray: '5,5'
    },
     tooltip: { enable: true },
     value:[25,40],
     data:  [
      { xData: 10, yData: 35 }, { xData: 20, yData: 28 },
      { xData: 30, yData: 34 }, { xData: 40, yData: 32 },
      { xData: 50, yData: 40 }
     ]
    };
  },
  provide: {
    rangeNavigator: [DateTime, AreaSeries]
  }
};
</script>
```

{% previewsample "page.domainurl/code-snippet/rangenavigator/getting-started-cs12" %}

Tick line customization

Ticklines are the small lines which is drawn on the axis line representing the axis labels. Ticklines will be drawn outside the axis by default. The `width`, `color`, and `dashArray` of the major ticklines can be customized by using the majorTickLines setting.

APP.VUE

```
<template>
    <div id="app">

Customization in Vue Range navigator component

Navigator appearance

The Range Selector can be customized by using the navigatorStyleSettings. The selectedRegionColor property is used to specify the color for the selected region, whereas the unselectedRegionColor property is used to specify the color for the unselected region.

APP.VUE

```
<template>
    <div id="app">
        <ejs-rangenavigator :valueType='valueType' :value='value'
:labelFormat='labelFormat' :navigatorStyleSettings='navigatorStyleSettings'>
            <e-rangenavigator-series-collection>
                <e-rangenavigator-series :dataSource='data' type='Area'
xName='x' yName='y' width=2>
                </e-rangenavigator-series>
            </e-rangenavigator-series-collection>
        </ejs-rangenavigator>
    </div>
</template>
<script>
import Vue from "vue";
import { RangeNavigatorPlugin, AreaSeries, DateTime } from "@syncfusion/ej2-
vue-charts";
import { bitCoinData } from "./default_data.js";
Vue.use(RangeNavigatorPlugin);
export default {
  data() {
    return {
     valueType: 'DateTime',
     value: [new Date('2017-09-01'), new Date('2018-02-01')],
     labelFormat: 'MMM-yy',
     navigatorStyleSettings: {
```

Copyright © 2001 -2024 Syncfusion Inc.

```
        unselectedRegionColor: 'skyblue',
        selectedRegionColor: 'pink'
         },
     data: bitCoinData
    };
  },
  provide: {
    rangeNavigator: [DateTime, AreaSeries]
  }
};
</script>
```

{% previewsample "page.domainurl/code-snippet/rangenavigator/getting-started-cs1" %}

Thumb

The thumb property allows to customize the border, fill color, size, and type of thumb. Thumbs can be of two shapes: **Circle** and **Rectangle**.

APP.VUE

```
<template>
    <div id="app">
        <ejs-rangenavigator :valueType='valueType' :value='value'
:labelFormat='labelFormat' :navigatorStyleSettings='navigatorStyleSettings'>
            <e-rangenavigator-series-collection>
                <e-rangenavigator-series :dataSource='data' type='Area'
xName='x' yName='y' width=2>
                </e-rangenavigator-series>
            </e-rangenavigator-series-collection>
        </ejs-rangenavigator>
    </div>
</template>
<script>
import Vue from "vue";
import { RangeNavigatorPlugin, AreaSeries, DateTime } from "@syncfusion/ej2-
vue-charts";
import { bitCoinData } from "./default_data.js";
Vue.use(RangeNavigatorPlugin);
export default {
  data() {
    return {
     valueType: 'DateTime',
     value: [new Date('2017-09-01'), new Date('2018-02-01')],
     labelFormat: 'MMM-yy',
     navigatorStyleSettings: {
     thumb:{
           type: 'Rectangle',
           border: { width: 2, color: 'red'},
           fill: 'pink'
       }
         },
     data: bitCoinData
    };
  },
  provide: {
    rangeNavigator: [DateTime, AreaSeries]
```

```
  }
};
</script>
```

{% previewsample "page.domainurl/code-snippet/rangenavigator/getting-started-cs2" %}

Border customization

Using the navigatorBorder, the width and color of the Range Selector border can be customized.

APP.VUE

```
<template>
    <div id="app">
        <ejs-rangenavigator :valueType='valueType' :value='value'
:labelFormat='labelFormat' :navigatorBorder='navigatorBorder'>
            <e-rangenavigator-series-collection>
                <e-rangenavigator-series :dataSource='data' type='Area'
xName='x' yName='y' width=2>
                </e-rangenavigator-series>
            </e-rangenavigator-series-collection>
        </ejs-rangenavigator>
    </div>
</template>
<script>
import Vue from "vue";
import { RangeNavigatorPlugin, AreaSeries, DateTime } from "@syncfusion/ej2-
vue-charts";
import { bitCoinData } from "./default_data.js";
Vue.use(RangeNavigatorPlugin);
export default {
  data() {
    return {
     valueType: 'DateTime',
     value: [new Date('2017-09-01'), new Date('2018-02-01')],
     labelFormat: 'MMM-yy',
     navigatorBorder : { width: 4, color: 'green'},
     data: bitCoinData
    };
  },
  provide: {
    rangeNavigator: [DateTime, AreaSeries]
  }
};
</script>
```

{% previewsample "page.domainurl/code-snippet/rangenavigator/getting-started-cs3" %}

Deferred update

If the enableDeferredUpdate property is set to **true**, then the changed event will be triggered after dragging the slider. If the enableDeferredUpdate is **false**, then the changed event will be triggered when dragging the slider. By default, the enableDeferredUpdate is set to **false**.

APP.VUE

```
<template>
    <div id="app">
```

Copyright © 2001 -2024 Syncfusion Inc.

```
        <ejs-rangenavigator :valueType='valueType' :value='value'
:labelFormat='labelFormat' :navigatorBorder='navigatorBorder'>
            <e-rangenavigator-series-collection>
                <e-rangenavigator-series :dataSource='data' type='Area'
xName='x' yName='y' width=2>
                </e-rangenavigator-series>
            </e-rangenavigator-series-collection>
        </ejs-rangenavigator>
    </div>
</template>

</script>
```

{% previewsample "page.domainurl/code-snippet/rangenavigator/getting-started-cs4" %}

Allow snapping

The allowSnapping property toggles the placement of the slider exactly to the left or on the nearest interval.

APP.VUE

```
<template>
    <div id="app">
        <ejs-rangenavigator :valueType='valueType' :value='value'
:labelFormat='labelFormat' :allowSnapping='allowSnapping'>
            <e-rangenavigator-series-collection>
                <e-rangenavigator-series :dataSource='data' type='Area'
xName='x' yName='y' width=2>
                </e-rangenavigator-series>
            </e-rangenavigator-series-collection>
        </ejs-rangenavigator>
    </div>
</template>
<script>
import Vue from "vue";
import { RangeNavigatorPlugin, AreaSeries, DateTime } from "@syncfusion/ej2-
vue-charts";
```

Copyright © 2001 -2024 Syncfusion Inc.

```
import { bitCoinData } from "./default_data.js";
Vue.use(RangeNavigatorPlugin);
export default {
  data() {
    return {
     valueType: 'DateTime',
     value: [new Date('2017-09-01'), new Date('2018-02-01')],
     labelFormat: 'MMM-yy',
      allowSnapping: true,
     data: bitCoinData
    };
  },
  provide: {
    rangeNavigator: [DateTime, AreaSeries]
  }
};
</script>
```

{% previewsample "page.domainurl/code-snippet/rangenavigator/getting-started-cs5" %}

Animation

The speed of the animation can be controlled using the animationDuration property. The default value of the animationDuration property is **500** milliseconds.

APP.VUE

```
<template>
    <div id="app">
        <ejs-rangenavigator :valueType='valueType' :value='value'
:labelFormat='labelFormat'  animationDuration=2000>
            <e-rangenavigator-series-collection>
                <e-rangenavigator-series :dataSource='data' type='Area'
xName='x' yName='y' width=2>
                </e-rangenavigator-series>
            </e-rangenavigator-series-collection>
        </ejs-rangenavigator>

Tool tip in Vue Range navigator component

<!-- markdownlint-disable MD036 -->

The tooltip for sliders are supported by the Range Selector. Sliders are used in the Range Selector to select data from a specific range. The tooltip displays the selected start and end values.

<!-- markdownlint-disable MD013 -->

Customization

Tooltip can be customized using the following properties:

- enable - Customizes the visibility of the tooltip.
- fill - Customizes the background color of the tooltip.
- opacity - Customizes the opacity of the tooltip.
- textStyle - Customizes the font size, color, family, style, weight, alignment, and overflow of the tooltip.

APP.VUE

```
<template>
    <div id="app">
        <ejs-rangenavigator :valueType='valueType' :value='value'
:labelFormat='labelFormat' :tooltip='tooltip'>
            <e-rangenavigator-series-collection>
                <e-rangenavigator-series :dataSource='data' type='Area'
xName='x' yName='y' width=2>
                </e-rangenavigator-series>
            </e-rangenavigator-series-collection>

Accessibility in Vue Range navigator component

The Range navigator component followed the accessibility guidelines and standards, including ADA, Section 508, WCAG 2.2 standards, and WCAG roles that are commonly used to evaluate accessibility.

The accessibility compliance for the Range navigator component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| WCAG 2.2 Support | |

| Section 508 Support | |

| Screen Reader Support | |

| Right-To-Left Support | |

| Color Contrast | |

| Mobile Device Support | |

| Keyboard Navigation Support | |

| Accessibility Checker Validation | |

| Axe-core Accessibility Validation | |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

 - All features of the component meet the requirement.

 - Some features of the component do not meet the requirement.

 - The component does not meet the requirement.

Copyright © 2001 -2024 Syncfusion Inc.

WAI-ARIA attributes

The Range navigator component followed the WAI-ARIA patterns to meet the accessibility. The following ARIA attributes are used in the Range navigator component:

- region (role)
- aria-label (attribute)

Keyboard interaction

The Range navigator component followed the keyboard interaction guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Range navigator component.

| **Press** | **To do this** |

| --- | --- |

| Tab | Moves the focus to the Range navigator element. |

| Ctrl + P | Prints the Range navigator. |

Ensuring accessibility

The Range navigator component's accessibility levels are ensured through an accessibility-checker and axe-core software tools during automated testing.

The accessibility compliance of the Range navigator component is shown in the following sample. Open the sample in a new window to evaluate the accessibility of the Range navigator component with accessibility tools.

{% previewsample "https://ej2.syncfusion.com/accessibility/range-navigator.html" %}

Range Slider

Getting Started with the Vue Range slider Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using Vue-CLI and integrating the Syncfusion Vue Range slider component using the Composition API / Options API.

Prerequisites

System requirements for Syncfusion Vue UI components

Setting up the Vue 2 project

To generate a Vue 2 project using Vue-CLI, use the vue create command. Follow these steps to install Vue CLI and create a new project:

`bash

npm install -g @vue/cli

vue create quickstart

cd quickstart

Copyright © 2001 -2024 Syncfusion Inc.

npm run serve

`

or

`bash

yarn global add @vue/cli

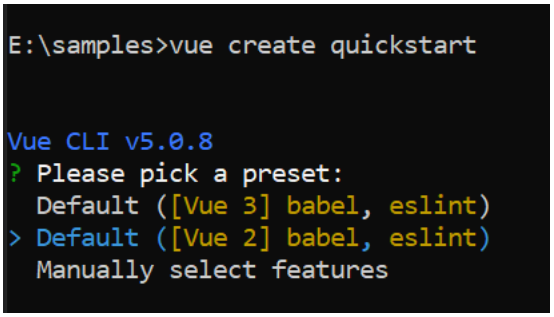
vue create quickstart

cd quickstart

yarn run serve

`

When creating a new project, choose the option Default ([Vue 2] babel, eslint) from the menu.



Once the quickstart project is set up with default settings, proceed to add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion packages are available at npmjs.com. To use Vue components, install the required npm package.

This article uses the [Vue Range slider component](https://www.syncfusion.com/vue-components/vue-slider as an example. Install the @syncfusion/ej2-vue-inputs package by running the following command:

`bash

npm install @syncfusion/ej2-vue-inputs --save

`

or

`bash

yarn add @syncfusion/ej2-vue-inputs

`

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

Copyright © 2001 -2024 Syncfusion Inc.

In this article, the Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the Range slider component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
</style>
```

Add Syncfusion Vue component

Follow the below steps to add the Vue Range slider component using Composition API or Options API:

1\. First, import and register the Range slider component in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { SliderComponent as EjsSlider } from "@syncfusion/ej2-vue-inputs";
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { SliderComponent } from "@syncfusion/ej2-vue-inputs";
export default {
components: {
'ejs-slider': SliderComponent
}
}
</script>
```

2\. In the template section, define the Range slider component with the value property.

~/SRC/APP.VUE

```
<template>
<div id="app">
<ejs-slider id='default' :value='value'></ejs-slider>
</div>
</template>
```

3\. Declare the value for the value property in the script section.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
const value = 30;
</script>
```

Copyright © 2001 -2024 Syncfusion Inc.

OPTIONS API (~/SRC/APP.VUE)

```
<script>
data() {
return {
value: 30
};
}
</script>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
    <div id="app">
    <ejs-slider id='default' :value='value'></ejs-slider>
  </div>
</template>
<script setup>
import { SliderComponent as EjsSlider } from "@syncfusion/ej2-vue-inputs";
const value = 30;
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-buttons/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-popups/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
   #app {
    color: #008cff;
    height: 40px;
    left: 30%;
    position: absolute;
    top: 40%;
    width: 50%;
  }
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
    <div id="app">
    <ejs-slider id='default' :value='value'></ejs-slider>
  </div>
</template>
<script>
import { SliderComponent } from "@syncfusion/ej2-vue-inputs";
export default {
  components: {
    'ejs-slider': SliderComponent
  },
  data() {
    return {
      value: 30
```

Copyright © 2001 -2024 Syncfusion Inc.

```
    };
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-buttons/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-popups/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
   #app {
    color: #008cff;
    height: 40px;
    left: 30%;
    position: absolute;
    top: 40%;
    width: 50%;
  }
</style>
```

Run the project

To run the project, use the following command:

`bash

npm run serve

`

or

`bash

yarn run serve

`

{% previewsample "page.domainurl/code-snippet/range-slider/getting-started-cs1" %}

Types

The types of Slider are as follows:

| **Types** | **Usage** |

| --- | --- |

| Default | Shows a default Slider to select a single value. |

| MinRange | Displays the shadow from the start value to the current selected value. |

| Range | Selects a range of values. It also displays the shadow in-between the selection range. |

Both the Default Slider and Min-Range Slider have same behavior that is used to select a single value. In Min-Range Slider, a shadow is considered from the start value to current handle position. But the Range Slider contains two handles that is used to select a range of values and a shadow is considered in between the two handles.

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
```

```
    <div id="app">
     <label class="labeltext">Default</label>
     <ejs-slider id='default' :value='minvalue'></ejs-slider>
      <label class="labeltext">MinRange</label>
      <ejs-slider id='default' :value='minvalue' :type="mintype"></ejs-
slider>
     <label class="labeltext">Range</label>
    <ejs-slider id='type' :value='value' :type="type"></ejs-slider>
  </div>
</template>
<script setup>
import { SliderComponent as EjsSlider } from "@syncfusion/ej2-vue-inputs";
const value = [30, 70];
const type = 'Range';
const mintype = 'MinRange';
const minvalue = 30;
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-buttons/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-popups/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
   #app {
    height: 40px;
    left: 30%;
    position: absolute;
    top: 40%;
    width: 50%;
  }
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
    <div id="app">
     <label class="labeltext">Default</label>
     <ejs-slider id='default' :value='minvalue'></ejs-slider>
      <label class="labeltext">MinRange</label>
      <ejs-slider id='default' :value='minvalue' :type="mintype"></ejs-
slider>
     <label class="labeltext">Range</label>
    <ejs-slider id='type' :value='value' :type="type"></ejs-slider>
  </div>
</template>
<script>
import { SliderComponent } from "@syncfusion/ej2-vue-inputs";
export default {
  components: {
    'ejs-slider': SliderComponent
  },
  data() {
    return {

    width: 50%;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/range-slider/getting-started-cs2" %}

Customization

Orientation

The Slider can be displayed, either in horizontal or vertical orientation. By default, the Slider renders in horizontal orientation.

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
    <div id="app">
    <ejs-slider id='orientation' :value='value'
:orientation="orientation"></ejs-slider>
  </div>
</template>
<script setup>
import { SliderComponent as EjsSlider } from "@syncfusion/ej2-vue-inputs";
// vertical orientation
const orientation = 'Vertical';
const value = 30;
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-buttons/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-popups/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
   #app {
    color: #008cff;
    height: 340px;
    left: 30%;
    position: absolute;
    width: 50%;
  }
</style>
```

OPTIONS API (~/SRC/APP.VUE)

Copyright © 2001 -2024 Syncfusion Inc.

```
<template>
    <div id="app">
    <ejs-slider id='orientation' :value='value'
:orientation="orientation"></ejs-slider>
  </div>
</template>
<script>
import { SliderComponent } from "@syncfusion/ej2-vue-inputs";
export default {
  components: {
    'ejs-slider': SliderComponent
  },
  data() {
    return {
        // vertical orientation
        orientation: 'Vertical',
        value: 30
    };
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-buttons/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-popups/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
   #app {
    color: #008cff;
    height: 340px;
    left: 30%;
    position: absolute;
    width: 50%;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/range-slider/getting-started-cs3" %}

Tooltip

The Slider displays the tooltip to indicate the current value by clicking the Slider bar or drag the Slider handle. The Tooltip position can be customized by using the placement property. Also decides the tooltip display mode on a page, i.e., on hovering, focusing, or clicking on the Slider handle. Tooltip always remains/displays on the page.

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
    <div id="app">
    <ejs-slider id='tooltip' :value='value' :tooltip="tooltip"
:type="type"></ejs-slider>
  </div>
</template>
<script setup>
import { SliderComponent as EjsSlider } from "@syncfusion/ej2-vue-inputs";
// Slider tooltip
const tooltip = { placement: 'After', isVisible: true, showOn: 'Always' };
const value = 30;
```

Copyright © 2001 -2024 Syncfusion Inc.

```
const type = 'MinRange';
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-buttons/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-popups/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
   #app {
    color: #008cff;
    height: 40px;
    left: 30%;
    position: absolute;
    top: 40%;
    width: 50%;
  }
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
    <div id="app">
    <ejs-slider id='tooltip' :value='value' :tooltip="tooltip"
:type="type"></ejs-slider>
  </div>
</template>
<script>
import { SliderComponent } from "@syncfusion/ej2-vue-inputs";
export default {
  components: {
    'ejs-slider': SliderComponent
  },
  data() {
    return {
        // Slider tooltip
        tooltip: { placement: 'After', isVisible: true, showOn: 'Always' },
        value: 30,
        type: 'MinRange'
    };
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-buttons/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-popups/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
   #app {
    color: #008cff;
    height: 40px;
    left: 30%;
    position: absolute;
    top: 40%;
    width: 50%;
  }
</style>
```

Copyright © 2001 -2024 Syncfusion Inc.

{% previewsample "page.domainurl/code-snippet/range-slider/getting-started-cs4" %}

Buttons

The Slider value can be changed by using the Increase and Decrease buttons. In Range Slider, by default the first handle value will be changed while clicking the button. Change the handle focus and press the button to change the last focused handle value.

After enabling the slider buttons if the 'Tab' key is pressed, the focus goes to the handle and not to the button.

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
    <div id="app">
    <ejs-slider id='buttons' :value='value' :showButtons="showButtons"
:type="type"></ejs-slider>
  </div>
</template>
<script setup>
import { SliderComponent as EjsSlider } from "@syncfusion/ej2-vue-inputs";
// Enable the button option in Slider
const showButtons = true;
const value = [30, 70];
const type = 'Range';
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-buttons/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-popups/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
   #app {
    color: #008cff;
    height: 40px;
    left: 30%;
    position: absolute;
    top: 40%;
    width: 50%;
  }
</style>
```

OPTIONS API (~/SRC/APP.VUE)

Getting Started with the Vue Range Slider Component in Vue 3

This article provides a step-by-step guide for setting up a Vite project with a JavaScript environment and integrating the Syncfusion Vue Range Slider component using the Composition API / Options API.

The Composition API is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

The Options API is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

Prerequisites

System requirements for Syncfusion Vue UI components

Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using Vite. To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

`bash

npm create vite@latest

`

Copyright © 2001 -2024 Syncfusion Inc.

or

`bash
yarn create vite
`

Using one of the above commands will lead you to set up additional configurations for the project as below:

1.Define the project name: We can specify the name of the project directly. Let's specify the name of the project as `my-project` for this article.

`bash
? Project name: » my-project
`

2.Select `Vue` as the framework. It will create a Vue 3 project.

`bash
? Select a framework: » - Use arrow-keys. Return to submit.
Vanilla
Vue
React
Preact
Lit
Svelte
Others
`

3.Choose `JavaScript` as the framework variant to build this Vite project using JavaScript and Vue.

`bash
? Select a variant: » - Use arrow-keys. Return to submit.
JavaScript
TypeScript
Customize with create-vue ↗
Nuxt ↗
`

4.Upon completing the aforementioned steps to create the `my-project`, run the following command to install its dependencies:

`bash
cd my-project

npm install

`

or

`bash

cd my-project

yarn install

`

Now that my-project is ready to run with default settings, let's add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion Vue component packages are available at npmjs.com. To use Syncfusion Vue components in the project, install the corresponding npm package.

This article uses the Vue Range Slider component as an example. To use the Vue Range Slider component in the project, the @syncfusion/ej2-vue-inputs package needs to be installed using the following command:

`bash

npm install @syncfusion/ej2-vue-inputs --save

`

or

`bash

yarn add @syncfusion/ej2-vue-inputs

`

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the Range Slider component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
</style>
```

Copyright © 2001 -2024 Syncfusion Inc.

Add Syncfusion Vue component

Follow the below steps to add the Vue Range Slider component using Composition API or Options API:

1.First, import and register the Range Slider component in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { SliderComponent as EjsSlider} from "@syncfusion/ej2-vue-inputs";
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { SliderComponent} from "@syncfusion/ej2-vue-inputs";
//Component registration
export default {
name: "App",
components: {
'ejs-slider': SliderComponent
}
}
</script>
```

2.Add the component definition in template section.

~/SRC/APP.VUE

```
<template>
<ejs-slider id='default' :value='value'></ejs-slider>
</template>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<div id="app">
<ejs-slider id='default' :value='value'></ejs-slider>
</div>
</template>
<script setup>
import { SliderComponent as EjsSlider} from "@syncfusion/ej2-vue-inputs";
const value = 30;
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
</style>
```

Copyright © 2001 -2024 Syncfusion Inc.

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<div id="app">
<ejs-slider id='default' :value='value'></ejs-slider>
</div>
</template>
<script>
import { SliderComponent} from "@syncfusion/ej2-vue-inputs";
//Component registration
export default {
name: "App",
components: {
'ejs-slider': SliderComponent
},
data() {
return {
value: 30,
};
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
</style>
```

Run the project

To run the project, use the following command:

`bash

npm run dev

`

or

`bash

yarn run dev

`

The output will appear as follows:

Types

The types of Range Slider are as follows:

| **Types** | **Usage** |

| --- | --- |

| Default | Shows a default Range Slider to select a single value. |

Copyright © 2001 -2024 Syncfusion Inc.

| MinRange | Displays the shadow from the start value to the current selected value. |

| Range | Selects a range of values. It also displays the shadow in-between the selection range. |

Both the Default Slider and Min-Range Slider have same behavior that is used to select a single value. In Min-Range Slider, a shadow is considered from the start value to current handle position. But the Range Slider contains two handles that is used to select a range of values and a shadow is considered in between the two handles.

In the following example demonstrates all types in Range Slider component.

COMPOSITION API (~/SRC/APP.VUE)

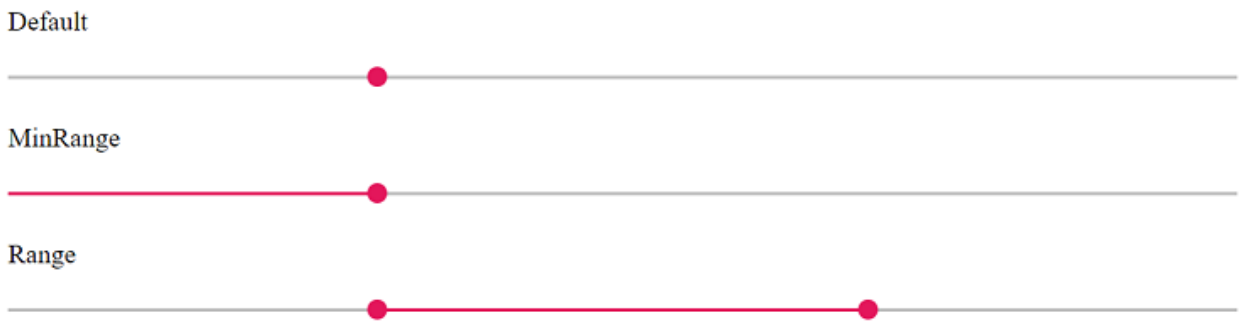
```
<template>
<div id="app">
<label class="labeltext">Default</label>
<ejs-slider id='default' :value='minvalue'></ejs-slider>
<label class="labeltext">MinRange</label>
<ejs-slider id='default' :value='minvalue' :type="mintype"></ejs-slider>
<label class="labeltext">Range</label>
<ejs-slider id='type' :value='value' :type="type"></ejs-slider>
</div>
</template>
<script setup>
import { SliderComponent as EjsSlider} from "@syncfusion/ej2-vue-inputs";
const minvalue = 30;
const value = [30, 70];
const type = 'Range';
const mintype = 'MinRange';
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<div id="app">
<label class="labeltext">Default</label>
<ejs-slider id='default' :value='minvalue'></ejs-slider>
<label class="labeltext">MinRange</label>
<ejs-slider id='default' :value='minvalue' :type="mintype"></ejs-slider>
<label class="labeltext">Range</label>
<ejs-slider id='type' :value='value' :type="type"></ejs-slider>
</div>
</template>
<script>
import { SliderComponent} from "@syncfusion/ej2-vue-inputs";
//Component registration
export default {
name: "App",
components: {
'ejs-slider': SliderComponent
},
```

Copyright © 2001 -2024 Syncfusion Inc.

```
data() {
return {
value: [30, 70],
minvalue: 30,
mintype: 'MinRange',
type: 'Range'
};
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
</style>
```



Customization

Orientation

The Range Slider can be displayed, either in horizontal or vertical orientation. By default, the Range Slider renders in horizontal orientation.

In the following example, orientation property set as Vertical in Range Slider component.

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<div id="app">
<ejs-slider id='orientation' :value='value'
:orientation="orientation"></ejs-slider>
</div>
</template>
<script setup>
import { SliderComponent as EjsSlider} from "@syncfusion/ej2-vue-inputs";
const value = 30;
const orientation = 'Vertical';
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
```

Copyright © 2001 -2024 Syncfusion Inc.

```
#app {
color: #008cff;

Tooltip

The Range Slider displays the tooltip to indicate the current value by clicking the Range Slider bar or drag the Range Slider handle. The Tooltip position can be customized by using the placement property. Also decides the tooltip display mode on a page, i.e., on hovering, focusing, or clicking on the Range Slider handle. Tooltip always remains/displays on the page.

In the following example, tooltip property is enabled in Range Slider component.

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<div id="app">
<ejs-slider id='tooltip' :value='value' :tooltip="tooltip"
:type="type"></ejs-slider>
</div>
</template>
<script setup>
import { SliderComponent as EjsSlider} from "@syncfusion/ej2-vue-inputs";
const value = 30;
const type = 'MinRange';
const tooltip = { placement: 'After', isVisible: true, showOn: 'Always' };
</script>
<style>

Buttons

The Range Slider value can be changed by using the Increase and Decrease buttons. In Range Range Slider, by default the first handle value will be changed while clicking the button. Change the handle focus and press the button to change the last focused handle value.

After enabling the Range Slider buttons if the 'Tab' key is pressed, the focus goes to the handle and not to the button.

In the following example, showButtons property is enabled in Range Slider component.

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<div id="app">
<ejs-slider id='buttons' :value='value' :showButtons="showButtons"
:type="type"></ejs-slider>
</div>

Two way binding in Vue Range slider component

It can be achieved by using the v-model directive in vue. In the following sample, when you change a value in one slider will automatically change the value in the other slider. It updates the other slider using value property.

APP.VUE

```
<template>
    <div id="app">
      <div>Default Slider</div>
    <ejs-slider id='default' v-model='value'></ejs-slider>
      <div>Min Range Slider</div>
    <ejs-slider id='minRange' type='MinRange' v-model='value'></ejs-slider>
  </div>
</template>
<script>
import Vue from "vue";
import { SliderPlugin } from "@syncfusion/ej2-vue-inputs";
Vue.use(SliderPlugin);
export default {
  data() {
    return {
        value: 30,
    };
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-buttons/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-popups/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
   #app {
    height: 40px;
    left: 30%;
    position: absolute;
    top: 40%;
    width: 50%;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/range-slider/two-way-binding-cs1" %}

Ticks in Vue Range slider component

The Ticks in Slider supports you to easily identify the current value/values of the Slider. It contains smallStep and largeStep. The value of the major ticks alone will be displayed in the slider. In order to enable/disable the small ticks, use the showSmallTicks property.

APP.VUE

```
<template>
    <div id="app">
    <ejs-slider id='ticks' :value='value' :tooltip="tooltip"
:ticks="ticks"></ejs-slider>
  </div>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
</template>
<script>
import Vue from "vue";
import { SliderPlugin } from "@syncfusion/ej2-vue-inputs";
Vue.use(SliderPlugin);
export default {
  data() {
    return {
       tooltip: { placement: 'Before', isVisible: true, showOn: 'Always' },
        value: 30,
        // Slider ticks customization
        ticks: { placement: 'After', largeStep: 20, smallStep: 10,
showSmallTicks: true }
    };
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-buttons/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-popups/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
   #app {
    height: 40px;
    left: 30%;
    position: absolute;
    top: 40%;
    width: 50%;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/range-slider/ticks-cs2" %}

Step

When the Slider is moved, it increases/decreases the value based on the step value. By default, the value is increased/decreased by 1. Use the step property to change the increment step value.

APP.VUE

```
<template>
    <div id="app">
    <ejs-slider id='steps' :value='value' :tooltip="tooltip" :ticks="ticks"
:step="step"></ejs-slider>
  </div>
</template>
<script>
import Vue from "vue";
import { SliderPlugin } from "@syncfusion/ej2-vue-inputs";
Vue.use(SliderPlugin);
export default {
  data() {
    return {
      ticks: { placement: 'After', largeStep: 20, smallStep: 10,
showSmallTicks: true },
        tooltip: { placement: 'Before', isVisible: true, showOn: 'Always' },
        value: 30,
```

```
        // Enables step
        step: 10
    };
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-buttons/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-popups/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
   #app {
    height: 40px;
    left: 30%;
    position: absolute;
    top: 40%;
    width: 50%;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/range-slider/ticks-cs3" %}

Min and Max

Enables the minimum/starting and maximum/ending value of the Slider, by using the min and max property. By default, the minimum value is 1 and maximum value is 100. In the following sample the slider is rendered with the min value as 100 and max value as 1000.

APP.VUE

```
<template>
    <div id="app">
    <ejs-slider id='minmax' :value='value' :tooltip="tooltip" :ticks="ticks"
:min="min" :max="max"></ejs-slider>
  </div>
</template>
<script>
import Vue from "vue";
import { SliderPlugin } from "@syncfusion/ej2-vue-inputs";
Vue.use(SliderPlugin);
export default {
  data() {
    return {
      ticks: { placement: 'After', largeStep: 200, smallStep: 100,
showSmallTicks: true },
        tooltip: { placement: 'Before', isVisible: true, showOn: 'Always' },
        // Minimum value
        min: 100,
        // Maximum value
        max: 1100,
        // Slider current value
        value: 400
    };
  }
}
</script>
<style>
```

```
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-buttons/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-popups/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
   #app {
    height: 40px;
    left: 30%;
    position: absolute;
    top: 40%;
    width: 50%;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/range-slider/ticks-cs4" %}

Format in Vue Range slider component

The format feature used to customize the units of Slider values to desired format. The formatted values will also be applied to the ARIA attributes of the slider. There are two ways of achieving formatting in slider.

- Use the format API of slider which utilizes our Internationalization to format values.
- Customize using the events namely renderingTicks and tooltipChange.

APP.VUE

```
<template>
    <div id="app">
    <ejs-slider id='format' :value='value' :min="min" :max="max"
:step="step"
    :tooltip="tooltip" :ticks="ticks" ></ejs-slider>
  </div>
</template>
<script>
import Vue from "vue";
import { SliderPlugin } from "@syncfusion/ej2-vue-inputs";
Vue.use(SliderPlugin);
export default {
  data() {
    return {
      min: 0, max: 100, step: 1, value: 30,
    // Applying currency formatting for tooltip with two decimal specifiers
    tooltip: { isVisible: true, format: 'C2' },
    // Applying currency formatting for ticks with two decimal specifiers
    ticks: { placement: 'After', format: 'C2', largeStep: 20, smallStep: 10,
showSmallTicks: true }
    };
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-buttons/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-popups/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
```

Copyright © 2001 -2024 Syncfusion Inc.

```
    #app {
     height: 40px;
     left: 30%;
     position: absolute;
     top: 40%;
     width: 50%;
   }
</style>
```

{% previewsample "page.domainurl/code-snippet/range-slider/format-cs2" %}

Using format API

In this method, we have different predefined formatting styles like Numeric (N), Percentage (P), Currency (C) and # specifiers. In this below example, we have formatted the ticks and tooltip values into percentage.

APP.VUE

```
<template>
    <div id="app">
    <ejs-slider id='api' :value='value' :min="min" :max="max" :step="step"
    :tooltip="tooltip" :ticks="ticks" ></ejs-slider>
  </div>
</template>
<script>
import Vue from "vue";
import { SliderPlugin } from "@syncfusion/ej2-vue-inputs";
Vue.use(SliderPlugin);
export default {
  data() {
    return {
    min: 0, max: 1, value: 0.3, step: 0.01,
    // Assigning ticks values to percentage formatting
    ticks: { placement: 'After', largeStep: .2, smallStep: .1,
showSmallTicks: true, format: 'P0' },
    // Assigning tooltip values to percentage formatting
    tooltip: { placement: 'Before', isVisible: true, showOn: 'Always',
format: 'P0' }
  }
}
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-buttons/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-popups/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
   #app {
    height: 40px;
    left: 30%;
    position: absolute;
    top: 40%;
    width: 50%;
  }
</style>
```

Copyright © 2001 -2024 Syncfusion Inc.

{% previewsample "page.domainurl/code-snippet/range-slider/format-cs3" %}

Using Events

In this method, we will be retrieving the values from the slider events then process them to desired formatted the values. In this sample we have customized the ticks values into weekdays as one formatting and tooltip values into day of the week as another formatting.

APP.VUE

```
<template>
    <div id="app">
    <ejs-slider id='events' :value='value' :tooltip="tooltip" :ticks="ticks"
:min="min" :max="max" :renderingTicks="renderingTicks"
:tooltipChange="tooltipChange"></ejs-slider>
  </div>
</template>
<script>
import Vue from "vue";
import { SliderPlugin } from "@syncfusion/ej2-vue-inputs";
Vue.use(SliderPlugin);
export default {
  data() {
    return {
       // Minimum value
        min: 0,
        // Maximum value
        max: 6,
        // Slider current value
        value: 2,
        // Assigning ticks data
        ticks: {
            placement: 'After',
            largeStep: 1
        },
        // Assigning tooltip data
        tooltip: {
            placement: 'Before',
            isVisible: true
        }
    };
  },
  methods: {
       renderingTicks: function (args) {
                // Weekdays Array
                var daysArr =
['Sunday','Monday','Tuesday','Wednesday','Thrusday','Friday','Saturday'];
                // Customizing each ticks text into weeksdays
                args.text = daysArr[parseFloat(args.value)];
        },
        tooltipChange: function (args) {
                // Customizing tooltip to display the Day (in numeric) of
the week
                args.text =  'Day ' + (Number(args.value) + 1).toString();
        }
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/range-slider/format-cs4" %}

Limits in Vue Range slider component

The slider limits restrict the slider thumb between a particular range. This is used if higher or lower value affects the process or product where the slider is being used.

The following are the six options in the slider's limits object. Each API in the limits object is optional.

- enabled: Enables the limits in the Slider.
- minStart: Sets the minimum limit for the first handle.
- minEnd: Sets the maximum limit for the first handle.
- maxStart: Sets the minimum limit for the second handle.
- maxEnd: Sets the maximum limit for the second handle.
- startHandleFixed: Locks the first handle.
- endHandleFixed: Locks the second handle.

Default and MinRange Slider limits

There is only one handle in the Default and MinRange Slider, so minStart, minEnd, and startHandleFixed options can be used. When the limits are enabled in the Slider, the limited area becomes darken. So you can differentiate the allowed and restricted area. Refer to the following snippet to enable the limits in the Slider.

`ts

.....

limits: { enabled: true, minStart: 10, minEnd: 40 }

.....

`

APP.VUE

```
<template>
    <div id="app">
    <ejs-slider id='default' :value='value' :limits='limits'
:tooltip='tooltip' :type='type'></ejs-slider>
  </div>
</template>
<script>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
import Vue from "vue";
import { SliderPlugin } from "@syncfusion/ej2-vue-inputs";
Vue.use(SliderPlugin);
export default {
  data() {
    return {
        value: 30,
        tooltip: { isVisible: true },
        limits: { enabled: true, minStart: 10, minEnd: 40 },
        type: 'MinRange'
    };
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-buttons/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-popups/styles/material.css";;
  @import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
   #app {
    height: 40px;
    left: 30%;
    position: absolute;
    top: 40%;
    width: 50%;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/range-slider/default-limit-cs1" %}

Range Slider limits

In the range slider, both handles can be restricted and locked from the limit's object. In this sample, the first handle is limited between 10 and 40, and the second handle is limited between 60 and 90.

`ts

.....

limits: { enabled: true, minStart: 10, minEnd: 40, maxStart: 60, maxEnd: 90 }

.....

`

APP.VUE

```
<template>
    <div id="app">
    <ejs-slider id='default' :value='value' :limits='limits'
:tooltip='tooltip' :type='type'></ejs-slider>
  </div>
</template>
<script>
import Vue from "vue";
import { SliderPlugin } from "@syncfusion/ej2-vue-inputs";
Vue.use(SliderPlugin);
export default {
  data() {
```

Copyright © 2001 -2024 Syncfusion Inc.

```
    return {
        value: [30, 70],
        tooltip: { isVisible: true },
        limits: { enabled: true, minStart: 10, minEnd: 40, maxStart: 60,
maxEnd: 90 },
        type: 'Range'
    };
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-buttons/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-popups/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
   #app {
    height: 40px;
    left: 30%;
    position: absolute;
    top: 40%;
    width: 50%;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/range-slider/range-limit-cs1" %}

Handle lock

The movement of slider handles can be locked by enabling the startHandleFixed and endHandleFixed properties in the limit's object.

In this sample, the movement of both slider handles has been locked.

`ts

.....

limits: { enabled: true, startHandleFixed: true, endHandleFixed: true }

.....

`

APP.VUE

```
<template>
    <div id="app">
    <ejs-slider id='default' :value='value' :limits='limits'
:tooltip='tooltip' :type='type'></ejs-slider>
  </div>
</template>
<script>
import Vue from "vue";
import { SliderPlugin } from "@syncfusion/ej2-vue-inputs";
Vue.use(SliderPlugin);
export default {
  data() {
    return {
        value: [30, 70],
```

Copyright © 2001 -2024 Syncfusion Inc.

```
        tooltip: { isVisible: true },
        limits: { enabled: true, startHandleFixed: true, endHandleFixed:
true },
        type: 'Range'
    };
  }
}
</script>

    height: 40px;
    left: 30%;
    position: absolute;
    top: 40%;
    width: 50%;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/range-slider/handle-lock-cs1" %}

Style in Vue Range slider component

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

Customizing the slider track

Use the following CSS to customize the slider track.

`

.e-control-wrapper.e-slider-container.e-horizontal .e-slider-track {

background: #007bff;

height: 3px;

}

`

Customizing the slider handle

Use the following CSS to customize the slider handle properties.

`

.e-control-wrapper.e-slider-container .e-slider .e-handle {

background-color: #f9920b;

border-radius: 50%;

border: 0;

}

`

Copyright © 2001 -2024 Syncfusion Inc.

Customizing the slider limits

Use the following CSS to customize the slider limits.

```
.e-control-wrapper.e-slider-container.e-horizontal .e-limits {
background-color: rgba(69, 100, 233, 0.46);
}
```

Customizing the slider ticks

Use the following CSS to customize the slider ticks.

```
.e-scale .e-tick.e-custom::before {
content: '\e967';
position: absolute;
}
```

Customizing the slider buttons

Use the following CSS to customize the slider buttons.

```
.e-control-wrapper.e-slider-container .e-slider-button {
background: #007bff;
height: 25px;
width: 25px;
}
```

Accessibility in Vue Range Slider component

The Range Slider component followed the accessibility guidelines and standards, including ADA, Section 508, WCAG 2.2 standards, and WCAG roles that are commonly used to evaluate accessibility.

The accessibility compliance for the Range Slider component is outlined below.

Accessibility Criteria	Compatibility
WCAG 2.2 Support	
Section 508 Support	

| Screen Reader Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Right-To-Left Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Color Contrast | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Mobile Device Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Keyboard Navigation Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Accessibility Checker Validation | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Axe-core Accessibility Validation | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> - All features of the component meet the requirement.

<img src="https://cdn.syncfusion.com/content/images/landing-page/intermediate.png" alt="Intermediate"> - Some features of the component do not meet the requirement.

<img src="https://cdn.syncfusion.com/content/images/landing-page/no.png" alt="No"> - The component does not meet the requirement.

WAI-ARIA attributes

The Range Slider component followed the WAI-ARIA patterns to meet the accessibility. The following ARIA attributes are used in the Range Slider component:

| Attributes | Purpose |

| --- | --- |

| `role=slider` | Used to convey a significant and contextual message to the user. |

| `aria-valuemin` | Indicates the Minimum value of the slider. |

| `aria-valuemax` | Indicates the Maximum value of the slider. |

| `aria-valuenow` | Indicates the current value of the slider. |

| `aria-valuetext` | Returns the current text of the slider. |

Copyright © 2001 -2024 Syncfusion Inc.

| aria-orientation | Indicates whether the Slider is oriented horizontally or vertically. |

| aria-label | Provides an accessible name for the Slider, serving as label text for the Slider's left and right buttons (for increment and decrement). |

Keyboard interaction

The Range Slider component followed the keyboard interaction guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Range Slider component.

| **Press** | **To do this** |

| --- | --- |

| Right Arrow/Up Arrow | Increase the Slider value. |

| Left Arrow/Down Arrow | Decrease the Slider value. |

| Home | Moves to the start value (for Range Slider when the second thumb is focused and the Home key is pressed, it moves to the first thumb value). |

| <kbd>End | Moves to the end value (for Range Slider when the first thumb is focused and the End key is pressed, it moves to the second thumb value). |

| Page Up | Increases the Slider by largeStep value. |

| Page Down | Decreases the Slider by largeStep value. |

Ensuring accessibility

The Range Slider component's accessibility levels are ensured through an accessibility-checker and axe-core software tools during automated testing.

The accessibility compliance of the Range Slider component is shown in the following sample. Open the sample in a new window to evaluate the accessibility of the Range Slider component with accessibility tools.

How To

Date range slider in Vue Range slider component

The date formatting can be achieved in ticks and tooltip using renderingTicks and tooltipChange events, respectively. The process of formatting is explained in the following sample.

{% previewsample "page.domainurl/code-snippet/range-slider/numeric-cs1" %}

Customize slider bar in Vue Range slider component

Slider appearance can be customized through CSS. By overriding the slider CSS classes, you can customize the slider bar. The slider bar can be customized with different themes. By default, slider have class name e-slider-track for bar. The class can be overridden with our own color values like the following code snippet.

```
.e-control.e-slider .e-slider-track .e-range {
background: linear-gradient(left, #e1451d 0, #fdff47 17%, #86f9fe 50%, #2900f8 65%, #6e00f8 74%, #e33df9 83%, #e14423 100%);
}
```

You can also apply background color for a certain range depending upon slider values, using change event.

```ts
onChange(args){
let sliderTrack = document.getElementById('dynamic*color*slider').querySelector('.e-range');
let sliderHandle = document.getElementById('dynamic*color*slider').querySelector('.e-handle');
if (args.value > 0 && args.value <= 25) {
// Change handle and range bar color to green when
(sliderHandle).style.backgroundColor = 'green';
(sliderTrack).style.backgroundColor = 'green';
} else if (args.value > 25 && args.value <= 50) {
// Change handle and range bar color to royal blue
(sliderHandle).style.backgroundColor = 'royalblue';
(sliderTrack).style.backgroundColor = 'royalblue';
} else if (args.value > 50 && args.value <= 75) {
// Change handle and range bar color to dark orange
(sliderHandle).style.backgroundColor = 'darkorange';
(sliderTrack).style.backgroundColor = 'darkorange';
} else if (args.value > 75 && args.value <= 100) {
// Change handle and range bar color to red
(sliderHandle).style.backgroundColor = 'red';
(sliderTrack).style.backgroundColor = 'red';
}
```

Copyright © 2001 -2024 Syncfusion Inc.

}
`

APP.VUE

```

Customize slider limits in Vue Range slider component

Slider appearance can be customized via CSS. By overriding the slider CSS classes, the slider limit bar can be customized. Here, the limit bar is customized with different background color. By default, the slider has class e-limits for limits bar. You can override the class with our own color values as given in the following code snippet.

`

.e-slider-container.e-horizontal .e-limits {

background-color: rgba(69, 100, 233, 0.46);

}

`

APP.VUE

```
<template>
   <div id='app'>
      <div class="col-lg-8 control-section">
            <div class="content-wrapper">
                <div class="sliderwrap">
                    <label class="userselect">MinRange Slider With
Limits</label>
                    <ejs-slider id="minrange" min=0 max=100 value=30  step=1

Customize slider ticks label in Vue Range slider component

Slider view can be customized via CSS. By overriding the slider CSS classes, you can customize the ticks. The ticks in slider allows you to easily identify the current value/values of the slider. It contains smallStep and largeStep. By default, slider has class e-tick for slider ticks. You can override the class as per your requirement. Refer to the following code snippet to render ticks.

`ts

.e-scale .e-tick.e-custom::before {

content: '\e967';

position: absolute;

}

`

Here, the color for rendered ticks has been applied through nth-child(child*number). The color is applied to the value of the child*number in the slider.

`ts

ticks_slider .e-scale :nth-child(1)::before {
color: red;

}

`

Customize slider thumb in Vue Range slider component

Slider appearance can be customized through CSS. By overriding the slider CSS classes, you can customize the thumb. By default, slider has unique class e-handle for slider thumb. You can override the following class as per your requirement. Here, in the sample, the slider thumb has been customized to square, circle, oval shapes, and background image has also been customized.

`ts

.e-control.e-slider .e-handle {

background-image: url('https://ej2.syncfusion.com/demos/src/slider/images/thumb.png');

background-color: transparent;

height: 25px;

width: 25px;

}

square_slider.e-control.e-slider .e-handle {

border-radius: 0%;

background-color: #f9920b;

border: 0;

}

circle_slider.e-control.e-slider .e-handle {

border-radius: 50%;

Copyright © 2001 -2024 Syncfusion Inc.

background-color: #f9920b;

border: 0;

}

oval_slider.e-control.e-slider .e-handle {
height: 25px;

width: 8px;

top: 3px;

border-radius: 15px;

background-color: #f9920b;

}

`

{% previewsample "page.domainurl/code-snippet/range-slider/thumb-cs1" %}

Form slider with form validator in Vue Range slider component

The Slider component can be validated using our FormValidator. The following steps walk-through slider validation.

- Render slider component inside a form.
- Bind [changed]../api/slider#changed) event in the slider component to validate the slider value when the value changes.
- Initialize and render FormValidator for the form using form ID.

`ts

// Initialize Form validation

let formObj: FormValidator;

formObj = new FormValidator("#formId", options);

`

- Set the required property in the FormValidator rules collection. Here, the min property of slider that sets the minimum value in the slider component is set, and it has hidden input as enable `validateHidden` property is set to true.

Copyright © 2001 -2024 Syncfusion Inc.

`ts

// Slider element

<ejs-slider id="default" name="slider"></ejs-slider>

// sets required property in the FormValidator rules collection

let options: FormValidatorModel = {

rules: {

'default': {

validateHidden: true,

min: [6, "You must select value greater than 5"]

}

}

};

`

Form validation is done either by ID or name value of the slider component. Above ID of the slider is used to validate it.

Using slider name: Render slider with name attribute. In the following code snippet, name attribute value of ?slider? is used for form validation.

`ts

// Slider element

<ejs-slider id="default" name="slider"></ejs-slider>

// sets required property in the FormValidator rules collection

let options: FormValidatorModel = {

rules: {

'slider': {

validateHidden: true,

min: [6, "You must select value greater than 5"]

}

}

};

`

- Validate the form using validate method, and it validates the slider value with the defined rules collection and returns the result. If user selects the value less than the minimum value, form will not submit.

`ts

Copyright © 2001 -2024 Syncfusion Inc.

formObj.validate();

`

- Slider validation can be done during value changes in slider. Refer to the following code snippet.

`ts

// change event handler for slider

onChanged(args) {

formObj.validate();

}

`

The FormValidator has following default validation rules, which are used to validate the Slider component.

| Rules | Description | Example |

| ---------- | ---------- | ---------- |

| max | Slider component must have value less than or equal to max number | if max: 3, **3** is valid and **4** is invalid |

| min | Slider component must have value greater than or equal to min number | if min: 4, **5** is valid and **2** is invalid |

| regex | Slider component must have valid value in regex format | if regex: '/4/, **4** is valid and **1** is invalid |

| range | Slider component must have value between range number | if range: [4,5], **4** is valid and **6** is invalid |

Show slider from hidden state in Vue Range slider component

This section demonstrates how-to render the Slider component in hidden state and make it visible in button click. We can initialize Slider in hidden state by setting the display as none.

In the sample, by clicking on the button, we can make the Slider visible from hidden state, and we must also call the refresh method of the Slider to render it properly based on its original dimensions.

APP.VUE

```
<template>
    <div id="app">
      <button type="button" id="btn" class="e-control e-btn" v-
on:click="onClick">Button</button>
      <div id="wrap">
        <ejs-slider
          id="slider"
          :min="minVal"
          :max="maxVal"
          :value="value"
          :tooltip="tooltip"
          :ticks="ticks"
          showButtons="true"
          :step="stepVal"
          v-on:renderingTicks="onRenderingTicks"
          v-on:tooltipChange="onTooltipChange"
        ></ejs-slider>
      </div>
    </div>
  </template>

    height: 40px;
    position: absolute;
    width: 98%;
  }
  #wrap {
    box-sizing: border-box;
    height: 260px;
    margin: 0 auto;
    padding: 30px 10px;
    width: 460px;
    display: none;
  }
  </style>
  <script>
  import Vue from "vue";
```

```
  import { SliderPlugin } from "@syncfusion/ej2-vue-inputs";
  Vue.use(SliderPlugin);
  export default {
    data: function() {
      return {
        tooltip: { placement: "Before", isVisible: true },
        minVal: new Date(2013, 6, 13, 11).getTime(),
        maxVal: new Date(2013, 6, 13, 17).getTime(),
        value: new Date(2013, 6, 13, 13).getTime(),
        stepVal: 3600000,
        // Slider ticks customization
        ticks: { placement: "After", largeStep: 2 * 3600000 }
      };
    },
    methods: {
      onTooltipChange(args) {
        let totalMiliSeconds = Number(args.text);
        let custom = { hour: "2-digit", minute: "2-digit" };
        args.text = new Date(totalMiliSeconds).toLocaleTimeString(
          "en-us",
          custom
        );
      },
      onRenderingTicks(args) {
        let totalMiliSeconds = Number(args.value);
        let custom = { hour: "2-digit", minute: "2-digit" };
        args.text = new Date(totalMiliSeconds).toLocaleTimeString(
          "en-us",
          custom
        );
      },
      onClick: function (event){
        let slider = document.getElementById("wrap");
        let ticks = document.getElementById("slider");
        slider.style.display = "block";
        ticks.ej2_instances[0].refresh();
      }
    }
  };
  </script>
```

Reversible Range Slider in Vue

You can create a Range Slider rendered with values in reverse order by setting the min property to the maximum value and the max property to the minimum value. An example of how to achieve a reversible Range Slider is shown below

APP.VUE

```
<template>
    <div id="app">
    <ejs-slider id='reverse' :orientation="orientation" :type="type"
:min="min" :max="max" :tooltip="tooltip" :ticks="ticks" ></ejs-slider>
  </div>
</template>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
<script>
import Vue from "vue";
import { SliderPlugin } from "@syncfusion/ej2-vue-inputs";
Vue.use(SliderPlugin);
export default {
  data() {
    return {
        ticks: { placement: 'Before', largeStep: 20, smallStep: 5,
showSmallTicks: true },
        tooltip: { placement: 'Before', isVisible: true, showOn: 'Always' },
        type: 'Range',
        // vertical orientation
        orientation: 'Vertical',
        // Set maximum value to min
        min: 100,
        // Set minimum value to max
        max: 0,
        // Slider current value
        value: [30, 70]
    };
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-buttons/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-popups/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
   #app {
    color: #008cff;
    height: 340px;
    left: 30%;
    position: absolute;
    width: 50%;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/range-slider/reversible-cs1" %}

Reversible order can be achieved with Horizontal orientation Range Slider by setting enableRtl as true.

Rating

Getting Started with the Vue Rating Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using Vue-CLI and integrating the Syncfusion Vue Rating component using the Composition API / Options API.

Dependencies

The list of dependencies required to use the Rating component in your application is given as follows:

`js

|-- @syncfusion/ej2-vue-inputs

|-- @syncfusion/ej2-vue-base

Copyright © 2001 -2024 Syncfusion Inc.

|-- @syncfusion/ej2-base

|-- @syncfusion/ej2-inputs

|-- @syncfusion/ej2-popups

`

Setting up the Vue 2 project

To generate a Vue 2 project using Vue-CLI, use the vue create command. Follow these steps to install Vue CLI and create a new project:

`bash

npm install -g @vue/cli

vue create quickstart

cd quickstart

npm run serve

`

or

`bash

yarn global add @vue/cli

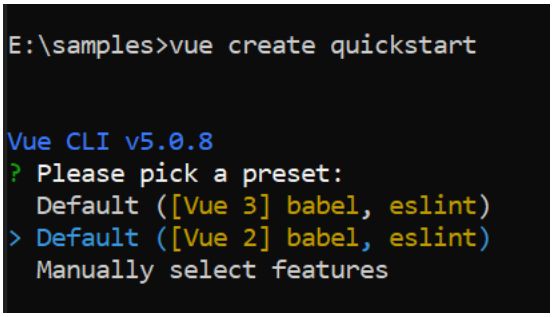
vue create quickstart

cd quickstart

yarn run serve

`

When creating a new project, choose the option `Default ([Vue 2] babel, eslint)` from the menu.



Once the `quickstart` project is set up with default settings, proceed to add Syncfusion components to the project.

Install Syncfusion `Rating` packages using below command.

Add Syncfusion Vue packages

Syncfusion packages are available at npmjs.com. To use Vue components, install the required npm package.

This article uses the Vue Rating component as an example. Install the @syncfusion/ej2-vue-inputs package by running the following command:

`bash

npm install @syncfusion/ej2-vue-inputs --save

`

or

`bash

yarn add @syncfusion/ej2-vue-inputs

`

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, the Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the Rating component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
</style>
```

Add Syncfusion Vue component

Follow the below steps to add the Vue Rating component using Composition API or Options API:

1\. First, import and register the Rating component in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { RatingComponent as EjsRating } from "@syncfusion/ej2-vue-inputs";
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { RatingComponent } from "@syncfusion/ej2-vue-inputs";
export default {
components: {
'ejs-rating': RatingComponent
}
}
</script>
```

Copyright © 2001 -2024 Syncfusion Inc.

2\. In the template section define the Rating component.

~/SRC/APP.VUE

```
<template>
<div class='wrap'>
<ejs-rating id="rating"></ejs-rating>
</div>
</template>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
    <div class='wrap'>
        <ejs-rating id="rating"></ejs-rating>
    </div>
</template>
<script setup>
import { RatingComponent as EjsRating } from "@syncfusion/ej2-vue-inputs";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
.wrap {
  margin: 50px auto;
  text-align: center;
}
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
    <div class='wrap'>
        <ejs-rating id="rating"></ejs-rating>
    </div>
</template>
<script>
import { RatingComponent } from "@syncfusion/ej2-vue-inputs";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
export default {
  components: {
    'ejs-rating': RatingComponent
  }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
```

Copyright © 2001 -2024 Syncfusion Inc.

```
.wrap {
  margin: 50px auto;
  text-align: center;
}
</style>
```

Run the project

To run the project, use the following command:

`bash

npm run serve

`

or

`bash

yarn run serve

`

{% previewsample "page.domainurl/code-snippet/rating/getting-started-cs1" %}

Value

You can set the rating value by using the value property.

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
    <div class='wrap'>
        <ejs-rating id="rating" value="3.0"></ejs-rating>
    </div>
</template>
<script setup>
import { RatingComponent as EjsRating } from "@syncfusion/ej2-vue-inputs";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
.wrap {
  margin: 50px auto;
  text-align: center;
}
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
    <div class='wrap'>
        <ejs-rating id="rating" value="3.0"></ejs-rating>
    </div>
</template>
<script>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
import { RatingComponent } from "@syncfusion/ej2-vue-inputs";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
export default {
  components: {
    'ejs-rating': RatingComponent
  }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
.wrap {
  margin: 50px auto;
  text-align: center;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/rating/value-cs1" %}

Getting Started with Syncfusion Rating Component in Vue 3

This article provides a step-by-step guide for setting up a Vite project with a JavaScript environment and integrating the Syncfusion Vue Rating component using the Composition API / Options API.

The Composition API is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

The Options API is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

Prerequisites

System requirements for Syncfusion Vue UI components

Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using Vite. To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

`bash

npm create vite@latest

`

or

`bash

yarn create vite

`

Using one of the above commands will lead you to set up additional configurations for the project as below:

Copyright © 2001 -2024 Syncfusion Inc.

1.Define the project name: We can specify the name of the project directly. Let's specify the name of the project as my-project for this article.

`bash

? Project name: » my-project

`

2.Select Vue as the framework. It will create a Vue 3 project.

`bash

? Select a framework: » - Use arrow-keys. Return to submit.

Vanilla

Vue

React

Preact

Lit

Svelte

Others

`

3.Choose JavaScript as the framework variant to build this Vite project using JavaScript and Vue.

`bash

? Select a variant: » - Use arrow-keys. Return to submit.

JavaScript

TypeScript

Customize with create-vue ↗

Nuxt ↗

`

4.Upon completing the aforementioned steps to create the my-project, run the following command to install its dependencies:

`bash

cd my-project

npm install

`

or

`bash

cd my-project

yarn install

`

Now that my-project is ready to run with default settings, let's add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion Vue component packages are available at npmjs.com. To use Syncfusion Vue components in the project, install the corresponding npm package.

This article uses the Vue Rating component as an example. To use the Vue Rating component in the project, the @syncfusion/ej2-vue-inputs package needs to be installed using the following command:

Adding Syncfusion Rating package in the application

Syncfusion Vue packages are maintained in the npmjs.com registry. The Rating component will be used in this example. To install it use the following command.

`bash

npm install @syncfusion/ej2-vue-inputs --save

`

or

`bash

yarn add @syncfusion/ej2-vue-inputs

`

Adding CSS reference for Syncfusion Vue Rating component

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the Button component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
</style>
```

Adding Syncfusion Vue Rating component in the application

Follow the below steps to add the Vue Rating component using Composition API or Options API:

1. First, import and register the Rating component in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

Copyright © 2001 -2024 Syncfusion Inc.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { RatingComponent as EjsRating } from "@syncfusion/ej2-vue-inputs";
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { RatingComponent } from "@syncfusion/ej2-vue-inputs";
export default {
name: "App",
components: {
"ejs-rating": RatingComponent
}
}
</script>
```

2. Add the component definition in template section.

~/SRC/APP.VUE

```
<template>
<ejs-rating id="rating"></ejs-rating>
</template>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<ejs-rating id="rating"></ejs-rating>
</template>
<script setup>
import { RatingComponent as EjsRating } from "@syncfusion/ej2-vue-inputs";
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<ejs-rating id="rating"></ejs-rating>
</template>
<script>
import { RatingComponent } from "@syncfusion/ej2-vue-inputs";
export default {
name: "App",
components: {
"ejs-rating": RatingComponent
}
```

Copyright © 2001 -2024 Syncfusion Inc.

```
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
</style>
```

Run the project

To run the project, use the following command:

`bash

npm run dev

`

or

`bash

yarn run dev

`

The output will appear as follows:

For migrating from Vue 2 to Vue 3, refer to the migration documentation.

Precision modes in Vue Rating component

You can use the precision property of the rating component to provide ratings with varying levels of precision.

The precision types of Rating are as follows:

- Full: The rating is increased in whole number increments. For example, if the current rating is 2, the next possible ratings are 3, 4, and so on.
- Half: The rating is increased in increments of 0.5 (half). For example, if the current rating is 2.5, the next possible ratings are 3, 3.5, 4, and so on.
- Quarter: The rating is increased in increments of 0.25 (quarter). For example, if the current rating is 3.75, the next possible ratings are 4, 4.25, 4.5, and so on.
- Exact: The rating is increased in increments of 0.1. For example, if the current rating is 3.9, the next possible ratings are 4, 4.1, 4.2, and so on.

.wrap {
  margin: 50px auto;
  text-align: center;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/rating/events-cs2" %}

Labels in Vue Rating component

You can use the showLabel property to display a label that shows the current value of the rating. When the showLabel property is set to true, a label will be displayed.

APP.VUE

```
<template>
    <div class='wrap'>
        <ejs-rating id="rating" value="3" :showLabel="true"></ejs-rating>
    </div>
</template>
<script>
import Vue from 'vue';
import { RatingPlugin } from "@syncfusion/ej2-vue-inputs";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(RatingPlugin);
export default {}
```

Copyright © 2001 -2024 Syncfusion Inc.

```
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
.wrap {
  margin: 50px auto;
  text-align: center;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/rating/labels/showlabel-cs1" %}

Label position

The rating component allows you to place the label on the top, bottom, left, or right side of the rating using the labelPosition property.

The following label positions are supported:

- Top: The label is placed on the top of the rating.
- Bottom: The label is placed on the bottom of the rating.
- Left: The label is placed on the left side of the rating.
- Right: The label is placed on the right side of the rating.

APP.VUE

```
<template>
    <div class='wrap'>
        <label>Left Label Position</label><br/>
        <ejs-rating id="rating1" value="3" :showLabel="true"
labelPosition="Left"></ejs-rating><br/>
        <label>Right Label Position</label><br/>
        <ejs-rating id="rating2" value="3" :showLabel="true"
labelPosition="Right"></ejs-rating><br/>
        <label>Top Label Position</label><br/>
        <ejs-rating id="rating3" value="3" :showLabel="true"
labelPosition="Top"></ejs-rating><br/>
        <label>Bottom Label Position</label><br/>
        <ejs-rating id="rating4" value="3" :showLabel="true"
labelPosition="Bottom"></ejs-rating><br/>
    </div>
</template>
<script>
import Vue from 'vue';
import { RatingPlugin } from "@syncfusion/ej2-vue-inputs";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(RatingPlugin);
export default {}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
.wrap {
```

Copyright © 2001 -2024 Syncfusion Inc.

```
  margin: 50px auto;
  text-align: center;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/rating/labels/label-positions-cs1" %}

Label template

You can use the labelTemplate tag directive to specify a custom template for the Label of the rating. The current value of the rating will be passed as the value property in the template context when building the content of the label. This allows you to include dynamic information about the rating in the template.

APP.VUE

```
<template>
    <div class='wrap'>
        <ejs-rating id="rating" value="3" :showLabel="true"
:labelTemplate="labelTemplate" ></ejs-rating>
    </div>
</template>
<script>
import Vue from 'vue';
import { RatingPlugin } from "@syncfusion/ej2-vue-inputs";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(RatingPlugin);
export default {
    data() {
        return {
            labelTemplate: function(e) {
                 return { template: Vue.component("labelTemplate", {
                    template: '<span>{{data.value}} out of 5</span>',
                    data() {
                        return {
                            data: {}
                        };
                    }
                })}
            }
        }
    };
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
.wrap {
  margin: 50px auto;
  text-align: center;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/rating/labels/label-template-cs1" %}

Tool tip in Vue Rating component

The rating component supports tooltip to show additional information in rating items by setting the showTooltip property. If enabled, the tooltip appears when the user hovers over a rating item.

APP.VUE

```
<template>
    <div class='wrap'>
        <ejs-rating id="rating" value="3" :showTooltip="true" ></ejs-rating>
    </div>
</template>
<script>
import Vue from 'vue';
import { RatingPlugin } from "@syncfusion/ej2-vue-inputs";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(RatingPlugin);
export default {}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
.wrap {
  margin: 50px auto;
  text-align: center;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/rating/tooltip/showtooltip-cs1" %}

Tooltip template

You can use the tooltipTemplate tag directive to specify a custom template for the tooltip of the rating. The current value of the rating will be passed as the value property in the template context when building the content of the tooltip. This allows you to include dynamic information about the rating in the template.

APP.VUE

```
<template>
    <div class='wrap'>
        <ejs-rating id="rating" value="3" :showTooltip="true"
:tooltipTemplate="tooltipTemplate"></ejs-rating>
    </div>
</template>
<script>
import Vue from 'vue';
import { RatingPlugin } from "@syncfusion/ej2-vue-inputs";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(RatingPlugin);
var ratingTooltipTemplate = Vue.component("tooltipTemplate", {
  template: `<b v-if='data.value==1'>Angry</b>
             <b v-else-if='data.value==2'>Sad</b>
             <b v-else-if='data.value==3'>Neutral</b>
             <b v-else-if='data.value==4'>Good</b>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
            <b v-else>Happy</b>`,
  data() {
    return {
        data: {}
    };
  }
});
export default {
    data() {
        return {
            tooltipTemplate: function(e) {
                return {
                    template: ratingTooltipTemplate
                }
            }
        }
    };
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
.wrap {
  margin: 50px auto;
  text-align: center;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/rating/tooltip/tooltip-template-cs1" %}

Tooltip customization

You can customize the appearance of the tooltips using the cssClass property of the rating component and by defining the custom styles for tooltip elements like the below example.

You can find more information about customizing the appearance of the tooltip in the Tooltip Customization documentation.

APP.VUE

```
<template>
    <div class='wrap'>
        <ejs-rating id="rating" value="3" :showTooltip="true"
cssClass="customtooltip" ></ejs-rating>
    </div>
</template>
<script>
import Vue from 'vue';
import { RatingPlugin } from "@syncfusion/ej2-vue-inputs";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(RatingPlugin);
export default {}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
```

Copyright © 2001 -2024 Syncfusion Inc.

```
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
.wrap {
  margin: 50px auto;
  text-align: center;
}
/* To change the radius of the tooltip corners. */
.customtooltip.e-tooltip-wrap {
  border-radius: 3px;
}
/* To change the size of the tooltip content. */
.customtooltip.e-tooltip-wrap .e-tip-content {
  font-size:14px;
}
/* To change the border color and width for tooltip. */
.customtooltip.e-tooltip-wrap.e-popup {
  border: 2px solid #000000;
}
/* To change the color for arrow of the tooltip. */
.customtooltip.e-tooltip-wrap .e-arrow-tip-inner.e-tip-bottom {
  border: 12px #9693
}
/* To change the top border color for arrow of the tooltip. */
.customtooltip.e-tooltip-wrap .e-arrow-tip-outer.e-tip-bottom {
  border-top: 9.5px solid #000000;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/rating/tooltip/custom-tooltip-cs1" %}

Selection in Vue Rating component

The rating component allows users to rate something using a visual scale, and the selection state can be changed by the user clicking or tapping on the stars in the rating scale or through code. The rating component has a minimum value and a reset button, and provides customization options for the selected rating value and selection behavior.

APP.VUE

```
<template>
    <div class='wrap'>
        <ejs-rating id="rating" value="3" ></ejs-rating>
    </div>
</template>
<script>
import Vue from 'vue';
import { RatingPlugin } from "@syncfusion/ej2-vue-inputs";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(RatingPlugin);
export default {}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
.wrap {
```

Copyright © 2001 -2024 Syncfusion Inc.

```
  margin: 50px auto;
  text-align: center;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/rating/selection/default-cs1" %}

Min value

You can use the min property of the rating component to set the minimum possible rating value the user can select. If you set the min property to 2, then you will not be able to select a rating lower than 2.

APP.VUE

```
<template>
    <div class='wrap'>
        <ejs-rating id="rating" min="2" ></ejs-rating>
    </div>
</template>
<script>
import Vue from 'vue';
import { RatingPlugin } from "@syncfusion/ej2-vue-inputs";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(RatingPlugin);
export default {}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
.wrap {
  margin: 50px auto;
  text-align: center;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/rating/selection/min-cs1" %}

Single selection

You can use the enableSingleSelection property of the rating component to select only one item at a time. When the enableSingleSelection property is set to true, only the selected item will be considered to be in the selected state, while all other items will be unselected.

APP.VUE

```
<template>
    <div class='wrap'>
        <ejs-rating id="rating" value="3"
:enableSingleSelection="true"></ejs-rating>
    </div>
</template>
<script>
import Vue from 'vue';
import { RatingPlugin } from "@syncfusion/ej2-vue-inputs";
import { enableRipple } from '@syncfusion/ej2-base';
```

Copyright © 2001 -2024 Syncfusion Inc.

```
enableRipple(true);
Vue.use(RatingPlugin);
export default {}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
.wrap {
  margin: 50px auto;
  text-align: center;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/rating/selection/single-selection-cs1" %}

Show or hide reset button

You can reset the rating value to its default by using the allowReset property of the rating component. When the allowReset property is set to true, a reset button will be shown that allows the user to reset the rating value to its default.

APP.VUE

```
<template>
    <div class='wrap'>
        <ejs-rating id="rating" value="3" :allowReset="true"></ejs-rating>
    </div>
</template>
<script>
import Vue from 'vue';
import { RatingPlugin } from "@syncfusion/ej2-vue-inputs";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(RatingPlugin);
export default {}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
.wrap {
  margin: 50px auto;
  text-align: center;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/rating/selection/allow-reset-cs1" %}

Templates in Vue Rating component

The rating component allows you to customize the appearance of the rating items using templates. You can use templates to specify a custom layout for the rating items, which can include any content you want. This allows you to create a more customized and interactive rating experience for the user.

The rating component supports below templates for item customization.

Copyright © 2001 -2024 Syncfusion Inc.

- emptyTemplate
- fullTemplate

Empty (unrated) symbol template

To customize the appearance of **unrated** items, you can use the emptyTemplate tag directive. It allows you to specify the desired custom content for the unrated items. The value and index are available in the template context for accessing information about the un-rated item.

If the fullTemplate is not defined, the emptyTemplate will be used as the default for both rated and unrated items. You can apply custom styles to differentiate between the rated and unrated states of the items.

APP.VUE

```
<template>
    <div class='wrap'>
        <ejs-rating id="rating" value="3" emptyTemplate="<span
class='custom-font sf-rating-heart'></span>" ></ejs-rating>
    </div>
</template>
<script>
import Vue from 'vue';
import { RatingPlugin } from "@syncfusion/ej2-vue-inputs";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(RatingPlugin);
export default {}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
.wrap {
  margin: 50px auto;
  text-align: center;
}
.e-rating-container .custom-font {
  /* To add the background color for the font icon. */
  background: linear-gradient(to right, rgb(254,87,133,255) var(--rating-
value), transparent var(--rating-value));
  /* To clip the background to the icon (text) alone. */
  background-clip: text;
  -webkit-background-clip: text;
  /* To make the background color visible instead of font color. */
  -webkit-text-fill-color: transparent;
  /* To provide a border for font icon. */
  -webkit-text-stroke: 1px rgb(254,87,133,255);
}

The current value of the rating item available in the template context as `value` and in the rating item element as CSS Variable(`--rating-value`) can be used to support precision in templates.

Full (rated) symbol template

To customize the appearance of **rated** items in the rating component, you can use the `fullTemplate` tag directive. This directive allows you to specify a custom layout for the rated items, which can include any content you desire. The `value` and `index` are available in the template context for accessing information about the rated item.

Using Emoji icon as rating symbol

You can use emojis of your choice as rating symbol by specifying them as template content within the `emptyTemplate` tag directive.

APP.VUE

```
<template>
    <div class='wrap'>
        <ejs-rating id="rating" value="4" :emptyTemplate="emptyTemplate"
:enableSingleSelection="true" :enableAnimation="false" ></ejs-rating>
    </div>
</template>
<script>
import Vue from 'vue';
import { RatingPlugin } from "@syncfusion/ej2-vue-inputs";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(RatingPlugin);
var emojiTemplate = Vue.component("emptyTemplate", {
  template: `<span v-if='data.index==0' class='angry emoji'>😠</span>
             <span v-else-if='data.index==1' class='disagree
emoji'>☹</span>
             <span v-else-if='data.index==2' class='neutral
emoji'>😐</span>
             <span v-else-if='data.index==3' class='agree emoji'>🙂</span>
             <span v-else class='happy emoji'>😀</span>`,
  data() {
    return {
```

Events in Vue Rating component

This section describes the rating events that will be triggered when appropriate actions are performed. The following events are available in the rating component.

beforeItemRender

The rating component triggers the beforeItemRender event before rendering each rating item. The RatingItemEventArgs passed as an event argument provides the details of the item to be rendered.

```
<template>
<div class='wrap'>
<ejs-rating id="rating" :beforeItemRender="beforeItemRender"></ejs-rating>
</div>
</template>
<script>
import Vue from 'vue';
import { RatingPlugin  } from "@syncfusion/ej2-vue-inputs";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(RatingPlugin);
export default {
methods : {
beforeItemRender: function(args: RatingItemEventArgs) {
//Your required action here
}
}
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
.wrap {
margin: 50px auto;
text-align: center;
}
```

Copyright © 2001 -2024 Syncfusion Inc.

```
</style>
`
```

created

The rating component triggers the created event when the rendering of the rating component is completed.

```
`
<template>
<div class='wrap'>
<ejs-rating id="rating" :created="created"></ejs-rating>
</div>
</template>
<script>
import Vue from 'vue';
import { RatingPlugin  } from "@syncfusion/ej2-vue-inputs";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(RatingPlugin);
export default {
methods : {
created: function() {
//Your required action here
}
}
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
.wrap {
margin: 50px auto;
text-align: center;
}
</style>
```

Copyright © 2001 -2024 Syncfusion Inc.

`

onItemHover

The rating component triggers the onItemHover event when the rating item is hovered. The RatingHoverEventArgs passed as an event argument provides the details of the hovered item.

`

```
<template>
<div class='wrap'>
<ejs-rating id="rating" :onItemHover="onItemHover"></ejs-rating>
</div>
</template>
<script>
import Vue from 'vue';
import { RatingPlugin  } from "@syncfusion/ej2-vue-inputs";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(RatingPlugin);
export default {
methods : {
onItemHover: function(args: RatingHoverEventArgs) {
//Your required action here
}
}
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
.wrap {
margin: 50px auto;
text-align: center;
}
</style>
```

`

Copyright © 2001 -2024 Syncfusion Inc.

valueChanged

The rating component triggers the valueChanged event when the value of the rating is changed. The RatingChangedEventArgs passed as an event argument provides the details when value is changed.

```
<template>
<div class='wrap'>
<ejs-rating id="rating" :valueChanged="valueChanged"></ejs-rating>
</div>
</template>
<script>
import Vue from 'vue';
import { RatingPlugin  } from "@syncfusion/ej2-vue-inputs";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(RatingPlugin);
export default {
methods : {
valueChanged: function(args: RatingChangedEventArgs) {
//Your required action here
}
}
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
.wrap {
margin: 50px auto;
text-align: center;
}
</style>
```

Below example demonstrates the valueChanged event of the Rating component.

Copyright © 2001 -2024 Syncfusion Inc.

APP.VUE

```
<template>
    <div class='wrap'>
        <ejs-rating id="rating" :valueChanged="valueChanged"></ejs-rating>
    </div>
</template>
<script>
import Vue from 'vue';
import { RatingPlugin, RatingChangedEventArgs  } from "@syncfusion/ej2-vue-inputs";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(RatingPlugin);
export default {
    methods : {
        valueChanged: function(args: RatingChangedEventArgs) {
          alert("Previous Value:"+args.previousValue+"\nValue:"+args.value);
        }
    }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
.wrap {
  margin: 50px auto;
  text-align: center;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/rating/events-cs1" %}

Appearance in Vue Rating component

You can also customize the appearance of rating component.

Items count

You can specify the number of rating items using the itemsCount property.

APP.VUE

```
<template>
    <div class='wrap'>
        <ejs-rating id="rating" itemsCount="8" value="3"></ejs-rating>
    </div>
</template>
<script>
import Vue from 'vue';
import { RatingPlugin  } from "@syncfusion/ej2-vue-inputs";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(RatingPlugin);
export default {}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
```

Copyright © 2001 -2024 Syncfusion Inc.

```
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
.wrap {
  margin: 50px auto;
  text-align: center;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/rating/appearance/items-count-cs1" %}

Disabled

You can disable the rating component by using the disabled property. When the disabled property is set to true, the rating component will be disabled and the user will not be able to interact with it and a disabled rating component may have a different visual appearance than an enabled one.

APP.VUE

```
<template>
    <div class='wrap'>
        <ejs-rating id="rating" value="3" :disabled="true"></ejs-rating>
    </div>
</template>
<script>
import Vue from 'vue';
import { RatingPlugin  } from "@syncfusion/ej2-vue-inputs";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(RatingPlugin);
export default {}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
.wrap {
  margin: 50px auto;
  text-align: center;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/rating/appearance/disabled-cs1" %}

Visible

You can use the visible property of the rating component to component the visibility of the component. When the visible property is set to true, the rating component will be visible on the page. When it is set to false, the component will be hidden.

APP.VUE

```
<template>
    <div class='wrap'>
        <button id='btn' @click="visible">Visible</button>
        <ejs-rating id="rating" value="3" :visible="true"
ref="rating"></ejs-rating>
    </div>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
</template>
<script>
import Vue from 'vue';
import { RatingPlugin  } from "@syncfusion/ej2-vue-inputs";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(RatingPlugin);
export default {
    methods : {
        visible: function() {
            this.$refs.rating.visible = !this.$refs.rating.visible;
        }
    }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
.wrap {
  margin: 50px auto;
  text-align: center;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/rating/appearance/visible-cs1" %}

Read only

You can use the readOnly property of the rating component to make the component non-interactive and prevent the user from changing the rating value.

APP.VUE

```
<template>
    <div class='wrap'>
        <ejs-rating id="rating" value="3" :readOnly="true"></ejs-rating>
    </div>
</template>
<script>
import Vue from 'vue';
import { RatingPlugin  } from "@syncfusion/ej2-vue-inputs";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(RatingPlugin);
export default {}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
.wrap {
  margin: 50px auto;
  text-align: center;
}
</style>
```

Copyright © 2001 -2024 Syncfusion Inc.

{% previewsample "page.domainurl/code-snippet/rating/appearance/read-only-cs1" %}

CssClass

You can customize the appearance of the rating component, such as by changing its colors, fonts, sizes, or other visual aspects by using the cssClass property.

Changing rating symbol border color

You can change the rating icon border color in rating component, you can use the cssClass property and set the text-stroke CSS property of .e-rating-icon to your desired border color.

APP.VUE

```
<template>
    <div class='wrap'>
        <ejs-rating id="rating" value="3" cssClass="custom-border" ></ejs-
rating>
    </div>
</template>
<script>
import Vue from 'vue';
import { RatingPlugin  } from "@syncfusion/ej2-vue-inputs";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(RatingPlugin);
export default {}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
.wrap {
  margin: 50px auto;
  text-align: center;
}
.e-rating-container.custom-border .e-rating-item-list:hover .e-rating-item-
container .e-rating-icon,
.e-rating-container.custom-border .e-rating-item-container .e-rating-icon {
  /* To change rating symbol border color */
  -webkit-text-stroke: 2px #ae9e9d;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/rating/appearance/border-cs1" %}

Changing rated/un-rated symbol fill color

You can customize the fill colors of rated and un-rated icons in the rating component using the cssClass property and the linear-gradient color-stops in the background CSS property of .e-rating-icon. The **first** color-stop defines the rated fill color and the **second** defines the un-rated fill color.

APP.VUE

```
<template>
    <div class='wrap'>
        <ejs-rating id="rating" value="3" cssClass="custom-fill" ></ejs-
rating>
    </div>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
</template>
<script>
import Vue from 'vue';
import { RatingPlugin  } from "@syncfusion/ej2-vue-inputs";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(RatingPlugin);
export default {}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
.wrap {
  margin: 50px auto;
  text-align: center;
}
.e-rating-container.custom-fill .e-rating-item-list:hover .e-rating-item-
container .e-rating-icon,
.e-rating-container.custom-fill .e-rating-item-container .e-rating-icon {
  /* To change rated symbol fill color and un-rated symbol fill color */
  background: linear-gradient(to right, #ffe814 var(--rating-value), #d8d7d4
var(--rating-value));
  background-clip: text;
  -webkit-background-clip: text;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/rating/appearance/fill-color-cs1" %}

This will customize the rated fill color to #ffe814 and un-rated fill color to #d8d7d4. --rating-value in the linear-gradient provides the current value of the rating item.

Changing the item spacing

You can change the space between the rating items in rating component, by using the cssClass property and setting the margin / padding CSS property of .e-rating-item-container to your desired size.

APP.VUE

```
<template>
    <div class='wrap'>
        <ejs-rating id="rating" value="3" cssClass="custom-font" ></ejs-
rating>
    </div>
</template>
<script>
import Vue from 'vue';
import { RatingPlugin  } from "@syncfusion/ej2-vue-inputs";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(RatingPlugin);
export default {}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
```

```
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
.wrap {
  margin: 50px auto;
  text-align: center;
}
.e-rating-container.custom-font .e-rating-item-container {
  /* To change the size between items */
  margin: 0px 7px;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/rating/appearance/spacing-cs1" %}

Changing icon using CssClass

You can change the rating item icon in rating component, you can use the `cssClass` property and set the `content` CSS property of `.e-icons.e-star-filled:before` to your desired font icon.

APP.VUE

```
<template>
    <div class='wrap'>
        <ejs-rating id="rating" value="3" cssClass="custom-icon" ></ejs-
rating>
    </div>
</template>
<script>
import Vue from 'vue';
import { RatingPlugin  } from "@syncfusion/ej2-vue-inputs";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(RatingPlugin);
export default {}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
.wrap {
  margin: 50px auto;
  text-align: center;
}
@font-face {
  font-family: 'custom-icon';
  src: url(data:application/x-font-ttf;charset=utf-

Accessibility in Vue Rating component

Accessibility is achieved in the rating component through WAI-ARIA standard and keyboard navigations. The rating component can be effectively accessed through assistive technologies such as screen readers.

Keyboard interaction

The rating component is interactive with below keyboard shortcuts.

| Keyboard shortcuts | Actions |

|------------|-------------------|

| Space | If a **Reset Button** is focused, resets the value to min value. |

| Arrow Up | Increases the value. |

| Arrow Left | Decreases the value and in RTL mode, increases the value. |

| Arrow Down | Decreases the value. |

| Arrow Right | Increases the value and in RTL mode, decreases the value. |

ARIA attribute

The following ARIA attributes are used in rating component based on its state.

Copyright © 2001 -2024 Syncfusion Inc.

| Properties | Functionality |

| ---------- | ---------- |

| role | This attribute is added to the div element to describe the actual role. |

| aria-label | Attribute provides the text label with some default description for the Rating and its items. |

| aria-valuemin | It defines the minimum value of rating. |

| aria-valuemax | It defines the maximum value of rating. |

| aria-valuenow | It defines the current value of rating. |

Ribbon

Getting Started with the Vue Ribbon Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using Vue-CLI and integrating the Syncfusion Vue Ribbon component

Prerequisites

System requirements for Syncfusion Vue UI components

Dependencies

The following list of dependencies are required to use the Ribbon component in your application.

`js

|-- @syncfusion/ej2-vue-ribbon

|-- @syncfusion/ej2-vue-base

|-- @syncfusion/ej2-base

|-- @syncfusion/ej2-data

|-- @syncfusion/ej2-buttons

|-- @syncfusion/ej2-popups

|-- @syncfusion/ej2-splitbuttons

|-- @syncfusion/ej2-inputs

|-- @syncfusion/ej2-lists

|-- @syncfusion/ej2-dropdowns

|-- @syncfusion/ej2-navigations

|-- @syncfusion/ej2-ribbon

`

Setting up the Vue 2 project

To generate a Vue 2 project using Vue-CLI, use the vue create command. Follow these steps to install Vue CLI and create a new project:

`bash

npm install -g @vue/cli

Copyright © 2001 -2024 Syncfusion Inc.

vue create quickstart

cd quickstart

npm run serve

`

or

`bash

yarn global add @vue/cli

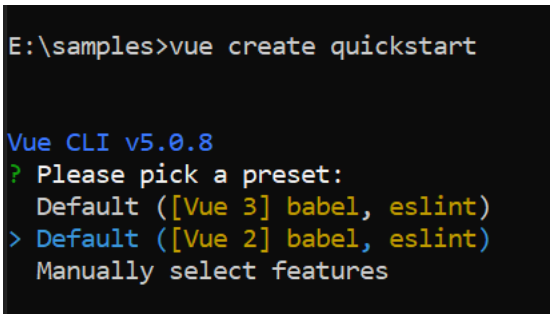
vue create quickstart

cd quickstart

yarn run serve

`

When creating a new project, choose the option Default ([Vue 2] babel, eslint) from the menu.



Once the quickstart project is set up with default settings, proceed to add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion packages are available at npmjs.com. To use Vue components, install the required npm package.

This article uses the Vue Ribbon component as an example. Install the @syncfusion/ej2-vue-ribbon package by running the following command:

`bash

npm install @syncfusion/ej2-vue-ribbon --save

`

or

`bash

yarn add @syncfusion/ej2-vue-ribbon

`

Copyright © 2001 -2024 Syncfusion Inc.

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, the Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the Ribbon component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-lists/styles/material.css";
@import "../node_modules/@syncfusion/ej2-dropdowns/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-ribbon/styles/material.css";
</style>
```

Add Syncfusion Vue component

Follow the below steps to add the Vue Ribbon component using:

1\. First, import and register the Ribbon component in the script section of the **src/App.vue** file.

~/SRC/APP.VUE

```
<script>
import { RibbonPlugin } from "@syncfusion/ej2-vue-ribbon";
export default {
components: {
'ejs-ribbon': RibbonComponent
}
}
</script>
```

2\. In the template section, define the Ribbon component.

~/SRC/APP.VUE

```
<template>
<ejs-ribbon id="ribbon"></ejs-ribbon>
</template>
```

Adding Ribbon Tab

In Ribbon, the options are arranged in tabs for easy access. You can use the e-ribbon-tab directive to define the ribbon tab like below.

~/SRC/APP.VUE

```
<template>
<ejs-ribbon id="ribbon">
```

Copyright © 2001 -2024 Syncfusion Inc.

```
<e-ribbon-tabs>
<e-ribbon-tab header="Home"></e-ribbon-tab>
</e-ribbon-tabs>
</ejs-ribbon>
</template>
<script>
import { RibbonComponent, RibbonTabDirective, RibbonTabsDirective } from
"@syncfusion/ej2-vue-ribbon";
export default {
components: {
'ejs-ribbon': RibbonComponent,
'e-ribbon-tab': RibbonTabDirective,
'e-ribbon-tabs': RibbonTabsDirective
}
};
</script>
```

Adding Ribbon Group

To define a ribbon group under each tab, you can use the e-ribbon-group directive like below. The orientation property of ribbon group defines whether the collection of items will be rendered column-wise or row-wise.

~/SRC/APP.VUE

```
<template>
<ejs-ribbon id="ribbon">
<e-ribbon-tabs>
<e-ribbon-tab header="Home">
<e-ribbon-groups>
<e-ribbon-group header="Clipboard" orientation="Row"></e-ribbon-group>
</e-ribbon-groups>
</e-ribbon-tab>
</e-ribbon-tabs>
</ejs-ribbon>
</template>
<script>
import { RibbonComponent, RibbonTabDirective, RibbonTabsDirective,
RibbonGroupDirective, RibbonGroupsDirective } from "@syncfusion/ej2-vue-
ribbon";
export default {
components: {
'ejs-ribbon': RibbonComponent,
'e-ribbon-tab': RibbonTabDirective,
'e-ribbon-tabs': RibbonTabsDirective,
'e-ribbon-groups': RibbonGroupsDirective,
'e-ribbon-group': RibbonGroupDirective
}
};
</script>
```

Adding Ribbon Items

You can use the e-ribbon-collection directive to define each ribbon collection that contains one or more items. To define each ribbon item, you can use the e-ribbon-item directive and the type property

Copyright © 2001 -2024 Syncfusion Inc.

to specify the type of component to be rendered, like a button, a drop-down button, a combo box, and more.

~/SRC/APP.VUE

```
<template>
<ejs-ribbon id="ribbon">
<e-ribbon-tabs>
<e-ribbon-tab header="Home">
<e-ribbon-groups>
<e-ribbon-group header="Clipboard" orientation="Column">
<e-ribbon-collections>
<e-ribbon-collection id="paste-collection">
<e-ribbon-items>
<e-ribbon-item type="SplitButton" :splitButtonSettings="pasteSettigs"></e-
ribbon-item>
</e-ribbon-items>
</e-ribbon-collection>
<e-ribbon-collection id="cutcopy-collection">
<e-ribbon-items>
<e-ribbon-item type="Button" :buttonSettings="cutButton"></e-ribbon-item>
<e-ribbon-item type="Button" :buttonSettings="copyButton"></e-ribbon-item>
</e-ribbon-items>
</e-ribbon-collection>
</e-ribbon-collections>
</e-ribbon-group>
</e-ribbon-groups>
</e-ribbon-tab>
</e-ribbon-tabs>
</ejs-ribbon>
</template>
<script>
import { RibbonComponent, RibbonTabDirective, RibbonTabsDirective,
RibbonGroupDirective, RibbonGroupsDirective, RibbonCollectionDirective,
RibbonCollectionsDirective, RibbonItemDirective, RibbonItemsDirective } from
"@syncfusion/ej2-vue-ribbon";
export default {
components: {
'ejs-ribbon': RibbonComponent,
'e-ribbon-tab': RibbonTabDirective,
'e-ribbon-tabs': RibbonTabsDirective,
'e-ribbon-group': RibbonGroupDirective,
'e-ribbon-groups': RibbonGroupsDirective,
'e-ribbon-collection': RibbonCollectionDirective,
'e-ribbon-collections': RibbonCollectionsDirective,
'e-ribbon-item': RibbonItemDirective,
'e-ribbon-items': RibbonItemsDirective
},
data: function () {
return {
pasteSettigs:{
iconCss: "e-icons e-paste", content: "Paste",
items: [{ text: "Keep Source Format" }, { text: "Merge format" }, { text:
"Keep text only" }]
},
cutButton:  { iconCss: "e-icons e-cut", content: "Cut" },
copyButton:  { iconCss: "e-icons e-copy", content: "Copy" },
```

Copyright © 2001 -2024 Syncfusion Inc.

```
}
}
};
</script>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

~/SRC/APP.VUE

```
<template>
  <ejs-ribbon :fileMenu="fileSettings">
    <e-ribbon-tabs>
      <e-ribbon-tab header="Home">
        <e-ribbon-groups>
          <e-ribbon-group header="Clipboard" groupIconCss="e-icons e-paste"
:showLauncherIcon="true" >
            <e-ribbon-collections>
              <e-ribbon-collection>
                <e-ribbon-items>
                  <e-ribbon-item type="SplitButton"
:allowedSizes="largeSize" :splitButtonSettings="pasteSettigs" >
                  </e-ribbon-item>
                </e-ribbon-items>
              </e-ribbon-collection>
              <e-ribbon-collection>
                <e-ribbon-items>
                  <e-ribbon-item type="Button" :buttonSettings="cutButton">
                  </e-ribbon-item>
                  <e-ribbon-item type="Button" :buttonSettings="copyButton">
                  </e-ribbon-item>
                  <e-ribbon-item type="Button"
:buttonSettings="formatButton">
                  </e-ribbon-item>
                </e-ribbon-items>
              </e-ribbon-collection>
            </e-ribbon-collections>
          </e-ribbon-group>
          <e-ribbon-group header="Font" orientation="Row"
:enableGroupOverflow="true" :isCollapsible="false" groupIconCss="e-icons e-
bold" cssClass="font-group" >
            <e-ribbon-collections>
              <e-ribbon-collection>
                <e-ribbon-items>
                  <e-ribbon-item type="ComboBox"
:comboBoxSettings="styleOptions" >
                  </e-ribbon-item>
                  <e-ribbon-item type="ComboBox"
:comboBoxSettings="sizeOptions">
                  </e-ribbon-item>
                </e-ribbon-items>
              </e-ribbon-collection>
              <e-ribbon-collection>
                <e-ribbon-items>
                  <e-ribbon-item type="ColorPicker"
displayOptions="Simplified" :allowedSizes="smallSize"
:colorPickerSettings="colorPicker" >
```

Getting Started with Syncfusion Ribbon Component in Vue 3

This article provides a step-by-step guide for setting up a Vite project with a JavaScript environment and integrating the Syncfusion Vue Ribbon component using the Composition API / Options API.

The Composition API is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

The Options API is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

Prerequisites

System requirements for Syncfusion Vue UI components

Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using Vite. To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

`bash

npm create vite@latest

`

or

`bash

yarn create vite

`

Using one of the above commands will lead you to set up additional configurations for the project as below:

1.Define the project name: We can specify the name of the project directly. Let's specify the name of the project as my-project for this article.

`bash

? Project name: » my-project

`

2.Select Vue as the framework. It will create a Vue 3 project.

`bash

? Select a framework: » - Use arrow-keys. Return to submit.

Vanilla

Vue

React

Preact

Lit

Svelte

Others

`

3.Choose JavaScript as the framework variant to build this Vite project using JavaScript and Vue.

`bash

? Select a variant: » - Use arrow-keys. Return to submit.

JavaScript

TypeScript

Customize with create-vue ↗

Nuxt ↗

`

4.Upon completing the aforementioned steps to create the my-project, run the following command to install its dependencies:

`bash

cd my-project

npm install

Copyright © 2001 -2024 Syncfusion Inc.

`

or

`bash

cd my-project

yarn install

`

Now that my-project is ready to run with default settings, let's add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion Vue component packages are available at npmjs.com. To use Syncfusion Vue components in the project, install the corresponding npm package.

This article uses the Vue Ribbon component as an example. To use the Vue Ribbon component in the project, the @syncfusion/ej2-vue-ribbon package needs to be installed using the following command:

`bash

npm install @syncfusion/ej2-vue-ribbon --save

`

or

`bash

yarn add @syncfusion/ej2-vue-ribbon

`

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the Button component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-lists/styles/material.css";
@import "../node_modules/@syncfusion/ej2-dropdowns/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-ribbon/styles/material.css";
</style>
```

Copyright © 2001 -2024 Syncfusion Inc.

Add Syncfusion Vue component

Follow the below steps to add the Vue Ribbon component using Composition API or Options API:

Importing the component, directives and required modules

First, import and register the Ribbon component, Ribbon directives and inject the required modules in the <script> section of the **src/App.vue** file.If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
//Component, Directives registeration
import { RibbonComponent as EjsRibbon, RibbonGroupDirective as ERibbonGroup,
RibbonGroupsDirective as ERibbonGroups, RibbonCollectionsDirective as
ERibbonCollections, RibbonCollectionDirective as ERibbonCollection,
RibbonItemsDirective as ERibbonItems, RibbonItemDirective as ERibbonItems,
RibbonTabsDirective as ERibbonTabs, RibbonTabDirective as ERibbonTab,
RibbonFileMenu, RibbonColorPicker } from "@syncfusion/ej2-vue-ribbon";
import { provide } from "vue";
const ribbon = [RibbonFileMenu, RibbonColorPicker];
provide('ribbon', ribbon);
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { RibbonComponent, RibbonGroupDirective, RibbonGroupsDirective,
RibbonCollectionsDirective, RibbonCollectionDirective, RibbonItemsDirective,
RibbonItemDirective, RibbonTabsDirective, RibbonTabDirective,RibbonFileMenu,
RibbonColorPicker } from "@syncfusion/ej2-vue-ribbon";
//Component, Directives registeration
export default {
components: {
'ejs-ribbon' : RibbonComponent,
'e-ribbon-tabs': RibbonTabsDirective,
'e-ribbon-tab': RibbonTabDirective,
'e-ribbon-groups': RibbonGroupsDirective,
'e-ribbon-group': RibbonGroupDirective,
'e-ribbon-collections': RibbonCollectionsDirective,
'e-ribbon-collection': RibbonCollectionDirective,
'e-ribbon-items': RibbonItemsDirective,
'e-ribbon-item': RibbonItemDirective
},
provide: {
ribbon: [RibbonFileMenu, RibbonColorPicker]
}
}
</script>
```

Adding the Ribbon component

Add the component definition in template section.

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
```

```
<ejs-ribbon id="ribbon"></ejs-ribbon>
</template>
<script setup>
import { RibbonComponent as EjsRibbon} from "@syncfusion/ej2-vue-ribbon";
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-lists/styles/material.css";
@import "../node_modules/@syncfusion/ej2-dropdowns/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-ribbon/styles/material.css";
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<ejs-ribbon id="ribbon"></ejs-ribbon>
</template>
<script>
import { RibbonComponent } from "@syncfusion/ej2-vue-ribbon";
export default {
components: {
"ejs-ribbon": RibbonComponent
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-lists/styles/material.css";
@import "../node_modules/@syncfusion/ej2-dropdowns/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-ribbon/styles/material.css";
</style>
```

Adding Ribbon Tab

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<ejs-ribbon id="ribbon">
<e-ribbon-tabs>
<e-ribbon-tab header="Home"></e-ribbon-tab>
</e-ribbon-tabs>
</ejs-ribbon>
</template>
<script setup>
import { RibbonComponent as EjsRibbon, RibbonTabsDirective as ERibbonTabs,
RibbonTabDirective as ERibbonTab } from "@syncfusion/ej2-vue-ribbon";
```

Copyright © 2001 -2024 Syncfusion Inc.

```
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-lists/styles/material.css";
@import "../node_modules/@syncfusion/ej2-dropdowns/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-ribbon/styles/material.css";
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<ejs-ribbon id="ribbon">
<e-ribbon-tabs>
<e-ribbon-tab header="Home"></e-ribbon-tab>
</e-ribbon-tabs>
</ejs-ribbon>
</template>
<script>
import { RibbonComponent, RibbonTabsDirective, RibbonTabDirective } from
"@syncfusion/ej2-vue-ribbon";
export default {
components: {
"ejs-ribbon": RibbonComponent,
'e-ribbon-tabs': RibbonTabsDirective,
'e-ribbon-tab': RibbonTabDirective
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-lists/styles/material.css";

@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-ribbon/styles/material.css";
</style>
```

Adding Ribbon Group

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<ejs-ribbon id="ribbon">
<e-ribbon-tabs>
<e-ribbon-tab header="Home">
<e-ribbon-groups>
<e-ribbon-group header="Clipboard" orientation="Row"></e-ribbon-group>
</e-ribbon-groups>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
</e-ribbon-tab>
</e-ribbon-tabs>
</ejs-ribbon>
</template>
<script setup>
import { RibbonComponent as EjsRibbon, RibbonTabsDirective as EjsTabs,
RibbonTabDirective as EjsTab, RibbonGroupDirective as EjsRibbonGroup,
RibbonGroupsDirective as EjsRibbonGroups } from "@syncfusion/ej2-vue-
ribbon";
</script>
<style>

@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-lists/styles/material.css";
@import "../node_modules/@syncfusion/ej2-dropdowns/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-ribbon/styles/material.css";
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<ejs-ribbon id="ribbon">
<e-ribbon-tabs>
<e-ribbon-tab header="Home">
<e-ribbon-groups>
<e-ribbon-group header="Clipboard" orientation="Row"></e-ribbon-group>
</e-ribbon-groups>
</e-ribbon-tab>
</e-ribbon-tabs>
</ejs-ribbon>
</template>
<script>
import { RibbonComponent, RibbonTabsDirective, RibbonTabDirective,
RibbonGroupDirective, RibbonGroupsDirective } from "@syncfusion/ej2-vue-
ribbon";
export default {
components: {
"ejs-ribbon": RibbonComponent,
'e-ribbon-tabs': RibbonTabsDirective,
'e-ribbon-tab': RibbonTabDirective,
'e-ribbon-groups': RibbonGroupsDirective,
'e-ribbon-group': RibbonGroupDirective
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";

@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-lists/styles/material.css";
```

Copyright © 2001 -2024 Syncfusion Inc.

```
@import "../node_modules/@syncfusion/ej2-dropdowns/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-ribbon/styles/material.css";
</style>
```

The orientation property of ribbon group defines whether the collection of items will be rendered column-wise or row-wise.

Adding Ribbon Items

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<ejs-ribbon id="ribbon">
<e-ribbon-tabs>
<e-ribbon-tab header="Home">
<e-ribbon-groups>
<e-ribbon-group header="Clipboard" orientation="Column">
<e-ribbon-collections>
<e-ribbon-collection id="paste-collection">
<e-ribbon-items>
<e-ribbon-item type="SplitButton" :splitButtonSettings="pasteSettings"></e-
ribbon-item>
</e-ribbon-items>
</e-ribbon-collection>
<e-ribbon-collection id="cutcopy-collection">
<e-ribbon-items>
<e-ribbon-item type="Button" :buttonSettings="cutButton"></e-ribbon-item>
<e-ribbon-item type="Button" :buttonSettings="copyButton"></e-ribbon-item>
</e-ribbon-items>
</e-ribbon-collection>
</e-ribbon-collections>
</e-ribbon-group>
</e-ribbon-groups>
</e-ribbon-tab>
</e-ribbon-tabs>
</ejs-ribbon>
</template>
<script setup>
import { RibbonComponent as EjsRibbon, RibbonTabsDirective as ERibbonTabs,
RibbonTabDirective as ERibbonTab, RibbonGroupDirective as ERibbonGroup,
RibbonGroupsDirective as ERibbonGroups, RibbonCollectionsDirective as
ERibbonCollections, RibbonCollectionDirective as ERibbonCollection,
RibbonItemsDirective as ERibbonItems, RibbonItemDirective as ERibbonItem }
from "@syncfusion/ej2-vue-ribbon";
const pasteSettings = {
iconCss: "e-icons e-paste", content: "Paste",
items: [{ text: "Keep Source Format" },
{ text: "Merge format" },
{ text: "Keep text only" }]
}
const cutButton = { iconCss: "e-icons e-cut", content: "Cut" }
const copyButton = { iconCss: "e-icons e-copy", content: "Copy" }
</script>

Run the project

To run the project, use the following command:

`bash

npm run dev

Copyright © 2001 -2024 Syncfusion Inc.

`

or

`bash

yarn run dev

`

The output will appear as follows:

For migrating from Vue 2 to Vue 3, refer to the migration documentation.

Modules in Ribbon component

The following modules are available in Ribbon. If the module injection type is **selective**, manual injection is required to extend the Ribbon's functionality.

| Module | Description | Module Injection Type |

|------|-------------|------|

| RibbonButton | To use the built-in button as a ribbon item. | default |

| RibbonCheckBox | To use the built-in checkbox as a ribbon item.| default |

| RibbonDropDown | To use the built-in dropdown button as a ribbon item.| default |

| RibbonSplitButton | To use the built-in split button as a ribbon item.| default |

| RibbonComboBox | To use the built-in combobox as a ribbon item. | default |

| RibbonColorPicker | Inject this module to use the built-in colorpicker as a ribbon item.| selective |

| RibbonFileMenu | Inject this module to use the file menu feature.| selective |

These selective modules should be injected into the provide section and use ribbon as a key of the object.

`

Tabs and Groups

The Ribbon component consists of a series of tabs that are organized into groups to enable quick access to specific commands or tools. Each tab contains a set of groups, and each group contains collections of items that are logically related to each other.

Adding Tabs

You can use the tabs property to add tabs to the Ribbon component and define the content of the tab header by using the header property.

APP.VUE

```
<template>
  <ejs-ribbon>
    <e-ribbon-tabs>
      <e-ribbon-tab header="Home">
      </e-ribbon-tab>
      <e-ribbon-tab header="Insert">
      </e-ribbon-tab>
    </e-ribbon-tabs>
  </ejs-ribbon>
</template>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-
splitbuttons/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";

  @import "../node_modules/@syncfusion/ej2-dropdowns/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-ribbon/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/ribbon/tabs" %}

Copyright © 2001 -2024 Syncfusion Inc.

Adding Groups

You can use the groups property to add groups for each tab in the Ribbon and define the name of the group header by using the header property.

APP.VUE

```
<template>
  <ejs-ribbon>
    <e-ribbon-tabs>
      <e-ribbon-tab header="Home">
        <e-ribbon-groups>
          <e-ribbon-group header="Clipboard">
          </e-ribbon-group>
        </e-ribbon-groups>
      </e-ribbon-tab>
      <e-ribbon-tab header="Insert">
        <e-ribbon-groups>
          <e-ribbon-group header="Tables">
          </e-ribbon-group>
        </e-ribbon-groups>
      </e-ribbon-tab>
    </e-ribbon-tabs>
  </ejs-ribbon>
</template>

{% previewsample "page.domainurl/code-snippet/ribbon/items" %}

For more information on the built-in and how to add custom Ribbon items, you can visit the items page.

Ribbon Items

Ribbon renders various built-in items based on the item type property. By default, the type property is set as `Button` which renders the Button.

Built-in items

You can render the built-in Ribbon items by using the `<e-ribbon-item>` tag directive, to specify the type property.

The following table explains the built-in items and their actions.

| Built-in Ribbon Items | Actions |

|---|---|

| Button | Renders button as ribbon item.|

| CheckBox | Renders checkbox as ribbon item.|

| DropDown | Renders dropdownbutton as ribbon item.|

| SplitButton | Renders splitbutton as ribbon item.|

| ComboBox | Renders combobox as ribbon item.|

| ColorPicker | Renders color picker as ribbon item.|

| GroupButton | Renders groupbutton as ribbon item.|

Button items

You can render the built-in button Ribbon item by setting the type property as `Button`. You can also customize the button item using the RibbonButtonSettingsModel, which provides options such as `iconCss`, `content`, `isToggle` and more.

Toggle button

The isToggle property can be used to define whether the button act as a toggle button or not. By default, the value is `false`.

`

Checkbox items

You can render the built-in checkBox Ribbon item by setting the type property to CheckBox. You can also customize the checkBox item using the RibbonCheckBoxSettingsModel, which provides options such as labelPosition, label, checked and more.

Checkbox state

You can use the checked property to handle the checked or unchecked state. By default, the value is false.

`

DropDown button items

You can render the built-in dropDown Ribbon item by setting the type property to DropDown. You can also customize the dropDown item through RibbonDropDownSettingsModel, which provides options such as iconCss, content, target and more.

Target

The target property specifies the element selector to be displayed in the DropDownButton popup.

APP.VUE

```
<template>

Combobox items

You can render the built-in comboBox Ribbon item by setting the type property to ComboBox. You can also customize the comboBox item through RibbonComboBoxSettingsModel, which provides options such as allowFiltering, autoFill, index, sortOrder and more.

Filtering

You can use the allowFiltering property to filter the data items. The filtering operation is initiated automatically, as soon as you start typing characters. If no match is found the value of the noRecordsTemplate property will be displayed. By default, the value is false.

```
`html
<template>
<ejs-ribbon>
<e-ribbon-tabs>
<e-ribbon-tab header="Home">
<e-ribbon-groups>
<e-ribbon-group header="Font">
<e-ribbon-collections>
<e-ribbon-collection>
<e-ribbon-items>
<e-ribbon-item type="ComboBox" :comboBoxSettings="styleOptions" >
</e-ribbon-item>
</e-ribbon-items>
</e-ribbon-collection>
</e-ribbon-collections>
</e-ribbon-group>
</e-ribbon-groups>
</e-ribbon-tab>
</e-ribbon-tabs>
</ejs-ribbon>
</template>
<script>
import Vue from "vue";
import { RibbonPlugin } from "@syncfusion/ej2-vue-ribbon";
Vue.use(RibbonPlugin);
export default {
data: function () {
```

`

SortOrder

You can use the sortOrder property to specify the order in which the DataSource should be sorted.

None	The data source is not sorted.
Ascending	The data source is sorted in ascending order.
Descending	The data source is sorted in descending order.

Colorpicker items

You can render the built-in colorPicker Ribbon item by setting the type property to `ColorPicker`. You can also customize the colorPicker item through RibbonColorPickerSettingsModel, which provides options such as `value`, `columns`, `showButtons` and more.

Value

You can use the value property to specify the color value. The value should be specified as Hex code.

```

Groupbutton items

You can render the built-in groupbutton Ribbon item by setting the type property to `GroupButton`. You can also customize the groupbutton item using the `RibbonGroupButtonSettingsModel`, which provides options such as `selection` and `items`.

Items

You can render the groupbutton items by using items property. You can also customize the groupbutton items through RibbonGroupButtonItemModel, which provides options such as content, iconCss, selected and more.

Item content

You can use the content property to define the text content for the groupbutton.

Items display Mode

You can use the displayOptions property to display the items in the Ribbon layout.

Auto	The items are displayed in all layouts based on the ribbon's overflow state.
Classic	The items are displayed only in the classic layout group.
Simplified	The items are displayed only in the simplified layout group.
Overflow	The items are displayed only in the overflow popup.

Display items in Classic only

To diplay the items only in the classic layout group, set the mode as DisplayMode.Classic in the displayOptions property.

Display items in Simplified only

To diplay the items only in the simplified layout group, set the mode as DisplayMode.Simplified in the displayOptions property.

```
`html
<template>
<ejs-ribbon>
```

```
<e-ribbon-tabs>
<e-ribbon-tab header="Home">
<e-ribbon-groups>
<e-ribbon-group header="Clipboard">
<e-ribbon-collections>
<e-ribbon-collection>
<e-ribbon-items>
<e-ribbon-item type="Button" :displayOptions="buttonDisplayMode" :buttonSettings="cutButton">
</e-ribbon-item>
</e-ribbon-items>
</e-ribbon-collection>
</e-ribbon-collections>
</e-ribbon-group>
</e-ribbon-groups>
</e-ribbon-tab>
</e-ribbon-tabs>
</ejs-ribbon>
</template>
<script>
import Vue from "vue";
import { RibbonPlugin,DisplayMode } from "@syncfusion/ej2-vue-ribbon";
Vue.use(RibbonPlugin);
export default {
data: function () {
return {
buttonDisplayMode: DisplayMode.Simplified,
cutButton:  { iconCss: "e-icons e-cut", content: "Cut" },
};
}
};
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";

`

Ribbon Layouts

The Ribbon allows to customize the layout by using the activeLayout property. The Ribbon component supports the following layouts:

Classic layout

In classic layout, the Ribbon component organizes the items and groups in a traditional form by setting the activeLayout property to Classic. By default, the Ribbon component renders in the Classic layout.

APP.VUE

```
<template>
  <ejs-ribbon activeLayout="Classic">
    <e-ribbon-tabs>
      <e-ribbon-tab header="Home">
        <e-ribbon-groups>
          <e-ribbon-group header="Clipboard">
            <e-ribbon-collections>
              <e-ribbon-collection>
                <e-ribbon-items>
                  <e-ribbon-item type="SplitButton"
:allowedSizes="largeSize" :splitButtonSettings="pasteSettigs" >
                  </e-ribbon-item>
                </e-ribbon-items>
              </e-ribbon-collection>
            </e-ribbon-collections>
          </e-ribbon-group>
        </e-ribbon-groups>
      </e-ribbon-tab>
      <e-ribbon-tab header="Insert">
        <e-ribbon-groups>
          <e-ribbon-group header="Tables">
            <e-ribbon-collections>
              <e-ribbon-collection>

```

{% previewsample "page.domainurl/code-snippet/ribbon/classic" %}

Defining items size

You can use the allowedSizes property to set the allowed size for an item. The Ribbon items can be appeared in three different sizes: Large(large icon with text), Medium(small icon with text) and Small(small icon only). On resizing, the items size can be changed based on the available width of the tab content from the order of Large-> Medium-> Small and viceversa.

{% previewsample "page.domainurl/code-snippet/ribbon/itemsSize" %}

Defining items orientation

The Ribbon group orientation property allows to manage how the items are aligned either in a Row or Column. By default, the orientation is set to Column, in which the items are arranged vertically.

APP.VUE

```
<template>
  <ejs-ribbon id="ribbon">
    <e-ribbon-tabs>
        <e-ribbon-tab header="Home">
            <e-ribbon-groups>
                <e-ribbon-group orientation="Column">
                    <e-ribbon-collections>
                        <e-ribbon-collection>
                            <e-ribbon-items>
                                <e-ribbon-item type="SplitButton"
:splitButtonSettings="pasteButton">
                                </e-ribbon-item>
                            </e-ribbon-items>
                        </e-ribbon-collection>
                        <e-ribbon-collection>
                            <e-ribbon-items>
                                <e-ribbon-item type="Button"

{% previewsample "page.domainurl/code-snippet/ribbon/orientation" %}

When the orientation is set to Row a group may have a maximum of three collections each of which may contain any number of items. When the orientation is set to Column a group may have any number of collections, each of which may contain one large-sized item or three medium/small-sized items. If two large-sized items are specified, it automatically converts into two medium/small-sized items.

Defining group header

You can use the header property to set the name for each group header.

APP.VUE

```
<template>
  <ejs-ribbon id="ribbon">
    <e-ribbon-tabs>
        <e-ribbon-tab header="Home">
            <e-ribbon-groups>
                <e-ribbon-group header="Clipboard">
                    <e-ribbon-collections>
                        <e-ribbon-collection>
                            <e-ribbon-items>
                                <e-ribbon-item type="SplitButton"
:splitButtonSettings="pasteButton">
                                </e-ribbon-item>
                            </e-ribbon-items>
                        </e-ribbon-collection>
                    </e-ribbon-collections>
                </e-ribbon-group>
                <e-ribbon-group header="Font">

Defining priority order for group collapse or expand

You can use the priority property to set the priority order for each group which should be collapsed or expanded on resizing. When collapsing, higher priority values are fetched first. When expanding, lower priority values are fetched first.

APP.VUE

```
<template>
  <ejs-ribbon id="ribbon">
    <e-ribbon-tabs>
        <e-ribbon-tab header="Home">
            <e-ribbon-groups>
                <e-ribbon-group header="Clipboard" groupIconCss="e-icons e-
paste" priority=2>

Simplified layout

In simplified layout, the Ribbon component organizes the items and groups into a single row by setting the activeLayout property to Simplified.

APP.VUE

```
<template>
  <ejs-ribbon activeLayout="Simplified">
    <e-ribbon-tabs>
      <e-ribbon-tab header="Home">
        <e-ribbon-groups>
          <e-ribbon-group header="Clipboard">
            <e-ribbon-collections>
              <e-ribbon-collection>
                <e-ribbon-items>
                  <e-ribbon-item type="SplitButton"
:allowedSizes="largeSize" :splitButtonSettings="pasteSettigs" >
                  </e-ribbon-item>
                </e-ribbon-items>
              </e-ribbon-collection>
            </e-ribbon-collections>

Minimized State

You can hide the Ribbon contents and display only the tab headers by double-clicking on the tab header. In minimized state, the Ribbon component expands to its normal state when click on the tab header.

You can use the isMinimized property to change the Ribbon component to minimized state. By default, the value is false.

APP.VUE

```

File Menu

The Ribbon component provides a built-in file menu that allows you to add menu items for performing specific actions. The file menu can be enabled by setting the fileMenu property.

Copyright © 2001 -2024 Syncfusion Inc.

Visibility

You can show the file menu by setting the visible property to true. By default, the file menu is hidden.

APP.VUE

```
<template>
  <ejs-ribbon :fileMenu="fileSettings">
    <e-ribbon-tabs>
      <e-ribbon-tab header="Home">

Ribbon Backstage

The Ribbon supports backstage view which is an addition to the traditional file menu. It displays information like application settings, user details, etc. The backstage view can be enabled by setting the backStageMenu property.

The backstage view options are displayed on the left, while the content of each option is shown on the right.

Adding backstage items

The menu items can be added to the backstage view by using the items property. You can show the backstage view by setting the visible property to true. By default, the backstage view is hidden.

Adding footer items

You can use the isFooter property in the items collection to add the backstage view footer items. By default, the value is false.

APP.VUE

```
<template>
  <ejs-ribbon ref="backstageRibbon"  :backStageMenu="backstageSettings">
    <e-ribbon-tabs>

Adding separator

The separators are horizontal lines used to separate the backstage view items. You can use the separator property to split the menu items.

APP.VUE

```
<template>

Backstage target

The target property specifies the element selector in which backstage will be displayed. The target element should have the position as relative, else the backstage will be positioned nearest to the relative element. By default, the backstage is positioned to ribbon element.

Adding Backstage events

Help Pane

The help pane is dedicated area where the users can define help contents like controlling document permissions, sharing features, and more which appears on the right side of the Ribbon. You can use the helpPaneTemplate property to set the help pane contents.

Tooltip

The Ribbon component supports tooltip to show additional information in the Ribbon items. The tooltip appears when the user hovers over a Ribbon item.

Adding title

You can use the title property to set the tooltip title for each Ribbon item.

`html

<template>

<ejs-ribbon id="ribbon">

<e-ribbon-tabs>

<e-ribbon-tab header="Home">

<e-ribbon-groups>

<e-ribbon-group header="Clipboard">

<e-ribbon-collections>

<e-ribbon-collection>

<e-ribbon-items>

<e-ribbon-item type="SplitButton" :splitButtonSettings="pasteButton"
:ribbonTooltipSettings="pasteOptions">

</e-ribbon-item>

</e-ribbon-items>

</e-ribbon-collection>

<e-ribbon-collection>

<e-ribbon-items>

<e-ribbon-item type="Button" :buttonSettings="cutButton" :ribbonTooltipSettings="cutOptions">

</e-ribbon-item>

<e-ribbon-item type="Button" :buttonSettings="copyButton" :ribbonTooltipSettings="copyOptions">

</e-ribbon-item>

<e-ribbon-item type="Button" :buttonSettings="formatButton"
:ribbonTooltipSettings="formatOptions">

</e-ribbon-item>

</e-ribbon-items>

Copyright © 2001 -2024 Syncfusion Inc.

```
</e-ribbon-collection>
</e-ribbon-collections>
</e-ribbon-group>
</e-ribbon-groups>
</e-ribbon-tab>
</e-ribbon-tabs>
</ejs-ribbon>
</template>
<script>
import Vue from "vue";
import { RibbonPlugin } from "@syncfusion/ej2-vue-ribbon";
Vue.use(RibbonPlugin);
export default {
data: function () {
return {
pasteButton:  {
iconCss: "e-icons e-paste",
content: "Paste",
items: [{ text: "Keep Source Format" }, { text: "Merge format" }, { text: "Keep text only" }]
},
cutButton:  { iconCss: "e-icons e-cut", content: "Cut" },
copyButton:  { iconCss: "e-icons e-copy", content: "Copy" },
formatButton:  { iconCss: "e-icons e-format-painter", content: "Format Painter" },
cutOptions: { title: "Cut" },
copyOptions: { title: "Copy" },
pasteOptions: { title: "Paste" },
formatOptions: { title: "Format Painter" }
};
}
};
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
```

@import "../node_modules/@syncfusion/ej2-vue-ribbon/styles/material.css";
</style>
`
```

Adding content

You can use the content property to set the tooltip content for each Ribbon item.

```
`html
<template>
<ejs-ribbon id="ribbon">
<e-ribbon-tabs>
<e-ribbon-tab header="Home">
<e-ribbon-groups>
<e-ribbon-group header="Clipboard">
<e-ribbon-collections>
<e-ribbon-collection>
<e-ribbon-items>
<e-ribbon-item type="SplitButton" :splitButtonSettings="pasteButton"
:ribbonTooltipSettings="pasteOptions">
</e-ribbon-item>
</e-ribbon-items>
</e-ribbon-collection>
<e-ribbon-collection>
<e-ribbon-items>
<e-ribbon-item type="Button" :buttonSettings="cutButton" :ribbonTooltipSettings="cutOptions">
</e-ribbon-item>
<e-ribbon-item type="Button" :buttonSettings="copyButton" :ribbonTooltipSettings="copyOptions">
</e-ribbon-item>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
<e-ribbon-item type="Button" :buttonSettings="formatButton"
:ribbonTooltipSettings="formatOptions">
</e-ribbon-item>
</e-ribbon-items>
</e-ribbon-collection>
</e-ribbon-collections>
</e-ribbon-group>
</e-ribbon-groups>
</e-ribbon-tab>
</e-ribbon-tabs>
</ejs-ribbon>
</template>
<script>
import Vue from "vue";
import { RibbonPlugin } from "@syncfusion/ej2-vue-ribbon";
Vue.use(RibbonPlugin);
export default {
data: function () {
return {
pasteButton:  {
iconCss: "e-icons e-paste",
content: "Paste",
items: [{ text: "Keep Source Format" }, { text: "Merge format" }, { text: "Keep text only" }]
},
cutButton:  { iconCss: "e-icons e-cut", content: "Cut" },
copyButton:  { iconCss: "e-icons e-copy", content: "Copy" },
formatButton:  { iconCss: "e-icons e-format-painter", content: "Format Painter" },
cutOptions: { title: "Cut", content: "Places the selected text or object on the clipboard so that you can
paste it somewhere else." },
copyOptions: { title: "Copy", content: "Copies the chosen text or object to the clipboard so that you can
reuse it elsewhere." },
pasteOptions: { title: "Paste", content: "Insert the clipboard content where the cursor is currently
placed." },
formatOptions: { title: "Format Painter", content: "Copies the formatting style of a selected text or
object and applies it to other content within the document." }
```

Copyright © 2001 -2024 Syncfusion Inc.

```
};
}
};
</script>
<style>

</style>
```

Adding icon

You can use the iconCss property to specify the icons to be displayed in the tooltip.

```html
<template>
<ejs-ribbon id="ribbon">
<e-ribbon-tabs>
<e-ribbon-tab header="Home">
<e-ribbon-groups>
<e-ribbon-group header="Clipboard">
<e-ribbon-collections>
<e-ribbon-collection>
<e-ribbon-items>
<e-ribbon-item type="SplitButton" :splitButtonSettings="pasteButton"
:ribbonTooltipSettings="pasteOptions">
</e-ribbon-item>
</e-ribbon-items>
</e-ribbon-collection>
<e-ribbon-collection>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
<e-ribbon-items>
<e-ribbon-item type="Button" :buttonSettings="cutButton" :ribbonTooltipSettings="cutOptions">
</e-ribbon-item>
<e-ribbon-item type="Button" :buttonSettings="copyButton" :ribbonTooltipSettings="copyOptions">
</e-ribbon-item>
<e-ribbon-item type="Button" :buttonSettings="formatButton"
:ribbonTooltipSettings="formatOptions">
</e-ribbon-item>
</e-ribbon-items>
</e-ribbon-collection>
</e-ribbon-collections>
</e-ribbon-group>
</e-ribbon-groups>
</e-ribbon-tab>
</e-ribbon-tabs>
</ejs-ribbon>
</template>
<script>
import Vue from "vue";
import { RibbonPlugin } from "@syncfusion/ej2-vue-ribbon";
Vue.use(RibbonPlugin);
export default {
data: function () {
return {
pasteButton:  {
iconCss: "e-icons e-paste",
content: "Paste",
items: [{ text: "Keep Source Format" }, { text: "Merge format" }, { text: "Keep text only" }]
},
cutButton:  { iconCss: "e-icons e-cut", content: "Cut" },
copyButton:  { iconCss: "e-icons e-copy", content: "Copy" },
formatButton:  { iconCss: "e-icons e-format-painter", content: "Format Painter" },
cutOptions: { title: "Cut", content: "Places the selected text or object on the clipboard so that you can
paste it somewhere else.", iconCss: "e-icons e-cut" },
```

copyOptions: { title: "Copy", content: "Copies the chosen text or object to the clipboard so that you can reuse it elsewhere.", iconCss: "e-icons e-copy" },

pasteOptions: { title: "Paste", content: "Insert the clipboard content where the cursor is currently placed.", iconCss: "e-icons e-paste" },

formatOptions: { title: "Format Painter", content: "Copies the formatting style of a selected text or object and applies it to other content within the document.", iconCss: "e-icons e-format-painter" }

};

{% previewsample "page.domainurl/code-snippet/ribbon/TooltipCustomization" %}

Ribbon Resizing

The Ribbon effectively resizes the ribbon elements while being resized. It extends when the ribbon size is increased and collapses when the ribbon size is decreased. The resizing can be performed in both the classic and simplified modes. Also, we have an option to resize the ribbon elements in the custom order.

Copyright © 2001 -2024 Syncfusion Inc.

In classic mode on resizing, the items size will be changed based on the available width of the tab content from the order of Large-> Medium-> Small and viceversa.

In simplified mode on resizing, the items size will be changed based on the available width of the tab content from the order of Medium-> Small and viceversa.

Defining items allowed size

You can use the allowedSizes property to maintain a constant size for an item. If allowedSizes is set, it keeps the size constant even when being resized.

APP.VUE

```
<template>
  <ejs-ribbon id="ribbon">
    <e-ribbon-tabs>
        <e-ribbon-tab header="Home">

Defining items active size

You can use the activeSize property to define the item size intially, before it is being resized. When resized the activeSize property is updated based on the ribbon's overflow state, which is determined by the allowedSizes property being configured. By default, the value is Medium.

Events

This section describes the ribbon events that will be triggered when appropriate actions are performed. The following events are available in the ribbon component.

tabSelected

The tabSelected event is triggered after selecting the tab item.

`html

<template>

<ejs-ribbon :tabSelected="tabSelected">

<e-ribbon-tabs>

<e-ribbon-tab header="Home">

<e-ribbon-groups>

<e-ribbon-group header="Clipboard">

<e-ribbon-collections>

<e-ribbon-collection>

<e-ribbon-items>

<e-ribbon-item type="Button" :buttonSettings="cutButton">

Copyright © 2001 -2024 Syncfusion Inc.

```
</e-ribbon-item>
</e-ribbon-items>
</e-ribbon-collection>
</e-ribbon-collections>
</e-ribbon-group>
</e-ribbon-groups>
</e-ribbon-tab>
</e-ribbon-tabs>
</ejs-ribbon>
</template>
<script>
import Vue from "vue";
import { RibbonPlugin } from "@syncfusion/ej2-vue-ribbon";
Vue.use(RibbonPlugin);
export default {
data: function () {
return {
cutButton:  { iconCss: "e-icons e-cut", content: "Cut" },
};
},
methods:{
tabSelected: function(args){
// Your required action here
}
}
};
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";

@import "../node_modules/@syncfusion/ej2-vue-ribbon/styles/material.css";

</style>

`

tabSelecting

The tabSelecting event is triggered before selecting the tab item.

`html

<template>

<ejs-ribbon :tabSelecting="tabSelecting">

<e-ribbon-tabs>

<e-ribbon-tab header="Home">

<e-ribbon-groups>

<e-ribbon-group header="Clipboard">

<e-ribbon-collections>

<e-ribbon-collection>

<e-ribbon-items>

<e-ribbon-item type="Button" :buttonSettings="cutButton">

</e-ribbon-item>

</e-ribbon-items>

</e-ribbon-collection>

</e-ribbon-collections>

</e-ribbon-group>

</e-ribbon-groups>

</e-ribbon-tab>

</e-ribbon-tabs>

</ejs-ribbon>

</template>

<script>

import Vue from "vue";

import { RibbonPlugin } from "@syncfusion/ej2-vue-ribbon";

Vue.use(RibbonPlugin);

Copyright © 2001 -2024 Syncfusion Inc.

```
export default {
data: function () {
return {
cutButton:  { iconCss: "e-icons e-cut", content: "Cut" },
};
},
methods:{
tabSelecting: function(args){
// Your required action here
}
}
};
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";

@import "../node_modules/@syncfusion/ej2-vue-ribbon/styles/material.css";
</style>
`
```

ribbonCollapsing

The ribbonCollapsing event is triggered before collapsing the ribbon.

```
`html
<template>
<ejs-ribbon :ribbonCollapsing="ribbonCollapsing">
<e-ribbon-tabs>
<e-ribbon-tab header="Home">
<e-ribbon-groups>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
<e-ribbon-group header="Clipboard">
<e-ribbon-collections>
<e-ribbon-collection>
<e-ribbon-items>
<e-ribbon-item type="Button" :buttonSettings="cutButton">
</e-ribbon-item>
</e-ribbon-items>
</e-ribbon-collection>
</e-ribbon-collections>
</e-ribbon-group>
</e-ribbon-groups>
</e-ribbon-tab>
</e-ribbon-tabs>
</ejs-ribbon>
</template>
<script>
import Vue from "vue";
import { RibbonPlugin } from "@syncfusion/ej2-vue-ribbon";
Vue.use(RibbonPlugin);
export default {
data: function () {
return {
cutButton:  { iconCss: "e-icons e-cut", content: "Cut" },
};
},
methods:{
ribbonCollapsing: function(args){
// Your required action here
}
}
};
</script>
<style>
```

@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-ribbon/styles/material.css";
</style>
`
```

ribbonExpanding

The ribbonExpanding event is triggered before expanding the ribbon.

```
`html
<template>
<ejs-ribbon :ribbonExpanding="ribbonExpanding">
<e-ribbon-tabs>
<e-ribbon-tab header="Home">
<e-ribbon-groups>
<e-ribbon-group header="Clipboard">
<e-ribbon-collections>
<e-ribbon-collection>
<e-ribbon-items>
<e-ribbon-item type="Button" :buttonSettings="cutButton">
</e-ribbon-item>
</e-ribbon-items>
</e-ribbon-collection>
</e-ribbon-collections>
</e-ribbon-group>
</e-ribbon-groups>
</e-ribbon-tab>
</e-ribbon-tabs>
</ejs-ribbon>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
</template>
<script>

RichText Editor

Getting Started with the Vue Rich text editor Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using Vue-CLI and integrating the Syncfusion Vue Rich text editor component

Prerequisites

System requirements for Syncfusion Vue UI components

Dependencies

The following list of dependencies are required to use the Rich Text Editor.

`js
|-- @syncfusion/ej2-vue-richtexteditor
|-- @syncfusion/ej2
|-- @syncfusion/ej2-base
|-- @syncfusion/ej2-data
|-- @syncfusion/ej2-buttons
|-- @syncfusion/ej2-lists
|-- @syncfusion/ej2-inputs
|-- @syncfusion/ej2-popups
|-- @syncfusion/ej2-splitbuttons
|-- @syncfusion/ej2-navigations
|-- @syncfusion/ej2-filemanager
|-- @syncfusion/ej2-vue-base
`

Setting up the Vue 2 project

To generate a Vue 2 project using Vue-CLI, use the vue create command. Follow these steps to install Vue CLI and create a new project:

`bash
npm install -g @vue/cli
vue create quickstart
cd quickstart
npm run serve
`

or

Copyright © 2001 -2024 Syncfusion Inc.

`bash

yarn global add @vue/cli

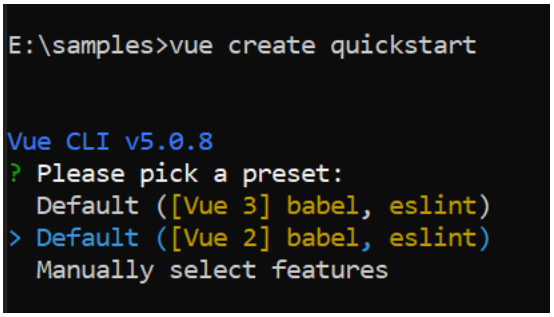
vue create quickstart

cd quickstart

yarn run serve

`

When creating a new project, choose the option Default ([Vue 2] babel, eslint) from the menu.



Once the quickstart project is set up with default settings, proceed to add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion packages are available at npmjs.com. To use Vue components, install the required npm package.

This article uses the Vue Rich text editor component as an example. Install the @syncfusion/ej2-vue-richtexteditor package by running the following command:

`bash

npm install @syncfusion/ej2-vue-richtexteditor --save

`

or

`bash

yarn add @syncfusion/ej2-vue-richtexteditor

`

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, the Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the Rich text editor component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-lists/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
richtexteditor/styles/material.css";
</style>
```

Add Syncfusion Vue component

Follow the below steps to add the Vue Rich text editor component using:

1\. First, import and register the Rich text editor component in the script section of the **src/App.vue** file.

~/SRC/APP.VUE

```
<script>
import { RichTextEditorComponent, Toolbar, Link, Image, Count, HtmlEditor,
QuickToolbar } from '@syncfusion/ej2-vue-richtexteditor';
export default {
components: {
'ejs-richtexteditor': RichTextEditorComponent
}
}
</script>
```

2\. In the template section, define the Rich text editor component with the height property.

~/SRC/APP.VUE

```
<template>
<ejs-richtexteditor ref="defaultRTE" :height="400">
<p>The Rich Text Editor component is WYSIWYG ("what you see is what you
get") editor that provides the best user experience to create and update the
content.Users can format their content using standard toolbar commands.</p>
<p><b>Key features:</b></p>
<ul>
<li><p>Provides IFRAME and DIV modes</p></li>
<li><p>Capable of handling markdown editing.</p></li>
<li><p>Contains a modular library to load the necessary functionality on
demand.</p></li>
<li><p>Provides a fully customizable toolbar.</p></li>
<li><p>Provides HTML view to edit the source directly for
developers.</p></li>
<li><p>Supports third-party library integration.</p></li>
<li><p>Allows preview of modified content before saving it.</p></li>
<li><p>Handles images, hyperlinks, video, hyperlinks, uploads, etc.</p></li>
<li><p>Contains undo/redo manager.</p></li>
<li><p>Creates bulleted and numbered lists.</p></li>
</ul>
</ejs-richtexteditor>
</template>
```

Copyright © 2001 -2024 Syncfusion Inc.

Initialize from `<div>` element

Rich Text Editor can be initialized on div element.

~/SRC/APP.VUE

```
<template>
  <div id="defaultRTE">
    <ejs-richtexteditor ref="defaultRTE" :height="340">
        <p>The Rich Text Editor component is WYSIWYG ("what you see is what
you get") editor that provides the best user experience to create and update
the content.Users can format their content using standard toolbar
commands.</p>
        <p><b>Key features:</b></p>
        <ul>
            <li><p>Provides IFRAME and DIV modes</p></li>
            <li><p>Capable of handling markdown editing.</p></li>
            <li><p>Contains a modular library to load the necessary
functionality on demand.</p></li>
            <li><p>Provides a fully customizable toolbar.</p></li>
            <li><p>Provides HTML view to edit the source directly for
developers.</p></li>
            <li><p>Supports third-party library integration.</p></li>
            <li><p>Allows preview of modified content before saving
it.</p></li>
            <li><p>Handles images, hyperlinks, video, hyperlinks, uploads,
etc.</p></li>
        </ul>
    </ejs-richtexteditor>
  </div>
</template>
<script>
    import { RichTextEditorComponent, Toolbar, Link, Image, Count,
HtmlEditor, QuickToolbar } from '@syncfusion/ej2-vue-richtexteditor';
    export default {
        components: {
            'ejs-richtexteditor': RichTextEditorComponent
        },
        provide: {
            richtexteditor:[Toolbar, Link, Image, Count, HtmlEditor,
QuickToolbar]
        }
    }
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-lists/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
richtexteditor/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/rich-text-editor/getting-started-cs5" %}

Copyright © 2001 -2024 Syncfusion Inc.

Initialize from `<IFRAME>` element

The Rich Text Editor's content is placed in an iframe and isolated from the rest of the page.

Initialize the Rich Text Editor on div element and set the enable field of iframeSettings property as true.

~/SRC/APP.VUE

```
<template>
    <ejs-richtexteditor ref="defaultRTE" :height="350"
:iframeSettings="iframeConfig">
        <p>The Rich Text Editor component is WYSIWYG ("what you see is what
you get") editor that provides the best user experience to create and update
the content.Users can format their content using standard toolbar
commands.</p>
        <p><b>Key features:</b></p>
        <ul>
            <li><p>Provides IFRAME and DIV modes</p></li>
            <li><p>Capable of handling markdown editing.</p></li>
            <li><p>Contains a modular library to load the necessary
functionality on demand.</p></li>
            <li><p>Provides a fully customizable toolbar.</p></li>
            <li><p>Provides HTML view to edit the source directly for
developers.</p></li>
            <li><p>Supports third-party library integration.</p></li>
            <li><p>Allows preview of modified content before saving
it.</p></li>
            <li><p>Handles images, hyperlinks, video, hyperlinks, uploads,
etc.</p></li>
        </ul>
    </ejs-richtexteditor>
</template>
<script>
    import { RichTextEditorComponent, Toolbar, Link, Image, Count,
HtmlEditor, QuickToolbar } from '@syncfusion/ej2-vue-richtexteditor';
    export default {
        components: {
            'ejs-richtexteditor': RichTextEditorComponent
        },
        data() {
            return {
                iframeConfig: {
                    enable: true
                }
            }
        },
        provide: {
            richtexteditor:[Toolbar, Link, Image, Count, HtmlEditor,
QuickToolbar]
        }
    }

{% previewsample "page.domainurl/code-snippet/rich-text-editor/getting-started-cs6" %}

Module injection

To create Rich Text Editor with additional features, inject the required modules. The following modules are used to extend Rich Text Editor's basic functionality.

- Toolbar - Inject this module to use Toolbar feature.
- Link - Inject this module to use link feature in Rich Text Editor.
- Image- Inject this module to use image feature in Rich Text Editor.
- Table- Inject this module to use table feature in Rich Text Editor.
- Count - Inject this module to use character count in Rich Text Editor.
- HtmlEditor - Inject this module to use Rich Text Editor as html editor.
- MarkdownEditor-Inject this module to use Rich Text Editor as markdown editor.
- QuickToolbar - Inject this module to use quick toolbar feature for the target element.
- Resize - Inject this module to use resize feature in Rich Text Editor.
- FileManager - Inject this module to use file browser feature in Rich Text Editor.
- PasteCleanup - Inject this module to use paste cleanup feature in Rich Text Editor.
- FormatPainter - Inject this module to use format painter feature in Rich Text Editor.
- EmojiPicker - Inject this module to use emoji picker feature in Rich Text Editor.

These modules should be injected into the Rich Text Editor through provide option.

Configure the toolbar

Configure the toolbar with the tools using items field of the toolbarSettings property as your application requires.

~/SRC/APP.VUE

```
<template>
<div>
<div class="control-section">
    <div class="sample-container">
        <div class="default-section">

</style>
```

{% previewsample "page.domainurl/code-snippet/rich-text-editor/getting-started-cs7" %}

| and - can insert a vertical and horizontal separator lines in the toolbar.

Insert images and links

The image module inserts an image into Rich Text Editor's content area, and the link module links external resources such as website URLs, to selected text in the Rich Text Editor's content, respectively.

The link inject module adds a link icon to the toolbar and the image inject module adds an image icon to the toolbar.

Specifies the items to be rendered in the quick toolbar based on the target element such image, link and text element. The quick toolbar opens to customize the element by clicking the target element.

Retrieve the formatted content

To retrieve the editor contents, use value property of Rich Text Editor.

`ts

var rteValue = this.$refs.rteObj.ej2Instances.value;

`

Or, you can use the public method, getHtml to retrieve the Rich Text Editor content.

`ts

var rteValue = this.$refs.rteObj.ej2Instances.getHtml();

`

To fetch the Rich Text Editor's text content, use getText method of Rich Text Editor.

`ts

var rteValue = this.$refs.rteObj.ej2Instances.getText();

`

Run the project

To run the project, use the following command:

`bash

npm run serve

`

or

Copyright © 2001 -2024 Syncfusion Inc.

`bash

yarn run serve

`

Add content using valueTemplate property

Rich Text Editor content can be added using valueTemplate property as given below

~/SRC/APP.VUE

```
<template>
  <div id="defaultRTE">
    <ejs-richtexteditor :valueTemplate="'vueTemplate'"  ref="defaultRTE"
:height="340">
    <template v-slot:vueTemplate>
        <p>The Rich Text Editor component is WYSIWYG ("what you see is what
you get") editor that provides the best user experience to create and update
the content.Users can format their content using standard toolbar
commands.</p>
    </template>
    </ejs-richtexteditor>
  </div>
</template>
<script>
    import { RichTextEditorComponent, Toolbar, Link, Image, Count,
HtmlEditor, QuickToolbar } from '@syncfusion/ej2-vue-richtexteditor';

    export default {
         components: {
```

Copyright © 2001 -2024 Syncfusion Inc.

```
            'ejs-richtexteditor': RichTextEditorComponent
          },
          data: function() {
    return { };
          },
          provide: {
              richtexteditor:[Toolbar, Link, Image, Count, HtmlEditor,
QuickToolbar]
          }
    }
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";

You can refer to our Vue Rich Text Editor feature tour page for its groundbreaking feature representations. You can also explore our Vue Rich Text Editor example that shows how to render and configure the rich text editor tools.

Getting Started with the Vue richtexteditor Component in Vue 3

This article provides a step-by-step guide for setting up a Vite project with a JavaScript environment and integrating the Syncfusion Vue Rich Text Editor component using the Composition API / Options API.

The Composition API is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

The Options API is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

Prerequisites

System requirements for Syncfusion Vue UI components

Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using Vite. To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

Copyright © 2001 -2024 Syncfusion Inc.

`bash
npm create vite@latest
`

or

`bash
yarn create vite
`

Using one of the above commands will lead you to set up additional configurations for the project as below:

1. Define the project name: We can specify the name of the project directly. Let's specify the name of the project as `my-project` for this article.

`bash
? Project name: » my-project
`

2. Select `Vue` as the framework. It will create a Vue 3 project.

`bash
? Select a framework: » - Use arrow-keys. Return to submit.
Vanilla
Vue
React
Preact
Lit
Svelte
Others
`

3. Choose `JavaScript` as the framework variant to build this Vite project using JavaScript and Vue.

`bash
? Select a variant: » - Use arrow-keys. Return to submit.
JavaScript
TypeScript
Customize with create-vue ↗

Nuxt ↗
`

4. Upon completing the aforementioned steps to create the my-project, run the following command to install its dependencies:

`bash
cd my-project
npm install
`

or

`bash
cd my-project
yarn install
`

Now that my-project is ready to run with default settings, let's add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion Vue component packages are available at npmjs.com. To use Syncfusion Vue components in the project, install the corresponding npm package.

This article uses the Vue Rich Text Editor component as an example. To use the Vue Rich Text Editor component in the project, the @syncfusion/ej2-vue-richtexteditor package needs to be installed using the following command:

`bash
npm install @syncfusion/ej2-vue-richtexteditor --save
`

or

`bash
yarn add @syncfusion/ej2-vue-richtexteditor
`

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the Rich Text Editor component and its dependents were imported into the <style> section of **src/App.vue** file.

Copyright © 2001 -2024 Syncfusion Inc.

~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-lists/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
richtexteditor/styles/material.css";
</style>
```

The order of importing CSS styles should be in line with its dependency graph.

Add Syncfusion Vue component

Follow the below steps to add the Vue Rich Text Editor component using Composition API or Options API:

1. First, import and register the Rich Text Editor component and its child directives in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { RichTextEditorComponent as
EjsRichtexteditor,Toolbar,Link,Image,HtmlEditor } from "@syncfusion/ej2-vue-
richtexteditor";
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { RichTextEditorComponent,Toolbar,Link,Image,HtmlEditor } from
"@syncfusion/ej2-vue-richtexteditor";
</script>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<div>
<div class="control-section">
<div class="sample-container">
<div class="default-section">
<ejs-richtexteditor id="default" ref="rteInstance" v-bind:value="value"
></ejs-richtexteditor>
</div>
</div>
</div>
</div>
```

@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
richtexteditor/styles/material.css";
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<div>
<div class="control-section">
<div class="sample-container">
<div class="default-section">
<ejs-richtexteditor ref="rte_instance" id="rte1" v-bind:value="value"></ejs-
richtexteditor>
</div>
</div>
</div>
</div>
</template>
<script>
import { RichTextEditorComponent,Toolbar,Link,Image,HtmlEditor } from
"@syncfusion/ej2-vue-richtexteditor";
export default {
name: "NormalView",
components: {
"ejs-richtexteditor": RichTextEditorComponent
},
data: function () {
return {
value: "<p>The Rich Text Editor component is a WYSIWYG editor that provides
the best user experience to create and update the content. Users can format
their content using standard toolbar commands.</p>"
}
},
provide: {
richtexteditor: [Toolbar, Link, Image, HtmlEditor]
```

Copyright © 2001 -2024 Syncfusion Inc.

```
},
};
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-lists/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
richtexteditor/styles/material.css";
</style>
```

Run the project

To run the project, use the following command:

`bash

npm run dev

`

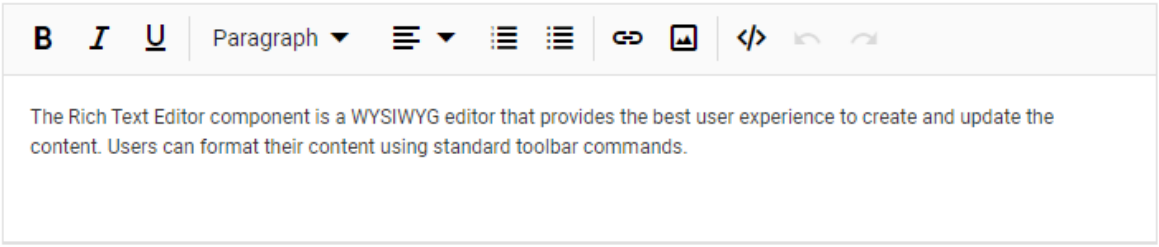
or

`bash

yarn run dev

`

The output will appear as follows:



Sample: vue-3-richrexteditor-getting-started.

For migrating from Vue 2 to Vue 3, refer to the migration documentation.

Editor modes in Vue Rich text editor component

The Rich Text Editor component used to create and edit the content and return valid HTML markup or markdown (MD) of the content. It supports the following two editing formation.

- HTML editor
- Markdown editor

Copyright © 2001 -2024 Syncfusion Inc.

HTML editor

Rich Text Editor is a WYSIWYG editing control for formatting the word content as HTML.

The HTML editing mode is the default mode in Rich Text Editor to format the content through the available toolbar items to return the valid HTML markup. Set the editorMode property as **HTML**.

To create Rich Text Editor with HTML editing feature, inject the HtmlEditor module to the Rich Text Editor using the RichTextEditor.Inject(HtmlEditor) method.

Markdown editor

Set the editorMode property as **Markdown**, to create or edit the content and apply formatting to view markdown formatted content.

The third-party library such as Marked or any other library is used to convert markdown into HTML content.

- Supported tags are h6, h5, h4, h3, h2, h1, blockquote, pre, p, OL, and UL.
- Supported selection tags are Bold, Italic, StrikeThrough, InlineCode, SubScript, SuperScript, UpperCase, and LowerCase.

Toolbar in Vue Rich text editor component

The Rich Text Editor toolbar contains a collection of tools such as bold, italic, and text alignment buttons that are used to format the content. However, in most integrations, you can customize the toolbar configurations easily to suit your needs.

To create Rich Text Editor with Markdown editing feature, inject the Toolbar module to the Rich Text Editor using the RichTextEditor.Inject(Toolbar) method.

The Rich Text Editor allows you to configure different types of toolbar using toolbarSettings.type property. The types of toolbar are:

1. Expand
2. MultiRow

Copyright © 2001 -2024 Syncfusion Inc.

Expand Toolbar

The default mode of toolbarSettings.type is Expand, it will hide the overflowing items in the next row. By clicking the expand arrow, view the overflowing toolbar items.

Floating Toolbar

By default, toolbar is float at the top of the Rich Text Editor on scrolling. It can be customized by specifying the offset of the floating toolbar from documents top position using floatingToolbarOffset.

Enable or disable the floating toolbar using enableFloating of thetoolbarSettings property.

Toolbar items

The following table lists the tools available in the toolbar.

| **Name** | **Summary** | **Initialization** |

| --- | --- | --- |

| Undo | Allows to undo the actions. | toolbarSettings: {
 items: ['Undo']
 } |

| Redo | Allows to redo the actions. | toolbarSettings: {
 items: ['Redo']
 } |

| Alignment | Align the content with left, center, and right margin. | toolbarSettings: {
 items: ['Alignments']
 } |

| OrderedList | Create a new list item (numbered). | toolbarSettings: {
 items: ['OrderedList']
 } |

| UnorderedList | Create a new list item (bulleted). | toolbarSettings: {
 items: ['UnorderedList']
 } |

Copyright © 2001 -2024 Syncfusion Inc.

| Indent |Allows to increase the indent level of the content. | toolbarSettings: {
 items: ['Indent']
 } |

| Outdent | Allows to decrease the indent level of the content. | toolbarSettings: {
 items: ['Outdent']
 } |

| Hyperlink | Creates a hyperlink to a text or image to a specific location in the content. | toolbarSettings: {
 items: ['CreateLink']
 } |

| Images | Inserts an image from an online source or local computer. | toolbarSettings: {
 items: ['Image']
 } |

| LowerCase | Change the case of selected text to lower in the content. | toolbarSettings: {
 items: ['LowerCase']
 } |

| UpperCase | Change the case of selected text to upper in the content. | toolbarSettings: {
 items: ['UpperCase']
 } |

| SubScript | Makes the selected text as subscript (lower). | toolbarSettings: {
 items: ['SubScript']
 } |

| SuperScript | Makes the selected text as superscript (higher). | toolbarSettings: {
 items: ['SuperScript']
 } |

| Print | Allows to print the editor content. | toolbarSettings: {
 items: ['Print']
 } |

| FontName | Defines the fonts that appear under the Font Family DropDownList from the Rich Text Editor's toolbar. | toolbarSettings: {
 items: ['FontName']
 } |

| FontSize | Defines the font sizes that appear under the Font Size DropDownList from the Rich Text Editor's toolbar. | toolbarSettings: {
 items: ['FontSize']
 } |

| FontColor | Specifies an array of colors can be used in the colors pop-up for font color. | toolbarSettings: {
 items: ['FontColor']
 } |

| BackgroundColor | Specifies an array of colors can be used in the colors pop-up for background color. | toolbarSettings: {
 items: ['BackgroundColor']
 } |

| Format | An object with the options that will appear in the paragraph format drop-down from the toolbar. | toolbarSettings: {
 items: ['Formats']
 } |

| StrikeThrough | Apply double line strike through formatting for the selected text. | toolbarSettings: {
 items: ['StrikeThrough']
 } |

| ClearFormat | The clear format tool is used to remove all formatting styles (such as bold, italic, underline, color, superscript, subscript, and more) from currently selected text. As a result, all the formatting text will be cleared and return to its default formatting styles. | toolbarSettings: {
 items: ['ClearFormat']
 } |

| FullScreen | Stretches the editor to the maximum width and height of the browser window. | toolbarSettings: {
 items: ['FullScreen']
 } |

| SourceCode | The RichTextBox includes the ability for users to directly edit the HTML code via Source View. If you made any modification in source view directly, synchronize with design view. | toolbarSettings: {
 items: ['SourceCode']
 } |

| NumberFormatList | Allows to create list items with various list style types(numbered)|toolbarSettings: {
 items: ['NumberFormatList']
 } |

Copyright © 2001 -2024 Syncfusion Inc.

| BulletFormatList | Allows to create list items with various list style types(bulleted)|toolbarSettings: {
 items: ['BulletFormatList']
 } |

By default, tools will be arranged in following order.

items: ['Bold', 'Italic', 'Underline', '|', 'Formats', 'Alignments', 'OrderedList', 'UnorderedList', '|', 'CreateLink', 'Image', '|', 'SourceCode', 'Undo', 'Redo']

The tools order can be customized as our application requirement. If you are not specifying any tools order, the editor will create the toolbar with default items.

Custom tool

The Rich Text Editor allows you to configure your own commands to its toolbar using the toolbarSettings property. The command can be plain text, icon, or HTML template. The order and the group can also be defined where the command should be included. Bind the action to the command by getting its instance.

This sample shows how to add your own commands to the toolbar of the Rich Text Editor. The **Ω** command is added to insert special characters in the editor. By clicking the **Ω** command, it will show the special characters list, and then choose the character to be inserted in the editor.

The following code snippet illustrates custom tool with tooltip text which will be included in items field of the toolbarSettings property.

In the following sample, once Rich Text Editor control is created, the concern event will be created the Dialog component can be rendered and target as Rich Text Editor content.

`javascript

{

tooltipText: 'Insert Symbol',

undo: true,

click: this.onClick.bind(this),

template: '<button class="e-tbar-btn e-btn" tabindex="-1" id="custom_tbar" style="width:100%"> Ω </button>'

}

`

Click the **Ω** command to show the special characters list, and then choose the character to be inserted in the editor.

{% previewsample "page.domainurl/code-snippet/rich-text-editor/toolbar-cs19" %}

The focus will be lost while rendering the required component for the custom toolbar, causing it to render outside the Rich Text Editor and triggering a blur event. During that time, proper functionality will not be achievable. Therefore, it is recommended to set the cssClass property or class as e-rte-elements in the dependency component.

Quick inline toolbar

Quick commands are opened as context-menu on clicking the corresponding element. The commands must be passed as string collection to image, text, link and table attributes of the quickToolbarSettings property.

| Target Element | Default Quick Toolbar items |

|----------------|---------|

|image | 'Replace', 'Align', 'Caption', 'Remove', 'InsertLink', 'Display', 'AltText','Dimension'.|

| link | 'Open', 'Edit', 'UnLink'.|

| text | null
 (Any toolbar items in the Rich Text Editor can be configured here).|

Copyright © 2001 -2024 Syncfusion Inc.

| table | 'TableHeader', 'TableRows', 'TableColumns', 'BackgroundColor', 'TableRemove', 'Alignments', 'TableCellVerticalAlign', 'Styles'.|

Custom tool can be added to the corresponding quick toolbar, using quickToolbarSettings property.

The following sample demonstrates the option to insert the image to the Rich Text Editor content as well as option to rotate the image through the quick toolbar. The image rotation functionalities have been achieved through the toolbarClick event.

Styling in Vue Rich text editor component

Font name and size

By default, the editor is initialized with font name and font size as **null**. To change it, select a different font name and font size from the drop-down in the editor's toolbar.

To apply different font style for section of the content, select the text that you would like to change, and select a required font style from the drop-down to apply the changes to the selected text.

FontName DropDowns

The following table lists the default font name and width of the fontname drop-down and available list of font names.

| **Property** | **Default value** |

| --- | --- |

| Default font name | null |

| Width | 65px |

| Items | { text: 'Segoe UI', value: 'Segoe UI' },
 { text: 'Arial', value: 'Arial,Helvetica,sans-serif' },
 { text: 'Courier New', value: 'Courier New,Courier,monospace' },
 { text: 'Georgia', value: 'Georgia,serif' },
 { text: 'Impact', value: 'Impact,Charcoal,sans-serif' },
 { text: 'Lucida Console', value: 'Lucida Console,Monaco,monospace' },
 { text: 'Tahoma', value: 'Tahoma,Geneva,sans-serif' },
 { text: 'Times New Roman', value: 'Times New Roman,Times,serif' },
 { text: 'Trebuchet MS', value: 'Trebuchet MS,Helvetica,sans-serif' },
 { text: 'Verdana', value: 'Verdana,Geneva,sans-serif' } |

FontSize DropDowns

The following table list the default font size and width of the fontsize dropdown and available list of font size.

| **Property** | **Default value** |

| --- | --- |

| Default font size | null |

| Width | 35px |

| Items | { text: '8', value: '8pt' },
 { text: '10', value: '10pt' },
 { text: '12', value: '12pt' },
 { text: '14', value: '14pt' },
 { text: '18', value: '18pt' },
 { text: '24', value: '24pt' },
 { text: '36', value: '36pt' } |

The following sample demonstrates the option to add the font name and font size tools to the toolbar as well as modify the default width of the tools.

Font and Background color

To apply font color or background color for a selected content of Rich Text Editor, use font color and background color tools.

Rich Text Editor supports to provide customs font color and background color with existing list through the colorCode field of fontColor and backgroundColor.

The FontColor and the BackgroundColor property has two mode Picker and Palette. Palette mode has predefined set of colorCode and in the picker mode, more colors has been provided. Through modeSwitcher, you can able to switch between these two options.

Editor content styles

By default, The content styles of Rich Text Editor are not returned while retrieving HTML value from the editor. So, the styles are not applied when using the HTML value outside of the editor. To get the styles

to Rich Text Editor's content for your application, You can copy and use the below styles directly in your application. The styles listed below which used in the UI elements of the Rich Text Editor.

Make sure to add a CSS class 'e-rte-content' to the content container.

```
.e-rte-content p {
margin: 0 0 10px;
margin-bottom: 10px;
}
.e-rte-content li {
margin-bottom: 10px;
}
.e-rte-content h1 {
font-size: 2.17em;
font-weight: 400;
line-height: 1;
margin: 10px 0;
}
.e-rte-content h2 {
font-size: 1.74em;
font-weight: 400;
margin: 10px 0;
}
.e-rte-content h3 {
font-size: 1.31em;
font-weight: 400;
margin: 10px 0;
}
.e-rte-content h4 {
font-size: 1em;
font-weight: 400;
margin: 0;
}
.e-rte-content h5 {
```

Image in Vue Rich text editor component

Rich Text Editor allows to insert images from online sources as well as local computer where you want to insert the image in your content. For inserting the image to the Rich Text Editor, the following list of options have been provided in the insertImageSettings

| Options | Description |

|----------------|---------|

| allowedTypes | Specifies the extensions of the image types allowed to insert on bowering and passing the extensions with comma separators. For example, pass allowedTypes as .jpg and .png.|

| display | Sets the default display for an image when it is inserted in to the Rich Text Editor. Possible options are: 'inline' and 'break'.|

| width | Sets the default width of the image when it is inserted in the Rich Text Editor.|

| height | Sets the default height of the image when it is inserted in the Rich Text Editor.|

| saveUrl | Provides URL to map the action result method to save the image.|

| path | Specifies the location to store the image.|

Upload options

Through the browse option in the Image dialog, select the image from the local machine and insert into the Rich Text Editor content.

If the path field is not specified in the insertImageSettings, the image will be transferred into base 64 and blob url for the image will be created and the generated url will be set to the src property of img tag.

`ts

<img src="blob:http://ej2.syncfusion.com/3ab56a6e-ec0d-490f-85a5-f0aeb0ad8879" >

`

If you want to insert a lot of tiny images in the editor and don't want a specific physical location for saving images, you can opt to save format as Base64.

In the following sample, the image has been loaded from the local machine and it will be saved in the given location.

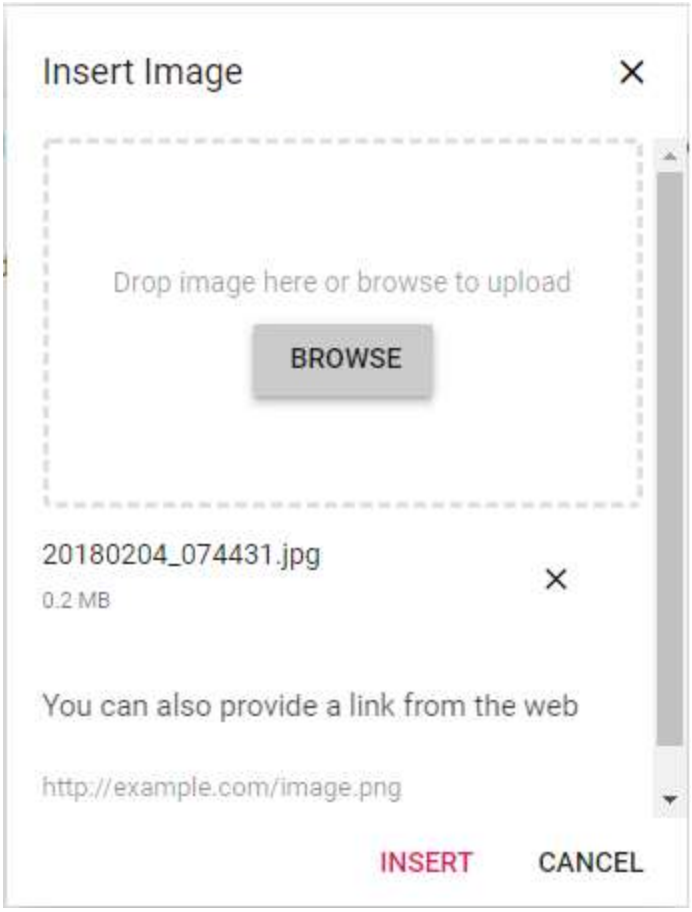
Image delete

To remove an image from the Rich Text Editor content, select the image and click Remove tool from the quick toolbar. It will delete the image from the Rich Text Editor content as well as from the service location if the saveUrl is given.

Once you select the image from the local machine, the URL for the image will be generate. From there,you can remove the image from the service location by clicking the cross icon.

Copyright © 2001 -2024 Syncfusion Inc.



The following sample explains, how to configure removeUrl to remove a saved image from the remote service location, when the following image remove actions are performed:

- delete key action.
- backspace key action.
- Removing uploaded image file from the insert image dialog.
- Deleting image using the quick toolbar remove option.

Insert from web

To insert an image from the online source like Google, Ping, etc., you should enable the image tool on the editor's toolbar. By default, the image tool opens a simple dialog which allows you to insert an image from online source.

Dimension

Sets the default width and height of the image when it is inserted in the Rich Text Editor using width and height of the insertImageSettings.

Through the quickToolbar, also you can change the width and height using Change Size option. Once click into the option. The Image Size dialog will open as below. In that specify the width and height of the image in pixel.

![image-size](./images/image-size.png)

Caption and Alt Text

Image caption and alternative text can be specified for the inserted image in the Rich Text Editor through the quick toolbar options such as, Image Caption and Alternative Text.

Through the Alternative Text option, set the alternative text for the image, when the image is not upload successfully into the Rich Text Editor.

By clicking the Image Caption, the image will get wrapped in an image element with a caption. Then, you can type caption content inside the Rich Text Editor.

Display position

Sets the default display for an image when it is inserted in the Rich Text Editor using display field in insertImageSettings. It has two possible options: 'inline' and 'break'.

APP.VUE

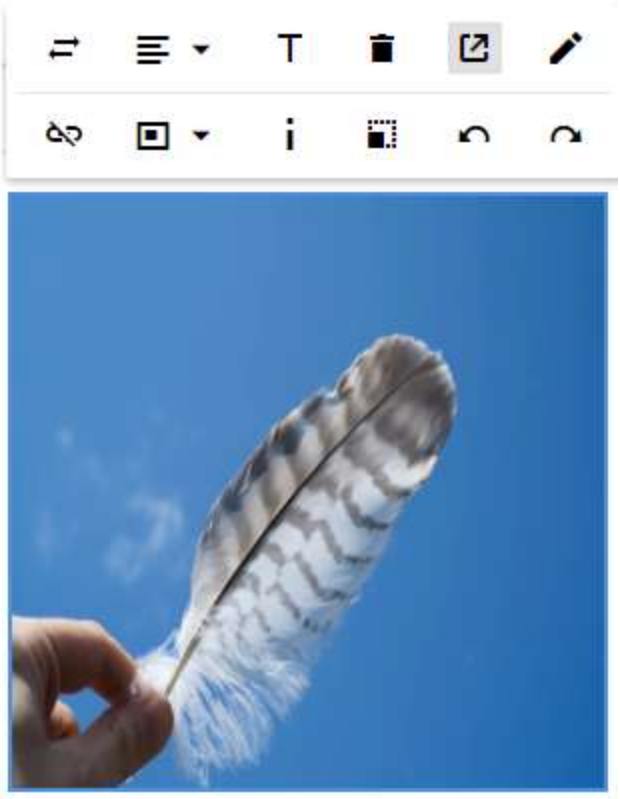
Image with link

The hyperlink itself can be an image in Rich Text Editor. If the image given as hyperlink, the remove, edit, and open link will be added to the quick toolbar of image. For further details about link, see the link documentation documentation.

Copyright © 2001 -2024 Syncfusion Inc.



Resize

Rich Text Editor has a built-in image inserting support. The resize points will be appearing on each corner of image when focus. So, users can resize the image using mouse points or thumb through the resize points easily. Also, the resize calculation will be done based on aspect ratio.

![image-resize](./images/image-resize.png)

Drag and Drop

By default, the Rich Text Editor allows you to insert images by drag-and-drop from the local file system such as Windows Explorer into the content editor area. And, you can upload the images to the server before inserting into the editor by configuring the saveUrl property. The images can be repositioned anywhere within the editor area by dragging and dropping the image.

In the following sample, you can see feature demo.

Drag and drop with specific extension images

You can allow the specific images alone to be uploaded using the the allowedExtentions property. The extension can be represented as collection by comma separators. By default, the Rich Text Editor allows the JPG, JPEG, and PNG formats. You can configure this formats as follows.

`ts

insertImageSettings: {

allowedTypes: ['.jpg']

}

`

Prevent drag and drop action

You can prevent drag-and-drop action by setting the actionBegin argument cancel value to true. The following code shows how to prevent the drag-and-drop.

`ts

actionBegin: function (args: any): void {

if(args.type === 'drop' || args.tpe === 'dragstart') {

args.cancel =true;

}

}

`

Audio in Vue Rich text editor component

The Rich Text Editor allows you to insert audio from online sources and local computers and then insert them into your content. You can insert the audio with the following list of options in the insertAudioSettings property.

| Options | Description |

|----------------|---------|

Copyright © 2001 -2024 Syncfusion Inc.

| allowedTypes | Specifies the extensions of the audio types allowed to insert on bowering and passing the extensions with comma separators. For example, pass allowedTypes as .mp3, .wav, .m4a and .wma. |

| layoutOption | Sets the default display for audio when it is inserted into the Rich Text Editor. Possible options are Inline and Break.|

| saveFormat | Sets the default save format of the audio element when inserted. Possible options are: Blob and Base64.|

| saveUrl | Provides URL to map the action result method to save the audio.|

| removeUrl | Provides URL to map the action result method to remove the audio.|

| path | Specifies the location to store the audio.|

Configure audio tool in the toolbar

You can add an audio tool in the Rich Text Editor toolbar using the toolbarSettings items property.

Rich Text Editor features are segregated into individual feature-wise modules. To use audio, inject the Audio module in provides section.

To configure the Audio toolbar item, refer to the below code.

APP.VUE

```
<template>
<div>
<div class="control-section">
    <div class="sample-container">
        <div class="default-section">
        <ejs-richtexteditor ref="rteObj" :height = "340"
:insertAudioSettings = "insertAudioSettings" :toolbarSettings =
"toolbarSettings" >
       <p>The Rich Text Editor component is WYSIWYG ("what you see is what
you get") editor that provides the best user experience to create and update
the content.
          Users can format their content using standard toolbar
commands.</p>
            <p><b>Key features:</b></p>
            <ul>
            <li><p>Provides < IFRAME > and < DIV > modes</p></li>
            <li><p>Capable of handling markdown editing.</p></li>
            <li><p>Contains a modular library to load the necessary
functionality on demand.</p></li>
            <li><p>Provides a fully customizable toolbar.</p></li>
            <li><p>Provides HTML view to edit the source directly for
developers.</p></li>
            <li><p>Supports third-party library integration.</p></li>
            <li><p>Allows preview of modified content before saving
it.</p></li>
            <li><p>Handles images, hyperlinks, video, hyperlinks, uploads,
etc.</p></li>
            </ul>
        </ejs-richtexteditor>

{% previewsample "page.domainurl/code-snippet/rich-text-editor/audio-cs1" %}

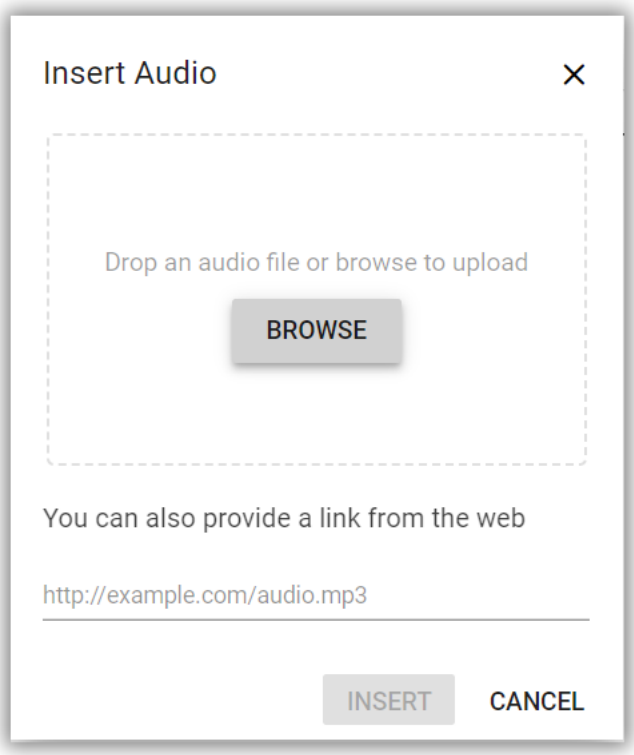
Insert audio from the web

You can insert audio from either the hosted link or the local machine, by clicking the audio button in the editor's toolbar. On clicking the audio button, a dialog opens, which allows you to insert audio from the web URL.

Insert from web URL

By default, the audio tool opens the audio dialog, allowing you to insert audio from an online source. Inserting the URL will be added to the `src` attribute of the `<source>` tag.

Copyright © 2001 -2024 Syncfusion Inc.



Insert audio from local machine

You can use the browse option on the audio dialog, to select the audio from the local machine and insert it into the Rich Text Editor content.

If the path field is not specified in the insertAudioSettings, the audio will be converted into the Blob URL or Base64 and inserted inside the Rich Text Editor.

Restrict audio upload based on size

You can restrict the audio uploaded from the local machine when the uploaded audio file size is greater than the allowed size by using the fileUploading event.

The file size in the argument will be returned in bytes.

In the following illustration, the audio size has been validated before uploading, and it is determined whether the audio has been uploaded or not.

`

<template>

<ejs-richtexteditor ref="rteObj" :height = "340" :insertAudioSettings = "insertAudioSettings" :toolbarSettings = "toolbarSettings" :fileUploading = "onFileUpload">

`
```

Server-side action

The selected audio can be uploaded to the required destination using the controller action below. Map this method name in insertAudioSettings.saveUrl and provide the required destination path through insertAudioSettings.path properties.

If you want to insert lower-sized audio files in the editor and don't want a specific physical location for saving the audio, you can opt to save the format as `Base64`.

In the following code blocks, the audio module has been injected and can insert the audio files saved in the specified path.

```
`
<template>
<div>
<div class="control-section">
<div class="sample-container">
<div class="default-section">
```

```
<ejs-richtexteditor ref="rteObj" :height="340" :toolbarSettings="toolbarSettings" :insertAudioSettings =

}
}
}
```

Audio save format

The audio files can be saved as `Blob` or `Base64` URL by using the insertAudioSettings.saveFormat property, which is of enum type, and the generated URL will be set to the `src` attribute of the `<source>` tag.

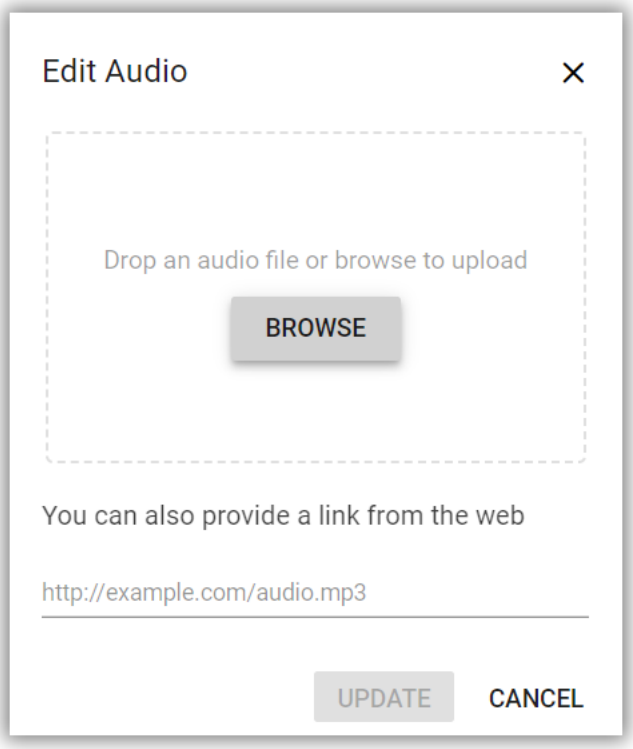
The default `saveFormat` property is set to `Blob` format.

```html
<audio>
<source src="blob:http://ej2.syncfusion.com/3ab56a6e-ec0d-490f-85a5-f0aeb0ad8879" type="audio/mp3" >
</audio>
<audio>
<source src="data:audio/mp3base64,iVBORw0KGgoAAAANSUhEUgAAADAAAAAwCAYAAABXAvmHA" type="audio/mp3" >
</audio>
```

Replacing audio

Once an audio file has been inserted, you can change it using the Rich Text Editor quickToolbarSettings `audioReplace` option. You can replace the audio file using the web URL or the browse option in the audio dialog.

Copyright © 2001 -2024 Syncfusion Inc.

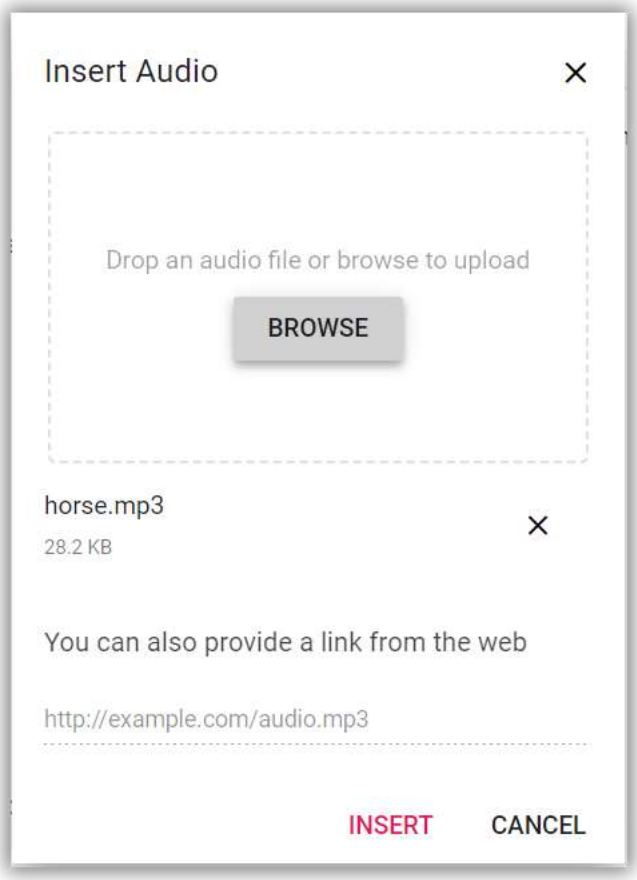


Delete audio

To remove audio from the Rich Text Editor content, select the audio and click the audioRemove button from the quick toolbar. It will delete the audio from the Rich Text Editor content as well as from the service location if the insertAudioSettings.removeUrl is given.

Once you select the audio from the local machine, the URL for the audio will be generated. You can remove the audio from the service location by clicking the cross icon.

Copyright © 2001 -2024 Syncfusion Inc.



Display position

Sets the default display property for audio when it is inserted in the Rich Text Editor using the insertAudioSettings.layoutOption property. It has two possible options: Inline and Break. When updating the display positions, it updates the audio elements' layout position.

The default layoutOption property is set to Inline.

`

```
<template>
<div>
<div class="control-section">
<div class="sample-container">
<div class="default-section">
<ejs-richtexteditor ref="rteObj" :height = "340" :insertAudioSettings = "insertAudioSettings"
:toolbarSettings = "toolbarSettings" >

`
```

Rename audio before inserting

You can use the insertAudioSettings property, to specify the server handler to upload the selected audio. Then by binding the fileUploadSuccess event, you can receive the modified file name from the server and update it in the Rich Text Editor's insert audio dialog.

```
`
<template>
<div>
<div class="control-section">
<div class="sample-container">
<div class="default-section">
<ejs-richtexteditor ref="rteObj" :height = "340" :insertAudioSettings = "insertAudioSettings" :toolbarSettings = "toolbarSettings" :fileUploadSuccess = "onFileUploadSuccess">
<p>The Rich Text Editor is WYSIWYG ("what you see is what you get") editor useful to create and edit content, and return the valid <a href="https://ej2.syncfusion.com/home/" target="blank”>HTML markup</a> or <a href=“https://ej2.syncfusion.com/home/” target=“blank">markdown</a> of the content</p>
</ejs-richtexteditor>
</div>
</div>
</div>
</div>
</template>
<script>
import Vue from "vue";
import { RichTextEditorPlugin, Toolbar, Link, Audio, HtmlEditor, QuickToolbar } from "@syncfusion/ej2-vue-richtexteditor";
Vue.use(RichTextEditorPlugin);
export default {
```

```
data: function() {
return {
toolbarSettings: {
items: ['Audio']
},
insertAudioSettings: {
saveUrl: "[SERVICEHOSTEDPATH]/api/uploadbox/Rename",
path: "[SERVICEHOSTEDPATH]/Files/"
}
};
},
methods: {
onFileUploadSuccess (args) {
alert("Get the new file name here");
if (args.e.currentTarget.getResponseHeader('name') != null) {
args.file.name = args.e.currentTarget.getResponseHeader('name');
let filename = document.querySelectorAll(".e-file-name")[0];
filename.innerHTML = args.file.name.replace(document.querySelectorAll(".e-file-type")[0].innerHTML,
'');
filename.title = args.file.name;
}
}
},
provide:{
richtexteditor:[Toolbar, Link, Audio, HtmlEditor, QuickToolbar]
}
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-calendars/styles/material.css';
@import '../node_modules/@syncfusion/ej2-dropdowns/styles/material.css';
```

@import "../node_modules/@syncfusion/ej2-vue-gantt/styles/material.css";
</style>
`
```

To configure the server-side handler, refer to the below code.

```c#
int x = 0;
string file;
[AcceptVerbs("Post")]
public void Rename()
{
try
{
var httpPostedFile = System.Web.HttpContext.Current.Request.Files["UploadFiles"];
fileName = httpPostedFile.FileName;
if (httpPostedFile != null)
{
var fileSave = System.Web.HttpContext.Current.Server.MapPath("~/Files");
if (!Directory.Exists(fileSave))
{
Directory.CreateDirectory(fileSave);
}
var fileName = Path.GetFileName(httpPostedFile.FileName);
var fileSavePath = Path.Combine(fileSave, fileName);
while (System.IO.File.Exists(fileSavePath))
```

Copyright © 2001 -2024 Syncfusion Inc.

```
{
fileName = "rteFiles" + x + "-" + fileName;
fileSavePath = Path.Combine(fileSave, fileName);
x++;
}
if (!System.IO.File.Exists(fileSavePath))
{
httpPostedFile.SaveAs(fileSavePath);
HttpResponse Response = System.Web.HttpContext.Current.Response;
Response.Clear();
Response.Headers.Add("name", fileName);
Response.ContentType = "application/json; charset=utf-8";
Response.StatusDescription = "File uploaded succesfully";
Response.End();
}
}
}
catch (Exception e)
{
HttpResponse Response = System.Web.HttpContext.Current.Response;
Response.Clear();
Response.ContentType = "application/json; charset=utf-8";
Response.StatusCode = 204;
Response.Status = "204 No Content";
Response.StatusDescription = e.Message;
Response.End();
}
}
`
```

Upload audio with authentication

You can add additional data with the audio uploaded from the Rich Text Editor on the client side, which can even be received on the server side by using the fileUploading event and its customFormData argument, you can pass parameters to the controller action. On the server side, you can fetch the custom headers by accessing the form collection from the current request, which retrieves the values sent using the POST method.

By default, it doesn't support the UseDefaultCredentials property; we need to manually append the default credentials with the upload request.

```
<template>
<div>
<div class="control-section">
<div class="sample-container">
<div class="default-section">
<ejs-richtexteditor ref="rteObj" :height = "340" :insertAudioSettings = "insertAudioSettings" :toolbarSettings = "toolbarSettings" :fileUploading = "onFileUpload">
</ejs-richtexteditor>

Video in Vue Rich text editor component

The Rich Text Editor allows you to insert videos from online sources and local computers and then insert them into your content. You can insert the video with the following list of options in the insertVideoSettings property.

| Options | Description |

|----------------|---------|

| allowedTypes | Specifies the extensions of the video types allowed to insert on bowering and passing the extensions with comma separators. For example, pass allowedTypes as .mp4, .mov, .wmv and .avi.|

| layoutOption | Sets the default display for a video when it is inserted into the Rich Text Editor. Possible options are: Inline and Break.|

| saveFormat | Sets the default save format of the video element when inserted. Possible options are: Blob and Base64.|

| width | Sets the default width of the video when it is inserted in the Rich Text Editor.|

| minWidth | Sets the minWidth of the video element when it is inserted in the Rich Text Editor.|

| maxWidth | Sets the maxWidth of the video element when it is inserted in the Rich Text Editor.|

| height | Sets the default height of the video when it is inserted in the Rich Text Editor.|

| minHeight | Sets the minHeight of the video element when it is inserted in the Rich Text Editor.|

| maxHeight | Sets the maxHeight of the video element when it is inserted in the Rich Text Editor.|

| saveUrl | Provides URL to map the action result method to save the video.|

| removeUrl | Provides URL to map the action result method to remove the video.|

| path | Specifies the location to store the video.|

| resize | Sets the resizing action for the video element.|

| resizeByPercent | Sets the percentage values for the video element with the resizing action.|

Configure the video tool in the toolbar

You can add the video tool in the Rich Text Editor toolbar using the toolbarSettings items property.

Rich Text Editor features are segregated into individual feature-wise modules. To use the video, inject the Video module in provides section.

To configure the Video toolbar item, refer to the below code.

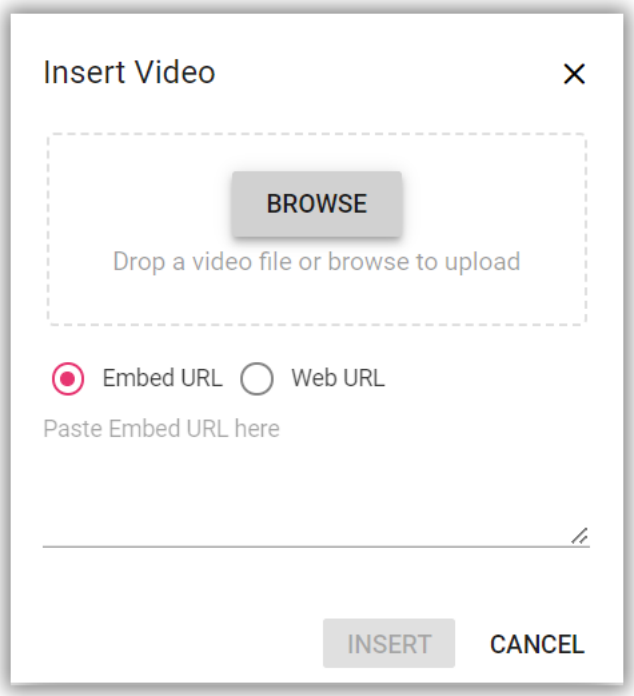
{% previewsample "page.domainurl/code-snippet/rich-text-editor/video-cs1" %}

Insert a video from the web

You can insert a video from either the hosted link or the local machine by clicking the video button in the editor's toolbar. On Clicking the Video button, a dialog opens which allows you to insert video from the Embedded URL or web URL.

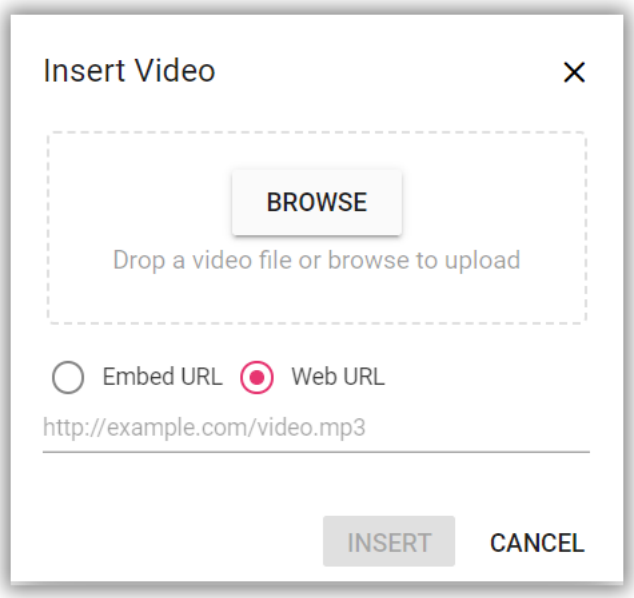
Insert from embed URL

The insert video dialog opens with the Embed URL option as default which allows you to insert an embedded URL.



Insert from web URL

You can switch to Web URL by selecting the web URL check box. Inserting with the web URL option will add the video URL as the src attribute of the <source> tag.



Insert video from local machine

You can use the browse option on the video dialog, to select the video from the local machine and insert it into the Rich Text Editor content.

If the path field is not specified in the insertVideoSettings, the video will be converted into the Blob URL or Base64 and inserted inside the Rich Text Editor.

Restrict video upload based on size

You can restrict the video uploaded from the local machine when the uploaded video file size is greater than the allowed size by using the fileUploading event.

The file size in the argument will be returned in bytes.

In the following example, the video size has been validated before uploading and determined whether the video has been uploaded or not.

`

`

Server-side action

The selected video can be uploaded to the required destination using the controller action below. Map this method name in insertVideoSettings.saveUrl and provide the required destination path through insertVideoSettings.path properties.

If you want to insert lower-sized video files in the editor and don't want a specific physical location for saving the video, you can save the format as `Base64`.

In the following code blocks, the video module has been injected and can insert the video files saved in the specified path.

`ts

}
}
}
```

Video save format

The video files can be saved as `Blob` or `Base64` URL by using the insertVideoSettings.saveFormat property, which is of enum type, and the generated URL will be set to the `src` attribute of the `<source>` tag.

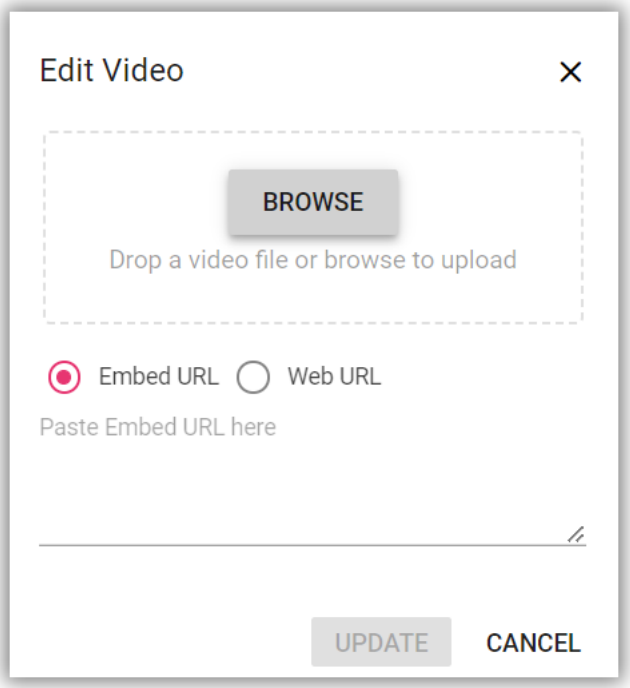
The default `saveFormat` property is set to `Blob` format.

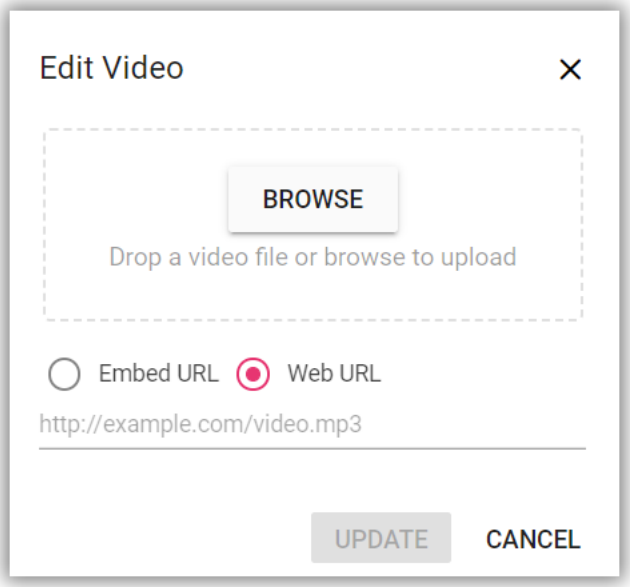
```html
<video>
<source src="blob:http://ej2.syncfusion.com/3ab56a6e-ec0d-490f-85a5-f0aeb0ad8879" type="video/mp4" >
</video>
<video>
<source src="data:video/mp4base64,iVBORw0KGgoAAAANSUhEUgAAADAAAAAwCAYAAABXAvmHA" type="video/mp4" >
</video>
```

Replacing video

Once a video file has been inserted, you can replace it using the Rich Text Editor quickToolbarSettings `videoReplace` option. You can replace the video file either by using the embedded URL or the web URL and the browse option in the video dialog.

Copyright © 2001 -2024 Syncfusion Inc.



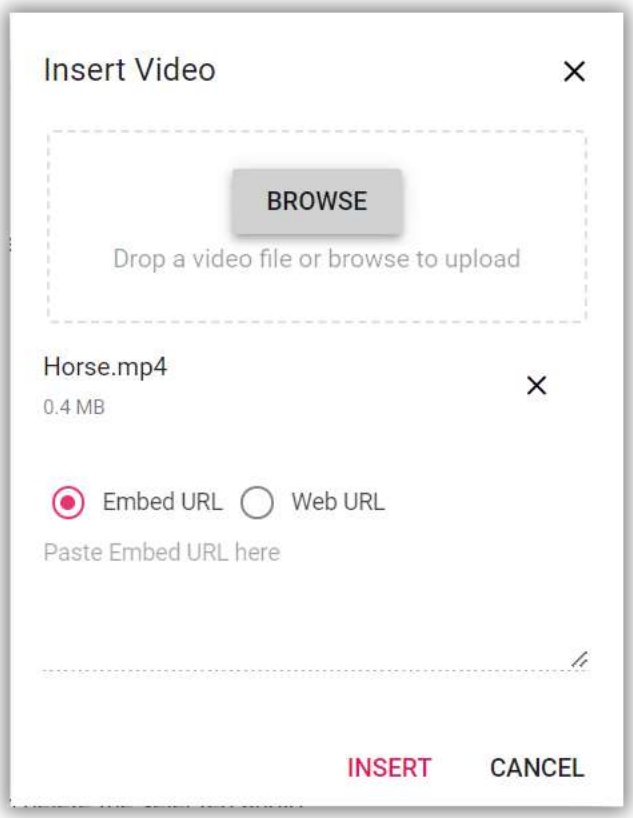


Delete video

To remove a video from the Rich Text Editor content, select the video and click the videoRemove button from the quick toolbar. It will delete the video from the Rich Text Editor content as well as from the service location if the insertVideoSettings.removeUrl is given.

Once you select the video from the local machine, the URL for the video will be generated. You can remove the video from the service location by clicking the cross icon.

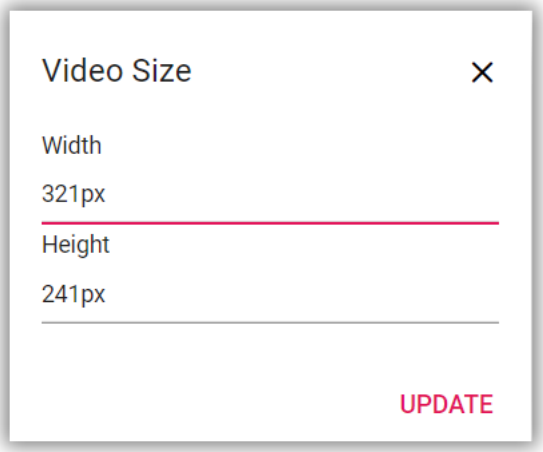
Copyright © 2001 -2024 Syncfusion Inc.



Dimension

Set the default width, minWidth, height, and minHeight of the video element, when it is inserted in the Rich Text Editor using the width, minWidth, height, minHeight properties.

Through the quickToolbarSettings, also you can change the width and height using the Change Size button. Once you click on the button, the video size dialog will open as below. In that, specify the width and height of the video in pixels.



Copyright © 2001 -2024 Syncfusion Inc.

Display position

Sets the default display property for the video when it is inserted in the Rich Text Editor using the insertVideoSettings.layoutOption property. It has two possible options: Inline and Break. When updating the display positions, it updates the video elements' layout position.

The default layoutOption property is set to Inline.

```

@import "../node_modules/@syncfusion/ej2-vue-gantt/styles/material.css";
</style>
`
```

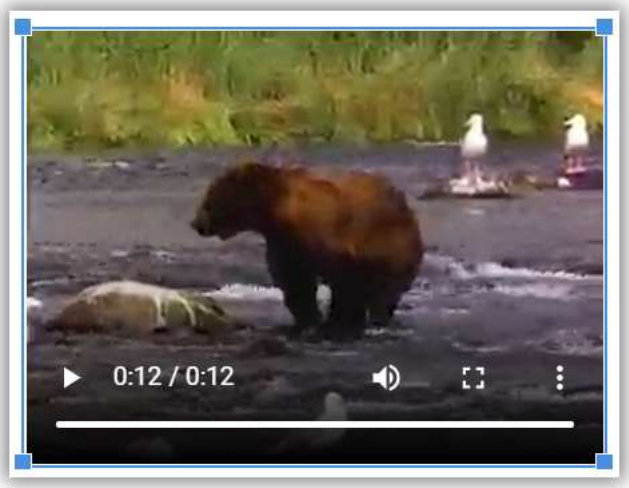
Resize video

The Rich Text Editor has built-in video resizing support, which is enabled for the video elements added. The resize points will appear on each corner of the video when focusing so users can easily resize the video using mouse points or thumb through the resize points. Also, the resize calculation will be done based on the aspect ratio.

You can disable the resize action by configuring `false` for the insertVideoSettings.resize property.

If the minWidth and minHeight properties are configured, the video resizing does not shrink below the specified values.

Copyright © 2001 -2024 Syncfusion Inc.



Rename video before inserting

You can use the insertVideoSettings property, to specify the server handler to upload the selected video. Then by binding the fileUploadSuccess event, you can receive the modified file name from the server and update it in the Rich Text Editor's insert video dialog.

`

<template>

<ejs-richtexteditor ref="rteObj" :height = "340" :insertVideoSettings = "insertVideoSettings" :toolbarSettings = "toolbarSettings" :fileUploadSuccess = "onFileUploadSuccess">

The Rich Text Editor is WYSIWYG ("what you see is what you get") editor useful to create and edit content, and return the valid HTML markup or markdown of the content

</ejs-richtexteditor>

</template>

<script>

import Vue from "vue";

```
import { RichTextEditorPlugin, Toolbar, Link, Video, HtmlEditor, QuickToolbar } from "@syncfusion/ej2-vue-richtexteditor";
Vue.use(RichTextEditorPlugin);
export default {
data: function() {
return {
toolbarSettings: {
items: ['Video']
},
insertVideoSettings: {
saveUrl: "[SERVICEHOSTEDPATH]/api/uploadbox/Rename",
path: "[SERVICEHOSTEDPATH]/Files/"
}
};
},
methods: {
onFileUploadSuccess (args) {
alert("Get the new file name here");
if (args.e.currentTarget.getResponseHeader('name') != null) {
args.file.name = args.e.currentTarget.getResponseHeader('name');
let filename = document.querySelectorAll(".e-file-name")[0];
filename.innerHTML = args.file.name.replace(document.querySelectorAll(".e-file-type")[0].innerHTML, '');
filename.title = args.file.name;
}
}
},
provide:{
richtexteditor:[Toolbar, Link, Video, HtmlEditor, QuickToolbar]
}
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
```

```
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-calendars/styles/material.css';
@import '../node_modules/@syncfusion/ej2-dropdowns/styles/material.css';

`
```

To configure server-side handler, refer to the below code.

```c#
int x = 0;
string file;
[AcceptVerbs("Post")]
public void Rename()
{
try
{
var httpPostedFile = System.Web.HttpContext.Current.Request.Files["UploadFiles"];
fileName = httpPostedFile.FileName;
if (httpPostedFile != null)
{
var fileSave = System.Web.HttpContext.Current.Server.MapPath("~/Files");
if (!Directory.Exists(fileSave))
{
Directory.CreateDirectory(fileSave);
}
```

Copyright © 2001 -2024 Syncfusion Inc.

```
var fileName = Path.GetFileName(httpPostedFile.FileName);
var fileSavePath = Path.Combine(fileSave, fileName);
while (System.IO.File.Exists(fileSavePath))
{
fileName = "rteFiles" + x + "-" + fileName;
fileSavePath = Path.Combine(fileSave, fileName);
x++;
}
if (!System.IO.File.Exists(fileSavePath))
{
httpPostedFile.SaveAs(fileSavePath);
HttpResponse Response = System.Web.HttpContext.Current.Response;
Response.Clear();
Response.Headers.Add("name", fileName);
Response.ContentType = "application/json; charset=utf-8";
Response.StatusDescription = "File uploaded succesfully";
Response.End();
}
}
}
catch (Exception e)
{
HttpResponse Response = System.Web.HttpContext.Current.Response;
Response.Clear();
Response.ContentType = "application/json; charset=utf-8";
Response.StatusCode = 204;
Response.Status = "204 No Content";
Response.StatusDescription = e.Message;
Response.End();
}
}
`
```

Upload video with authentication

You can add additional data with the video uploaded from the Rich Text Editor on the client side, which can even be received on the server side by using the fileUploading event and its customFormData argument, you can pass parameters to the controller action. On the server side, you can fetch the custom headers by accessing the form collection from the current request, which retrieves the values sent using the POST method.

By default, it doesn't support the UseDefaultCredentials property, you can manually append the default credentials with the upload request.

The Rich Text Editor link tool validates the URLs, as you type in the Web Address. URLs considered invalid will be highlighted with red color by clicking the insert button in the Insert Link dialog.

Remove link

If you want to remove a hyperlink from a text or image, select the text or image with the hyperlink and click “Remove Hyperlink” tool from toolbar. It will keep the text or image.

Auto-link

When you type URL and Enter key to the Rich Text Editor, the typed URL will be automatically changed into the hyperlink.

Copyright © 2001 -2024 Syncfusion Inc.

Manipulation

Add the custom tools on the selected link inside the Rich Text Editor through the quick toolbar.

The quick toolbar for the Link has the following options.

| Tools | Description |

|---|---|

| Open | The given link page, will be open in new window. |

| Edit Link | Used to edit the link in the Rich Text Editor content. |

| Remove Link | Used to remove link from the content of Rich Text Editor. |

| Custom Tool | Used to add the custom options in the quick toolbar. |

Table in Vue Rich text editor component

Rich Text Editor allows to insert table of content in edit panel and provide options to add, edit, and remove the table as well as perform other table related action. For inserting the table to the Rich Text Editor, the following list of options have been provided in the tableSettings

| Options | Description | Default Value |

|---|---|---|

| minWidth | Sets the default minWidth of the table. | 0 |

| maxWidth | Sets the default maxWidth of the table. | null |

| resize | Enable resize feature in table.| true |

| styles | This is an array of key value pair, on each pair, key should be name of styling and value is class name. this list will be shown on quick toolbar options to change the styles of table on designing like dashed, double bordered. | TableStyleItems |

| width | Sets the default width of the table. | 100% |

Insert table

Using the table toolbar option, select a number of rows and columns to be inserted over the table grid and insert table into Rich Text Editor content using the mouse.

Tables can also be inserted through the Insert Table option in the pop-up where the number of rows and columns can be provided manually, and this is the default way in devices.

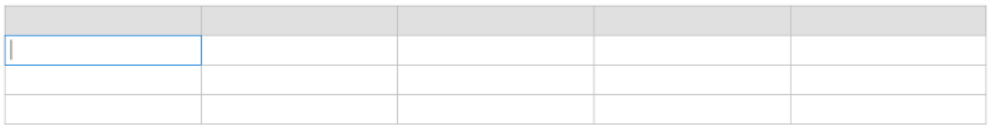
Quick Toolbar

Quick toolbar is opened by clicking the table. It has different sets of commands to be performed on the table which increases the feasibility to edit the table easily.

Table Header

Table Header command is available with quick toolbar option through which the header row can be added or removed from the inserted table. The following image illustrates the table header.



Insert Rows

Rows can be inserted above or below the required table cell through the quick toolbar. Also, focused row can be deleted. The following screenshot shows the available options of the row item.

Insert Columns

Columns can be inserted to the left or right side of the required table cell through the quick toolbar. Also, the focused column can be deleted. The following screenshot shows the available options of the column item.

Set Color

The background color can be set for each table cell through the background color command available with quick toolbar.

Delete Table

Using the delete item in the quick toolbar, users can delete the entire table.

Vertical Align

Text inside the table can be aligned to top, middle, or bottom using the `tableCellVerticalAlign` tool of the quick toolbar.

Horizontal Align

Text inside the table can be aligned left, right, or center using the `tableCellHorizontalAlign` tool of the quick toolbar.

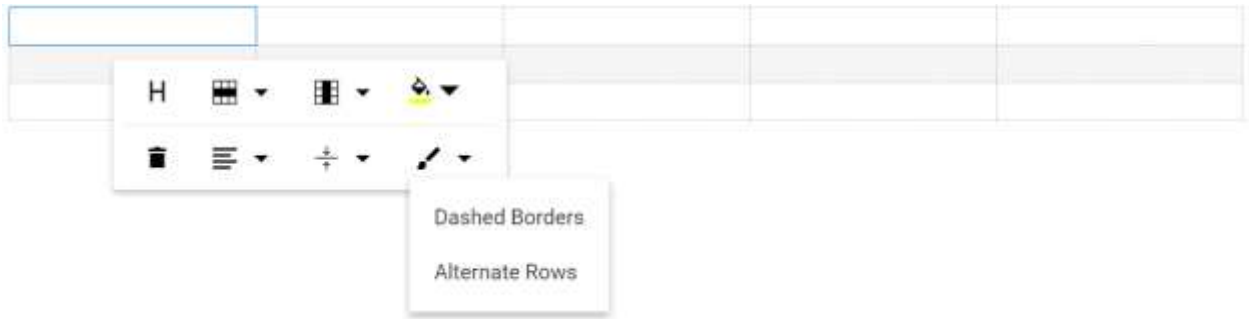
Table Styles

Table styles provided for class name should be appended to a table element. It helps to design the table in specific CSS styles when inserting in the editor.

By Default, provides Dashed border and Alternate rows.

Dashed border: Applies the dashed border to the table.

Alternate border: Applies the alternative background to the table.



Copyright © 2001 -2024 Syncfusion Inc.

Table Properties

Sets the default width of the table when it is inserted in the Rich Text Editor using the width of `tableSettings`.

Using the quick toolbar, users can change the width, cell padding, and cell spacing in the selected table using the properties option.

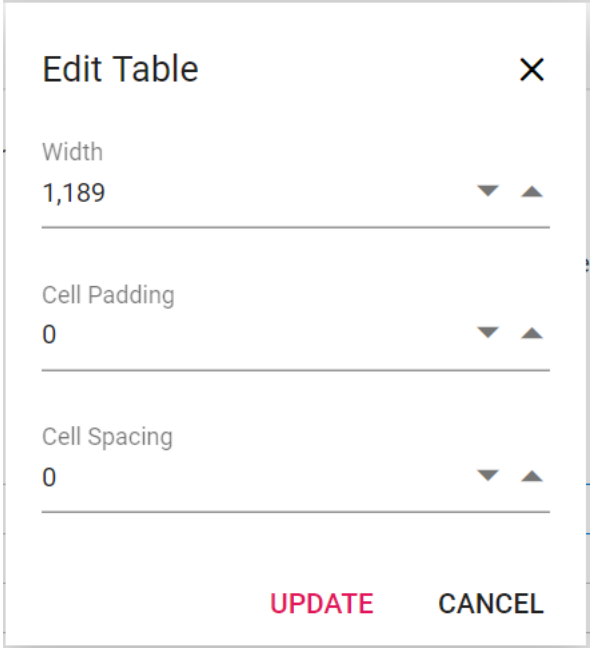


Table cell merge and split

The Rich Text Editor allows users to change the appearance of the tables by splitting or merging the table cells.

`TableCell` item should be configured in the Table quickToolbarSettings Property to show the merge/split icons while selecting the table cells

Table cell merge

The table cell merge feature allows you to merge two or more row and column cells into a single cell with its contents.

The following image explains the table merge action.

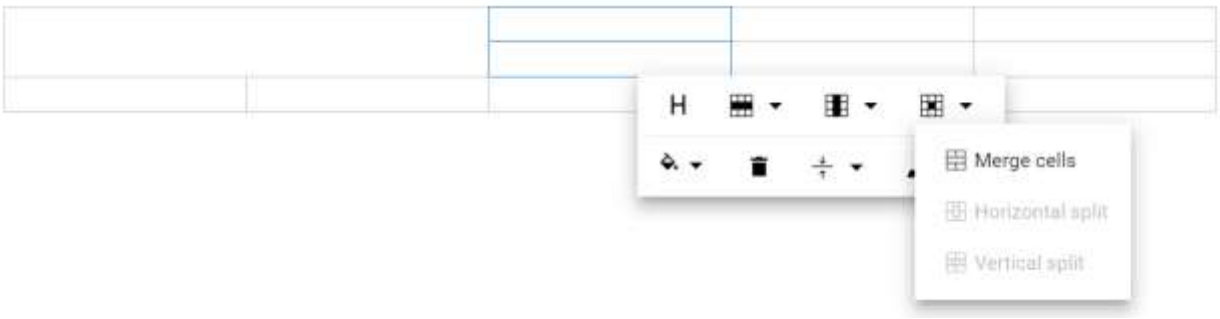

Table cell split

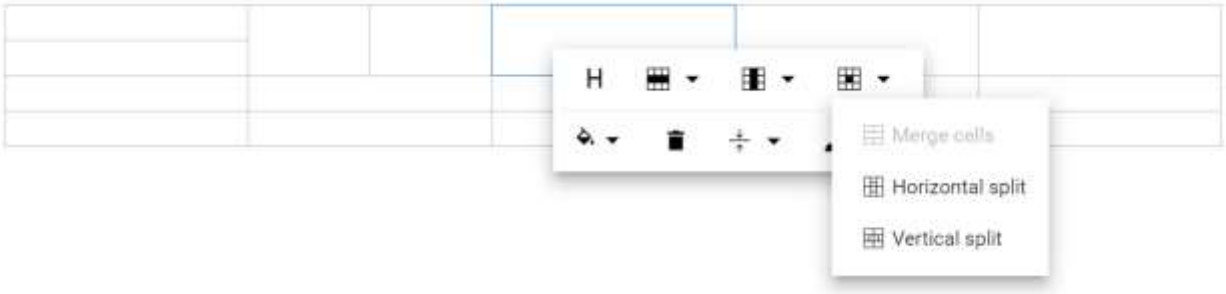
The table cell split feature allows you to a selected cell can be split both horizontally and vertically.

The following image explains the table split action.



Emoji Picker in Vue RichTextEditor component

An emoji picker is a tool that allows users to add emojis or emoticons to their text easily. Typically, it is a small window or panel that displays a variety of emojis arranged in different categories, such as smileys, animals, food, and so on. Users can select the desired emoji by clicking on it or by typing its name in a search bar.

Enabling the toolbar option and custom emojis.

Add the `EmojiPicker` tool to the toolbar of the RichTextEditor by utilizing the `toolbarSettings` items property.

By default, a predefined set of emojis is configured. However, you can customize these icons according to your needs. To achieve this, utilize the emojiPickerSettings property.

```
<template>
<div>
<div class="control-section">
<div class="sample-container">
<div class="default-section">
<ejs-richtexteditor ref="rteObj" :height="340" :emojiPickerSettings="emojiPickerSettings"
:toolbarSettings="toolbarSettings">
</ejs-richtexteditor>
</div>
</div>
</div>
</div>
</template>
<script>
import Vue from "vue";

</style>
`
```

Additionally, you have the option to customize the icons of toolbar items using the iconCss and code properties. The iconCSS property allows you to define a custom CSS class for the toolbar item icon, while the code property enables you to specify the Unicode character code for the icon.

When both iconCSS and code properties are provided, the iconCSS property takes precedence in determining the appearance of the toolbar item icon.

Additionally, you have the option to enhance the user experience by implementing a filtering feature for efficiently managing a large dataset of emojis. By setting the showSearchBox property to true (which is the default value), users will be able to utilize a search box to filter the displayed emojis according to their preferences.

The following code example shows how to add the emoji picker tool in the RichTextEditor.

APP.VUE

```
<template>
```

```
<div>
<div class="control-section">
    <div class="sample-container">
        <div class="default-section">

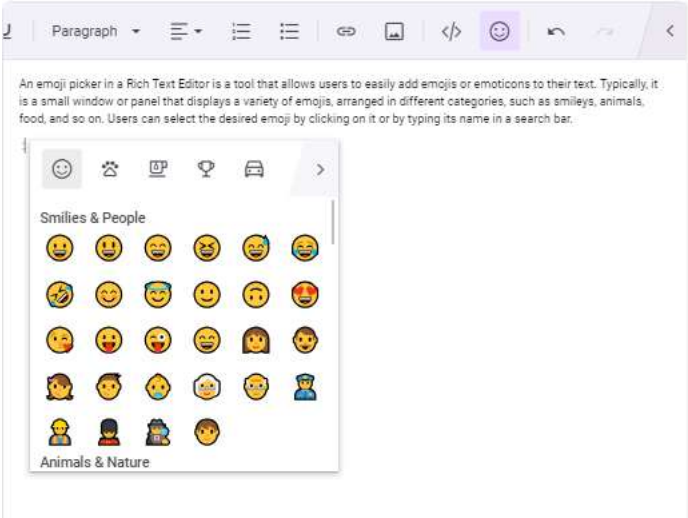
Rich Text Editor features are segregated into individual feature-wise modules. To use emojis, inject the EmojiPicker module in provide section.

Using the shortcut key to open the emoji picker

Quickly access the emoji picker by pressing the colon (:) key while typing a word prefix in an editor, allowing instant emoji selection and display. Moreover, continue typing in the editor after the colon (:) to filter and refine your search for the desired emojis.



Navigating and selecting emojis using the keyboard

The emoji picker popup offers keyboard navigation options, allowing you to move the emoji focus from one emoji to another. The following keys are used for navigation:

Arrow keys: Use the arrow keys (up, down, left, right) to move the emoji focus in the corresponding direction.

Enter: Press Enter key to select the currently focused emoji.

Escape: Press Escape to close the emoji picker popup without selecting an emoji.

Markdown in Vue Rich text editor component

When you format the word in Markdown format, you should add Markdown syntax to the word to indicate the words and phrases that looks different from each other.

Rich Text Editor supports markdown editing when the editorMode set as **markdown** and using both *keyboard interaction* and *toolbar action*, you can apply the formatting to text

To use quick Markdown editing feature, inject MarkdownEditorService in the provider section of AppModule.

Supported Commands

The Vue Markdown editor supports the following commands to format the markdown content:

|Commands|Syntax| Description |

|--------|--|------------|

| Bold | Sample content for **bold text**. | For bold, add or to front and back of the text. | For order list, precede each line with a number. |

Copyright © 2001 -2024 Syncfusion Inc.

| Italic | Sample content for *Italic text*. | For Italic, add * or _ to front and back of the text. |

| Bold and Italics | Sample content for ***bold and Italic text***. | For bold and Italics, add * to the front and back of the text. |

| Heading 1 | # Heading 1 content | For heading 1, add # to start of the line. |

| Heading 2 | ## Heading 2 content | For heading 2, add ## to start of the line. |

| Heading 3 | ### Heading 3 content | For heading 3, add ### to start of the line. |

| Heading 4 | #### Heading 4 content | For heading 4, add #### to start of the line. |

| Heading 5 | ##### Heading 5 content | For heading 5, add ##### to start of the line. |

| Heading 6 | ###### Heading 6 content | For heading 6, add ###### to start of the line. |

| Line Break | First line
Second line | For line break, press enter two times (or) add <br> in between the first and the second line. |

| Blockquotes | > Blockquotes text | For blockquotes, add > to start of the line. |

| Strike Through | Sample content for ~~strike through text~~. | For strike through, add ~~ to front and back of the text. |

| Code (Single line) | \Single line code\ | For single line code, add ` to front and back of the text. |

| Code block (Multi Line) | \\\
Multi line code text
Multi line code text
\\\ | For multiple line code, add \\` in the new line before and after the content. |

| Subscript | _{Subscript text} | For subscript, add _{to the front and} to the back of the text. |

| Superscript | ^{Superscript text} | For superscript, add ^{to the front and} to the back of the text. |

| Ordered List | 1. First
1. Second | For ordered list, preceding one or more lines of text with 1. |

| Unordered List | *First
* second | For unordered list, preceding one or more lines of text with *. |

| Links | **Link text without title text**
`` Link text ``
 Link text with title text
[Link text](URL , “title text”) | Create an inline link by wrapping link text in brackets [ ], and then wrapping the URL as first parameter and title as second parameter in the parentheses ().
Note: The title text is optional, if needed it can be given manually.|

Table		Heading 1	Heading 2
Col A1	Col A2
Col B1	Col B2		Create a table using the pipes and underscores as given in the syntax to create 2 x 2 table.

| Horizontal Line | ***(three asterix in new line)
(or)
 (three underscores in new line) | For horizontal line, add or* to the start of the new line. |

| Image | | Create an image by wrapping the image source in parentheses (). |

| Image with alternate text | ![alternate text](URL path) | Create an image with alternate text by wrapping an alternative text in brackets [], and then link of the image source in parentheses

Copyright © 2001 -2024 Syncfusion Inc.

().
Note: When inserting the image using toolbar, the alternate text cannot be provided that needs to be given manually. |

| Escape tick marks supported | Sample text content with **bold and** not bold **text can be in the same line.** | In the syntax, the whole content is made as bold where the content not bold can be made as normal text by adding the bold syntax to the start and end of the respective text. Likewise you can do the same for various inline commands. |

| Escape Character | \(any syntax) | Escape any markdown syntax by prefix \ to the syntax.
Example:
Bold text|

| HTML Entities | Copyright: © - ©
Trade mark: ™ - ™
Registered: ® - ®
Ampersand: & - &
Less than: < - <
Greater than: > - > | For HTML entities, add & and ; to the front and back of the respective entities. |

The above listed commands alone are supported in Syncfusion Markdown editor. For other unsupported commands, you can achieve using the HTML tags in Markdown editor. The foot notes, definitions, math, and check list markdown syntax are also not supported.

Markdown to HTML

The Rich Text Editor allows you to preview markdown changes immediately using preview. In this sample, the third-party library Marked is used to convert markdown into HTML content.

This sample demonstrates how to preview markdown changes in Rich Text Editor. Type or edit the display text, and apply format to view the preview of markdown. The actionComplete event can be used to convert Markdown to HTML.

APP.VUE

```
<template>
  <div id="defaultRTE">
    <ejs-richtexteditor id="preview" ref="rteInstance"
:toolbarSettings="toolbarSettings" :created="created"
:actionComplete='actionComplete' :editorMode="editorMode" :height="height">
In Rich Text Editor , you click the toolbar buttons to format the words and
the changes
are visible immediately.
Markdown is not like that. When you format the word in Markdown format, you
need to
add Markdown syntax to the word to indicate which words
and phrases should look different from each other
Rich Text Editor supports markdown editing when the editorMode set as
**markdown** and using both *keyboard interaction* and *toolbar action*, you
can apply the formatting to text.
We can add our own custom formation syntax for the Markdown formation,
[sample link](https://ej2.syncfusion.com/home/).
The third-party library <b>Marked</b> is used in this sample to convert
markdown into HTML content.
      </ejs-richtexteditor>

Table

Rich Text Editor allows to insert Markdown table in edit panel with 2 X 2 rows and columns along with the heading. To use table tool, add the `CreateTable` item in toolbar items.

Insert table

To insert the table in Rich Text Editor, click the `table` toolbar option to insert the table into Rich Text Editor content and this is the default way in all the devices.

Please refer the below sample and code snippets to add the table in Markdown editor

APP.VUE

```
<template>
  <div id="defaultRTE">
    <ejs-richtexteditor id="preview" ref="rteInstance"
:toolbarSettings="toolbarSettings" :created="created"
:actionComplete='actionComplete' :editorMode="editorMode" :height="height">
In Rich Text Editor , you click the toolbar buttons to format the words and
the changes
are visible immediately.
Markdown is not like that. When you format the word in Markdown format, you
need to
add Markdown syntax to the word to indicate which words
and phrases should look different from each other
Rich Text Editor supports markdown editing when the editorMode set as
**markdown** and using both *keyboard interaction* and *toolbar action*, you
can apply the formatting to text.
We can add our own custom formation syntax for the Markdown formation,
[sample link](https://ej2.syncfusion.com/home/).
The third-party library <b>Marked</b> is used in this sample to convert
markdown into HTML content.

Custom formation

The Rich Text Editor allows you to customize the markdown syntax by overriding its default syntax. Configure the customized markdown syntax using the formatterproperty.

This sample demonstrates how to customize tags of markdown formatting.

Copyright © 2001 -2024 Syncfusion Inc.

For example, apply + to Unordered list, apply 1., 2., 3. to Ordered list, for bold, , and for italic _.

File browser in Vue Rich text editor component

Rich Text Editor allows to browse and insert images in the edit panel using the file browser. File browser allows the users to browse and select a file or folder from the file system and it supports various cloud services.

Required additional dependency

The following list of additional dependencies are required to use the file browser feature in the Rich Text Editor.

`js

|-- @syncfusion/ej2-vue-richtexteditor

|-- @syncfusion/ej2-layouts

|-- @syncfusion/ej2-grids

|-- @syncfusion/ej2-filemanager

`

Additional CSS Reference

Additionally add the styles as given below in `<style>` section of the `App.vue` file.

`

<style>

@import "../node_modules/@syncfusion/ej2-layouts/styles/material.css";

@import "../node_modules/@syncfusion/ej2-grids/styles/material.css";

@import "../node_modules/@syncfusion/ej2-filemanager/styles/material.css";

</style>

`

The following example explains about how to configure the file browser within the Rich Text Editor component.

- Configure the `FileManager` toolbar item in the `toolbarSettings` API `items` property.

Copyright © 2001 -2024 Syncfusion Inc.

- Set enable property as true on fileManagerSettings property to make the file browser in the Rich Text Editor to appear on the FileManager toolbar click action.

Rich Text Editor features are segregated into individual feature-wise modules. To use the file browser tool, configure FileManager in the provider.

Format Painter in Vue Rich Text Editor Component | Syncfusion

A format painter is a tool that allows you to copy the formatting from a piece of text and apply it to another one. Format Painter can be accessed via the toolbar or the keyboard shortcuts. The format painter can copy the formatting of a single word or a whole paragraph. The format painter can be customized using the formatPainterSettings property.

Enabling the toolbar option for Format Painter

You can add the `FormatPainter` tool in the Rich Text Editor using the `toolbarSettings` items property.

Rich Text Editor features are segregated into individual feature-wise modules. To use the Format Painter feature, we need to import and inject the `FormatPainter` module in `provides` section.

Copyright © 2001 -2024 Syncfusion Inc.

By double-clicking the format painter toolbar button, sticky mode will be enabled. In sticky mode, the format painter will be disabled when the user clicks the Escape key again.

The following code example shows how to add the format painter tool in the Rich Text Editor.

APP.VUE

```
<template>
    <div>
        <div class="control-section">
            <div class="sample-container">
                <div class="default-section">
                <ejs-richtexteditor ref="rteObj"
:toolbarSettings="toolbarSettings" >
                    <h3><strong>Format Painter</strong></h3>
                    <p>
                        A Format Painter is a Rich Text Editor feature
allowing users to quickly
                        <span style="background-color: rgb(198, 140,
83);"><strong>copy</strong></span>
                        and
                        <span style="background-color: rgb(198, 140,
83);"><strong>paste</strong></span>
                        formatting from one text to another. With a rich
text editor, utilize the format painter as follows:
                    </p>
                    <ul>
                        <li>
                            Select the text whose format you want to copy.
                        </li>
                        <li>
                            Click on the <strong><em>Format
Painter</em></strong> button in the toolbar. It may look like a paintbrush
icon.
                        </li>
                        <li>
                            The cursor will change to a
<strong>paintbrush</strong> icon. Click and drag the cursor over the text
you want to apply the copied format.
                        </li>
                        <li>
                            Release the mouse button to apply the format.
                        </li>
                    </ul>
                    <p>
                        Using the format painter in a rich text editor can
save you time when formatting a large document, You can quickly
                        copy and apply formatting
                        to <span style="background-color: rgb(198, 140,
83);"><strong>multiple sections</strong></span>.
                        It's a helpful tool for anyone who works with text
editing regularly, such as writers, editors, and content creators.
                    </p>
                </ejs-richtexteditor>
                </div>

Customization of copy and paste format

You can customize the format painter tool in the Rich Text Editor using the formatPainterSettings property.

The allowedFormats property helps you to specify tag names that allow the formats to be copied from the selected text. For instance, you can include formats from the selected text using tags like p; h1; h2; h3; div; ul; ol; li; span; strong; em; code;. The following example demonstrates how to customize this functionality.

Similarly, with the deniedFormats property, you can utilize the selectors to prevent specific formats from being pasted onto the selected text. The table below illustrates the selectors and their respective usage.

Type	Description	Selector	Usage

Copyright © 2001 -2024 Syncfusion Inc.

|------|-------------------|---|---|

| () | Class Selector | h3(e-rte-block-blue-text) | The class name e-rte-block-blue-text of H3 element is not copied. |

| [] | Attribute Selector | span\[title] | The title attribute of span element is not copied. |

| {} | Style Selector | span{background-color, color} | The background-color and color styles of span element is not copied. |

Using the deniedFormats property following styles are denied copying from the selected text such as h3(e-rte-block-blue-text){background-color,padding}[title]; li{color}; span(e-inline-text-highlight)[title]; strong{color}(e-rte-strong-bg).

APP.VUE

```
<template>
    <div>
        <div class="control-section">
            <div class="sample-container">
                <div class="default-section">
                <ejs-richtexteditor ref="rteObj"
:formatPainterSettings="formatPainterSettings"
:toolbarSettings="toolbarSettings" >
                    <h3 class="e-rte-block-blue-text" title="Format Painter"
style="color: #0079f3; background-color: #eff6ff; padding: 10px;"><strong
>Format Painter</strong></h3>
                    <p>
                        A Format Painter is a Rich Text Editor feature
allowing users to quickly
                        <span class="e-inline-text-highlight" style="color:
blue;" title="Styled by CSS Class selector"><strong>copy</strong></span>
                        and
                        <span class="e-inline-text-highlight" style="color:
blue;"  title="Styled by CSS Class selector"><strong>paste</strong></span>
                        formatting from one text to another. With a rich
text editor, utilize the format painter as follows:
                    </p>
                    <ul>
                        <li style="color: crimson;">
                            Select the text whose format you want to copy.
                        </li>
                        <li style="color: crimson;">
                            Click on the <strong><em>Format
Painter</em></strong> button in the toolbar. It may look like a paintbrush
icon.
                        </li>
                        <li style="color: crimson;">
                            The cursor will change to a
<strong>paintbrush</strong> icon. Click and drag the cursor over the text
you want to apply the copied format.
                        </li>
                        <li style="color: crimson;">
                            Release the mouse button to apply the format.
                        </li>
```

```
                    </ul>
                    <p>
                        Using the format painter in a rich text editor can
save you time when formatting a large document, You can quickly
                        copy and apply formatting
                        to <strong class="e-rte-strong-bg" style="color:
blue">multiple sections</strong>.
                        It's a helpful tool for anyone who works with text
editing regularly, such as writers, editors, and content creators.
                    </p>
                </ejs-richtexteditor>
                </div>
            </div>

Using the shortcut key to copy and paste the format

You can use the following shortcut keys to copy and paste the format in the Rich Text Editor.

Actions	Keyboard shortcuts	Description
Copy the format	Alt + Shift + c	Copy the selection format or current range.
Pate the format	Alt + Shift + v	Paint the copied format.
Escape	Esc	Remove the previously copied format and disable the sticky mode.

The format painter retains the formatting after application making it possible to apply the same formatting multiple times by using the Alt + Shift + v keyboard shortcut.

Additionally, You can perform the format painter actions programmatically using the executeCommand public method.

Form support in Vue Rich text editor component

The following sample demonstrates how to get the Rich Text Editor value in button click.

Render the Rich Text Editor

Render the Rich Text Editor in form.

Validation in Vue Rich text editor component

Validation rules

The Rich Text Editor provides the functionality of character count and its validation. So, you can validate the Rich Text Editor's value on form submission by applying validationRules and validationMessage to the Rich Text Editor.

| Rules | Description |

|---|---|

| required | Requires value for the Rich Text Editor control.|

| minlength | Requires the value to be of given minimum characters count.|

| maxlength | Requires the value to be of given maximum characters count.|

Copyright © 2001 -2024 Syncfusion Inc.

This sample is used to validate form using the obtrusive Validation. Type the values in Rich Text Editor and the form enables the validation with the formvalidator rules by clicking on the submit externally. All rules are validated by the formvalidator rules.

APP.VUE

```
<template>
<div id="app">
    <div id='container'>
        <br>
        <form id="myForm" class="form-vertical">

Globalization in Vue Rich text editor component

Localization

The Rich Text Editor provides an option to localize its strings; it is used to adapting the editor to a particular local language. By default, the editor will use the US English (en-US) as its language. Please find the table with a list of keys and their corresponding values for the default language (en-US).

{% previewsample "page.domainurl/code-snippet/rich-text-editor/getting-started-cs24" %}

Character count

The Rich Text Editor automatically counts the number of characters in the content are while typing using the showCharCount property. The characters count displayed at the bottom of the editor. You can limit the number of characters in your content using the maxLength property. By default, the editor sets the characters limit value is infinity.

Copyright © 2001 -2024 Syncfusion Inc.

The character count color will be modified based on the characters in the Rich Text Editor.

| **Status** | **Description** |

| --- | --- |

| Normal | Till 70% of given maxLength value, character count color is black. |

| Warning | Once the number of character count in the Rich Text Editor reached 70% of given maxLength value, the character count color will be orange, indicating that, the count value going to reach the maximum count. |

| Error | Once the number of character count in the Rich Text Editor reached 90% of given maxLength value, the character count color will be red, indicating that, the count value reached the maximum count. |

To create Rich Text Editor with character count feature, inject the Count module to the Rich Text Editor using the RichTextEditor.Inject(Count) method.

Code view

Rich Text Editor includes the ability for users to directly edit HTML code via Source View in the text area. If you made any modification in Source view directly, the changes will be reflected in the Rich Text Editor's content. So, the users will have more flexibility over the content they have created.

APP.VUE

```

Undo/Redo manager

Undo and redo tools allow you to edit the text by disregard/cancel the recently made changes and restore it to previous state. It is a useful tool to restore the performed action which got changed by mistake. By default, upto 30 actions can be undo/redo in the editor.

To undo and redo operations, do one of the following:

- Press the undo/redo button on the toolbar.
- Press the **Ctrl + Z/Ctrl + Y** combination on the keyboard.

Customize the undo/redo step count using the undoRedoSteps property. By default, undo/redo actions take 300ms time interval for store the action to the undoRedoManager. The time interval can be customized by using the undoRedoTimer.

APP.VUE

```

Prevention of cross-site scripting (XSS)

The Rich Text Editor allows the users to edit the content with security by preventing cross-site scripting (XSS). By default, provided built-in support to remove the elements from editor content, which cause XSS attack. The editor removes the elements based on the attributes if it is possible to execute script.

In the following sample, removed `script` tag and `onmouseover` attribute from content of the Rich Text Editor.

APP.VUE

```
<template>
   <ejs-richtexteditor :value="value"></ejs-richtexteditor>
</template>
<script>
  import Vue from 'vue';
  import { RichTextEditorPlugin, Toolbar, Link, Image, HtmlEditor,
QuickToolbar } from '@syncfusion/ej2-vue-richtexteditor';
```

Copyright © 2001 -2024 Syncfusion Inc.

```
  Vue.use(RichTextEditorPlugin);
  export default {
    data() {
      return {
        value: `<div onmouseover='javascript:alert(1)'>Prevention of Cross
Sit Scripting (XSS) </div> <script>alert('hi')<\/script>`
      }
    },
    provide: {
      richtexteditor: [Toolbar, Link, Image, HtmlEditor, QuickToolbar]
    }
  }
</script>
<style>
@import

@import "../../node_modules/@syncfusion/ej2-vue-
richtexteditor/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/rich-text-editor/getting-started-cs27" %}

It is only applicable to editorMode as HTML.

Custom cross-site scripting

You can also filter the elements and attributes additionally, which cause the XSS attack through beforeSanitizeHtml event. Return the value from the event argument helper function to apply in the editor. To prevent the built-in support and make own cross-site scripting rules, set cancel argument to true.

The following sample demonstrates how to filter script tag from value.

APP.VUE

```
<template>
   <ejs-richtexteditor :value="value"
:beforeSanitizeHtml="beforeSanitizeHtml"></ejs-richtexteditor>
</template>
<script>
  import Vue from 'vue';
  import { RichTextEditorPlugin, Toolbar, Link, Image, HtmlEditor,
QuickToolbar } from '@syncfusion/ej2-vue-richtexteditor';
  import { detach } from "@syncfusion/ej2-base";
  Vue.use(RichTextEditorPlugin);
  export default {
    data() {
      return {
```

```
        value: `<div>Prevention of Cross Sit Scripting (XSS) </div>
<script>alert('hi')<\/script>`
      }
    },
    provide: {
      richtexteditor: [Toolbar, Link, Image, HtmlEditor, QuickToolbar]
    },
    methods: {
    beforeSanitizeHtml: function(e) {
      e.helper = value => {
        e.cancel = true;
        let temp = document.createElement("div");
        temp.innerHTML = value;
        let scriptTag = temp.querySelector("script");
        if (scriptTag) {
          detach(scriptTag);
        }
        return temp.innerHTML;
      };
    }
  }
  }
</script>

{% previewsample "page.domainurl/code-snippet/rich-text-editor/getting-started-cs28" %}

Resizable support

This feature allows the editor to be resized dynamically. The users can enable or disable this feature using the enableResize property in the Rich Text Editor. If enableResize is set to true, the Rich Text Editor component creates grip at the bottom right corner, which allows resizing the component in the diagonal direction. The following sample demonstrates the resizable feature.

Enabling the resizable support

To render the Rich Text Editor in the resizable mode, set the enableResize property to true. The above feature is built as module and hence the Resize module needs to be included in your application.

APP.VUE

```
<template>
    <div class="control-section">
        <div class="sample-container">
            <div class="default-section">
```

richtexteditor/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/rich-text-editor/toolbar-cs12" %}

Specifying the Minimum and Maximum width and height for Resize

To have a restricted resizable area for the Rich Text Editor, you need to specify the min-width, max-width, min-height, and max-height CSS properties for the control's wrapper element. By default, the control is capable of resizing upto the current viewport. The e-richtexteditor CSS class will be available in the component's wrapper and can be used for applying the above mentioned styles.

APP.VUE

```
<template>
    <div class="control-section">
        <div class="sample-container">
            <div class="default-section">
            <ejs-richtexteditor :enableResize="true"><p>The Rich Text Editor
component is WYSIWYG ("what you see is what you get") editor that provides
the best user experience to create and update the content.
                    Users can format their content using standard toolbar
commands.</p>
            </ejs-richtexteditor>
            </div>

Xhtml validation in Vue Rich text editor component

The editor provides an option to validate the source content of the Rich Text Editor against the XHTML standard using the 'enableXhtml' property. When you enter or modify content in the editor, it continuously checks the XHTML source content and removes elements and attributes that are not valid.

The editor checks the following settings on validation:

Attributes

- Must be specified in lowercase.
- Proper use of quotation marks around the attributes.
- Must be valid attributes for corresponding HTML element.
- All the required attributes must be included in the HTML element.

HTML Elements

- Must be in lowercase.
- All opening tags must be closed.
- Allows only the valid HTML elements.
- Elements must be properly nested.
- All elements must have one root element.
- Should not use inline elements inside the block elements.

APP.VUE

```
<template>
    <ejs-richtexteditor ref="defaultRTE" :height="400" enableXhtml=true>
        <p>The Rich Text Editor component is WYSIWYG ("what you see is what
you get") editor that provides the best user experience to create and update
the content.Users can format their content using standard toolbar
commands.</p>
        <p><b>Key features:</b></p>
        <ul>
            <li><p>Provides IFRAME and DIV modes</p></li>
            <li><p>Capable of handling markdown editing.</p></li>

Inline mode in Vue Rich text editor component

This is the inline example for the Rich Text Editor. For this you must set the inlineMode property.

Inline edition allows you to select any editable element or click the element on the page and edit it in-place.

Inline editing is a true WYSIWYG formation and on the contrary to Rich Text Editor HTML/MD editing, the styles that are used for edited content comes directly from the document stylesheet. This means that inline editors ignore the default Rich Text Editor content styles.

Show on select/click

Enabling the onSelection option of inlineMode makes the inline Rich Text Editor to appear. You can select the text in the editable area otherwise the inline Rich Text Editor will be appear once click into the editable area.

APP.VUE

```
<template>
  <ejs-richtexteditor ref="defaultRTE" :height="340"
:toolbarSettings="toolbarData" :inlineMode="inlineModeData">
    <p>The Rich Text Editor component is WYSIWYG ("what you see is what you
get") editor that provides the best user experience to create and update the
content. Users can format their content using standard toolbar commands.</p>
    <p><b>Key features:</b></p>

Paste cleanup in Vue Rich text editor component

The Rich Text Editor allows you to reduce the effort while converting the Microsoft Word content to HTML format with format and styles.

MS Word to HTML

By default, Rich Text Editor consider the following processes on paste content from Microsoft Word.

List conversion: The list elements copied from the Microsoft Word document contains paragraph tags with styles and classes. The list elements are converted to standard HTML list elements by referring the styles and class names in the paragraph tags.

Converting style: The styles of the elements copied from the Microsoft Word document are converted to standard CSS styles and added as inline styles for each respective element.

Tags and comments: The Microsoft Word specific XML tags and comments are removed when cleanup on paste.

Paste cleanup

You can control the formatting and styles on pasting the content to the editor using the pasteCleanup settings property. The following settings are available to clean up the content:

| API | Description | Default Value | Type |

|:---------------:|:---------:|:--------------------------:|:---------:|

| prompt | To invoke prompt dialog with paste options on pasting the content in editor. | false | boolean |

| plainText | To paste the content as plain text. | false | boolean |

| keepFormat | To keep the same format with copied content. | true | boolean |

| deniedTags | To ignore the tags when pasting HTML content. | null | string[] |

| deniedAttrs | To paste the content by filtering out these attributes from the content. | null | string[] |

| allowedStyleProps | To paste the content by accepting these style attributes and removing other style attributes. | ['background', 'background-color', 'border', 'border-bottom', 'border-left', 'border-radius', 'border-right', 'border-style', 'border-top', 'border-width', 'clear', 'color', 'cursor', 'direction', 'display', 'float', 'font', 'font-family', 'font-size', 'font-weight', 'font-style', 'height', 'left', 'line-height', 'margin', 'margin-top', 'margin-left', 'margin-right', 'margin-bottom', 'max-height', 'max-width', 'min-height', 'min-

Copyright © 2001 -2024 Syncfusion Inc.

width', 'overflow', 'overflow-x', 'overflow-y', 'padding', 'padding-bottom', 'padding-left', 'padding-right', 'padding-top', 'position', 'right', 'table-layout', 'text-align', 'text-decoration', 'text-indent', 'top', 'vertical-align', 'visibility', 'white-space', 'width'] | string[] |

Rich Text Editor features are segregated into individual feature-wise modules. To use paste cleanup, inject paste cleanup module using the RichTextEditor.Inject(PasteCleanup).

Prompt dialog

When prompt is set to true, pasting the content in the editor will open a dialog box that contains three options Keep, Clean, and Plain Text as radio buttons:

1. Keep: Radio button to keep the same format with copied content.
2. Clean: Radio button to clear all the style formats with copied content.
3. Plain Text: Radio button to paste the copied content as plain text without any formatting or style (including the removal of all tags).

When prompt value is set true, the API properties plainText and keepFormat will not be considered for processing when pasting the content.

Paste as plain text

When plainText is set to true, the copied content will be converted as plain text by removing all the HTML tags and styles applied to it and only the plain text is pasted in the editor.

When plainText value is set true, the API property prompt should be set to false, and keepFormat will not be considered for processing when pasting the content.

Keep format

When keepFormat is set to true, the copied content will maintain all the style formatting allowed in the allowedStyleProps on pasting the content in the editor.

When keepFormat is set to false, the style in the copied content will be removed without considering the allowed styles in the allowedStyleProps when pasting the content in the editor.

When keepFormat value is set true, the API property prompt and plainText should be set to false.

Denied tags

When deniedTags values are set, the tags that matches the 'denied tags' list will be removed on pasting the copied content in the editor. For Example,

1. ‘a’: Paste the content by filtering out anchor tags.
2. ‘a[!href]’: Paste the content by filtering out anchor tags that do not have the ‘href’ attribute.
3. ‘a[href, target]’: Paste the content by filtering out anchor tags that have the ‘href’ and ‘target’ attributes.

Denied attributes

When the deniedAttrs values are set, the attributes that matches the 'denied attributes' list will be removed on pasting the copied content in the editor. For Example,

‘id’, ‘title’: This will remove the attributes ‘id’ and ‘title’ from all tags.

Copyright © 2001 -2024 Syncfusion Inc.

Allowed style properties

By default, the following basic styles are allowed on pasting the content to the editor.

['background', 'background-color', 'border', 'border-bottom', 'border-left', 'border-radius', 'border-right', 'border-style', 'border-top', 'border-width', 'clear', 'color', 'cursor', 'direction', 'display', 'float', 'font', 'font-family', 'font-size', 'font-weight', 'font-style', 'height', 'left', 'line-height', 'margin', 'margin-top', 'margin-left', 'margin-right', 'margin-bottom', 'max-height', 'max-width', 'min-height', 'min-width', 'overflow', 'overflow-x', 'overflow-y', 'padding', 'padding-bottom', 'padding-left', 'padding-right', 'padding-top', 'position', 'right', 'table-layout', 'text-align', 'text-decoration', 'text-indent', 'top', 'vertical-align', 'visibility', 'white-space', 'width']

When you configure allowedStyleProps, the styles, which matches the 'allowed style properties' list are allowed, all other style properties will be removed on pasting the content in the editor.

For Example,

allowedStyleProps: ['color', 'margin']': This will allow only the style properties 'color' and 'margin' in each pasted element.

In the following example, the paste cleanup related settings are explained with its module configuration

Mention integration in Vue Rich text editor component

By integrating the Mention component with a Rich Text Editor, users can easily mention or tag other users or objects from the suggested list without having to manually type out their names or other identifying information.

The target property of the Mention component allows you to specify the ID of the content editable div element within the Rich Text Editor that you want to bind the Mention component to. This allows you to enable the Mention functionality within the Rich Text Editor, so that users can mention or tag other users or objects from the suggested list while editing the text.

When the user types the @ symbol followed by a character, the Rich Text Editor will display a list of suggestions for items that the user can select from. The user can then select an item from the list by clicking on it, or by typing the name of the item they want to tag.

In the following sample, configured the following properties with popup dimensions.

- allowSpaces - Allow to continue search action if user enter space after mention character while searching.
- suggestionCount - The maximum number of items that will be displayed in the suggestion list.
- itemTemplate - Used to display the customized appearance in suggestion list.

APP.VUE

```
<template>
    <div>
        <ejs-richtexteditor id="mention_integration"  placeholder="Type @
and tag the name" :actionBegin="onActionBegin">

- Mention

Enter key in Vue Rich text editor component

Rich Text Editor allows to customize the tag that is inserted when pressing the enter key and shift + enter key in the Rich Text Editor.

Enter key customization

By default, the <p> tag will be created while pressing the enter key. The enter key can be customized by using the enterKey property, where the possible tags that can be used to customize are <p>, , and <br>.

When the enter key is customized with any of the possible values, pressing the enter key in the editor will create a new tag that is configured. Also, when the enter key is configured the default value of the Rich Text Editor will also change respectively with the configured values.

Adding external CSS/Script file

The editor offers you to add external CSS file to style the <iframe> element. Easily change the appearance of editor's content using an external CSS file using styles field in the iframeSettings property.

Likewise, add the external script file to the <iframe> element using the scripts field of iframeSettings to provide the additional functionalities to the Rich Text Editor.

APP.VUE

```

Third party integration in Vue Rich text editor component

The Rich Text Editor can be integrated with third-party to suite the application scenario.

Copyright © 2001 -2024 Syncfusion Inc.

CodeMirror Integration

Rich Text Editor comes with a basic HTML source editor through the view-source property. CodeMirror plugin can be used to highlight the syntax of HTML. CodeMirror plugin for Rich Text Editor makes editing of HTML source code with a pleasant experience.

Import necessary CSS and JS files of CodeMirror to the HTML page.

Required JS files of code mirror.

`ts

import CodeMirror from "https://cdnjs.cloudflare.com/ajax/libs/codemirror/5.3.0/codemirror.js";

import CodeMirror from "https://cdnjs.cloudflare.com/ajax/libs/codemirror/5.3.0/mode/css/css.js";

import CodeMirror from "https://cdnjs.cloudflare.com/ajax/libs/codemirror/5.3.0/mode/xml/xml.js";

import CodeMirror from "https://cdnjs.cloudflare.com/ajax/libs/codemirror/5.3.0/mode/htmlmixed/htmlmixed.js";

import CodeMirror from "https://cdnjs.cloudflare.com/ajax/libs/codemirror/5.3.0/mode/javascript/javascript.js";

`

Required CSS file of code mirror

`ts

@import "https://cdnjs.cloudflare.com/ajax/libs/codemirror/5.3.0/codemirror.min.css";

`

Add a custom icon for HTML source editor in the toolbar of Rich Text Editor using the template option of ToolbarSettings, define the code mirror plugins, and then pass the Rich Text Editor content as argument in the actionComplete event.

Exec command in Vue Rich text editor component

In Rich Text Editor, execCommand used to perform commands for the modification of content in editable area.

The execCommand will perform the following commands.

| Commands | Description | Code snippets |

|---|---|---|

| bold | Bold the selected content in the Rich Text Editor. |rteObj.executeCommand('bold');|

| italic | The selected text will be italics. |rteObj.executeCommand('italic');|

| underline | Underline the selected text in the Rich Text Editor. |rteObj.executeCommand('underline');|

| strikeThrough | Apply single line strike through formatting for the selected text. |rteObj.executeCommand('strikeThrough');|

| superscript | Makes the selected text as superscript (higher). |rteObj.executeCommand('superscript');|

| subscript | Makes the selected text as subscript (lower). |rteObj.executeCommand('subscript');|

Copyright © 2001 -2024 Syncfusion Inc.

| uppercase | Change the case of selected text to upper in the content. |rteObj.executeCommand('uppercase');|

| lowercase | Change the case of selected text to lower in the content. |rteObj.executeCommand('uppercase');|

| fontColor | Apply the specified font color for the selected text. |rteObj.executeCommand('fontColor', 'yellow');|

| fontName | Apply the specified font name for the selected text. |rteObj.executeCommand('fontName', 'Arial');|

| fontSize | Apply the specified font size for the selected text. |rteObj.executeCommand('fontSize', '10pt');|

| formatBlock | Apply the specified format styles for the selected text. |rteObj.executeCommand('formatBlock', 'H1');|

| backColor | Apply the specified background color the selected text. | rteObj.executeCommand('backColor', 'red');|

| justifyCenter | Align the content with center margin. | rteObj.executeCommand('justifyCenter');|

| justifyFull | Align the content with justify margin. |rteObj.executeCommand('justifyFull');|

| justifyLeft | Align the content with left margin. | rteObj.executeCommand('justifyLeft');|

| justifyRight | Align the content with right margin. | rteObj.executeCommand('justifyLeft');|

| undo | Allows to undo the actions. | rteObj.executeCommand('undo');|

| createLink | Creates a hyperlink to a text or image to a specific location in the content. | rteObj.executeCommand('createLink',{ text: 'Links', url: 'http://', title : 'Link' }); |

| indent | Allows to increase the indent level of the content. | rteObj.executeCommand('indent');|

| insertHTML | Insert the html content to the current cursor position. | rteObj.executeCommand('insertHTML', 'inserted an html');|

| insertOrderedList | Create a new list item(numbered). | rteObj.executeCommand('insertOrderedList');|

| insertUnorderedList | Create a new list item(bulleted). |rteObj.executeCommand('insertUnorderedList');|

| outdent | Allows to decrease the indent level of the content. | rteObj.executeCommand('outdent');|

| redo | Allows to redo the actions | rteObj.executeCommand('redo');|

| removeFormat | remove all formatting styles (such as bold, italic, underline, color, superscript, subscript, and more) from currently selected text. |rteObj.executeCommand('removeFormat');|

| insertText | Insert text to the current cursor position. | rteObj.executeCommand('insertText', 'inserted a text'); |

Copyright © 2001 -2024 Syncfusion Inc.

| insertImage | Insert an image to the current cursor position. | rteObj.executeCommand('insertImage', { url: 'https://ej2.syncfusion.com/javascript/demos/src/rich-text-editor/images/RTEImage-Feather.png', cssClass: 'rte-img'}); |

| copyFormatPainter | Copy the format of selected text and apply it to another text. | rteObj.executeCommand('copyFormatPainter', formatPainterSettings);|

| applyFormatPainter | Apply the copied format to the selected text. | rteObj.executeCommand('applyFormatPainter');|

| escapeFormatPainter | Remove the previously copied format and disable the sticky mode | rteObj.executeCommand('escapeFormatPainter');|

Note: The 'ExecuteCommand' public method is not supported in Syncfusion Markdown Editor

Style in Vue Rich text editor component

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

Customizing the Rich Text Editor's content

Use the following CSS to customize the default Rich Text Editor's content properties like font-family, font-size and color.

`css

/ *To change font family and font size* /

.e-richtexteditor .e-rte-content .e-content,

.e-richtexteditor .e-source-content .e-content {

font-size: 20px;

font-family: Segoe ui;

}

/ *To change font color and content background* /

.e-richtexteditor .e-rte-content,

.e-richtexteditor .e-source-content {

background: seashell;

color: blue;

}

`

Customizing the Rich Text Editor's toolbar

Use the following CSS to customize the default color in the Rich Text Editor's toolbar icon.

`css

/ *To change font color for toolbar icon* /

.e-richtexteditor .e-rte-toolbar .e-toolbar-item .e-icons,

Copyright © 2001 -2024 Syncfusion Inc.

```
.e-richtexteditor .e-rte-toolbar .e-toolbar-item .e-icons:active {
color: red;
}
/ To change font color for toolbar button /
.e-toolbar .e-tbar-btn,
.e-toolbar .e-tbar-btn:active,
.e-toolbar .e-tbar-btn:hover {
color: red;
}
/ To change font color for toolbar button in active state/
.e-richtexteditor .e-rte-toolbar .e-toolbar-item .e-dropdown-btn.e-active .e-icons, .e-richtexteditor .e-rte-toolbar .e-toolbar-item .e-dropdown-btn.e-active .e-rte-dropdown-btn-text {
color: red;
}
/ To change font color for expanded toolbar items /
.e-richtexteditor .e-rte-toolbar .e-toolbar-extended .e-toolbar-item .e-tbar-btn .e-icons,
.e-toolbar.e-extended-toolbar .e-toolbar-extended .e-toolbar-item .e-tbar-btn {
color: red;
}
```

Customizing the Rich Text Editor's character count

Use the following CSS to customize the default color in the Rich Text Editor's character count.

```
`css
/ To change font color, font family, font size and opacity  /
.e-richtexteditor .e-rte-character-count {
color: red;
font-family: segoe ui;
font-size: 18px;
opacity: 00.54;
padding-bottom: 2px;
padding-right: 14px;
}
`
```

Keyboard support in Vue Rich text editor component

The editor has full keyboard accessibility that includes shortcuts to open and other actions with toolbar items, drop-down lists, and dialogs.

HTML formation shortcut key

You can use the following key shortcuts when the Rich Text Editor renders with HTML editMode.

Actions	Keyboard shortcuts
Toolbar focus	Alt + f10
Insert link	Ctrl + k
Insert image	Ctrl + Shift + i
Insert audio	Ctrl + Shift + a
Insert video	Ctrl + Alt + v
Insert table	Ctrl + Shift + e
Undo	Ctrl + z
Redo	Ctrl + y
Copy	Ctrl + c
Cut	Ctrl + x
Paste	Ctrl + v
Bold	Ctrl + b
Italic	Ctrl + i
Underline	Ctrl + u
Strikethrough	Ctrl + Shift + s
Uppercase	Ctrl + Shift + u
Lowercase	Ctrl + Shift + l
Superscript	Ctrl + Shift + =
Subscript	Ctrl + =
Indents	Ctrl +]
Outdents	Ctrl + [
HTML source	Ctrl + Shift + h
Fullscreen	Ctrl + Shift + f
Exit Fullscreen	Esc
Justify center	Ctrl + e

Copyright © 2001 -2024 Syncfusion Inc.

| Justify full | Ctrl + j |

| Justify left | Ctrl + l |

| Justify right | Ctrl + r |

| Clear format | Ctrl + Shift + r |

| Ordered list | Ctrl + Shift + o |

| Unordered list | Ctrl + Alt + o |

| Format Painter Copy| Alt + Shift + c |

| Format Painter Paste| Alt + Shift + v |

| Format Painter Escape | Esc |

Custom key config

Customize the key config for the keyboard interaction of Rich Text Editor, using the keyConfig property.

In the following sample, customize the cut, copy, paste toolbar action with ctrl+1, ctrl+2, ctrl+3, respectively.

APP.VUE

```
<template>
  <ejs-richtexteditor ref="defaultRTE" :height="340"
:toolbarSettings="toolbarData" :keyConfigs="keyConfig">
    <p>The Rich Text Editor component is WYSIWYG ("what you see is what you
get") editor that provides the best user experience to create and update the
content. Users can format their content using standard toolbar commands.</p>

Accessibility in Vue Rich text editor component

The Rich Text Editor component has been designed, keeping in mind the WAI-ARIA specifications, and applies the WAI-ARIA roles, states, and properties. This component is characterized by complete ARIA accessibility support that makes it easy for people who use assistive technologies (AT) or those who completely rely on keyboard navigation.

The accessibility compliance for the Rich Text Editor component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| WCAG 2.2 Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Section 508 Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Screen Reader Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Right-To-Left Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Color Contrast | <img src="https://cdn.syncfusion.com/content/images/landing-page/intermediate.png" alt="Intermediate"> |

| Mobile Device Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Keyboard Navigation Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Accessibility Checker Validation | <img src="https://cdn.syncfusion.com/content/images/landing-page/intermediate.png" alt="Intermediate"> |

| Axe-core Accessibility Validation | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

display: inline-block;

margin: 0.5em 0;

}

</style>

<img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> - All features of the component meet the requirement.

<img src="https://cdn.syncfusion.com/content/images/landing-page/intermediate.png" alt="Intermediate"> - Some features of the component do not meet the requirement.

<img src="https://cdn.syncfusion.com/content/images/landing-page/no.png" alt="No"> - The component does not meet the requirement.

ARIA attributes

The toolbar of Rich Text Editor, assigned the role of Toolbar and has the following list of ARIA attributes.

| **Roles and Attributes** | **Functionalities** |

| --- | --- |

| role="toolbar" | This attribute added to the toolbar element describes the actual role of the element. |

| aria-orientation | Indicates the toolbar orientation. Default value is horizontal. |

| aria-haspopup | Indicates the popup mode of the toolbar. The default value is false. When popup mode is enabled, attribute value has to be changed to true. |

| aria-disabled | Indicates the disabled state of the toolbar. |

| aria-owns | Identifies an element to define a visual, functional, or contextual parent/child relationship between DOM elements when the DOM hierarchy cannot represent the relationship. In the Rich Text Editor, the attribute contains the ID of the Rich Text Editor to indicate the popup as a child element. |

For further details of toolbar ARIA attributes, refer the accessibility of Toolbar documentation.

The Rich Text Editor element is assigned the role of application.

| **Roles and Attributes** | **Functionalities** |

| --- | --- |

| role="application" | This attribute added to the Rich Text Editor element describes the actual role of the element. |

| aria-disabled | Indicates the disabled state of the Rich Text Editor. |

Keyboard interaction

The Rich Text Editor component followed the keyboard interaction guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Rich Text Editor component.

HTML formation shortcut key

You can use the following key shortcuts when the Rich Text Editor renders with HTML edit mode.

| Actions | Keyboard shortcuts |

|---|---|

| Toolbar focus | Alt + f10 |

| Insert link | Ctrl + k |

| Insert image | Ctrl + Shift + i |

| Insert table | Ctrl + Shift + e |

| Undo | Ctrl + z |

| Redo | Ctrl + y |

| Copy | Ctrl + c |

| Cut | Ctrl + x |

| Paste| Ctrl + v |

| Bold| Ctrl + b |

| Italic| Ctrl + i |

| Underline| Ctrl + u |

| Strikethrough| Ctrl + Shift + s |

| Uppercase| Ctrl + Shift + u |

| Lowercase| Ctrl + Shift + l |

| Superscript| Ctrl + Shift + = |

| Subscript| Ctrl + = |

| Indents| Ctrl +] |

Copyright © 2001 -2024 Syncfusion Inc.

| Outdents| Ctrl + [|

| HTML source | Ctrl + Shift + h |

| Fullscreen| Ctrl + Shift + f |

| Exit Fullscreen| Esc |

| Justify center| Ctrl + e |

| Justify full | Ctrl + j |

| Justify left | Ctrl + l |

| Justify right | Ctrl + r |

| Clear format | Ctrl + Shift + r |

| Ordered list | Ctrl + Shift + o |

| Unordered list | Ctrl + Alt + o |

| Format Painter Copy| Alt + Shift + c |

| Format Painter Paste| Alt + Shift + v |

| Format Painter Escape | Esc |

Markdown formation shortcut key

You can use the following key shortcuts when the Rich Text Editor renders with Markdown edit mode

| Actions | Keyboard shortcuts |

|---|---|

| Toolbar focus| Alt + f10 |

| Insert link| Ctrl + k |

| Insert image| Ctrl + Shift + i |

| Insert table| Ctrl + Shift + e |

| Undo| Ctrl + z |

| Redo| Ctrl + y |

| Copy| Ctrl + c |

| Cut| Ctrl + x |

| Paste| Ctrl + v |

| Bold| Ctrl + b |

| Italic| Ctrl + i |

| Strikethrough| Ctrl + Shift + s |

| Uppercase| Ctrl + Shift + u |

| Lowercase| Ctrl + Shift + l |

Copyright © 2001 -2024 Syncfusion Inc.

| Superscript| Ctrl + Shift + = |

| Subscript| Ctrl + = |

| Fullscreen| Ctrl + Shift + f |

| Ordered list| Ctrl + Shift + o |

| Unordered list| Ctrl + Alt + o |

Ensuring accessibility

The Rich Text Editor component's accessibility levels are ensured through an accessibility-checker and axe-core software tools during automated testing.

The accessibility compliance of the Rich Text Editor component is shown in the following sample. Open the sample in a new window to evaluate the accessibility of the Rich Text Editor component with accessibility tools.

How To

Add google fonts in Vue Rich text editor component

To use web fonts in Rich Text Editor, it is not needed for the web fonts to be present in local machine. To add the web fonts to Rich Text Editor, we need to refer the web font links and add the font names in the fontFamily property.

APP.VUE

```
<template>
<div>
<div class="control-section">
    <div class="sample-container">
        <div class="default-section">
        <ejs-richtexteditor ref="rteObj" :fontFamily="fontFamily"
:toolbarSettings="toolbarSettings" ><p>The Rich Text Editor component is
WYSIWYG ("what you see is what you get") editor that provides the best user
experience to create and update the content. Users can format their content
using standard toolbar commands.</p>
        <p><b>Key features:</b></p>
          <ul>
            <li><p>Provides IFRAME and DIV modes</p></li>
            <li><p>Capable of handling markdown editing.</p></li>
            <li><p>Contains a modular library to load the necessary
functionality on demand.</p></li>
            <li><p>Provides a fully customizable toolbar.</p></li>
          </ul></ejs-richtexteditor>
        </div>
    </div>
</div>
</div>
</template>
<script>
```

```
import Vue from "vue";
import { RichTextEditorPlugin, Toolbar, Link, Count, Image, HtmlEditor,
QuickToolbar } from "@syncfusion/ej2-vue-richtexteditor";
Vue.use(RichTextEditorPlugin);
export default {
     data: function() {
        return {
       fontFamily: {
        items:[
          {text: "Segoe UI", value: "Segoe UI", class: "e-segoe-ui",
command: "Font", subCommand: "FontName"},
          {text: "Roboto", value: "Roboto",  command: "Font", subCommand:

The below font style links are referred in the page.

`ts

<link rel="stylesheet" href="http://fonts.googleapis.com/css?family=Roboto">

<link rel="stylesheet" href="http://fonts.googleapis.com/css?family=Great+Vibes">

`

In the above sample, you can see that we have added two Google web fonts (Roboto and Great vibes) to Rich Text Editor.

Change default font family in Vue Rich text editor component

By using default property, you can change the default font-family of the Rich Text Editor. To change the font-family of the Rich Text Editor content while loading, we need to give the font-family in the style section with the help of cssClass property.

APP.VUE

```
<template>
<div>
<div class="control-section">
    <div class="sample-container">
        <div class="default-section">
        <ejs-richtexteditor ref="rteObj" :fontFamily="fontFamily"
:cssClass="cssClass" :toolbarSettings="toolbarSettings" ><p>The Rich Text
Editor component is WYSIWYG ("what you see is what you get") editor that
provides the best user experience to create and update the content. Users
can format their content using standard toolbar commands.</p>
        <p><b>Key features:</b></p>
          <ul>
            <li><p>Provides IFRAME and DIV modes</p></li>
            <li><p>Capable of handling markdown editing.</p></li>
            <li><p>Contains a modular library to load the necessary
functionality on demand.</p></li>
            <li><p>Provides a fully customizable toolbar.</p></li>
          </ul></ejs-richtexteditor>
        </div>
    </div>
</div>
<style>
 .customClass .e-rte-content .e-content {
            /* to get the desired font on intially*/
            font-family: "Noto Sans";
        }
        </style>
</div>
</template>
<script>
import Vue from "vue";
import { RichTextEditorPlugin, Toolbar, Link, Count, Image, HtmlEditor,
QuickToolbar } from "@syncfusion/ej2-vue-richtexteditor";
Vue.use(RichTextEditorPlugin);
export default {
     data: function() {
        return {
       fontFamily: {
```

```

Check image size in Vue Rich text editor component

By using the Rich text editor's `imageUploading` event, you can get the image size before uploading and restrict the image to upload, when the given image size is greater than the allowed size.

In the following, we have validated the image size before uploading and determined whether the image has been uploaded or not.

APP.VUE

```
<template>
```

```
<div>
<div class="control-section">
    <div class="sample-container">
        <div class="default-section">
        <ejs-richtexteditor :imageUploading="onImageUploading"
:insertImageSettings="insertImageSettings"
:toolbarSettings="toolbarSettings" >
          </ejs-richtexteditor>
        </div>
    </div>
</div>
</div>
</template>
<script>
    import Vue from "vue";
    import { RichTextEditorPlugin, Toolbar, Link, Count, Image, HtmlEditor,
QuickToolbar } from "@syncfusion/ej2-vue-richtexteditor";
    Vue.use(RichTextEditorPlugin);
    export default {
        data: function() {
            return {
            toolbarSettings: {
                items: ['Bold', 'Italic', 'Underline', 'StrikeThrough','|',
                    'FontName', 'FontSize', 'FontColor', 'BackgroundColor',
                    'LowerCase', 'UpperCase', '|',
                    'Formats', 'Alignments', 'OrderedList', 'UnorderedList',
                    'Outdent', 'Indent', '|',

Customize placeholder style in Vue Rich text editor component

By using e-rte-placeholder class, you can customize the placeholder style.

APP.VUE

```
<template>
  <div>
    <ejs-richtexteditor ref="defaultRTE" :placeholder="placeholder" >
    </ejs-richtexteditor>
  </div>
  <style>
        .e-richtexteditor .e-rte-placeholder {
            font-family: monospace;
            color: deeppink;
        }
    </style>
</template>
<script>
  import Vue from 'vue';
  import { RichTextEditorPlugin, Toolbar, Link, Image, HtmlEditor,
QuickToolbar } from '@syncfusion/ej2-vue-richtexteditor';
  Vue.use(RichTextEditorPlugin);
  export default {
    data() {
      return {
          placeholder: "Type Something",
      }
    },
    provide: {
      richtexteditor: [Toolbar, Link, Image, HtmlEditor, QuickToolbar]
    }
  }
</script>

Customize shortcut keys in Vue Rich text editor component

It can be achieved by using formatter property. We need to create customformatterModel to configure the keyConfig using IHtmlFormatterModel class and assign the same to the formatter property. Here, ctrl+q is configured to open the Insert Hyperlink dialog.

APP.VUE

```
<template>
  <ejs-richtexteditor ref="defaultRTE" :placeholder="placeholder"
:formatter="formatter" >
    <p>The Rich Text Editor component is WYSIWYG ("what you see is what you
get") editor that provides the best user experience to create and update the
content. Users can format their content using standard toolbar commands.</p>
    <p><b>Key features:</b></p>
    <ul>
      <li>
        <p>Provides IFRAME and DIV modes</p>
      </li>
      <li>
        <p>Capable of handling markdown editing.</p>
      </li>
      <li>
        <p>Contains a modular library to load the necessary functionality on
demand.</p>
      </li>
      <li>
        <p>Provides a fully customizable toolbar.</p>
      </li>
    </ul>
  </ejs-richtexteditor>
</template>
<script>
  import Vue from 'vue';
  import { RichTextEditorPlugin, Toolbar, Link, Image, HtmlEditor,
QuickToolbar, IHtmlFormatterModel, HTMLFormatter } from '@syncfusion/ej2-
vue-richtexteditor';
  Vue.use(RichTextEditorPlugin);
  export default {
    data() {
    var customHTMLModel = {
  keyConfig: {
'insert-link': 'ctrl+q', // confite the desired key
}
}
      return {
        placeholder: "Type Something",
        formatter: new HTMLFormatter(customHTMLModel), // to configure
custom key
    }
    },
```

```
    provide: {
      richtexteditor: [Toolbar, Link, Image, HtmlEditor, QuickToolbar]
    }
  }
</script>
<style>
@import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-lists/styles/material.css";

richtexteditor/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/rich-text-editor/toolbar-cs8" %}

We need to import IHtmlFormatterModel and HTMLFormatter to configure the shortcut key.

Set the cursor at the specific range in Vue Rich text editor component

This can be achieved by using setRange method in the Rich Text Editor using NodeSelection instance. In this below sample, we have passed the text node (specific location in Rich Text Editor content) in setStart method and passed the range in setRange method of Rich Text Editor.

APP.VUE

```
<template>
<div>
  <ejs-richtexteditor ref="defaultRTE" :placeholder="placeholder" >
    <p>The Rich Text Editor component is WYSIWYG ("what you see is what you
get") editor that provides the best user experience to create and update the
content. Users can format their content using standard toolbar commands.</p>
    <p id="key"><b>Key features:</b></p>
    <ul>
      <li>
        <p>Provides IFRAME and DIV modes</p>
      </li>
      <li>
        <p>Capable of handling markdown editing.</p>
      </li>
      <li>
        <p>Contains a modular library to load the necessary functionality on
demand.</p>
      </li>
      <li>
        <p>Provides a fully customizable toolbar.</p>
      </li>
    </ul>
  </ejs-richtexteditor>
  <button v-on:click="onClick" class="e-btn">Set Cursor Position</button>
  </div>
</template>
```

Rename images in server in Vue Rich text editor component

By using the insertImageSettings property, you can specify the server handler to upload the selected image. Then you can bind the imageUploadSuccess event, to receive the modified file name from the server and update it in the Rich Text Editor's insert image dialog.

`

<template>

<ejs-richtexteditor ref="rteObj" :imageUploadSuccess="onImageUploadSuccess" :insertImageSettings="insertImageSettings" :toolbarSettings="toolbarSettings" > The Rich Text Editor component is WYSIWYG ("what you see is what you get") editor that provides the best user experience to create and update the content. Users can format their content using standard toolbar commands.

Key features:

 Provides IFRAME and DIV modes

 Capable of handling markdown editing.

 Contains a modular library to load the necessary functionality on demand.

 Provides a fully customizable toolbar.

</ejs-richtexteditor>

`

File attachment in Vue Rich text editor component

The Rich Text Editor allows you to attach a file based on the file upload. You can attach your files using the file upload or drag-and-drop from your local path. When the file upload gets success, the attachment link inserts into the content.

In the below sample, configure the saveUrl and path properties to achieve file attachments.

1. saveUrl: Provides service URL to save the files.
2. path: Specifies the location to store the image.

The following sample illustrates how to attach a file in the Rich Text Editor.

`

```
<template>
<div>
<div class="control-section">
<div class="sample-container">
<div class="default-section">
<ejs-richtexteditor ref="rteObj" :insertImageSettings="insertImageSettings">
<p>The Rich Text Editor component is WYSIWYG ("what you see is what you get") editor that provides the best user experience to create and update the content. Users can format their content using standard toolbar commands.</p>
<p><b>Key features:</b></p>

Schedule

Getting Started with the Vue Schedule Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using Vue-CLILink to the Video and integrating the Syncfusion Vue Schedule component.

Check out this video to see how to develop a Vue Scheduler application:

Prerequisites

System requirements for Syncfusion Vue UI components

Setting up the Vue 2 project

To generate a Vue 2 project using Vue-CLI, use the vue create command. Follow these steps to install Vue CLI and create a new project:

`bash

npm install -g @vue/cli

vue create quickstart

cd quickstart

npm run serve

`

or

`bash

yarn global add @vue/cli

vue create quickstart

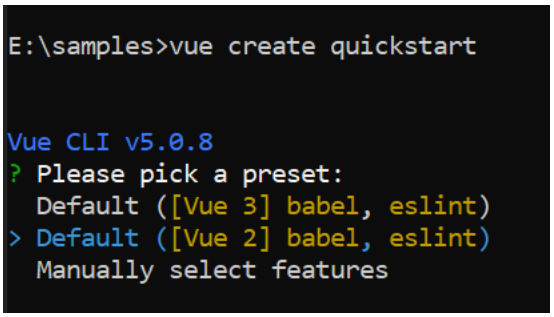
cd quickstart

yarn run serve

`

When creating a new project, choose the option Default ([Vue 2] babel, eslint) from the menu.

Copyright © 2001 -2024 Syncfusion Inc.



Once the quickstart project is set up with default settings, proceed to add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion packages are available at npmjs.com. To use Vue components, install the required npm package.

This article uses the Vue Schedule component as an example. Install the @syncfusion/ej2-vue-schedule package by running the following command:

`bash

npm install @syncfusion/ej2-vue-schedule --save

`

or

`bash

yarn add @syncfusion/ej2-vue-schedule

`

The **--save** will instruct NPM to include the Scheduler package inside of the dependencies section of the package.json.

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, the Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the Schedule component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import '/node_modules/@syncfusion/ej2-base/styles/material.css';
@import '/node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '/node_modules/@syncfusion/ej2-calendars/styles/material.css';
@import '/node_modules/@syncfusion/ej2-dropdowns/styles/material.css';
@import '/node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '/node_modules/@syncfusion/ej2-navigations/styles/material.css';
@import '/node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '/node_modules/@syncfusion/ej2-vue-schedule/styles/material.css';
```

Copyright © 2001 -2024 Syncfusion Inc.

```
</style>
```

Add Syncfusion Vue component

Follow the below steps to add the Vue Schedule component using:

1\. First, import and register the Schedule component in the script section of the **src/App.vue** file.

~/SRC/APP.VUE

```
<script>
import { ScheduleComponent } from '@syncfusion/ej2-vue-schedule';
</script>
```

2\. In the template section, define the Schedule component property.

~/SRC/APP.VUE

```
<template>
<div id='app'>
<ejs-schedule ></ejs-schedule>
</div>
</template>
```

Module injection

The crucial step on creating a Schedule with specific views, is to inject the required modules. The modules that are available with common Schedule basic functionality are as follows.

- **Day** - Inject this module for displaying day view.
- **Week** - Inject this module for displaying week view.
- **WorkWeek** - Inject this module for displaying work week view.
- **Month** - Inject this module for displaying month view.
- **Agenda** - Inject this module for displaying agenda view.
- **MonthAgenda** - Inject this module for displaying month agenda view.
- **TimelineViews** - Inject this module for displaying timeline day, timeline week, timeline work week view.
- **TimelineMonth** - Inject this module for displaying timeline month view.

These modules should be injected into the Schedule using the provide method within the app.vue file as shown below. On doing so, only the injected views will be loaded and displayed on the Schedule.

[src/app/app.vue]

`html

<template>

<ejs-schedule ></ejs-schedule>

</template>

Copyright © 2001 -2024 Syncfusion Inc.

<script>

import { ScheduleComponent, Day, Week, WorkWeek, Month, Agenda } from '@syncfusion/ej2-vue-schedule';

export default {

components: {

'ejs-schedule': ScheduleComponent

},

provide: {

schedule: [Day, Week, WorkWeek, Month, Agenda]

}

}

</script>

`

Run the project

To run the project, use the following command:

`bash

npm run serve

`

or

`bash

yarn run serve

`

The output will display the empty Scheduler.

Populating appointments

To populate the empty Scheduler with appointments, define either the local JSON data or remote data through the dataSource property available within the eventSettings option. To define any appointments, start and end time fields are mandatory. In the following example, you can see the appointment defined with default fields such as Id, Subject, StartTime and EndTime.

`html

<template>

<ejs-schedule height='550px' :selectedDate='selectedDate' :eventSettings='eventSettings'></ejs-schedule>

</template>

Copyright © 2001 -2024 Syncfusion Inc.

```
<script>
import { ScheduleComponent, Day, Week, WorkWeek, Month, Agenda } from '@syncfusion/ej2-vue-schedule';
export default {
components: {
'ejs-schedule': ScheduleComponent
},
data () {
return {
selectedDate: new Date(2018, 1, 15),
eventSettings: {
dataSource: [{
Id: 1,
Subject: 'Meeting',
StartTime: new Date(2018, 1, 15, 10, 0),
EndTime: new Date(2018, 1, 15, 12, 30)
}]
}
}
},
provide: {
schedule: [Day, Week, WorkWeek, Month, Agenda]
}
}
</script>
```

You can also provide different names to these default fields, for which the custom names of those fields must be mapped appropriately within fields property as shown below.

```
`html
<template>
<div id='app'>
<ejs-schedule height='550px' :selectedDate='selectedDate' :eventSettings='eventSettings'></ejs-schedule>
</div>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
</template>
<script>
import { ScheduleComponent, Day, Week, WorkWeek, Month, Agenda } from '@syncfusion/ej2-vue-schedule';
let data = [{
Id: 2,
EventName: 'Meeting',
StartTime: new Date(2018, 1, 15, 10, 0),
EndTime: new Date(2018, 1, 15, 12, 30),
IsAllDay: false
}];
export default {
components: {
'ejs-schedule': ScheduleComponent
},
data () {
return {
selectedDate: new Date(2018, 1, 15),
eventSettings: {
dataSource: data,
fields: {
id: 'Id',
subject: { name: 'EventName' },
isAllDay: { name: 'IsAllDay' },
startTime: { name: 'StartTime' },
endTime: { name: 'EndTime' }
}
}
}
},
provide: {
schedule: [Day, Week, WorkWeek, Month, Agenda]
}
```

Copyright © 2001 -2024 Syncfusion Inc.

```
}
</script>
```

The other fields available in Scheduler can be referred from here.

Setting date

Scheduler usually displays the system date as its current date. To change the current date of Scheduler with specific date, define the `selectedDate property.

[src/app/app.vue]

```
`html
<template>
<div id='app'>
<ejs-schedule height='550px' :selectedDate='selectedDate'></ejs-schedule>
</div>
</template>
<script>
import { ScheduleComponent, Day, Week, WorkWeek, Month, Agenda } from '@syncfusion/ej2-vue-schedule';
export default {
components: {
'ejs-schedule': ScheduleComponent
},
data (){
return {
selectedDate: new Date(2018, 1, 15)
}
},
provide: {
schedule: [Day, Week, WorkWeek, Month, Agenda]
}
}
</script>
`
```

Copyright © 2001 -2024 Syncfusion Inc.

Setting view

Scheduler displays week view by default. To change the current view, define the applicable view name to the currentView property. The applicable view names are,

- Day
- Week
- WorkWeek
- Month
- Year
- Agenda
- MonthAgenda
- TimelineDay
- TimelineWeek
- TimelineWorkWeek
- TimelineMonth
- TimelineYear

```
`html

<template>

<div id='app'>

<ejs-schedule height='550px' :selectedDate='selectedDate' :currentView='currentView'>

</ejs-schedule>

</div>

</template>

<script>

import { ScheduleComponent, Day, WorkWeek, Agenda, Month, Week } from '@syncfusion/ej2-vue-schedule';

export default {

components: {

'ejs-schedule': ScheduleComponent

},

data () {

return {

selectedDate: new Date(2018, 1, 15),

currentView: 'Month',

}

},

provide: {

schedule: [Day, WorkWeek, Agenda, Month, Week]
```

Copyright © 2001 -2024 Syncfusion Inc.

}

}

</script>

`

Individual view customization

Each individual Scheduler views can be customized with its own options such as setting different start and end hour on Week and Work Week views, whereas hiding the weekend days on Month view alone.

This can be achieved by defining views property to accept the array of object type, where each object depicts the individual view customization.

The output will display the Scheduler with the specified view configuration.

~/SRC/APP.VUE

```
<template>
  <div id='app'>
      <ejs-schedule height='550px' width='100%' :selectedDate='selectedDate'
      :eventSettings= 'eventSettings'>
        <e-views>
          <e-view option='Week' startHour='07:00' endHour='15:00' ></e-view>
          <e-view option='WorkWeek' startHour='10:00' endHour='18:00' ></e-
view>
          <e-view option='Month' showWeekend=false></e-view>
        </e-views>
      </ejs-schedule>
  </div>
</template>
<script>
  import { scheduleData } from './datasource.js';
  import { extend } from '@syncfusion/ej2-base';
  import { ScheduleComponent, ViewsDirective, ViewDirective,  WorkWeek,
Month, Week } from '@syncfusion/ej2-vue-schedule';
  export default {
    components: {
      'ejs-schedule': ScheduleComponent,
      'e-view': ViewDirective,
      'e-views': ViewsDirective
    },
    data () {
      return {
        eventSettings: { dataSource: extend([], scheduleData, null, true) },
        selectedDate: new Date(2018, 1, 15)
      }
    },
    provide: {
      schedule: [ WorkWeek, Month, Week]
    }
  }
</script>
<style>
@import '/node_modules/@syncfusion/ej2-base/styles/material.css';
@import '/node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '/node_modules/@syncfusion/ej2-calendars/styles/material.css';
```

Copyright © 2001 -2024 Syncfusion Inc.

```
@import '/node_modules/@syncfusion/ej2-dropdowns/styles/material.css';
@import '/node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '/node_modules/@syncfusion/ej2-navigations/styles/material.css';
@import '/node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '/node_modules/@syncfusion/ej2-vue-schedule/styles/material.css';
</style>
```

{% previewsample "page.domainurl/code-snippet/schedule/view-cs1" %}

You can also explore our Vue Scheduler example that shows how to use the toolbar buttons to play with Scheduler functionalities.

Getting Started with Syncfusion Scheduler Component in Vue 3

This article provides a step-by-step guide for setting up a Vite project with a JavaScript environment and integrating the Syncfusion Vue Scheduler component using the Composition API / Options API.

The Composition API is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

The Options API is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

Prerequisites

System requirements for Syncfusion Vue UI components

Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using Vite. To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

`bash

npm create vite@latest

`

or

`bash

yarn create vite

`

Using one of the above commands will lead you to set up additional configurations for the project as below:

1.Define the project name: We can specify the name of the project directly. Let's specify the name of the project as my-project for this article.

`bash

? Project name: » my-project

`

2.Select Vue as the framework. It will creates a Vue 3 project.

Copyright © 2001 -2024 Syncfusion Inc.

`bash

? Select a framework: » - Use arrow-keys. Return to submit.

Vanilla

Vue

React

Preact

Lit

Svelte

Others

`

3.Choose JavaScript as framework variant to build this Vite project using JavaScript and Vue.

`bash

? Select a variant: » - Use arrow-keys. Return to submit.

JavaScript

TypeScript

Customize with create-vue ↗

Nuxt ↗

`

4.Upon completing the aforementioned steps to create the my-project, run the following command to install its dependencies:

`bash

cd my-project

npm install

`

or

`bash

cd my-project

yarn install

`

Now that my-project is ready to run with default settings, let's add Syncfusion Scheduler component to the project.

Adding Syncfusion Vue packages

Syncfusion Vue component packages are available at npmjs.com. To use Syncfusion Vue components in the project, install the corresponding npm package.

Copyright © 2001 -2024 Syncfusion Inc.

This article uses the Vue Scheduler component as an example. To use the Vue Scheduler component in the project, the @syncfusion/ej2-vue-schedule package needs to be installed using the following command

`bash

npm install @syncfusion/ej2-vue-schedule --save

`

or

`bash

yarn add @syncfusion/ej2-vue-schedule

`

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the Scheduler component and its dependents were imported into the <style> section of the **src/App.vue** file.

`html

<style>

@import '../node_modules/@syncfusion/ej2-base/styles/material.css';

@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';

@import '../node_modules/@syncfusion/ej2-calendars/styles/material.css';

@import '../node_modules/@syncfusion/ej2-dropdowns/styles/material.css';

@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';

@import '../node_modules/@syncfusion/ej2-navigations/styles/material.css';

@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';

@import '../node_modules/@syncfusion/ej2-vue-schedule/styles/material.css';

</style>

`

Note: Scheduler component use other Syncfusion components too, the dependent component's CSS references need to be added for using all the Scheduler functionalities.

Add Syncfusion Vue component

Follow the below steps to add the Vue Scheduler component using Composition API or Options API:

1.First, import and register the Scheduler component and its child directives in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

Copyright © 2001 -2024 Syncfusion Inc.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { provide } from "vue";
import {
ScheduleComponent as EjsSchedule, ViewsDirective as EViews, ViewDirective as
EView,
ResourcesDirective as EResources, ResourceDirective as EResource,
Day, Week, WorkWeek, Month, Agenda
} from "@syncfusion/ej2-vue-schedule";
provide('schedule', [Day, Week, WorkWeek, Month, Agenda]);
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
import {
Day,
Week,
WorkWeek,
Month,
Agenda,
MonthAgenda,
ScheduleComponent, ViewsDirective, ViewDirective
} from "@syncfusion/ej2-vue-schedule";
export default {
name: "App",
components: {
'ejs-schedule' : ScheduleComponent,
'e-views' : ViewsDirective,
'e-view' : ViewDirective,
'e-resources': ResourcesDirective,
'e-resource': ResourceDirective
}
}
</script>
```

2.In the template section, define the Scheduler component with the selectedDate, eventSettings properties and resources definition with dataSource property.

`html

<template>

<ejs-schedule height='550px' width='100%' :selectedDate='selectedDate'
:eventSettings='eventSettings'>

<e-views>

<e-view option='Day'></e-view>

<e-view option='Week'></e-view>

<e-view option='WorkWeek'></e-view>

<e-view option='Month'></e-view>

<e-view option='Agenda'></e-view>

Copyright © 2001 -2024 Syncfusion Inc.

</e-views>

<e-resources>

<e-resource field="OwnerId" title="Owner" name="Owners" :dataSource="ownerDataSource" textField="OwnerText"

idField="Id" colorField="OwnerColor">

</e-resource>

</e-resources>

</ejs-schedule>

</template>

`

3.Declare the values for the selectedDate, eventSettings and resources dataSource properties in the script section.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
const selectedDate = new Date(2023, 7, 8);
const eventSettings = {
dataSource: [
{
Id: 1,
Subject: 'Surgery - Andrew',
EventType: 'Confirmed',
StartTime: new Date(2023, 7, 10, 9, 0),
EndTime: new Date(2023, 7, 10, 10, 0),
OwnerId: 2
},
{
Id: 2,
Subject: 'Consulting - John',
EventType: 'Confirmed',
StartTime: new Date(2023, 7, 9, 10, 0),
EndTime: new Date(2023, 7, 9, 11, 30),
OwnerId: 3
},
{
Id: 3,
Subject: 'Therapy - Robert',
EventType: 'Requested',
StartTime: new Date(2023, 7, 8, 11, 30),
EndTime: new Date(2023, 7, 8, 12, 30),
OwnerId: 1
}
]
};
const ownerDataSource = [
{ OwnerText: "Nancy", Id: 1, OwnerColor: "#ffaa00" },
{ OwnerText: "Steven", Id: 2, OwnerColor: "#f8a398" },
{ OwnerText: "Michael", Id: 3, OwnerColor: "#7499e1" }
];
```

Copyright © 2001 -2024 Syncfusion Inc.

```
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
data: function () {
return {
selectedDate = new Date(2023, 7, 8),
eventSettings = {
dataSource: [
{
Id: 1,
Subject: 'Surgery - Andrew',
EventType: 'Confirmed',
StartTime: new Date(2023, 7, 10, 9, 0),
EndTime: new Date(2023, 7, 10, 10, 0),
OwnerId: 2
},
{
Id: 2,
Subject: 'Consulting - John',
EventType: 'Confirmed',
StartTime: new Date(2023, 7, 9, 10, 0),
EndTime: new Date(2023, 7, 9, 11, 30),
OwnerId: 3
},
{
Id: 3,
Subject: 'Therapy - Robert',
EventType: 'Requested',
StartTime: new Date(2023, 7, 8, 11, 30),
EndTime: new Date(2023, 7, 8, 12, 30),
OwnerId: 1
}
]
},
ownerDataSource =[
{ OwnerText: "Nancy", Id: 1, OwnerColor: "#ffaa00" },
{ OwnerText: "Steven", Id: 2, OwnerColor: "#f8a398" },
{ OwnerText: "Michael", Id: 3, OwnerColor: "#7499e1" }
]
}
},
</script>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<ejs-schedule height='550px' width='100%' :selectedDate='selectedDate'
:eventSettings='eventSettings'>
<e-views>
<e-view option='Day'></e-view>
<e-view option='Week'></e-view>
<e-view option='WorkWeek'></e-view>
```

```
<e-view option='Month'></e-view>
<e-view option='Agenda'></e-view>
</e-views>
<e-resources>
<e-resource field="OwnerId" title="Owner" name="Owners"
:dataSource="ownerDataSource" textField="OwnerText"
idField="Id" colorField="OwnerColor">
</e-resource>
</e-resources>
</ejs-schedule>
</template>
<script setup>
import { provide } from "vue";
import {
ScheduleComponent as EjsSchedule, ViewsDirective as EViews, ViewDirective as
EView,
ResourcesDirective as EResources, ResourceDirective as EResource,
Day, Week, WorkWeek, Month, Agenda
} from "@syncfusion/ej2-vue-schedule";
provide('schedule', [Day, Week, WorkWeek, Month, Agenda]);
const selectedDate = new Date(2023, 7, 8);
const eventSettings = {
dataSource: [
{
Id: 1,
Subject: 'Surgery - Andrew',
EventType: 'Confirmed',
StartTime: new Date(2023, 7, 10, 9, 0),
EndTime: new Date(2023, 7, 10, 10, 0),
OwnerId: 2
},
{
Id: 2,
Subject: 'Consulting - John',
EventType: 'Confirmed',
StartTime: new Date(2023, 7, 9, 10, 0),
EndTime: new Date(2023, 7, 9, 11, 30),
OwnerId: 3
},
{
Id: 3,
Subject: 'Therapy - Robert',
EventType: 'Requested',
StartTime: new Date(2023, 7, 8, 11, 30),
EndTime: new Date(2023, 7, 8, 12, 30),
OwnerId: 1
}
]
};
const ownerDataSource = [
{ OwnerText: "Nancy", Id: 1, OwnerColor: "#ffaa00" },
{ OwnerText: "Steven", Id: 2, OwnerColor: "#f8a398" },
{ OwnerText: "Michael", Id: 3, OwnerColor: "#7499e1" }
];
</script>

```

Run the project

To run the project, use the following command:

`bash

npm run dev

`

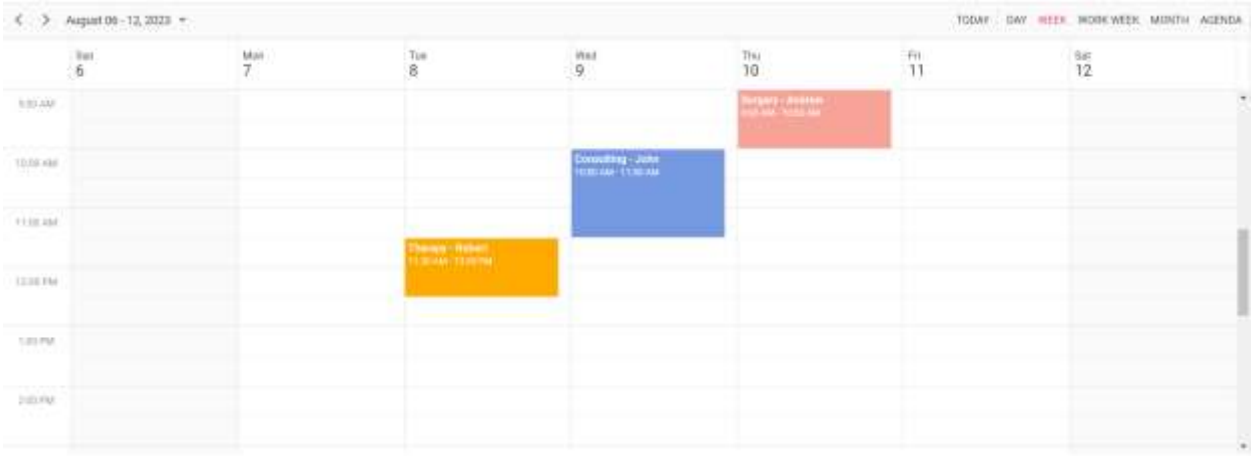
or

`bash

yarn run dev

`

The output will appear as follows:



Refer the sample Vue 3 using Composition API Scheduler getting started

For migrating from Vue 2 to Vue 3, refer to the migration documentation.

Module injection in Vue Schedule component

The crucial step on creating a Scheduler with required views, is to import and inject the required modules. The modules that are available on Scheduler to work with its related functionalities are as follows.

- Day - Inject this module to work with day view.
- Week - Inject this module to work with week view.
- WorkWeek - Inject this module to work with work week view.
- Month - Inject this module to work with month view.
- Year - Inject this module to work with year view.
- Agenda - Inject this module to work with agenda view.
- MonthAgenda - Inject this module to work with month agenda view.
- TimelineViews - Inject this module to work with timeline day, timeline week, and timeline work week views.
- TimelineMonth - Inject this module to work with timeline month view.
- TimelineYear - Inject this module to work with timeline year view.
- DragAndDrop - Inject this module to allow drag and drop of appointments on Scheduler.
- Resize - Inject this module for enabling the resize functionality of appointments on Scheduler.
- ExcelExport - Inject this module for exporting the Scheduler events data as excel file format.

Copyright © 2001 -2024 Syncfusion Inc.

- ICalendarExport - Inject this module for exporting the Scheduler events data to an ICS file.
- ICalendarImport - Inject this module for importing the Scheduler events data from an ICS file.

Module injection

The required modules should be injected into the Scheduler using the provide method of Scheduler within the app.vue file as shown below. On doing so, only the injected module functionalities will be loaded and can be worked with Scheduler.

[src/app.vue]

`html

provide: {

schedule: [Day, Week, WorkWeek, Month, Agenda, MonthAgenda]

},

`

Note: If a Scheduler currentView is set to any one of the available views without injecting that respective view module, then a script error will occur and the Scheduler will not render.

You can refer to our Vue Scheduler feature tour page for its groundbreaking feature representations. You can also explore our Vue Scheduler example to knows how to present and manipulate data.

Scheduler interactions in Vue Schedule component

The following table describes the Scheduler actions and also illustrates how those actions are carried out through mouse and touch interactions on Scheduler.

|Actions | Mouse interaction | Touch interaction |

|---|---|---|

| Single click or tap on cells | Single click on a cell to select a cell. | Single tapping on cells, will display a + icon on the cell. Tapping on it again will open the new event editor window. |

| Multiple cell selection | Single click on a cell and drag the selection to other cells to enable multiple cell selection. | No multiple cell selection is allowed using touch gestures. |

| Event selection | Single click on an event to select it. | Tap holding on events, select an event and opens a small popup at the top holding the options to edit or delete. The popup also displays the selected event's subject. |

| Multiple event selection and deletion | Pressing Ctrl key and altogether single clicking on multiple events one after the other will enable multiple event selection. Pressing Delete key after event selection will delete all the selected events. | Tap hold an event to select it, which opens a small popup at the top holding the options to edit or delete. As a continuation of this action, keep on single tapping on other events, to enable multiple event selection. Also, the popup displayed at the top remains in opened state, showing the count of the number of selected events. Pressing Delete option from the popup will delete all the selected events. |

| Date navigation | Clicking on the previous or next date navigation icons in the header bar allows you to navigate between dates. | Swiping the scheduler view port to the left or right will allow you to navigate between the dates on touch devices. You can prevent the swiping action by disabling allowSwiping

Copyright © 2001 -2024 Syncfusion Inc.

property. NOTE: Swiping does not work when horizontal scroller present in the Scheduler. You can also make use of the previous and next navigation icons at the header bar to navigate. |

| View navigation | Click on an event and try moving it over the Scheduler to enable drag and drop action. | The view options are available within the popup options at the top right extreme end of the header bar and you can choose the view from it. |

| Drag and drop | Click on an event and try moving it over the Scheduler to enable drag and drop action. | Tap hold the event and try moving it over the Scheduler to enable drag and drop action. |

| Event resizing | Hover the mouse across the extremities or edges of the Scheduler events and when the mouse pointer changes into resize handler, now click and start resizing an event to the desired time range. | Touch the event extremities and start resizing the events directly. |

| Tooltip | Hover the mouse pointer over the events or resource header and the tooltip will be displayed. | Tap holding the events will open the tooltip on events. |

| Open editor window | Double click on cells or events to open the editor window. | Double click on cells or events to open the editor window. Single tap on cells, which displays a + icon on the cell. Now, tap on it again to open the new event editor window. To open the editor on events, single tap on it and then click on the edit icon to open the editor window in Edit mode. |

| Open quick info popup | Single clicking on a cell will open a quick popup prompting for new event creation. Single clicking on an event will open a popup displaying event information along with the option to edit and delete it. | No quick info popup is available while single tapping on cells. Single tapping on events, opens the popup showing event information. |

You can refer to our Vue Scheduler feature tour page for its groundbreaking feature representations. You can also explore our Vue Scheduler exampleLink to the Video to knows how to present and manipulate data.

Appointments in Vue Schedule component

Appointments can be anything that are scheduled for a specific time period. It can be created on varied time range and each appointments are categorized based on this range. The Scheduler events can be categorized as,

- Normal events
- Spanned events
- All-day events
- Recurring events

You can watch the following video to learn more about scheduling appointments and how to customize it in the Vue Scheduler

Normal events

Represents an appointment that is created for any specific time interval within a day.

Creating a normal event

The following example depicts how to define a normal event on the Scheduler, with event data being loaded from simple JSON data.

APP.VUE

```
<template>
```

```
  <div id='app'>
    <div id='container'>
        <ejs-schedule :height='height' :selectedDate='selectedDate' :views =
'views' :eventSettings='eventSettings'></ejs-schedule>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import {SchedulePlugin, Day, Week, TimelineViews, Month, Agenda } from
'@syncfusion/ej2-vue-schedule';
let data = [{
    Id: 1,
    Subject: 'Paris',
    StartTime: new Date(2018, 1, 15, 10, 0),
    EndTime: new Date(2018, 1, 15, 12, 30)
}];
Vue.use(SchedulePlugin);
export default {
  data (){
    return {
      height: '550px',
      views: ['Day', 'Week', 'TimelineWeek', 'Month', 'Agenda'],
      eventSettings: {
        dataSource: data
      },
      selectedDate: new Date(2018, 1, 15),
    }
  },
  provide: {
    schedule: [Day, Week, TimelineViews, Month, Agenda]
  }
}
</script>
<style>
  @import '../../node_modules/@syncfusion/ej2-base/styles/material.css';
  @import '../../node_modules/@syncfusion/ej2-vue-
buttons/styles/material.css';
  @import '../../node_modules/@syncfusion/ej2-vue-
calendars/styles/material.css';

schedule/styles/material.css';
</style>
```

{% previewsample "page.domainurl/code-snippet/schedule/event-cs1" %}

Copyright © 2001 -2024 Syncfusion Inc.

Spanned events

Represents an appointment that is created for more than 24 hours, and usually displayed on the all-day row. Also, represents another type of appointment that is created for more than one day but less than 24 hours, and usually displayed appropriately on both the days.

For example, if an appointment is created for two days say from November 25, 2018 – 11.00 PM to November 26, 2018 2.00 AM but less than 24 hours time interval, then the appointment is split into two partitions and will be displayed on both the days.

All-day events

Represents an appointment that is created for an entire day such as holiday events. It is usually displayed separately in an all-day row, a separate row for all-day appointments below the date header section. In Timeline views, the all-day appointments displays in the working space area, and no separate all-day row is present in that view.

To change normal appointment into all-day event, set isAllDay field to true.

Hide all-day row events

You can make use of the CSS customization to prevent the display of all-day row appointments on the Scheduler UI.

`html

<style>

.e-schedule .e-date-header-wrap .e-schedule-table thead {

display: none;

}

</style>

`

Expand all day appointments view on initial load

When you have larger number of appointments in all-day view, you can show all all-day events using dataBound event on at initial load. So, user don't have to click the toggle to expand all-day events.

APP.VUE

```
<template>
  <div id="app">
    <div id="container">
      <ejs-schedule ref='scheduleObj' :height="height"
:selectedDate="selectedDate" :views="views"
        :eventSettings="eventSettings" :dataBound=this.dataBound></ejs-
schedule>
    </div>
  </div>
</template>
<script>

Customize the rendering of the spanned events

By default, Scheduler will renders the spanned events (appointment with more than 24 hours duration) in the all-day row by setting `AllDayRow` will the default type renders to the `spannedEventPlacement` option within the eventSettings property. Now we can customize rendering of the that events inside the work cells itself by modifying the `spannedEventPlacement` option as `TimeSlot`. In this following example, shows how to render the spanned appointments inside the work cells as follows.

APP.VUE

```

{% previewsample "page.domainurl/code-snippet/schedule/event-cs3" %}

Recurring events

Represents an appointment that is created for a certain time interval and occurring repeatedly on a daily, weekly, monthly or yearly basis at the same time interval based on the provided recurrence rule. Usually, the recurring events are indicated by a repeat marker added at the bottom-right position.

Creating a recurring event

The following example depicts how to create a recurring event on Scheduler with the specific recurrence rule. In the following example, an event is made to repeat on daily mode and ends after 5 occurrences.

APP.VUE

```
<template>
  <div id='app'>
    <div id='container'>
        <ejs-schedule :height='height' :selectedDate='selectedDate' :views =
'views' :eventSettings='eventSettings'></ejs-schedule>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { SchedulePlugin, Day, Week, TimelineMonth, Month, Agenda } from
'@syncfusion/ej2-vue-schedule';
let data = [{
    Id: 1,
    Subject: 'Paris',
    StartTime: new Date(2018, 1, 15, 10, 0),
    EndTime: new Date(2018, 1, 15, 12, 30),
    IsAllDay: false,
    RecurrenceRule: 'FREQ=DAILY;INTERVAL=1;COUNT=5'
}];
Vue.use(SchedulePlugin);
export default {
  data (){
    return {
      height: '550px',
      views: ['Day', 'Week', 'TimelineMonth', 'Month', 'Agenda'],
      eventSettings: {
        dataSource: data
      },
      selectedDate: new Date(2018, 1, 15),
    }
  },
  provide: {
    schedule: [Day, Week, TimelineMonth, Month, Agenda]
  }
}
</script>
<style>
  @import '../../node_modules/@syncfusion/ej2-base/styles/material.css';

  @import '../../node_modules/@syncfusion/ej2-vue-
schedule/styles/material.css';
</style>
```

{% previewsample "page.domainurl/code-snippet/schedule/event-cs4" %}

Adding exceptions

A few instance of the recurrence series can be excluded on specific dates, by adding those exceptional dates to the recurrenceException field. These date values should be given in the ISO date time format with no hyphens(-) separating the date elements.

For example, 22nd February 2018 can be represented as 20180222. Also, the time part being represented in UTC format needs to add "Z" after the time portion with no space. "07:30:00 UTC" is therefore represented as "073000Z".

APP.VUE

```
<template>
  <div id='app'>
    <div id='container'>
        <ejs-schedule :height='height' :selectedDate='selectedDate'
:eventSettings='eventSettings'></ejs-schedule>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { SchedulePlugin, Day, Week, WorkWeek, Month, Agenda } from
'@syncfusion/ej2-vue-schedule';
let data = [{
    Id: 1,
    Subject: 'Paris',
    StartTime: new Date(2018, 0, 28, 10, 0),
    EndTime: new Date(2018, 0, 28, 12, 30),
    RecurrenceRule: 'FREQ=DAILY;INTERVAL=1;COUNT=8',
    RecurrenceException:'20180129T043000Z,20180131T043000Z,20180202T043000Z'
}];
Vue.use(SchedulePlugin);
export default {
  data (){
    return {
      height: '550px',
      eventSettings: {
        dataSource: data
      },
      selectedDate: new Date(2018, 0, 28),
```

```
    }
  },
  provide: {
    schedule: [Day, Week, WorkWeek, Month, Agenda]
  }
}
</script>

</style>
```

{% previewsample "page.domainurl/code-snippet/schedule/event-cs5" %}

Editing an occurrence from a series

To dynamically edit a particular occurrence from an event series and display it on the initial load of Scheduler, the edited occurrence needs to be added as a new event to the dataSource collection, with an additional `recurrenceID` field defined to it. The `recurrenceID` field of edited occurrence usually maps the ID value of the parent event.

In this example, a recurring instance that displays on the date 30th Jan 2018 is edited with different timings. Therefore, this particular date is excluded from the parent recurring event that repeats from 28th January 2018 to 4th February 2018. This can be done by adding the `recurrenceException` field with the excluded date value on the parent event. Also, the edited occurrence event which is created as a new event should carry the `recurrenceID` field pointing to the parent event's `Id` value.

APP.VUE

```
<template>
  <div id='app'>
    <div id='container'>
        <ejs-schedule :height='height' :selectedDate='selectedDate'
:eventSettings='eventSettings'></ejs-schedule>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { SchedulePlugin, Day, Week, WorkWeek, Month, Agenda } from
'@syncfusion/ej2-vue-schedule';
let data = [{
    Id: 1,
```

```
    Subject: 'Scrum Meeting',
    StartTime: new Date(2018, 0, 28, 10, 0),
    EndTime: new Date(2018, 0, 28, 12, 30),
    IsAllDay: false,
    RecurrenceRule: 'FREQ=DAILY;INTERVAL=1;COUNT=8',
    RecurrenceException:'20180130T043000Z'
},
{
    Id: 2,
    Subject: 'Scrum Meeting',
    StartTime: new Date(2018, 0, 30, 9, 0),
    EndTime: new Date(2018, 0, 30, 10, 30),
    Description: 'Meeting time changed based on team activities.',
    RecurrenceID: 1
}];
Vue.use(SchedulePlugin);
export default {
  data (){
    return {
      height: '550px',
      eventSettings: {
        dataSource: data
      },
      selectedDate: new Date(2018, 0, 28),
    }
  },
  provide: {
    schedule: [Day, Week, WorkWeek, Month, Agenda]
  }
}
</script>
<style>

</style>
```

{% previewsample "page.domainurl/code-snippet/schedule/event-cs6" %}

Edit only the current and following events

To edit only the current and following events enable the property editFollowingEvents within eventSettings property. The edited occurrence needs to be added as a new event to the dataSource

collection, with an additional followingID field defined to it. The followingID field of edited occurrence usually maps the ID value of the immediate parent event.

In this example, a recurring instance that displays on the date 30th Jan 2018 and its following dates are edited with different subject. Therefore, this particular date and its following dates are excluded from the parent recurring event that repeats from 28th January 2018 to 4th February 2018. This can be done by updating the recurrenceRule field with the until date value on the parent event. Also, the edited events which is created as a new event should carry the followingID field pointing to the immediate parent event's Id value.

APP.VUE

```
<template>
  <div id='app'>
    <div id='container'>
        <ejs-schedule :height='height' :selectedDate='selectedDate'

Recurrence options and rules

Events can be repeated on a daily, weekly, monthly or yearly basis based on the recurrence rule which accepts the string value. The following details should be assigned to the `recurrenceRule` property to generate the recurring instances.

- Repeat type - daily/weekly/monthly/yearly.
- How many times it needs to be repeated?
- The interval duration.
- The time period to render the appointment, etc.

There are four repeat types available namely,

- **Daily** - Creates the recurring instances on daily basis.
- **Weekly** - Creates the recurring instances on weekly basis for the selected days.
- **Monthly** - Creates the recurring instances on monthly basis for the selected months and other provided recurrence criteria.
- **Yearly** - Creates the recurring instances on yearly basis.

Recurrence properties

The properties based on which the recurrence appointments are created with its respective time period are depicted in the following table. Also, the valid rule string can be referred from iCalendar specifications.

Refer iCalendar specifications for valid recurrence rule string.

Property	Purpose	Example
FREQ	Maintains the repeat type (Daily, Weekly, Monthly, Yearly) value of the appointment.	FREQ=DAILY;INTERVAL=1

Copyright © 2001 -2024 Syncfusion Inc.

| INTERVAL | Maintains the interval value of the appointments. When you create the daily appointment at an interval of 2, the appointments are rendered on the days Monday, Wednesday and Friday (Creates an appointment on all days by leaving the interval of one day gap). | FREQ=DAILY;INTERVAL=2|

| COUNT | It holds the appointment's count value. When the COUNT value is 10, then 10 instances of appointments are created in the recurrence series. | FREQ=DAILY;INTERVAL=1;COUNT=10|

| UNTIL | This property holds the end date value (in ISO format) denoting when the recurrence actually ends. | FREQ=DAILY;INTERVAL=1;UNTIL=20180530T041343Z;|

| BYDAY | It holds the day value(s), representing on which the appointments actually renders. Create the weekly appointment, and select the day(s) from the day options (Monday/Tuesday/Wednesday/Thursday/Friday/Saturday/Sunday). When Monday is selected, the first two letters of the selected day "MO" is saved in the BYDAY property. When multiple days are selected, the values are separated by commas. | FREQ=WEEKLY;INTERVAL=1;BYDAY=MO,WE;COUNT=10|

| BYMONTHDAY | This property is used to store the date value of the Month, while creating the Month recurrence appointment. When you create a Monthly recurrence appointment for every 3rd day of the month, then BYMONTHDAY holds the value 3 and creates the appointment on 3rd day of every month. | FREQ=MONTHLY;BYMONTHDAY=3;INTERVAL=1;COUNT=10|

| BYMONTH | This property is used to store the index value of the selected Month while creating the yearly appointments. When you create the yearly appointment on June month, the index value of June month 6 will get stored in the BYMONTH field. The appointment is created on every 6th month of a year. | FREQ=YEARLY;BYMONTHDAY=16;BYMONTH=6;INTERVAL=1;COUNT=10|

| BYSETPOS | This property is used to store the index value of the week. When you create the monthly appointment in second week of a month, the index value of the second week (2) is stored in BYSETPOS. | FREQ=MONTHLY;BYDAY=MO;BYSETPOS=2;COUNT=10|

The default recurrence related validation has been included for recurrence appointments similar to the one available in Outlook. The validation usually occurs during the recurrence appointment creation, editing, drag and drop or resizing of the recurrence appointments and also if any single occurrence changes.

Daily Frequency

| Description | Example |

|---|---|

| Daily recurring event that never ends | FREQ=DAILY;INTERVAL=1 |

| Daily recurring event that ends after 5 occurrences | FREQ=DAILY;INTERVAL=1;COUNT=5 |

| Daily recurring event that ends exactly on 12/12/2018 | FREQ=DAILY;INTERVAL=1;UNTIL=20181212T041343Z |

| Daily event that recurs on alternative days and repeats for 10 occurrences | FREQ=DAILY;INTERVAL=2;COUNT=10 |

Weekly Frequency

| Description | Example |

|---|---|

| Weekly recurring event that repeats on every Monday, Wednesday and Friday and never ends | FREQ=WEEKLY;INTERVAL=1;BYDAY=MO,WE,FR |

Copyright © 2001 -2024 Syncfusion Inc.

| Repeats every week Thursday and ends after 10 occurrences | FREQ=WEEKLY;INTERVAL=1;BYDAY=TH; COUNT=10 |

| Repeats every week Monday and ends on 12/12/2018 | FREQ=WEEKLY;INTERVAL=1;BYDAY=MO; UNTIL=20181212T041343Z |

| Repeats on Monday, Wednesday and Friday of alternative weeks and ends after 10 occurrences | FREQ=WEEKLY;INTERVAL=2;BYDAY=MO,WE,FR;COUNT=10 |

Monthly Frequency

| Description | Example |

|---|---|

| Monthly recurring event that repeats on every 15th day of a month and never ends | FREQ=MONTHLY; BYMONTHDAY=15;INTERVAL=1 |

| Monthly recurring event that repeats on every 16th day of a month and ends after 10 occurrences | FREQ=MONTHLY;BYMONTHDAY=16;INTERVAL=1;COUNT=10 |

| Repeats every 17th day of a month and ends on 12/12/2018 | FREQ=MONTHLY;BYMONTHDAY=17; INTERVAL=1;UNTIL=20181212T041343Z |

| Repeats every 2nd Friday of a month and never ends | FREQ=MONTHLY;BYDAY=FR;BYSETPOS=2; INTERVAL=1 |

| Repeats every 4th Wednesday of a month and ends after 10 occurrences | FREQ=MONTHLY;BYDAY=WE; BYSETPOS=4;INTERVAL=1;COUNT=10 |

| Repeats every 4th Friday of a month and ends on 12/12/2018 | FREQ=MONTHLY;BYDAY=FR;BYSETPOS=4; INTERVAL=1;UNTIL=20181212T041343Z; |

Yearly Frequency

| Description | Example |

|---|---|

| Yearly event that repeats on every 15th day of December month and never ends | FREQ=YEARLY; BYMONTHDAY=15;BYMONTH=12;INTERVAL=1 |

| Event that repeats on every 10th day of December month and ends after 10 occurrences | FREQ=YEARLY; BYMONTHDAY=10;BYMONTH=12;INTERVAL=1;COUNT=10 |

| Repeats on every 12th day of December month and ends on 12/12/2025 | FREQ=YEARLY;BYMONTHDAY=12; BYMONTH=12;INTERVAL=1;UNTIL=20251212T041343Z |

| Repeats on every 3rd Friday of December month and never ends | FREQ=YEARLY;BYDAY=FR;BYMONTH=12; BYSETPOS=3;INTERVAL=1 |

| Repeats on every 3rd Tuesday of December month and ends after 10 occurrences | FREQ=YEARLY; BYDAY=TU;BYMONTH=12;BYSETPOS=3;INTERVAL=1;COUNT=10 |

| Repeats on every 4th Wednesday of December month and ends on 12/12/2028 | FREQ=YEARLY;BYDAY=WE; BYMONTH=12;BYSETPOS=4;INTERVAL=1;UNTIL=20281212T041343Z |

Recurrence Validation

The built-in validation support has been added by default for recurring appointments during its creation, edit, drag and drop or resize action. The following are the possible validation alerts that displays on Scheduler while creating or editing the recurring events.

| Validation messages | Description |

|-------|---------|

| The recurrence pattern is not valid. | This alert will raise, when the selected recurrence rule value is not a valid one. For example, when you try to select the end date value (using `Until` option) for a recurring event, which occurs before the start date, an alert will popup out saying that the chosen pattern is invalid. |

| The changes made to specific instances of this series will be cancelled and those events will match the series again. | This alert will raise, when you try to edit the whole series, whose occurrence might have been already edited. For example, If there are five occurrences and one of the occurrence is already edited. Now, when you try to edit the entire series, you will get this validation alert. |

| The duration of the event must be shorter than how frequently it occurs. Shorten the duration, or change the recurrence pattern in the recurrence event editor. | This validation will occur, if the event duration is longer than the selected frequency. For example, if you create a recurring appointment with two days duration in `Daily` frequency with no intervals set to it, you may get this alert. |

| Some months have fewer than the selected date. For these months, the occurrence will fall on the last date of the month. | When you try to create a recurring appointment on 31st of every month, where few months won't have 31 days and in this scenario, you will get this alert. |

| Two occurrences of the same event cannot occur on the same day. | This validation will occur, when you try to edit or move any single occurrence to some other date, where another occurrence of the same event is already present. |

Event fields

The Scheduler dataSource usually holds the event instances, where each of the instance includes a collection of appropriate fields. It is mandatory to map these fields with the equivalent fields of database, when remote data is bound to it. When the local JSON data is bound, then the field names defined within the instances needs to be mapped with the scheduler event fields correctly.

To create an event on Scheduler, it is enough to define the `startTime` and `endTime`. Also `id` field becomes mandatory to process CRUD actions on appropriate events.

Built-in fields

The built-in fields available on Scheduler event object are as follows.

| Field name | Description |

|------------------|---------|

| id | The `id` field needs to be defined as mandatory and this field usually assigns a unique ID value to each of the events.|

| subject | The `subject` field is optional, and usually assigns the summary text to each of the events.|

| startTime | The `startTime` field defines the start time of an event and it is mandatory to provide it for any of the valid event objects.|

Copyright © 2001 -2024 Syncfusion Inc.

| endTime | The endTime field defines the end time of an event and it is mandatory to provide the end time for any of the valid event objects.|

| startTimezone | It maps the startTimezone field from the dataSource and usually accepts the valid IANA timezone names. It is assumed that the value provided for this field is taken into consideration while processing the startTime field. When this field is not mapped with any timezone names, then the events will be processed based on the timezone assigned to the Scheduler.|

| endTimezone | It maps the endTimezone field from the dataSource and usually accepts the valid IANA timezone names. It is assumed that the value provided for this field is taken into consideration while processing the endTime field. When this field is not mapped with any timezone names, then the events will be processed based on the timezone assigned to the Scheduler.|

| location | It maps the location field from the dataSource and the location text value will be displayed over the events.|

| description | It maps the description field from the dataSource and denotes the event description which is optional.|

| isAllDay | The isAllDay field is mapped from the dataSource and is used to denote whether an event is created for an entire day or for specific time alone. Usually, an event with isAllDay field set to true will be considered as an all-day event. |

| recurrenceID | It maps the recurrenceID field from dataSource and usually holds the ID value of the parent recurrence event. This field is applicable only for the edited occurrence events.|

| recurrenceRule | It maps the recurrenceRule field from dataSource and holds the recurrence rule value in a string format. Also, it uniquely identifies whether the event belongs to a recurring type or normal ones. |

| recurrenceException | It maps the recurrenceException field from dataSource and is used to hold the collection of exception dates, on which the recurring occurrences needs to be excluded. The recurrenceException should be specified in UTC format. |

| isReadonly | It maps the isReadonly field from dataSource. It is mainly used to make specific appointments as readonly when set to true. |

| isBlock | It maps the isBlock field from dataSource. It is used to block the particular time ranges in the Scheduler and prevents the event creation on those time slots. |

Binding different field names

When the fields of event instances has the default mapping name, it is not mandatory to map them manually. If a Scheduler's dataSource holds the events collection with different field names, then it is necessary to map them with its equivalent field name within the eventSettings property.

{% previewsample "page.domainurl/code-snippet/schedule/event-cs8" %}

The mapper field id is of string type and has no additional validation options, whereas all other fields are of Object type and has additional options.

Event field settings

Each field of the Scheduler events are provided with additional settings such as options to set default value, to map with appropriate data source fields, to validate every event fields and to provide label values for those fields in the event window.

| Options | Description |

|---|---|

| default | Accepts the default value to the applicable fields (Subject, Location and Description), when no values are provided to them from dataSource. |

| name | Accepts the field name to be mapped from the dataSource fields. |

| title | Accepts the label values to be displayed for the fields of event editor. |

| validation | Defines the validation rules to be applied on the event fields within the event editor. |

In following example, the Subject field in event editor will display its appropriate label as **Summary**. When no subject value is provided while saving an event, then the appointment will be saved with the default subject value as **Add Summary**.

APP.VUE

```
<template>
  <div id='app'>

schedule/styles/material.css';
</style>
```

{% previewsample "page.domainurl/code-snippet/schedule/event-cs9" %}

Adding Custom fields

Apart from the default Scheduler fields, the user can include 'n' number of custom fields for appointments. The following code example shows how to include two custom fields namely **Status** and **Priority** within event collection. It is not necessary to bind the custom fields within the eventSettings. However, those additional fields can be accessed easily, for internal processing as well as from application end.

APP.VUE

```
<template>
  <div id='app'>
    <div id='container'>
        <ejs-schedule :height='height' :selectedDate='selectedDate'
:eventSettings='eventSettings'></ejs-schedule>
    </div>
```

```
  </div>
</template>
<script>
import Vue from 'vue';
import { SchedulePlugin, Day, Week, WorkWeek, Month, Agenda } from
'@syncfusion/ej2-vue-schedule';
let data = [{
    Id: 2,
    Subject: 'Meeting',
    StartTime: new Date(2018, 1, 15, 10, 0),
    EndTime: new Date(2018, 1, 15, 12, 30),
    IsAllDay: false,
    Status: 'Completed',
    Priority: 'High'
}];
Vue.use(SchedulePlugin);
export default {
  data (){
    return {
      height: '550px',
      eventSettings: {
        dataSource: data,
        fields: {
            id: 'Id',
            subject: { name: 'Subject' },
            isAllDay: { name: 'IsAllDay' },
            startTime: { name: 'StartTime' },
            endTime: { name: 'EndTime' }
        }
      },
      selectedDate: new Date(2018, 1, 15),
    }
  },
  provide: {
    schedule: [Day, Week, WorkWeek, Month, Agenda]
  }
}
</script>
<style>
  @import '../../node_modules/@syncfusion/ej2-base/styles/material.css';

{% previewsample "page.domainurl/code-snippet/schedule/event-cs10" %}

Customize the order of the overlapping events

By default, the scheduler will render the overlapping events based on the start and end time. Now we can customize the order of the overlapping events based on the custom fields by using the sortComparer property grouped under the eventSettings property. The following code example shows how to sort the appointments based on the custom field as follows.

APP.VUE

```
<template>
  <div id='app'>
    <div id='container'>
        <ejs-schedule :height='height' :selectedDate='selectedDate'
:eventSettings='eventSettings'></ejs-schedule>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { SchedulePlugin, Day, Week, WorkWeek, Month, Agenda,
SortComparerFunction } from '@syncfusion/ej2-vue-schedule';
let data = [{
    Id: 1,
    Subject: 'Rank 1',
    StartTime: new Date(2017, 9, 29, 10, 0),
    EndTime: new Date(2017, 9, 29, 11, 30),
    IsAllDay: false,
    RankId: '1'
}, {
    Id: 2,
    Subject: 'Rank 3',
    StartTime: new Date(2017, 9, 29, 10, 30),
    EndTime: new Date(2017, 9, 29, 12, 30),
    IsAllDay: false,
    RankId: '3'
}, {
    Id: 3,
    Subject: 'Rank 6',
    StartTime: new Date(2017, 9, 29, 7, 0),
    EndTime: new Date(2017, 9, 29, 14, 30),
    IsAllDay: false,
    RankId: '6'
}, {
    Id: 4,
    Subject: 'Rank 9',
    StartTime: new Date(2017, 9, 29, 11, 0),
    EndTime: new Date(2017, 9, 29, 15, 30),
    IsAllDay: false,
    RankId: '9'
}];
let comparerFun = (args) => {
  args.sort((event1, event2) => event1.RankId.localeCompare(event2.RankId,
undefined, { numeric: true }));
  return args;
}
Vue.use(SchedulePlugin);
```

Copyright © 2001 -2024 Syncfusion Inc.

```
export default {
  data (){
    return {
      height: '550px',
      eventSettings: {
        dataSource: data,
        sortComparer: comparerFun
      },
      selectedDate: new Date(2017, 9, 29),
    }
  },

{% previewsample "page.domainurl/code-snippet/schedule/event-cs11" %}

Drag and drop appointments

Appointments can be rescheduled to any time by dragging and dropping them onto the desired location. To work with drag and drop functionality, it is necessary to inject the module DragAndDrop and make sure that allowDragAndDrop is set to true on Scheduler. In mobile mode, you can drag and drop the events by tap holding an event and dropping them on to the desired location.

By default, drag and drop action is applicable on all Scheduler views, except Agenda, Month-Agenda and Year view.

APP.VUE

```
<template>
  <div id='app'>
    <div id='container'>
        <ejs-schedule :height='height' :width='width'
:selectedDate='selectedDate' :views='views'
:eventSettings='eventSettings'></ejs-schedule>
    </div>
  </div>
</template>

Drag and drop multiple appointments

We can drag and drop multiple appointments by enabling the allowMultiDrag property. We can select multiple appointments by holding the CTRL key. Once the events are selected, we can leave the CTRL key and start dragging the event.

We can also drag multiple events from one resource to another resource. In this case, if all the selected events are in the different resources, then all the events should be moved to the single resource that is related to the target event.

Note: Multiple events drag and drop is not supported on mobile devices.

APP.VUE

```
<template>
```

```
  <div id='app'>
    <div id='container'>
        <ejs-schedule :height='height' :selectedDate='selectedDate'

Disable the drag action

By default, you can drag and drop the events within any of the applicable scheduler views, and to disable it, set `false` to the allowDragAndDrop property.

APP.VUE

```
<template>
  <div id='app'>
```

```
    <div id='container'>
        <ejs-schedule :height='height' :selectedDate='selectedDate'
:allowDragAndDrop='allowDragAndDrop' :eventSettings='eventSettings'></ejs-
schedule>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { SchedulePlugin, Day, Week, WorkWeek, Month, Agenda, DragAndDrop }
from '@syncfusion/ej2-vue-schedule';
import { scheduleData } from './datasource.js';
Vue.use(SchedulePlugin);
export default {
  data (){
    return {
      height: '550px',
      allowDragAndDrop: false,
      eventSettings: { dataSource: scheduleData },
      selectedDate: new Date(2018, 1, 15),
    }
  },
  provide: {
    schedule: [Day, Week, WorkWeek, Month, Agenda, DragAndDrop]
  }
}
</script>

```

{% previewsample "page.domainurl/code-snippet/schedule/event-cs14" %}

Preventing drag and drop on specific targets

It is possible to prevent the drag action on particular target, by passing the target to be excluded in the excludeSelectors option within dragStart event. In this example, we have prevented the drag action on all-day row.

APP.VUE

```
<template>
  <div id='app'>
```

```
    <div id='container'>
        <ejs-schedule :height='height' :selectedDate='selectedDate'
:eventSettings='eventSettings' :dragStart='onDragStart'></ejs-schedule>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { SchedulePlugin, Day, Week, WorkWeek, Month, Agenda, DragAndDrop }
from '@syncfusion/ej2-vue-schedule';
import { scheduleData } from './datasource.js';
Vue.use(SchedulePlugin);
export default {
  data (){
    return {
      height: '550px',
      eventSettings: { dataSource: scheduleData },
      selectedDate: new Date(2018, 1, 15),
    }
  },
  methods: {
    onDragStart: function(args) {
        args.excludeSelectors = 'e-header-cells,e-header-day,e-header-
date,e-all-day-cells';
    }
  },
  provide: {
    schedule: [Day, Week, WorkWeek, Month, Agenda, DragAndDrop]
  }
}
</script>
<style>

</style>
```

{% previewsample "page.domainurl/code-snippet/schedule/event-cs15" %}

Disable scrolling on drag action

By default, while dragging an appointment to the edges, either top/bottom in the vertical Scheduler or left/right in the timeline Scheduler, scrolling action takes place automatically. To prevent this scrolling, set `false` to the `scroll` value within the dragStart event arguments.

Auto navigation of date ranges on dragging an event

When an event is dragged either to the left or right extreme edges of the Scheduler and kept hold for few seconds without dropping, the auto navigation of date ranges will be enabled allowing the Scheduler to navigate from current date range to back and forth respectively. This action is set to `false` by default and to enable it, you need to set `navigation` to true within the dragStart event.

By default, the navigation delay is set to 2000ms. The navigation delay decides how long the user needs to drag and hold the appointments at the extremities. You can also set your own delay value for letting the users to navigate based on it, using the `timeDelay` within the `dragStart` event.

APP.VUE

```

Drag and drop items from external source

It is possible to drag and drop the unplanned items from any of the external source into the scheduler, by manually saving those dropped item as a new appointment data through Link to the Video method of Scheduler.

Visit this video to find out more about drag and drop events from an external source into the Vue Scheduler:

In this example, we have used the tree view control as an external source and the child nodes from the tree view component are dragged and dropped onto the Scheduler. Therefore, it is necessary to make use of the nodeDragStop event of the TreeView component, where we can form an event object and save it using the addEvent method.

Opening the editor window on drag stop

There are scenarios where you want to open the editor filled with data on newly dropped location and may need to proceed to save it, only when Save button is clicked on the editor. On clicking the cancel button should revert these changes. This can be achieved using the dragStop event of Scheduler.

APP.VUE

```
<template>
  <div id='app'>
    <div id='container'>
        <ejs-schedule ref='scheduleObj' :height='height'
:selectedDate='selectedDate' :eventSettings='eventSettings'
:dragStop='onDragStop'></ejs-schedule>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { SchedulePlugin, Day, Week, WorkWeek, Month, Agenda, DragAndDrop }
from '@syncfusion/ej2-vue-schedule';
import { scheduleData } from './datasource.js';
Vue.use(SchedulePlugin);
export default {
  data (){
    return {
      height: '550px',
      eventSettings: { dataSource: scheduleData },
      selectedDate: new Date(2018, 1, 15),
```

```
    }
  },
  methods: {
    onDragStop: function(args) {
        args.cancel = true; //cancels the drop action
        this.$refs.scheduleObj.ej2Instances.openEditor(args.data, 'Save');
//open the event window with updated start and end time
    }
  },
  provide: {
    schedule: [Day, Week, WorkWeek, Month, Agenda, DragAndDrop]
  }
}

```

{% previewsample "page.domainurl/code-snippet/schedule/event-cs20" %}

Inline Appointment

In Scheduler, another easier way for adding or editing the appointment's subject alone can be achieved by using the inline Add/Edit support. It allows the user to add and edit the appointments inline. To get familiar with the inline Add mode, single click on any of the Scheduler cells or press enter key on the selected cells.

When the inline adding mode is ON, a text box will get created within the clicked Scheduler cells with a blinking cursor in it, requiring the user to enter the subject of an appointment. Once the subject is entered, the appointment will be saved on pressing the enter key.

To enable the inline edit mode, single click on any of the existing appointment's subject, so that the user can edit the subject of that appointment. The edited subject of that appointment will be updated on pressing the enter key.

The inline option can be enabled/disabled on the Scheduler by using the allowInline API, whereas its default value is set to false.

While using the allowInline the showQuickInfo will be turned off. The quickPopup will not show on clicking the work cell or clicking the appointment when the allowInline property is set to true.

Copyright © 2001 -2024 Syncfusion Inc.

In work cells, select multiple cells using keyboard, and then press enter key. The appointment wrapper will be created, and focus will be on the subject field. Also, consider the overlapping scenarios when creating an inline event.

Normal Event

While editing appointments, single-click the appointment subject, the editable option will be enabled in UI and the cursor will focus at the end of the text. Inline editing will be considered for all possible views.

Recurrence Event

While editing the occurrence from the recurrence series, it is only possible to edit a single occurrence, not an entire series.

APP.VUE

```
<template>
    <div id='app'>
        <ejs-schedule height='550px' :selectedDate='selectedDate'
:eventSettings='eventSettings' :allowInline='allowInline'
:currentView='currentView'>
        </ejs-schedule>
    </div>
</template>
<script>
  import Vue from 'vue';
  import { scheduleData } from './datasource.js';
  import { SchedulePlugin, Day, WorkWeek, Agenda, Month, Week } from
'@syncfusion/ej2-vue-schedule';
  Vue.use(SchedulePlugin);
  export default {
    data () {
      return {
        selectedDate: new Date(2018, 1, 17),
        allowInline: true,
        eventSettings: { dataSource: scheduleData },
        currentView: 'Month',
      }
    },
    provide: {
      schedule: [Day, WorkWeek, Agenda, Month, Week]
    }
  }
</script>
```

{% previewsample "page.domainurl/code-snippet/schedule/event-cs21" %}

Appointment Resizing

Another way of rescheduling an appointment can be done by resizing it through either of its handlers. To work with resizing functionality, it is necessary to inject the module Resize and make sure that allowResizing property is set to true.

APP.VUE

```
<template>
  <div id='app'>
    <div id='container'>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
        <ejs-schedule :height='height' :selectedDate='selectedDate'
:eventSettings='eventSettings'></ejs-schedule>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { SchedulePlugin, Day, Week, WorkWeek, Month, Agenda, Resize } from
'@syncfusion/ej2-vue-schedule';
import { scheduleData } from './datasource.js';
Vue.use(SchedulePlugin);
export default {
  data (){
    return {
      height: '550px',
      eventSettings: { dataSource: scheduleData },
      selectedDate: new Date(2018, 1, 15),
    }
  },
  provide: {
    schedule: [Day, Week, WorkWeek, Month, Agenda, Resize]
  }
}
</script>
<style>
  @import '../../node_modules/@syncfusion/ej2-base/styles/material.css';

schedule/styles/material.css';
</style>
```

{% previewsample "page.domainurl/code-snippet/schedule/event-cs23" %}

Disable scrolling on resize action

By default, while resizing an appointment, when its handler reaches the extreme edges of the Scheduler, scrolling action will takes place along with event resizing. To prevent this scrolling action, set false to `scroll` value within the resizeStart event.

APP.VUE

```
<template>
  <div id='app'>
    <div id='container'>
        <ejs-schedule :height='height' :selectedDate='selectedDate'
:resizeStart='onResizeStart' :eventSettings='eventSettings'></ejs-schedule>
    </div>
```

```
  </div>
</template>
<script>
import Vue from 'vue';
import { SchedulePlugin, Day, Week, WorkWeek, Month, Agenda, Resize } from
'@syncfusion/ej2-vue-schedule';
import { scheduleData } from './datasource.js';
Vue.use(SchedulePlugin);
export default {
  data (){
    return {
      height: '550px',
      eventSettings: { dataSource: scheduleData },
      selectedDate: new Date(2018, 1, 15),
    }
  },
  methods: {
    onResizeStart: function(args) {
      args.scroll = { enable: false };
    }
  },
  provide: {
    schedule: [Day, Week, WorkWeek, Month, Agenda, Resize]
  }
}
</script>
<style>
  @import '../../node_modules/@syncfusion/ej2-base/styles/material.css';
  @import '../../node_modules/@syncfusion/ej2-vue-

  @import '../../node_modules/@syncfusion/ej2-vue-
schedule/styles/material.css';
</style>
```

{% previewsample "page.domainurl/code-snippet/schedule/event-cs24" %}

Controlling scroll speed while resizing an event

The speed of the scrolling action while resizing an appointment to the Scheduler edges, can be controlled within the resizeStart event by setting the desired value to the scrollBy option.

APP.VUE

```
<template>
  <div id='app'>
    <div id='container'>
```

```
        <ejs-schedule :height='height' :selectedDate='selectedDate'
:resizeStart='onResizeStart' :eventSettings='eventSettings'></ejs-schedule>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { SchedulePlugin, Day, Week, WorkWeek, Month, Agenda, Resize } from
'@syncfusion/ej2-vue-schedule';
import { scheduleData } from './datasource.js';
Vue.use(SchedulePlugin);
export default {
  data (){
    return {
      height: '550px',
      eventSettings: { dataSource: scheduleData },
      selectedDate: new Date(2018, 1, 15),
    }
  },
  methods: {
    onResizeStart: function(args) {
      args.scroll = { enable: true, scrollBy: 15 };
    }
  },
  provide: {
    schedule: [Day, Week, WorkWeek, Month, Agenda, Resize]
  }
}
</script>
<style>
  @import '../../node_modules/@syncfusion/ej2-base/styles/material.css';

  @import '../../node_modules/@syncfusion/ej2-vue-
schedule/styles/material.css';
</style>
```

{% previewsample "page.domainurl/code-snippet/schedule/event-cs25" %}

Setting resize time interval

By default, while resizing an appointment, it extends or shrinks at an interval of 30 minutes. To change this default resize interval, set appropriate values to interval option within the resizeStart event.

APP.VUE

```
<template>
```

```
  <div id='app'>
    <div id='container'>
        <ejs-schedule :height='height' :selectedDate='selectedDate'
:resizeStart='onResizeStart' :eventSettings='eventSettings'></ejs-schedule>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { SchedulePlugin, Day, Week, WorkWeek, Month, Agenda, Resize } from
'@syncfusion/ej2-vue-schedule';
import { scheduleData } from './datasource.js';
Vue.use(SchedulePlugin);
export default {
  data (){
    return {
      height: '550px',
      eventSettings: { dataSource: scheduleData },
      selectedDate: new Date(2018, 1, 15),
    }
  },
  methods: {
    onResizeStart: function(args) {
      args.interval = 10; //resize interval time is changed to 10 minutes
    }
  },
  provide: {
    schedule: [Day, Week, WorkWeek, Month, Agenda, Resize]
  }
}
</script>
<style>
  @import '../../node_modules/@syncfusion/ej2-base/styles/material.css';

</style>
```

{% previewsample "page.domainurl/code-snippet/schedule/event-cs26" %}

Appointment customization

The look and feel of the Scheduler events can be customized using any one of the following ways.

- Using event template

- Using eventRendered event
- Using custom CSS class

Using template

Any kind of text, images and links can be added to customize the look of the events. The user can format and change the default appearance of the events by making use of the template option available within the Link to the Video property.

Check out the following video to learn how to customise events using templates in the Vue Scheduler:

The following code example customizes the appointment's default color and time format.

APP.VUE

```
<template>
  <div id='app'>
    <div id='container'>
        <ejs-schedule :height='height' :width='width'
:selectedDate='selectedDate'
        readonly='true' :eventSettings='eventSettings'></ejs-schedule>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { Internationalization } from '@syncfusion/ej2-base';
import { SchedulePlugin, Day, Week, WorkWeek, Month, Agenda } from
'@syncfusion/ej2-vue-schedule';
import { webinarData } from './datasource.js';
Vue.use(SchedulePlugin);
var instance = new Internationalization();
var eventTemplateVue = Vue.component('eventTemplate', {
  template:`<div class='template-wrap' :style='{background:
data.SecondaryColor}'>
        <div class='subject'
:style='{background:data.PrimaryColor}'>{{data.Subject}}</div>
        <div class='time' :style='{background:data.PrimaryColor}'>Time:
{{getTimeString(data.StartTime)}} -
{{getTimeString(data.EndTime)}}</div></div>`,
  data() {
    return {
      data: {}
    };
  },
  methods: {
    getTimeString: function (value) {
      return instance.formatDate(value, { skeleton: 'hm' });
    }
  }
});
export default {
  data (){
    return {
      height: '550px',
      width: '100%',
      eventSettings: {
```

```
        dataSource: webinarData,
        template: function (e) {
          return {
            template: eventTemplateVue
          };
        }
      },
      selectedDate: new Date(2018, 1, 15),
    }
  },
  provide: {
    schedule: [Day, Week, WorkWeek, Month, Agenda]
  }
}
</script>
<style>
  @import '../../node_modules/@syncfusion/ej2-base/styles/material.css';

```
</style>
```

{% previewsample "page.domainurl/code-snippet/schedule/event-template-cs1" %}

All the built-in fields that are mapped to the appropriate field properties within the eventSettings, as well as custom mapped fields from the Scheduler dataSource can be accessed within the template code.

Using eventRendered event

The eventRendered event triggers before the appointment renders on the Scheduler. Therefore, this client-side event can be utilized to customize the look of events based on any specific criteria, before rendering them on the scheduler.

APP.VUE

```
<template>
  <div id='app'>
    <div id='container'>
        <ejs-schedule :height='height' :width='width'
:selectedDate='selectedDate' :views='views' cssClass= 'custom-class'
:eventSettings='eventSettings' :eventRendered='onEventRendered'></ejs-
schedule>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { SchedulePlugin, Day, Week, WorkWeek, Month, Agenda } from
'@syncfusion/ej2-vue-schedule';
import { scheduleData } from './datasource.js';
Vue.use(SchedulePlugin);
export default {
  data (){
    return {
      height: '550px',
      width: '100%',
      views: ['Day', 'Week', 'WorkWeek', 'Month', 'Agenda'],
      eventSettings: {
        dataSource: scheduleData
      },
      selectedDate: new Date(2018, 1, 15),
    }
  },
  methods:{
    onEventRendered: function(args) {
      let categoryColor = args.data.CategoryColor;
      if (!args.element || !categoryColor) {
          return;
      }
      if (this.currentView === 'Agenda') {
          args.element.firstChild.style.borderLeftColor = categoryColor;
      } else {
          args.element.style.backgroundColor = categoryColor;
      }
    }
  },
  provide: {
```

```
    schedule: [Day, Week, WorkWeek, Month, Agenda]
  }
}
</script>
<style>
  @import '../../node_modules/@syncfusion/ej2-base/styles/material.css';
  @import '../../node_modules/@syncfusion/ej2-vue-
buttons/styles/material.css';
  @import '../../node_modules/@syncfusion/ej2-vue-
calendars/styles/material.css';
  @import '../../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css';
  @import '../../node_modules/@syncfusion/ej2-vue-
inputs/styles/material.css';
  @import '../../node_modules/@syncfusion/ej2-vue-
navigations/styles/material.css';
  @import '../../node_modules/@syncfusion/ej2-vue-
popups/styles/material.css';
  @import '../../node_modules/@syncfusion/ej2-vue-
schedule/styles/material.css';
</style>
```

{% previewsample "page.domainurl/code-snippet/schedule/event-cs27" %}

Using cssClass

The customization of events can also be achieved using cssClass property of the Scheduler. In the following example, the background of appointments has been changed using the cssClass.

APP.VUE

```
<template>
  <div id='app'>
    <div id='container'>
        <ejs-schedule :height='height' :width='width'
:selectedDate='selectedDate' :views='views' cssClass= 'custom-class'
:eventSettings='eventSettings'></ejs-schedule>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { SchedulePlugin, Day, Week, WorkWeek, Month, Agenda } from
'@syncfusion/ej2-vue-schedule';
import { scheduleData } from './datasource.js';
Vue.use(SchedulePlugin);
export default {
  data (){
    return {
      height: '550px',

Setting minimum height

It is possible to set minimal height for appointments on Scheduler using `eventRendered` event, when its start and end time duration is less than the default duration of a single slot.

APP.VUE

```
<template>
  <div id='app'>
    <div id='container'>
        <ejs-schedule ref='scheduleObj' :height='height' :width='width'
:selectedDate='selectedDate' :views='views' :eventSettings='eventSettings'
:eventRendered='onEventRendered'></ejs-schedule>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { SchedulePlugin, Day, Week, WorkWeek, Month } from '@syncfusion/ej2-
vue-schedule';
Vue.use(SchedulePlugin);
var data = [{
        Id: 13,
        Subject: 'Myths of Andromeda Galaxy',
        StartTime: new Date(2018, 1, 16, 10, 30),
```

Block Dates and Times

It is possible to block a set of dates or a particular time ranges on the Scheduler. To do so, define an appointment object within eventSettings along with the required time range to block and set the isBlock field to true. Usually, the event objects defined with isBlock field set to true will block the entire time cells lying within the appropriate time ranges specified through startTime and endTime fields.

APP.VUE

```
<template>
  <div id='app'>
    <div id='container'>
        <ejs-schedule :height='height' :width='width'
:selectedDate='selectedDate' :views='views'
:eventSettings='eventSettings'></ejs-schedule>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { SchedulePlugin, Day, Week, TimelineViews, Month, Agenda, Resize,
DragAndDrop } from '@syncfusion/ej2-vue-schedule';
import { blockData } from './datasource.js';
Vue.use(SchedulePlugin);
export default {
  data (){
    return {
      height: '550px',
      width: '100%',
      views: ['Day', 'Week', 'TimelineWeek', 'Month', 'Agenda'],
      eventSettings: {
        dataSource: blockData
      },
      selectedDate: new Date(2018, 1, 15),
    }

{% previewsample "page.domainurl/code-snippet/schedule/event-cs31" %}

Readonly

An interaction with the appointments of Scheduler can be enabled/disabled using the `readonly property. With this property enabled, you can simply navigate between the Scheduler dates, views and can be able to view the appointment details in the quick info window. Most importantly, the users are not allowed to perform any CRUD actions on Scheduler, when this property is set to true. By default, it is set as false`.

APP.VUE

```
<template>
  <div id='app'>
    <div id='container'>
        <ejs-schedule :height='height' :width='width'
:selectedDate='selectedDate' readonly='true'
:eventSettings='eventSettings'></ejs-schedule>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { SchedulePlugin, Day, Week, WorkWeek, Month, Agenda } from
'@syncfusion/ej2-vue-schedule';
import { scheduleData } from './datasource.js';
Vue.use(SchedulePlugin);
export default {
  data (){
    return {
      height: '550px',
      width: '100%',
      eventSettings: {
        dataSource: scheduleData
      },
      selectedDate: new Date(2018, 1, 15),
    }
  },
  provide: {
    schedule: [Day, Week, WorkWeek, Month, Agenda]
  }
}

{% previewsample "page.domainurl/code-snippet/schedule/event-cs32" %}

Make specific events readonly

There are scenarios where you need to restrict the CRUD action on specific appointments alone based on certain conditions. In the following example, the events that has occurred on the past hours from the current date of the Scheduler are made as read-only and the CRUD actions has been prevented only on those appointments. This can be achieved by setting isReadonly field of read-only events to true.

APP.VUE

```
<template>
  <div id='app'>
    <div id='container'>
        <ejs-schedule :height='height' :width='width'
:selectedDate='selectedDate' :views='views'
:eventSettings='eventSettings'></ejs-schedule>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { SchedulePlugin, Day, Week, WorkWeek } from '@syncfusion/ej2-vue-
schedule';
import { readonlyData } from './datasource.js';
Vue.use(SchedulePlugin);
export default {
  data (){
    return {
      height: '550px',
      width: '100%',
      views: ['Day','Week','WorkWeek'],
      eventSettings: {
        dataSource: readonlyData
      },
      selectedDate: new Date(2018, 1, 15),
    }
```

Copyright © 2001 -2024 Syncfusion Inc.

```
  },
  provide: {
    schedule: [Day, Week, WorkWeek]
  }
}
</script>
<style>
  @import '../../node_modules/@syncfusion/ej2-base/styles/material.css';
  @import '../../node_modules/@syncfusion/ej2-vue-
buttons/styles/material.css';
  @import '../../node_modules/@syncfusion/ej2-vue-
calendars/styles/material.css';
  @import '../../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css';
  @import '../../node_modules/@syncfusion/ej2-vue-
inputs/styles/material.css';
  @import '../../node_modules/@syncfusion/ej2-vue-
navigations/styles/material.css';
  @import '../../node_modules/@syncfusion/ej2-vue-
popups/styles/material.css';
  @import '../../node_modules/@syncfusion/ej2-vue-
schedule/styles/material.css';
</style>
```

{% previewsample "page.domainurl/code-snippet/schedule/event-cs33" %}

By default, the event editor is prevented to open on the read-only events when isReadonly field is set to true.

Restricting event creation on specific time slots

You can restrict the users to create and update more than one appointment on specific time slots. Also, you can disable the CRUD action on those time slots if it is already occupied, which can be achieved using Scheduler's public method isSlotAvailable.

Note: The **isSlotAvailable** is centered around verifying appointments within the present view's date range. Yet, it does not encompass an evaluation of availability for recurrence occurrences that fall beyond this particular date range.

APP.VUE

```
<template>
  <div id='app'>
    <div id='container'>
        <ejs-schedule ref='scheduleObj' :height='height' :width='width'
:selectedDate='selectedDate' :views='views' :currentView='currentView'
:eventSettings='eventSettings' :actionBegin='onActionBegin'></ejs-schedule>
    </div>
  </div>
</template>
<script>

Appointments occupying entire cell

The Scheduler allows the event to occupies the full height of the cell without its header part by setting `true` for `enableMaxHeight` Property.

We can show more indicator if more than one appointment is available in a same cell by setting `true` to `enableIndicator` property whereas its default value is false.

APP.VUE

How to limit maximum number of events to display

In the Scheduler, the default behavior is to display concurrent events based on cell height, with each new event represented as

+n more characters. However, you may want to improve the quality of the presentation by limiting the number of concurrent events. This can be accomplished by using the maxEventsPerRow property, which is defaulted to the views property.

The maxEventsPerRow property is specific to the month, timeline month, and timeline year views, allowing you to view events visually in these rows. Below is a code example that demonstrates how to use this constraint and the events displayed in a cell have been created:

APP.VUE

```
<template>
  <div id='app'>
    <div id='container'>
        <ejs-schedule :height='height' :selectedDate='selectedDate'
:eventSettings='eventSettings'>
          <e-views>
            <e-view option="Month" :maxEventsPerRow='maxEventsPerRow'></e-
view>
          </e-views>
        </ejs-schedule>
    </div>
  </div>
</template>
```

```

{% previewsample "page.domainurl/code-snippet/schedule/max-events-per-row-cs1" %}

The property maxEventsPerRow will be applicable only when rowAutoHeight feature is disabled in the Scheduler.

Display tooltip for appointments

The tooltip shows the Scheduler appointment's information in a formatted style by making use of the tooltip related options.

Show or hide built-in tooltip

The tooltip can be displayed for appointments by setting `true` to the `enableTooltip` option within the eventSettings property.

APP.VUE

```
<template>
```

```
  <div id='app'>
    <div id='container'>
        <ejs-schedule ref='scheduleObj' :height='height' :width='width'
:selectedDate='selectedDate' :views='views'
:eventSettings='eventSettings'></ejs-schedule>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { SchedulePlugin, TimelineViews, Week, WorkWeek, Month, Agenda } from
'@syncfusion/ej2-vue-schedule';
import { scheduleData } from './datasource.js';
Vue.use(SchedulePlugin);
export default {
  data (){
    return {
      height: '550px',
      width: '100%',
      views: ['TimelineDay', 'Week', 'WorkWeek', 'Month', 'Agenda'],
      eventSettings: {
        dataSource: scheduleData,
        enableTooltip: true
      },
      selectedDate: new Date(2018, 1, 15),
    }
  },

{% previewsample "page.domainurl/code-snippet/schedule/event-cs37" %}

Customizing event tooltip using template

After enabling the default tooltip, it is possible to customize the display of needed event information on tooltip by making use of the `tooltipTemplate` option within the eventSettings.

APP.VUE

```
<template>
  <div id='app'>
    <div id='container'>
        <ejs-schedule ref='scheduleObj' :height='height' :width='width'
:selectedDate='selectedDate' :views='views'
:eventSettings='eventSettings'></ejs-schedule>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { SchedulePlugin, TimelineViews, Week, WorkWeek, Month } from
'@syncfusion/ej2-vue-schedule';
import { eventsData } from './datasource.js';
Vue.use(SchedulePlugin);
var eventTooltipTemplateVue = Vue.component('eventTooltipTemplate', {
  template:`<div class='tooltip-wrap'>
        <div class='content-area'><div
class='name'>{{data.Subject}}</></div>
        <div v-if='data.City!== null && data.City!==undefined'
class='city'>{{data.City}}</div>
        <div class='time'>From : {{data.StartTime.toLocaleString()}} </div>
        <div class='time'>To   : {{data.EndTime.toLocaleString()}}
</div></div></div>`,
  data() {
    return {
      data: {}
    };
  }
});
export default {
  data (){
    return {
      height: '550px',
      width: '100%',
      views: ['TimelineDay', 'Week', 'WorkWeek', 'Month'],
      eventSettings: {
        dataSource: eventsData,
        enableTooltip: true,
        tooltipTemplate: function (e) {
          return {
            template: eventTooltipTemplateVue
          };
        }
      },
      selectedDate: new Date(2018, 1, 15),
    }
  },
  provide: {
    schedule: [TimelineViews, Week, WorkWeek, Month]
  }
}
</script>
<style>
  @import '../../node_modules/@syncfusion/ej2-base/styles/material.css';
```

</style>
```

{% previewsample "page.domainurl/code-snippet/schedule/tooltip-cs1" %}

All the field names that are mapped from the Scheduler dataSource to the appropriate field properties such as subject, description, location, startTime and endTime within the eventSettings can be accessed within the template.

Appointment filtering

The appointments can be filtered by passing the predicate value to query option in eventSettings. The following code example shows how to filter and render the selected appointments alone in the Scheduler.

APP.VUE

```
<template>
    <div id='app'>
        <div id='container'>
            <table id='property' title="Filter events">
                <tbody>
                    <tr>
                        <td>
                            <ejs-checkbox ref='confirmedObj'
label='Confirmed' :checked='true' :change='onChange'></ejs-checkbox>
                        </td>
                        <td>
                            <ejs-checkbox ref='requestedObj'
label='Requested' :checked='true' :change='onChange'></ejs-checkbox>
                        </td>
                        <td>
                            <ejs-checkbox ref='newObj' label='New'
:checked='true' :change='onChange'></ejs-checkbox>
                        </td>
                    </tr>
                </tbody>
            </table>
            <ejs-schedule ref='scheduleObj' :height='height' :width='width'
:selectedDate='selectedDate'
            :eventSettings='eventSettings'
:eventRendered='onEventRendered'></ejs-schedule>
        </div>
    </div>
```

{% previewsample "page.domainurl/code-snippet/schedule/event-filter-cs1" %}

Appointment selection

Appointment selection can be done either through mouse or keyboard actions. The selected events in UI will have a box shadow effect around to differentiate it from other appointments.

| Action | Description |

|-------|---------|

| Mouse click or Single tap on appointments | Selects single appointment. |

| Ctrl + [Mouse click] or [Single tap] on appointments | Selects multiple appointments.|

Deleting multiple appointments

With the options available to select multiple appointments, it is also possible to delete the multiple selected appointments simply by pressing the `delete` key. In case of deleting multiple selected occurrences of an event series, only those occurrences will be deleted and not the entire series.

Retrieve event details from the UI of an event

It is possible to access the information about the event fields of an appointment element displayed on the Scheduler UI. This can be achieved by passing an appointment element as argument to the public method `getEventDetails`.

In the following example, the subject of the appointment clicked has been displayed.

APP.VUE

```

Refresh appointments

If your requirement is to simply refresh the appointments instead of refreshing the entire Scheduler elements from your application end, make use of the refreshEvents public method.

`

scheduleObj.refreshEvents();

`

You can refer to our Vue Scheduler feature tour page for its groundbreaking feature representations. You can also explore our Vue Scheduler example to knows how to present and manipulate data.

Copyright © 2001 -2024 Syncfusion Inc.

Data binding in Vue Schedule component

The Scheduler uses DataManager, which supports both RESTful data service binding and JavaScript object array binding. The dataSource property of Scheduler can be assigned either with the instance of DataManager or JavaScript object array collection, as it supports the following two kind of data binding methods:

- Local data
- Remote data

Binding local data

To bind local JSON data to the Scheduler, you can simply assign a JavaScript object array to the dataSource option of the scheduler within the eventSettings property. The JSON object dataSource can also be provided as an instance of DataManager and assigned to the Scheduler dataSource property.

APP.VUE

```
<template>
  <div id='app'>
    <div id='container'>
        <ejs-schedule :height='height' :selectedDate='selectedData'
:eventSettings='eventSettings'></ejs-schedule>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { SchedulePlugin, Day, Week, WorkWeek, Month, Agenda } from
'@syncfusion/ej2-vue-schedule';
Vue.use(SchedulePlugin);
let scheduleData = [{
    Id: 1,
    Subject: 'Explosion of Betelgeuse Star',
    StartTime: new Date(2018, 1, 15, 9, 30),
    EndTime: new Date(2018, 1, 15, 11, 0)
}, {
    Id: 2,
    Subject: 'Thule Air Crash Report',
    StartTime: new Date(2018, 1, 12, 12, 0),
    EndTime: new Date(2018, 1, 12, 14, 0)
}, {
    Id: 3,
    Subject: 'Blue Moon Eclipse',
    StartTime: new Date(2018, 1, 13, 9, 30),
    EndTime: new Date(2018, 1, 13, 11, 0)
}, {
    Id: 4,
    Subject: 'Meteor Showers in 2018',
    StartTime: new Date(2018, 1, 14, 13, 0),
    EndTime: new Date(2018, 1, 14, 14, 30)
}];
export default {
  data (){
    return {
      height: '550px',
```

```
      eventSettings: {
          dataSource: scheduleData
      },
      selectedData: new Date(2018, 1, 15),
    }
  },
  provide: {
    schedule: [Day, Week, WorkWeek, Month, Agenda]
  }

{% previewsample "page.domainurl/code-snippet/schedule/data-bind-cs1" %}

By default, DataManager uses JsonAdaptor for binding local data.

You can also bind different field names to the default event fields as well as include additional custom fields to the event object collection which can be referred here.

Binding remote data

Any kind of remote data services can be bound to the Scheduler. To do so, create an instance of DataManager and provide the service URL to the url option of DataManager and then assign it to the dataSource property within eventSettings.

Using ODataV4Adaptor

ODataV4 is a standardized protocol for creating and consuming data. Refer to the following code example to retrieve the data from ODataV4 service using the DataManager. To connect with ODataV4 service end points, it is necessary to make use of ODataV4Adaptor within DataManager.

APP.VUE

```
<template>
    <div id='app'>
      <div id='container'>
        <ejs-schedule height='550px' :selectedDate='selectedDate'
:eventSettings='eventSettings'
        :readOnly='readOnly'></ejs-schedule>
      </div>
    </div>
</template>
<script>
```

```
    import Vue from 'vue';
    import { DataManager, ODataV4Adaptor, Query } from '@syncfusion/ej2-
data';
    import { SchedulePlugin, Day, Week, WorkWeek, Month, Agenda, View } from
'@syncfusion/ej2-vue-schedule';
    Vue.use(SchedulePlugin);
    let dataManager = new DataManager({
        url:
'https://services.odata.org/V4/Northwind/Northwind.svc/Orders/',
        adaptor: new ODataV4Adaptor(),
        crossDomain: true
    });
    export default {
        data() {
            return {
                selectedDate: new Date(1996, 6, 9),
                readOnly: true,
                eventSettings: { dataSource: dataManager,
                    fields: {
                        id: 'Id',
                        subject: { name: 'ShipName' },
                        location: { name: 'ShipCountry' },
                        description: { name: 'ShipAddress' },
                        startTime: { name: 'OrderDate' },
                        endTime: { name: 'RequiredDate' },

Filter events using the in-built query

To enable server-side filtering operations based on predetermined conditions, the includeFiltersInQuery API can be set to true, this allows the filter query to be constructed using the start date, end date, and recurrence rule which in turn enables the request to be filtered accordingly.

This method greatly improves the component's performance by reducing the data that needs to be transferred to the client side. As a result, the component's efficiency and responsiveness are significantly enhanced, resulting in a better user experience. However, it is important to consider the possibility of longer query strings, which may cause issues with the maximum URL length or server limitations on query string length.

APP.VUE

```
<template>
    <div id='app'>
        <div id='container'>
            <ejs-schedule height='550px' :selectedDate='selectedDate'
:eventSettings='eventSettings'
                :readOnly='readOnly'></ejs-schedule>
        </div>
    </div>
</template>

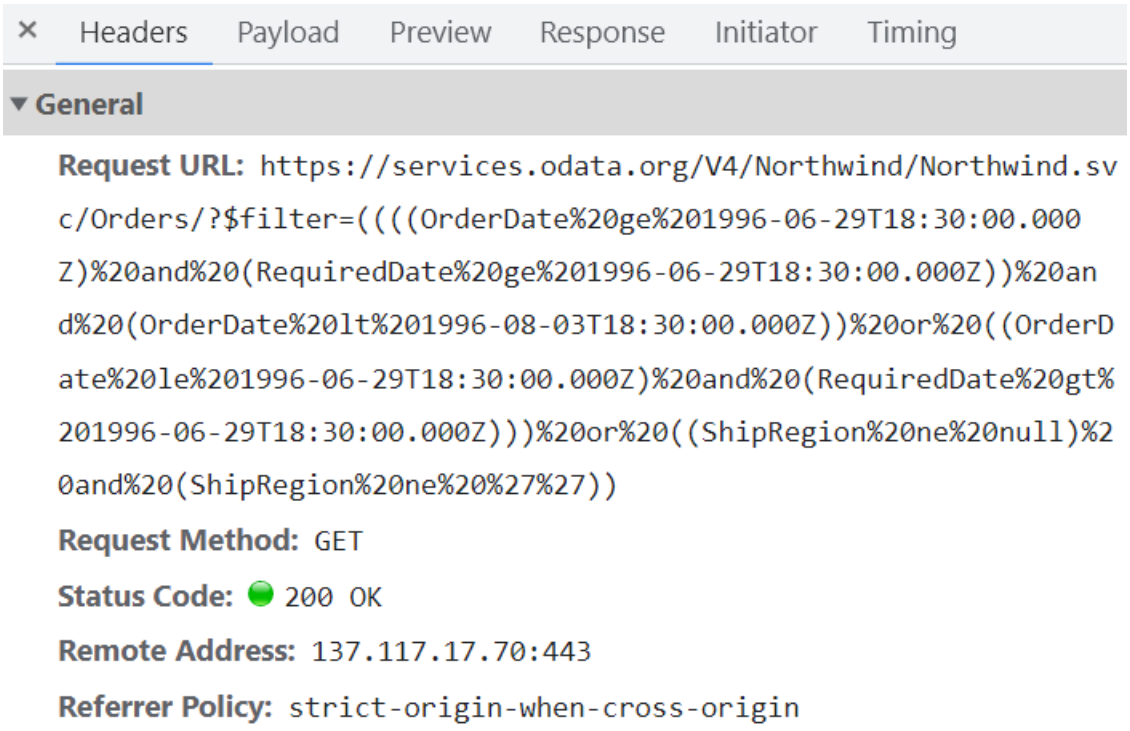
{% previewsample "page.domainurl/code-snippet/schedule/data-bind-cs7" %}

The following image represents how the parameters are passed using ODataV4 filter.



Using custom adaptor

It is possible to create your own custom adaptor by extending the built-in available adaptors. The following example demonstrates the custom adaptor usage and how to add a custom field EventID for the appointments by overriding the built-in response processing using the processResponse method of the ODataV4Adaptor.

APP.VUE

```
<template>
```

```
    <div id='app'>
      <div id='container'>
        <ejs-schedule height='550px' :selectedDate='selectedDate'
:eventSettings='eventSettings' :readOnly='readOnly'></ejs-schedule>
      </div>
    </div>
</template>
<script>
    import Vue from 'vue';
    import { DataManager, ODataV4Adaptor, Query } from '@syncfusion/ej2-
data';
    import { SchedulePlugin, Day, Week, WorkWeek, Month, Agenda, View } from
'@syncfusion/ej2-vue-schedule';
    Vue.use(SchedulePlugin);
    class CustomAdaptor extends ODataV4Adaptor {
        processResponse() {
            let i = 0;
            // calling base class processResponse function
            let original = super.processResponse.apply(this, arguments);
            // adding employee id
            original.forEach((item) => item['EventID'] = ++i);
            return  original;
        }
    }
    let dataManager = new DataManager({
       url: 'https://services.odata.org/V4/Northwind/Northwind.svc/Orders/',
       adaptor: new CustomAdaptor(),
       crossDomain: true
    });
    export default {
        data() {
            return {
                selectedDate: new Date(1996, 6, 9),
                readOnly: true,
                eventSettings: { dataSource: dataManager,
                 fields: {
                        id: 'Id',
                        subject: { name: 'ShipName' },
                        location: { name: 'ShipCountry' },
                        description: { name: 'ShipAddress' },
                        startTime: { name: 'OrderDate' },
                        endTime: { name: 'RequiredDate' },
                        recurrenceRule: { name: 'ShipRegion' }
                    }
                }
            };
        },
        provide: {
            schedule: [Day, Week, WorkWeek, Month, Agenda]
        }
    }

{% previewsample "page.domainurl/code-snippet/schedule/data-bind-cs3" %}

Loading data via AJAX post

You can bind the event data through external ajax request and assign it to the dataSourceproperty of Scheduler. In the following code example, we have retrieved the data from server with the help of ajax request and assigned the resultant data to the dataSource property of Scheduler within the onSuccess event of Ajax.

[src/app/App.vue]

`html

<template>

<ejs-schedule height='550px' :selectedDate='selectedDate'

:eventSettings='eventSettings'></ejs-schedule>

</template>

<script>

import Vue from 'vue';

import { Ajax } from '@syncfusion/ej2-base';

import { SchedulePlugin, Day, Week, WorkWeek, Month, Agenda, View } from '@syncfusion/ej2-vue-schedule';

Vue.use(SchedulePlugin);

let dataManager = [];

let ajax = new Ajax('Home/GetData', 'GET', false);

ajax.onSuccess = function (value) {

dataManager = value;

};

Copyright © 2001 -2024 Syncfusion Inc.

ajax.send();

export default {

data() {

return {

selectedDate: new Date(2017, 5, 11),

eventSettings: { dataSource: dataManager }

};

},

provide: {

schedule: [Day, Week, WorkWeek, Month, Agenda]

}

}

</script>

`

Definition for the controller method GetData can be referred here.

Passing additional parameters to the server

To send an additional custom parameter to the server-side post, you need to make use of the addParams method of Query. Now, assign this Query object with additional parameters to the query property of Scheduler.

APP.VUE

```
<template>
    <div id='app'>
      <div id='container'>
        <ejs-schedule height='550px' :selectedDate='selectedDate'
:eventSettings='eventSettings'
        :readOnly='readOnly'></ejs-schedule>
      </div>
    </div>
</template>
<script>
    import Vue from 'vue';
    import { DataManager, ODataV4Adaptor, Query } from '@syncfusion/ej2-
data';
    import { SchedulePlugin, Day, Week, WorkWeek, Month, Agenda, View } from
'@syncfusion/ej2-vue-schedule';
    Vue.use(SchedulePlugin);
    let dataManager = new DataManager({
        url:
'https://services.odata.org/V4/Northwind/Northwind.svc/Orders/',
        adaptor: new ODataV4Adaptor(),
        crossDomain: true
    });
    let dataQuery = new Query().addParams('readOnly', 'true');
```

```
    export default {
        data() {
            return {
                selectedDate: new Date(1996, 6, 9),
                readOnly: true,
                eventSettings: { dataSource: dataManager, query: dataQuery,
                fields: {
                        id: 'Id',
                        subject: { name: 'ShipName' },
                        location: { name: 'ShipCountry' },
                        description: { name: 'ShipAddress' },
                        startTime: { name: 'OrderDate' },
                        endTime: { name: 'RequiredDate' },
                        recurrenceRule: { name: 'ShipRegion' }
                    }
                }
            };
        },
        provide: {
            schedule: [Day, Week, WorkWeek, Month, Agenda]
        }
    }
</script>
<style>

```

{% previewsample "page.domainurl/code-snippet/schedule/data-bind-cs4" %}

The parameters added using the query property will be sent along with the data request sent to the server on every scheduler actions.

Handling failure actions

During the time of Scheduler interacting with server, there are chances that some server-side exceptions may occur. You can acquire those error messages or exception details in client-side using the actionFailure event of Scheduler.

The argument passed to the actionFailure event contains the error details returned from the server.

APP.VUE

{% previewsample "page.domainurl/code-snippet/schedule/data-bind-cs5" %}

The actionFailure event will be triggered not only on server returning errors, but also when there is an exception while processing any of the Scheduler CRUD actions.

Scheduler CRUD actions

The CRUD (Create, Read, Update and Delete) actions can be performed easily on Scheduler appointments using the various adaptors available within the DataManager. Most preferably, we will be using UrlAdaptor for performing CRUD actions on scheduler appointments.

[src/app/App.vue]

```
`html
<template>
<div id='app'>
<div id='container'>
<ejs-schedule height='550px' :selectedDate='selectedDate'
:eventSettings='eventSettings'></ejs-schedule>
</div>
</div>
</template>
<script>
import Vue from 'vue';
import { SchedulePlugin, Day, Week, WorkWeek, Month, Agenda, View } from '@syncfusion/ej2-vue-schedule';
import { DataManager, UrlAdaptor } from '@syncfusion/ej2-data';
Vue.use(SchedulePlugin);
let dataManager = new DataManager({
url: 'Home/GetData', // 'controller/actions'
crudUrl: 'Home/UpdateData',
adaptor: new UrlAdaptor
});
export default {
data() {
return {
selectedDate: new Date(2017, 5, 11),
eventSettings: { dataSource: dataManager }
```

Copyright © 2001 -2024 Syncfusion Inc.

```
};
},
provide: {
schedule: [Day, Week, WorkWeek, Month, Agenda]
}
}
</script>
`
```

The server-side controller code to handle the CRUD operations are as follows.

```
`c#
using System;
using System.Collections.Generic;
using System.Linq;
using System.Web;
using System.Web.Mvc;
using ScheduleSample.Models;
namespace ScheduleSample.Controllers
{
public class HomeController : Controller
{
ScheduleDataDataContext db = new ScheduleDataDataContext();
public ActionResult Index()
{
return View();
}
public JsonResult LoadData()  // Here we get the Start and End Date and based on that can filter the data and return to Scheduler
{
var data = db.ScheduleEventDatas.ToList();
return Json(data, JsonRequestBehavior.AllowGet);
}
[HttpPost]
public JsonResult UpdateData(EditParams param)
```

```
{
if (param.action == "insert" || (param.action == "batch" && param.added != null)) // this block of code will execute while inserting the appointments
{
var value = (param.action == "insert") ? param.value : param.added[0];
int intMax = db.ScheduleEventDatas.ToList().Count > 0 ? db.ScheduleEventDatas.ToList().Max(p => p.Id) : 1;
DateTime startTime = Convert.ToDateTime(value.StartTime);
DateTime endTime = Convert.ToDateTime(value.EndTime);
ScheduleEventData appointment = new ScheduleEventData()
{
Id = intMax + 1,
StartTime = startTime.ToLocalTime(),
EndTime = endTime.ToLocalTime(),
Subject = value.Subject,
IsAllDay = value.IsAllDay,
StartTimezone = value.StartTimezone,
EndTimezone = value.EndTimezone,
RecurrenceRule = value.RecurrenceRule,
RecurrenceID = value.RecurrenceID,
RecurrenceException = value.RecurrenceException
};
db.ScheduleEventDatas.InsertOnSubmit(appointment);
db.SubmitChanges();
}
if (param.action == "update" || (param.action == "batch" && param.changed != null)) // this block of code will execute while updating the appointment
{
var value = (param.action == "update") ? param.value : param.changed[0];
var filterData = db.ScheduleEventDatas.Where(c => c.Id == Convert.ToInt32(value.Id));
if (filterData.Count() > 0)
{
DateTime startTime = Convert.ToDateTime(value.StartTime);
DateTime endTime = Convert.ToDateTime(value.EndTime);
```

```
ScheduleEventData appointment = db.ScheduleEventDatas.Single(A => A.Id ==
Convert.ToInt32(value.Id));
appointment.StartTime = startTime.ToLocalTime();
appointment.EndTime = endTime.ToLocalTime();
appointment.StartTimezone = value.StartTimezone;
appointment.EndTimezone = value.EndTimezone;
appointment.Subject = value.Subject;
appointment.IsAllDay = value.IsAllDay;
appointment.RecurrenceRule = value.RecurrenceRule;
appointment.RecurrenceID = value.RecurrenceID;
appointment.RecurrenceException = value.RecurrenceException;
}
db.SubmitChanges();
}
if (param.action == "remove" || (param.action == "batch" && param.deleted != null)) // this block of
code will execute while removing the appointment
{
if (param.action == "remove")
{
int key = Convert.ToInt32(param.key);
ScheduleEventData appointment = db.ScheduleEventDatas.Where(c => c.Id == key).FirstOrDefault();
if (appointment != null) db.ScheduleEventDatas.DeleteOnSubmit(appointment);
}
else
{
foreach (var apps in param.deleted)
{
ScheduleEventData appointment = db.ScheduleEventDatas.Where(c => c.Id == apps.Id).FirstOrDefault();
if (appointment != null) db.ScheduleEventDatas.DeleteOnSubmit(appointment);
}
}
db.SubmitChanges();
}
var data = db.ScheduleEventDatas.ToList();
```

Copyright © 2001 -2024 Syncfusion Inc.

```
return Json(data, JsonRequestBehavior.AllowGet);
}
public class EditParams
{
public string key { get; set; }
public string action { get; set; }
public List<ScheduleEventData> added { get; set; }
public List<ScheduleEventData> changed { get; set; }
public List<ScheduleEventData> deleted { get; set; }
public ScheduleEventData value { get; set; }
}
}
}
`
```

Configuring Scheduler with Google API service

We have assigned our custom created Google Calendar url to the DataManager and assigned the same to the Scheduler dataSource. Since the events data retrieved from the Google Calendar will be in its own object format, therefore it needs to be resolved manually within the Scheduler's dataBinding event. Within this event, the event fields needs to be mapped properly and then assigned to the result.

APP.VUE

```
<template>
  <div id='app'>
    <div id='container'>
        <ejs-schedule :height='height' :currentView='currentView'
:readonly='readonly' :eventSettings='eventSettings'
:dataBinding='onDataBinding'></ejs-schedule>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { DataManager, WebApiAdaptor } from '@syncfusion/ej2-data';
import { SchedulePlugin, Day, Week, WorkWeek, Month, Agenda } from
'@syncfusion/ej2-vue-schedule';
Vue.use(SchedulePlugin);
var calendarId = 'en.usa%23holiday@group.v.calendar.google.com';
var publicKey = 'AIzaSyBgbX_tgmVanBP4yafDPPXxWr70sjbKAXM';
var dataManager = new DataManager({

{% previewsample "page.domainurl/code-snippet/schedule/data-bind-cs6" %}

You can refer to our Vue Scheduler feature tour page for its groundbreaking feature representations. You can also explore our Vue Scheduler example to knows how to present and manipulate data.

Crud actions in Vue Schedule component

Events, a.k.a. Appointments, play an important role in Scheduler with which the users mostly interact. You can easily manipulate (add/edit/delete) the desired appointments as and when required either using the editor window or through the drag and resize action.

Add

Any kind of appointments such as normal, all-day, spanned or recurring events can be easily added on Scheduler using any one of the following ways.

- Creation using editor window
- Creation Using addEvent method

Creation using editor window

The default editor window opens when you double click on the Scheduler cells. It provides you with event related options such as Subject, Location, Start and End time, All-day, Timezone, Description and other recurrence options. With these available fields, you can choose to provide detailed information to the events. Once the fields are filled with proper values, enter the Save button to add an event.

In case, if you want to simply provide the Subject alone for appointments, just single click on the required cells which will open the quick popup expecting you to enter subject alone and save it. You can also select multiple cells and press Enter key to open the quick popup for selected time range and save the appointment for that time range.

In case, if you need to add some other additional fields to the editor window, then you can opt for custom editor window which allows you to include fields as per your application needs. If you need to add just one or two additional fields to the existing default editor window, you can do so by defining it manually and then appending it to the editor window.

Creation using addEvent method

The appointments can be created dynamically by using addEvent method. Either you can add a single or a collection of appointment objects using addEvent method. The following code example let you know how to use the addEvent method to create multiple appointments simultaneously.

APP.VUE

```
<template>
    <div id="app">
        <div id="container">
            <tr>
                <td>
                    <div>
                        <ejs-button id="btn1" v-
on:click.native="onAddClick">Add</ejs-button>
                    </div>
                </td>
            </tr>
```

{% previewsample "page.domainurl/code-snippet/schedule/add-event-cs1" %}

Inserting events into database at server-side

While adding the normal or recurring events to the Scheduler, insert action takes place and the following code example describes how to add a new event into database at server side.

`ts

if (param.action == "insert" || (param.action == "batch" && param.added != null)) // this block of code will execute while inserting the appointments

{

var value = (param.action == "insert") ? param.value : param.added[0];

int intMax = db.ScheduleEventDatas.ToList().Count > 0 ? db.ScheduleEventDatas.ToList().Max(p => p.Id) : 1;

DateTime startTime = Convert.ToDateTime(value.StartTime);

DateTime endTime = Convert.ToDateTime(value.EndTime);

ScheduleEventData appointment = new ScheduleEventData()

{

Id = intMax + 1,

StartTime = startTime.ToLocalTime(),

EndTime = endTime.ToLocalTime(),

Subject = value.Subject,

IsAllDay = value.IsAllDay,

StartTimezone = value.StartTimezone,

EndTimezone = value.EndTimezone,

RecurrenceRule = value.RecurrenceRule,

Copyright © 2001 -2024 Syncfusion Inc.

RecurrenceID = value.RecurrenceID,

RecurrenceException = value.RecurrenceException

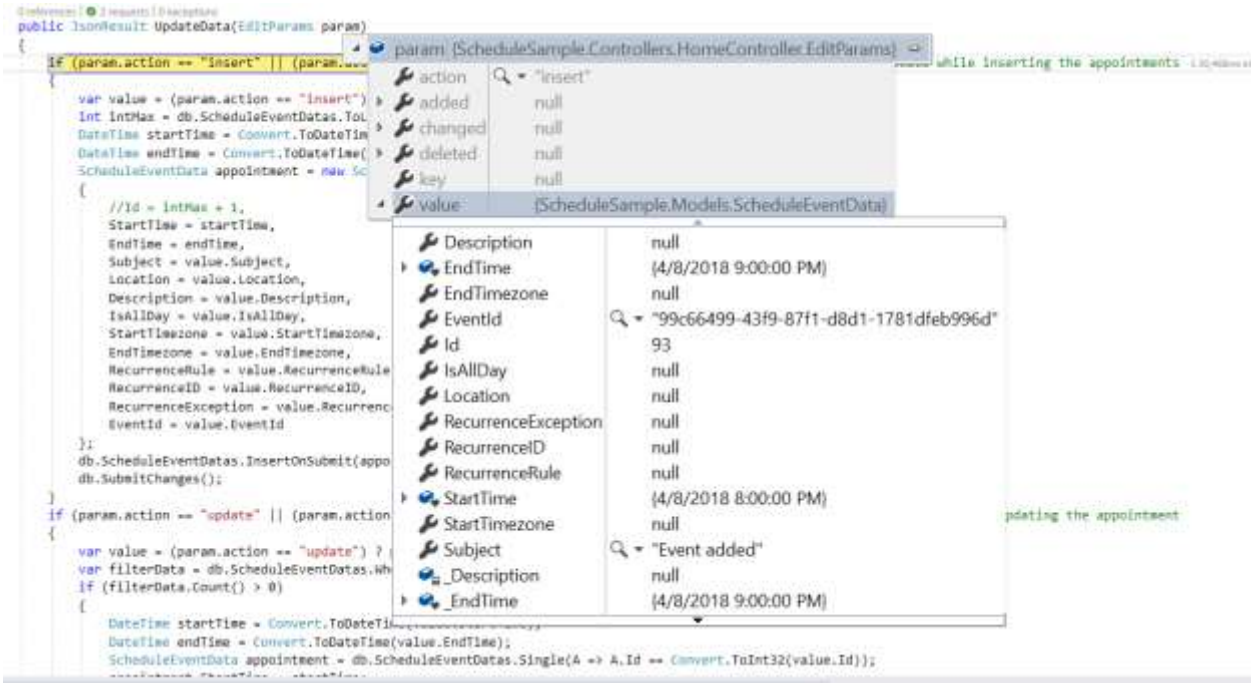
};

db.ScheduleEventDatas.InsertOnSubmit(appointment);

db.SubmitChanges();

}

`



Restricting add action based on specific criteria

In the following example, the specific fields of Scheduler editor window such as Subject and Location are made to undergo validation such that if it is left as blank, then the default Required validation message will be displayed, while clicking on a save button.

Additionally, the regex condition has been added to the Location field, so that if any special characters are typed into it, then the custom validation message will be displayed.

```

{% previewsample "page.domainurl/code-snippet/schedule/default-cs1" %}

You can also dynamically prevent the creation of appointments on Scheduler. For example, say if you want to decline the creation of appointments on weekend days, you can check for its appropriate condition within the actionBegin event.

Edit

The same way the appointments such as normal, all-day, spanned or recurring events are created, it can be easily edited using any of the following ways.

- Update using editor window
- Update using saveEvent method

Update using editor window

You can open the default editor window filled with appointment details by double clicking on the required events. It gets pre-filled with event options such as Subject, Location, Start and End time, All-day, timezone, description and other recurrence options, from which you can edit the desired field values and, then enter the Save button to update it.

You can also single click on appointments, which opens the quick info popup with edit and delete options. Clicking on the edit option will open the default editor filled with event details and delete option will prompt for delete confirmation.

Update using saveEvent method

The appointments can be edited and updated manually using the saveEvent method. The following code examples shows how to edit the normal and recurring events.

Normal event - Here, an event with ID 3 is edited and its subject is changed with a new text. When the modified data object is passed onto the saveEvent method, the changes gets reflected onto the original event. The Id field is mandatory in this edit process, where the modified event object should hold the valid Id value that exists in the Scheduler data source.

{% previewsample "page.domainurl/code-snippet/schedule/edit-event-cs1" %}

Recurring event - The following code example shows how to edit a single occurrence of a recurring event. In this case, the modified data should hold an additional field namely RecurrenceID mapping to its parent recurring event's Id value. Also, this modified occurrence will be considered as a new event in the Scheduler dataSource, where it is linked with its parent event through the RecurrenceID field value. The saveEvent method takes 2 arguments, first one accepting the modified event data object and second argument accepting either of the 2 text values - EditOccurrence or EditSeries.

When the second argument is passed as EditOccurrence, which means that the passed event data is a single modified occurrence - whereas if the second argument is passed as EditSeries, it means that the modified data needs to be edited as a whole series and therefore no new event object will be maintained in the Scheduler dataSource.

In case of modifying the single occurrence, it is also necessary to update the RecurrenceException field of parent event altogether with the occurrence editing. To know more about how to set RecurrenceException values, refer the recurring events topic.

Updating events in database at server-side

While editing the normal events in the Scheduler, update action takes place and the following code example describes how to update event into database at server side.

`ts

```
if (param.action == "update" || (param.action == "batch" && param.changed != null)) // this block of code will execute while updating the appointment
{
var value = (param.action == "update") ? param.value : param.changed[0];
var filterData = db.ScheduleEventDatas.Where(c => c.Id == Convert.ToInt32(value.Id));
if (filterData.Count() > 0)
{
DateTime startTime = Convert.ToDateTime(value.StartTime);
DateTime endTime = Convert.ToDateTime(value.EndTime);
ScheduleEventData appointment = db.ScheduleEventDatas.Single(A => A.Id == Convert.ToInt32(value.Id));
appointment.StartTime = startTime.ToLocalTime();
appointment.EndTime = endTime.ToLocalTime();
appointment.StartTimezone = value.StartTimezone;
appointment.EndTimezone = value.EndTimezone;
appointment.Subject = value.Subject;
appointment.IsAllDay = value.IsAllDay;
appointment.RecurrenceRule = value.RecurrenceRule;
appointment.RecurrenceID = value.RecurrenceID;
appointment.RecurrenceException = value.RecurrenceException;
}
db.SubmitChanges();
}
`
```

How to edit a single occurrence or entire series and update it in database at server-side

The recurring appointments can be edited in either of the following two ways.

- Single occurrence
- Entire series

Editing single occurrence - When you double click on a recurring event, a popup prompts you to choose either to edit the single event or entire series. From this, if you choose to select **EDIT EVENT** option, a single occurrence of the recurring appointment alone will be edited. The following process takes place while editing a single occurrence,

- A new event will be created from the parent event data and added to the Scheduler dataSource, with all its default field values overwritten with the newly modified data and additionally, the `recurrenceID` field will be added to it, that holds the `id` value of the parent recurring event. Also, a new `Id` will be generated for this event in the dataSource.
- The parent recurring event needs to be updated with appropriate `recurrenceException` field to hold the edited occurrence appointment's date collection.

Therefore, when a single occurrence is edited from a recurring event, the batch action takes place by allowing both the `Add` and `Edit` action requests to take place together.

In case, if you edit an existing edited occurrence of a recurring event, only those edited occurrence which present in the database as an individual event object will get updated. In this case, `update` action alone takes place on the edited occurrence object on the database.

`ts

```
if (param.action == "insert" || (param.action == "batch" && param.added != null)) // this block of code will execute while inserting the appointments
{
var value = (param.action == "insert") ? param.value : param.added[0];
int intMax = db.ScheduleEventDatas.ToList().Count > 0 ? db.ScheduleEventDatas.ToList().Max(p => p.Id) : 1;
DateTime startTime = Convert.ToDateTime(value.StartTime);
DateTime endTime = Convert.ToDateTime(value.EndTime);
ScheduleEventData appointment = new ScheduleEventData()
{
Id = intMax + 1,
StartTime = startTime.ToLocalTime(),
EndTime = endTime.ToLocalTime(),
Subject = value.Subject,
IsAllDay = value.IsAllDay,
StartTimezone = value.StartTimezone,
EndTimezone = value.EndTimezone,
RecurrenceRule = value.RecurrenceRule,
RecurrenceID = value.RecurrenceID,
RecurrenceException = value.RecurrenceException
};
db.ScheduleEventDatas.InsertOnSubmit(appointment);
db.SubmitChanges();
}
if (param.action == "update" || (param.action == "batch" && param.changed != null)) // this block of code will execute while updating the appointment
{
var value = (param.action == "update") ? param.value : param.changed[0];
var filterData = db.ScheduleEventDatas.Where(c => c.Id == Convert.ToInt32(value.Id));
if (filterData.Count() > 0)
{
DateTime startTime = Convert.ToDateTime(value.StartTime);
DateTime endTime = Convert.ToDateTime(value.EndTime);
```

```
ScheduleEventData appointment = db.ScheduleEventDatas.Single(A => A.Id ==
Convert.ToInt32(value.Id));

appointment.StartTime = startTime.ToLocalTime();

appointment.EndTime = endTime.ToLocalTime();

appointment.StartTimezone = value.StartTimezone;

appointment.EndTimezone = value.EndTimezone;

appointment.Subject = value.Subject;

appointment.IsAllDay = value.IsAllDay;

appointment.RecurrenceRule = value.RecurrenceRule;

appointment.RecurrenceID = value.RecurrenceID;

appointment.RecurrenceException = value.RecurrenceException;

}

db.SubmitChanges();

}
`
```

Editing entire series - When you select an option **EDIT SERIES** from the popup that opens on double clicking the recurring event, the whole recurring series will be updated with the newly provided value. When this option is chosen explicitly, if a parent event holds any edited occurrences - then all its child occurrences will be removed from the dataSource and simply the single parent data will be updated.

This action of editing entire series also leads to the batch process, as both the `Delete` and `Edit` action takes place together.

```
`ts

if (param.action == "update" || (param.action == "batch" && param.changed != null)) // this block of
code will execute while updating the appointment

{

var value = (param.action == "update") ? param.value : param.changed[0];

var filterData = db.ScheduleEventDatas.Where(c => c.Id == Convert.ToInt32(value.Id));

if (filterData.Count() > 0)

{

DateTime startTime = Convert.ToDateTime(value.StartTime);

DateTime endTime = Convert.ToDateTime(value.EndTime);

ScheduleEventData appointment = db.ScheduleEventDatas.Single(A => A.Id ==
Convert.ToInt32(value.Id));

appointment.StartTime = startTime.ToLocalTime();

appointment.EndTime = endTime.ToLocalTime();
```

Copyright © 2001 -2024 Syncfusion Inc.

```
appointment.StartTimezone = value.StartTimezone;
appointment.EndTimezone = value.EndTimezone;
appointment.Subject = value.Subject;
appointment.IsAllDay = value.IsAllDay;
appointment.RecurrenceRule = value.RecurrenceRule;
appointment.RecurrenceID = value.RecurrenceID;
appointment.RecurrenceException = value.RecurrenceException;
}
db.SubmitChanges();
}
if (param.action == "remove" || (param.action == "batch" && param.deleted != null)) // this block of code will execute while removing the appointment
{
if (param.action == "remove")
{
int key = Convert.ToInt32(param.key);
ScheduleEventData appointment = db.ScheduleEventDatas.Where(c => c.Id == key).FirstOrDefault();
if (appointment != null) db.ScheduleEventDatas.DeleteOnSubmit(appointment);
}
else
{
foreach (var apps in param.deleted)
{
ScheduleEventData appointment = db.ScheduleEventDatas.Where(c => c.Id == apps.Id).FirstOrDefault();
if (appointment != null) db.ScheduleEventDatas.DeleteOnSubmit(appointment);
}
}
db.SubmitChanges();
}
`
```

To know more about handling recurrence exceptions, refer the Adding exceptions topic.

How to edit from the current and following events of a series

The recurring appointments can be edited from current and following events when enable the property `editFollowingEvents`.

Editing Following Events - When you double click on a recurring event, a popup prompts you to choose either to edit the single event or Edit Following Events or entire series. From this, if you choose to select **EDIT FOLLOWING EVENTS** option, a current and following events of the recurring appointment will be edited. The following process takes place while editing a following events,

- A new event will be created from the parent event data and added to the Scheduler dataSource, with all its default field values overwritten with the newly modified data and additionally, the followingID field will be added to it, that holds the id value of the immediate parent recurring event. Also, a new Id will be generated for this event in the dataSource.
- The parent recurring event needs to be updated with appropriate recurrenceRule field to hold the modified occurrence appointment's end date.

Therefore, when a following events are edited from a recurring event, the batch action takes place by allowing the Add, Edit and Delete action requests to take place together.

`ts

```
if (param.action == "insert" || (param.action == "batch" && param.added != null)) // this block of code will execute while inserting the appointments
{
var value = (param.action == "insert") ? param.value : param.added[0];
int intMax = db.ScheduleEventDatas.ToList().Count > 0 ? db.ScheduleEventDatas.ToList().Max(p => p.Id) : 1;
DateTime startTime = Convert.ToDateTime(value.StartTime);
DateTime endTime = Convert.ToDateTime(value.EndTime);
ScheduleEventData appointment = new ScheduleEventData()
{
Id = intMax + 1,
StartTime = startTime.ToLocalTime(),
EndTime = endTime.ToLocalTime(),
Subject = value.Subject,
IsAllDay = value.IsAllDay,
StartTimezone = value.StartTimezone,
EndTimezone = value.EndTimezone,
RecurrenceRule = value.RecurrenceRule,
RecurrenceID = value.RecurrenceID,
FollowingID = value.FollowingID,
RecurrenceException = value.RecurrenceException
};
```

if (appointment != null) db.ScheduleEventDatas.DeleteOnSubmit(appointment);
}
}
db.SubmitChanges();
}
`
```

Restricting edit action based on specific criteria

You can also dynamically prevent the editing of appointments on Scheduler. For example, say if you want to decline the updating of appointments on non-working hours, you can check for its appropriate condition within the actionBegin event.

APP.VUE

```
<template>
    <div id="app">
        <div id="container">
            <ejs-schedule ref='scheduleObj' width="100%" height="550px"

Delete

The appointments can be deleted in either of the following ways,

- Selecting an appointment and clicking the delete icon from the quick popup that opens.
- Selecting an appointment and pressing Delete key.
- Selecting multiple appointments by tap holding an event and then continuously single clicking on other consecutive events and then clicking the Delete key.

Copyright © 2001 -2024 Syncfusion Inc.

- Double clicking on an event which opens the default event editor pre-filled with event details, and then choosing Delete button in it.

While performing all these above mentioned actions, a pop-up with a delete confirmation message will be displayed prompting either to proceed with deleting an appointment.

Deletion using editor window

When you double click an event, the default editor window will be opened which includes a Delete button at the bottom left position to allow you to delete that particular appointment. When deleting an appointment through this editor window, the delete alert confirmation will not be asked and the event will be deleted immediately.

Deletion using deleteEvent method

The appointments can be removed manually using the deleteEvent method. The following code examples shows how to edit the normal and recurring events.

Normal event - You can delete the normal appointments of Scheduler by simply passing its Id value or the entire event object collection to the deleteEvent method.

APP.VUE

```
<template>
    <div id="app">
        <div id="container">
            <tr>
                <td>
                    <div>
                        <ejs-button id="btn1" v-
on:click.native="onDeleteClick">Delete</ejs-button>
                    </div>
                </td>
            </tr>

{% previewsample "page.domainurl/code-snippet/schedule/delete-event-cs2" %}

Removing events from database at server-side

While deleting the event from the Scheduler, remove action takes place and the following code example describes how to delete event from database at server side.

`ts

if (param.action == "remove" || (param.action == "batch" && param.deleted != null)) // this block of code will execute while removing the appointment

{

if (param.action == "remove")

{

int key = Convert.ToInt32(param.key);

ScheduleEventData appointment = db.ScheduleEventDatas.Where(c => c.Id == key).FirstOrDefault();

if (appointment != null) db.ScheduleEventDatas.DeleteOnSubmit(appointment);

}

else

{

foreach (var apps in param.deleted)

{

ScheduleEventData appointment = db.ScheduleEventDatas.Where(c => c.Id == apps.Id).FirstOrDefault();

if (appointment != null) db.ScheduleEventDatas.DeleteOnSubmit(appointment);

}

}

db.SubmitChanges();

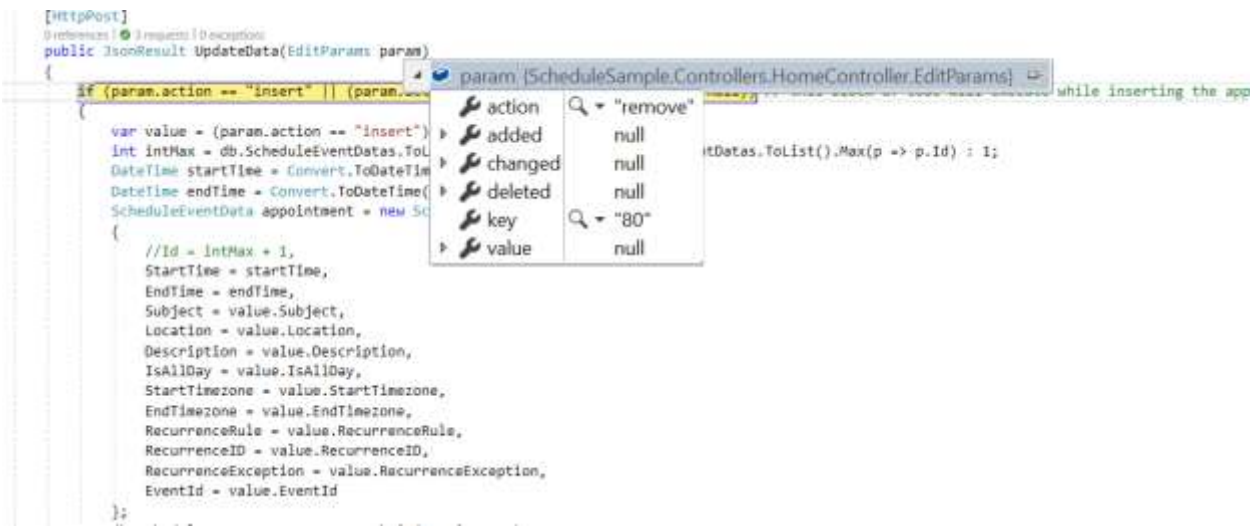
}

`



How to delete a single occurrence or entire series from Scheduler and update it in database at server-side

The recurring events can be deleted in either of the following two ways.

- Single occurrence
- Entire series

Single occurrence - When you attempt to delete the recurring events, a popup prompts you to choose either to delete the single event or entire series. From this, if you choose to select **DELETE EVENT** option, a single occurrence of the recurring appointment alone will be removed. The following process takes place while removing a single occurrence,

- The selected occurrence will be deleted from the Scheduler user interface.
- In code, the parent recurring event object will be updated with appropriate `recurrenceException` field, to hold the deleted occurrence appointment's date collection.

Therefore, when a single occurrence is deleted from a recurring event, the `update` action takes place on the parent recurring event as shown in the following code example.

In case, if you delete an existing edited occurrence of a recurring event, only those edited occurrence which present in the database as an individual event object will get removed. In this case, `delete` action takes place instead of `update` action and the parent recurring event object remains same with no changes.

`ts

if (param.action == "update" || (param.action == "batch" && param.changed != null)) // this block of code will execute while updating the appointment

{

var value = (param.action == "update") ? param.value : param.changed[0];

var filterData = db.ScheduleEventDatas.Where(c => c.Id == Convert.ToInt32(value.Id));

Copyright © 2001 -2024 Syncfusion Inc.

```
if (filterData.Count() > 0)
{
DateTime startTime = Convert.ToDateTime(value.StartTime);
DateTime endTime = Convert.ToDateTime(value.EndTime);
ScheduleEventData appointment = db.ScheduleEventDatas.Single(A => A.Id ==
Convert.ToInt32(value.Id));
appointment.StartTime = startTime.ToLocalTime();
appointment.EndTime = endTime.ToLocalTime();
appointment.StartTimezone = value.StartTimezone;
appointment.EndTimezone = value.EndTimezone;
appointment.Subject = value.Subject;
appointment.IsAllDay = value.IsAllDay;
appointment.RecurrenceRule = value.RecurrenceRule;
appointment.RecurrenceID = value.RecurrenceID;
appointment.RecurrenceException = value.RecurrenceException;
}
db.SubmitChanges();
}
`
```

Entire series - When you select an option **DELETE SERIES** from the popup, the whole recurring series will be deleted. When this option is chosen explicitly, if a parent event holds any edited occurrences - then all its child occurrences which are maintained as separate event objects will also be removed from the dataSource. This action of deleting entire series leads to remove action and removes one or more event objects at the same time.

```ts
if (param.action == "remove" || (param.action == "batch" && param.deleted != null)) // this block of
code will execute while removing the appointment
{
if (param.action == "remove")
{
int key = Convert.ToInt32(param.key);
ScheduleEventData appointment = db.ScheduleEventDatas.Where(c => c.Id == key).FirstOrDefault();
if (appointment != null) db.ScheduleEventDatas.DeleteOnSubmit(appointment);
}
else
```

```
{
foreach (var apps in param.deleted)
{
ScheduleEventData appointment = db.ScheduleEventDatas.Where(c => c.Id == apps.Id).FirstOrDefault();
if (appointment != null) db.ScheduleEventDatas.DeleteOnSubmit(appointment);
}
}
db.SubmitChanges();
}
`
```

How to delete only the current and following events of a series

The recurring events can be deleted from current and following events only when enable `editFollowingEvents` property.

Delete Following Events - When you attempt to delete the recurring events, a popup prompts you to choose either to delete the single event or Following Events or entire series. From this, if you choose to select **FOLLOWING EVENT** option, a current and following events of the recurring appointment alone will be removed. The following process takes place while removing a single occurrence,

- The selected occurrence and the following events in same series will be deleted from the Scheduler user interface.
- In code, the parent recurring event object will be updated with appropriate `recurrenceRule` field, to update the end date of the recurring events.

Therefore, when following events are deleted from a recurring event, the `remove` and `update` action takes place on the immediate parent recurring event as shown in the following code example.

```
`ts
if (param.action == "update" || (param.action == "batch" && param.changed != null)) // this block of code will execute while updating the appointment
{
var value = (param.action == "update") ? param.value : param.changed[0];
var filterData = db.ScheduleEventDatas.Where(c => c.Id == Convert.ToInt32(value.Id));
if (filterData.Count() > 0)
{
DateTime startTime = Convert.ToDateTime(value.StartTime);
DateTime endTime = Convert.ToDateTime(value.EndTime);
ScheduleEventData appointment = db.ScheduleEventDatas.Single(A => A.Id == Convert.ToInt32(value.Id));
appointment.StartTime = startTime.ToLocalTime();
```

Copyright © 2001 -2024 Syncfusion Inc.

```
appointment.EndTime = endTime.ToLocalTime();
appointment.StartTimezone = value.StartTimezone;
appointment.EndTimezone = value.EndTimezone;
appointment.Subject = value.Subject;
appointment.IsAllDay = value.IsAllDay;
appointment.RecurrenceRule = value.RecurrenceRule;
appointment.RecurrenceID = value.RecurrenceID;
appointment.FollowingID = value.FollowingID;
appointment.RecurrenceException = value.RecurrenceException;
}
db.SubmitChanges();
}
if (param.action == "remove" || (param.action == "batch" && param.deleted != null)) // this block of code will execute while removing the appointment
{
if (param.action == "remove")
{
int key = Convert.ToInt32(param.key);
ScheduleEventData appointment = db.ScheduleEventDatas.Where(c => c.Id == key).FirstOrDefault();
if (appointment != null) db.ScheduleEventDatas.DeleteOnSubmit(appointment);
}
else
{
foreach (var apps in param.deleted)
{
ScheduleEventData appointment = db.ScheduleEventDatas.Where(c => c.Id == apps.Id).FirstOrDefault();
if (appointment != null) db.ScheduleEventDatas.DeleteOnSubmit(appointment);
}
}
db.SubmitChanges();
}
`
```

Drag and drop

When you drag and drop a normal event on the Scheduler, the event editing action takes place. When a recurring event is drag and dropped on a desired time range, the batch action explained in Editing a single occurrence process will takes place - thus allowing both the Add and Link to the Video action to take place together.

By default, when you drag a recurring instance, only the occurrence of the event gets edited and not a whole series.

You can watch the following video to learn more about Vue Scheduler's advanced drag and resize options:

APP.VUE

```
<template>
    <div id="app">
        <div id="container">
            <ejs-schedule ref='scheduleObj' id='Schedule' width="100%"
height="550px" :eventSettings='eventSettings' :selectedDate='selectedDate'>

You can refer to our Vue Scheduler feature tour page for its groundbreaking feature representations. You can also explore our Vue Scheduler example to knows how to present and manipulate data.

Virtual scrolling in Vue Schedule component

To achieve better performance in the Scheduler when loading a large number of resources and events, we have added virtual scrolling support load a large set of resources and events instantly as you scroll. You can dynamically load large number of resources and events in the Scheduler by setting true to the allowVirtualScrolling property within the view specific settings. The virtual loading of events is possible in Agenda view, by setting allowVirtualScrolling property to true within the agenda view specific settings.

APP.VUE

```

{% previewsample "page.domainurl/code-snippet/schedule/virtual-scrolling-cs2" %}

For now, the virtual loading of resources and events is not supported in MonthAgenda, Year and TimelineYear (Horizontal Orientation) views.

Enabling lazy loading for appointments

The lazy loading feature provides a convenient way to efficiently load resource appointments into the Scheduler using an on-demand approach. With this feature, you can seamlessly load a large volume of appointment data into the Scheduler without experiencing any performance degradation.

By default, the Scheduler fetches all the relevant appointments from the server with in the current date range. However, enabling this feature will trigger query requests to the server for appointment retrieval whenever new resources are rendered due to scroll actions. These queries contain the resource IDs of currently displayed resources along with current date range, which can be passed as a comma-separated string. In the server controller, these resource IDs are parsed to filter the necessary appointments to render in the scheduler.

When you enable this feature, the Scheduler becomes capable of fetching events from remote services only for the current view port alone to optimize the data retrieval. The remaining appointment data is fetched form the server on-demand based on currently rendered view port resources as you scroll's through the scheduler content.

To enable this feature, you have to set the enableLazyLoading property to true within the view specific settings.

{% previewsample "page.domainurl/code-snippet/schedule/lazy-loading-cs1" %}

Here's the server-side controller code that retrieves appointment data based on the resource IDs provided as query parameters:

```c#
using Microsoft.AspNetCore.Mvc;
using System.Collections.Generic;
using System;
using Microsoft.EntityFrameworkCore;
using System.Linq;
using System.ComponentModel.DataAnnotations;
using Microsoft.AspNetCore.OData.Query;
namespace LazyLoadingServices.Controllers
{
public class VirtualEventDataController : Controller
{
private readonly EventsContext dbContext;
[HttpGet]
[EnableQuery]
[Route("api/VirtualEventData")]
public IActionResult GetData([FromQuery] Params param)
{
IQueryable<EventData> query = dbContext.Events;
// Filter the appointment data based on the ResourceId query params.
if (!string.IsNullOrEmpty(param.ResourceId))
{
string[] resourceId = param.ResourceId.Split(',');
query = query.Where(data => resourceId.Contains(data.ResourceId.ToString()));
}
return Ok(query.ToList());
}
}
public class Params
{
public DateTime? StartDate { get; set; }
public DateTime? EndDate { get; set; }
public string ResourceId { get; set; }
```

}

}

`

Note:

- The property will be effective, when large number of resources and appointments bound to the Scheduler.
- This property is applicable only when resource grouping is enabled in Scheduler.

- Virtual scrolling in Agenda view

You can refer to our Vue Scheduler feature tour page for its groundbreaking feature representations. You can also explore our Vue Scheduler example to knows how to present and manipulate data.

Editor template in Vue Schedule component

Scheduler makes use of popups and dialog to display the required notifications, as well as includes an editor window with event fields for making the appointment creation and editing process easier. You can also easily customize the editor window and the fields present in it, and can also apply validations on those fields.

Event editor

The editor window usually opens on the Scheduler, when a cell or event is double clicked. When a cell is double clicked, the detailed editor window opens in "Add new" mode, whereas when an event is double clicked, the same is opened in an "Edit" mode.

In mobile devices, you can open the detailed editor window in edit mode by clicking the edit icon on the popup, that opens on single tapping an event. You can also open it in add mode by single tapping a cell, which will display a `+` indication, clicking on it again will open the editor window.

You can also prevent the editor window from opening, by rendering Scheduler in a `readonly` mode or by doing code customization within the popupOpen event.

How to change the editor window header title and text of footer buttons

You can change the header title and the text of buttons displayed at the footer of the editor window by changing the appropriate localized word collection used in the Scheduler.

Field validation

It is possible to validate the required fields of the editor window from client-side before submitting it, by adding appropriate validation rules to each field. The appointment fields have been extended to accept both string and object type values. To perform validations, it is necessary to specify object values for the event fields.

APP.VUE

{% previewsample "page.domainurl/code-snippet/schedule/editor-window-cs3" %}

Applicable validation rules can be referred from form validation documentation.

Add additional fields to the default editor

The additional fields can be added to the default event editor by making use of the popupOpen event which gets triggered before the event editor opens on the Scheduler. The popupOpen is a client-side event that triggers before any of the generic popups opens on the Scheduler. The additional field (any of the form elements) should be added with a common class name e-field, so as to handle and process those additional data along with the default event object. In the following example, an additional field Event Type has been added to the default event editor and its value is processed accordingly.

APP.VUE

```
<template>
  <div id='app'>
    <div id='container'>
        <ejs-schedule :height='height' :width='width' :views='views'

Customizing the default time duration in editor window

In default event editor window, start and end time duration are processed based on the interval value set within the timeScale property. By default, interval value is set to 30, and therefore the start/end time duration within the event editor will be in a 30 minutes time difference. You can change this duration value by changing the duration option within the popupOpen event as shown in the following code example.

APP.VUE

In case, if you need to prevent only specific popups on Scheduler, then you can check the condition based on the popup type. The types of the popup that can be checked within the popupOpen event are as follows.

| Type | Description |

|------|-------------|

| Editor | For Detailed editor window.|

| QuickInfo | For Quick popup which opens on cell click.|

| EditEventInfo |For Quick popup which opens on event click.|

| ViewEventInfo | For Quick popup which opens on responsive mode.|

| EventContainer | For more event indicator popup.|

| RecurrenceAlert | For edit recurrence event alert popup.|

| DeleteAlert | For delete confirmation popup.|

Copyright © 2001 -2024 Syncfusion Inc.

| ValidationAlert | For validation alert popup.|

| RecurrenceValidationAlert | For recurrence validation alert popup.|

Customizing timezone collection in the editor window

By default, the timezone collections in the editor window have been loaded with built-in timezone collections. Now we can be able to customize the timezone collections using the timezoneDataSource property with the collection of TimezoneFields data.

APP.VUE

```
<template>
  <div id='app'>
    <div id='container'>
        <ejs-schedule :height='height' :selectedDate='selectedDate' :views =
'views' :eventSettings='eventSettings'
:timezoneDataSource='timezoneDataSource'></ejs-schedule>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import {SchedulePlugin, Day, Week, Month, Agenda } from '@syncfusion/ej2-
vue-schedule';
let data = [{
        Id: 1,
        Subject: 'Explosion of Betelgeuse Star',
        StartTime: new Date(2020, 1, 15, 10, 0),
        EndTime: new Date(2018, 1, 15, 12, 30),
        IsAllDay: false
    },{
        Id: 2,
        Subject: 'Blue Moon Eclipse',
        StartTime: new Date(2020, 1, 16, 12, 0),
        EndTime: new Date(2018, 1, 16, 13, 0),
        IsAllDay: false
    }];
Vue.use(SchedulePlugin);
export default {
  data (){
    return {
      height: '550px',
      views: ['Day', 'Week', 'Month', 'Agenda'],
      eventSettings: {dataSource: data},

Customizing event editor using template

The event editor window can be customized by making use of the editorTemplate option. Here, the custom window design is built with the required fields using the script template and its type should be of **text/x-template**.

Each field defined within template should contain the **e-field** class, so as to allow the processing of those field values internally. The ID of this customized script template section is assigned to the editorTemplate option, so that these customized fields will be replaced onto the default editor window.

Note: **e-field** class only applicable for **DropDownList**, **DateTimePicker**, **MultiSelect**, **DatePicker**, **CheckBox** and **TextBox** components. Since we have processed the field values internally for the above mentioned components.

As we are using our Syncfusion sub-components within our editor using template in the following example, the custom defined form elements needs to be configured as required Syncfusion components such as **DropDownList** and **Link to the Video** within the popupOpen event. This particular step can be skipped, if the user needs to simply use the usual form elements.

Check out this video for further information on how to customise an editor window using a template in the Vue Scheduler:

How to customize header and footer using template

The editor window's header and footer can be enhanced with custom designs using the editorHeaderTemplate and editorFooterTemplate options. To achieve this, create a script template that includes the necessary fields. Ensure that the template type is set to **text/x-template**.

In this demo, we tailor the editor's header according to the appointment's subject field using the editorHeaderTemplate. Furthermore, we make use of the editorFooterTemplate to handle the functionality of validating specific fields before proceeding with the save action or canceling it if validation requirements are not met.

APP.VUE

```
<template>
  <div id="app">
    <div id="container">
      <ejs-schedule
        :height="height"
        :width="width"
        ref='schedule_instance'
        :eventSettings="eventSettings"
        :editorHeaderTemplate="editorHeaderTemplate"
        :editorFooterTemplate="editorFooterTemplate"
        :popupOpen="onPopupOpen"
      >
      </ejs-schedule>
    </div>
  </div>
</template>
<script>
import Vue from "vue";
import {
  SchedulePlugin,
  Day,
  Week,
  WorkWeek,
  Month,
} from "@syncfusion/ej2-vue-schedule";
Vue.use(SchedulePlugin);
const today = new Date();
var data = [
  {
    Id: 1,
    Subject: "Surgery - Andrew",
    StartTime: new Date(today.getFullYear(), today.getMonth(),
today.getDate(), 9, 0),
    EndTime: new Date(today.getFullYear(), today.getMonth(),
today.getDate(), 10, 0),
    IsAllDay: false
  },
  {

How to add recurrence options within editor template

The following code example shows how to add recurrence options within the editor template by importing RecurrenceEditor.

APP.VUE

```
<template>
  <div id='app'>
    <div id='container'>
      <ejs-schedule ref='scheduleObj' :height='height' :width='width'
:views='views' :selectedDate='selectedDate' :eventSettings='eventSettings'
:editorTemplate='editorTemplate' :popupOpen='onPopupOpen'>
      </ejs-schedule>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import {
    SchedulePlugin, Day, Week, WorkWeek, Month, RecurrenceEditor
} from '@syncfusion/ej2-vue-schedule';
import { DateTimePicker } from '@syncfusion/ej2-calendars';
import { eventData } from './datasource.js';
Vue.use(SchedulePlugin);
var editorTemplateVue = Vue.component('editorTemplate', {
  template: `<table class="custom-event-editor" width="100%"
cellpadding="5">
        <tbody>
            <tr>
                <td class="e-textlabel">Summary</td>
```

```
                <td colspan="4">
                    <input id="Subject" class="e-field e-input" type="text"
value="" name="Subject" style="width: 100%" />
                </td>
            </tr>
            <tr>

Apply validations on editor template fields

In the following code example, validation has been added to the status field.

APP.VUE

```
<template>
  <div id='app'>
    <div id='container'>
      <ejs-schedule :height='height' :width='width' :views='views'
:selectedDate='selectedDate'
        :eventSettings='eventSettings' :editorTemplate='editorTemplate'
:popupOpen='onPopupOpen'>
      </ejs-schedule>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { SchedulePlugin, Day, Week, WorkWeek, Month } from '@syncfusion/ej2-
vue-schedule';
import { DropDownList } from '@syncfusion/ej2-dropdowns';
import { DateTimePicker } from '@syncfusion/ej2-calendars';
import { FormValidator } from '@syncfusion/ej2-inputs';
import { isNullOrUndefined } from '@syncfusion/ej2-base';
import { eventData } from './datasource.js';
Vue.use(SchedulePlugin);
var editorTemplateVue = Vue.component('editorTemplate', {
  template: `<table class="custom-event-editor" width="100%"
cellpadding="5"><tbody><tr>
  <td class="e-textlabel">Summary</td><td colspan="4"><input id="Subject"
class="e-field e-input" type="text" value="" name="Subject" style="width:
100%" /></td></tr><tr><td class="e-textlabel">Status</td><td
colspan="4"><input type="text" id="EventType" name="EventType" class="e-
field" style="width: 100%" /></td></tr><tr><td class="e-
textlabel">From</td><td colspan="4"><input id="StartTime" class="e-field"
type="text" name="StartTime" /></td></tr><tr>
  <td class="e-textlabel">To</td><td colspan="4"><input id="EndTime"
class="e-field" type="text" name="EndTime" /></td></tr><tr><td class="e-
textlabel">Reason</td><td colspan="4">
  <textarea id="Description" class="e-field e-input" name="Description"
rows="3" cols="50"                  style="width: 100%; height: 60px
!important; resize: vertical"></textarea></td></tr></tbody></table>`,
  data() {
    return {
      data: {}
    };
  }
});
export default {
  data() {
    return {
      height: '550px',
      width: '100%',
      views: ['Day', 'Week', 'WorkWeek', 'Month'],
      eventSettings: {

How to save the customized event editor using template

The **e-field** class is not added to each field defined within the template, so you should allow to set those field values externally by using the popupClose event.

Note: You can allow to retrieve the data only on the save and delete option. Data cannot be retrieved on the close and cancel options in the editor window.

The following code example shows how to save the customized event editor using a template by the popupClose event.

APP.VUE

```
<template>
  <div id='app'>
    <div id='container'>
      <ejs-schedule :height='height' :width='width' :views='views'
:selectedDate='selectedDate'
        :eventSettings='eventSettings' :editorTemplate='editorTemplate'
:popupOpen='onPopupOpen' :popupClose='onPopupClose' >
      </ejs-schedule>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { SchedulePlugin, Day, Week, WorkWeek, Month } from '@syncfusion/ej2-
vue-schedule';
import { DropDownList } from '@syncfusion/ej2-dropdowns';
import { DateTimePicker } from '@syncfusion/ej2-calendars';
import { eventData } from './datasource.js';
```

In case, if you need to prevent only specific popups on Scheduler, then you can check the condition based on the popup type. The types of the popup that can be checked within the popupClose event are as follows.

| Type | Description |

|------|-------------|

| Editor | For Detailed editor window.|

| QuickInfo | For Quick popup which opens on cell click.|

| EditEventInfo |For Quick popup which opens on event click.|

| ViewEventInfo | For Quick popup which opens on responsive mode.|

| EventContainer | For more event indicator popup.|

| RecurrenceAlert | For edit recurrence event alert popup.|

| DeleteAlert | For delete confirmation popup.|

| ValidationAlert | For validation alert popup.|

| RecurrenceValidationAlert | For recurrence validation alert popup.|

Quick popups

The quick info popups are the ones that gets opened, when a cell or appointment is single clicked on the desktop mode. On single clicking a cell, you can simply provide a subject and save it. Also, while single clicking on an event, a popup will be displayed where you can get the overview of the event information. You can also edit or delete those events through the options available in it.

By default, these popups are displayed over cells and appointments of Scheduler and to disable this action, set `false` to showQuickInfo property.

The quick popup that opens while single clicking on the cells are not applicable on mobile devices.

How to open QuickInfo popup on multiple cell selection

By default the QuickInfo popup will open on single click of the cell. To open the quick info popup on multiple cell selection, you need to select the cells and press enter key. You can open this popup immediately after multiple cell selection by setting up true to quickInfoOnSelectionEnd property where as its default value is false.

APP.VUE

```
<template>
  <div id='app'>
    <div id='container'>
        <ejs-schedule :height='height' :width='width' :views='views'
:quickInfoOnSelectionEnd='quickInfoOnSelectionEnd'></ejs-schedule>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { SchedulePlugin, Day, Week, Month, TimelineViews, Agenda } from
'@syncfusion/ej2-vue-schedule';
Vue.use(SchedulePlugin);
export default {
  data (){
    return {
      height: '550px',
      width: '100%',
      views: ['TimelineDay', 'Day', 'Week', 'Month', 'Agenda'],
      quickInfoOnSelectionEnd: true,
    }
  },
  provide: {
    schedule: [TimelineViews, Day, Week, Month, Agenda]
  }
}

How to change the watermark text of quick popup subject

By default, Add Title text is displayed on the subject field of quick popup. To change the default watermark text, change the value of the appropriate localized word collection used in the Scheduler.

`ts

L10n.load({

'en-US': {

'schedule': {

'addTitle' : 'New Title'

}

}

});

`

Customizing quick popups

The look and feel of the built-in quick popup window, which opens when single clicked on the cells or appointments can be customized by making use of the quickInfoTemplates property of the Scheduler. There are 3 sub-options available to customize them easily,

- header - Accepts the template design that customizes the header part of the quick popup.
- content - Accepts the template design that customizes the content part of the quick popup.
- footer - Accepts the template design that customizes the footer part of the quick popup.

```

{% previewsample "page.domainurl/code-snippet/schedule/quick-info-cs1" %}

The quick popup in adaptive mode can also be customized using quickInfoTemplates using e-device class.

More events indicator and popup

When the number of appointments count that lies on a particular time range * default appointment height exceeds the default height of a cell in month view and all other timeline views, a + more text indicator will be displayed at the bottom of those cells. This indicator denotes that the cell contains few more appointments in it and clicking on that will display a popup displaying all the appointments present on that day.

To disable this option of showing popup with all hidden appointments, while clicking on the text indicator, you can do code customization within the popupOpen event.

The same indicator is displayed on all-day row in calendar views such as day, week and work week views alone, when the number of appointment count present in a cell exceeds three. Clicking on the text indicator here will not open a popup, but will allow the expand/collapse option for viewing the remaining appointments present in the all-day row.

The following code example shows how to disable the display of such popups while clicking on the more text indicator.

You can refer to our Vue Scheduler feature tour page for its groundbreaking feature representations. You can also explore our Vue Scheduler example to knows how to present and manipulate data.

Recurrence editor in Vue Schedule component

The Recurrence editor is integrated into Scheduler editor window by default, to process the recurrence rule generation for events. Apart from this, it can also be used as an individual component referring from the Scheduler repository to work with the recurrence related processes.

All the valid recurrence rule string mentioned in the iCalendar specifications are applicable to use with the recurrence editor.

Customizing the repeat type option in editor

By default, there are 5 types of repeat options available in recurrence editor such as,

- Never
- Daily
- Weekly
- Monthly
- Yearly

It is possible to customize the recurrence editor to display only the specific repeat options such as Daily and Weekly options alone by setting the appropriate frequencies option.

APP.VUE

```
<template>
```

```
  <div id='app'>
    <div id='container'>
      <ejs-schedule height='550px' width='100%' :selectedDate='selectedDate'
      :eventSettings='eventSettings' :popupOpen='onPopupOpen'>
      </ejs-schedule>
    </div>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { scheduleData } from './datasource.js';
  import { SchedulePlugin, Day, Week, WorkWeek, Month, Agenda } from
'@syncfusion/ej2-vue-schedule';
  Vue.use(SchedulePlugin);
  export default {
    data () {
      return {
        selectedDate: new Date(2018, 1, 15),
        eventSettings: { dataSource: scheduleData }
      }
    },
    methods: {
        onPopupOpen: function(args) {
            if (args.type == 'Editor') {
                let recurrenceEditorObj =
                    args.element.querySelector('.e-
recurrenceeditor').ej2_instances[0];
                recurrenceEditorObj.frequencies = ['none', 'daily',
'weekly'];
            }
        }
    },
    provide: {
      schedule: [ Day, Week, WorkWeek, Month, Agenda]
    }
  }
</script>
<style>

```

{% previewsample "page.domainurl/code-snippet/schedule/recurrence-cs1" %}

The other properties available in recurrence editor are tabulated below,

| Properties | Type | Description |

|------------|------|-------------|

| firstDayOfWeek | number | Sets the first day of the week on recurrence editor.|

| startDate | Date | Sets the start date from which date the recurrence event starts. |

| dateFormat | string | Sets the specific date format on recurrence editor.|

| locale | string | Sets the locale to be applied on recurrence editor.|

| cssClass | string | Allows styling to be applied on recurrence editor with custom class names.|

| enableRtl | boolean | Allows recurrence editor to render in RTL mode.|

| minDate | Date | Sets the minimum date on recurrence editor.|

| maxDate | Date | Sets the maximum date on recurrence editor.|

| value | string | Sets the recurrence rule value on recurrence editor. |

| selectedType | number | Sets the specific repeat type on the recurrence editor.|

Customizing the End Type Option in Editor

By default, there are 3 types of end options available in the recurrence editor such as:

- Never
- Until
- Count

It is possible to customize the recurrence editor to display only the specific end options, such as the `Until` and `Count` options alone, by setting the appropriate `endTypes` option.

APP.VUE

```
<template>
  <div id="app">
    <div id="container">
      <ejs-recurrenceeditor id="editor" ref="EditorObj"></ejs-
recurrenceeditor>
    </div>
  </div>
</template>
<script>

Accessing the recurrence rule string

The recurrence rule is usually generated based on the options selected from the recurrence editor and also it follows the iCalendar specifications. The generated recurrence rule string is a valid one to be used with the Scheduler event's recurrence rule field.

There is a change event available in recurrence editor, that triggers on every time the fields of recurrence editor tends to change. Within this event argument, you can access the generated recurrence value through the value option as shown in the following code example.

APP.VUE

```
<template>
  <div id='app'>
    <div id='container'>
        <div style='padding-bottom:15px;'>
            <label>Rule Output</label>
                <div class='rule-output-container'>
                    <div id='rule-output'></div>
                </div>
            </div>
        <ejs-recurrenceeditor :selectedType='selectedType'
:change='onChange'></ejs-recurrenceeditor>
    </div>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { RecurrenceEditorPlugin } from '@syncfusion/ej2-vue-schedule';
  Vue.use(RecurrenceEditorPlugin);
  export default {
    data () {
      return {
        selectedType: 1
      }
    },
    mounted: function () {
        let outputElement = document.querySelector('#rule-output');
        outputElement.innerText = 'Select Rule';
    },
    methods: {
        onChange: function(args) {
            let outputElement = document.querySelector('#rule-output');
            if(args.value == "") {
                outputElement.innerText = 'Select Rule';
            } else {
```

```
                outputElement.innerText = args.value;
            }
        }
    }
  }
</script>
<style>

Recurrence date generation

You can parse the recurrenceRule of an event to generate the date instances on which that particular event is going to occur, using the getRecurrenceDates method. It generates the dates based on the recurrenceRule that we provide. The parameters to be provided for getRecurrenceDates method are as follows.

| Field name | Type | Description |

|---|---|---|

| startDate | Date| Appointment start date. |

| rule | String| Recurrence rule present in an event object. |

| excludeDate | String | Date collection (in ISO format) to be excluded. It is **optional**. |

| maximumCount | Number | Number of date count to be generated. It is **optional**. |

| viewDate | Date | Current view range's first date. It is **optional**. |

APP.VUE

```
<template>
  <div id='app'>
    <div id='container'>
        <div style='padding-bottom:15px;'>
            <label id='rule-label'>Rule Output</label>
                <div class='rule-output-container'>
                    <div id='rule-output'></div>
                </div>
            </div>
        <ejs-recurrenceeditor id='editor' style="display: none;"
ref='EditorObj' :selectedType='selectedType'>
        </ejs-recurrenceeditor>
    </div>
  </div>
</template>
<script>
  import Vue from 'vue';
  import { RecurrenceEditorPlugin } from '@syncfusion/ej2-vue-schedule';
  import { createElement } from '@syncfusion/ej2-base';

}
</style>
```

{% previewsample "page.domainurl/code-snippet/schedule/recur-editor-cs3" %}

Above example will generate two dates January 7, 2018 & January 9 2018 by excluding the in between dates January 8 2018 & January 10 2018, since those dates were given in the exclusion list. Generated dates can then be utilised to create appointments.

Recurrence date generation in server-side

It is also possible to generate recurrence date instances from server-side by manually referring the `RecurrenceHelper` class, which is specifically written and referred from application end to handle this date generation process.

Copyright © 2001 -2024 Syncfusion Inc.

Refer here for the step by step procedure to achieve date generation in server-side.

Restrict date generation with specific count

In case, if the rule is given in "NEVER ENDS" category, then you can mention the maximum count when you actually want to stop the date generation starting from the provided start date. To do so, provide the appropriate `maximumCount` value within the `getRecurrenceDates` method as shown in the following code example.

APP.VUE

```
<template>

{% previewsample "page.domainurl/code-snippet/schedule/recur-editor-cs4" %}

You can refer to our Vue Scheduler feature tour page for its groundbreaking feature representations. You can also explore our Vue Scheduler example to knows how to present and manipulate data.

Timezone in Vue Schedule component

The Scheduler makes use of the current system time zone by default. If it needs to follow some other user-specific time zone, then the timezone property needs to be used. Apart from the default action of applying specific timezone to the Scheduler, it is also possible to set different time zone values for each appointments through the properties `startTimezone` and `endTimezone` which can be defined as separate fields within the event fields collection.

Note: **timezone** property only applicable for the appointment processing and current time indication.

Understanding date manipulation in JavaScript

The `new Date()` in JavaScript returns the exact current date object with complete time and timezone information. For example, it may return value such as `Wed Dec 12 2018 05:23:27 GMT+0530 (India Standard Time)` which indicates that the current date is December 12, 2018 and the current time is 5.23 AM on browsers following the IST timezone.

Scheduler with no timezone

When no specific time zone is set to Scheduler, appointments will be displayed based on the client system's timezone which is the default behavior. Here, the same appointment when viewed from different timezone will have different start and end times.

Copyright © 2001 -2024 Syncfusion Inc.

The following code example displays an appointment from 9.00 AM to 10.00 AM when you open the Scheduler from any of the timezone. This is because, we are providing the start and end time enclosing with `new Date()` which works based on the client browser's timezone.

APP.VUE

```
<template>
  <div id='app'>
    <div id='container'>
        <ejs-schedule :height='height' :selectedDate='selectedDate'
:eventSettings='eventSettings'>

Scheduler set to specific timezone

When a time zone is set to Scheduler through timezone property, the appointments will be displayed exactly based on the Scheduler timezone regardless of its client timezone. In the following code example, appointments will be displayed based on Eastern Time (UTC -05:00).

APP.VUE

```
<template>
    <div>
        <div id='app'>
            <div id='container'>
                <ejs-schedule height='550px' :selectedDate='selectedDate'
:timezone='timezone' :eventSettings='eventSettings'>
                    <e-views>
                        <e-view option='Day'></e-view>
                        <e-view option='Week'></e-view>
                        <e-view option='Month'></e-view>
                    </e-views>
                </ejs-schedule>
            </div>
        </div>
    </div>
</template>
<script>
    import Vue from 'vue';
    import { scheduleData } from './datasource.js';
    import { SchedulePlugin, Day, Week, Month } from '@syncfusion/ej2-vue-
schedule';
    Vue.use(SchedulePlugin);
    export default {
        data () {
            return {
                eventSettings: { dataSource: scheduleData },
                selectedDate: new Date(2018, 1, 17),
                timezone: 'America/New_York'
            }
        },
        provide: {
            schedule: [Day, Week, Month]
        }
    }
</script>

{% previewsample "page.domainurl/code-snippet/schedule/time-zone-cs5" %}

Timezone methods

offset

This method is used to calculate the difference between passed UTC date and timezone.

| Parameters | Type | Description |

|------------|------|-------------|

| Date | Date | UTC time as date object.|

| Timezone | String | Timezone.|

Returns number

`

// Assume your local timezone as IST/UTC+05:30

let timezone = new Timezone();

let date: Date = new Date(2018,11,5,15,25,11);

let timeZoneOffset = timezone.offset(date,"Europe/Paris");

console.log(timeZoneOffset); //-60

`

convert

This method is used to convert the passed date from one timezone to another timezone.

| Parameters | Type | Description |

|------------|------|-------------|

| Date | Date | UTC time as date object.|

| fromOffset | number/string | Timezone from which date need to be converted.|

| toOffset | number/string | Timezone to which date need to be converted.|

Returns Date

`

// Assume your local timezone as IST/UTC+05:30

let timezone = new Timezone();

let date = new Date(2018,11,5,15,25,11);

let convertedDate = timezone.convert(date, "Europe/Paris", "Asia/Tokya");

let convertedDate1 = timezone.convert(date, 60, -360);

console.log(convertedDate); //2018-12-05T08:55:11.000Z

console.log(convertedDate1); //2018-12-05T16:55:11.000Z

`

Copyright © 2001 -2024 Syncfusion Inc.

add

This method is used to add the time difference between passed UTC date and timezone.

| Parameters | Type | Description |

|------------|------|-------------|

| Date | Date | UTC time as date object.|

| Timezone | String | Timezone.|

Returns Date

`

// Assume your local timezone as IST/UTC+05:30

let timezone = new Timezone();

let date = new Date(2018,11,5,15,25,11);

let convertedDate = timezone.add(date, "Europe/Paris");

console.log(convertedDate); //2018-12-05T05:25:11.000Z

`

remove

This method is used to remove the time difference between passed UTC date and timezone.

| Parameters | Type | Description |

|------------|------|-------------|

| Date | Date | UTC as date object.|

| Timezone | String | Timezone.|

Returns Date

`

// Assume your local timezone as IST/UTC+05:30

let timezone = new Timezone();

let date = new Date(2018,11,5,15,25,11);

let convertedDate = timezone.remove(date, "Europe/Paris");

console.log(convertedDate); //2018-12-05T14:25:11.000Z

`

removeLocalOffset

This method is used to remove the local offset time from the date passed.

| Parameters | Type | Description |

|------------|------|-------------|

| Date | Date | UTC as date object.|

Returns Date

Copyright © 2001 -2024 Syncfusion Inc.

```
// Assume your local timezone as IST/UTC+05:30
let timezone = new Timezone();
let date = new Date(2018,11,5,15,25,11);
let convertedDate = timezone.removeLocalOffset(date);
console.log(convertedDate); //2018-12-05T15:25:11.000Z
```

You can refer to our Vue Scheduler feature tour page for its groundbreaking feature representations. You can also explore our Vue Scheduler example to knows how to present and manipulate data.

Views in Vue Schedule component

The Scheduler includes wide variety of view modes with unique configuration options for each view. The available view modes are Day, Week, Work Week, Month, Year, Agenda, Month Agenda, Timeline Day, Timeline Week, Timeline Work Week and Timeline Month, Timeline Year, out of which the `Week` view is set as active.

To navigate between different views and dates, the navigation options are available at the Scheduler header bar. The active view option is usually highlighted by default. The date range of the active view will also be displayed at the left corner of the header bar, clicking on which will open a calendar popup for the ease of desired date selection.

By default, Scheduler displays the calendar views such as day, week, work week, month and agenda.

Setting specific view on scheduler

As the Scheduler displays `week` view by default, therefore to change the active view, set `currentView` property with the desired view name. The applicable view names that the Scheduler accepts are as follows,

- Day
- Week
- WorkWeek
- Month
- Year
- Agenda
- MonthAgenda
- TimelineDay
- TimelineWeek
- TimelineWorkWeek
- TimelineMonth
- TimelineYear

It is necessary to import and inject the appropriate view modules into the application to make use of these view modes on the Scheduler. Also, it is possible to display only the desired views on the Scheduler. To define and configure specific views, use the views property.

Copyright © 2001 -2024 Syncfusion Inc.

In the following example, the Scheduler displays 4 views namely, Week, Month, TimelineWeek and TimelineMonth. The appropriate view modules are imported and injected properly to display those views on the Scheduler.

APP.VUE

```
<template>
    <div id='app'>
        <div id='container'>
            <ejs-schedule id='Schedule' height='550px' width='100%'
:selectedDate='selectedDate' :eventSettings='eventSettings'>
                <e-views>
                    <e-view option='Week'></e-view>
                    <e-view option='TimelineWeek'></e-view>
                    <e-view option='Month'></e-view>
                    <e-view option='TimelineMonth'></e-view>
                </e-views>

{% previewsample "page.domainurl/code-snippet/schedule/view-cs2" %}

To configure Scheduler with simply 2 views, but with different configurations on each view, refer the following code example. Here, the Week view displays the dates in dd-MM-yyyy format whereas the Month view hides the weekend days and also displays it in readonly mode.

APP.VUE

```
<template>
    <div id='app'>
        <div id='container'>
            <ejs-schedule id='Schedule' height='550px' width='100%'
:selectedDate='selectedDate' :eventSettings='eventSettings'>
                <e-views>
                    <e-view option='Week' dateFormat='dd-MMM-yyyy'></e-view>
                    <e-view option='Month' :showWeekend='showWeekend'
readonly=true></e-view>
                </e-views>
            </ejs-schedule>
        </div>
    </div>
</template>
<script>
    import Vue from 'vue';
    import { scheduleData } from './datasource.js';
    import { SchedulePlugin, Week, Month } from '@syncfusion/ej2-vue-
schedule';
    Vue.use(SchedulePlugin);
    export default {
        data () {
            return {
                selectedDate: new Date(2018, 1, 15),
                eventSettings: { dataSource: scheduleData },
                showWeekend: false
            }
        },
        provide: {
            schedule: [Week, Month]
        }
    }

{% previewsample "page.domainurl/code-snippet/schedule/view-cs3" %}

View specific configuration

There are scenarios where each view may need to have different configurations. For such cases, you can define the applicable scheduler properties within the views Property for each view option as depicted in the following examples. The fields available to be used within each view options are as follows.

| Property | Type | Description | Applicable views |

|---|---|---|---|

| option | View | It accepts the Scheduler view name, based on which we can define its related properties. The view names can be Day, Week and so on. | All views.|

| isSelected | Boolean | It acts similar to the currentView property and defines the active view of the Scheduler.| All views. |

| dateFormat | Date | By default, Scheduler follows the date format as per the default culture assigned to it. When it is defined under specific view, only those assigned views follows this date format. | All views. |

| readonly | Boolean | When set to true, prevents the CRUD actions on the respective view under where it is defined. | All views. |

| resourceHeaderTemplate | String | The template option which is used to customize the resource header cells on the Scheduler. It gets applied only on the views, wherever it is defined.| All views. |

| dateHeaderTemplate | String | The template option which is used to customize the date header cells and is applied only on the views, wherever it is defined. | All views. |

| eventTemplate | String | The template option to customize the events background. It will get applied to the events of the view to which it is currently being defined. | All views. |

| showWeekend | Boolean | When set to false, it hides the weekend days of a week from the views on which it is defined.| All views. |

| group | GroupModel | Allows to set different resource grouping options on all available Scheduler view modes. | All views. |

| cellTemplate | String | The template option to customize the work cells of the Scheduler and is applied only on the views, on which it is defined. | Applicable on all views except Agenda view. |

| workDays | Number[] | It is used to set the working days on the Scheduler views. | Applicable on all views except Agenda view. |

| displayName | String | When a particular view is customized to display with different intervals, this property allows the user to set different display name for each of the views. | Applicable on all views except Agenda and Month Agenda. |

Copyright © 2001 -2024 Syncfusion Inc.

| interval | Number | It allows to customize the default Scheduler views with different set of days, weeks, work weeks or months on the applicable view type. | Applicable on all views except Agenda and Month Agenda. |

| startHour | String | It is used to specify the start hour, from which the Scheduler should be displayed. It accepts the time string in a short skeleton format and also, hides the time beyond the specified start time. | Applicable on Day, Week, Work Week, Timeline Day, Timeline Week and Timeline Work Week views. |

| endHour | String | It is used to specify the end hour, at which the Scheduler ends. It accepts the time string in a short skeleton format. | Applicable on Day, Week, Work Week, Timeline Day, Timeline Week, and Timeline Work Week views. |

| timeScale | TimeScaleModel | Allows to set different timescale configuration on each applicable view modes. | Applicable on Day, Week, Work Week, Timeline Day, Timeline Week, and Timeline Work Week views. |

| showWeekNumber | Boolean | When set to true, shows the week number on the respective weeks.| Applicable on Day, Week, Work Week, and Month views. |

| allowVirtualScrolling | Boolean | It is used to enable or disable the virtual scrolling functionality. | Applicable on Agenda and Timeline views. |

| headerRows | HeaderRowsModel | Allows defining the custom header rows on timeline views of the Scheduler to display the year, month, week, date and hour label as an individual row. | Applicable only on all timeline views. |

Day view

Usually a day view displays a single day with all its related appointments. It is possible to customize the day view to display more number of days by extending the views property with interval option. You can also define any of the above defined properties within the views object definition as depicted in the following code example.

APP.VUE

```
<template>
    <div id='app'>
        <div id='container'>
            <ejs-schedule id='Schedule' height='550px' width='100%'
:selectedDate='selectedDate' :eventSettings='eventSettings'
:currentView='currentView'>
                <e-views>
                    <e-view option='Day' startHour='09:30' endHour='18:00'
:timeScale='timeScale'></e-view>
                </e-views>
            </ejs-schedule>
        </div>
    </div>
</template>
<script>
    import Vue from 'vue';
    import { scheduleData } from './datasource.js';
    import { SchedulePlugin, Day } from '@syncfusion/ej2-vue-schedule';
    Vue.use(SchedulePlugin);
    export default {
```

Copyright © 2001 -2024 Syncfusion Inc.

```
        data () {
            return {
                selectedDate: new Date(2018, 1, 15),
                eventSettings: { dataSource: scheduleData },
                currentView: 'Day',
                timeScale: {enable: true, slotCount: 5}
            }
        },
        provide: {
            schedule: [Day]
        }
    }
</script>
<style>
  @import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../../node_modules/@syncfusion/ej2-vue-
buttons/styles/material.css";
  @import "../../node_modules/@syncfusion/ej2-vue-
calendars/styles/material.css";
  @import "../../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
  @import "../../node_modules/@syncfusion/ej2-vue-
inputs/styles/material.css";
  @import "../../node_modules/@syncfusion/ej2-vue-
navigations/styles/material.css";
  @import "../../node_modules/@syncfusion/ej2-vue-
popups/styles/material.css";
  @import "../../node_modules/@syncfusion/ej2-vue-
schedule/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/schedule/view-cs4" %}

All the above defined properties can be accessed within Day view except `allowVirtualScrolling` and `headerRows`.

Week view

The Week view displays a count of 7 days (from Sunday to Saturday) with all its related appointments. The first day of the week can be changed using the `firstDayOfWeek` which accepts the integer (Sunday=0, Monday=1, Tuesday=2 and so on) value. You can navigate to a particular date in day view from the week view by clicking on the appropriate dates on the date header bar.

APP.VUE

```
<template>
    <div id='app'>
        <div id='container'>
            <ejs-schedule id='Schedule' height='550px' width='100%'
:selectedDate='selectedDate' :eventSettings='eventSettings'>
                <e-views>
                    <e-view option='Day' interval=2 displayName='2 Days'
startHour='09:30'
                    endHour='18:00' timeScale='timeScale'></e-view>
                    <e-view option='Week' displayName='2 Weeks' interval=2
:showWeekend='showWeekend' isSelected= true></e-view>
                </e-views>
```

```
            </ejs-schedule>
        </div>
    </div>
</template>
<script>
    import Vue from 'vue';
    import { scheduleData } from './datasource.js';
    import { SchedulePlugin, Day, Week } from '@syncfusion/ej2-vue-
schedule';
    Vue.use(SchedulePlugin);
    export default {
        data () {
            return {
                selectedDate: new Date(2018, 1, 15),
                eventSettings: { dataSource: scheduleData },
                timeScale: {enable: true, slotCount: 5},
                showWeekend: false
            }
        },
        provide: {
            schedule: [Day, Week]
        }
    }
</script>
<style>
  @import "../../node_modules/@syncfusion/ej2-base/styles/material.css";

  @import "../../node_modules/@syncfusion/ej2-vue-
schedule/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/schedule/view-cs5" %}

All the above defined properties in the table can be accessed within Week and Work week views except `allowVirtualScrolling` and `headerRows`.

Work Week view

The Work week view displays only the working days of a week (count of 5 days) and its associated appointments. It is possible to customize the working days on the work week view by using the `workDays` property which accepts an array of integer values (such as Sunday=0, Monday=1, Tuesday=2 and so on). By default, it displays from Monday to Friday (5 days). You can also navigate to a particular date in the day view from the work week view by clicking on the appropriate dates in the date header bar.

Copyright © 2001 -2024 Syncfusion Inc.

The following code example depicts how to change the working days only on the Work Week view of the Scheduler.

APP.VUE

```
<template>
    <div id='app'>
        <div id='container'>
            <ejs-schedule id='Schedule' height='550px' width='100%'
:selectedDate='selectedDate' :eventSettings='eventSettings'>
                <e-views>
                    <e-view option='WorkWeek' :workDays='workDays'></e-view>
                </e-views>
            </ejs-schedule>
        </div>
    </div>
</template>
<script>
    import Vue from 'vue';
    import { scheduleData } from './datasource.js';
    import { SchedulePlugin, WorkWeek } from '@syncfusion/ej2-vue-schedule';
    Vue.use(SchedulePlugin);
    export default {
        data () {
            return {
                selectedDate: new Date(2018, 1, 15),
                eventSettings: { dataSource: scheduleData },
                workDays: [2,3,5]
            }
        },
        provide: {
            schedule: [WorkWeek]
        }
    }
</script>

The Week, Work week and Day views can display the all-day row appointments in a separate all-day row with an expand/collapse option to view it.

Month view

A Month view displays the entire days of a particular month and all its related appointments. You can navigate to a particular date in the day view by clicking on the appropriate date text on the month cells.

By default, when you try to create an appointment through Month view, it is considered as created for an entire day. You can explicitly change this behavior by unchecking the All-day option from editor window, so that it defaults to the start time duration as 9.00 AM and end time as 9.30 AM.

You can also have the + more text indicator on each day cell of a Month view, clicking on which will allows you to view the hidden appointments of a day.

APP.VUE

```
<template>
    <div id='app'>
        <div id='container'>
            <ejs-schedule id='Schedule' height='550px' width='100%'
:selectedDate='selectedDate' :eventSettings='eventSettings'>
                <e-views>
                    <e-view option='Month' showWeekNumber=true readonly=true
></e-view>
                </e-views>
            </ejs-schedule>
        </div>
    </div>
</template>

{% previewsample "page.domainurl/code-snippet/schedule/view-cs7" %}

Year view

A Year view displays all the days of a particular year with months and all its related appointments. You can navigate to a particular date in the day view by clicking on the appropriate date text on the year cells.

Year view is available in both the Horizontal and Vertical orientations. You can manage the orientation of year view through views property.

APP.VUE

```
<template>
    <div id='app'>
        <div id='container'>
            <ejs-schedule id='Schedule' height='550px' width='100%'
:selectedDate='selectedDate' :eventSettings='eventSettings'>
                <e-views>
                    <e-view option='Year' showWeekNumber=true readonly=true
></e-view>
                </e-views>
            </ejs-schedule>
        </div>
    </div>
</template>
<script>
    import Vue from 'vue';
    import { scheduleData } from './datasource.js';
    import { SchedulePlugin, Year } from '@syncfusion/ej2-vue-schedule';
    Vue.use(SchedulePlugin);
    export default {
        data () {
            return {
                selectedDate: new Date(2018, 1, 15),
                eventSettings: { dataSource: scheduleData }
            }
        },
        provide: {
            schedule: [Year]
        }
    }
</script>
<style>
  @import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../../node_modules/@syncfusion/ej2-vue-
buttons/styles/material.css";
  @import "../../node_modules/@syncfusion/ej2-vue-
calendars/styles/material.css";
```

  @import "../../node_modules/@syncfusion/ej2-vue-
schedule/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/schedule/view-cs8" %}

The year view also has module support. In that, you can get all the months of a particular year in a calendar view format. In that calendar view, appointment contained dates are highlighted with dots placed under the individual date. When you click on the date, the event popup will be displayed and the events will be listed.

Agenda view

The Agenda view lists out the appointments in a grid-like view for the next 7 days by default from the current date. The count of the days can be changed using the API `agendaDaysCount`. It allows virtual scrolling of dates by enabling the `allowVirtualScrolling` property. Also, you can enable or disable the display of days on Scheduler that has no appointments by setting true or false to the `hideEmptyAgendaDays` property.

The following code example depicts how to customize the display of events within Agenda view alone.

APP.VUE

```
<template>
    <div id='app'>
        <div id='container'>
            <ejs-schedule id='Schedule' height='350px' width='100%'
:selectedDate='selectedDate' :eventSettings='eventSettings'>
                <e-views>
                    <e-view option='Agenda' :eventTemplate='eventTemplate'
allowVirtualScrolling=true></e-view>
                </e-views>
            </ejs-schedule>
        </div>
    </div>
</template>
<script>
    import Vue from 'vue';
    import { Internationalization } from '@syncfusion/ej2-base';
    import { SchedulePlugin, Agenda } from '@syncfusion/ej2-vue-schedule';
    import { eventData } from './datasource.js';
    Vue.use(SchedulePlugin);
    var instance = new Internationalization();
    var agendaTemplateVue = Vue.component('agendaTemplate', {
        template: `<div class="template-wrap"><div
class="subject">{{data.Subject}}</div><div
class="time">{{getTimeString(data.StartTime)}} -
{{getTimeString(data.EndTime)}}</div></div>`,
```

```
        data() {
            return {
                data: {}
            };
        },
        methods: {
            getTimeString: function(value) {
                return instance.formatDate(value, { skeleton: "hm"});
            }
        }
    });
    export default {
        data () {
            return {
                selectedDate: new Date(2018, 1, 15),
                eventTemplate: function(e){
                    return {
                        template: agendaTemplateVue
                    }

</style>
> Schedule Height is mandatory to set in pixels for Agenda view alone.
```

{% previewsample "page.domainurl/code-snippet/schedule/view-cs9" %}

Month Agenda view

A Month-Agenda view shows a month calendar, where clicking on a particular day will display the appointments present on that date below the calendar. The day with appointments are differentiated with a circular dot below the date of the calendar.

{% previewsample "page.domainurl/code-snippet/schedule/view-cs10" %}

Timeline views – Day, Week, Work Week

Similar to the day view, timeline day view shows a single day with all its appointments where the time slots are displayed horizontally. By default, the cell height adjusts as per the height set to Scheduler. When the number of appointments exceeds the visible area of the cells, the + more text indicator will be displayed at the bottom to denote the presence of few more appointments in that time range.

To make use of the timeline views (Timeline Day, Timeline Week and Timeline Work Week) on Scheduler, import and inject the module TimelineViews from the ej2-schedule package.

APP.VUE

```
<template>
    <div id='app'>
        <div id='container'>
            <ejs-schedule id='Schedule' height='550px' width='100%'
:selectedDate='selectedDate' :eventSettings='eventSettings'>
                <e-views>
                    <e-view option='TimelineDay' startHour='10:00'
endHour='15:30'></e-view>
                </e-views>
            </ejs-schedule>
        </div>
    </div>
</template>
<script>
    import Vue from 'vue';
    import { SchedulePlugin, TimelineViews } from '@syncfusion/ej2-vue-
schedule';
    import { scheduleData } from './datasource.js';
    Vue.use(SchedulePlugin);
    export default {
        data () {
            return {
                selectedDate: new Date(2018, 1, 15),
                eventSettings: { dataSource: scheduleData}
            }
        },
        provide: {
            schedule: [TimelineViews]
        }
    }
</script>

```

{% previewsample "page.domainurl/code-snippet/schedule/view-cs13" %}

Clicking on the dates in the date header bar of Timeline day, Timeline week and Timeline work week will allow you to navigate to the Agenda view.

Timeline Month view

A Timeline Month view displays the current month days along with its appointments. To make use of the timeline Month view on Scheduler, import and inject TimelineMonth module from the ej2-schedule package.

APP.VUE

```
<template>
    <div id='app'>
        <div id='container'>
            <ejs-schedule id='Schedule' height='550px' width='100%'
:selectedDate='selectedDate' :eventSettings='eventSettings'>
                <e-views>
                    <e-view option='TimelineMonth'
:showWeekend='showWeekend'></e-view>
                </e-views>
            </ejs-schedule>
        </div>
    </div>
</template>
<script>
    import Vue from 'vue';
    import { SchedulePlugin, TimelineMonth } from '@syncfusion/ej2-vue-
schedule';
    import { scheduleData } from './datasource.js';
    Vue.use(SchedulePlugin);
    export default {
        data () {
            return {
                selectedDate: new Date(2018, 1, 15),
                eventSettings: { dataSource: scheduleData},
                showWeekend: false
            }
        },
        provide: {
            schedule: [TimelineMonth]
        }
    }
</script>
<style>
  @import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../../node_modules/@syncfusion/ej2-vue-
buttons/styles/material.css";
```

Copyright © 2001 -2024 Syncfusion Inc.

```
  @import "../../node_modules/@syncfusion/ej2-vue-
calendars/styles/material.css";
  @import "../../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
  @import "../../node_modules/@syncfusion/ej2-vue-
inputs/styles/material.css";

</style>
```

{% previewsample "page.domainurl/code-snippet/schedule/view-cs14" %}

Clicking on the dates in the date header bar of Timeline month will allow you to navigate to the Timeline day view.

Timeline Year view

In Timeline Year view, each row depicts a single resource. Whereas in the vertical view, each resource is grouped parallelly as columns. Here, the resource grouping follows the tree-view like hierarchical grouping structure and can contain any level of child resources.

To make use of the timeline Year view on Scheduler, import and inject `TimelineYear` module from the `ej2-schedule` package.

APP.VUE

```
<template>
    <div id='app'>
        <div id='container'>
            <ejs-schedule id='Schedule' height='550px' width='100%'
:selectedDate='selectedDate' :eventSettings='eventSettings'>
                <e-views>
                    <e-view option='TimelineYear' displayName='Horizontal
Timeline Year'></e-view>
                </e-views>
            </ejs-schedule>
        </div>
    </div>
</template>
<script>
    import Vue from 'vue';
    import { SchedulePlugin, TimelineYear } from '@syncfusion/ej2-vue-
schedule';
    import { scheduleData } from './datasource.js';
    Vue.use(SchedulePlugin);
    export default {
        data () {
            return {
                selectedDate: new Date(2018, 1, 15),
                eventSettings: { dataSource: scheduleData},
                showWeekend: false
            }
        },
```

`

Auto row height

Timeline Year view supports Auto row height. When the feature rowAutoHeight is enabled, the row height gets auto-adjusted based on the number of overlapping events occupied in the same time range. If you disable the Auto row height, you have the + more text indicator on each day cell of a Timeline Year view, clicking on which will allow you to view the hidden appointments of a day.

APP.VUE

```
<template>

```

{% previewsample "page.domainurl/code-snippet/schedule/view-cs16" %}

Extending view intervals

It is possible to customize the display of default number of days on different Scheduler view modes. For example, a day view can be extended to display 3 days by setting the `interval` option as 3 for the `Day` option within the `views` property as depicted in the following code example. In the same way, you can also display 2 weeks by setting interval 2 for the `Week` option.

You can provide the alternative display name for such customized views on the Scheduler header bar, by setting the appropriate `displayName` property.

APP.VUE

```
<template>
    <div id='app'>
        <div id='container'>
            <ejs-schedule id='Schedule' height='550px' width='100%'
:selectedDate='selectedDate' :eventSettings='eventSettings'
:currentView='currentView'>
                <e-views>
                    <e-view option='Day' :interval='3' displayName='3
Days'></e-view>
                    <e-view option='Week' :interval='2' displayName='2
Weeks'></e-view>
                </e-views>
            </ejs-schedule>
        </div>
    </div>

You can refer to our Vue Scheduler feature tour page for its groundbreaking feature representations. You can also explore our Vue Scheduler example to knows how to present and manipulate data.

Calendar mode in Vue Schedule component

The Scheduler supports the following two types of calendar mode.

- Gregorian Calendar
- Islamic Calendar

Gregorian Calendar

The Scheduler by default displays the gregorian calendar dates which is the most widely used calendar in the world. The Gregorian calendar is a solar calendar which has 12 months with 28 to 31 days each. A

Copyright © 2001 -2024 Syncfusion Inc.

year which is divisible by four is said to be a leap year in this calendar mode. A leap year usually has 366 days whereas the regular year has 365 days.

Islamic Calendar

The Islamic Calendar, also known as the Hijri or Muslim calendar, is a lunar calendar which has 12 months in a year with 354 or 355 days. Each month of this calendar denotes the birth of the new lunar cycle and therefore, each month can have 29 or 30 days depending on the visibility of the moon. Here, the odd-numbered months have 30 days and the even months have 29 days.

The current Islamic year is 1440 AH. Usually the Gregorian calendar runs from approximately 11 September 2018 to 30 August 2019 for this 1440 AH year.

The Scheduler has a property `calendarMode` which is used to switch between the gregorian and islamic calendar modes. By default, it is set to `Gregorian` and to use it with Islamic calendar dates, define the `calendarMode` of Scheduler to `Islamic`. The following example depicts, how to display the Islamic calendar dates on Scheduler.

To make use of Islamic calendar in Scheduler, import the `Calendar` and `Islamic` module from `ej2-calendars` package and also inject it using the `Calendar.Inject` method. Apart from this, it requires the following CLDR data to be loaded using loadCldr function.

- numberingSystems.json
- ca-gregorian.json
- numbers.json
- timeZoneNames.json
- ca-islamic.json

To know more information on, how to install the CLDR data, refer the Internationalization topic.

You can refer to our Vue Scheduler feature tour page for its groundbreaking feature representations. You can also explore our Vue Scheduler example to knows how to present and manipulate data.

Copyright © 2001 -2024 Syncfusion Inc.

Resources in Vue Schedule component

Resources and grouping support allows the Scheduler to be shared by multiple resources. Also, the appointments of each resources are displayed under relevant resources. Each resource in the Scheduler is arranged in a column/row wise order, with individual spacing to display all its respective appointments on a single page. It also supports the multiple levels of grouping of resources, thus enabling the categorization of resources in a hierarchical structure and shows it either in expandable groups (Timeline views) or else vertical hierarchy one after the other (Calendar views).

It is also possible to assign one or more resources to the same appointment, by allowing multiple selection of resource options available in the event editor window.

The HTML5 JavaScript Scheduler groups the resources based on different criteria. It includes grouping appointments based on resources, grouping resources based on dates, and timeline scheduling. Also, the data for resources bind with Scheduler either as a local JSON collection or URL, retrieving data from remote data services.

Resource fields

The default options available within the resources collection are as follows,

| Field name | Type | Description |

|---|---|---|

| field | String | A value that binds to the resource field of event object. |

| title | String | It holds the title of the resource field to be displayed on the event editor window. |

| name | String | A unique resource name used for differentiating various resource objects while grouping. |

| allowMultiple | Boolean | When set to true, allows multiple selection of resource names, thus creating multiple instances of same appointment for the selected resources. |

| dataSource | Object | Assigns the resource dataSource, where data can be passed either as an array of JavaScript objects, or else can create an instance of DataManager in case of processing remote data and can be assigned to the dataSource property. With the remote data assigned to dataSource, check the available adaptors to customize the data processing. |

| query | Query | Defines the external query that will be executed along with the data processing. |

| idField | String | Binds the resource ID field name from the resources dataSource. |

| expandedField | String | Binds the expandedField name from the resources dataSource. It usually holds boolean value which decide whether the resource of timeline views is in collapse or expand state on initial load. |

| textField | String | Binds the text field name from the resources dataSource. It usually holds the resource names. |

| groupIDField | String | Binds the group ID field name from the resource dataSource. It usually holds the value of resource IDs of parent level resources. |

| colorField | String | Binds the color field name from the resource dataSource. The color value mapped in this field will be applied to the events of resources. |

Copyright © 2001 -2024 Syncfusion Inc.

| startHourField | String | Binds the start hour field name from the resource dataSource. It allows to provide different work start hour for the resources. |

| endHourField | String | Binds the end hour field name from the resource dataSource. It allows to provide different work end hour for the resources. |

| workDaysField | String | Binds the work days field name from the resources dataSource. It allows to provide different working days collection for the resources. |

| cssClassField | String | Binds the custom CSS class field name from the resources dataSource. It maps the CSS class written for the specific resources and applies it to the events of those resources. |

Resource data binding

The data for resources can bind with Scheduler either as a local JSON collection or a service URL, retrieving resource data from remote data services.

Using local JSON data

The following code example depicts how to bind the local JSON data to the dataSource of resources collection.

```
`html

<template>

<div>

<div id='app'>

<div id='container'>

<ejs-schedule id='Schedule' width='100%' height='550px' :eventSettings='eventSettings' :selectedDate='selectedDate' :currentView='currentView'>

<e-views>

<e-view option='Week'></e-view>

<e-view option='Month'></e-view>

<e-view option='TimelineWeek'></e-view>

<e-view option='TimelineMonth'></e-view>

<e-view option='Agenda'></e-view>

</e-views>

<e-resources>

<e-resource field='OwnerId' title='Owner' name='Owners'  :dataSource='resourceDataSource' textField='OwnerText' idField='Id' colorField='OwnerColor'>

</e-resource>

</e-resources>

</ejs-schedule>

</div>

</div>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
</div>
</template>
<script>
import Vue from 'vue';
import { resourceData } from './datasource.js';
import { SchedulePlugin, Week, Month, Agenda, TimelineViews, TimelineMonth } from
'@syncfusion/ej2-vue-schedule';
Vue.use(SchedulePlugin);
export default {
data () {
return {
width: '100%',
height: '550px',
currentView: 'Week',
views: ['Week', 'Month', 'TimelineWeek','TimelineMonth', 'Agenda'],
selectedDate: new Date(2018, 3, 1),
resourceDataSource: [
{ OwnerText: 'Nancy', Id: 1, OwnerColor: '#ffaa00' },
{ OwnerText: 'Steven', Id: 2, OwnerColor: '#f8a398' },
{ OwnerText: 'Michael', Id: 3, OwnerColor: '#7499e1' }
],
eventSettings: { dataSource: resourceData }
}
},
provide: {
schedule: [Week, Month, Agenda, TimelineViews, TimelineMonth]
}
}
</script>
<style>
@import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-vue-buttons/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";

</style>
`
```

Using remote service URL

The following code example depicts how to bind the remote data for resources dataSource.

```
`html
<template>
<div>
<div id='app'>
<div id='container'>
<ejs-schedule id='Schedule' width='100%' height='550px' :eventSettings='eventSettings'
:selectedDate='selectedDate' :currentView='currentView'>
<e-views>
<e-view option='Week'></e-view>
<e-view option='Month'></e-view>
<e-view option='TimelineWeek'></e-view>
<e-view option='TimelineMonth'></e-view>
<e-view option='Agenda'></e-view>
</e-views>
<e-resources>
<e-resource field='OwnerId' title='Owner' name='Owners'  :dataSource='resourceDataSource'
textField='OwnerText' idField='Id' colorField='OwnerColor'>
</e-resource>
</e-resources>
</ejs-schedule>
</div>
</div>
</div>
</template>
<script>
```

```
import Vue from 'vue';
import { DataManager, UrlAdaptor } from '@syncfusion/ej2-data';
import { SchedulePlugin, Week, Month, Agenda, TimelineViews, TimelineMonth } from
'@syncfusion/ej2-vue-schedule';
import { resourceData } from './datasource.js';
Vue.use(SchedulePlugin);
let resource = new DataManager({
url: 'Home/GetResourceData',
adaptor: new UrlAdaptor,
crossDomain: true
});
export default {
data () {
return {
width: '100%',
height: '550px',
currentView: 'Week',
views: ['Week', 'Month', 'TimelineWeek','TimelineMonth', 'Agenda'],
selectedDate: new Date(2018, 3, 1),
resourceDataSource: resource,
eventSettings: { dataSource: resourceData }
}
},
provide: {
schedule: [Week, Month, Agenda, TimelineViews, TimelineMonth]
}
}
</script>
<style>
@import "../../node_modules/@syncfusion/ej2-base/styles/material.css";

Scheduler with multiple resources

It is possible to display the Scheduler in default mode without visually showcasing all the resources in it, but allowing to assign the required resources to the appointments through the event editor resource options.

The appointments belonging to the different resources will be displayed altogether on the default Scheduler, which will be differentiated based on the resource color assigned in the **Link to the Video** (depicting to which resource that particular appointment belongs) collection.

Learn how to add appointments from multiple resources to Vue Scheduler by watching this video.

Example: To display default Scheduler with multiple resource options in the event editor, ignore the group option and simply define the resources property with all its internal options.

{% previewsample "page.domainurl/code-snippet/schedule/multiple-resources-cs1" %}

Setting `allowMultiple` to `true` in the above code example allows you to select multiple resources from the event editor and also creates multiple copies of the same appointment in the Scheduler for each resources while rendering.

Resource grouping

Resource grouping support allows the Scheduler to group the resources in a hierarchical structure both as an expandable groups (Timeline views) and as vertical hierarchy displaying resources one after the other (Resources view).

Copyright © 2001 -2024 Syncfusion Inc.

Scheduler supports both single and multiple levels of resource grouping that can be customized both in timeline and vertical Scheduler views.

Vertical resource view

The following code example displays how the multiple resources are grouped and its events are portrayed in the default calendar views.

APP.VUE

```
<template>
    <div id='app'>
        <div id='container'>
            <ejs-schedule id='Schedule' width='100%' height='550px'

{% previewsample "page.domainurl/code-snippet/schedule/resource-grouping-cs2" %}

Grouping single-level resources

This kind of grouping allows the Scheduler to display all the resources at a single level simultaneously. The appointments mapped under resources will be displayed with the colors as per the colorField defined on the resources collection.

Example: To display the Scheduler with single level resource grouping,

APP.VUE

```
<template>
    <div>
        <div id='app'>
            <div id='container'>
                <ejs-schedule id='Schedule' width='100%' height='550px'
:eventSettings='eventSettings' :selectedDate='selectedDate' :group='group'>
                    <e-views>
                        <e-view option='Week'></e-view>
                        <e-view option='Month'></e-view>
                        <e-view option='TimelineWeek'></e-view>
                        <e-view option='TimelineMonth'></e-view>
                        <e-view option='Agenda'></e-view>
                    </e-views>
                    <e-resources>
                        <e-resource field='OwnerId' title='Owner'
name='Owners' :allowMultiple='allowMultiple' :dataSource='ownerDataSource'
                        textField='OwnerText' idField='Id'
colorField='OwnerColor'>
                        </e-resource>
                    </e-resources>
                </ejs-schedule>
            </div>
        </div>
    </div>
</template>
<script>
    import Vue from 'vue';
    import { resourceData } from './datasource.js';
    import { SchedulePlugin, Week, Month, Agenda, TimelineViews,
TimelineMonth } from '@syncfusion/ej2-vue-schedule';
    Vue.use(SchedulePlugin);
    export default {
        data () {
            return {
                width: '100%',
                height: '550px',
                currentView: 'TimelineWeek',
```

{% previewsample "page.domainurl/code-snippet/schedule/single-level-resource-cs1" %}

The `name` field defined in the **resources** collection namely `Owners` will be mapped within the `group` property, in order to enable the grouping option with those resource levels on the Scheduler.

Grouping multi-level resources

It is possible to group the resources of Scheduler in multiple levels, by mapping the child resources to each parent resource. In the following example, there are 2 levels of resources, on which the second level resources are defined with `Link to the Video` mapping to the first level resource's ID so as to establish the parent-child relationship between them.

To get start quickly about Grouping Multiple Resources in Vue Scheduler, you can check on this video:

Example: To display the Scheduler with multiple level resource grouping options,

APP.VUE

```
<template>
    <div>
        <div id='app'>
```

```
            <div id='container'>
                <ejs-schedule id='Schedule' width='100%' height='550px'
:eventSettings='eventSettings' :selectedDate='selectedDate' :group='group'>
                    <e-views>
                        <e-view option='Week'></e-view>
                        <e-view option='Month'></e-view>
                        <e-view option='TimelineWeek'></e-view>
                        <e-view option='TimelineMonth'></e-view>
                        <e-view option='Agenda'></e-view>
                    </e-views>
                    <e-resources>
                        <e-resource field='RoomId' title='Room' name='Rooms'
:dataSource='roomDataSource' textField='RoomText' idField='Id'
colorField='RoomColor'>
                        </e-resource>
                        <e-resource field='OwnerId' title='Owner'
name='Owners' :allowMultiple='allowMultiple' :dataSource='ownerDataSource'
                        textField='OwnerText' idField='Id' groupIDField=
'OwnerGroupId' colorField='OwnerColor'>
                        </e-resource>
                    </e-resources>
                </ejs-schedule>
            </div>
        </div>
    </div>
</template>
<script>
    import Vue from 'vue';

{% previewsample "page.domainurl/code-snippet/schedule/resource-grouping-cs3" %}

One-to-One grouping

In multi-level grouping, Scheduler usually groups the resources on the child level based on the GroupID that maps with the Id field of parent level resources (as byGroupID set to true by default). There are also option which allows you to group all the child resource(s) against each of its parent resource(s). To enable this kind of grouping, set false to the byGroupID option within the group property. In the following code example, there are two levels of resources, on which all the 3 resources at the child level is mapped one to one with each resource on the first level.

APP.VUE

```
<template>
    <div>
        <div id='app'>
            <div id='container'>
                <ejs-schedule id='Schedule' width='100%' height='550px'
:eventSettings='eventSettings' :selectedDate='selectedDate' :group='group'>
                    <e-views>
                        <e-view option='Week'></e-view>
                        <e-view option='Month'></e-view>
                        <e-view option='TimelineWeek'></e-view>
                        <e-view option='TimelineMonth'></e-view>
                        <e-view option='Agenda'></e-view>
                    </e-views>
                    <e-resources>
                        <e-resource field= 'RoomId' title= 'Room' name=
'Rooms' :dataSource='roomDataSource' textField='RoomText' idField='Id'
colorField='RoomColor'>
                        </e-resource>
                        <e-resource field='OwnerId' title='Owner'
name='Owners' :allowMultiple='allowMultiple' :dataSource='ownerDataSource'
```

```
                        textField='OwnerText' idField='Id' groupIDField=
'OwnerGroupId' colorField='OwnerColor'>
                        </e-resource>
                    </e-resources>
                </ejs-schedule>
            </div>
        </div>
    </div>
</template>

{% previewsample "page.domainurl/code-snippet/schedule/resource-grouping-cs4" %}

Grouping resources by date

It groups the number of resources under each date and is applicable only on the calendar views such as Day, Week, Work Week, Month, Agenda and Month-Agenda. To enable such grouping, set byDate option to true within the group property.

Example: To display the Scheduler with resources grouped by date,

APP.VUE

```
<template>
    <div>
        <div id='app'>
            <div id='container'>
                <ejs-schedule id='Schedule' width='100%' height='550px'
:eventSettings='eventSettings' :selectedDate='selectedDate' :group='group'>
                    <e-views>
                        <e-view option='Week'></e-view>
                        <e-view option='Month'></e-view>
                        <e-view option='Agenda'></e-view>
                    </e-views>
                    <e-resources>
                        <e-resource field='OwnerId' title='Owner'
name='Owners' :allowMultiple='allowMultiple' :dataSource='ownerDataSource'
                        textField='text' idField='id' colorField='color'>
                        </e-resource>
                    </e-resources>
                </ejs-schedule>
            </div>
        </div>
    </div>
</template>
<script>
    import Vue from 'vue';
    import { resourceData } from './datasource.js';
    import { SchedulePlugin, Week, Month, Agenda} from '@syncfusion/ej2-vue-
schedule';
    Vue.use(SchedulePlugin);
    export default {
        data () {
            return {
                width: '100%',
                height: '550px',
                selectedDate: new Date(2018, 3, 4),
                group: {
                    byDate: true,
                    resources: ['Owners']
```

Copyright © 2001 -2024 Syncfusion Inc.

```
                },
                allowMultiple: true,
                ownerDataSource: [
                    { text: 'Alice', id: 1, color: '#1aaa55' },
                    { text: 'Smith', id: 2, color: '#7fa900' }
                ],
                eventSettings: { dataSource: resourceData },
            }
        },
        provide: {
            schedule: [Week, Month, Agenda]
        }
    }
</script>
<style>
  @import "../../node_modules/@syncfusion/ej2-base/styles/material.css";

  @import "../../node_modules/@syncfusion/ej2-vue-
navigations/styles/material.css";
  @import "../../node_modules/@syncfusion/ej2-vue-
popups/styles/material.css";
  @import "../../node_modules/@syncfusion/ej2-vue-
schedule/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/schedule/single-level-resource-cs2" %}

This kind of grouping by date is not applicable on any of the timeline views.

Customizing parent resource cells

In timeline view work cells of parent resource can be customized by checking the `elementType` as `resourceGroupCells` in the event `renderCell`. In the following code example, background color of the work hours has been changed.

APP.VUE

```
<template>
    <div>
        <div id='container'>
            <ejs-schedule ref='scheduleObj' id='Schedule' width='100%'
height='550px' :eventSettings='eventSettings'
            :selectedDate='selectedDate' :currentView='currentView'
:group='group' :renderCell='onRenderCell'>
                <e-views>
                    <e-view option='TimelineDay'></e-view>
                    <e-view option='TimelineWeek'></e-view>
                    <e-view option='TimelineMonth'></e-view>
                </e-views>
                <e-resources>
```

```
                    <e-resource field='RoomId' title='Room' name='Rooms'
:dataSource='roomDataSource' textField='RoomText' idField='Id' groupIDField=
'RoomGroupId' colorField='RoomColor'>
                    </e-resource>
                    <e-resource field='OwnerId' title='Owner' name='Owners'
:allowMultiple='allowMultiple' :dataSource='ownerDataSource'
                    textField='OwnerText' idField='Id' groupIDField=
'OwnerGroupId' colorField='OwnerColor'>
                    </e-resource>
                </e-resources>
            </ejs-schedule>
        </div>
    </div>
</template>
<script>
    import Vue from 'vue';
    import { resourceData } from './datasource.js';
    import { SchedulePlugin, TimelineViews, TimelineMonth } from

Working with shared events

Multiple resources can share the same events, thus allowing the CRUD action made on it to reflect on all other shared instances simultaneously. To enable such option, set `allowGroupEdit` option to `true` within the `group` property. With this property enabled, a single appointment

object will be maintained within the appointment collection, even if it is shared by more than one resource – whereas the resource fields of such appointment object will be in array which hold the IDs of the multiple resources.

Any actions such as create, edit or delete held on any one of the shared event instances, will be reflected on all other related instances visible on the UI.

Example: To edit all the resource events simultaneously,

APP.VUE

```
<template>

{% previewsample "page.domainurl/code-snippet/schedule/resource-grouping-cs6" %}

Simple resource header customization

It is possible to customize the resource header cells using built-in template option and change the look and appearance of it in both the vertical and timeline view modes. All the resource related fields and other information can be accessed within the resource header template option.

Example: To customize the resource header and display it along with designation field, refer the below code example.

APP.VUE

```
<template>
        <div id='app'>
            <div id='container'>
                <ejs-schedule id='Schedule' width='100%' height='550px'
:eventSettings='eventSettings' :selectedDate='selectedDate' :group='group'
:resourceHeaderTemplate='resourceHeaderTemplate'>
                    <e-views>
                        <e-view option='Week'></e-view>
                        <e-view option='Month'></e-view>
                        <e-view option='TimelineWeek'></e-view>
                        <e-view option='TimelineMonth'></e-view>
                        <e-view option='Agenda'></e-view>
                    </e-views>
                    <e-resources>
                        <e-resource field='DoctorId' title='Doctor Name'
name='Doctors' :dataSource='ownerDataSource'
                        textField='text' idField='id' colorField='color'>
                        </e-resource>
                    </e-resources>
                </ejs-schedule>
            </div>
        </div>
</template>
<script>
    import Vue from 'vue';
    import { doctorData} from './datasource.js';
    import { SchedulePlugin, Week, Month, Agenda, TimelineViews,
TimelineMonth} from '@syncfusion/ej2-vue-schedule';
    Vue.use(SchedulePlugin);
    var resourceHeaderTemplateVue = Vue.component('headerTemplate', {
        template: `<div class='template-wrap'><div class="resource-
details"><div class="resource-name">{{data.resourceData.text}}</div><div
class="resource-
designation">{{data.resourceData.designation}}</div></div></div>`,
        data() {
            return {
                data: {}
            };
        }
    });
    export default {
        data () {
            return {
                selectedDate: new Date(2018, 3, 4),
                group: {
```

```
                    resources: ['Doctors']
                },
                ownerDataSource: [

```
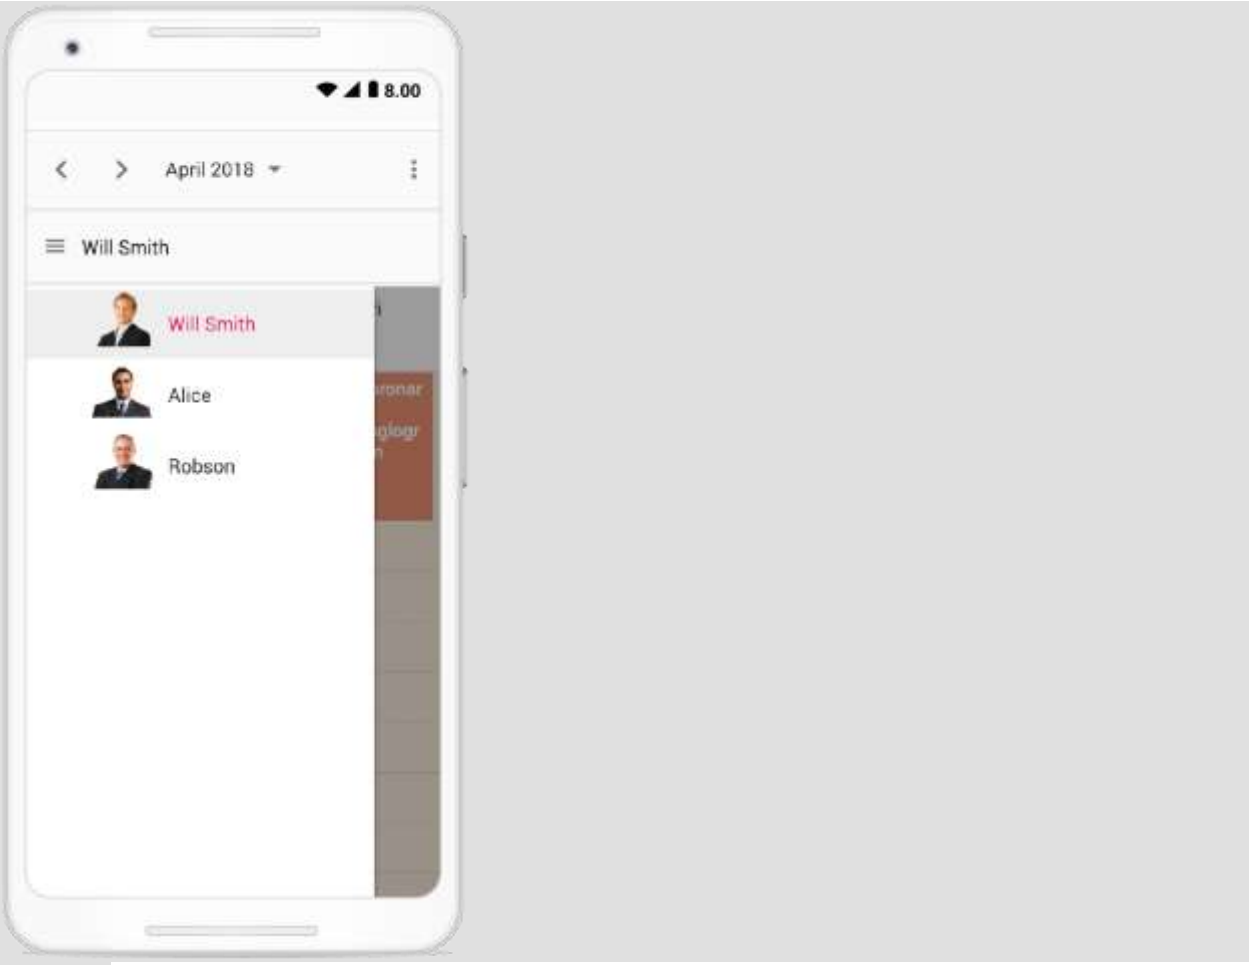
    }
    .e-schedule.e-device .e-resource-tree-popup .e-fullrow {
        height: 50px;
    }
    .e-schedule.e-device .template-wrap .resource-details .resource-
designation {
        display: none;
    }
</style>
```

{% previewsample "page.domainurl/code-snippet/schedule/resource-header-cs1" %}

To customize the resource header in compact mode properly make use of the class



e-device as in the code example.

![Resource header template in compact mode](./images/header-template.png)

Customizing resource header with multiple columns

It is possible to customize the resource headers to display with multiple columns such as Room, Type and Capacity. The following code example depicts the way to achieve it and is applicable only on timeline views.

APP.VUE

```
<template>
        <div id='app'>
            <div id='container'>
                <ejs-schedule id='Schedule' width='100%' height='550px'
:eventSettings='eventSettings' :selectedDate='selectedDate' :group='group'
:resourceHeaderTemplate='resourceHeaderTemplate' :renderCell='onRenderCell'>
                    <e-views>
                        <e-view option='TimelineWeek'></e-view>
                        <e-view option='TimelineMonth'></e-view>
                    </e-views>
                    <e-resources>
                        <e-resource field='RoomId' title='RoomType'
name='MeetingRoom'  :dataSource='ownerDataSource'
                        textField='text' idField='id' colorField='color'>
                        </e-resource>
                    </e-resources>
                </ejs-schedule>
            </div>
        </div>
</template>
<script>
    import Vue from 'vue';
    import { roomData} from './datasource.js';
    import { SchedulePlugin, TimelineViews, TimelineMonth} from
'@syncfusion/ej2-vue-schedule';
    Vue.use(SchedulePlugin);
    var resourceHeaderTemplateVue = Vue.component('headerTemplate', {
        template: `<div class='template-wrap'>
                <div class="room-name">{{data.resourceData.text}}</div>
                <div class="room-type">{{data.resourceData.type}}</div>
                <div class="room-
capacity">{{data.resourceData.capacity}}</div>
                </div>`,
        data() {
            return {
                data: {}
            };
        }
    });
    export default {
        data () {
            return {
                selectedDate: new Date(2018, 7, 1),

Collapse/Expand child resources in timeline views

It is possible to expand and collapse the resources which have child resource in timeline views dynamically. By default, resources are in expanded state with their child resource. We can collapse and expand the child resources in UI by setting `expandedField` option as `false` whereas its default value is `true`.

APP.VUE

```
<template>
    <div>
        <div id='app'>

Displaying tooltip for resource headers

It is possible to display tooltips over the resource headers showing the resource information. By default, there won't be any tooltips displayed on the resource headers, and to enable it, you need to assign the customized template design to the `headerTooltipTemplate` option within the `group` property.

Choosing among resource colors for appointments

By default, the colors defined on the top level resources collection will be applied for the events. In case, if you want to apply specific resource color to events irrespective of its top-level parent resource color, it can be achieved by defining `resourceColorField` option within the `eventSettings` property.

In the following example, the colors mentioned in the second level will get applied over the events.

Dynamically add and remove resources

It is possible to add or remove the resources dynamically to and from the Scheduler respectively. In the following example, when the checkboxes are checked and unchecked, the respective resources gets added up or removed from the Scheduler layout. To add new resource dynamically, addResource method is used which accepts the arguments such as resource object, resource name (within which level, the resource object to be added) and index (position where the resource needs to be added).

To remove the resources dynamically, removeResource method is used which accepts the index (position from where the resource to be removed) and resource name (within which level, the resource object presents) as parameters.

Setting different working days and hours for resources

Each resource in the Scheduler can have different working hours as well as different working days set to it. There are default options available within the `resources` collection, to customize the default working hours and days of the Scheduler.

Set different work days

Different working days can be set for the resources of Scheduler using the `workDaysField` property which maps the working days field from the resource dataSource. This field accepts the collection of day indexes (from 0 to 6) of a week. By default, it is set to [1, 2, 3, 4, 5] and in the following example, each resource has been set with different values and therefore each of them will render only those working days. This option is applicable only on the calendar views and is not applicable on timeline views.

Set different work hours

Working hours indicates the work hour duration of a day, which is highlighted visually with active color over the work cells. Each resource on the Scheduler can be defined with its own set of working hours as depicted in the following example.

- startHourField - Denotes the start time of the working/business hour in a day.
- endHourField - Denotes the end time limit of the working/business hour in a day.

Hide non-working days when grouped by date

In Scheduler, you can set custom work days for each resource and group the Scheduler by date to display these work days. By default, the Scheduler will show all days when it is grouped by date, even if they are not included in the custom work days for the resources. However, you can use the hideNonWorkingDays property to only display the custom work days in the Scheduler.

To use the hideNonWorkingDays property, you need to include it in the configuration options for your Scheduler component. Set the value of hideNonWorkingDays to true to enable this feature.

Example: To display the Scheduler with resources grouped by date for custom working days,

{% previewsample "page.domainurl/code-snippet/schedule/single-level-resource-cs3" %}

The hideNonWorkingDays property only applies when the Scheduler is grouped byDate.

Compact view in mobile

Although the Scheduler views are designed keeping in mind the responsiveness of the control in mobile devices, however when using Scheduler with multiple resources - it is difficult to view all the resources and its relevant events at once on the mobile. Therefore, we have introduced a new compact mode specially for displaying multiple resources of Scheduler on mobile devices. By default, this mode is enabled while using Scheduler with multiple resources on mobile devices. If in case, you need to disable this compact mode, set `false` to the `enableCompactView` option within the `group` property. Disabling this option will display the exact desktop mode of Scheduler view on mobile devices.

With this compact view enabled on mobile, you can view only single resource at a time and to switch to other resources, there is a treeview at the left listing out all other available resources - clicking on which will display that particular resource and its related appointments.

Copyright © 2001 -2024 Syncfusion Inc.

Clicking on the menu icon before the resource text will show the resources available in the Scheduler as following.

Copyright © 2001 -2024 Syncfusion Inc.

Adaptive UI in desktop

By default, the Scheduler layout adapts automatically in the desktop and mobile devices with appropriate UI changes. In case, if the user wants to display the Adaptive scheduler in desktop mode with adaptive enhancements, then the property `enableAdaptiveUI` can be set to true. Enabling this option will display the exact mobile mode of Scheduler view on desktop devices.

Some of the default changes made for compact Scheduler to render in desktop devices are as follows,

- View options displayed in the Navigation drawer.
- Plus icon is added to the header for new event creation.
- Today icon is added to the header instead of the Today button.
- With Multiple resources – only one resource has been shown to enhance the view experience of resource events details clearly. To switch to other resources, there is a TreeView on the left that lists all other available resources, clicking on which will display that particular resource and its related events.

You can refer to our Vue Scheduler feature tour page for its groundbreaking feature representations. You can also explore our Vue Scheduler example to knows how to present and manipulate data.

Header rows in Vue Schedule component

The Timeline views can have additional header rows other than its default date and time header rows. It is possible to show individual header rows for displaying year, month and week separately using the headerRows property. This property is applicable only on the timeline views. The possible rows which can be added using headerRows property are as follows.

- Year
- Month
- Week
- Date
- Hour

Copyright © 2001 -2024 Syncfusion Inc.

The Link to the Video row is not applicable for Timeline month view.

Check out this video to learn about customizing header rows of the timeline views in Vue Scheduler.

The following example shows the Scheduler displaying all the available header rows on timeline views.

APP.VUE

```
<template>
  <div id='app'>
    <div id='container'>
        <ejs-schedule :height='height' :width='width'
:selectedDate='selectedDate' :eventSettings='eventSettings' :views='views'
:startHour='startHour' :endHour='endHour' :headerRows='headerRows'></ejs-
schedule>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { SchedulePlugin, TimelineViews } from '@syncfusion/ej2-vue-
schedule';
import { scheduleData } from './datasource.js';
Vue.use(SchedulePlugin);
export default {
  data (){
    return {
      height: '550px',
      width: '100%',
      startHour: '09:00',
      endHour: '13:00',
      headerRows: [
        { option: 'Year' },
        { option: 'Month' },
        { option: 'Week' },
        { option: 'Date' },
        { option: 'Hour' }
      ],
      views: ['TimelineWeek'],
      selectedDate: new Date(2018, 11, 31),
      eventSettings: { dataSource: scheduleData }
    }
  },
  provide: {
    schedule: [TimelineViews]
  }
}
</script>

Display year and month rows in timeline views

To display the timeline Scheduler simply with year and month names alone, define the option Year and Month within the headerRows property.

APP.VUE

```
<template>
  <div id='app'>
    <div id='container'>
        <ejs-schedule :height='height' :width='width'
:selectedDate='selectedDate' :eventSettings='eventSettings' :views='views'
:currentView='currentView' :headerRows='headerRows'></ejs-schedule>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { SchedulePlugin, TimelineMonth } from '@syncfusion/ej2-vue-
schedule';
import { scheduleData } from './datasource.js';
Vue.use(SchedulePlugin);
export default {
  data (){
    return {
      width: '100%',
      height: '550px',
      selectedDate: new Date(2018, 11, 31),
      headerRows: [{ option: 'Year' }, { option: 'Month' }],
      currentView: 'TimelineMonth',
      views: [{ option: 'TimelineMonth', interval: 24 }],
      eventSettings: { dataSource: scheduleData }
    }
  },
  provide: {
    schedule: [TimelineMonth]
  }
}
</script>
<style>
  @import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../../node_modules/@syncfusion/ej2-vue-
buttons/styles/material.css";
  @import "../../node_modules/@syncfusion/ej2-vue-
calendars/styles/material.css";
  @import "../../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
```

popups/styles/material.css";
  @import "../../node_modules/@syncfusion/ej2-vue-
schedule/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/schedule/header-rows-cs2" %}

Display week numbers in timeline views

The week number can be displayed in a separate header row of the timeline Scheduler by setting Week option within headerRows property.

APP.VUE

```
<template>
  <div id='app'>
    <div id='container'>
        <ejs-schedule :height='height' :width='width'
:selectedDate='selectedDate' :eventSettings='eventSettings' :views='views'
:currentView='currentView' :headerRows='headerRows'></ejs-schedule>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { SchedulePlugin, TimelineMonth, TimelineViews } from
'@syncfusion/ej2-vue-schedule';
import { scheduleData } from './datasource.js';
Vue.use(SchedulePlugin);
export default {
  data (){
    return {
      width: '100%', height: '550px',
      selectedDate: new Date(2018, 11, 31),
      headerRows: [{ option: 'Week' }, { option: 'Date' }, { option: 'Hour'
}],
      currentView: 'TimelineMonth',
      views: [
          { option: 'TimelineMonth', interval: 24 },
          { option: 'TimelineWeek', interval: 3 },
          { option: 'TimelineDay', interval: 4 }
      ],
      eventSettings: { dataSource: scheduleData }
    }
  },
  provide: {
    schedule: [TimelineViews, TimelineMonth]
  }
}
</script>
<style>
  @import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
```

```
  @import "../../node_modules/@syncfusion/ej2-vue-
buttons/styles/material.css";
  @import "../../node_modules/@syncfusion/ej2-vue-
