```

{% previewsample "page.domainurl/code-snippet/textbox/icon-samples-cs1" %}

Floating label

The floating label TextBox floats the label above the TextBox after focusing, or filled with value in the TextBox. You can create the floating label TextBox by using `floatLabelType` API.

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
    <div class ='wrap'>
        <div id ='input-container'>
            <ejs-textbox id='textbox' floatLabelType="Auto"
placeholder="First Name"></ejs-textbox>
        </div>
    </div>
</template>
<script setup>
import { TextBoxComponent as EjsTextbox } from '@syncfusion/ej2-vue-inputs';
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
  .wrap {
    box-sizing: border-box;
    margin: 0 auto;
    padding: 20px 10px;
    width: 340px;
  }
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
    <div class ='wrap'>
        <div id ='input-container'>
            <ejs-textbox id='textbox' floatLabelType="Auto"
placeholder="First Name"></ejs-textbox>
        </div>
    </div>
</template>
<script>
import { TextBoxComponent } from '@syncfusion/ej2-vue-inputs';
export default {
   components: {
    'ejs-textbox': TextBoxComponent
   },
   data: function() {
        return { }
    }
```

Getting Started with the Vue TextBox Component in Vue 3

This article provides a step-by-step guide for setting up a Vite project with a JavaScript environment and integrating the Syncfusion Vue TextBox component using the Composition API / Options API.

The Composition API is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

The Options API is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

Prerequisites

System requirements for Syncfusion Vue UI components

Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using Vite. To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

`bash

npm create vite@latest

`

or

`bash

yarn create vite

`

Using one of the above commands will lead you to set up additional configurations for the project as below:

Copyright © 2001 -2024 Syncfusion Inc.

1.Define the project name: We can specify the name of the project directly. Let's specify the name of the project as my-project for this article.

`bash

? Project name: » my-project

`

2.Select Vue as the framework. It will create a Vue 3 project.

`bash

? Select a framework: » - Use arrow-keys. Return to submit.

Vanilla

Vue

React

Preact

Lit

Svelte

Others

`

3.Choose JavaScript as the framework variant to build this Vite project using JavaScript and Vue.

`bash

? Select a variant: » - Use arrow-keys. Return to submit.

JavaScript

TypeScript

Customize with create-vue ↗

Nuxt ↗

`

4.Upon completing the aforementioned steps to create the my-project, run the following command to install its dependencies:

`bash

cd my-project

npm install

`

or

`bash

cd my-project

yarn install

`

Now that my-project is ready to run with default settings, let's add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion Vue component packages are available at npmjs.com. To use Syncfusion Vue components in the project, install the corresponding npm package.

This article uses the Vue TextBox component as an example. To use the Vue TextBox component in the project, the @syncfusion/ej2-vue-inputs package needs to be installed using the following command:

`bash

npm install @syncfusion/ej2-vue-inputs --save

`

or

`bash

yarn add @syncfusion/ej2-vue-inputs

`

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the TextBox component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
</style>
```

The order of importing CSS styles should be in line with its dependency graph.

Add Syncfusion Vue component

Follow the below steps to add the Vue TextBox component using Composition API or Options API:

1.First, import and register the TextBox component in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { TextBoxComponent as EjsTextbox } from "@syncfusion/ej2-vue-inputs";
</script>
```

Copyright © 2001 -2024 Syncfusion Inc.

OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { TextBoxComponent } from "@syncfusion/ej2-vue-inputs";
//Component registeration
export default {
name: "App",
components: {
'ejs-textbox' : TextBoxComponent,
}
}
</script>
```

2.In the template section, define the TextBox component with the dataSource property and column definitions.

~/SRC/APP.VUE

```
<template>
<div id ='wrap'>
<div id ='input-container'>
<div>
<!--element which is going to render the TextBox-->
<input class="e-input" type="text" placeholder="Enter Date" />
</div>
</div>
</div>
</template>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<div id ='wrap'>
<div id ='input-container'>
<div>
<!--element which is going to render the TextBox-->
<input class="e-input" type="text" placeholder="Enter Date" />
</div>
</div>
</div>
</template>
<script setup>
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
.wrap {
box-sizing: border-box;
margin: 0 auto;
padding: 20px 10px;
width: 340px;
}
```

Copyright © 2001 -2024 Syncfusion Inc.

```
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<div id ='wrap'>
<div id ='input-container'>
<div>
<!--element which is going to render the TextBox-->
<input class="e-input" type="text" placeholder="Enter Date" />
</div>
</div>
</div>
</template>
<script>
export default {
name: 'App',
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
.wrap {
box-sizing: border-box;
margin: 0 auto;
padding: 20px 10px;
width: 340px;
}
</style>
```

Adding icons to the TextBox

You can create a TextBox with icon as a group by creating the parent div element with the class e-input-group and add the icon element as span with the class e-input-group-icon. For detailed information, refer to the Groups section.

~/SRC/APP.VUE

```
<!--element which is going to render the TextBox with date icon-->
<div class="e-input-group">
<input class="e-input" name='input' type="text" placeholder="Enter Date"/>
<span class="e-input-group-icon e-input-popup-date"></span>
</div>
```

~/SRC/APP.VUE

```
.e-input-group-icon.e-input-popup-date:before {
content: "\e901";
}
```

Run the project

To run the project, use the following command:

`bash

Copyright © 2001 -2024 Syncfusion Inc.

npm run dev

`

or

`bash

yarn run dev

`

Floating label

The floating label TextBox floats the label above the TextBox after focusing, or filled with value in the TextBox.

You can create the floating label TextBox by using `floatLabelType` API.

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<div class ='wrap'>
<div id ='input-container'>
<ejs-textbox id='textbox' floatLabelType="Auto" placeholder="First
Name"></ejs-textbox>
</div>
</div>
</template>
<script setup>
import { TextBoxComponent as EjsTextbox } from "@syncfusion/ej2-vue-inputs";
const data = [];
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
.wrap {
box-sizing: border-box;
margin: 0 auto;
padding: 20px 10px;
width: 340px;
}
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<div class ='wrap'>
<div id ='input-container'>
<ejs-textbox id='textbox' floatLabelType="Auto" placeholder="First
Name"></ejs-textbox>
</div>
</div>
</template>
<script>
import { TextBoxComponent } from "@syncfusion/ej2-vue-inputs";
export default {
name: 'App',
components: {
```

Copyright © 2001 -2024 Syncfusion Inc.

```
"ejs-textbox": TextBoxComponent
},
data: function () {
return {}
},
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
.wrap {
box-sizing: border-box;
margin: 0 auto;
padding: 20px 10px;
width: 340px;
}
</style>
```

The output will appear as follows:

- How to add floating label to TextBox programmatically

Groups in Vue Textbox component

The following section explains you the steps required to create TextBox with icon and floating label.

TextBox:

- Create a parent div element with the class e-input-group
- Place input element with the class e-input inside the parent div element.

`

<input class="e-input" name='input' type="text" placeholder="Enter Date"/>

`

Floating label:

- Add the e-float-input class to the parent div element.
- Remove the e-input class and add required attribute to the input element.
- Place the span element with class e-float-line after the input element.
- Place the label element with class e-float-text after the above created span element. When you focus or filled with value in the TextBox, the label floats above the TextBox.

Copyright © 2001 -2024 Syncfusion Inc.

Creating the Floating label TextBox, you have to set the required attribute to the Input element to achieve the floating label functionality which is used for validating the value existence in TextBox. If you want to render the Floating label TextBox without required attribute then refer to the Floating label without required attribute section.

`

<input type="text" required/>

<label class="e-float-text">Enter Name </label>

`

And refer to the following sections to add the icons to the TextBox.

With icon and floating label

Create an icon element as a span with the class e-input-group-icon, and the user can place the icon in either side of TextBox by adding the created icon element before/after the input.

For the floating label enabled TextBox add the icon element as first or last element inside the TextBox wrapper, and based on the element position it will act as prefix or suffix icon.

APP.VUE

```
<template>
    <div class ='wrap'>
        <div id ='input-container'>
            <h4> TextBox with icons </h4>
            <div class="e-input-group">
            <input class="e-input" type="text" placeholder="Enter Date"/>
            <span class="e-input-group-icon e-input-popup-date"></span>
            </div>
            <div class="e-input-group e-float-icon-left">
            <span class="e-input-group-icon e-input-date"></span>
            <div class="e-input-in-wrap">
                <input class="e-input" type="text" placeholder="Enter
Date"/>
            </div>
            </div>
            <div class="e-input-group e-float-icon-left">
            <span class="e-input-group-icon e-input-date"></span>
            <div class="e-input-in-wrap">
                <input class="e-input" type="text" placeholder="Enter
Date"/>
                <span class="e-input-group-icon e-input-down"></span>
            </div>
            </div>
            <h4> Floating label with icons </h4>
            <div class="e-float-input e-input-group">
                <input required type="text" />
                <span class="e-float-line"></span>
                <label class="e-float-text"> Enter Date </label>
```

classes */
    content: '\e806';
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/textbox/icon-floating-cs1" %}

To place the icon on left side of the TextBox, create a div element with the class e-input-in-wrap as wrapper to the input element and place the floating line, floating text, and right side icon element within it. Add the e-float-icon-left class to the TextBox container element.

With clear button and floating label

The clear button is added to the input for clearing the value given in the TextBox. It is shown only when the input field has a value, otherwise not shown.

You can add the clear button to the TextBox by using showClearButton API

APP.VUE

```
<template>
    <div class ='wrap'>
        <div id ='input-container'>
           <h4> TextBox with clear button </h4>
            <ejs-textbox id='textbox' floatLabelType="Never"
showClearButton="true" placeholder="First Name"></ejs-textbox>
            <h4>Floating TextBox with clear button </h4>
            <ejs-textbox id='textbox' floatLabelType="Auto"
showClearButton="true" placeholder="Last Name"></ejs-textbox>
        </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { TextBoxPlugin } from '@syncfusion/ej2-vue-inputs';
Vue.use(TextBoxPlugin);
```

    padding: 20px 10px;
    width: 340px;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/textbox/clear-icon-samples-cs1" %}

Floating label without required attribute

You can render the Floating label TextBox without required attribute by manually float the label above of the TextBox using input events.

You can manually float the label above of the TextBox by adding the below list of classes to the floating label element. The classes are:

Class Name | Description

e-label-top | Floats the label above of the TextBox.

e-label-bottom | Label to be placed as placeholder for the TextBox.

APP.VUE

```
<template>
    <div class ='wrap'>
        <div id ='input-container'>
           <h4> Floating label without required attribute </h4>
            <div class="e-float-input">
                <input type="text"  id='inpt1' />
                <span class="e-float-line"></span>
                <label class="e-float-text"> Enter Value </label>
            </div>
        </div>
    </div>
</template>
<script>
import Vue from 'vue';
export default {
   data: function() {
        return { }
    },
    mounted: function() {
        /* To get the Input element */
        let inputElement = document.getElementById('inpt1');
        /* Update the label position based on Input value */
```

```
        updateLabelState(inputElement.value,
inputElement.parentElement.querySelector('.e-float-text'));
        inputElement.addEventListener("focus", function () {
            let label = this.parentElement.querySelector('.e-float-text');
            label.classList.add('e-label-bottom');
            label.classList.remove('e-label-top');
        });

Multi-line input with floating label

Add the HTML textarea element with the e-input class to create default multi-line input.

Add the floating label support to the multi-line input by creating the floating label structure as defined in the initial section.

APP.VUE

```
<template>
    <div class ='wrap'>
        <div id ='input-container'>
           <textarea class="e-input"> Address </textarea>
            <div class="e-float-input">
                <textarea required></textarea>
                <span class="e-float-line"></span>
                <label class="e-float-text"> Address </label>
            </div>
        </div>
    </div>
</template>
<script>
import Vue from 'vue';
export default {
   data: function() {
        return { }
    },
    mounted: function() {
        let input = document.querySelectorAll('.e-input-group .e-input,.e-
float-input.e-input-group input');

Sizing in Vue Textbox component

You can render the TextBox in two different sizes.

Property | Description

Normal | By default, the TextBox is rendered with normal size.

Small | You need to add e-small class to the input element, or else add to the input container.

APP.VUE

```
<template>
    <div class ='wrap'>
        <div id ='input-container'>
            <h4> Normal Size </h4>
            <div class="e-input-group">
                <input class="e-input" type="text" placeholder="Enter Name"
/>
            </div>
            <div class="e-float-input">
                <input type='text' required />
                <span class="e-float-line"></span>
                <label class="e-float-text">Enter Name</label>
            </div>
            <div class="e-input-group">
                <input class="e-input" type="text" placeholder="Enter Date"
/>
                <span class="e-input-group-icon e-input-popup-date"></span>
            </div>
            <h4> Small Size </h4>
            <div class="e-input-group e-small">
                <input class="e-input" type="text" placeholder="Enter Name"
/>
            </div>
            <div class="e-float-input e-small">

Validation in Vue Textbox component

The TextBox supports three types of validation styles namely error, warning, and success. These states are enabled by adding corresponding classes .e-error, .e-warning, or .e-success to the input parent element.

Multiline in Vue Textbox component

This feature allows the textbox to accept one or more lines of text like address, description, comments, and more.

Create multiline textbox

You can convert the default textbox into the multiline textbox by setting the multiline API value as true or pass HTML5 textarea as element to the textbox.

The multiline textbox allows you to resize it in vertical direction alone.

APP.VUE

```
<template>
        <div class="multiline">
            <ejs-textbox name='default' :multiline="true" placeholder="Enter
your address" value= 'Mr. Dodsworth Dodsworth, System Analyst, Studio 103,
The Business Center'></ejs-textbox>
        </div>
    </div>
</template>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
<script>
import Vue from 'vue';
import { TextBoxPlugin } from '@syncfusion/ej2-vue-inputs';
Vue.use(TextBoxPlugin);
export default {
 data: function(){
        return {
        }
    }
}
</script>
<style>
@import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
    #container {
        visibility: hidden;
        padding-left: 5%;
        width: 100%;
    }
    #loader {
        color: #008cff;
        font-family: 'Helvetica Neue','calibiri';
        font-size: 14px;
        height: 40px;
        left: 45%;
        position: absolute;
        top: 45%;
        width: 30%;
    }
    .multiline{
    margin: 10px auto;
    width: 30%;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/textbox/textarea-cs1" %}

Implementing floating label

You can achieve the floating label behavior in the multiline textbox by setting floatLabelType as 'Auto'. The placeholder text act as floating label to the multiline textbox. You can provide the placeholder text to the multiline textbox either by using the placeholder property or placeholder attribute.

APP.VUE

```
<template>
        <div class="multiline">
            <label class="label">Float label type auto</label>
            <ejs-textbox id='default' :multiline="true" placeholder="Enter
your address" floatLabelType="Auto" maxlength="15"></ejs-textbox>
            <label class="label">Float label type always</label>
            <ejs-textbox id='default' :multiline="true" placeholder="Enter
your address" floatLabelType="Always"></ejs-textbox>
            <label class="label">Float label type never</label>
            <ejs-textbox id='default' :multiline="true" placeholder="Enter
your address" floatLabelType="Never"></ejs-textbox>
        </div>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
    </div>
</template>
<script>
import Vue from 'vue';
import { TextBoxPlugin } from '@syncfusion/ej2-vue-inputs';
import { ButtonPlugin } from "@syncfusion/ej2-vue-buttons";
Vue.use(TextBoxPlugin);
Vue.use(ButtonPlugin);
export default {
 data: function(){
        return {
             clickHandler: function(event) {
                  this.$refs.textareaObj.addAttributes({maxlength: 15});
             }
        }
    }
}
</script>
<style>
@import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
    #container {
        visibility: hidden;
        padding-left: 5%;
        width: 100%;
    }
    #loader {
        color: #008cff;
        font-family: 'Helvetica Neue','calibiri';
        font-size: 14px;
        height: 40px;
        left: 45%;
        position: absolute;
        top: 45%;
        width: 30%;
    }
    .multiline{
    margin: 10px auto;
    width: 30%;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/textbox/float-cs1" %}

Auto resizing

By default, you can manually resize the multiline textbox. But you can also create an auto resizing multiline textbox with both the initial and dynamic value change. It can be done by calculating the height of the textarea in the created event for initial value update and in the input event for dynamic value update of the auto resize multiline textbox, as explained in the following code sample.

APP.VUE

```
<template>
        <div class="multiline">
            <ejs-textbox ref="textareaObj" id='default' :multiline="true"
value= 'Mr. Dodsworth Dodsworth, System Analyst, Studio 103, The Business
```

```
Center' placeholder="Enter your address" floatLabelType="Auto" :input=
"inputHandler" :created= "createHandler"></ejs-textbox>
        </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { TextBoxPlugin } from '@syncfusion/ej2-vue-inputs';
Vue.use(TextBoxPlugin);
export default {
 data: function(){
        return {
            createHandler: (args) => {
                this.$refs.textareaObj.addAttributes({rows: 1});
                this.$refs.textareaObj.$el.style.height = "auto";
                this.$refs.textareaObj.$el.style.height =
(this.$refs.textareaObj.$el.scrollHeight)+"px";
            },
            inputHandler: (args) => {
                args.event.currentTarget.style.height = "auto";
                args.event.currentTarget.style.height =
(args.event.currentTarget.scrollHeight)+"px";
            }
        }
    }
}
</script>
<style>
@import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
    #container {
        visibility: hidden;
        padding-left: 5%;
        width: 100%;
    }
    #loader {
        color: #008cff;
        font-family: 'Helvetica Neue','calibiri';
        font-size: 14px;
        height: 40px;
        left: 45%;
        position: absolute;
        top: 45%;
        width: 30%;
    }
    .multiline{
        margin: 10px auto;
        width: 30%;
    }
</style>
```

{% previewsample "page.domainurl/code-snippet/textbox/auto-resize-cs1" %}

Disable resizing

By default, the multiline textbox is rendered with resizable. You can disable the resize of the multiline textbox by applying the following CSS styles.

Copyright © 2001 -2024 Syncfusion Inc.

`css

textarea.e-input,

.e-float-input textarea,

.e-float-input.e-control-wrapper textarea,

.e-input-group textarea,

.e-input-group.e-control-wrapper textarea {

resize: none;

}

`

APP.VUE

```
<template>
        <div class="multiline">
            <ejs-textbox name='default' :multiline="true" placeholder="Enter
your address" floatLabelType="Auto" cssClass="sample"></ejs-textbox>
        </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { TextBoxPlugin } from '@syncfusion/ej2-vue-inputs';
Vue.use(TextBoxPlugin);
export default {
 data: function(){
        return {
        }
    }
}
</script>
<style>
@import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
    #container {
        visibility: hidden;
        padding-left: 5%;
        width: 100%;
    }
    #loader {
        color: #008cff;
        font-family: 'Helvetica Neue','calibiri';
        font-size: 14px;
        height: 40px;
        left: 45%;
        position: absolute;
        top: 45%;
        width: 30%;
    }
    .multiline{
        margin: 10px auto;
        width: 30%;
```

Copyright © 2001 -2024 Syncfusion Inc.

```
    }
    .sample textarea[name=default]{
        resize: none;
    }
</style>
```

{% previewsample "page.domainurl/code-snippet/textbox/disable-cs1" %}

Limit the text length

By default, the text length of the multiline textbox is unlimited. You can limit the text length by setting the maxLength attribute using the addAttributes method.

APP.VUE

```
<template>
        <div class="multiline">
            <label class="label">Add maxlength attribute through
inline</label>
            <ejs-textbox id='default' :multiline="true" placeholder="Enter
your address" floatLabelType="Auto" maxlength="15"></ejs-textbox>
            <label class="label">Add maxlength attribute through
addAttributes method</label>
            <ejs-textbox id='default' :multiline="true" placeholder="Enter
your address" floatLabelType="Auto" ref="textareaObj"></ejs-textbox>
             <ejs-button id='modalbtn' v-on:click.native="modalBtnClick">Add
max length</ejs-button>
        </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { TextBoxPlugin } from '@syncfusion/ej2-vue-inputs';
import { ButtonPlugin } from "@syncfusion/ej2-vue-buttons";
Vue.use(TextBoxPlugin);
Vue.use(ButtonPlugin);
export default {
 data: function(){
        return {
             modalBtnClick: function() {
                 this.$refs.textareaObj.addAttributes({maxlength: 15});
             }
        }
    }
}
</script>
<style>
@import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-buttons/styles/material.css";
    #container {
        visibility: hidden;
        padding-left: 5%;
        width: 100%;
    }
    #loader {
        color: #008cff;
```

Copyright © 2001 -2024 Syncfusion Inc.

```
        font-family: 'Helvetica Neue','calibiri';
        font-size: 14px;
        height: 40px;
        left: 45%;
        position: absolute;
        top: 45%;
        width: 30%;
    }
    .multiline{
    margin: 10px auto;
    width: 30%;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/textbox/maxlength-cs1" %}

Count characters

You can show the number of characters entered inside the textarea by calculating the character count in the input event of multiline textbox. The character count is updated while entering or deleting any character inside the textarea. The character count shows how many characters can be entered or left to be entered.

APP.VUE

```
<template>
        <div class="multiline">
            <ejs-textbox id='default' :multiline="true" placeholder="Enter
your address" floatLabelType="Auto" :input= "inputHandler"
maxlength="25"></ejs-textbox>
            <span id='numbercount'></span>
        </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { TextBoxPlugin } from '@syncfusion/ej2-vue-inputs';
Vue.use(TextBoxPlugin);
export default {
 data: function(){
        return {
            inputHandler: (args) => {
                let word, addresscountRem, addressCount;
                word = args.value;
                addressCount = word.length;
                addresscountRem = document.getElementById('numbercount');
                addresscountRem.textContent = addressCount+"/25";
            }
        }
    }
}
</script>
<style>
@import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";

Accessibility in Vue Textbox component

The Textbox component followed the accessibility guidelines and standards, including ADA, Section 508, WCAG 2.2 standards, and WCAG roles that are commonly used to evaluate accessibility.

The accessibility compliance for the Textbox component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| WCAG 2.2 Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Section 508 Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Screen Reader Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Right-To-Left Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Color Contrast | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Mobile Device Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Keyboard Navigation Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Accessibility Checker Validation | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

Copyright © 2001 -2024 Syncfusion Inc.

| Axe-core Accessibility Validation | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> - All features of the component meet the requirement.

<img src="https://cdn.syncfusion.com/content/images/landing-page/intermediate.png" alt="Intermediate"> - Some features of the component do not meet the requirement.

<img src="https://cdn.syncfusion.com/content/images/landing-page/no.png" alt="No"> - The component does not meet the requirement.

WAI-ARIA attributes

The Textbox is characterized with complete ARIA Accessibility support that helps to access through the on-screen readers and other assistive technology devices. This component is designed with the reference of the guidelines document given in WAI ARAI Accessibility practices.

The Textbox uses the `textbox` role and following ARIA properties for its element based on its state.

| **Property** | **Functionality** |

| --- | --- |

| aria-placeholder | The `aria-placeholder` is a short hint to help the users with data entry when the Textbox has no value. |

| aria-labelledby | The `aria-labelledby` property indicates the floating label element of the Textbox. |

Ensuring accessibility

The Textbox component's accessibility levels are ensured through an accessibility-checker and axe-core software tools during automated testing.

The accessibility compliance of the Textbox component is shown in the following sample. Open the sample in a new window to evaluate the accessibility of the Textbox component with accessibility tools.

{% previewsample "https://ej2.syncfusion.com/accessibility/textbox.html" %}

Two way binding in Vue Textbox component

Two-way binding can be achieved by using the `v-model` directive in Vue. In the following sample, when you change the value in one Textbox component, v-model will automatically update the value in the other Textbox.

Copyright © 2001 -2024 Syncfusion Inc.

The following example demonstrates how to set the two-way-binding in the Textbox.

APP.VUE

```
<template>
<div id="app">
    <div id="wrapper1">
        <ejs-textbox floatLabelType="Auto" placeholder="Enter a name" v-
model="value"></ejs-textbox>
    </div>
    <div id="wrapper2">
        <ejs-textbox floatLabelType="Auto" placeholder="Enter a name" v-
model="value"></ejs-textbox>
    </div>
</div>
</template>
<script>
import Vue from 'vue';
import { TextBoxPlugin } from '@syncfusion/ej2-vue-inputs';
Vue.use(TextBoxPlugin);
export default {
 data: function(){
        return {
            value: null
        }
    }
}
</script>
<style>
@import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
#wrapper1{
    min-width: 250px;
    float: left;
    margin-left: 100px;
}
#wrapper2{
    min-width: 250px;
    float: right;
    margin-right: 100px;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/textbox/two-way-cs1" %}

Style appearance in Vue Textbox component

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

Customizing the appearance of TextBox wrapper element

Use the following CSS to customize the appearance of wrapper element.

`

/ To specify height and font size /

Copyright © 2001 -2024 Syncfusion Inc.

.e-input:not(:valid), .e-input:valid, .e-float-input.e-control-wrapper input:not(:valid), .e-float-input.e-control-wrapper input:valid, .e-float-input input:not(:valid), .e-float-input input:valid, .e-input-group input:not(:valid), .e-input-group input:valid, .e-input-group.e-control-wrapper input:not(:valid), .e-input-group.e-control-wrapper input:valid, .e-float-input.e-control-wrapper textarea:not(:valid), .e-float-input.e-control-wrapper textarea:valid, .e-float-input textarea:not(:valid), .e-float-input textarea:valid, .e-input-group.e-control-wrapper textarea:not(:valid), .e-input-group.e-control-wrapper textarea:valid, .e-input-group textarea:not(:valid), .e-input-group textarea:valid {

font-size: 30px;

height: 40px;

}

`

Customizing the TextBox placeholder

Use the following CSS to customize the TextBox placeholder

`

/ To specify font size and color /

.e-float-input.e-control-wrapper:not(.e-error) input:valid ~ label.e-float-text, .e-float-input.e-control-wrapper:not(.e-error) input ~ label.e-label-top.e-float-text {

color: pink;

font-size: 15px;

}

`

How To

Set the rounded corner in Vue Textbox component

Render the TextBox with `rounded corner` by adding the `e-corner` class to the input parent element.

APP.VUE

```
<template>
    <div class ='wrap'>
        <div id ='input-container'>
            <div class="e-input-group e-corner">
                <input class="e-input" type="text" placeholder="Enter Date"
/>
                <span class="e-input-group-icon e-input-popup-date"></span>
            </div>
            <div class="e-float-input e-input-group e-corner">
                <input type='text' required />
                <span class="e-float-line"> </span>
                <label class="e-float-text">Enter Date </label>
                <span class="e-input-group-icon e-input-popup-date"></span>
            </div>
        </div>
    </div>
</template>
<script>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
import Vue from 'vue';
export default {
   data: function() {
        return { }
    },
    mounted: function() {
        // To get the all input fields and its container.
        let inputElement = document.querySelectorAll('.e-input-group .e-
input,.e-float-input.e-input-group input');
        // Add 'e-input-focus' class to the input for achive ripple effect
when focus on the input field.
        for (let i = 0; i < inputElement.length; i++) {
            inputElement[i].addEventListener("focus", function () {
                let parentElement = this.parentNode;
                if (parentElement.classList.contains('e-input-in-wrap')) {
                    parentElement.parentNode.classList.add('e-input-focus');
                } else {
                    this.parentNode.classList.add('e-input-focus');
                }
            });
            inputElement[i].addEventListener("blur", function () {
                let parentElement = this.parentNode;
                if (parentElement.classList.contains('e-input-in-wrap')) {
                    parentElement.parentNode.classList.remove('e-input-
focus');
                } else {
                    this.parentNode.classList.remove('e-input-focus');
                }
            });
        }
        // Add 'e-input-btn-ripple' class to the icon element for achive
ripple effect when click on the icon.
        var inputIcon = document.querySelectorAll('.e-input-group-icon');
        for (let i = 0; i < inputIcon.length; i++) {
            inputIcon[i].addEventListener('mousedown', function () {
                this.classList.add('e-input-btn-ripple');
            });
            inputIcon[i].addEventListener('mouseup', function () {
                let element = this;
                setTimeout(function () {
                    element.classList.remove('e-input-btn-ripple');
                }, 500);
            });
        }
    });
}
</script>
<style>
  @import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../../node_modules/@syncfusion/ej2-vue-

Add textbox programmatically in Vue Textbox component

- Create a TypeScript file and import the Input modules from ej2-inputs library as shown below.

`ts

import {Input} from '@syncfusion/ej2-inputs';

`

- Pass the HTML Input element as parameter to the createInput method.
- You can also add the icons on the input by passing buttons property value with the class name e-input-group-icon as parameter to the createInput method.

APP.VUE

```
<template>
    <div class ='wrap'>
        <div id ='input-container'>
        </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { Input, InputObject } from  '@syncfusion/ej2-inputs';
export default {
```

```
    data: function() {
        return { }
    },
    mounted: function() {
        // To get the all input fields and its container.
        let inputElement = document.querySelectorAll('.e-input-group .e-
input,.e-float-input.e-input-group input');
        // Add 'e-input-focus' class to the input for achive ripple effect
when focus on the input field.
        for (let i = 0; i < inputElement.length; i++) {
            inputElement[i].addEventListener("focus", function () {
                this.parentNode.classList.add('e-input-focus')
            });
            inputElement[i].addEventListener("blur", function () {
                this.parentNode.classList.remove('e-input-focus')
            });
        }
        // Add 'e-input-btn-ripple' class to the icon element for achive
ripple effect when click on the icon.
        var inputIcon = document.querySelectorAll('.e-input-group-icon');
        for (let i = 0; i < inputIcon.length; i++) {
            inputIcon[i].addEventListener('mousedown', function () {
                this.classList.add('e-input-btn-ripple');
            });
            inputIcon[i].addEventListener('mouseup', function () {
                var element = this;
                setTimeout(function () {

{% previewsample "page.domainurl/code-snippet/textbox/utility-rendering-cs1" %}

Add floating label to textbox programmatically in Vue Textbox component

The Floating Label TextBox floats label above the TextBox after focusing, or entering a value in the TextBox.

Floating label supports the types of actions as given below.

Type | Description

Auto | The floating label will float above the input after focusing, or entering a value in the input.

Always | The floating label will always float above the input.

Never | By default, never float the label in the input when the placeholder is available.

- Import the Input modules from ej2-inputs library as shown below.

`

import {Input} from '@syncfusion/ej2-inputs';

`

- Pass the HTML Input element and floatLabelType property as Auto to the createInput method.
- Set the placeholder value to the input element via element attribute or pass the parameter to the createInput method.

The watermark label will be updated based on the specified placeholder value of the Floating Label TextBox.

- You can add the icons on the input by passing buttons property value with the class name e-input-group-icon as parameter to the createInput method.

APP.VUE

```
<template>
    <div class ='wrap'>
        <div id="input-container">
            <h4> FloatLabelType as Auto </h4>
        </div>
        <div id="input-container-01">
            <h4> FloatLabelType as Always </h4>
        </div>
        <div id="input-container-02">
            <h4> FloatLabelType as Never </h4>
        </div>
        <div id="input-container-03">
            <h4> Float label input with icons </h4>
        </div>
    </div>
</template>
```

Change the floating label color of the textbox in Vue Textbox component

You can change the floating label color of the TextBox for both success and warning validation states by applying the following CSS styles.

`css

/ *For Success state* /

.e-float-input.e-success label.e-float-text,

.e-float-input.e-success input:focus ~ label.e-float-text,

.e-float-input.e-success input:valid ~ label.e-float-text {

color: #22b24b;

}

/ *For Warning state* /

.e-float-input.e-warning label.e-float-text,

.e-float-input.e-warning input:focus ~ label.e-float-text,

.e-float-input.e-warning input:valid ~ label.e-float-text {

color: #ffca1c;

}

`

APP.VUE

Change the color of the textbox based on its value in Vue Textbox component

You can change the color of the TextBox by validating its value using regular expression in the keyup event for predicting the numeric values as demonstrated in the following code sample.

APP.VUE

```
<template>
    <div class ='wrap'>
        <div id ='input-container'>
            <label>Normal Input</label>
            <div class="e-input-group">
                <input class="e-input" type="text" placeholder="Enter numeric values" @keyup="onKeyup" />
            </div>
                <label> Floating Input </label>
            <div class="e-float-input">
                <input type="text" @keyup="onKeyup" required />
                <span class="e-float-line"> </span>
                <label class="e-float-text">Enter numeric values</label>
            </div>
        </div>
    </div>
</template>
<script>
import Vue from 'vue';
export default {
   data: function() {
```

```
        return { }
    },
    methods: {
        // To Configure RegExp for predicting Numeric values on keyUp event
function
        onKeyup(e) {
            let str = e.target.value.match(/^[0-9]+$/);
            if (!((str && str.length > 0)) && e.target.value.length) {
            e.target.parentElement.classList.add('e-error');
            } else {
            e.target.parentElement.classList.remove('e-error');
            }
        }
    }
    mounted: function() {
        // To get the all input fields and its container.
        let inputElement = document.querySelectorAll('.e-input-group .e-
input,.e-float-input.e-input-group input');
        // Add 'e-input-focus' class to the input for achive ripple effect
when focus on the input field.
        for (let i = 0; i < inputElement.length; i++) {
            inputElement[i].addEventListener("focus", function () {
                let parentElement = this.parentNode;
                if (parentElement.classList.contains('e-input-in-wrap')) {
                    parentElement.parentNode.classList.add('e-input-focus');
                } else {
                    this.parentNode.classList.add('e-input-focus');
                }
            });
            inputElement[i].addEventListener("blur", function () {
                let parentElement = this.parentNode;
                if (parentElement.classList.contains('e-input-in-wrap')) {
                    parentElement.parentNode.classList.remove('e-input-
focus');
                } else {
                    this.parentNode.classList.remove('e-input-focus');
                }
            });
        }
    });
}
</script>
<style>
  @import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../../node_modules/@syncfusion/ej2-vue-
inputs/styles/material.css";

    color: #f44336;
  }
  .e-float-input.e-error input { /* csslint allow: adjoining-classes */
    color: #f44336;
  }
  .wrap label { /* csslint allow: adjoining-classes */
    font-weight:bold;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/textbox/text-color-cs1" %}

Add floating label to read only textbox in Vue Textbox component

You can achieve floating label for read-only textboxes by adding/removing e-label-top and e-label-bottom classes to the label element

In this sample, click the update value button to fill the read-only textbox with value and float a label.

APP.VUE

```
<template>
    <div class ='wrap'>
        <div class="row">
          <div class="e-float-input">
            <input class="e-input myField" id="myText" name="readonlyAttr"
type="text" readOnly>
            <span class="e-float-line"></span>
            <label class="e-float-text">Enter value</label>
          </div>
          <div class="row">
            <button class="e-btn update_value" id='valuebtn' v-
on:click="valuebtnClick">Set value</button>
            <button class="e-btn remove_value" id='removebtn' v-
on:click="removebtnClick">Remove value</button>
          </div>
        </div>
    </div>
</template>
<script>
import Vue from 'vue';
export default {
   data: function() {
        return { }
    },
    methods: {
        valuebtnClick: function(args){
            (document.getElementsByClassName('myField')[0]).value = '10';
            this.checkFloatingLabel('myText')
        },
        removebtnClick: function(args){
            (document.getElementsByClassName('myField')[0]).value = '';
            this.checkFloatingLabel('myText')
        },
        checkFloatingLabel: function(id) {
```

```
        var inputElement=  document.getElementById(id);
        var labelElement = inputElement.parentElement.querySelector('.e-
float-text');
        if (inputElement.value !== '') {
            labelElement.classList.remove('e-label-bottom');
            labelElement.classList.add('e-label-top');
        } else {
            labelElement.classList.remove('e-label-top');
            labelElement.classList.add('e-label-bottom');
        }
        var inputField = document.getElementById('myText');
        }
    },
    mounted: function() {
        // To get the all input fields and its container.
        let inputElement = document.querySelectorAll('.e-input-group .e-
input,.e-float-input.e-input-group input');
        // Add 'e-input-focus' class to the input for achive ripple effect
when focus on the input field.
        for (let i = 0; i < inputElement.length; i++) {
            inputElement[i].addEventListener("focus", function () {
                this.parentNode.classList.add('e-input-focus');
            });
            inputElement[i].addEventListener("blur", function () {
                this.parentNode.classList.remove('e-input-focus');
            });
        }
    }
};
</script>
<style>
  @import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
.wrap {
  box-sizing: border-box;
  margin: 0 auto;
  padding: 20px 10px;
  width: 260px;
}
.update_value, .remove_value {
    margin-top: 20px;
}
.remove_value {
    margin-left: 10px;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/textbox/read-only-cs1" %}

Customize the textbox background color and text color in Vue Textbox component

You can customize the textbox styles such as background-color, text-color and border-color by overriding its default styles.

To change the styles of the floating label, you must override the style to the input element.

APP.VUE

```
<template>
    <div class ='wrap'>
        <div id ='input-container'>
            <label>Normal Input</label>
            <div class="e-input-group">
                <input class="e-input" type="text" placeholder="First Name"
/>
            </div>
                <label> Floating Input </label>
            <div class="e-float-input">
                <input type="text" required />
                <span class="e-float-line"> </span>
                <label class="e-float-text">Last Name</label>
            </div>
        </div>
    </div>
</template>
<script>
import Vue from 'vue';
export default {
   data: function() {
        return { }
    },
    mounted: function() {
        // To get the all input fields and its container.
        let inputElement = document.querySelectorAll('.e-input-group .e-
input,.e-float-input.e-input-group input');
        // Add 'e-input-focus' class to the input for achive ripple effect
when focus on the input field.
        for (let i = 0; i < inputElement.length; i++) {
            inputElement[i].addEventListener("focus", function () {
                this.parentNode.classList.add('e-input-focus');
            });
            inputElement[i].addEventListener("blur", function () {
                this.parentNode.classList.remove('e-input-focus');
            });
        }
    });
});
</script>
<style>
  @import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../../node_modules/@syncfusion/ej2-vue-
inputs/styles/material.css";
.wrap {
  box-sizing: border-box;
  margin: 0 auto;
  padding: 20px 10px;
  width: 260px;

TimePicker

Getting Started with the Vue Timepicker Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using Vue-CLI and integrating the Syncfusion Vue Timepicker component using the Composition API / Options API.

Prerequisites

System requirements for Syncfusion Vue UI components

Dependencies

The list of dependencies required to use the Vue TimePicker component in your application is given below:

`javascript

|-- @syncfusion/ej2-vue-calendars

|-- @syncfusion/ej2-base

|-- @syncfusion/ej2-data

|-- @syncfusion/ej2-vue-base

|-- @syncfusion/ej2-calendars

|-- @syncfusion/ej2-inputs

|-- @syncfusion/ej2-splitbuttons

Copyright © 2001 -2024 Syncfusion Inc.

|-- @syncfusion/ej2-lists

|-- @syncfusion/ej2-popups

|-- @syncfusion/ej2-buttons

`

Setting up the Vue 2 project

To generate a Vue 2 project using Vue-CLI, use the vue create command. Follow these steps to install Vue CLI and create a new project:

`bash

npm install -g @vue/cli

vue create quickstart

cd quickstart

npm run serve

`

or

`bash

yarn global add @vue/cli

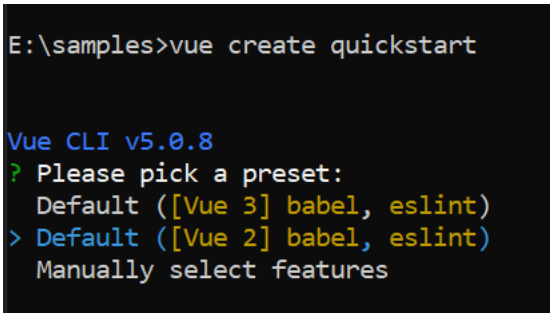
vue create quickstart

cd quickstart

yarn run serve

`

When creating a new project, choose the option Default ([Vue 2] babel, eslint) from the menu.



Once the quickstart project is set up with default settings, proceed to add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion packages are available at npmjs.com. To use Vue components, install the required npm package.

This article uses the Vue Timepicker component as an example. Install the @syncfusion/ej2-vue-calendars package by running the following command:

Copyright © 2001 -2024 Syncfusion Inc.

`bash

npm install @syncfusion/ej2-vue-calendars --save

`

or

`bash

yarn add @syncfusion/ej2-vue-calendars

`

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, the Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the Timepicker component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
</style>
```

Note: If you want to refer the combined component styles, please make use of our CRG (Custom Resource Generator) in your application.

Add Syncfusion Vue component

Follow the below steps to add the Vue Timepicker component using Composition API or Options API:

1\. First, import and register the Timepicker component in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { TimePickerComponent as EjsTimepicker } from '@syncfusion/ej2-vue-
calendars';
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { TimePickerComponent } from '@syncfusion/ej2-vue-calendars';
export default {
components: {
'ejs-timepicker': TimePickerComponent
```

Copyright © 2001 -2024 Syncfusion Inc.

```
}
}
</script>
```

2\. In the template section, define the Timepicker component with the placeholder property.

~/SRC/APP.VUE

```
<template>
<div id="app">
<div class='wrapper'>
<ejs-timepicker :placeholder="waterMark"></ejs-timepicker>
</div>
</div>
</template>
```

3\. Declare the value for the placeholder property in the script section.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { TimePickerComponent as EjsTimepicker } from '@syncfusion/ej2-vue-
calendars';
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
data () {
return {
waterMark : 'Select a time'
}
}
</script>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
    <div id="app">
      <div class='wrapper'>
        <ejs-timepicker :placeholder="waterMark"></ejs-timepicker>
      </div>
    </div>
</template>
<script setup>
import { TimePickerComponent as EjsTimepicker } from '@syncfusion/ej2-vue-
calendars';
const waterMark = 'Select a time';
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
```

Copyright © 2001 -2024 Syncfusion Inc.

```
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
  .wrapper {
    max-width: 250px;
    margin: 0 auto;
  }
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
    <div id="app">
      <div class='wrapper'>
        <ejs-timepicker :placeholder="waterMark"></ejs-timepicker>
      </div>
    </div>
</template>
<script>
import { TimePickerComponent } from '@syncfusion/ej2-vue-calendars';
export default {
  components: {
    'ejs-timepicker': TimePickerComponent
  },
  data () {
    return {
      waterMark : 'Select a time'
    }
  }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
  .wrapper {
    max-width: 250px;
    margin: 0 auto;
  }
</style>
```

Run the project

To run the project, use the following command:

`bash

npm run serve

`

or

`bash

yarn run serve

`

{% previewsample "page.domainurl/code-snippet/timepicker/getting-started-cs1" %}

Setting the value, min, and max time

The following example demonstrates how to set the value, min, and max time on initializing the TimePicker. The Vue TimePicker allows you to select the time value within a range from 7:00 AM to 4:00 PM.

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
    <div id="app">
      <div class='wrapper'>
       <ejs-timepicker :min="minDate" :max="maxDate" :value="timeVal"></ejs-
timepicker>
      </div>
    </div>
</template>
<script setup>
import { TimePickerComponent as EjsTimepicker } from '@syncfusion/ej2-vue-
calendars';
const minDate =  new Date("05/07/2017 7:00 AM");
const maxDate = new Date("05/07/2017 4:00 PM");
const timeVal = new Date("05/27/2017 1:00 PM");

</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
   .wrapper {
    max-width: 250px;
    margin: 0 auto;
  }
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
    <div id="app">
      <div class='wrapper'>
       <ejs-timepicker :min="minDate" :max="maxDate" :value="timeVal"></ejs-
timepicker>
      </div>
    </div>
</template>
<script>
import { TimePickerComponent } from '@syncfusion/ej2-vue-calendars';
export default {
  components: {
    'ejs-timepicker': TimePickerComponent
  },
  data () {
```

Copyright © 2001 -2024 Syncfusion Inc.

```
        return {
           minDate : new Date("05/07/2017 7:00 AM"),
           maxDate : new Date("05/07/2017 4:00 PM"),
           timeVal : new Date("05/27/2017 1:00 PM")
        }
    }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
   .wrapper {
    max-width: 250px;
    margin: 0 auto;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/timepicker/min-max-cs1" %}

Setting the time format

Time formats is a way of representing the time value in different string format in textbox and popup list. By default, the TimePicker's format is based on the culture. You can also customize the format by using the format property. To know more about the time format standards, refer to the Date and Time Format section.

The following example demonstrates the TimePicker component in 24 hours format with 60 minutes interval. The time interval is set to 60 minutes by using the step property.

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
    <div id="app">
    <div class='wrapper'>
    <ejs-timepicker :step="timeStep" :format="timeFormat"
:value="timeVal"></ejs-timepicker></div>
  </div>
</template>
<script setup>
import { TimePickerComponent as EjsTimepicker } from '@syncfusion/ej2-vue-
calendars';
const timeStep = 60;
const timeFormat = 'HH:mm';
const timeVal = new Date();
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
   .wrapper {
    max-width: 250px;
    margin: 0 auto;
```

Copyright © 2001 -2024 Syncfusion Inc.

```
  }
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
    <div id="app">
    <div class='wrapper'>
    <ejs-timepicker :step="timeStep" :format="timeFormat"
:value="timeVal"></ejs-timepicker></div>
  </div>
</template>
<script>
import { TimePickerComponent } from '@syncfusion/ej2-vue-calendars';
export default {
  components: {
    'ejs-timepicker': TimePickerComponent
  },
  data () {
        return {
           timeStep : 60,
           timeFormat : 'HH:mm',
           timeVal : new Date()
        }
    }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
   .wrapper {
    max-width: 250px;
    margin: 0 auto;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/timepicker/format-cs1" %}

Once the time format property is defined, it will be applicable to all the cultures.

Getting Started with the Vue TimePicker Component in Vue 3

This article provides a step-by-step guide for setting up a Vite project with a JavaScript environment and integrating the Syncfusion Vue TimePicker component using the Composition API / Options API.

Copyright © 2001 -2024 Syncfusion Inc.

The Composition API is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

The Options API is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

Prerequisites

System requirements for Syncfusion Vue UI components

Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using Vite. To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

`bash

npm create vite@latest

`

or

`bash

yarn create vite

`

Using one of the above commands will lead you to set up additional configurations for the project as below:

1.Define the project name: We can specify the name of the project directly. Let's specify the name of the project as my-project for this article.

`bash

? Project name: » my-project

`

2.Select Vue as the framework. It will create a Vue 3 project.

`bash

? Select a framework: » - Use arrow-keys. Return to submit.

Vanilla

Vue

React

Preact

Lit

Svelte

Others

`

Copyright © 2001 -2024 Syncfusion Inc.

3.Choose JavaScript as the framework variant to build this Vite project using JavaScript and Vue.

`bash

? Select a variant: » - Use arrow-keys. Return to submit.

JavaScript

TypeScript

Customize with create-vue ↗

Nuxt ↗

`

4.Upon completing the aforementioned steps to create the my-project, run the following command to install its dependencies:

`bash

cd my-project

npm install

`

or

`bash

cd my-project

yarn install

`

Now that my-project is ready to run with default settings, let's add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion Vue component packages are available at npmjs.com. To use Syncfusion Vue components in the project, install the corresponding npm package.

This article uses the Vue TimePicker component as an example. To use the Vue TimePicker component in the project, the @syncfusion/ej2-vue-calendars package needs to be installed using the following command:

`bash

npm install @syncfusion/ej2-vue-calendars --save

`

or

`bash

yarn add @syncfusion/ej2-vue-calendars

`

Copyright © 2001 -2024 Syncfusion Inc.

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the TimePicker component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
</style>
```

The order of importing CSS styles should be in line with its dependency graph.

Add Syncfusion Vue component

Follow the below steps to add the Vue TimePicker component using Composition API or Options API:

1.First, import and register the TimePicker component in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { TimePickerComponent as EjsTimepicker } from "@syncfusion/ej2-vue-
calendars";
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { TimePickerComponent } from "@syncfusion/ej2-vue-calendars";
//Component registeration
export default {
name: "App",
components: {
'ejs-timepicker' : TimePickerComponent,
}
}
</script>
```

2.In the template section, define the TimePicker component with the dataSource property and column definitions.

~/SRC/APP.VUE

```
<template>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
<div class="control_wrapper">
<ejs-timepicker></ejs-timepicker>
</div>
</template>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<div class="control_wrapper">
<ejs-timepicker></ejs-timepicker>
</div>
</template>
<script setup>
import { TimePickerComponent as EjsTimepicker } from "@syncfusion/ej2-vue-
calendars";
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
.control_wrapper {
max-width: 250px;
margin: 0 auto;
}
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<div class="control_wrapper">
<ejs-timepicker></ejs-timepicker>
</div>
</template>
<script>
import { TimePickerComponent } from "@syncfusion/ej2-vue-calendars";
//Component registeration
export default {
name: 'App',
components: {
"ejs-timepicker": TimePickerComponent
},
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
.control_wrapper {
max-width: 250px;
margin: 0 auto;
```

Copyright © 2001 -2024 Syncfusion Inc.

```
}
</style>
```

Run the project

To run the project, use the following command:

`bash

npm run dev

`

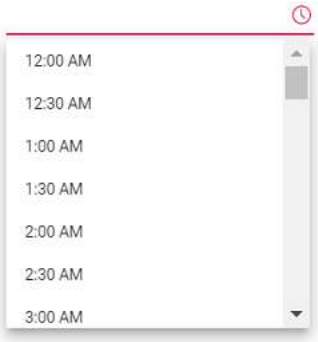
or

`bash

yarn run dev

`

The output will appear as follows:



Setting the value, min, and max time

The following example demonstrates how to set the value, min, and max time on initializing the TimePicker. The TimePicker allows you to select the time value within a range from 7:00 AM to 4:00 PM.

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<div id="app">
<div class='wrapper'>
<ejs-timepicker :min="data[0].minDate" :max="data[0].maxDate"
:value="data[0].timeVal"></ejs-timepicker>
</div>
</div>
</template>
<script setup>
import { TimePickerComponent as EjsTimepicker } from "@syncfusion/ej2-vue-
calendars";
const data = [{ minDate : new Date("05/07/2017 7:00 AM"),
maxDate : new Date("05/07/2017 4:00 PM"),
timeVal : new Date("05/27/2017 1:00 PM") }]
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
```

```
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
.wrapper {
max-width: 250px;
margin: 0 auto;
}
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<div id="app">
<div class='wrapper'>
<ejs-timepicker :min="minDate" :max="maxDate" :value="timeVal"></ejs-
timepicker>
</div>
</div>
</template>
<script>
import { TimePickerComponent } from "@syncfusion/ej2-vue-calendars";
//Component registeration
export default {
name: 'App',
components: {
"ejs-timepicker": TimePickerComponent
},
data () {
return {
minDate : new Date("05/07/2017 7:00 AM"),
maxDate : new Date("05/07/2017 4:00 PM"),
timeVal : new Date("05/27/2017 1:00 PM")
}
}
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
.wrapper {
max-width: 250px;
margin: 0 auto;
}
</style>
```

The output will appear as follows:

Setting the time format

Time formats is a way of representing the time value in different string format in textbox and popup list. By default, the TimePicker's format is based on the culture. You can also customize the format by using the format property. To know more about the time format standards, refer to the Date and Time Format section.

The following example demonstrates the TimePicker component in 24 hours format with 60 minutes interval. The time interval is set to 60 minutes by using the step property.

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<div id="app">
<div class='wrapper'>
<ejs-timepicker :step="data[0].timeStep" :format="data[0].timeFormat"
:value="data[0].timeVal"></ejs-timepicker>
</div>
</div>
</template>
<script setup>
import { TimePickerComponent as EjsTimepicker } from "@syncfusion/ej2-vue-
calendars";
const data = [{ timeStep : 60,
timeFormat : 'HH:mm',
timeVal : new Date() }]
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
.wrapper {
max-width: 250px;
margin: 0 auto;
}
</style>
```

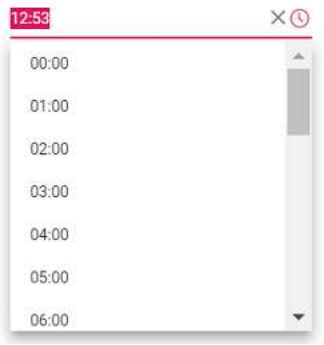
OPTIONS API (~/SRC/APP.VUE)

```
<template>
<div id="app">
<div class='wrapper'>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
<ejs-timepicker :step="timeStep" :format="timeFormat"
:value="timeVal"></ejs-timepicker>
</div>
</div>
</template>
<script>
import { TimePickerComponent } from "@syncfusion/ej2-vue-calendars";
//Component registeration
export default {
name: 'App',
components: {
"ejs-timepicker": TimePickerComponent
},
data () {
return {
timeStep : 60,
timeFormat : 'HH:mm',
timeVal : new Date()
}
}
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
.wrapper {
max-width: 250px;
margin: 0 auto;
}
</style>
```

Output be like the below.



Once the time format property is defined, it will be applicable to all the cultures.

Time range in Vue Timepicker component

TimePicker provides an option to select a time value within a specified range by using the min and max properties. The min value should always be lesser than the max value.

When the min and max properties are configured and the selected time value is out-of-range or invalid, then the model value will be set to out of range time value or null respectively with highlighted error class to indicates the time is out of range or invalid.

The value property depends on the min/max with respect to strictMode property.

The following example allows you to select a time value within a range of 9:00 AM to 11:30 AM.

APP.VUE

```
<template>
  <div id="app">
        <div class='wrap'>
           <ejs-timepicker id='timepicker' :value='timeval' :min='minTime'
:max='maxTime'></ejs-timepicker>
        </div>
  </div>
</template>
<script>
import Vue from "vue";
import { TimePickerPlugin } from "@syncfusion/ej2-vue-calendars";
Vue.use(TimePickerPlugin);
export default {
  data () {
    return{
        timeval:new Date('3/8/2017 11:00 AM'),
        minTime: new Date('3/8/2017 9:00 AM'),
        maxTime: new Date('3/8/2017 11:30 AM')
    }
  }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
 .wrap {
    margin: 35px auto;
    width: 240px;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/timepicker/range-cs1" %}

If the value of min or max property is changed through code behind you have to update the value property to set within the range.

Copyright © 2001 -2024 Syncfusion Inc.

Time masking in Vue Timepicker component

TimePicker has enableMask property that provides the option to enable the built-in date masking support. Also, you must inject the MaskedDateTime module to enable the masking support.

APP.VUE

```
<template>
<div id="app">
        <div class='wrapper'>
        <ejs-timepicker id="timepicker" :enableMask="true"></ejs-timepicker>
     </div>
  </div>
</template>
<script>
import Vue from "vue";
import { TimePickerPlugin, TimePicker, MaskedDateTime } from
"@syncfusion/ej2-vue-calendars";
TimePicker.Inject(MaskedDateTime)
Vue.use(TimePickerPlugin);
export default Vue.extend({
  data: function() {
    return {
    };
  },
  provide: {
      timepicker: [MaskedDateTime]
  }
});
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
  .wrapper {
    max-width: 250px;
    margin: 0 auto;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/timepicker/mask-module-cs1" %}

The mask pattern is defined based on the provided time format to the component. If the format is not specified, the mask pattern is formed based on the default format of the current culture.

| **Keys** | **Actions** |

| --- | --- |

| Up / Down arrows | To increment and decrement the selected portion of the time. |

| Left / Right arrows and Tab | To navigate the selection from one portion to next portion |

The following example demonstrates default and custom format of TimePicker component with mask.

APP.VUE

Copyright © 2001 -2024 Syncfusion Inc.

```
<template>
<div id="app">
        <div class='wrapper1'>
         <!-- Specifies the masked timepicker without format property. -->
         <ejs-timepicker id="timepicker" :enableMask="true" ></ejs-
timepicker>
     </div>
     <div class='wrapper2'>
          <!-- Specifies the masked timepicker with format property. -->
         <ejs-timepicker id="format" :enableMask="true"
:format="dateFormat"></ejs-timepicker>
     </div>
  </div>
</template>
<script>
import Vue from "vue";
import { TimePickerPlugin, TimePicker, MaskedDateTime } from
"@syncfusion/ej2-vue-calendars";
TimePicker.Inject(MaskedDateTime)
Vue.use(TimePickerPlugin);
export default{
  data() {
    return {
      dateFormat: 'hh:mm a'
    };
  },
  provide: {
      timepicker: [MaskedDateTime]
  }
};
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
#wrapper1{
  min-width: 250px;
    float: left;
    margin-left: 100px;
}
#wrapper2{
  min-width: 250px;
    float: right;
     margin-right: 100px;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/timepicker/mask-module-cs2" %}

Configure Mask Placeholder

You can change mask placeholder value through property `maskPlaceholder`. By default , it takes the full name of time co-ordinates such as `hour`, `minute` and `second`.

Copyright © 2001 -2024 Syncfusion Inc.

While changing to a culture other than English, ensure that locale text for the concerned culture is loaded through load method of L10n class for mask placeholder values like below.

`ts

//Load the L10n from ej2-base

import { L10n } from '@syncfusion/ej2-base';

//load the locale object to set the localized mask placeholder value

L10n.load({

'de': {

'timepicker': { hour: 'Stunde' ,minute: 'Minute', second:'Sekunde' }

}

});

`

The following example demonstrates default and customized mask placeholder value.

APP.VUE

```
<template>
<div id="app">
        <div class='wrapper1'>
        <!-- Specifies the masked timepicker without mask placeholder. -->
        <ejs-timepicker id="timepicker" :enableMask="true" ></ejs-
timepicker>
     </div>
     <div class='wrapper2'>
        <!-- Specifies the masked timepicker with mask placeholder. -->
        <ejs-timepicker id="placeholder" :enableMask="true"
:maskPlaceholder="maskPlaceholderValue"></ejs-timepicker>
     </div>
  </div>
</template>
<script>
import Vue from "vue";
import { TimePickerPlugin, TimePicker, MaskedDateTime } from
"@syncfusion/ej2-vue-calendars";
TimePicker.Inject(MaskedDateTime)
Vue.use(TimePickerPlugin);
export default{
  data() {
    return {
      maskPlaceholderValue: { hour: 'h', minute: 'm', second: 's' }
    };
  },
  provide: {
      timepicker: [MaskedDateTime]
  }
};
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
```

Copyright © 2001 -2024 Syncfusion Inc.

```
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
#wrapper1{
  min-width: 250px;
    float: left;
    margin-left: 100px;
}
#wrapper2{
  min-width: 250px;
  float: right;
  margin-right: 100px;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/timepicker/mask-module-cs3" %}

Globalization in Vue Timepicker component

Globalization is the combination of internalization and localization. You can adapt the component to various languages by parsing and formatting the date or number internationalization, and also add culture specific customization and translation to the text localization.

By default, the time format and meridian names are specific to the American English culture. It utilizes the Essential JavaScript 2 Internationalization package to parse and format the date object based on the culture by using the official UNICODE CLDR JSON data. It provides the loadCldr method to load culture specific CLDR JSON data. To use a different culture other than English, follow the steps below:

- Install the CLDR-Data package by using the following command (installs all the CLDR JSON data). To know more about CLDR-Data refer to the CLDR-Data link.

`

npm install cldr-data --save

`

Once the package is installed, you can find the culture specific JSON data under the location /node_modules/cldr-data.

- Import the installed CLDR JSON data into the app.vue file.
- Use the loadCldr

method to load the culture specific CLDR JSON data from the installed location to app.vue file.

- TimePicker displayed Sunday as the first day of week based on default culture ("en-US"). If you want to display the TimePicker with loaded culture's first day of week, you need to import weekdata.json file from the cldr-data/suppemental as given in the code example.

`ts

//Load the loadCldr from ej2-base

Copyright © 2001 -2024 Syncfusion Inc.

import { loadCldr } from '@syncfusion/ej2-base';

import * as numberingSystems from 'cldr-data/supplemental/numberingSystems.json';

import * as gregorian from 'cldr-data/main/de/ca-gregorian.json';

import * as numbers from 'cldr-data/main/de/numbers.json';

import * as weekData from 'cldr-data/supplemental/weekdata.json';// To load the culture based first day of week

loadCldr(numberingSystems, gregorian, numbers, weekData);

`

- Before changing to a culture other than English, ensure that the\ locale text for the concerned culture is loaded through L10n.loadmethod.

`ts

//Load the L10n from ej2-base

import { L10n } from '@syncfusion/ej2-base';

//load the locale object to set the localized placeholder value

L10n.load({

'de': {

'timepicker': { placeholder: 'Wählen Sie Zeit' }

}

});

`

- Set the culture by using the locale property.

The following example demonstrates the TimePicker in German culture.

APP.VUE

```
<template>
    <div id="app">
      <div class='wrapper'>
        <ejs-timepicker id="timepicker"  locale="de" ></ejs-timepicker>
      </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { loadCldr,L10n} from '@syncfusion/ej2-base';
import { TimePickerPlugin } from '@syncfusion/ej2-vue-calendars';
// Here we have referred local json files for preview purpose
import * as numberingSystems from './numberingSystems.json';
import * as gregorian from './ca-gregorian.json';
import * as numbers from './numbers.json';
```

Copyright © 2001 -2024 Syncfusion Inc.

```
import { enableRipple } from '@syncfusion/ej2-base';
//enable ripple style
enableRipple(true);
Vue.use(TimePickerPlugin);
loadCldr(numberingSystems, gregorian, numbers);
L10n.load({
    'de': {
        'timepicker': { placeholder: 'Wählen Sie Zeit' }
    }
});
export default {}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
 .wrapper {
    max-width: 250px;
    margin: 0 auto;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/timepicker/locale-cs1" %}

Right-To-Left

The TimePicker supports RTL (right-to-left) functionality for languages like Arabic and Hebrew to displays the text in the right-to-left direction. Use enableRtl property to set the RTL direction.

The code example demonstrates the TimePicker component in Arabic culture. It also explains how to set localized text to the placeholder using L10n.load method.

`

APP.VUE

```
<template>
    <div id="app">
      <div class='wrapper'>
        <ejs-timepicker id="timepicker"  :locale="locale" :enableRtl="rtl"
></ejs-timepicker>
      </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { loadCldr,L10n} from '@syncfusion/ej2-base';
import { TimePickerPlugin } from '@syncfusion/ej2-vue-calendars';
// Here we have referred local json files for preview purpose
import * as numberingSystems from './numberingSystems.json';
import * as gregorian from './ca-gregorian.json';

@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
 .wrapper {
    max-width: 250px;
    margin: 0 auto;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/timepicker/locale-rtl-cs1" %}

Strict mode in Vue Timepicker component

Enable Strict Mode

The strictMode is an act that allows you to enter only valid time value within the specified min/max range in the textbox. If the time value is invalid, the component value sets to the previous value. If the time value is out of range, the component sets the time value to min/max value.

The following example demonstrates the TimePicker in strictMode with min/max range of 10:00 AM to 4:00 PM . It allows you to enter only valid time within the specified range. If you enter the out-of-range value like 8:00 PM, the value sets to the max time 4:00 PM as the value 8:00 PM is greater than max value of 4:00 PM. If you enter invalid time value like 9:00 tt, the value sets to the previous value.

APP.VUE

```
<template>
  <div id="app">
        <div class='wrap'>
           <ejs-timepicker id='timepicker' :strictMode='Strict'
:value='timeval' :min='minTime' :max='maxTime'></ejs-timepicker>
        </div>
  </div>
</template>
<script>
import Vue from "vue";
import { TimePickerPlugin } from "@syncfusion/ej2-vue-calendars";
Vue.use(TimePickerPlugin);
```

Copyright © 2001 -2024 Syncfusion Inc.

```
export default {
  data () {
    return{
        Strict: true,
        timeval:new Date('7/18/2017 3:00 PM'),
        minTime: new Date('7/18/2017 10:00 AM'),
        maxTime: new Date('7/18/2017 4:00 PM')
    }
  }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
 .wrap {
    margin: 35px auto;
    width: 240px;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/timepicker/strict-cs2" %}

Disable Strict Mode

By default, the TimePicker act in strictMode `false` state, that allows to enter the invalid or out-of-range time in textbox.

If the time is out-of-range or invalid, then the model value will be set to `out of range` time value or `null` respectively with highlighted `error` class to indicates the time is out of range or invalid.

The following example demonstrates the `strictMode` as `false`. Here, it allows to enter the valid or invalid value in textbox. If you are entering the out-of-range or invalid time value, then the model value will be set to`out of range` time value or `null` respectively with highlighted `error` class to indicates the time is out of range or invalid.

APP.VUE

```
<template>
  <div id="app">
        <div class='wrap'>
           <ejs-timepicker id='timepicker' :value='timeval' :min='minTime'
:max='maxTime'></ejs-timepicker>
        </div>
  </div>
</template>
<script>
import Vue from "vue";
import { TimePickerPlugin } from "@syncfusion/ej2-vue-calendars";
Vue.use(TimePickerPlugin);
export default {
  data () {
    return{
        timeval:new Date('7/18/2017 3:00 PM'),
```

Copyright © 2001 -2024 Syncfusion Inc.

```
        minTime: new Date('7/18/2017 10:00 AM'),
        maxTime: new Date('7/18/2017 4:00 PM')
    }
  }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-calendars/styles/material.css";
 .wrap {
    margin: 35px auto;
    width: 240px;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/timepicker/strict-cs3" %}

If the value of min or max property is changed through code behind, update the value property to set within the range.

Accessibility in Vue Timepicker component

The TimePicker component followed the accessibility guidelines and standards, including ADA, Section 508, WCAG 2.2 standards, and WCAG roles that are commonly used to evaluate accessibility.

The accessibility compliance for the TimePicker component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| WCAG 2.2 Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Section 508 Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Screen Reader Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Right-To-Left Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Color Contrast | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Mobile Device Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Keyboard Navigation Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Accessibility Checker Validation | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

Copyright © 2001 -2024 Syncfusion Inc.

| Axe-core Accessibility Validation | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> - All features of the component meet the requirement.

<img src="https://cdn.syncfusion.com/content/images/landing-page/intermediate.png" alt="Intermediate"> - Some features of the component do not meet the requirement.

<img src="https://cdn.syncfusion.com/content/images/landing-page/no.png" alt="No"> - The component does not meet the requirement.

WAI-ARIA attributes

The web accessibility makes web applications and its content more accessible to people with disabilities without any barriers. It especially it tracks the dynamic value changes and DOM changes.

The TimePicker component has covered the WAI-ARIA specifications with the following list of WAI-ARIA attributes: aria-haspopup, aria-selected, aria-disabled, aria-activedescendant, aria-expanded, aria-owns, and aria-autocomplete.

Here in TimePicker, the combobox plays the role of input element, and the listbox plays the role of popup element.

- **Aria-haspopup**: Provides the information about whether this element display a pop-up window or not.
- **Aria-selected**: Indicates the current selected value of the TimePicker component.
- **Aria-disabled**: Indicates disabled state of the TimePicker component.
- **Aria-expanded**: Indicates the expanded state of the popup.
- **Aria-autocomplete**: Indicates whether user input completion suggestions are provided or not.
- **Aria-owns**: Attribute that creates a parent/child relationship between two DOM element in the accessibility layer.
- **Aria-activedescendent**: Attribute that helps in managing the current active child of the TimePicker component.
- **Role**: Attribute that gives assistive technology information for handling each element in a widget.

Keyboard Interaction

Keyboard accessibility is one of the most important aspects of web accessibility. Disabled people like blind and those who have motor disabilities or birth defects use keyboard shortcuts more than the mouse.

Copyright © 2001 -2024 Syncfusion Inc.

The TimePicker component has built-in keyboard accessibility support by following the WAI-ARIA practices.

It supports the following list of shortcut keys to interact with the TimePicker control.

| **Press** | **To do this** |

| --- | --- |

| Upper Arrow | Navigate and select the previous item. |

| Down Arrow | Navigate and select the next item. |

| Left Arrow | Move the cursor towards arrow key pressed direction. |

| Right Arrow | Move the cursor towards arrow key pressed direction. |

| Home | Navigate and select the first item. |

| End | Navigate and select the last item. |

| Enter | Select the currently focused item and close the popup. |

| Alt + Upper Arrow | Close the popup. |

| Alt + Down Arrow | Open the popup. |

| Esc | Close the popup. |

In the below sample use the alt+t keys to focus the TimePicker component.

APP.VUE

```
<template>
  <div id="app">
        <div class='wrap'>
           <ejs-timepicker id='timepicker' ref="time"></ejs-timepicker>
        </div>
  </div>
</template>
<script>
import Vue from "vue";
import { TimePickerPlugin } from "@syncfusion/ej2-vue-calendars";
Vue.use(TimePickerPlugin);
export default {
  mounted () {
      let TimeObj = this.$refs.time;
       document.onkeyup = function (e) {
            if (e.altKey && e.keyCode === 84) {
            // press alt+t to focus the control.
            TimeObj.$el.focus();
            }
        }
    }
}
</script>
<style>

Ensuring accessibility

The TimePicker component's accessibility levels are ensured through an accessibility-checker and axe-core software tools during automated testing.

The accessibility compliance of the TimePicker component is shown in the following sample. Open the sample in a new window to evaluate the accessibility of the TimePicker component with accessibility tools.

{% previewsample "https://ej2.syncfusion.com/accessibility/time-picker.html" %}

Two way binding in Vue Timepicker component

Two-way binding can be achieved by using the v-model directive in Vue. In the following sample, when you change the value in one TimePicker component, v-model will automatically update the value in the other TimePicker.

The following example demonstrates how to set the two-way-binding in the TimePicker.

APP.VUE

```
<template>
<div id="app">
    <div id="wrapper1">
        <ejs-timepicker id="timepicker" v-model="date"></ejs-timepicker>
    </div>
    <div id="wrapper2">
        <ejs-timepicker id="timepicker1" v-model="date"></ejs-timepicker>
    </div>
</div>
</template>
<script>
import Vue from "vue";
import { TimePickerPlugin } from "@syncfusion/ej2-vue-calendars";
Vue.use(TimePickerPlugin);
export default {
  data: function() {
    return {
      date: new Date()
    };
  }
}
```

Copyright © 2001 -2024 Syncfusion Inc.

```
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-
calendars/styles/material.css";
#wrapper1{
    min-width: 250px;
    float: left;
    margin-left: 100px;
}
#wrapper2{
    min-width: 250px;
    float: right;
     margin-right: 100px;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/timepicker/two-way-cs1" %}

Style appearance in Vue Timepicker component

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

Customizing the appearance of TimePicker wrapper element

Use the following CSS to customize the appearance of wrapper element.

`

/ To specify height and font size /

.e-input-group input.e-input, .e-input-group.e-control-wrapper input.e-input, .e-input-group textarea.e-input, .e-input-group.e-control-wrapper textarea.e-input {

font-size: 20px;

height: 40px;

}

`

Customizing the TimePicker icon element

Use the following CSS to customize the TimePicker icon element

`

/ To specify background color and font size /

.e-time-wrapper .e-time-icon.e-icons, *.e-control-wrapper.e-time-wrapper .e-time-icon.e-icons {

font-size: 20px;

background-color: beige;

}

`

Copyright © 2001 -2024 Syncfusion Inc.

Customizing the TimePicker popup

Use the following CSS to customize the TimePicker popup

```
/ To specify height /
.e-timepicker.e-popup {
height: 100px;
}
```

Customizing the TimePicker popup content

Use the following CSS to customize the TimePicker popup content

```
/ To specify height /
.e-timepicker.e-popup .e-list-parent.e-ul li.e-list-item {
background-color: beige;
font-size: 20px;
}
```

Full screen mode support in mobiles and tablets

The DateTimePicker component's full-screen mode feature enables users to view the component popup element in full-screen mode on mobile devices with improved visibility and a better user experience. It is important to mention that this feature is exclusively available for mobile and tablet devices in both landscape and portrait orientations. To activate the full screen mode within the TimePicker component, simply set the fullScreenMode API value to true. This action will extend the popup element to occupy the entire screen on mobile devices.

```html
<template>
<div id="app">
<ejs-timepicker :fullScreenMode="mobileMode" ></ejs-timepicker>
</div>
</template>
<script>
import Vue from 'vue';
import { TimePickerPlugin } from '@syncfusion/ej2-vue-calendars';
Vue.use(TimePickerPlugin);
export default {
```

Copyright © 2001 -2024 Syncfusion Inc.

```
data () {
return {
mobileMode : true
}
}
}
</script>
`
```

How To

Css customization in Vue Timepicker component

TimePicker allows you to customize the textbox and popup list appearance to suit your application by using cssClass property.

The below sample demonstrates customization of text appearance in a textbox, popup button, and popup list along with hover and active

state by using e-custom-style class. Following is the list of available classes used to customize the entire TimePicker component.

| **Class Name** | **Description** |

| --- | --- |

| e-time-wrapper | Applied to TimePicker wrapper element. |

| e-timepicker | Applied to input element and TimePicker popup element. |

| e-time-wrapper.e-timepicker | Applied to input element only. |

| e-input-group-icon.e-time-icon | Applied to popup button. |

| e-float-text | Applied to floating label text element. |

| e-popup | Applied to popup element. |

| e-timepicker.e-popup | Applied to TimePicker popup element only. |

| e-list-parent | Applied to popup UL element. |

| e-timepicker.e-list-parent | Applied to TimePicker popup UL element only. |

| e-list-item | Applied to LI elements. |

| e-hover | Applied to LI element hovering time. |

| e-active | Applied to active LI element. |

Client side validation using form validator in Vue Timepicker component

To achieve client side validation in a TimePicker component, use Essential JavaScript 2 FormValidator. It provides an option to customize feedback error messages to the corresponding fields for taking action and resolving the issue.

In the following example, the required field validation is implemented by mapping the name attribute value to the rules property. It validates the TimePicker component and displays the validation message when the textbox value is empty during form post back or focus out.

APP.VUE

```
<template>
  <div id="app">
    <div class='wrap'>
      <form id="form-element" class="form-horizontal">
           <div class="form-group" style="padding-top: 11px;">
                <div class="col-lg-8">
                     <ejs-timepicker id="time" name="time"
:change="onTimeChange" class="form-control" placeholder='Select a
Time'></ejs-timepicker>
                </div>
            </div>
      </form>
    </div>
  </div>
</template>
<script>
import Vue from "vue";
import { TimePickerPlugin } from "@syncfusion/ej2-vue-calendars";
import { FormValidator } from '@syncfusion/ej2-inputs';
Vue.use(TimePickerPlugin);
export default {
    data: function() {
        return {
          formObj: '',
          options : {
            customPlacement: function(inputelement, errorElement) {
                var parentElement = inputelement.closest('.form-group');
                parentElement.appendChild(errorElement);
            },
            rules: {
                'time': {
                    required: true
                }
            }
          }
        }
    },
  mounted: function () {
      this.formObj = new FormValidator('#form-element', this.options);
  },

Toast

Getting Started with the Vue Toast Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using Vue-CLI and integrating the Syncfusion Vue Toast component using the Composition API / Options API.

Prerequisites

System requirements for Syncfusion Vue UI components

Dependencies

The following list of dependencies are required to use the toast component in your application:

`js

|-- @syncfusion/ej2-vue-notifications

|-- @syncfusion/ej2-popups

|-- @syncfusion/ej2-buttons

|-- @syncfusion/ej2-vue-base

`

Setting up the Vue 2 project

To generate a Vue 2 project using Vue-CLI, use the vue create command. Follow these steps to install Vue CLI and create a new project:

`bash

npm install -g @vue/cli

vue create quickstart

cd quickstart

npm run serve

`

or

Copyright © 2001 -2024 Syncfusion Inc.

`bash

yarn global add @vue/cli

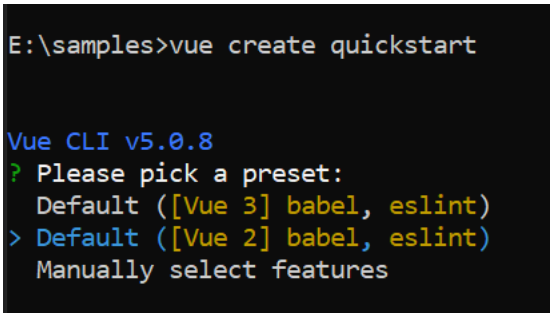
vue create quickstart

cd quickstart

yarn run serve

`

When creating a new project, choose the option Default ([Vue 2] babel, eslint) from the menu.



Once the quickstart project is set up with default settings, proceed to add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion packages are available at npmjs.com. To use Vue components, install the required npm package.

This article uses the Vue Toast component as an example. Install the @syncfusion/ej2-vue-notifications package by running the following command:

`bash

npm install @syncfusion/ej2-vue-notifications --save

`

or

`bash

yarn add @syncfusion/ej2-vue-notifications

`

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, the Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the Toast component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
notifications/styles/material.css";
</style>
```

Add Syncfusion Vue component

Follow the below steps to add the Vue Toast component using Composition API or Options API:

1\. First, import and register the Toast component in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { ToastComponent as EjsToast } from '@syncfusion/ej2-vue-
notifications';
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { ToastComponent } from '@syncfusion/ej2-vue-notifications';
export default {
components: {
'ejs-toast': ToastComponent
}
}
</script>
```

2\. In the template section, define the Toast component with content and title property.

~/SRC/APP.VUE

```
<template>
<div id="app">
<ejs-toast ref='defaultRef' title='Matt sent you a friend request' timeOut=0
content='Hey, wanna dress up as wizards and ride our hoverboards?'></ejs-
toast>
</div>
</template>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
  <div id="app">
       <ejs-toast ref='defaultRef' title='Matt sent you a friend request'
timeOut=0 content='Hey, wanna dress up as wizards and ride our
hoverboards?'></ejs-toast>
  </div>
</template>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
<script setup>
import { ToastComponent as EjsToast } from '@syncfusion/ej2-vue-
notifications';
import { ref, onMounted } from 'vue';
const defaultRef = ref(null);
onMounted (() => {
      defaultRef.value.show();
  });
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
notifications/styles/material.css";
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
  <div id="app">
       <ejs-toast ref='defaultRef' title='Matt sent you a friend request'
timeOut=0 content='Hey, wanna dress up as wizards and ride our
hoverboards?'></ejs-toast>
  </div>
</template>
<script>
import { ToastComponent } from '@syncfusion/ej2-vue-notifications';
export default {
  components: {
    'ejs-toast': ToastComponent
  },
  name: 'app',
  mounted: function() {
      this.$refs.defaultRef.show();
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
notifications/styles/material.css";
</style>
```

Run the project

To run the project, use the following command:

`bash

npm run serve

`

or

`bash

yarn run serve

Copyright © 2001 -2024 Syncfusion Inc.

`

Getting Started with the Vue Toast Component in Vue 3

This article provides a step-by-step guide for setting up a Vite project with a JavaScript environment and integrating the Syncfusion Vue Toast component using the Composition API / Options API.

The Composition API is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

The Options API is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

Prerequisites

System requirements for Syncfusion Vue UI components

Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using Vite. To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

`bash

npm create vite@latest

`

or

`bash

yarn create vite

`

Using one of the above commands will lead you to set up additional configurations for the project as below:

1.Define the project name: We can specify the name of the project directly. Let's specify the name of the project as my-project for this article.

`bash

? Project name: » my-project

`

2.Select Vue as the framework. It will create a Vue 3 project.

Copyright © 2001 -2024 Syncfusion Inc.

`bash

? Select a framework: » - Use arrow-keys. Return to submit.

Vanilla

Vue

React

Preact

Lit

Svelte

Others

`

3.Choose JavaScript as the framework variant to build this Vite project using JavaScript and Vue.

`bash

? Select a variant: » - Use arrow-keys. Return to submit.

JavaScript

TypeScript

Customize with create-vue ↗

Nuxt ↗

`

4.Upon completing the aforementioned steps to create the my-project, run the following command to install its dependencies:

`bash

cd my-project

npm install

`

or

`bash

cd my-project

yarn install

`

Now that my-project is ready to run with default settings, let's add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion Vue component packages are available at npmjs.com. To use Syncfusion Vue components in the project, install the corresponding npm package.

Copyright © 2001 -2024 Syncfusion Inc.

This article uses the Vue Toast component as an example. To use the Vue Toast component in the project, the @syncfusion/ej2-vue-notifications package needs to be installed using the following command:

`bash

npm install @syncfusion/ej2-vue-notifications --save

`

or

`bash

yarn add @syncfusion/ej2-vue-notifications

`

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the Toast component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
notifications/styles/material.css";
</style>
```

The order of importing CSS styles should be in line with its dependency graph.

Add Syncfusion Vue component

Follow the below steps to add the Vue Toast component using Composition API or Options API:

1.First, import and register the Toast component in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { ToastComponent as EjsToast } from "@syncfusion/ej2-vue-
notifications";
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { ToastComponent } from "@syncfusion/ej2-vue-notifications";
//Component registeration
export default {
```

Copyright © 2001 -2024 Syncfusion Inc.

```
name: "App",
components: {
"ejs-toast": ToastComponent,
}
}
</script>
```

2.In the template section, define the Toast component with the dataSource property and column definitions.

~/SRC/APP.VUE

```
<template>
<div id="app">
<ejs-toast ref='defaultRef' title='Matt sent you a friend request' timeOut=0
content='Hey, wanna dress up as wizards and ride our hoverboards?'></ejs-
toast>
</div>
</template>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<div id="app">
<ejs-toast
id="toast_default"
ref="defaultRef"
title="Adaptive Tiles Meeting"
timeOut="0"
icon="e-meeting"
content="Conference Room 01 / Building 135 10:00 AM-10:30 AM"
></ejs-toast>
</div>
</template>
<script setup>
import { ToastComponent as EjsToast } from "@syncfusion/ej2-vue-
notifications";
import { ref, onMounted } from 'vue';
const defaultRef = ref(null);
onMounted(() => {
defaultRef.value.show();
});
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
notifications/styles/material.css";
#toast_default .e-meeting::before {
content: "\e705";
font-size: 17px;
}
.bootstrap4 #toast_default .e-meeting::before {
content: "\e763";
font-size: 20px;
```

Copyright © 2001 -2024 Syncfusion Inc.

```
}
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<div id="app">
<ejs-toast
id="toast_default"
ref="defaultRef"
title="Adaptive Tiles Meeting"
timeOut="0"
icon="e-meeting"
content="Conference Room 01 / Building 135 10:00 AM-10:30 AM"
></ejs-toast>
</div>
</template>
<script>
import { ToastComponent } from "@syncfusion/ej2-vue-notifications";
export default {
name: "App",
components: {
"ejs-toast": ToastComponent,
},
mounted: function () {
this.$refs.defaultRef.show();
},
data: function () {
return {};
},
};
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
notifications/styles/material.css";
#toast_default .e-meeting::before {
content: "\e705";
font-size: 17px;
}
.bootstrap4 #toast_default .e-meeting::before {
content: "\e763";
font-size: 20px;
}
</style>
```

Run the project

To run the project, use the following command:

`bash

npm run dev

`

or

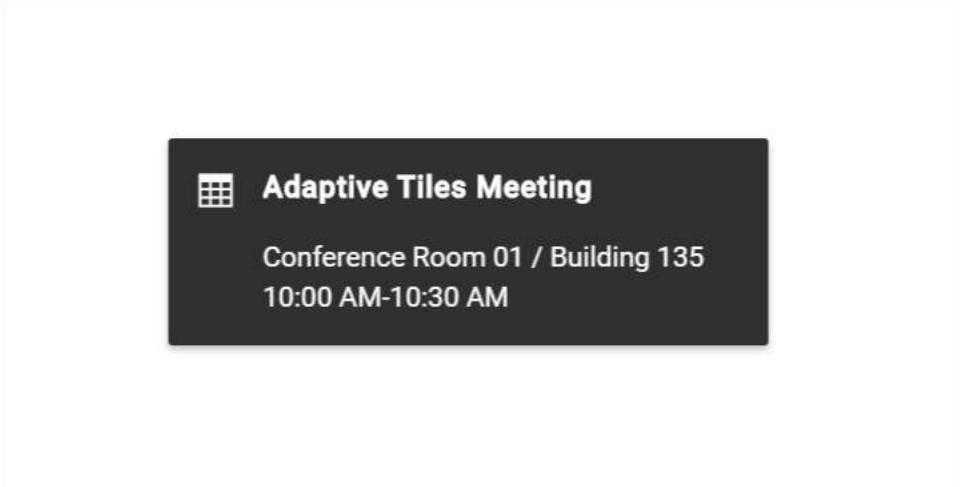
`bash

yarn run dev

`

Web server will be initiated, Open the quick start app in the browser at port localhost:8080.

The output will appear as follows:



Config in Vue Toast component

This section explains the steps required to customize the appearance of the toast using built-in APIs.

Title and content template

Toast can be created with the notification message. The message contains title and content of the toasts. The title and contents are adaptable in any resolution.

The Title or Content property can be given as HTML element/element ID to a string that can be displayed as a toast.

APP.VUE

```
<template>
  <div id="app">
       <ejs-button ref='showButtonRef' class="e-btn" id="show_toast" v-
on:click.native="showBtnClick">Show Toast</ejs-button>
       <ejs-toast ref='defaultRef' title='Matt sent you a friend request'
content='You have a new friend request yet to accept'
:position='position'></ejs-toast>
  </div>
</template>
<script>
import Vue from 'vue';
import { ToastPlugin } from '@syncfusion/ej2-vue-notifications';
import { ButtonPlugin } from '@syncfusion/ej2-vue-buttons';
Vue.use(ToastPlugin);
Vue.use(ButtonPlugin);
export default {
  name: 'app',
  data: function(){
    return {
```

```
        position: { X: 'Center' }
    }
  },
  mounted: function() {
      this.$refs.defaultRef.show();
  },
  methods: {
      showBtnClick: function(args){
          this.$refs.defaultRef.show();
      }
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-
notifications/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/toast/config/title-content-cs1" %}

Specifying custom target

By default, the toast can be rendered in the document body. You can change the target position for toast rendering using the target property. Based on the target, the position will be updated.

Close button

By default, the showCloseButton is not enabled. You can enable it by setting the true value. Before expiring the toast, you can use this button to close or destroy toasts manually.

Progress bar

By default, the showProgressBar is not enabled. If it is enabled, it can visually indicate how long to get toast expires. Based on the timeOut property, progress bar will appear.

Progress bar direction

By default, the progressDirection is set to "Rtl" and it will appear from right to left direction. You can change the progressDirection to "Ltr" to make it appear from left to right direction.

Newest on top

By default, the newly created toasts will append next with existing toasts. You can change the sequence like inserting before the toast by enabling the newestOnTop.

Here, The following sample demonstrates the combination of the target, showCloseButton, showProgressBar, and newestOnTop properties in toast.

APP.VUE

```
<template>
  <div id="app">
       <ejs-button ref='showButtonRef' class="e-btn" id="show_toast" v-
on:click.native="showBtnClick">Show Toast</ejs-button>
       <ejs-toast ref='defaultRef' title='File Downloading' content='<div
class="progress"><span style="width: 80%"></span></div>'
:position='position' showCloseButton=true target='#toast_target'
newestOnTop=true showProgressBar=true progressDirection="Ltr"></ejs-toast>
       <br/><br/>
       <div id='toast_target'></div>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
  </div>
</template>
<script>
import Vue from 'vue';
import { ToastPlugin } from '@syncfusion/ej2-vue-notifications';
import { ButtonPlugin } from '@syncfusion/ej2-vue-buttons';
Vue.use(ToastPlugin);
Vue.use(ButtonPlugin);
export default {
  name: 'app',
  data: function(){
    return {
        position: { X: 'Center' }
    }
  },
  mounted: function() {
      this.$refs.defaultRef.show();
  },
  methods: {
      showBtnClick: function(args){
          this.$refs.defaultRef.show();
      }
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-
notifications/styles/material.css";
</style>

@-webkit-keyframes moveAnimate {
    0% {
       background-position: 0 0;
    }
    100% {
       background-position: 50px 50px;
    }
}
</style>
```

{% previewsample "page.domainurl/code-snippet/toast/config/custom-target-cs1" %}

Width and height

The dimensions of the toast can be set using the width and height properties. This will individually set all toasts. You can create different custom dimension toasts.

By default, the toast can be rendered with `300px` width with `auto` height.

In mobile devices, the default width of the toast gets '100%' width of the page.

When you set toast width as '100%', the toast occupies full width and will be displayed at the top or bottom based on the position `Y` property.

Both the width and height properties allow setting pixels/numbers/percentage. The number value is considered as pixels.

APP.VUE

```
<template>
  <div id="app">
       <div id='container'>
        <ejs-button ref='showButtonRef' class="e-btn" id="show_toast" v-
on:click.native="showBtnClick">Show Toast</ejs-button>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
        <ejs-toast ref='defaultRef' id='element' title='Matt sent you a
friend request' content='You have a new friend request yet to accept'

- Prevent duplicate toasts
- Customize the progress bar

Position in Vue Toast component

The toast position can be updated based on predefined positions or customizable positions. The predefined position combinations are updated in the X and Y position properties.

Predefined

X Positions

- Left
- Center
- Right

Y Positions

- Top
- Bottom

In multiple toast display, the new toast position will not be updated on dynamic change of property values until the old toast messages removed.

The toast occupies full width when you set the width to '100%', so the X positions will not affect the changes when the width is '100%'.

Custom

Custom X and Y positions can be given as pixels/numbers/percentage. The number value is considered as pixels based on the top and left values updated in the toast.

APP.VUE

Action buttons in Vue Toast component

You can include action buttons to the toast component by adding the buttons property. The collection of Essential JS 2 button models can be bound to the model property inside the buttons property. You can also include the click event callback function for each button.

APP.VUE

Timeout in Vue Toast component

The toast can be expired based on the timeOut property. The toast can live till the time out reaches without user interaction, a time out value is considered as a millisecond.

- The timeOut delay can be visually represented using Progress Bar.
- The extendedTimeOut property determines how long the toast should be displayed after a user hovers over it.

You can terminate the process by using the showCloseButton property for destroying the toast at any time.

Template in Vue Toast component

The Template property in toast can be defined as HTML element, this can be either a string or selector.

The HTML element tag can be given as a string for the Template property.

`ts

template: " Toast Content "

`

The Template property allows getting the template content using the query selector. Here, the element ID attribute is specified in the template.

`ts

template: "#Template"

`

Animation in Vue Toast component

The toast component supports custom animations for both shows and hide actions from the provided animation option of the `Animation` library.

The default animation is given as `FadeIn` for showing the toast and `FadeOut` for hiding the toast.

The following sample demonstrates some types of animations that suit toast. You can check all the animation effects here.

APP.VUE

```
<template>
   <div id='app'>
        <div id="default" style="padding-bottom:75px;">
            <div class='row'>
                 <ejs-button ref='showButtonRef' class="e-btn"
id="show_toast" v-on:click.native="showBtnClick">Show Toast</ejs-button>
             </div>
            <div class='row'>
                <div class="col-xs-6 col-sm-6 col-lg-6 col-md-6">
```

```
                    <label> Show Animation </label>
                </div>

Toast services in Vue Toast component

The Vue Toast component provides a built-in utility function to render the toast with minimal code. The utility function will render the toast without the need of rendering the container element in the DOM where the toast is appended. So that, the toast can now be rendered on the go. The following are the option to render the toast using the utility function.

Show Toast with predefined types

The Toast component support 4 types of predefined toast with essential colors for various situations which can be shown using the ToastUtility.show by just defining the type of the toast without defining any class names. The following options are used as an argument on calling the utility function for predefined types:

| Options | Description |

|----------|-------------|

| content | Specifies the content that can be displayed on the Toast. |

| type | Specifies the type of the predefined Toasts. The 4 types of predefined toasts are Information, Success, Error, Warning |

| timeOut | Specifies the Toast display time duration on the page in milliseconds. Once the time expires, Toast message will be removed. Setting 0 as a time out value displays the Toast on the page until the user closes it manually. |

APP.VUE

```
<template>
   <div id='app'>
        <div>
            <ejs-button ref='infoButtonRef' class="e-btn e-control e-info"
id="info_toast" v-on:click.native="infoToast">Info Message</ejs-button>
            <ejs-button ref='successButtonRef' class="e-btn e-control e-
success" id="success_toast" v-on:click.native="successToast">Success
Message</ejs-button>
            <ejs-button ref='warningButtonRef' class="e-btn e-control e-
warning" id="warning_toast" v-on:click.native="warningToast">Warning
Message</ejs-button>
            <ejs-button ref='dangerButtonRef' class="e-btn e-control e-
danger" id="danger_toast" v-on:click.native="dangerToast">Danger

</style>
```

{% previewsample "page.domainurl/code-snippet/toast/action-button-cs2" %}

Show Toast with ToastModel

The utility function can be called using the ToastModel as argument to show the toast where all the properties in the ToastModel like any events, position, close icon, action buttons, etc. can be used in the ToastUtility.show.

APP.VUE

```
<template>
   <div id='app'>
```

```
        <center><ejs-button ref='showButtonRef' class="e-btn" id="show_toast"
v-on:click.native="showToast">Show Toast</ejs-button></center>
    </div>
</template>
<script>
import Vue from "vue";
import { ToastPlugin, Toast, ToastUtility } from "@syncfusion/ej2-vue-
notifications";
import { ButtonPlugin } from '@syncfusion/ej2-vue-buttons';
import { closest } from '@syncfusion/ej2-base';
Vue.use(ToastPlugin);
Vue.use(ButtonPlugin);
let ToastObj = undefined;
export default {
  name: 'app',
  data: function(){
    return { }
  },
  methods: {
      showToast: function(args){
          ToastObj = ToastUtility.show({
            title: 'Toast Title',
            content: 'Toast shown using utility function with ToastModel',
            timeOut: 20000,
            position: { X: 'Right', Y: 'Bottom' },
            showCloseButton: true,
            click: this.toastClick,
            buttons:  [{
                model: { content: 'Close' }, click: this.toastClose
            }]
        });
      },
      toastClose: function(){
        ToastObj.hide();
      }
      toastClick: function(){
        console.log('Toast click event triggered');
      }
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-
notifications/styles/material.css";
</style>
<style lang="scss">
#loader {
    color: #008cff;
    height: 40px;

Style in Vue Toast component

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

Customizing the toast title

Use the following CSS to customize the default toast's content properties like font-family, font-size and color.

```css
/* To change color, font family and font size */
.e-toast-container .e-toast .e-toast-message .e-toast-title {
color: red;
font-size: 18px;
font-weight: bold;
}
```

Customizing the toast content

Use the following CSS to customize the default toast's content properties like font-family, font-size and color.

```css
/* To change color, font family and font size */
.e-toast-container .e-toast .e-toast-message .e-toast-content {
color: aqua;
font-size: 13px;
font-weight: normal;
}
```

Customizing the toast icon

Use the following CSS to customize the default toast icon color.

```css
/* To change icon color */
.e-toast-container .e-toast .e-toast-icon {
color: yellow;
}
```

Copyright © 2001 -2024 Syncfusion Inc.

Customizing the toast background

Use the following CSS to customize the default toast's background color.

`css

/ *To change background color* /

.e-toast-container .e-toast {

background-color: navy;

}

`

Accessibility in Vue Toast component

The Toast component followed the accessibility guidelines and standards, including ADA, Section 508, WCAG 2.2 standards, and WCAG roles that are commonly used to evaluate accessibility.

The accessibility compliance for the Toast component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| WCAG 2.2 Support | <img src="https://cdn.syncfusion.com/content/images/documentation/full.png" alt="Yes"> |

| Section 508 Support | <img src="https://cdn.syncfusion.com/content/images/documentation/full.png" alt="Yes"> |

| Screen Reader Support | <img src="https://cdn.syncfusion.com/content/images/documentation/full.png" alt="Yes"> |

| Right-To-Left Support | <img src="https://cdn.syncfusion.com/content/images/documentation/full.png" alt="Yes"> |

| Color Contrast | <img src="https://cdn.syncfusion.com/content/images/documentation/full.png" alt="Yes"> |

| Mobile Device Support | <img src="https://cdn.syncfusion.com/content/images/documentation/full.png" alt="Yes"> |

| Keyboard Navigation Support | <img src="https://cdn.syncfusion.com/content/images/documentation/not-supported.png" alt="No"> |

| Accessibility Checker Validation | <img src="https://cdn.syncfusion.com/content/images/documentation/full.png" alt="Yes"> |

| Axe-core Accessibility Validation | <img src="https://cdn.syncfusion.com/content/images/documentation/full.png" alt="Yes"> |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<img src="https://cdn.syncfusion.com/content/images/documentation/full.png" alt="Yes"> - All features of the component meet the requirement.

<img src="https://cdn.syncfusion.com/content/images/documentation/partial.png" alt="Intermediate"> - Some features of the component do not meet the requirement.

<img src="https://cdn.syncfusion.com/content/images/documentation/not-supported.png" alt="No"> - The component does not meet the requirement.

WAI-ARIA attributes

The toast component has been designed with WAI-ARIA specifications in mind by applying the prompt WAI-ARIA roles, states, and properties with the keyboard support. It helps users who use assistive WAI-ARIA accessibility support, which is achieved using attributes.

It provides information about the elements in a document for assistive technology.

The toast component implements the keyboard navigation support by using the following WAI-ARIA practices and is tested in major screen readers.

<!-- markdownlint-disable MD033 -->

| Class | Description |

| -------- | -------- |

| role | alert: Identifies the element as a container when alert content will be added or updated. |

APP.VUE

```
<template>
   <div id='app'>
         <ejs-toast ref='elementRef' timeOut=0 id='element' title='Matt sent you a friend request' content='You have a new friend request yet to accept'></ejs-toast>
    </div>
</template>
<script>
import Vue from "vue";
import { ToastPlugin, Toast } from "@syncfusion/ej2-vue-notifications";
Vue.use(ToastPlugin);
export default {
  name: 'app',
  mounted: function() {
      this.$refs.elementRef.show();
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-notifications/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/toast/accessibility-cs1" %}

Ensuring accessibility

The Toast component's accessibility levels are ensured through an accessibility-checker and axe-core software tools during automated testing.

The accessibility compliance of the Toast component is shown in the following sample. Open the sample in a new window to evaluate the accessibility of the Toast component with accessibility tools.

{% previewsample "https://ej2.syncfusion.com/accessibility/toast.html" %}

How To

Prevent duplicate toast display in Vue Toast component

You can prevent identical same toast displaying in a screen by the event function and terminate the toast displaying process by setting the cancel event property in the beforeOpen event.

The following sample demonstrates preventing duplicate title toast element displaying with custom code blocks.

APP.VUE

```
<template>
   <div id='app'>
        <ejs-button ref='showButtonRef' class="e-btn" id="show_toast" v-
on:click.native="showBtnClick">Show Toast</ejs-button>
        <ejs-toast ref='elementRef' id='element' title='Sample Toast Title'
content='Sample Toast content' :position='position' :beforeOpen='beforeOpen'
:close="onClose" :created="onCreated"></ejs-toast>
   </div>
</template>
<script>
import Vue from "vue";
import { ToastPlugin, Toast } from "@syncfusion/ej2-vue-notifications";
import { ButtonPlugin } from "@syncfusion/ej2-vue-buttons";
Vue.use(ToastPlugin);
Vue.use(ButtonPlugin);
export default {
  name: 'app',
  data: function(){
        return {
            position: { X: 'Center' }
        }
   },
  mounted: function() {
      this.toastFlag = 0;
      this.toasts = [
                { title: 'Warning !', content: 'There was a problem with your
network connection.', isOpen: false },
                { title: 'Success !', content: 'Your message has been sent
successfully.', isOpen: false },

Restrict the maximum toast to show in Vue Toast component

You can restrict the maximum toast count by using the event callback function and terminate the toast displaying process by setting the cancel event property in the beforeOpen event.

Copyright © 2001 -2024 Syncfusion Inc.

The following sample demonstrates restricting toast displaying up to 3. You can restrict by your own count with custom code blocks.

APP.VUE

```
<template>
   <div id='app'>
        <ejs-button ref='showButtonRef' class="e-btn" id="show_toast" v-
on:click.native="showBtnClick">Show Toast</ejs-button>
        <ejs-toast ref='elementRef' id='element' title='Sample Toast Title'
content='Sample Toast content' :position='position'
:beforeOpen='beforeOpen'></ejs-toast>
   </div>
</template>
<script>
import Vue from "vue";
import { ToastPlugin, Toast } from "@syncfusion/ej2-vue-notifications";
import { ButtonPlugin } from "@syncfusion/ej2-vue-buttons";
Vue.use(ToastPlugin);
Vue.use(ButtonPlugin);
export default {

Show different types of toast in Vue Toast component

The Essential JS 2 toast has the following predefined styles that can be defined using the cssClass property for achieving different types of toast:

| Class | Description |

| -------- | -------- |

| e-toast-success | Represents a positive toast |

| e-toast-info | Represents an informative toast |

| e-toast-warning | Represents a toast with caution |

| e-toast-danger | Represents a negative toast |

APP.VUE

Prevent toast close with mobile swipe in Vue Toast component

You can prevent the toast close with mobile swipe action by setting beforeClose argument cancel value to true while argument type as a swipe. The following code shows how to prevent toast close with mobile swipe.

The following sample demonstrates preventing toast close with mobile swipe element displaying with custom code blocks.

APP.VUE

```
<template>
  <div id="app">
        <ejs-button ref='showButtonRef' class="e-btn" id="show_toast" v-
on:click.native="showBtnClick">Show Toast</ejs-button>
        <ejs-toast ref='defaultRef' title='Matt sent you a friend request'
content='You have a new friend request yet to accept'
:beforeClose='onBeforeClose' :position='position'></ejs-toast>
  </div>
</template>
<script>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
import Vue from 'vue';
import { ToastPlugin } from '@syncfusion/ej2-vue-notifications';
import { ButtonPlugin } from '@syncfusion/ej2-vue-buttons';
Vue.use(ToastPlugin);
Vue.use(ButtonPlugin);
export default {
  name: 'app',
  data: function(){
    return {
        position: { X: 'Center' }
    }
  },
  mounted: function() {
      this.$refs.defaultRef.show();
  },
  methods: {
      showBtnClick: function(){
          this.$refs.defaultRef.show();
      },
      onBeforeClose: function(e) {
        if (e.event.type === "swipe") {
            this.toast.cancel = true;
        }
    }
  }
}
</script>
<style>

notifications/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/toast/how-to/preventSwipe-cs1" %}

Toolbar

Getting Started with the Vue Toolbar Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using Vue-CLI and integrating the Syncfusion Vue Toolbar component

Prerequisites

System requirements for Syncfusion Vue UI components

Dependencies

Install the below required dependency package in order to use the Toolbar component in your application.

`javascript

|-- @syncfusion/ej2-vue-navigations

|-- @syncfusion/ej2-base

|-- @syncfusion/ej2-vue-base

|-- @syncfusion/ej2-navigations

Copyright © 2001 -2024 Syncfusion Inc.

|-- @syncfusion/ej2-inputs

|-- @syncfusion/ej2-buttons

`

Setting up the Vue 2 project

To generate a Vue 2 project using Vue-CLI, use the vue create command. Follow these steps to install Vue CLI and create a new project:

`bash

npm install -g @vue/cli

vue create quickstart

cd quickstart

npm run serve

`

or

`bash

yarn global add @vue/cli

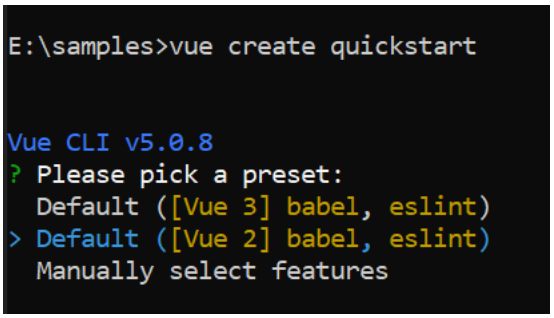
vue create quickstart

cd quickstart

yarn run serve

`

When creating a new project, choose the option Default ([Vue 2] babel, eslint) from the menu.



Once the quickstart project is set up with default settings, proceed to add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion packages are available at npmjs.com. To use Vue components, install the required npm package.

This article uses the Vue Toolbar component as an example. Install the @syncfusion/ej2-vue-navigations package by running the following command:

`bash

npm install @syncfusion/ej2-vue-navigations --save

`

or

`bash

yarn add @syncfusion/ej2-vue-navigations

`

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, the Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the Toolbar component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
navigations/styles/material.css";
</style>
```

Add Syncfusion Vue component

Follow the below steps to add the Vue Toolbar component:

1\. First, import and register the Toolbar component in the script section of the **src/App.vue** file.

~/SRC/APP.VUE

```
<script>
import { ToolbarComponent, ItemDirective, ItemsDirective } from
"@syncfusion/ej2-vue-navigations";
export default {
components: {
'ejs-toolbar': ToolbarComponent,
'e-item': ItemDirective,
'e-items': ItemsDirective
}
}
</script>
```

2\. In the template section, define the Toolbar component with text property.

~/SRC/APP.VUE

```
<template>
<div id="app">
<ejs-toolbar >
```

Copyright © 2001 -2024 Syncfusion Inc.

```
<e-items>
<e-item text='Cut'></e-item>
<e-item text='Copy'></e-item>
<e-item text='Paste'></e-item>
<e-item type='Separator'></e-item>
<e-item text='Bold'></e-item>
<e-item text='Italic'></e-item>
<e-item text='Underline'></e-item>
</e-items>
</ejs-toolbar>
</div>
</template>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

~/SRC/APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:100%;">
        <br>
         <ejs-toolbar >
    <e-items>
             <e-item text='Cut'></e-item>
             <e-item text='Copy'></e-item>
             <e-item text='Paste'></e-item>
             <e-item type='Separator'></e-item>
             <e-item text='Bold'></e-item>
             <e-item text='Italic'></e-item>
             <e-item text='Underline'></e-item>
          </e-items>
    </ejs-toolbar>
    </div>
  </div>
</template>
<script>
import { ToolbarComponent, ItemDirective, ItemsDirective } from
"@syncfusion/ej2-vue-navigations";
export default {
  components: {
    'ejs-toolbar': ToolbarComponent,
    'e-item': ItemDirective,
    'e-items': ItemsDirective
  },
  name: 'app',
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-
navigations/styles/material.css";
</style>
```

Copyright © 2001 -2024 Syncfusion Inc.

Run the project

To run the project, use the following command:

`bash

npm run serve

`

or

`bash

yarn run serve

`

{% previewsample "page.domainurl/code-snippet/toolbar/getting-started-cs1" %}

Initialize the Toolbar using HTML elements

The Toolbar component can be rendered based on the given HTML element using <ejs-toolbar>. You need to follow the below structure of HTML elements to render the Toolbar inside the <ejs-toolbar> tag.

`

<ejs-toolbar> --> Root Toolbar Element

  --> Toolbar Items Container

  --> Toolbar Item Element

</ejs-toolbar>

`

~/SRC/APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:100%;">
        <br>
         <ejs-toolbar>
            <div>
                <div><button class="e-btn e-tbar-btn">Cut</button></div>
                <div><button class="e-btn e-tbar-btn">Copy</button></div>
                <div><button class="e-btn e-tbar-btn">Paste</button></div>
                <div class="e-separator"></div>
                <div><button class="e-btn e-tbar-btn">Bold</button></div>
                <div><button class="e-btn e-tbar-btn">Italic</button></div>
            </div>
          </ejs-toolbar>
    </div>
  </div>
</template>
<script>
import { ToolbarComponent } from "@syncfusion/ej2-vue-navigations";
```

Copyright © 2001 -2024 Syncfusion Inc.

```
export default {
  components: {
    'ejs-toolbar': ToolbarComponent
  },
  name: 'app',
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-
navigations/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/toolbar/toolbar-container-cs1" %}

Note: You can refer to our Vue Toolbar feature tour page for its groundbreaking feature representations. You can also explore our Vue Toolbar example that shows you how to render the Toolbar in Vue.

Getting Started with Syncfusion Vue Toolbar Component in Vue 3

This article provides a step-by-step guide for setting up a Vite project with a JavaScript environment and integrating the Syncfusion Vue Toolbar component using the Composition API / Options API.

The Composition API is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

The Options API is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

Prerequisites

System requirements for Syncfusion Vue UI components

Setup the Vite project

A recommended approach for beginning with Vue is to scaffold a project using Vite. To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

`bash

npm create vite@latest

`

or

`bash

yarn create vite

`

Using one of the above commands will lead you to set up additional configurations for the project as below:

1.Define the project name: We can specify the name of the project directly. Let's specify the name of the project as my-project for this article.

`bash

? Project name: » my-project

`

2.Select Vue as the framework. It will creates a Vue 3 project.

`bash

? Select a framework: » - Use arrow-keys. Return to submit.

Vanilla

Vue

React

Preact

Lit

Svelte

Others

`

3.Choose JavaScript as framework variant to build this Vite project using JavaScript and Vue.

`bash

? Select a variant: » - Use arrow-keys. Return to submit.

JavaScript

TypeScript

Customize with create-vue ↗

Nuxt ↗

`

4.Upon completing the aforementioned steps to create the my-project, run the following command to install its dependencies:

`bash

cd my-project

npm install

`

or

`bash

cd my-project

yarn install

`

Now that my-project is ready to run with default settings, let's add Syncfusion Vue Toolbar component to the project.

Adding Syncfusion Vue Toolbar package in the application

Syncfusion Vue component packages are available at npmjs.com. To use Syncfusion Vue components in the project, install the corresponding npm package.

This article uses the Vue Toolbar component as an example. To use the Vue Toolbar component in the project, the @syncfusion/ej2-vue-navigations package needs to be installed using the following command.

`bash

npm install @syncfusion/ej2-vue-navigations --save

`

or

`bash

yarn add @syncfusion/ej2-vue-navigations

`

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the Toolbar component and its dependents were imported into the <style> section of the **src/App.vue** file.

`html

<style>

@import "../node_modules/@syncfusion/ej2-base/styles/material.css";

@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";

@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";

@import "../node_modules/@syncfusion/ej2-vue-navigations/styles/material.css";

</style>

`

Adding Syncfusion Vue Toolbar component in the application

Follow the below steps to add the Vue Toolbar component using Composition API:

Copyright © 2001 -2024 Syncfusion Inc.

1.First, import and register the Toolbar component and its child directives in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { ToolbarComponent as EjsToolbar, ItemsDirective as EItems,
ItemDirective as EItem } from "@syncfusion/ej2-vue-navigations";
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
import {
ToolbarComponent,
ItemDirective,
ItemsDirective,
} from "@syncfusion/ej2-vue-navigations";
export default {
name: "App",
components: {
"ejs-toolbar": ToolbarComponent,
"e-items": ItemsDirective,
"e-item": ItemDirective
}
}
</script>
```

2.Add the component definition in template section.

`html

<template>

<ejs-toolbar id="toolbar" width="800">

<e-items>

<e-item text="Cut" prefixIcon="e-cut-icon tb-icons"></e-item>

<e-item text="Copy" prefixIcon="e-copy-icon tb-icons"></e-item>

<e-item type="Separator"></e-item>

<e-item text="Bold" prefixIcon="e-bold-icon tb-icons"></e-item>

<e-item text="Underline" prefixIcon="e-underline-icon tb-icons"></e-item>

<e-item text="Italic" prefixIcon="e-italic-icon tb-icons"></e-item>

<e-item text="Color-Picker" prefixIcon="e-color-icon tb-icons"></e-item>

<e-item type="Separator"></e-item>

<e-item text="A-Z Sort" prefixIcon="e-ascending-icon tb-icons"></e-item>

<e-item text="Z-A Sort" prefixIcon="e-descending-icon tb-icons"></e-item>

Copyright © 2001 -2024 Syncfusion Inc.

<e-item text="Clear" prefixIcon="e-descending-icon tb-icons"></e-item>

</e-items>

</ejs-toolbar>

</template>

`

3.Add styles for Toolbar component to render icons.

`html

<style>

.e-tbar-btn .e-icons {

font-family: "Material_toolbar";

font-size: 16px;

font-style: normal;

font-weight: normal;

font-variant: normal;

text-transform: none;

}

.custom_bold .e-tbar-btn-text {

font-weight: 900;

}

.custom_italic .e-tbar-btn-text {

font-style: italic;

}

.custom_underline .e-tbar-btn-text {

text-decoration: underline red;

}

.e-txt-casing .e-tbar-btn-text {

font-variant: small-caps;

}

@font-face {

font-family: "Material_toolbar";

src: url(data:application/x-font-ttf;charset=utf-8base64,AAEAAAAKAIAAAwAgT1MvMj1tShMAAAEoAAAAVmNtYXDoMOjqAAACDAAAAHhnbHlmIuy19QAAAswAACNMaGVhZA6okZMAAADQAAAANmhoZWEIUQQkAAAArAAAACRobXR4jAAAAAAAAYAAAACMbG9jYYc0kUIAAAKEAAAASG1heHABOwG8AAABCAAAACBuYW1lx/RZbQAAJhgAAAKRcG9zdJZeEVUAACi

Run the project

To run the project, use the following command:

`bash

npm run dev

`

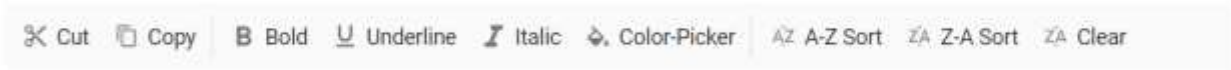
or

`bash

yarn run dev

`

The output will appear as follows:



Refer the sample Vue 3 using Composition API Toolbar getting started

For migrating from Vue 2 to Vue 3, refer to the migration documentation.

Item configuration in Vue Toolbar component

The Vue Toolbar can be rendered by defining an array of items. Items can be constructed with the following built-in command types or item template.

Button

`Button` is the default command `type`, and it can be rendered by using the `text` property. Properties of the button command type:

Property | Description

text | The text to be displayed for button.

id | The ID of the button to be rendered. If the ID is not given, auto ID is generated.

prefixIcon | Defines the class used to specify an icon for the button. The icon is `positioned before` the text if text is available or the icon alone button is rendered.

suffixIcon | Defines the class used to specify an icon for the button. The icon is `positioned after` the text if text is available. If both `prefixIcon` and `suffixIcon` are specified, only `prefixIcon` is considered.

width | Used to set the width of the button.

Separator

The `Separator` type adds a vertical separation between the Toolbar's single/multiple commands.

APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:100%;">
        <br>
         <ejs-toolbar >
    <e-items>
             <e-item text='Cut'></e-item>
             <e-item text='Copy'></e-item>
             <e-item text='Paste'></e-item>
             <e-item type='Separator'></e-item>
             <e-item text='Bold'></e-item>
             <e-item text='Italic'></e-item>
             <e-item text='Underline'></e-item>
          </e-items>
    </ejs-toolbar>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { ToolbarPlugin } from "@syncfusion/ej2-vue-navigations";
Vue.use(ToolbarPlugin);
export default {
  name: 'app',
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-buttons/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-popups/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-
navigations/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/toolbar/toolbar-items-cs1" %}

If Separator is added as the first or the last item, it will not be visible.

Enabling tab key navigation in Toolbar

The tabIndex property of a Toolbar item is used to enable tab key navigation for the item. By default, the user can switch between items using the arrow keys, but the tabIndex property allows you to switch between items using the Tab and Shift+Tab keys as well.

To use the tabIndex property, you need to set it for each Toolbar item that you want to enable tab key navigation. The tabIndex property should be set to a positive integer value. A value of 0 or a negative value will disable tab key navigation for the item.

For example, to enable tab key navigation for two Toolbar items, you can use the following code:

`

<template>

<ejs-toolbar>

```
<e-items>
<e-item text='Item 1' tabIndex="1"></e-item>
<e-item text='Item 2' tabIndex="2"></e-item>
<e-item text='Item 3' tabIndex="3"></e-item>
</e-items>
</ejs-toolbar>
</div>
</template>
<script>
import Vue from 'vue';
import { ToolbarPlugin } from '@syncfusion/ej2-vue-navigations';
Vue.use(ToolbarPlugin);
export default {
name: 'app',
}
</script>
```

With the above code, the user can switch between the two Toolbar items using the Tab and Shift+Tab keys, in addition to using the arrow keys. The items will be navigated in the order specified by the tabIndex values.

If you set the tabIndex value to 0 for all Toolbar items, tab key navigation will be based on the element order rather than the tabIndex values. For example:

```
<template>
<div id="app">
<ejs-toolbar>
<e-items>
<e-item text='Item 1' tabIndex="0"></e-item>
<e-item text='Item 2' tabIndex="0"></e-item>
<e-item text='Item 3' tabIndex="0"></e-item>
</e-items>
</ejs-toolbar>
</div>
</template>
```

Copyright © 2001 -2024 Syncfusion Inc.

<script>

import Vue from 'vue';

import { ToolbarPlugin } from '@syncfusion/ej2-vue-navigations';

Vue.use(ToolbarPlugin);

export default {

name: 'app',

}

</script>

`

In this case, the user can switch between the two Toolbar items using the Tab and Shift+Tab keys, and the items will be navigated in the order in which they appear in the DOM.

Example:

Here is an example of how you can use the tabIndex property to enable tab key navigation for a Toolbar component:

APP.VUE

```
<template>
  <div id="app">
    <ejs-toolbar>
      <e-items>
        <e-item text='Cut' tabIndex="0"></e-item>
        <e-item text='Copy' tabIndex="0"></e-item>
        <e-item text='Paste' tabIndex="0"></e-item>
        <e-item type='Separator'></e-item>
        <e-item text='Bold'></e-item>
        <e-item text='Italic'></e-item>
        <e-item text='Underline'></e-item>
      </e-items>
    </ejs-toolbar>
  </div>
</template>
<script>
import Vue from 'vue';
import { ToolbarPlugin } from '@syncfusion/ej2-vue-navigations';
Vue.use(ToolbarPlugin);
export default {
  name: 'app',
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
navigations/styles/material.css";
</style>
```

Copyright © 2001 -2024 Syncfusion Inc.

{% previewsample "page.domainurl/code-snippet/toolbar/toolbar-container-cs2" %}

With the above code, the user can switch between the Toolbar items using the Tab and Shift+Tab keys, and the items will be navigated based on the element order.

Template configuration in Vue Toolbar component

Integrate menu component

You can integrate menu component as toolbar item in Toolbar using Vue **template**. Menu can be populated with items as needed.

APP.VUE

```
<template>
    <div id="app">
        <ejs-toolbar >
           <e-items>
             <e-item :template='menuTemplate' ></e-item>
          </e-items>
        </ejs-toolbar>
    </div>
</template>
<script>
import Vue from 'vue';
import { MenuPlugin, ToolbarPlugin } from "@syncfusion/ej2-vue-navigations";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(MenuPlugin);
Vue.use(ToolbarPlugin);
var menutemplateVue = Vue.component("demo", {
  template: '<ejs-menu :items="menuItems"></ejs-menu>',
  data() {
    return {
      data: {},
      menuItems: [
            {
                text: 'Appliances',
                items: [
                    {
                        text: 'Kitchen',
                        items: [
                            { text: 'Electric Cookers' },
                            { text: 'Coffee Makers' },
                            { text: 'Blenders' }
                        ]
                    },
                    {
                        text: 'Washing Machine',
                        items: [
                            { text: 'Fully Automatic' },
                            { text: 'Semi Automatic' }
                        ]
                    },
```

```
                    {
                        text: 'Air Conditioners',
                        items: [
                            { text: 'Inverter ACs' },
                            { text: 'Split ACs' },
                            { text: 'Window ACs' }
                        ]
                    }
                ]
            },
            {
                text: 'Accessories',
                items: [
                    {

{% previewsample "page.domainurl/code-snippet/toolbar/menu-component-cs1" %}

Responsive mode in Vue Toolbar component

This section explains the supported display modes of the Toolbar when the content exceeds the viewing area. Possible modes are:

- Scrollable
- Popup

Scrollable

The default overflow mode of the Toolbar is Scrollable. Scrollable display mode supports display of commands in a single line with

horizontal scrolling enabled when commands overflow to available space.

Copyright © 2001 -2024 Syncfusion Inc.

- The right and left navigation arrows are added to the start and end of the Toolbar to navigate to hidden commands.
- You can also see the hidden commands using touch swipe action.
- By default, if navigation icon in the left side is disabled, you can see the hidden commands by moving to the right.
- By clicking the arrow or by holding the arrow continuously, hidden commands will become visible.
- If device navigation icons are not available, you can touch swipe to see the hidden commands of the Toolbar.

- Once the Toolbar reaches the last or first command, the corresponding navigation icon will be disabled and you can move to the opposite direction.

- You can continuously scroll the Toolbar content by holding the navigation icon.

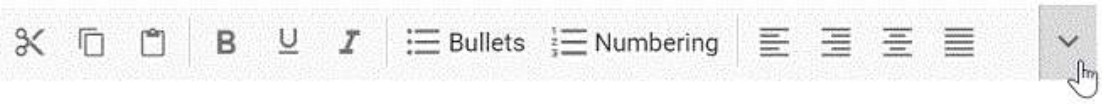
{% previewsample "page.domainurl/code-snippet/toolbar/responsive-mode/toolbar-scrollable-cs1" %}

Popup

Popup is another type of overflowMode in which the Toolbar container holds the commands that can be placed in the available space. The rest of the overflowing commands that do not fit within the viewing area moves to the overflow popup container.

The commands placed in the popup can be viewed by opening the popup using the drop down icon given at the end of the Toolbar.

Copyright © 2001 -2024 Syncfusion Inc.



If the popup content overflows the height of the page, then the rest of the commands will be hidden.

Priority of commands

Default popup priority is set as none, and when the commands of the Toolbar overflow, the ones listed last will be moved to the popup.

You can customize the priority of commands to be displayed on the Toolbar and popup by using the overflow property.

Property | Description

Both | Button text is visible in both Toolbar and Popup.

Overflow | Button text is only visible in Popup.

Toolbar | Button text is only visible on the Toolbar.

In the following code sample, text is only visible in the popup container and not in the Toolbar container.

APP.VUE

```

Accessibility in Vue Toolbar component

The Vue Toolbar component has been designed, keeping in mind the WAI-ARIA specifications, and applying the WAI-ARIA roles, states, and properties along with keyboard support for people who use assistive devices. WAI-ARIA accessibility support is achieved through attributes like aria-label, and aria-orientation, It provides information about elements in a document for assistive technology. The component implements keyboard navigation support by following the WAI-ARIA practices, and has been tested in major screen readers.

The accessibility compliance for the Toolbar component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| WCAG 2.2 Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Section 508 Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Screen Reader Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Right-To-Left Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Color Contrast | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Mobile Device Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

Copyright © 2001 -2024 Syncfusion Inc.

| Keyboard Navigation Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Accessibility Checker Validation | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Axe-core Accessibility Validation | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> - All features of the component meet the requirement.

<img src="https://cdn.syncfusion.com/content/images/landing-page/intermediate.png" alt="Intermediate"> - Some features of the component do not meet the requirement.

<img src="https://cdn.syncfusion.com/content/images/landing-page/no.png" alt="No"> - The component does not meet the requirement.

ARIA attributes

Toolbar component is designed by considering WAI-ARIA standard. Toolbar is supported with ARIA Accessibility which is accessible by on-screen readers, and other assistive technology devices. The following list of attributes are added in the Toolbar.

| **Property** | **Functionalities** |

| --- | --- |

| role="toolbar" | Attribute is set to the ToolBar element describes the actual role of the element. |

| aria-orientation | Attribute is set to the ToolBar element to indicates the ToolBar orientation. Default value is `horizontal`. |

| aria-label | Attribute is set to ToolBar element describes the purpose of the set of toolbar. |

| aria-expanded | Attribute is set to the ToolBar Popup element to indicates the expanded state of the popup.|

| aria-haspopup | Attribute is set to the popup element to indicates the popup mode of the Toolbar. Default value is false. When popup mode is enabled, attribute value has to be changed to `true`. |

| aria-disabled | Attribute set to the ToolBar element to indicates the disabled state of the ToolBar. |

Keyboard interaction

Keyboard navigation is enabled by default. Possible keys are

| Key | Description |

|----------|---|

| Left | Focuses the previous element. |

| Right | Focuses the next element. |

| Enter | When focused on a ToolBar command, clicking the key triggers the click of Toolbar element. When popup drop-down icon is focused, the popup opens. |

| Esc(Escape) | Closes popup. |

| Down | Focuses the next popup element. |

| Up | Focuses the previous popup element. |

| Home | Moves focus to the first Toolbar. |

| End | Moves focus to the last Toolbar. |

| Tab | To Move focus through the interactive elements. |

| Shift + Tab | To Move focus through the interactive elements. |

Ensuring accessibility

The Toolbar component's accessibility levels are ensured through an accessibility-checker and axe-core software tools during automated testing.

The accessibility compliance of the Toolbar component is shown in the following sample. Open the sample in a new window to evaluate the accessibility of the Toolbar component with accessibility tools.

Style in Vue Toolbar component

The following content provides the exact CSS structure that can be used to modify the control’s appearance based on user preference.

Customizing Toolbar

Use the following CSS to customize the Toolbar.

```css
.e-toolbar {
border: 5px solid rgb(173, 255, 47);
}
```

Customizing the Toolbar items

Use the following CSS to customize the items of Toolbar.

```css
.e-toolbar .e-toolbar-item {
background: #add8e6;
```

Copyright © 2001 -2024 Syncfusion Inc.

```
border: 1px solid #5a70cc;
}
```

Use the following CSS to customize the button in the items of Toolbar.

```css
.e-toolbar .e-tbar-btn {
background: #add8e6;
border: 1px solid #5a70cc;
}
```

Customizing Toolbar's item icon

Use the following CSS to customize the item icon of Toolbar control.

```css
.e-toolbar .e-tbar-btn .e-icons {
background: #185655;
color: #d7f9d4;
}
```

Customizing the hover state of Toolbar control

Use the following CSS to customize the toolbar item when hovering.

```css
.e-toolbar .e-tbar-btn:hover {
background: #c0e3a1;
border: 1px solid green;
}
```

Customizing selected item of Toolbar control

Use the following CSS to customize the selected toolbar item.

```css
.e-toolbar .e-tbar-btn:focus {
background: #add8e6;
border: 1px solid #5a70cc;
}
```

How To

Set command customization in Vue Toolbar component

The htmlAttributes property of the Toolbar item is used to set the HTML attributes ('ID', 'class', 'style' ,'role') for the commands.

When style attributes are added, if the same attributes were already present, they will be replaced. This is not so in the case of class

attribute. Classes will be added to the element instead of replacing the existing ones.

Single or multiple CSS classes can be added to the Toolbar commands using the Toolbar item cssClass property.

Set tool tip to the commands in Vue Toolbar component

The tooltipText property of the Toolbar item is used to set the HTML Tooltip to the commands that can be viewed as hint texts on mouse hover.

To change the tooltipText to ej2-tooltip component:

- Import the Tooltip module from ej2-popups,and initialize the Tooltip with the Toolbar target. Refer to the following code example:

APP.VUE

```
<template>
  <div id="app">
    <div id = 'Tooltip'  id ='Toolbar' :created="oncreated">
         <ejs-toolbar >
    <e-items>
             <e-item text='Cut'></e-item>
             <e-item text='Copy'></e-item>
             <e-item text='Paste'></e-item>
```

```
            <e-item type='Separator'></e-item>
            <e-item text='Bold'></e-item>
            <e-item text='Italic'></e-item>
            <e-item text='Underline'></e-item>
          </e-items>
    </ejs-toolbar>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { ToolbarPlugin } from "@syncfusion/ej2-vue-navigations";
import { Tooltip } from "@syncfusion/ej2-popups";
Vue.use(ToolbarPlugin);
export default {
  name: 'app',
   data() {
    },
    methods:{
      oncreated: function(e){
      var tooltip  = new Tooltip({ target: '#Toolbar',content: 'This is
Toolbar'});
       tooltip.appendTo('#Tooltip');
      }
    }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-buttons/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-popups/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-
navigations/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/toolbar/how-to/Tooltip-cs1" %}

Set item wise custom template in Vue Toolbar component

The Toolbar supports adding template commands using the template property. Template property can be given as the HTML element that is

either a string or a query selector.

As a string

The HTML element tag can be given as a string for the template property. Here, the checkbox is rendered as a HTML template.

`html

template: " <input type='checkbox' id='check1' checked=''>Accept</input> "

`

As a selector

The template property also allows getting template content through query selector. Here, checkbox 'ID' attribute is specified in the template.

Copyright © 2001 -2024 Syncfusion Inc.

`ts

template: "#Template"

`

APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:100%;">
        <br>
         <ejs-toolbar >
    <e-items>
             <e-item text='Cut'></e-item>
             <e-item type='Separator'></e-item>
             <e-item text='Paste'></e-item>
             <e-item type='Separator'></e-item>
             <e-item :template='templateEle'></e-item>
             <e-item text='Undo'></e-item>
             <e-item text='Redo'></e-item>
             <e-item :template='templateEleId'></e-item>
          </e-items>

Add toggle button in Vue Toolbar component

Toolbar supports to add a toggle Button by using the template property. Refer below steps

- By using Toolbar template property, pass required HTML String to render toggle button.

Copyright © 2001 -2024 Syncfusion Inc.

`

<e-item template='<button class="e-btn" id="media_btn"></button>'></e-item>

`

- Now render the toggle Button into the targeted element in Toolbar created event handler and bind click event for it. On clicking the

toggle Button, change the required icon and content based on current active state.

APP.VUE

```
<template>
  <div id="app">
        <br>
         <ejs-toolbar id="toolbar" class="toggle" :created='create'>
    <e-items>
              <e-item template='<button class="e-btn"
id="media_btn"></button>'></e-item>
                <e-item type='Separator'></e-item>
                <e-item template='<button class="e-btn"
id="zoom_btn"></button>'></e-item>
                <e-item type='Separator'></e-item>
                <e-item template='<button class="e-btn"
id="undo_btn"></button>'></e-item>
                <e-item type='Separator'></e-item>
                <e-item template='<button class="e-btn"
id="filter_btn"></button>'></e-item>
                <e-item type='Separator'></e-item>
                <e-item template='<button class="e-btn"
id="visible_btn"></button>'></e-item>
          </e-items>
    </ejs-toolbar>
    <br/>
        <div id="content">
          This content will be hidden, when you click on hide button and
toggle get an active state as show, otherwise it will be visible.
        </div>
    </div>
</template>
<script>

Customize toolbar scroll step in Vue Toolbar component

Toolbar supports to customize the scrolling distance when you click the left and right side navigation icons. we can customize ScrollStep property for scrolling distance. Refer to the following code example.

By using Toolbar scrollStep property, pass a required value to customize toolbar scrollStep.

APP.VUE

```
<template>
  <div id="app">
        <br>
        <ejs-toolbar id="toolbar" width="600" scrollStep="50">
            <e-items>
                <e-item prefixIcon='e-cut-icon tb-icons'
tooltipText='Cut'></e-item>

Add link to toolbar item in Vue Toolbar component

You can add link inside Toolbar using Vue **template**. Follow the below guidelines for add link as template in Toolbar.

- Declare a template in the **template** section of the ".vue" file. An empty object "data" needs to be initialized in the data option of the default export object in **script** section.
- The template function needs to be assigned to the content property of the EJ2 Vue Toolbar Component.

APP.VUE

```
<template>
    <div id="app">
    <ejs-toolbar >
           <e-items>
             <e-item text='Cut'></e-item>
             <e-item text='Copy' ></e-item>
             <e-item type='Separator'></e-item>
             <e-item text='Paste' ></e-item>
             <e-item type='Separator'></e-item>
             <e-item :template='AnchorTemplate'></e-item>
          </e-items>
      </ejs-toolbar>
  </div>
</template>
<script>
import Vue from 'vue';
import { ToolbarPlugin } from '@syncfusion/ej2-vue-navigations';
Vue.use(ToolbarPlugin);
var AnchorData = Vue.component("demo", {
  template: '<a target="_blank"
href="https://ej2.syncfusion.com/vue/documentation/toolbar/getting-
started/">Anchor Toolbar Link</a>',
  data() {
    return {
      data: {}
    };
  }
});
export default {
  name: 'app',
  data: function(){
    return {
      AnchorTemplate: function () {
        return {
          template: AnchorData
        }
      }
   }
 }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-buttons/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-popups/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-
navigations/styles/material.css";
</style>
```

Render other components in toolbar using template in Vue Toolbar component

You can render other components inside Toolbar using Vue **template**. Through this, we can add content as other components directly with all functionalities to our Toolbar. Follow the below guidelines for using the other components as template in Toolbar.

- Declare a template in the **template** section of the ".vue" file. An empty object "data" needs to be initialized in the data option of the default export object in **script** section.
- The template function needs to be assigned to the content property of the EJ2 Vue Toolbar Component.

APP.VUE

```
<template>
    <div id="app">
    <ejs-toolbar >
           <e-items>
             <e-item :template='Template1' ></e-item>
             <e-item text='Italic' ></e-item>
             <e-item text='Underline' ></e-item>
             <e-item type='Separator'></e-item>
             <e-item :template='Template2'></e-item>
          </e-items>
      </ejs-toolbar>
  </div>
</template>
<script>
import Vue from 'vue';
import { ToolbarPlugin } from '@syncfusion/ej2-vue-navigations';
Vue.use(ToolbarPlugin);
import { DatePickerComponent,CalendarComponent,
DatePickerPlugin,CalendarPlugin } from '@syncfusion/ej2-vue-calendars';
Vue.use(DatePickerPlugin);
Vue.use(CalendarPlugin);
import { NumericTextBoxComponent,NumericTextBoxPlugin } from
"@syncfusion/ej2-vue-inputs";
Vue.use(NumericTextBoxPlugin);
export default {
  name: 'app',
  data: function(){
    return {
      Template1: function () {
        return {
          template: Vue.component('NumericTextBoxComponent', {
            template: '<ejs-numerictextbox value="10"></ejs-
numerictextbox>',
            data() { return { }; }
          })
        }
      },
        Template2: function () {
        return {
          template: Vue.component('DatePickerComponent', {
```

```
            template: ' <ejs-datepicker :min="minDate" :max="maxDate"
:value="dateVal" ></ejs-datepicker>',
            data() { return { minDate : new Date("05/09/2017"),
                              maxDate : new Date("05/15/2017"),
                              dateVal : new Date("05/11/2017") }; }
          })
        }
      },
    }
  }
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-buttons/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-popups/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-
navigations/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-
calendars/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
</style>
```

Tooltip

Getting Started with the Vue Tooltip Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using Vue-CLI and integrating the Syncfusion Vue Tooltip component using the Composition API / Options API.

Prerequisites

System requirements for Syncfusion Vue UI components

Setting up the Vue 2 project

To generate a Vue 2 project using Vue-CLI, use the vue create command. Follow these steps to install Vue CLI and create a new project:

`bash

npm install -g @vue/cli

vue create quickstart

cd quickstart

npm run serve

`

or

`bash

yarn global add @vue/cli

vue create quickstart

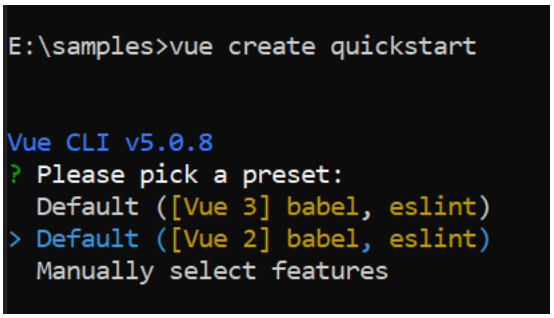
Copyright © 2001 -2024 Syncfusion Inc.

cd quickstart

yarn run serve

`

When creating a new project, choose the option Default ([Vue 2] babel, eslint) from the menu.



Once the quickstart project is set up with default settings, proceed to add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion packages are available at npmjs.com. To use Vue components, install the required npm package.

This article uses the Vue Tooltip component as an example. Install the @syncfusion/ej2-vue-popups package by running the following command:

`bash

npm install @syncfusion/ej2-vue-popups --save

`

or

`bash

yarn add @syncfusion/ej2-vue-popups

`

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, the Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the Tooltip component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-popups/styles/material.css";
</style>
```

Copyright © 2001 -2024 Syncfusion Inc.

We can also use CRG to generate combined component styles.

Add Syncfusion Vue component

Follow the below steps to add the Vue Tooltip component using Composition API or Options API:

1\. First, import and register the Tooltip component in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { TooltipComponent as EjsTooltip } from "@syncfusion/ej2-vue-popups";
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { TooltipComponent } from "@syncfusion/ej2-vue-popups";
export default {
components: {
'ejs-tooltip': TooltipComponent
}
}
</script>
```

2\. In the template section, define the Tooltip component with the content property

~/SRC/APP.VUE

```
<template>
<div id="app">
<ejs-tooltip ref="tooltip" content='Tooltip content' >
<span>Show Tooltip</span>
</ejs-tooltip>
</div>
</template>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
  <div id="app">
    <div id='container'>
      <ejs-tooltip class="tooltipcontainer" content='Tooltip content'
target="#target">
        <div style="display: inline-block; position: relative; left:
50%;top: 100px;transform: translateX(-50%);">
          <ejs-button id='target'>Show Tooltip</ejs-button>
        </div>
      </ejs-tooltip>
    </div>
  </div>
</template>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
<script setup>
import { TooltipComponent as EjsTooltip } from "@syncfusion/ej2-vue-popups";
import { ButtonComponent as EjsButton } from "@syncfusion/ej2-vue-buttons";
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-popups/styles/material.css";
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
  <div id="app">
    <div id='container'>
      <ejs-tooltip class="tooltipcontainer" content='Tooltip content'
target="#target">
        <div style="display: inline-block; position: relative; left:
50%;top: 100px;transform: translateX(-50%);">
          <ejs-button id='target'>Show Tooltip</ejs-button>
        </div>
      </ejs-tooltip>
    </div>
  </div>
</template>
<script>
import { TooltipComponent } from "@syncfusion/ej2-vue-popups";
import { ButtonComponent } from "@syncfusion/ej2-vue-buttons";
export default {
  components: {
    'ejs-tooltip': TooltipComponent,
    'ejs-button': ButtonComponent
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-popups/styles/material.css";
</style>
```

Run the project

To run the project, use the following command:

`bash

npm run serve

`

or

`bash

yarn run serve

`

{% previewsample "page.domainurl/code-snippet/tooltip/getting-started-cs1" %}

Getting Started with the Vue Tooltip Component in Vue 3

This article provides a step-by-step guide for setting up a Vite project with a JavaScript environment and integrating the Syncfusion Vue Tooltip component using the Composition API / Options API.

The Composition API is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

The Options API is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

Prerequisites

System requirements for Syncfusion Vue UI components

Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using Vite. To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

`bash

npm create vite@latest

`

or

`bash

yarn create vite

`

Using one of the above commands will lead you to set up additional configurations for the project as below:

1.Define the project name: We can specify the name of the project directly. Let's specify the name of the project as my-project for this article.

`bash

? Project name: » my-project

`

2.Select Vue as the framework. It will create a Vue 3 project.

`bash

? Select a framework: » - Use arrow-keys. Return to submit.

Vanilla

Copyright © 2001 -2024 Syncfusion Inc.

Vue

React

Preact

Lit

Svelte

Others

`

3.Choose JavaScript as the framework variant to build this Vite project using JavaScript and Vue.

`bash

? Select a variant: » - Use arrow-keys. Return to submit.

JavaScript

TypeScript

Customize with create-vue ↗

Nuxt ↗

`

4.Upon completing the aforementioned steps to create the my-project, run the following command to install its dependencies:

`bash

cd my-project

npm install

`

or

`bash

cd my-project

yarn install

`

Now that my-project is ready to run with default settings, let's add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion Vue component packages are available at npmjs.com. To use Syncfusion Vue components in the project, install the corresponding npm package.

This article uses the Vue Tooltip component as an example. To use the Vue Tooltip component in the project, the @syncfusion/ej2-vue-popups package needs to be installed using the following command:

`bash

npm install @syncfusion/ej2-vue-popups --save

`

or

`bash

yarn add @syncfusion/ej2-vue-popups

`

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the Tooltip component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-popups/styles/material.css";
</style>
```

Add Syncfusion Vue component

Follow the below steps to add the Vue Tooltip component using Composition API or Options API:

1.First, import and register the Tooltip component in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { TooltipComponent as EjsTooltip  } from "@syncfusion/ej2-vue-
popups";
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { TooltipComponent  } from "@syncfusion/ej2-vue-popups";
//Component registration
export default {
name: "App",
components: {
"ejs-tooltip": TooltipComponent
}
}
</script>
```

Copyright © 2001 -2024 Syncfusion Inc.

2.Add the component definition in template section.

~/SRC/APP.VUE

```
<template>
<ejs-tooltip content='Tooltip content' >
<span>Show Tooltip</span>
</ejs-tooltip>
</template>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<div id="app">
<ejs-tooltip content='Tooltip content' target="#target">
<div style="display: inline-block; position: relative; left: 50%;top:
100px;transform: translateX(-50%);">
<button id='target' class="e-control e-btn e-lib">Show Tooltip</button>
</div>
</ejs-tooltip>
</div>
</template>
<script setup>
import { TooltipComponent as EjsTooltip  } from "@syncfusion/ej2-vue-
popups";
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-popups/styles/material.css";
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<div id="app">
<ejs-tooltip content='Tooltip content' target="#target">
<div style="display: inline-block; position: relative; left: 50%;top:
100px;transform: translateX(-50%);">
<button id='target' class="e-control e-btn e-lib">Show Tooltip</button>
</div>
</ejs-tooltip>
</div>
</template>
<script>
import { TooltipComponent  } from "@syncfusion/ej2-vue-popups";
//Component registration
export default {
name: "App",
components: {
"ejs-tooltip": TooltipComponent
},
data() {
return {
```

Copyright © 2001 -2024 Syncfusion Inc.

```
};
},
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-popups/styles/material.css";
</style>
```

Run the project

To run the project, use the following command:

`bash

npm run dev

`

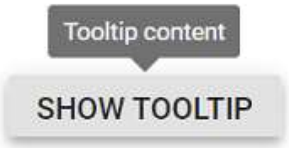
or

`bash

yarn run dev

`

The output will appear as follows:



Tooltip Positioning

Tooltips can be attached to 12 static locations around the target.

On initializing the Tooltip, you can set the position property with any one of the following values:

- TopLeft
- TopCenter
- TopRight
- BottomLeft
- BottomCenter
- BottomRight
- LeftTop
- LeftCenter
- LeftBottom
- RightTop

Copyright © 2001 -2024 Syncfusion Inc.

- RightCenter
- RightBottom

By default, Tooltip is placed at the TopCenter of the target element.

In the following example, the position property set as BottomCenter.

COMPOSITION API (~/SRC/APP.VUE)

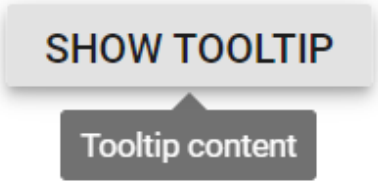
```
<template>
<div id="app">
<ejs-tooltip content="Tooltip content" :position='position'
target="#tooltip">
<div id='container'>
<ejs-button id="tooltip">Show tooltip</ejs-button>
</div>
</ejs-tooltip>
</div>
</template>
<script setup>
import { TooltipComponent as EjsTooltip  } from "@syncfusion/ej2-vue-
popups";
import { ButtonComponent as EjsButton } from '@syncfusion/ej2-vue-buttons';
const position = 'BottomCenter';
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-popups/styles/material.css";
#container {
display: inline-block;
position: relative;
left: 50%;
margin-top: 100px;
transform: translateX(-50%);
height: 200px;
}
#tooltip {
display: inline-block;
margin: 30px 130px 30px 50px;
}
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<div id="app">
<ejs-tooltip content="Tooltip content" :position='position'
target="#tooltip">
<div id='container'>
<ejs-button id="tooltip">Show tooltip</ejs-button>
</div>
</ejs-tooltip>
</div>
</template>
<script>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
import { TooltipComponent  } from "@syncfusion/ej2-vue-popups";
import { ButtonComponent } from '@syncfusion/ej2-vue-buttons';
//Component registration
export default {
name: "App",
components: {
"ejs-tooltip": TooltipComponent,
"ejs-button": ButtonComponent
},
data() {
return {
position: "BottomCenter"
};
},
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-popups/styles/material.css";
#container {
display: inline-block;
position: relative;
left: 50%;
margin-top: 100px;
transform: translateX(-50%);
height: 200px;
}
#tooltip {
display: inline-block;
margin: 30px 130px 30px 50px;
}
</style>
```



For migrating from Vue 2 to Vue 3, refer to the migration documentation.

Setting dimension in Vue Tooltip component

Height and width

The Tooltip can either be assigned auto height and width values or specific pixel values. The `width` and `height` properties are used to

set the outer dimension of the Tooltip element. The default value for both the properties is `auto`. It also accepts string and number values in pixels.

The following sample explains how to set dimensions for the Tooltip.

APP.VUE

```
<template>
   <div id='app'>
      <div id='container'>
        <ejs-tooltip id="tooltip" content="This tooltip has 180px width and
40px height" width='180px' height='40px' target="#target">
          <div style="display: inline-block; position: relative; left:
50%;top: 100px;transform: translateX(-50%);">
              <ejs-button id='target'>Show Tooltip</ejs-button>
          </div>
        </ejs-tooltip>
      </div>
    </div>
</template>
<script>
import Vue from "vue";
import { TooltipPlugin } from "@syncfusion/ej2-vue-popups";
import { ButtonPlugin } from "@syncfusion/ej2-vue-buttons";
Vue.use(TooltipPlugin);
Vue.use(ButtonPlugin);
export default {
    data() {
    return {
    };
    }
}
</script>
<style>
@import "node_modules/@syncfusion/ej2-base/styles/material.css";
@import "node_modules/@syncfusion/ej2-vue-popups/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/tooltip/dimensions/height-width-cs1" %}

Scroll mode

When `height` is specified with a certain pixel value and the Tooltip content overflows, the scrolling mode gets enabled.

Copyright © 2001 -2024 Syncfusion Inc.

APP.VUE

```
<template>
  <div id='app'>
    <ejs-tooltip id='tooltip' :content='content' target='#target'
width='300px' height='60px' isSticky='true'>
      <p>A green home is a type of house designed to be  <a
id="target"><u>environmentally friendly</u></a>
        and sustainable. And also focuses on the efficient use of "energy,
water, and building materials." As green homes
        have become more prevalent we have also seen the emergence of green
affordable housing.
      </p>
    </ejs-tooltip>
  </div>
</template>
<style>
@import "node_modules/@syncfusion/ej2-base/styles/material.css";
@import "node_modules/@syncfusion/ej2-vue-popups/styles/material.css";
  #tooltipContent {
    padding: 0 10px;
    font-weight: 400;
    font-size: 12px;
    line-height: 22px;
  }
</style>
<script>
import Vue from "vue";
import { TooltipPlugin } from "@syncfusion/ej2-vue-popups";
Vue.use(TooltipPlugin);
var demoVue = Vue.component("demo", {
  template: `
    <div id="tooltipContent"><p><strong>Environmentally friendly</strong> or
<strong>environment-friendly</strong>, <i>(also referred to as eco-friendly,
nature-friendly, and green)</i> are marketing and sustainability terms
referring to goods and services, laws, guidelines and policies that inflict
reduced, minimal, or no harm upon ecosystems or the environment.</p></div>`,
  data() {
    return {
      data: {}
    };
  }
});
export default {
  data: function() {
    return {
      content: function () {
        return { template : demoVue}
      }
    };
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/tooltip/dimensions/scroll-mode-cs1" %}

Copyright © 2001 -2024 Syncfusion Inc.

The scrolling mode can best be seen when the sticky mode of the Tooltip is enabled. To enable sticky mode, set the isSticky property to true.

Content in Vue Tooltip component

A text or a piece of information assigned to the Tooltip's content property will be displayed as the main text stream of the Tooltip. It can be a string or a template content. If the content property is not provided with any specific value, then it takes the value assigned to the title attribute of the target element on which the Tooltip was initialized. The content can also dynamically be assigned to the Tooltip via Fetch.

Template content

Any text or image can be added to the Tooltip, by default. To customize the Tooltip layout or to create your own visualized element on the

Tooltip, template can be used.

Refer to the following code example to add formatted HTML content to the Tooltip.

APP.VUE

```
<template>
   <div id='app'>
    <ejs-tooltip id='tooltip' :content='content' target='#target'>
        <p>A green home is a type of house designed to be  <a
id="target"><u>environmentally friendly</u></a>
          and sustainable. And also focuses on the efficient use of "energy,
water, and building materials." As green homes
          have become more prevalent we have also seen the emergence of
green affordable housing.
        </p>
      </ejs-tooltip>
    </div>
</template>
<style>
@import "node_modules/@syncfusion/ej2-base/styles/material.css";
@import "node_modules/@syncfusion/ej2-vue-popups/styles/material.css";
  #tooltipContent {
    padding: 10px;
    font-weight: 400;
    font-size: 14px;
    line-height: 22px;
  }
</style>
<script>
import Vue from "vue";
import { TooltipPlugin } from "@syncfusion/ej2-vue-popups";
Vue.use(TooltipPlugin);
var demoVue = Vue.component("demo", {
  template: `
    <div id="tooltipContent"><p><strong>Environmentally friendly</strong> or
<strong>environment-friendly</strong>, <i>(also referred to as eco-friendly,
nature-friendly, and green)</i> are marketing and sustainability terms
referring to goods and services, laws, guidelines and policies that inflict
reduced, minimal, or no harm upon ecosystems or the environment.</p></div>`,
  data() {
    return {
```

Copyright © 2001 -2024 Syncfusion Inc.

```
      data: {}
    };
  }
});
export default {
  data: function() {
    return {
      content: function () {
        return { template : demoVue}
      }
    };
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/tooltip/content-cs1" %}

Dynamic content via Fetch

The Tooltip content can be dynamically loaded by making use of the Fetch call. The Fetch request is usually made within the `beforeRender` event of the Tooltip, and then the Tooltip's `content` is assigned the value retrieved on it's success.

Note: The Tooltip **target** property includes a unique identifier used to associate Tooltips with specific elements on a webpage or application interface. When setting the Tooltip **target** value as a GUID (Globally Unique Identifier), it's important to note that the GUID must start with a combination of **letters** before the numeric portion of the GUID. For example, **target: '#' + ' tooltip'+ '96ad88bd-294c-47c3-999b-a9daa3285a05'**.

APP.VUE

```
<template>
  <div id='app'>
    <ejs-tooltip style="display:block;" class="e-prevent-select"
:content='content' target='.target' position='RightCenter'
:beforeRender='onBeforeRender'>
      <div id='container'>
        <h4>National Sports</h4>
        <div id="targetContainer" class="e-prevent-select">
            <div id="countrylist">
                <ul>
                    <li class="target" title="1"><span>Australia</span></li>
                    <li class="target" title="2"><span>Bhutan</span></li>
                    <li class="target" title="3"><span>China</span></li>
                    <li class="target" title="4"><span>Cuba</span></li>
                    <li class="target" title="5"><span>India</span></li>
                    <li class="target"
title="6"><span>Switzerland</span></li>
                    <li class="target" title="7"><span>United
States</span></li>
                </ul>
            </div>
        </div>
      </div>
    </ejs-tooltip>
  </div>
```

        });
       }
   }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/tooltip/ajax-content-cs1" %}

Position in Vue Tooltip component

Tooltips can be attached to 12 static locations around the target. On initializing the Tooltip, you can set the position property with any one of the following values:

- TopLeft
- TopCenter
- TopRight
- BottomLeft
- BottomCenter
- BottomRight
- LeftTop
- LeftCenter
- LeftBottom
- RightTop
- RightCenter
- RightBottom

By default, Tooltip is placed at the TopCenter of the target element.

APP.VUE

```
<template>
   <div id='app'>
        <ejs-tooltip ref="tooltip" content="Tooltip content"
position='TopCenter' target="#tooltip">
            <div id='container'>
                <ejs-button id="tooltip">Show tooltip</ejs-button>
                <div class="ddl">
                    <select id="positions" ref="positions" class="form-
control" style="width:150px" v-on:click='onclick' v-on:change='onchange'>
                        <option value="TopLeft">Top Left</option>
                        <option value="TopCenter" selected>Top
Center</option>
                        <option value="TopRight">Top Right</option>
                        <option value="BottomLeft">Bottom Left</option>
                        <option value="BottomCenter">Bottom Center</option>
                        <option value="BottomRight">Bottom Right</option>
                        <option value="LeftTop">Left Top</option>
                        <option value="LeftCenter">Left Center</option>
                        <option value="LeftBottom">Left Bottom</option>

Tip pointer positioning

The Tooltip pointer can be attached or detached from the Tooltip by using the showTipPointer property. Pointer positions can be adjusted using the tipPointerPosition property that can be assigned to one of the following values:

- Auto
- Start
- Middle
- End

The following code example illustrates how to set the pointer to the start position of the Tooltip.

APP.VUE

```
<template>
   <div id='app'>
        <ejs-tooltip content="Tooltip content" tipPointerPosition="Start"
target="#target">
            <ejs-button id="target">Show tooltip</ejs-button>
        </ejs-tooltip>
    </div>
</template>
<script>
import Vue from "vue";
import { TooltipPlugin } from "@syncfusion/ej2-vue-popups";
import { ButtonPlugin } from "@syncfusion/ej2-vue-buttons";
Vue.use(TooltipPlugin);
Vue.use(ButtonPlugin);
export default {
    data() {
    return {
    };
    }
}
</script>
<style>
@import "node_modules/@syncfusion/ej2-base/styles/material.css";
@import "node_modules/@syncfusion/ej2-vue-popups/styles/material.css";
#target {
  position: relative;
  left: 50%;
  margin-top: 100px;
  transform: translateX(-50%)
}
</style>
```

{% previewsample "page.domainurl/code-snippet/tooltip/position/tip-position-cs1" %}

By default, tip pointers are auto adjusted so that the arrow does not point outside the target element.

Dynamic positioning

The Tooltip and its tip pointer can be positioned dynamically based on the target's location. This can be achieved by using the refresh

Copyright © 2001 -2024 Syncfusion Inc.

method, which auto adjusts the Tooltip over the target.

APP.VUE

```
<template>
  <div id='app'>
        <ejs-tooltip id="targetContainer" ref="tooltip" content='Drag me
!!!' target='#demoSmart' :animation='tooltipAnimation'>
            <div id="demoSmart" ref="demoSmart"></div>
       </ejs-tooltip>
    </div>
</template>
<script>
import Vue from "vue";
import { TooltipPlugin } from "@syncfusion/ej2-vue-popups";
import { Draggable } from '@syncfusion/ej2-base';
Vue.use(TooltipPlugin);
export default {
    data() {
        return {
            tooltipAnimation: {
                open: { effect: 'None' },
                close: { effect: 'None' }
            }
        };
    },
    mounted: function (args) {
        var ele = this.$refs.demoSmart;
        var drag = new Draggable(ele, {
            clone : false,
            dragArea: '#targetContainer',
            drag: (args) => {
                if (args.element.getAttribute('data-tooltip-id') === null) {
                    this.$refs.tooltip.open(args.element);
                } else {
                    this.$refs.tooltip.refresh(args.element);
                }
            },
            dragStart: (args) => {
                if (args.element.getAttribute('data-tooltip-id') === null) {
                    this.$refs.tooltip.open(args.element);
                }
            },
            dragStop: (args) => {
                this.$refs.tooltip.close();
            }
        });
    }

Mouse trailing

Tooltips can be positioned relative to the mouse pointer. This behavior can be enabled or disabled by using the `mouseTrail` property. By default, it is set to `false`.

APP.VUE

```
<template>
  <div id='app'>
        <ejs-tooltip  mouseTrail='true' content='Tooltip content'
target="#target" :showTipPointer=false>
          <div id="target">Show tooltip</div>
        </ejs-tooltip>
    </div>
</template>
<script>
import Vue from "vue";
import { TooltipPlugin } from "@syncfusion/ej2-vue-popups";
Vue.use(TooltipPlugin);
export default {
    data() {
        return {};
    }
}
</script>
<style>
@import "node_modules/@syncfusion/ej2-base/styles/material.css";
@import "node_modules/@syncfusion/ej2-vue-popups/styles/material.css";
#target {

{% previewsample "page.domainurl/code-snippet/tooltip/position/mouse-trail-cs1" %}

When mouse trailing option is enabled, the tip pointer position gets auto adjusted based on the target, and

other position values like start, end, and middle are not applied (to prevent the pointer from moving out of target).

Setting offset values

Offset values are set to specify the distance between the target and tooltip element.

offsetX and offsetY properties are used to specify the offset left and top values.

- offsetX specifies the distance between the target and Tooltip element in X axis.
- offsetY specifies the distance between the target and Tooltip element in Y axis.

The following code example illustrates how to set offset values.

APP.VUE

```
<template>
  <div id='app'>
        <ejs-tooltip mouseTrail='true' content='Tooltip content'
:offsetX='xvalue' :offsetY='yvalue' :showTipPointer=false target="#target">
          <div id="target">Show tooltip</div>
        </ejs-tooltip>
    </div>
</template>
<script>
import Vue from "vue";
import { TooltipPlugin } from "@syncfusion/ej2-vue-popups";
Vue.use(TooltipPlugin);
export default {
    data() {
    return {
        xvalue: 30,
        yvalue: 30,
        tip: false
    };
    }
}
</script>
<style>
@import "node_modules/@syncfusion/ej2-base/styles/material.css";
@import "node_modules/@syncfusion/ej2-vue-popups/styles/material.css";
#target {
    background-color: #cfd8dc;
    border: 3px solid #eceff1;
    box-sizing: border-box;
    margin: 80px auto;
    padding: 20px 0;
    width: 200px;
    text-align: center;
    color: #424242;
    font-size: 20px;
```

Copyright © 2001 -2024 Syncfusion Inc.

```
}
</style>
```

{% previewsample "page.domainurl/code-snippet/tooltip/position/offset-value-cs1" %}

By default, collision is handled automatically and therefore when collision is detected the Tooltip fits horizontally and flips vertically.

Open mode in Vue Tooltip component

You can decide the mode on which the Tooltip is to be opened on a page, i.e., on hovering, focusing, or clicking on the target elements.

On mobile devices, Tooltips appear when you tap and hold the element, even if the opensOn option is assigned with hover.

Tooltips are also displayed as long as you continue to tap and hold the element. On lift, it disappears in the next 1.5 seconds.

If there is another action before that time ends, then the Tooltip disappears.

The opensOn property can take either a single or a combination of multiple values, separated by space from the following options. The table below explains how the Tooltip opens on both desktop and mobile based on the value(s) assigned to the opensOn property. By default, it takes auto value.

| Values | Desktop | Mobile |

| ---------- | ---------- | ---------- |

| Auto | Tooltip appears when you hover over the target or when the target element receives the focus. | Tooltip opens on tap and hold of the target element. |

| Hover | Tooltip appears when you hover over the target. | Tooltip opens on tap and hold of the target element. |

| Click | Tooltip appears when you click a target element. | Tooltip appears when you single tap the target element. |

| Focus | Tooltip appears when you focus (say through tab key) on a target element. | Tooltip appears with a single tap on the target element. |

| Custom | Tooltip is not triggered by any default action. So, you have to bind your own events and use either open or close public methods. | Same as Desktop. |

To open the Tooltip for multiple actions, say while hovering over or clicking on a target element, the opensOn property can be assigned with multiple values, separated by space as Hover Click.

Auto value cannot be used with any combination for multiple values.

The following code example shows how to set the open mode for Tooltips.

APP.VUE

```
<template>
   <div id='app'>
        <div id='container'>
            <ejs-tooltip id="tooltipHover" opensOn='Hover' content='Tooltip
from hover' target="#tooltiphover">
```

Vue.use(TooltipPlugin);
Vue.use(ButtonPlugin);
export default {
  data: function() {
    return {
    };
  },
  methods: {
        onCustomOpen: function(args){
           if (args.target.getAttribute('data-tooltip-id')) {
           this.$refs.tooltip.close();
        } else {
            this.$refs.tooltip.open(args.target);
        }
        }
    }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/tooltip/open-mode-cs1" %}

Custom open mode

Other than the above specified options, the custom mode makes the Tooltip appear on screen for user-defined custom actions such as

right-click, double-click, and so on. Here, the tooltip is not triggered by any default action, and you have to bind your own events and use either open or close public methods to show or hide the Tooltips.

The following code example shows how to define custom open mode for the Tooltip.

APP.VUE

```
<template>
   <div id='app'>
    <ejs-tooltip ref="tooltip" id="tooltip" content='Tooltip from custom
mode' opensOn='Custom' v-on:dblclick.native='customOpen'>
            <div id="box">Double-click to open Tooltip.</div>
    </ejs-tooltip>
    </div>
</template>
<style>
@import "node_modules/@syncfusion/ej2-base/styles/material.css";
@import "node_modules/@syncfusion/ej2-vue-popups/styles/material.css";
#box {
    background-color: #cfd8dc;
    border: 3px solid #eceff1;
    box-sizing: border-box;
    margin: 80px auto;
```

Copyright © 2001 -2024 Syncfusion Inc.

```
    padding: 20px 0;
    width: 300px;
    text-align: center;
    color: #424242;
    font-size: 20px;
    user-select: none;
}
</style>
<script>
import Vue from "vue";
import { TooltipPlugin } from "@syncfusion/ej2-vue-popups";
Vue.use(TooltipPlugin);
export default {
  data: function() {
    return {
    };
  },
  methods: {
        customOpen: function(args){
           if (args.target.getAttribute('data-tooltip-id')) {
           this.$refs.tooltip.close();
        } else {
            this.$refs.tooltip.open(args.target);
        }
        }
    }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/tooltip/custom-open-cs1" %}

Sticky mode

With this mode set to true, Tooltips can be made to show up on the screen as long as the close icon is pressed. In this mode, close icon is attached to the Tooltip located at the top right corner. This mode can be enabled or disabled using the isSticky property.

APP.VUE

```
<template>
   <div id='app'>
        <ejs-tooltip id="tooltip" content='Click close icon to close me'
isSticky='true'>
            <div id="target">
                Show tooltip
            </div>
    </ejs-tooltip>
    </div>

  data: function() {
    return {
    };
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/tooltip/open-close-cs1" %}

Animation in Vue Tooltip component

To animate the Tooltip, a set of specific animation effects are available, and it can be controlled using the animation property.The animation property also allows you to set delay, duration, and various other effects of your choice.

AnimationModel is derived from base to apply the chosen animation effect, duration, etc. on Tooltips.

By default, Tooltip entrance occurs over 150 ms using the ease-out timing function. It exits also at 150 ms, but uses ease-in timing function.

The default animation effect for the Tooltip is set to FadeIn for its open action, and FadeOut for its close action. The default duration is set to 150 ms and delay is set to 0.

APP.VUE

```
<template>
   <div id='app'>
      <ejs-tooltip id="tooltip" ref="tooltip" content='Tooltip animation
effect' :animation='TooltipAnimation'>
            <div id="target">
                Show tooltip
            </div>
    </ejs-tooltip>
    </div>
</template>
<style>
@import "node_modules/@syncfusion/ej2-base/styles/material.css";
@import "node_modules/@syncfusion/ej2-vue-popups/styles/material.css";
#target {
    background-color: #cfd8dc;
    border: 3px solid #eceff1;
    box-sizing: border-box;
    margin: 80px auto;
    padding: 20px 0;
    width: 200px;
    text-align: center;
    color: #424242;
    font-size: 20px;
    user-select: none;
}
</style>
<script>
import Vue from "vue";
import { TooltipPlugin } from "@syncfusion/ej2-vue-popups";
```

```
Vue.use(TooltipPlugin);
export default {
  data: function() {
    return {
      TooltipAnimation: {
        open: { effect: 'ZoomIn', duration: 1000, delay: 0 },
        close: { effect: 'ZoomOut', duration: 500, delay: 0 }
    }
    };
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/tooltip/animation/default-animation-cs1" %}

Animation effects

The animation effects that are applicable to Tooltips are:

- FadeIn
- FadeOut
- FadeZoomIn
- FadeZoomOut
- FlipXDownIn
- FlipXDownOut
- FlipXUpIn
- FlipXUpOut
- FlipYLeftIn
- FlipYLeftOut
- FlipYRightIn
- FlipYRightOut
- ZoomIn
- ZoomOut
- None

When the `effect` is specified as `none`, no effect will be applied to the Tooltip, and animation is considered to be set to `off`.

Some of the above animation effects suits the Tooltip better when its tip pointer is hidden.

This can be achieved by setting the `showTipPointer` to false.

Animating via open/close methods

Animations can also be applied on Tooltips dynamically through `open` and `close` methods. These methods accept the animation model as an

optional parameter. If you pass `TooltipAnimationSettings`, animation takes this model; otherwise, it takes the values from the

`animation` property. It is also possible to pass different animations for Tooltips on each target.

Refer to the code snippet below to apply animations using public methods.

Customization in Vue Tooltip component

The Tooltip can be customized by using the cssClass property, which accepts custom CSS class names that define specific user-defined styles and themes to be applied on the Tooltip element.

Tip pointer customization

Styling the tip pointer's size, background, and border colors can be done using the cssClass property, as given below.

APP.VUE

```
<template>
    <div id="app">
    <ejs-tooltip ref="tooltip"  class="tooltipcontainer"
:cssClass="cssClass" content='Tooltip arrow customized' >
            <div id="target">
                Show tooltip
            </div>
    </ejs-tooltip>
  </div>
</template>
<script>
import Vue from "vue";
import { TooltipPlugin } from "@syncfusion/ej2-vue-popups";
Vue.use(TooltipPlugin);
export default {
    data() {
```

Copyright © 2001 -2024 Syncfusion Inc.

```
    return {
        cssClass: 'customtip'
    }
    }
}
</script>
<style>

Tooltip customization

The complete look and feel of the Tooltip can be customized by changing it's background color, opacity, content font, etc.

The following code example shows the way to achieve it.

APP.VUE

```
<template>
    <div id="app">
    <ejs-tooltip ref="tooltip"  class="tooltipcontainer"
:cssClass="cssClass" content='Tooltip arrow customized' >
            <div id="target">
                Show tooltip
            </div>
        </ejs-tooltip>
  </div>
</template>
<script>
import Vue from "vue";
import { TooltipPlugin } from "@syncfusion/ej2-vue-popups";
Vue.use(TooltipPlugin);
export default {
    data() {
    return {
        cssClass: 'customtooltip'
    }
    }
}
</script>
<style>
@import "node_modules/@syncfusion/ej2-base/styles/material.css";
@import "node_modules/@syncfusion/ej2-vue-popups/styles/material.css";
#target {
    background-color: #cfd8dc;
    border: 3px solid #eceff1;
    box-sizing: border-box;
    margin: 80px auto;
    padding: 20px 0;
    width: 200px;
    text-align: center;
    color: #424242;
    font-size: 20px;
    user-select: none;
}
/* csslint ignore:start */
.customtooltip.e-tooltip-wrap .e-tip-content {

Style in Vue Tooltip component

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

Customizing the tooltip

Use the following CSS to customize the tooltip.

`

.e-tooltip-wrap {

border-radius: 4px;

opacity: 1;

}

`

Customizing the tooltip popup

Use the following CSS to customize the tooltip popup properties.

`

.e-tooltip-wrap.e-popup {

background-color: #fff;

border: 2px solid #000;

}

`

Customizing the tooltip content

Use the following CSS to customize the tooltip content.

`

.e-tooltip-wrap .e-tip-content {

color: red;

font-size: 12px;

line-height: 20px;

}

`

Copyright © 2001 -2024 Syncfusion Inc.

Customizing the tooltip arrow tip

Use the following CSS to customize the tooltip arrow tip.

```
/ To customize the arrow tip at bottom /
.e-tooltip-wrap .e-arrow-tip.e-tip-bottom {
height: 12px;
left: 50%;
top: 100%;
width: 24px;
}
/ To customize the arrow tip at top /
.e-tooltip-wrap .e-arrow-tip.e-tip-top {
height: 12px;
left: 50%;
top: -9px;
width: 24px;
}
/ To customize the arrow tip at left /
.e-tooltip-wrap .e-arrow-tip.e-tip-left {
height: 24px;
left: -9px;
top: 48%;
width: 12px;
}
/ To customize the arrow tip at right /
.e-tooltip-wrap .e-arrow-tip.e-tip-right {
height: 24px;
left: 100%;
top: 50%;
width: 12px;
}
```

Customizing the tooltip inner tip

Use the following CSS to customize the tooltip inner tip.

Copyright © 2001 -2024 Syncfusion Inc.

```
.e-tooltip-wrap .e-arrow-tip-inner.e-tip-right,
.e-tooltip-wrap .e-arrow-tip-inner.e-tip-left,
.e-tooltip-wrap .e-arrow-tip-inner.e-tip-bottom,
.e-tooltip-wrap .e-arrow-tip-inner.e-tip-top {
color: #fff;
font-size: 25.9px;
}
```

Customizing the tooltip outer tip

Use the following CSS to customize the tooltip outer tip.

```
/ To customize the arrow tip at bottom /
.e-tooltip-wrap .e-arrow-tip-outer.e-tip-bottom {
border-left: 12px solid transparent;
border-right: 14px solid transparent;
border-top: 12px solid #000;
}
/ To customize the arrow tip at top /
.e-tooltip-wrap .e-arrow-tip-outer.e-tip-top {
border-bottom: 12px solid #000;
border-left: 12px solid transparent;
border-right: 12px solid transparent;
}
/ To customize the arrow tip at left /
.e-tooltip-wrap .e-arrow-tip-outer.e-tip-left {
border-bottom: 12px solid transparent;
border-right: 12px solid #000;
border-top: 12px solid transparent;
}
/ To customize the arrow tip at right /
.e-tooltip-wrap .e-arrow-tip-outer.e-tip-right {
border-bottom: 12px solid transparent;
```

Copyright © 2001 -2024 Syncfusion Inc.

border-left: 12px solid #000;

border-top: 12px solid transparent;

}

`

Accessibility in Vue Tooltip component

The Tooltip component followed the accessibility guidelines and standards, including ADA, Section 508, WCAG 2.2 standards, and WCAG roles that are commonly used to evaluate accessibility.

The accessibility compliance for the Tooltip component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| WCAG 2.2 Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Section 508 Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Screen Reader Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Right-To-Left Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Color Contrast | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Mobile Device Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Keyboard Navigation Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Accessibility Checker Validation | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Axe-core Accessibility Validation | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> - All features of the component meet the requirement.

Copyright © 2001 -2024 Syncfusion Inc.

<img src="https://cdn.syncfusion.com/content/images/landing-page/intermediate.png" alt="Intermediate"> - Some features of the component do not meet the requirement.

<img src="https://cdn.syncfusion.com/content/images/landing-page/no.png" alt="No"> - The component does not meet the requirement.

WAI-ARIA attributes

The Tooltip component followed the WAI-ARIA patterns to meet the accessibility. The following ARIA attributes are used in the Tooltip component.

| Attributes | Description |

| --- | --- |

| role="tooltip" | The element that serves as the container for the tooltip has the ARIA role of tooltip. |

| aria-describedby | This attribute is added to the target element on which the Tooltip gets opened, when focusing or hovering over it. It usually holds the randomly generated Id value of the Tooltip element.

In case, the target element already holds an aria-describedby attribute with Id value of some other component, then the Tooltip Id value can be additionally appended to the existing aria-describedby attribute separated by a space as shown in the example below.

 For example:
 aria-describedby = "my-text my-tooltip"
 my-text is the Id of some other component.
 my-tooltip is the id of Tooltip component.

 When the Tooltip is closed, the aria-describedby attribute is removed from the target. |

| aria-hidden | This attribute is assigned to the Tooltip element whose default value is true.

 When true, it denotes that the Tooltip element is in a hidden or a closed state. When the Tooltip appears on the screen, it’s value changes to false.|

Keyboard interaction

The Tooltip component followed the keyboard interaction guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Tooltip component.

| Keys | Description |

| --- | --- |

| Escape | Closes or dismisses the Tooltip. |

| Tab | A form control receiving focus (say through tab key), opens the Tooltip, and on focus out closes it. |

1. When the Tooltip is being displayed on the target element, focus continues to stay on it.

2. If the Tooltip opens on mouse entering into the target element space, then it should be dismissed only when the mouse leaves that target.

3. If the Tooltip opens on the target element that receives focus, then it should be closed only when the focus moves out of that target element.

Likewise, if the Tooltip opens on a click, then it should be closed only on another click action.

Ensuring accessibility

The Tooltip component's accessibility levels are ensured through an accessibility-checker and axe-core software tools during automated testing.

Copyright © 2001 -2024 Syncfusion Inc.

The accessibility compliance of the Tooltip component is shown in the following sample. Open the sample in a new window to evaluate the accessibility of the Tooltip component with accessibility tools.

How To

Show tooltip on disabled elements and disable tooltip in Vue Tooltip component

By default, tooltips will not be displayed on disabled elements. However, you can enable this behavior by using the following steps:

1. Add a disabled element like the button element into a div whose display style is set to inline-block.
2. Set the pointer event as none for the disabled element (button) through CSS.
3. Initialize the tooltip for outer div element that holds the disabled button element.

APP.VUE

```
<template>
   <div id='app'>
    <ejs-tooltip id='tooltip' :content='content' target='#box'>
        <div id='container'>
            <div id="box" style="display: inline-block;">
                <ejs-button id='disabledbutton' disabled=true>Disabled
button</ejs-button>
            </div>
        </div>
    </div>
</template>

Dynamic tooltip content with html elements in Vue Tooltip component

The Tooltip component loads HTML tags using the content template.

The HTML tags such as , , bold, italic, underline, etc., can be used. Style attributes can also be applied with HTML tags.

Here, Bold, Italic, Underline, and Anchor tags are used.

APP.VUE

```
<template>
   <div id='app'>
        <ejs-tooltip target='#title' cssClass='e-tooltip-css'
ref="tooltipTitle" position='BottomCenter' opensOn='Click' ref="tooltip"
:content="content">
            <div id="container">
                <div id="tooltipContent">
                    <div class="content">
                        <ejs-button class="text" id="title">HTML(With
Title)</ejs-button>
                    </div>
                </div>
            </div>

Custom tooltip with dynamic html in Vue Tooltip component

Tooltip loads HTML pages via HTML tags such as iframe, video, and map using the content property, which supports both string and HTML tags.

To load an iframe element in tooltip, set the required iframe in the content of tooltip while initializing the tooltip component. Refer to the following code.

`ts

Tooltip open or display modes in Vue Tooltip component

The open mode property of tooltip can be defined on a target that is hovering, focusing, or clicking.

Tooltip component have the following types of open mode:

- Auto
- Hover
- Click
- Focus
- Custom

Auto

Tooltip appears when you hover over the target or when the target element receives the focus.

Hover

Tooltip appears when you hover over the target.

Click

Tooltip appears when you click a target element.

Focus

Tooltip appears when you focus (say through tab key) on a target element.

Custom

Tooltip is not triggered by any default action. So, bind your own events and use either open or close public methods.

Fancy tooltip customization in Vue Tooltip component

The arrow of the tooltip can be customized as needed by customizing CSS in the sample-side. The EJ2 tooltip component is achieved through CSS3 format and positioned the tip arrow according to the tooltip positions like TopCenter, BottomLeft, RightTop, and more.

Here, the tip arrow is customized as Curved tooltip and Bubble tooltip.

Curved tip

The content for the tip pointer arrow has been added. To customize the curved tip arrow, override the following CSS class of tip arrow.

```ts
.e-arrow-tip-outer.e-tip-bottom,
.e-arrow-tip-outer.e-tip-top {
border-left: none !important;
border-right: none !important;
border-top: none !important;
}
.e-arrow-tip.e-tip-top {
transform: rotate(170deg);
}
```

Bubble tip

The two divs(inner div and outer div) have been added to achieve the bubble tip arrow. To customize the bubble tip arrow, override the following CSS class of tip arrow.

```ts
.e-arrow-tip-outer.e-tip-bottom, .e-arrow-tip-outer.e-tip-top
{
border-radius: 50px;
height: 10px;
width: 10px;
}
.e-arrow-tip-inner.e-tip-bottom, .e-arrow-tip-inner.e-tip-top
{
border-radius: 50px;
height: 10px;
width: 10px;
```

Copyright © 2001 -2024 Syncfusion Inc.

}
`

These tip arrow customizations have been achieved through CSS changes in the sample level. The tooltip position can be changed by using the radio button click event.

The arrow tip pointer can also be disabled by using the showTipPointer property in a tooltip.

APP.VUE

```
<template>
   <div id='app'>
        <ejs-tooltip ref='tooltip_1' cssClass="curvetips e-tooltip-css"
content="Tooltip arrow customized" target="#target">
            <ejs-tooltip mouseTrail=true :showTipPointer=false
content='Disabled tooltip pointer' target='#tooltip' cssClass='pointertip e-
tooltip-css'>
                <ejs-tooltip position="TopRight" content='Tooltip arrow
customized as balloon tip' target='#bubbletip' cssClass='bubbletip e-
tooltip-css' ref="tooltip_2">

Display tooltip on svg and canvas elements in Vue Tooltip component

Tooltip can be displayed on both SVG and Canvas elements. You can directly attach the <svg> or <canvas> elements to show tooltips on data visualization elements.

SVG

Create the SVG square element and refer to the following code snippet to render the tooltip on SVG square.

`ts

<ejs-tooltip target='#square' cssClass='e-tooltip-css' content='SVG Square'>

<svg>

<rect id="square" class="shape" x="50" y="20" width="50" height="50"
style="fill:#FDA600;stroke:none;stroke-width:5;stroke-opacity:0.9" />

</svg>

</ejs-tooltip>

Canvas

Create the canvas circle element and refer to the following code snippet to render the tooltip on Canvas circle.

`ts

<ejs-tooltip target='#circle' cssClass='e-tooltip-css' content='Canvas Circle'>

<canvas id="circle" class="shape" width="60" height="60"></canvas>

</ejs-tooltip>

`

APP.VUE

```

Dynamic tooltip content in Vue Tooltip component

The tooltip content can be changed dynamically using the Fetch request.

Copyright © 2001 -2024 Syncfusion Inc.

The Fetch request should be made within the beforeRender event of the tooltip. On every success, the corresponding retrieved data will be set to the content property of the tooltip.

When you hover over the icons, its respective data will be retrieved dynamically and then assigned to the tooltip's content.

Refer to the following code snippet to change the tooltip content dynamically.

`ts

onBeforeRender(args) {

this.$refs.box.content = 'Loading...';

this.$refs.box.dataBind();

let fetchApi = new Fetch('./tooltip.json', 'GET');

fetchApi.send().then(

(result) => {

for (let i = 0; i < result.length; i++) {

if (result[i].Id == args.target.id) {

/ *tslint:disable* /

this.$refs.box.content = result[i].Name;

/ *tslint:enable* /

}

}

this.$refs.box.dataBind();

},

(reason) => {

this.$refs.box.content = reason.message;

this.$refs.box.dataBind();

});

}

`

Create and show tooltip on multiple targets in Vue Tooltip component

Tooltip can be created and shown on multiple targets within a container by defining the specific target elements to the target property. So, the tooltip is initialized only on matched targets within a container.

In this case, the tooltip content is assigned from the title attribute of the target element.

`ts

<ejs-tooltip target='.e-info' position='RightCenter'>

</ejs-tooltip>

`

APP.VUE

```
<template>
   <div id='app'>
        <ejs-tooltip target='.e-info' position='RightCenter'>
            <div id="container">
                <form id="details" role="form">
                    <div id="user">
                    <div class="info">User Name:</div>
                    <div class="inputs">
                        <input type="text" ref="uname" id="uname" class="e-
info e-input" name="firstname" title="Please enter your name">
                    </div>
                    </div>
                    <br/>
                    <div>
                    <div class="info">Email Address:</div>

TreeGrid

Getting Started with the Vue Treegrid Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using Vue-CLILink to the Video and integrating the Syncfusion Vue Treegrid component

To get start quickly with Vue tree grid, you can check on this video:

Prerequisites

System requirements for Syncfusion Vue UI components

Copyright © 2001 -2024 Syncfusion Inc.

Setting up the Vue 2 project

To generate a Vue 2 project using Vue-CLI, use the vue create command. Follow these steps to install Vue CLI and create a new project:

`bash

npm install -g @vue/cli

vue create quickstart

cd quickstart

npm run serve

`

or

`bash

yarn global add @vue/cli

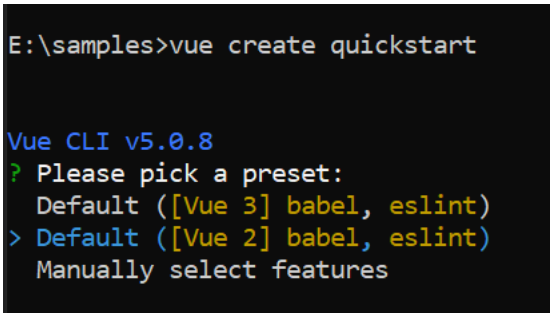
vue create quickstart

cd quickstart

yarn run serve

`

When creating a new project, choose the option `Default ([Vue 2] babel, eslint)` from the menu.



Once the `quickstart` project is set up with default settings, proceed to add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion packages are available at npmjs.com. To use Vue components, install the required npm package.

This article uses the Vue Treegrid component as an example. Install the `@syncfusion/ej2-vue-treegrid` package by running the following command:

`bash

npm install @syncfusion/ej2-vue-treegrid --save

`

or

`bash

yarn add @syncfusion/ej2-vue-treegrid

`

The **--save** will instruct NPM to include the TreeGrid package inside of the dependencies section of the package.json.

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

The TreeGrid has different themes. They are:

- Material
- Fabric
- Bootstrap
- High Contrast

import components CSS as given below in <style> section of the App.vue file.

~/SRC/APP.VUE

```
<style>
<!-- Material theme used for this sample -->
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-calendars/styles/material.css';
@import '../node_modules/@syncfusion/ej2-dropdowns/styles/material.css';

@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
@import "../node_modules/@syncfusion/ej2-grids/styles/material.css";
@import "../node_modules/@syncfusion/ej2-treegrid/styles/material.css";
</style>
```

Add Syncfusion Vue component

Follow the below steps to add the Vue Treegrid component:

1\. First, import and register the Treegrid component in the script section of the **src/App.vue** file.

~/SRC/APP.VUE

```
<script>
import { TreeGridComponent } from "@syncfusion/ej2-vue-treegrid";
export default {
components: {
'ejs-treegrid': TreeGridComponent
}
}
</script>
```

Copyright © 2001 -2024 Syncfusion Inc.

2\. In the template section, define the Treegrid component.

~/SRC/APP.VUE

```
<template>
<div id="app">
<ejs-treegrid></ejs-treegrid>
</div>
</template>
```

Defining Row Data

Data for the TreeGrid component is bind by using the dataSource property and value is defined in the Vue component.

It accepts either an array of JavaScript object or DataManager instance.

~/SRC/APP.VUE

```
<template>
<div id="app">
<ejs-treegrid :dataSource="data" childMapping="subtasks"
:treeColumnIndex="1"> </ejs-treegrid>
</div>
</template>
<script>
import { TreeGridComponent } from "@syncfusion/ej2-vue-treegrid";
let dataSource = [
{
taskID: 1,
taskName: 'Planning',
startDate: new Date('02/03/2017'),
endDate: new Date('02/07/2017'),
progress: 100,
duration: 5,
priority: 'Normal',
approved: false,
subtasks: [
{ taskID: 2, taskName: 'Plan timeline', startDate: new Date('02/03/2017'),
endDate: new Date('02/07/2017'), duration: 5, progress: 100, priority:
'Normal', approved: false },
{ taskID: 3, taskName: 'Plan budget', startDate: new Date('02/03/2017'),
endDate: new Date('02/07/2017'), duration: 5, progress: 100, approved: true
},
{ taskID: 4, taskName: 'Allocate resources', startDate: new
Date('02/03/2017'), endDate: new Date('02/07/2017'), duration: 5, progress:
100, priority: 'Critical', approved: false },
{ taskID: 5, taskName: 'Planning complete', startDate: new
Date('02/07/2017'), endDate: new Date('02/07/2017'), duration: 0, progress:
0, priority: 'Low', approved: true }
]
},
{
taskID: 6,
taskName: 'Design',
startDate: new Date('02/10/2017'),
endDate: new Date('02/14/2017'),
duration: 3,
```

Copyright © 2001 -2024 Syncfusion Inc.

```
progress: 86,
priority: 'High',
approved: false,
subtasks: [
{ taskID: 7, taskName: 'Software Specification', startDate: new
Date('02/10/2017'), endDate: new Date('02/12/2017'), duration: 3, progress:
60, priority: 'Normal', approved: false },
{ taskID: 8, taskName: 'Develop prototype', startDate: new
Date('02/10/2017'), endDate: new Date('02/12/2017'), duration: 3, progress:
100, priority: 'Critical', approved: false },
{ taskID: 9, taskName: 'Get approval from customer', startDate: new
Date('02/13/2017'), endDate: new Date('02/14/2017'), duration: 2, progress:
100, approved: true },
{ taskID: 10, taskName: 'Design Documentation', startDate: new
Date('02/13/2017'), endDate: new Date('02/14/2017'), duration: 2, progress:
100, approved: true },
{ taskID: 11, taskName: 'Design complete', startDate: new
Date('02/14/2017'), endDate: new Date('02/14/2017'), duration: 0, progress:
0, priority: 'Normal', approved: true }
]
}];
export default {
components: {
'ejs-treegrid': TreeGridComponent
}
data () {
return {
data: dataSource;
}
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-treegrid/styles/material.css";
</style>
```

Defining Columns

The TreeGrid has an option to define the columns as an array. In these columns, the following properties are used to customize the columns.

- The field has been added to map with a property name in an array of JavaScript objects.
- The headerText has been added to change the title of columns.
- The textAlign has been used to change the alignment of columns. By default, columns will be left aligned. To change the columns to right align, define the textAlign to Right.
- Also, the another useful property, format has been used. Using this, you can format number and date values to standard or custom formats. Here it is defined for the conversion of date objects to formatted strings.

Tree Column is used to expand or collapse child rows is defined by using the treeColumnIndex property.

~/SRC/APP.VUE

Copyright © 2001 -2024 Syncfusion Inc.

```
<ejs-treegrid :dataSource='data' :treeColumnIndex='1'
childMapping='subtasks'>
<e-columns>
<e-column field='taskID' headerText='Task ID' textAlign='Right'
width=70></e-column>
<e-column field='taskName' headerText='Task Name' textAlign='Left'
width=200></e-column>
<e-column field='startDate' headerText='Start Date' textAlign='Right'
format='yMd' width=90></e-column>
<e-column field='duration' headerText='Duration' textAlign='Right'
width=80></e-column>
</e-columns>
</ejs-treegrid>
```

In the above code example, we represent the hierarchical data binding in which chilMapping property denotes the hierarchy relationship; whereas in self-referencing data binding idMapping and parentIdMapping denotes the hierarchy relationship.

Module injection

To create TreeGrid with additional features, inject the required modules. The following modules are used to extend TreeGrid's basic functionality.

- Page- Inject this module to use paging feature.
- Sort - Inject this module to use sorting feature.
- Filter - Inject this module to use filtering feature.
- ExcelExport - Inject this module to use Excel export feature.
- PdfExport - Inject this module to use PDF export feature.

Register the required array of modules under the key treegrid in the provide section.

Additional feature modules are available here

Enable Paging

The paging feature enables users to view the TreeGrid record in a paged view. It can be enabled by setting the allowPaging property to true. Also, need to inject the Page module in the provide section as follows. If the Page module is not injected, the pager will not be rendered in the TreeGrid. The pager can be customized using the pageSettings property.

In root-level paging mode, paging is based on the root-level rows only i.e., it ignores the child rows count and it can be enabled by using the pageSettings.pageSizeMode property.

~/SRC/APP.VUE

```
<template>
    <div id="app">
        <ejs-treegrid :dataSource="data" :treeColumnIndex='1'
childMapping='subtasks' :allowPaging="true" :pageSettings='pageSettings'>
          <e-columns>
                <e-column field='taskID' headerText='Task ID'
textAlign='Right' width=90></e-column>
                <e-column field='taskName' headerText='Task Name'
textAlign='Left' width=180></e-column>
```

{% previewsample "page.domainurl/code-snippet/treegrid/getting-started/default-cs1" %}

Enable Sorting

The sorting feature enables the user to order the records. It can be enabled by setting allowSorting property to true. Also, need to inject the Sort module in the provide section as follow.

If we didn't inject the Sort module, then user not able to sort when click on headers. Sorting feature can be customized using sortSettings property.

~/SRC/APP.VUE

```

Enable Filtering

The filtering feature enables you to view the reduced amount of records based on the filter criteria. It can be enabled by setting the allowFiltering property to true. Also, need to inject the Filter module in the provide section as follow. If Filter module is not injected, filter bar will not be rendered in TreeGrid. Filtering feature can be customized using the filterSettings property.

By default, filtered records are shown along with its parent records. This behavior can be changed by using the filterSettings-hierarchyMode property.

Getting Started with the Vue Tree Grid Component in Vue 3

This article provides a step-by-step guide for setting up a Vite project with a JavaScript environment and integrating the Syncfusion Vue Tree Grid component using the Composition API / Options API.

The Composition API is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

The Options API is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

Prerequisites

System requirements for Syncfusion Vue UI components

Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using Vite. To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

`bash

npm create vite@latest

`

or

`bash

yarn create vite

`

Using one of the above commands will lead you to set up additional configurations for the project as below:

Copyright © 2001 -2024 Syncfusion Inc.

1.Define the project name: We can specify the name of the project directly. Let's specify the name of the project as my-project for this article.

`bash

? Project name: » my-project

`

2.Select Vue as the framework. It will create a Vue 3 project.

`bash

? Select a framework: » - Use arrow-keys. Return to submit.

Vanilla

Vue

React

Preact

Lit

Svelte

Others

`

3.Choose JavaScript as the framework variant to build this Vite project using JavaScript and Vue.

`bash

? Select a variant: » - Use arrow-keys. Return to submit.

JavaScript

TypeScript

Customize with create-vue ↗

Nuxt ↗

`

4.Upon completing the aforementioned steps to create the my-project, run the following command to install its dependencies:

`bash

cd my-project

npm install

`

or

`bash

cd my-project

Copyright © 2001 -2024 Syncfusion Inc.

yarn install

`

Now that my-project is ready to run with default settings, let's add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion Vue component packages are available at npmjs.com. To use Syncfusion Vue components in the project, install the corresponding npm package.

This article uses the Vue Grid component as an example. To use the Vue Tree Grid component in the project, the @syncfusion/ej2-vue-treegrid package needs to be installed using the following command:

`bash

npm install @syncfusion/ej2-vue-treegrid --save

`

or

`bash

yarn add @syncfusion/ej2-vue-treegrid

`

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the Tree Grid component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-calendars/styles/material.css";
@import "../node_modules/@syncfusion/ej2-dropdowns/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-treegrid/styles/material.css";
</style>
```

The order of importing CSS styles should be in line with its dependency graph.

Add Syncfusion Vue component

Follow the below steps to add the Vue Tree Grid component using Composition API or Options API:

Copyright © 2001 -2024 Syncfusion Inc.

1.First, import and register the Tree Grid component and its child directives in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { TreeGridComponent as EjsTreegrid, ColumnsDirective as EColumns,
ColumnDirective as EColumn } from '@syncfusion/ej2-vue-treegrid';
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { TreeGridComponent, ColumnsDirective, ColumnDirective } from
'@syncfusion/ej2-vue-treegrid';
//Component registration
export default {
name: "App",
components: {
'ejs-treegrid' : TreeGridComponent,
"e-columns": ColumnsDirective,
"e-column": ColumnDirective
}
}
</script>
```

2.In the template section, define the Tree Grid component with the dataSource property and column definitions.

~/SRC/APP.VUE

```
<template>
<ejs-treegrid :dataSource='data' :treeColumnIndex='1'
childMapping='subtasks'>
<e-columns>
<e-column field='taskID' headerText='Task ID' textAlign='Right'
width=70></e-column>
<e-column field='taskName' headerText='Task Name' textAlign='Left'
width=200></e-column>
<e-column field='startDate' headerText='Start Date' textAlign='Right'
format='yMd' width=90></e-column>
<e-column field='duration' headerText='Duration' textAlign='Right'
width=80></e-column>
</e-columns>
</ejs-treegrid>
</template>
```

3.Declare the values for the dataSource property in the script section.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
const data = [
{
```

Copyright © 2001 -2024 Syncfusion Inc.

```
taskID: 1,
taskName: 'Planning', startDate: new Date('02/03/2017'), endDate: new
Date('02/07/2017'),      progress: 100, duration: 5, priority: 'Normal',
approved: false,
subtasks: [
{ taskID: 2, taskName: 'Plan timeline', startDate: new Date('02/03/2017'),
endDate: new Date('02/07/2017'), duration: 5, progress: 100, priority:
'Normal', approved: false },
{ taskID: 3, taskName: 'Plan budget', startDate: new Date('02/03/2017'),
endDate: new Date('02/07/2017'), duration: 5, progress: 100, approved: true
},
{ taskID: 4, taskName: 'Allocate resources', startDate: new
Date('02/03/2017'), endDate: new Date('02/07/2017'), duration: 5, progress:
100, priority: 'Critical', approved: false },
{ taskID: 5, taskName: 'Planning complete', startDate: new
Date('02/07/2017'), endDate: new Date('02/07/2017'), duration: 0, progress:
0, priority: 'Low', approved: true }
]
},
{
taskID: 6, taskName: 'Design', startDate: new Date('02/10/2017'), endDate:
new Date('02/14/2017'), duration: 3, progress: 86, priority: 'High',
approved: false,
subtasks: [
{ taskID: 7, taskName: 'Software Specification', startDate: new
Date('02/10/2017'), endDate: new Date('02/12/2017'), duration: 3, progress:
60, priority: 'Normal', approved: false },
{ taskID: 8, taskName: 'Develop prototype', startDate: new
Date('02/10/2017'), endDate: new Date('02/12/2017'), duration: 3, progress:
100, priority: 'Critical', approved: false },
{ taskID: 9, taskName: 'Get approval from customer', startDate: new
Date('02/13/2017'), endDate: new Date('02/14/2017'), duration: 2, progress:
100, approved: true },
{ taskID: 10, taskName: 'Design Documentation', startDate: new
Date('02/13/2017'), endDate: new Date('02/14/2017'), duration: 2, progress:
100, approved: true },
{ taskID: 11, taskName: 'Design complete', startDate: new
Date('02/14/2017'), endDate: new Date('02/14/2017'), duration: 0, progress:
0, priority: 'Normal', approved: true }
]
}
];
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
data() {
return {
data:[
{
taskID: 1,
taskName: 'Planning', startDate: new Date('02/03/2017'), endDate: new
Date('02/07/2017'),      progress: 100, duration: 5, priority: 'Normal',
approved: false,
subtasks: [
```

```
{ taskID: 2, taskName: 'Plan timeline', startDate: new Date('02/03/2017'),
endDate: new Date('02/07/2017'), duration: 5, progress: 100, priority:
'Normal', approved: false },
{ taskID: 3, taskName: 'Plan budget', startDate: new Date('02/03/2017'),
endDate: new Date('02/07/2017'), duration: 5, progress: 100, approved: true
},
{ taskID: 4, taskName: 'Allocate resources', startDate: new
Date('02/03/2017'), endDate: new Date('02/07/2017'), duration: 5, progress:
100, priority: 'Critical', approved: false },
{ taskID: 5, taskName: 'Planning complete', startDate: new
Date('02/07/2017'), endDate: new Date('02/07/2017'), duration: 0, progress:
0, priority: 'Low', approved: true }
]
},
{
taskID: 6, taskName: 'Design', startDate: new Date('02/10/2017'), endDate:
new Date('02/14/2017'), duration: 3, progress: 86, priority: 'High',
approved: false,
subtasks: [
{ taskID: 7, taskName: 'Software Specification', startDate: new
Date('02/10/2017'), endDate: new Date('02/12/2017'), duration: 3, progress:
60, priority: 'Normal', approved: false },
{ taskID: 8, taskName: 'Develop prototype', startDate: new
Date('02/10/2017'), endDate: new Date('02/12/2017'), duration: 3, progress:
100, priority: 'Critical', approved: false },
{ taskID: 9, taskName: 'Get approval from customer', startDate: new
Date('02/13/2017'), endDate: new Date('02/14/2017'), duration: 2, progress:
100, approved: true },
{ taskID: 10, taskName: 'Design Documentation', startDate: new
Date('02/13/2017'), endDate: new Date('02/14/2017'), duration: 2, progress:
100, approved: true },
{ taskID: 11, taskName: 'Design complete', startDate: new
Date('02/14/2017'), endDate: new Date('02/14/2017'), duration: 0, progress:
0, priority: 'Normal', approved: true }
]
}
],
};
}
</script>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<ejs-treegrid :dataSource='data' :treeColumnIndex='1'
childMapping='subtasks'>
<e-columns>
<e-column field='taskID' headerText='Task ID' textAlign='Right'
width=70></e-column>
<e-column field='taskName' headerText='Task Name' textAlign='Left'
width=200></e-column>
<e-column field='startDate' headerText='Start Date' textAlign='Right'
format='yMd' width=90></e-column>
```

```

Run the project

To run the project, use the following command:

`bash

Copyright © 2001 -2024 Syncfusion Inc.

npm run dev

`

or

`bash

yarn run dev

`

The output will appear as follows:

For migrating from Vue 2 to Vue 3, refer to the migration documentation.

Module in Vue Treegrid component

The following value providers should be injected to extend TreeGrid's functionality.

| Module | Description |

|------|------------|

| PageService| Inject this module to use paging feature.|

| SortService| Inject this module to use sorting feature.|

| FilterService| Inject this module to use filtering feature.|

| EditService| Inject this module to use editing feature.|

| AggregateService| Inject this module to use aggregate feature.|

| ColumnMenuService| Inject this module to use column menu feature.|

| CommandColumnService| Inject this module to use command column feature.|

| ContextMenuService| Inject this module to use context menu feature.

| ResizeService| Inject this module to use resize feature.|

| ReorderService| Inject this module to use reorder feature.|

Copyright © 2001 -2024 Syncfusion Inc.

| PrintService | Inject this module to use to use print feature and this is a default injected module. |

| ToolbarService | Inject this module to use toolbar feature. |

| ExcelExportService | Inject this module to use Excel export feature. |

| PdfExportService | Inject this module to use PDF export feature. |

These modules should be injected into the provide section and use treegrid as a key of the object.

Data Binding

Data binding in Vue Treegrid component

The TreeGrid uses DataManager, which supports both RESTful JSON data services binding and local JavaScript object array binding. The dataSource property can be assigned either with the instance of Link to the Video or JavaScript object array collection.

It supports two kinds of data binding method:

- Local data
- Remote data

To learn about tree grid data binding quickly, you can check on this video:

Binding with ajax

You can use TreeGrid dataSource property to bind the data source to TreeGrid from external Fetch request. In the below code we have fetched the data source from the server with the help of Fetch request and provided that to dataSource property by using onSuccess event of the Fetch.

APP.VUE

```
<template>
  <div id="app">
    <ejs-button v-on:click.native="btnClick">Bind Data</ejs-button>
        <ejs-treegrid ref=treegrid :dataSource="data" idMapping='TaskID'
parentIdMapping='ParentItem'  :treeColumnIndex='1' :allowPaging='true'
:pageSettings='pageSettings'>
            <e-columns>
                <e-column field='TaskID' headerText='Task ID' width='90'
textAlign='Right'></e-column>
                <e-column field='TaskName' headerText='Task Name'
width='100'></e-column>
                <e-column field='Duration' headerText='Duration' width='80'
textAlign='Right'></e-column>
                </e-columns>
                <e-column field='Progress' headerText='Progress' width='80'
textAlign='Right'></e-column>
                </e-columns>
        </ejs-treegrid>
</div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin, Page } from "@syncfusion/ej2-vue-treegrid";
import { ButtonPlugin } from "@syncfusion/ej2-vue-buttons";
import { Fetch } from '@syncfusion/ej2-base';
Vue.use(TreeGridPlugin);
```

Copyright © 2001 -2024 Syncfusion Inc.

```
Vue.use(ButtonPlugin);
export default {
  data () {
    return {
      data: {},
      pageSettings: { pageCount: 4 }
    };
  },
  provide: {
      treegrid: [ Page ]
    },
   methods:{
         btnClick: function (args){
        let treegrid = document.getElementsByClassName("e-
treegrid")[0].ej2_instances[0]; // TreeGrid instance
        let fetch = new Fetch
("https://ej2services.syncfusion.com/production/web-
services/api/SelfReferenceData", "GET");treegrid.showSpinner();
        fetch.send();
        fetch.onSuccess = function (result) {
        treegrid.hideSpinner();
        treegrid.dataSource = result;
        };
      }
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/data-binding/default-cs1" %}

* If you bind the dataSource from this way, then it acts like a local dataSource. So you cannot perform any server side crud actions.

Handling expandStateMapping

To denotes the expand status of parent row, define the expandStateMapping property of tree grid. The expandStateMapping property maps the field name in data source, that denotes whether parent record is in expanded or collapsed state and this is useful to renders parent row in expanded or collapsed state based on this mapping property value in data source.

`

<template>

<ejs-treegrid :dataSource='data' idMapping='TaskID' parentIdMapping='ParentValue' hasChildMapping='isParent' :treeColumnIndex='1' expandStateMapping='IsExpanded' height='400px'>

<e-columns>

<e-column field='TaskID' headerText='Task ID' width=90 textAlign='Right'></e-column>

<e-column field='TaskName' headerText='Task Name' width=180></e-column>

<e-column field='Duration' headerText='Duration' width=80></e-column>

</e-columns>

```
public int? ParentValue { get; set; }
public bool? isParent { get; set; }
public bool IsExpanded { get; set; }
public TreeData() { }
public static List<TreeData> GetTree()
{
if (tree.Count == 0)
{
int root = 0;
for (var t = 1; t <= 500; t++)
{
Random ran = new Random();
string math = (ran.Next() % 3) == 0 ? "High" : (ran.Next() % 2) == 0 ? "Release Breaker" : "Critical";
string progr = (ran.Next() % 3) == 0 ? "Started" : (ran.Next() % 2) == 0 ? "Open" : "In Progress";
root++;
int rootItem = root;
tree.Add(new TreeData() { TaskID = rootItem, TaskName = "Parent task " + rootItem.ToString(), isParent
= true, IsExpanded = false, ParentValue = null, Duration = ran.Next(1, 50) });
int parent = root;
for (var d = 0; d < 1; d++)
{
root++;
string value = ((parent + 1) % 3 == 0) ? "Low" : "Critical";
int par = parent + 1;
progr = (ran.Next() % 3) == 0 ? "In Progress" : (ran.Next() % 2) == 0 ? "Open" : "Validated";
int iD = root;
tree.Add(new TreeData() { TaskID = iD, TaskName = "Child task " + iD.ToString(), isParent = true,
IsExpanded = false, ParentValue = rootItem, Duration = ran.Next(1, 50) });
int subparent = root;
for (var c = 0; c < 500; c++)
{
root++;
string val = ((subparent + c + 1) % 3 == 0) ? "Low" : "Critical";
int subchild = subparent + c + 1;
```

string progress = (ran.Next() % 3) == 0 ? "In Progress" : (ran.Next() % 2) == 0 ? "Open" : "Validated";

int childID = root ;

tree.Add(new TreeData() { TaskID = childID, TaskName = "sub Child task " + childID.ToString(), isParent = false, IsExpanded = false, ParentValue = subparent, Duration = ran.Next(1, 50) });

}

}

}

}

return tree;

}

}

`

Local data in Vue Treegrid component

In Local Data binding, data source for rendering the TreeGrid control is retrieved from the same application locally.

Two types of Data binding are possible with the TreeGrid control.

- Hierarchical Datasource binding
- Self-Referential Data binding (Flat Data)

To bind local data to the treegrid, you can assign a JavaScript object array to the dataSource property. The local data source can also be provided as an instance of the DataManager.

By default, DataManager uses JsonAdaptor for local data-binding.

Hierarchy data source binding

The childMapping property is used to map the child records in hierarchy data source.

The following code example shows you how to bind the hierarchical local data into the TreeGrid control.

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid :dataSource="data" childMapping='subtasks'
:treeColumnIndex='1' :allowPaging='true' :pageSettings='pageSettings'>
            <e-columns>
                <e-column field='taskID' headerText='Task ID' width=70
textAlign='Right'></e-column>
                <e-column field='taskName' headerText='Task Name'
width=200></e-column>
                <e-column field='startDate' headerText='Start Date' width=90
format="yMd" textAlign='Right'></e-column>
                <e-column field='duration' headerText='Duration' width=80
textAlign='Right'></e-column>
            </e-columns>
        </ejs-treegrid>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
</div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin, Page } from "@syncfusion/ej2-vue-treegrid";
import { sampleData } from './datasource.js';
Vue.use(TreeGridPlugin);
export default {
  data () {
    return {
      data: sampleData,
      pageSettings: { pageSize: 7 }
    };
  },
  provide: {
      treegrid: [ Page ]
    }
}
</script>
> * Remote data binding is not supported for Hierarchy Data.
```

{% previewsample "page.domainurl/code-snippet/treegrid/data-binding/default-cs2" %}

Self-Referential data binding (Flat data)

TreeGrid is rendered from Self-Referential data structures by providing two fields, ID field and parent ID field.

- **ID Field**: This field contains unique values used to identify nodes. Its name is assigned to the idMapping property.
- **Parent ID Field**: This field contains values that indicate parent nodes. Its name is assigned to the parentIdMapping property.

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid :dataSource="data" idMapping='TaskID'
parentIdMapping='parentID' :treeColumnIndex='1' :allowPaging='true'
:pageSettings='pageSettings'>
            <e-columns>
                <e-column field='TaskID' headerText='Task ID' width=90
textAlign='Right'></e-column>
                <e-column field='TaskName' headerText='Task Name'
width=180></e-column>
                <e-column field='StartDate' headerText='Start Date' width=90
format="yMd" textAlign='Right'></e-column>
                <e-column field='Duration' headerText='Duration' width=80
textAlign='Right'></e-column>
                </e-columns>
        </ejs-treegrid>
</div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin, Page } from "@syncfusion/ej2-vue-treegrid";
```

```
import { projectData } from './datasource.js';
Vue.use(TreeGridPlugin);
export default {
  data () {
    return {
      data: projectData,
      pageSettings: { pageSize: 7 }
    };
  },
  provide: {
      treegrid: [ Page ]
    },
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/data-binding/default-cs3" %}

Herewith we have provided list of reserved properties and the purpose used in TreeGrid. We recommend to avoid these reserved properties for Internal purpose(To get rid of conflicts).

Reserved keywords | Purpose

childRecords | Specifies the childRecords of a parentData

hasChildRecords | Specifies whether the record contains child records

hasFilteredChildRecords | Specifies whether the record contains filtered child records

expanded | Specifies whether the child records are expanded

parentItem | Specifies the parentItem of childRecords

index | Specifies the index of current record

level | Specifies the hierarchy level of record

filterLevel | Specifies the hierarchy level of filtered record

parentIdMapping | Specifies the parentID

uniqueID | Specifies the unique ID of a record

parentUniqueID | Specifies the parent Unique ID of a record

checkboxState | Specifies the checkbox state of a record

isSummaryRow | Specifies the summary of a record

taskData | Specifies the main data

primaryParent | Specifies the Primary data

Remote data in Vue Treegrid component

To bind remote data to TreeGrid component, assign service data as an instance of DataManager to the dataSource property. To interact with remote data source, provide the endpoint url and define the hasChildMapping property of treegrid.

The hasChildMapping property maps the field name in data source, that denotes whether current record holds any child records. This is useful internally to show expand icon while binding child data on demand.

Copyright © 2001 -2024 Syncfusion Inc.

The TreeGrid provides Load on Demand support for rendering remote data. The Load on demand is considered in TreeGrid for the following actions.

- Expanding root nodes.
- Navigating pages, with paging enabled in TreeGrid.

When load on demand is enabled, all the root nodes are rendered in collapsed state at initial load.

When load on demand support is enabled in TreeGrid with paging, the current or active page's root node alone will be rendered in collapsed state. On expanding the root node, the child nodes will be loaded from the remote server.

When a root node is expanded, its child nodes are rendered and are cached locally, such that on consecutive expand/collapse actions on root node, the child nodes are loaded from the cache instead from the remote server.

Similarly, if the user navigates to a new page, the root nodes of that specific page, will be rendered with request to the remote server.

Remote Data Binding supports only Self-Referential Data and by default the pageSizeMode for Remote Data is Root mode. i.e only root node's count will be shown in pager while using Remote Data

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid :dataSource="data" idMapping='TaskID'
parentIdMapping='ParentID' :treeColumnIndex='1' :allowPaging='true'>
            <e-columns>
                <e-column field='TaskID' headerText='Task ID' width=90
textAlign='Right'></e-column>
                <e-column field='TaskName' headerText='Task Name'
width=180></e-column>
                <e-column field='StartDate' headerText='Start Date' width=90
format="yMd" textAlign='Right'></e-column>
                <e-column field='Duration' headerText='Duration' width=80
textAlign='Right'></e-column>
                </e-columns>
        </ejs-treegrid>
</div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin, Page } from "@syncfusion/ej2-vue-treegrid";
import { DataManager, WebApiAdaptor } from "@syncfusion/ej2-data";
Vue.use(TreeGridPlugin);
export default {
   data() {
    let SERVICE_URI ="https://ej2services.syncfusion.com/production/web-
services/api/SelfReferenceData";
    return {
      data: new DataManager({
        url: SERVICE_URI,
        adaptor: new WebApiAdaptor(),
        crossDomain: true
      })
```

```
    };
  }
  provide: {
      treegrid: [ Page ]
    },
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/data-binding/default-cs4" %}

By default, DataManager uses ODataAdaptor for remote data-binding.

Based on the RESTful web services, set the corresponding adaptor to DataManager. Refer here for more details.

Filtering and searching server-side data operations are not supported in load on demand

LoadChildOnDemand

While binding remote data to Tree Grid component, by default Tree Grid renders parent rows in collapsed state. Tree Grid provides option to load the child records also during the initial rendering itself for remote data binding by setting loadChildOnDemand as true.

When loadChildOnDemand is enabled parent records are rendered in expanded state.

The following code example describes the behavior of the loadChildOnDemand feature of Tree Grid.

`

<template>

<ejs-treegrid :dataSource='data' idMapping='TaskID' parentIdMapping='parentID' :treeColumnIndex='1' :allowPaging='true' :loadChildOnDemand='true' height='270px'>

<e-columns>

<e-column field='TaskID' :isPrimaryKey='true' headerText='Task ID' width=90 textAlign='Right'></e-column>

<e-column field='TaskName' headerText='Task Name' width=180></e-column>

<e-column field='StartDate' headerText='Start Date' editType= 'datepickeredit' type= 'date' format= 'yMd' textAlign='Right' width=170></e-column>

<e-column field='EndDate' headerText='End Date' editType= 'datepickeredit' type= 'date' format= 'yMd' textAlign='Right' width=170></e-column>

<e-column field='Priority' headerText='Priority' width=110></e-column>

</ejs-treegrid>

</template>

<script>

import Vue from "vue";

Copyright © 2001 -2024 Syncfusion Inc.

```
import { TreeGridPlugin, Page } from "@syncfusion/ej2-vue-treegrid";
import { DataManager, UrlAdaptor } from '@syncfusion/ej2-data';
Vue.use(TreeGridPlugin);
export default {
data() {
return {
data: new DataManager({
url: "Home/DataSource",
updateUrl: "Home/Update",
insertUrl: "Home/Insert",
removeUrl: "Home/Delete",
batchUrl: "Home/Remove",
adaptor: new UrlAdaptor
})
};
},
provide: {
treegrid: [ Page ]
}
}
</script>
`
```

Also while using **loadChildOnDemand** we need to handle the child records on server end and it is applicable to CRUD operations also.

The following code example describes handling of child records at server end.

```ts
public ActionResult UrlDatasource(DataManagerRequest dm)
{
if (TreeData.tree.Count == 0)
TreeData.GetTree();
IEnumerable DataSource = TreeData.tree;
DataOperations operation = new DataOperations();
if (dm.Where != null && dm.Where.Count > 0)
```

Copyright © 2001 -2024 Syncfusion Inc.

```
{
DataSource = operation.PerformFiltering(DataSource, dm.Where, "and");  //perform filtering
}
if (dm.Sorted != null && dm.Sorted.Count > 0)
{
DataSource = operation.PerformSorting(DataSource, dm.Sorted);  //perform sorting
}
var count = DataSource.ToList<TreeData>().Count();
if (dm.Skip != 0)
{
DataSource = operation.PerformSkip(DataSource, dm.Skip);   //Paging
}
if (dm.Take != 0)
{
DataSource = operation.PerformTake(DataSource, dm.Take);
}
if (dm.Where != null)
{
DataSource = CollectChildRecords(DataSource, dm);    // method to collect child records
}
return dm.RequiresCounts ? Json(new { result = DataSource, count = count }) : Json(DataSource);
}
public IEnumerable CollectChildRecords(IEnumerable datasource, DataManagerRequest dm)
{
DataOperations operation = new DataOperations();
IEnumerable DataSource = TreeData.tree;     // use the total DataSource here
string IdMapping = "TaskID";     // define your IdMapping field name here
int[] TaskIds = new int[0];
foreach (var rec in datasource)
{
int taskid = (int)rec.GetType().GetProperty(IdMapping).GetValue(rec);
TaskIds = TaskIds.Concat(new int[] { taskid }).ToArray();   //get the Parentrecord Ids based on IdMapping
Field
```

```
}

IEnumerable ChildRecords = null;

foreach (int id in TaskIds)

{

dm.Where[0].value = id;

IEnumerable records = operation.PerformFiltering(DataSource, dm.Where, dm.Where[0].Operator);
//perform filtering to collect the childrecords based on Ids

ChildRecords = ChildRecords == null || (ChildRecords.AsQueryable().Count() == 0) ? records :
((IEnumerable<object>)ChildRecords).Concat((IEnumerable<object>)records);  //concate the
childrecords with dataSource

}

if (ChildRecords != null)

{

ChildRecords = CollectChildRecords(ChildRecords, dm);    // repeat the operation for inner level child

if (dm.Sorted != null && dm.Sorted.Count > 0) // perform Sorting

{

ChildRecords = operation.PerformSorting(ChildRecords, dm.Sorted);

}

datasource = ((IEnumerable<object>)datasource).Concat((IEnumerable<object>)ChildRecords);
//concate the childrecords with dataSource

}

return datasource;

}
`
```

Offline mode

On remote data binding, all treegrid actions such as paging, loading child on-demand, will be processed on server-side. To avoid postback, set the treegrid to load all data on initialization and make the actions process in client-side. To enable this behavior, use the offline property of DataManager.

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid :dataSource="data" idMapping='TaskID'
parentIdMapping='ParentItem' hasChildMapping='isParent' :treeColumnIndex='1'
:allowPaging='true' :pageSettings='pageSettings'>
            <e-columns>
                <e-column field='TaskID' headerText='Task ID' width=90
textAlign='Right'></e-column>
                <e-column field='TaskName' headerText='Task Name'
width=180></e-column>
```

```
                <e-column field='StartDate' headerText='Start Date' width=90
format="yMd" textAlign='Right'></e-column>
                <e-column field='Duration' headerText='Duration' width=80
textAlign='Right'></e-column>
                </e-columns>
        </ejs-treegrid>
</div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin, Page } from "@syncfusion/ej2-vue-treegrid";
import { DataManager, WebApiAdaptor } from "@syncfusion/ej2-data";
Vue.use(TreeGridPlugin);
export default {
  data () {
      let SERVICE_URI: string =
      "https://ej2services.syncfusion.com/production/web-
services/api/SelfReferenceData";
    return {
      data: new DataManager({
        url: SERVICE_URI,
        adaptor: new WebApiAdaptor(),
        offline: true
      }),
      pageSettings: { pageCount: 4 }
    };
  },
  provide: {
      treegrid: [ Page ]
    },
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/data-binding/default-cs5" %}

Custom adaptor

You can create your own adaptor by extending the built-in adaptors. The following demonstrates custom adaptor approach and how to add a serial number for the records by overriding the built-in response processing using the `processResponse` method of the `WebApiAdaptor`.

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid :dataSource="data" idMapping='TaskID'
parentIdMapping='ParentItem' hasChildMapping='isParent' :treeColumnIndex='1'
:allowPaging='true' :pageSettings='pageSettings'>
            <e-columns>
                <e-column field='Sno' headerText='SNO' width='90'
textAlign='Right'></e-column>
                <e-column field='TaskName' headerText='Task Name'
width='180'></e-column>
                <e-column field='StartDate' headerText='Start Date'
width='90' format="yMd" textAlign='Right'></e-column>
                <e-column field='Duration' headerText='Duration' width='80'
textAlign='Right'></e-column>
```

```
                </e-columns>
        </ejs-treegrid>
</div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin, Page } from "@syncfusion/ej2-vue-treegrid";
import { DataManager, WebApiAdaptor } from "@syncfusion/ej2-data";
Vue.use(TreeGridPlugin);
class SerialNoAdaptor extends WebApiAdaptor {
    public processResponse(): Object[] {
        let i: number = 0;
        // calling base class processResponse function
        let original: Object[] = super.processResponse.apply(this,
arguments);
        // adding serial number
        original.forEach((item: Object) => item['Sno'] = ++i);
        return original;
    }
}
export default {
  data () {
      let SERVICE_URI: string =
      "https://ej2services.syncfusion.com/production/web-
services/api/SelfReferenceData";
    return {
      data: new DataManager({
        url: SERVICE_URI,
        adaptor: new SerialNoAdaptor(),
        offline: true
      }),
      pageSettings: { pageCount: 4 }
    };
  },
  provide: {
      treegrid: [ Page ]
    },
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/data-binding/default-cs6" %}

Sending additional parameters to the server

To add a custom parameter to the data request, use the addParams method of Query class. Assign the Query object with additional parameters to the treegrid query property.

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid :dataSource="data" idMapping='TaskID'
parentIdMapping='ParentItem' hasChildMapping='isParent' :query='query'
:treeColumnIndex='1' :allowPaging='true' :pageSettings='pageSettings'>
            <e-columns>
                <e-column field='TaskID' headerText='Task ID' width='90'
textAlign='Right'></e-column>
```

```
                <e-column field='TaskName' headerText='Task Name'
width='180'></e-column>
                <e-column field='StartDate' headerText='Start Date'
width='90' format="yMd" textAlign='Right'></e-column>
                <e-column field='Duration' headerText='Duration' width='80'
textAlign='Right'></e-column>
                </e-columns>
        </ejs-treegrid>
</div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin, Page } from "@syncfusion/ej2-vue-treegrid";
import { DataManager, WebApiAdaptor , Query } from "@syncfusion/ej2-data";
Vue.use(TreeGridPlugin);
export default {
  data () {
      let SERVICE_URI: string =
      "https://ej2services.syncfusion.com/production/web-
services/api/SelfReferenceData";
    return {
      data: new DataManager({
        url: SERVICE_URI,
        adaptor: new WebApiAdaptor(),
      }),
      pageSettings: { pageCount: 4 }
      query: new Query().addParams('ej2treegrid', 'true');
    };
  },
  provide: {
      treegrid: [ Page ]
    },
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/data-binding/default-cs7" %}

Handling HTTP error

During server interaction from the treegrid, some server-side exceptions may occur, and you can acquire those error messages or exception details in client-side using the actionFailure event.

The argument passed to the actionFailure event contains the error details returned from the server.

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid ref=treegrid :dataSource="data" idMapping='TaskID'
parentIdMapping='parentItem':treeColumnIndex='1'
:actionFailure='actionFailure'>
            <e-columns>
                <e-column field='TaskID' headerText='Task ID' width=90
textAlign='Right'></e-column>
                <e-column field='TaskName' headerText='Task Name'
width=180></e-column>
                <e-column field='StartDate' headerText='Start Date' width=90
format="yMd" textAlign='Right'></e-column>
```

```
                <e-column field='Duration' headerText='Duration' width=80
textAlign='Right'></e-column>
                </e-columns>
        </ejs-treegrid>
</div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin, Page } from "@syncfusion/ej2-vue-treegrid";
import { DataManager, WebApiAdaptor } from "@syncfusion/ej2-data";
Vue.use(TreeGridPlugin);
export default {
  data () {
      let SERVICE_URI: string =
      "http://some.com/invalidUrl";
    return {
      data: new DataManager({
        url: SERVICE_URI,
        adaptor: new WebApiAdaptor(),
        offline: true
      }),
      pageSettings: { pageCount: 4 }
    };
  },
  provide: {
      treegrid: [ Page ]
    },
   methods:{
       actionFailure: function() {
       let span = document.createElement('span');
       let treegrid = document.getElementsByClassName("e-
treegrid")[0].ej2_instances[0];
       treegrid.element.parentNode.insertBefore(span, treegrid.element);
       span.style.color = '#FF0000'
       span.innerHTML = 'Server exception: 404 Not found';
    }
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/data-binding/default-cs8" %}

The actionFailure event will be triggered not only for the server errors, but also when there is an exception while processing the treegrid actions.

Load on demand with virtualization

While binding remote data to Tree Grid component, by default Tree Grid renders parent rows in collapsed state. When expanding the root node, the child nodes will be loaded from the remote server.

When using virtualization with remote data binding, it helps you to improve the tree grid performance while loading a large set of data by setting enableVirtualization as true. The Tree Grid UI virtualization allows it to render only rows and columns visible within the view-port without buffering the entire datasource.hasChildMapping property maps the field name in data source, that denotes whether current record holds any child records. This is useful internally to show expand icon while binding child data on demand.

Load parent rows in expanded state with virtualization

Tree Grid provides an option to load the child records in the initial rendering itself for remote data binding by setting the loadChildOnDemand as true. When the loadChildOnDemand is enabled, parent records are rendered in expanded state.

Copyright © 2001 -2024 Syncfusion Inc.

When using virtualization with loadChildOnDemand , it helps you to improve the tree grid performance while loading the child records during the initial rendering for remote data binding by setting enableVirtualization as true and loadChildOnDemand as true.

```

Immutable mode in Vue Treegrid component

The immutable mode optimizes the TreeGrid re-rendering performance by using the object reference and deep compare concept. When performing the TreeGrid actions, it will only re-render the modified or newly added rows and prevent the re-rendering of the unchanged rows.

To enable this feature, you have to set the enableImmutableMode property as **true**.

* This feature uses the primary key value for data comparison. So, you need to provide the isPrimaryKey column.

Limitations

The following features are not supported in the immutable mode:

- Frozen rows and columns
- Row Template
- Detail Template
- Column reorder
- Virtualization

Columns

Columns in Vue Treegrid component

The column definitions are used as the dataSource schema in the TreeGrid. This plays a vital role in rendering column values in the required format.

The treegrid operations such as sorting, filtering and searching etc. are performed based on column definitions. The field property of the columns

is necessary to map the data source values in TreeGrid columns.

1. If the column field is not specified in the dataSource, the column values will be empty.

2. If the field name contains “dot” operator, it is considered as complex binding.

treeColumnIndex property denotes the column that is used to expand and collapse child rows.

Format

To format cell values based on specific culture, use the columns.format property. The TreeGrid uses Internalization library to format number and date

values.

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid :dataSource="data" childMapping='subtasks'
:treeColumnIndex='1' height='315px'>
            <e-columns>
                <e-column field='orderID' headerText='Order ID' width=90
textAlign='Right'></e-column>
                <e-column field='orderName' headerText='Order Name'
width=220></e-column>
                <e-column field='price' headerText='Price' format='C2'
width=80 textAlign='Right'></e-column>
            </e-columns>
        </ejs-treegrid>
</div>
</template>
<script>
import Vue from "vue";
```

```
import { TreeGridPlugin } from "@syncfusion/ej2-vue-treegrid";
import { formatData } from "./datasource.js";
Vue.use(TreeGridPlugin);
export default {
  data() {
    return {
      data: formatData,
    };
  },
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/columns/default-cs10" %}

By default, the number and date values are formatted in en-US locale.

Number formatting

The number or integer values can be formatted using the below format strings.

Format |Description |Remarks

{ type:'date', format:'dd/MM/yyyy' } | 04/07/1996

{ type:'date', format:'dd.MM.yyyy' } | 04.07.1996

{ type:'date', skeleton:'short' } | 7/4/96

{ type: 'dateTime', format: 'dd/MM/yyyy hh:mm a' } | 04/07/1996 12:00 AM

{ type: 'dateTime', format: 'MM/dd/yyyy hh:mm:ss a' } | 07/04/1996 12:00:00 AM

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid :dataSource="data" childMapping='subtasks'
:treeColumnIndex='1' height='315px'>
            <e-columns>
                <e-column field='orderID' headerText='Order ID' width=90
textAlign='Right'></e-column>
                <e-column field='orderName' headerText='Order Name'
width=100></e-column>
                <e-column field='orderDate' headerText='Order Date'
width=160 :format='formatOptions' type='date' textAlign='Right'></e-column>
                <e-column field='price' headerText='Price' width=90
format='C2' textAlign='Right'></e-column>
            </e-columns>
        </ejs-treegrid>
</div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin } from "@syncfusion/ej2-vue-treegrid";
import { formatData } from "./datasource.js";
Vue.use(TreeGridPlugin);
export default {
  data() {
    return {
```

```
      data: formatData,
      formatOptions: {type:'date', format:'dd/MM/yyyy'},
    };
  },
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/columns/default-cs11" %}

Lock columns

You can lock columns by using column.lockColumn property. The locked columns will be moved to the first position. Also you can't reorder its position.

In the below example, duration column is locked and its reordering functionality is disabled.

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid :dataSource="data" childMapping='subtasks'
:treeColumnIndex='1' :allowReordering='true' :allowSelection='false'
height='315px'>
            <e-columns>
                <e-column field='taskID' headerText='Task ID' width=90
textAlign='Right'></e-column>
                <e-column field='taskName' headerText='Task Name'
width=180></e-column>
                <e-column field='startDate' headerText='Start Date' width=90
format="yMd" textAlign='Right'></e-column>
                <e-column field='duration' headerText='Duration' width=80
textAlign='Right' :lockColumn='true'
:customAttributes="customAttributes"></e-column>
            </e-columns>
        </ejs-treegrid>
</div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin, Reorder } from "@syncfusion/ej2-vue-treegrid";
import { sampleData } from "./datasource.js";
Vue.use(TreeGridPlugin);
export default {
  data() {
    return {
      data: sampleData,
      customAttributes : {class: 'customcss'}
    };
  },
  provide: {
      treegrid: [ Reorder ]
    },
}
</script>
<style>
 @import
"https://ej2.syncfusion.com/vue/documentation/node_modules/@syncfusion/ej2-
vue-treegrid/styles/material.css";
```

```
  .e-grid .e-rowcell.customcss{
   background-color: #ecedee;
}
.e-grid .e-headercell.customcss{
   background-color: #ecedee;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/treegrid/columns/default-cs12" %}

Touch interaction

When the right edge of the header cell is tapped, a floating handler will be visible over the right border of the column. To resize the column, tap and drag the floating handler as needed.

The following screenshot represents the column resizing in touch device.

<!-- markdownlint-disable MD033 -->

<img src="../images/column-resizing.png" alt="Touch interaction image" style="width:320px;height:620px">

<!-- markdownlint-enable MD033 -->

Column type

Column type can be specified using the columns.type property. It specifies the type of data the column binds.

If the format is defined for a column, the column uses type to select the appropriate format option (number

or date).

TreeGrid column supports the following types:

- string
- number
- boolean
- date
- datetime

If the type is not defined, it will be determined from the first record of the dataSource.

Checkbox column

To render checkboxes in existing column, you need to set [columns.showCheckbox] property as true.

It is also possible to select the rows hierarchically using checkboxes in TreeGrid by enabling [autoCheckHierarchy] property. When we check on any parent record checkbox then the child record checkboxes will get checked.

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid :dataSource="data" :treeColumnIndex='1'
:autoCheckHierarchy='true' childMapping='subtasks' :height='400'>
            <e-columns>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
                <e-column field='taskID' headerText='Task ID'
textAlign='Right' width=90></e-column>
                <e-column field='taskName' headerText='Task Name' width=180
:showCheckbox='true'></e-column>
                <e-column field='startDate' headerText=' Start Date'
textAlign='Right' format='yMd' type='date' width=90></e-column>
                <e-column field='duration' headerText='Duration'
textAlign='Right'  width=80></e-column>
            </e-columns>
        </ejs-treegrid>
</div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin, Page } from "@syncfusion/ej2-vue-treegrid";
import { sampleData } from "./datasource.js";
Vue.use(TreeGridPlugin);
export default {
 data() {
    return {
      data: sampleData,
    };
  },
  provide: {
      treegrid: [Page]
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/columns/default-cs13" %}

Controlling Tree Grid actions

You can enable or disable treegrid action for a particular column by setting the allowFiltering, and allowSorting properties.

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid :dataSource="data" childMapping='subtasks'
:treeColumnIndex='1' :allowFiltering="true" :allowSorting="true"
:height='270'>
            <e-columns>
                <e-column field='taskID' headerText='Task ID' width=90
:allowSorting="false" textAlign='Right'></e-column>
                <e-column field='taskName' headerText='Task Name'
width=180></e-column>
                <e-column field='startDate' headerText='Start Date' width=90
:allowFiltering="false" format="yMd" textAlign='Right'></e-column>
                <e-column field='duration' headerText='Duration' width=80
textAlign='Right'></e-column>
            </e-columns>
        </ejs-treegrid>
</div>
</template>
<script>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
import Vue from "vue";
import { TreeGridPlugin, Sort , Filter } from "@syncfusion/ej2-vue-
treegrid";
import { sampleData } from "./datasource.js";
Vue.use(TreeGridPlugin);
export default {
 data() {
    return {
      data: sampleData
    };
  },
  provide: {
      treegrid: [Sort, Filter]
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/columns/default-cs14" %}

Show/hide columns by external button

You can show or hide treegrid columns dynamically using external buttons by invoking the showColumns or hideColumns method.

APP.VUE

```
<template>
<div id="app">
        <ejs-button @click.native="show"> Show </ejs-button>
        <ejs-button @click.native="hide"> Hide </ejs-button>
        <ejs-treegrid ref=treegrid :dataSource="data"
childMapping='subtasks' :treeColumnIndex='1' :height='270'>
            <e-columns>
                <e-column field='taskID' headerText='Task ID' width=90
textAlign='Right'></e-column>
                <e-column field='taskName' headerText='Task Name'
width=180></e-column>
                <e-column field='startDate' headerText='Start Date' width=90
format="yMd" textAlign='Right'></e-column>
                <e-column field='duration' headerText='Duration' width=80
textAlign='Right'></e-column>
            </e-columns>
        </ejs-treegrid>
</div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin } from "@syncfusion/ej2-vue-treegrid";
import { sampleData } from "./datasource.js";
import { ButtonPlugin } from "@syncfusion/ej2-vue-buttons";
Vue.use(TreeGridPlugin);
Vue.use(ButtonPlugin);
export default {
  data() {
    return {
      data: sampleData
    };
```

Copyright © 2001 -2024 Syncfusion Inc.

```
  },
   methods:{
       show: function() {
        this.$refs.treegrid.showColumns(['Task ID', 'Duration']); // show by
HeaderText
    },
    hide: function() {
        this.$refs.treegrid.hideColumns(['Task ID', 'Duration']); // hide by
HeaderText
    }
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/columns/default-cs15" %}

ValueAccessor

The valueAccessor is used to access/manipulate the value of display data. You can achieve custom value formatting by using the valueAccessor.

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid  :dataSource="data" childMapping='subtasks'
:treeColumnIndex='1' height='315px'>
            <e-columns>
                <e-column field='orderID' headerText='Order ID' width=100
textAlign='Right'></e-column>
                <e-column field='orderName' headerText='Order Name'
:valueAccessor='orderFormatter' width=215></e-column>
                <e-column field='orderDate' headerText='Order Date'
width=110 :format='formatOptions' type='date' textAlign='Right'></e-column>
                <e-column field='price' headerText='Price' width=100
:valueAccessor='currencyFormatter' textAlign='Right'></e-column>
            </e-columns>
        </ejs-treegrid>
</div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin, Page } from "@syncfusion/ej2-vue-treegrid";
import { formatData } from "./datasource.js";
Vue.use(TreeGridPlugin);
export default {
   data() {
    return {
      data: formatData,
      formatOptions: {type:'date', format:'dd/MM/yyyy'},
    };
    },
    methods:{
        currencyFormatter: function(field, data, column) {
            return '€' + data['price'];
        },
    orderFormatter: function (field, data, column) {
```

```
        return data[field] + '-' + data['Category'];
    }
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/columns/default-cs16" %}

Display array type columns

You can bind an array of objects in a column by using the valueAccessor property.

In this example, the name field has an array of two objects, FirstName and LastName. These two objects are joined and bound to a column using the

valueAccessor.

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid  :dataSource='data' childMapping='subtasks'
:treeColumnIndex='1' height='315px'>
            <e-columns>
               <e-column field='taskID' headerText='Task ID' width=110
textAlign='Right'></e-column>
                <e-column field='taskName' headerText='Task Name'
width=180></e-column>
                <e-column field='name' headerText='Assignee' width=150
:valueAccessor='valueAccess' textAlign='Left'></e-column>
                <e-column field='duration' headerText='Duration' width=80
textAlign='Right'></e-column>
            </e-columns>
        </ejs-treegrid>
</div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin } from "@syncfusion/ej2-vue-treegrid";
import { stringData } from "./datasource.js";
Vue.use(TreeGridPlugin);
export default {
  data() {
    return {
      data: stringData,
    };
    },
    methods:{
          valueAccess: function(field, data, column) {
              return data[field].map((s) => { return s.lastName ||
s.firstName; }).join(' ');
              }
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/columns/default-cs17" %}

Copyright © 2001 -2024 Syncfusion Inc.

Expression column

You can achieve the expression column by using the valueAccessor property.

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid  :dataSource="data" childMapping='subtasks'
:treeColumnIndex='1' height='315px'>
            <e-columns>
                <e-column field='orderID' headerText='Order ID' width=110
textAlign='Right'></e-column>
                <e-column field='orderName' headerText='Order Name'
width=210></e-column>
                <e-column field='units' headerText='Units' width=120
textAlign='Right'></e-column>
                <e-column field='unitPrice' headerText='Unit Price'
width=120 textAlign='Right'></e-column>
                <e-column field='price' headerText='Price' width=120
:valueAccessor='totalPrice'

</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/columns/default-cs18" %}

How to render boolean values as checkbox

To render boolean values as checkbox in columns, you need to set displayAsCheckBox property as true.

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid :dataSource="data" childMapping='subtasks'
:treeColumnIndex='1' height='315px'>
            <e-columns>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
                <e-column field='taskID' headerText='Task ID' width=90
textAlign='Right'></e-column>
                <e-column field='taskName' headerText='Task Name'
width=180></e-column>
                <e-column field='approved' headerText='Approved' width=90
displayAsCheckBox='true'></e-column>
                <e-column field='duration' headerText='Duration' width=80
textAlign='Right'></e-column>
            </e-columns>
        </ejs-treegrid>
</div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin } from "@syncfusion/ej2-vue-treegrid";
import { sampleData } from "./datasource.js";
Vue.use(TreeGridPlugin);
export default {
  data() {
    return {
      data: sampleData,
    };
  },
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/columns/default-cs19" %}

Headers in Vue Treegrid component

Header text

By default, column header title is displayed from column field value. To override the default header title, you have to define the headerText value.

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid :dataSource="data" childMapping='subtasks'
:treeColumnIndex='1' height='315px'>
            <e-columns>
                <e-column field='taskID' headerText='Task ID' width=90
textAlign='Right'></e-column>
                <e-column field='taskName' headerText='Task Name'
width=180></e-column>
                <e-column field='startDate' headerText='Start Date' width=90
format="yMd" textAlign='Right'></e-column>
                <e-column field='duration' headerText='Duration' width=80
textAlign='Right'></e-column>
            </e-columns>
        </ejs-treegrid>
</div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin } from "@syncfusion/ej2-vue-treegrid";
import { sampleData } from "./datasource.js";
```

Copyright © 2001 -2024 Syncfusion Inc.

```
Vue.use(TreeGridPlugin);
export default {
  data() {
    return {
      data: sampleData,
    };
  },
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/columns/default-cs21" %}

* If both the field and headerText

are not defined in the column, the column renders with “empty” header text.

Header template

You can customize the header element by using the headerTemplate property.

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid :dataSource="data" childMapping='subtasks'
:treeColumnIndex='0' height='315px'>
            <e-columns>
                <e-column field='taskName' :headerTemplate='projectName'
width=180></e-column>
                <e-column field='startDate' :headerTemplate='dateTemplate'
format="yMd" textAlign='Right'></e-column>
                <e-column field='duration'
:headerTemplate='durationTemplate' textAlign='Right'></e-column>
                <e-column field='progress'
:headerTemplate='progressTemplate' textAlign='Right'></e-column>
            </e-columns>
        </ejs-treegrid>
</div>
</template>
<script>

{% previewsample "page.domainurl/code-snippet/treegrid/column-template/default-cs1" %}

TreeGrid actions such as editing, filtering and sorting etc. will depend upon the column field. If the field is not specified in the template column, the treegrid actions cannot be performed.

Using condition template

You can render the template elements based on condition.

In the following code, checkbox is rendered based on Approved field value.

`

<script id="template" type="text/x-template">

`

<input type="checkbox" checked />

<div v-else class="template_checkbox">

<input type="checkbox" />

`

</script>

`

APP.VUE

    };
  }
}
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/columns/default-cs9" %}

Complex data binding in Vue Treegrid component

You can achieve complex data binding in the treegrid by using the dot(.) operator in the column.field.

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid :dataSource='data' childMapping='subtasks'
:treeColumnIndex='1' :height='315'>
            <e-columns>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
                <e-column field='taskID' headerText='Task ID' width=90
textAlign='Right'></e-column>
                <e-column field='taskName' headerText='Task Name'
width=180></e-column>
                <e-column field='assignee.firstName' headerText='Assignee'
width=90></e-column>
                <e-column field='duration' headerText='Duration' width=80
textAlign='Right'></e-column>
            </e-columns>
        </ejs-treegrid>
</div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin } from "@syncfusion/ej2-vue-treegrid";
import { complexData } from "./datasource.js";
Vue.use(TreeGridPlugin);
export default {
   data() {
    return {
      data: complexData
    };
  },
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/columns/default-cs20" %}

Column reorder in Vue Treegrid component

Reordering can be done by drag and drop of a particular column header from one index to another index within the treegrid. To enable reordering, set the allowReordering to true.

To use reordering, inject the Reorder module in the treegrid.

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid :dataSource="data" childMapping='subtasks'
:allowReordering='true' :treeColumnIndex='1' height='285px'>
            <e-columns>
                <e-column field='taskID' headerText='Task ID' width=90
textAlign='Right'></e-column>
                <e-column field='taskName' headerText='Task Name'
width=180></e-column>
                <e-column field='startDate' headerText='Start Date' width=90
format="yMd" textAlign='Right'></e-column>
                <e-column field='duration' headerText='Duration' width=80
textAlign='Right'></e-column>
            </e-columns>
        </ejs-treegrid>
</div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin, Reorder } from "@syncfusion/ej2-vue-treegrid";
```

Copyright © 2001 -2024 Syncfusion Inc.

```
import { sampleData } from "./datasource.js";
Vue.use(TreeGridPlugin);
export default {
  data() {
    return {
      data: sampleData,
    };
  },
   provide: {
      treegrid: [ Reorder ]
    }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/columns/default-cs4" %}

You can disable reordering a particular column by setting the columns.allowReordering to false.

Reorder multiple columns

Multiple columns can be reordered at a time by using the reorderColumns method.

APP.VUE

```
<template>
<div id="app">
    <ejs-button id='reorderMultipleCols' @click.native='reorder'>Reorder
TASK ID AND DURATION TO LAST</ejs-button>
        <ejs-treegrid ref='treegrid' :dataSource="data"
childMapping='subtasks' :allowReordering='true' :treeColumnIndex='1'
height='285px'>
            <e-columns>
                <e-column field='taskID' headerText='Task ID' width=90
textAlign='Right'></e-column>
                <e-column field='taskName' headerText='Task Name'
width=180></e-column>
                <e-column field='duration' headerText='Duration' width=80
textAlign='Right'></e-column>
                <e-column field='progress' headerText='Progress' width=80
textAlign='Right'></e-column>
            </e-columns>
        </ejs-treegrid>
</div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin, Reorder } from "@syncfusion/ej2-vue-treegrid";
import { sampleData } from "./datasource.js";
import { ButtonPlugin } from "@syncfusion/ej2-vue-buttons";
Vue.use(TreeGridPlugin);
Vue.use(ButtonPlugin);
export default {
  data() {
    return {
      data: sampleData,
    };
  },
   provide: {
```

Copyright © 2001 -2024 Syncfusion Inc.

```
      treegrid: [ Reorder ]
    },
     methods:{
       reorder: function() {

this.$refs.treegrid.reorderColumns(['taskID','duration'],'progress');
      }
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/columns/default-cs5" %}

Column resizing in Vue Treegrid component

Column width can be resized by clicking and dragging the right edge of the column header. While dragging, the width of the respective column will be resized immediately. Each column can be auto resized by double-clicking the right edge of the column header to fit the width of that column based on the widest cell content. To enable column resize, set the allowResizing property to true.

To use the column resize, inject Resize module in the treegrid.

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid :dataSource="data" childMapping='subtasks'
:treeColumnIndex='1' :allowResizing='true' height='315px'>
            <e-columns>
                <e-column field='taskID' headerText='Task ID' width=90
textAlign='Right'></e-column>
                <e-column field='taskName' headerText='Task Name'
width=180></e-column>
                <e-column field='startDate' headerText='Start Date' width=90
format="yMd" textAlign='Right'></e-column>
                <e-column field='duration' headerText='Duration' width=80
textAlign='Right'></e-column>
            </e-columns>
        </ejs-treegrid>
</div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin, Resize } from "@syncfusion/ej2-vue-treegrid";
import { sampleData } from "./datasource.js";
Vue.use(TreeGridPlugin);
export default {
  data() {
    return {
      data: sampleData,
    };
  },
   provide: {
      treegrid: [ Resize ]
    },
}
</script>
```

Copyright © 2001 -2024 Syncfusion Inc.

{% previewsample "page.domainurl/code-snippet/treegrid/columns/default-cs6" %}

* You can disable resizing for a particular column by setting the columns.allowResizing to false.

* In RTL mode, you can click and drag the left edge of the header cell to resize the column.

Min and max width

Column resize can be restricted between minimum and maximum width by defining the columns->minWidth and columns->maxWidth.

In the following sample, minimum and maximum width are defined for Duration, and Task Name columns.

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid :dataSource="data" childMapping='subtasks'
:treeColumnIndex='1' :allowResizing='true' height='315px'>
            <e-columns>
                <e-column field='taskID' headerText='Task ID' width=90
textAlign='Right'></e-column>
                <e-column field='taskName' headerText='Task Name'minWidth=
170 width=180 maxWidth=250></e-column>
                <e-column field='duration' headerText='Duration' minWidth=

Resize stacked column

Stacked columns can be resized by clicking and dragging the right edge of the stacked column header. While dragging, the width of the respective child columns will be resized at the same time. You can disable resize for particular stacked column by setting allowResizing as false to its columns.

Column menu in Vue Treegrid component

The column menu has options to integrate features like sorting, filtering, and autofit. It will show a menu with the integrated feature when users click on multiple icon of the column. To enable column menu, you need to define the showColumnMenu property as true.

By default, column menu is enabled for all columns and you can disable column menu for a particular column by defining the showColumnMenu as false in columns property.

To use the column menu, inject the ColumnMenu module in the treegrid.

Copyright © 2001 -2024 Syncfusion Inc.

The default items are displayed in following table.

| Item | Description |

|-----|-----|

| SortAscending | Sort the current column in ascending order. |

| SortDescending | Sort the current column in descending order. |

| AutoFit | Auto fit the current column. |

| AutoFitAll | Auto fit all columns. |

| Filter | Show the filter option as given in filterSettings.type |

APP.VUE

Row

Copyright © 2001 -2024 Syncfusion Inc.

Row in Vue Treegrid component

The row represents record details fetched from data source.

Customize rows

You can customize the appearance of a row by using the rowDataBound event.

The rowDataBound event triggers for every row. In the event handler, you can get the

RowDataBoundEventArgs that contains details of the row.

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid :dataSource="data" :treeColumnIndex='1'
childMapping='subtasks' height='315px' :rowDataBound='rowDataBound'>
            <e-columns>
                <e-column field='taskID' headerText='Task ID'
textAlign='Right'  width='90'></e-column>
                <e-column field='taskName' headerText='Task Name'
width='180'></e-column>
                <e-column field='startDate' headerText=' Start Date'
textAlign='Right'  format='yMd' type='date' width='90'></e-column>
                <e-column field='duration' headerText='Duration'
textAlign='Right'  width='80'></e-column>
            </e-columns>
        </ejs-treegrid>
</div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin } from "@syncfusion/ej2-vue-treegrid";
import { sampleData } from "./datasource.js";
Vue.use(TreeGridPlugin);
export default {
  data () {
    return {
      data: sampleData,
    };
  },
  methods:{
     rowDataBound: function(args) {
         if (args.data['duration'] == 0 ) {
        args.row.style.background= '#336c12';
    } else if (args.data['duration'] < 3) {
        args.row.style.background= '#7b2b1d';
    }
    }
}
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/row/default-cs1" %}

Styling alternate rows

You can change the treegrid's alternative rows' background color by overriding the .e-altrow class.

Copyright © 2001 -2024 Syncfusion Inc.

`

.e-treegrid .e-altrow {

background-color: #fafafa;

}

`

Please refer to the following example.

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid :dataSource="data" :treeColumnIndex='1'
childMapping='subtasks' height='315px'>
            <e-columns>
                <e-column field='taskID' headerText='Task ID'
textAlign='Right'  width='90'></e-column>
                <e-column field='taskName' headerText='Task Name'
width='180'></e-column>
                <e-column field='startDate' headerText=' Start Date'

Limitations

Row template feature is not compatible with all the features which are available in treegrid and it has limited features support. Here we have listed out the features which are not compatible with row template feature.

- Filtering
- Paging
- Sorting
- Scrolling
- Searching
- Rtl
- Context Menu
- State Persistence

Detail template in Vue Treegrid component

The detail template provides additional information about a particular row. By expanding the parent row the child rows are expanded along with their detail template. The detailTemplate property accepts either the template string or HTML element ID.

APP.VUE

```
<template>
<div id="app">
<ejs-treegrid :dataSource="data" childMapping='Children' height=317
width='auto' :treeColumnIndex='0' :detailTemplate='detailTemplate'>

Row drag and drop in Vue Treegrid component

The TreeGrid rows can be reordered, dropped to another TreeGrid or custom control by enabling the allowRowDragAndDrop to true.

To use row drag and drop, inject the RowDD module in the TreeGrid.

Copyright © 2001 -2024 Syncfusion Inc.

Drag and drop within Tree Grid

The TreeGrid row drag and drop allows you to drag and drop TreeGrid rows on the same TreeGrid using drag icon. To enable row drag and drop, set the allowRowDragAndDrop to true. It provides the way to drop the row above, below or child to the target row with respective to the target row position.

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid id='TreeGrid' :dataSource="data"
:allowRowDragAndDrop='true' height='315' :treeColumnIndex='1'
:rowDropSettings='rowDrop'
         :selectionSettings='selectionSettings'
         childMapping='subtasks' >
            <e-columns>
                    <e-column field='taskID' headerText='Task ID'
:isPrimaryKey='true' textAlign='Right' width=90></e-column>
                    <e-column field='taskName' headerText='Task Name'
textAlign='Left' width=180></e-column>
                    <e-column field='startDate' headerText='Start Date'
textAlign='Right' format='yMd' width=90></e-column>
                    <e-column field='duration' headerText='Duration'
textAlign='Right' width=80></e-column>
            </e-columns>
        </ejs-treegrid>
</div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin, RowDD } from "@syncfusion/ej2-vue-treegrid";
import { sampleData } from "./datasource.js";
Vue.use(TreeGridPlugin);
export default {
  data () {
    return {
      data: sampleData,
      selectionSettings: { type: 'Multiple' },
      rowDrop: { targetID: 'destTree' }
    };
  },
    provide: {
    treegrid: [RowDD]
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/row/row-cs1" %}

* Selection feature must be enabled for row drag and drop.

* For multiple row selection, the type property must be set to multiple.

* The isPrimaryKey property is necessary to perform row drag and drop operation.

Copyright © 2001 -2024 Syncfusion Inc.

Drag and drop to another Tree Grid

To drag and drop between two TreeGrid, enable the allowRowDragAndDrop property and specify the target TreeGrid ID in targetID property of rowDropSettings.

APP.VUE

```
<template>
<div id="app">
<div style="display: inline-block">
        <ejs-treegrid id='TreeGrid' :dataSource="data"
:allowRowDragAndDrop='true' height='315' :treeColumnIndex='1'
:rowDropSettings='rowDrop' :selectionSettings='selectionSettings'

    }
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/row/row-cs2" %}

Drag and drop events

The following events are triggered while drag and drop the treegrid rows.

rowDragStartHelper - Triggers when click the drag icon or treegrid row and this event is used to customize the drag element based on user criteria.

rowDragStart -Triggers when starts to drag the treegrid row.

rowDrag - Triggers while dragging the treegrid row.

rowDrop - Triggers when a drag element is dropped on the target element.

Prevent reordering a row as child to another row

You can prevent the default behavior of dropping rows as children to the target by setting the cancel property to true in rowDrop event argument. You can also change the drop position after cancelling using reorderRows method.

In the below example drop action is cancelled and dropped above to target row.

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid id='TreeGrid' ref='treeGrid' :dataSource="data"
:allowRowDragAndDrop='true' height='315' :treeColumnIndex='1'
         childMapping='subtasks' :rowDrop="rowDrop" >
            <e-columns>
                    <e-column field='taskID' headerText='Task ID'
:isPrimaryKey='true' textAlign='Right' width=90></e-column>
                    <e-column field='taskName' headerText='Task Name'
textAlign='Left' width=180></e-column>
                    <e-column field='startDate' headerText='Start Date'
textAlign='Right' format='yMd' width=90></e-column>
                    <e-column field='duration' headerText='Duration'
textAlign='Right' width=80></e-column>
            </e-columns>
        </ejs-treegrid>
</div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin, RowDD } from "@syncfusion/ej2-vue-treegrid";
import { sampleData } from "./datasource.js";
Vue.use(TreeGridPlugin);
export default {
  data () {
    return {
      data: sampleData,
    };
  },
    provide: {
```

```
    treegrid: [RowDD]
  },
  methods: {
    rowDrop: function(args) {
              if (args.dropPosition == 'middleSegment') {
                    args.cancel = true;
                    this.$refs.treeGrid.reorderRows([args.fromIndex],
args.dropIndex, 'above');
                  }
            }
  },
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/row/row-cs3" %}

Indent in Vue Treegrid component

The Indent and Outdent feature will help to change the hierarchy level of rows in tree grid. The indent action moves the selected row as the last child of its previous row, whereas the outdent action moves the selected row as a sibling to its parent row.

To use the indent and outdent feature, inject the RowDD module in the Tree Grid. The tree grid toolbar has the built-in items to execute indent and outdent actions. Define this by using the toolbar property.

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid :dataSource='data' childMapping='subtasks'
:treeColumnIndex='1' :selectedRowIndex='2' height='270px'
:toolbar='toolbar'>
        <e-columns>
                <e-column field='taskID'  :isPrimaryKey='true'
headerText='Task ID'  width=90 textAlign='Right'></e-column>
                <e-column field='taskName' headerText='Task Name'  width=180
></e-column>
                <e-column field='priority' headerText='Priority' width=80
textAlign='Right'></e-column>
                <e-column field='duration' headerText='Duration' width=80
textAlign='Right'></e-column>
                </e-columns>
        </ejs-treegrid>
</div>
</template>
<script>

}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/cell/default-cs6" %}

Auto wrap in Vue Treegrid component

The auto wrap allows the cell content of the treegrid to wrap to the next line when it exceeds the boundary of the cell width. The Cell Content wrapping works based on the position of white space between words. To enable auto wrap, set the allowTextWrap property to true. You can configure the auto wrap mode by setting the textWrapSettings.wrapMode property.

There are three types of wrapMode. They are:

Copyright © 2001 -2024 Syncfusion Inc.

- **Both**: Both value is set by default. Auto wrap will be enabled for both the content and the header.
- **Header**: Auto wrap will be enabled only for the header.
- **Content**: Auto wrap will be enabled only for the content.

Note: When a column width is not specified, then auto wrap of columns will be adjusted with respect to the treegrid's width.

In the following example, the textWrapSettings.wrapMode is set to Content.

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid :dataSource='data' childMapping='subtasks'
:treeColumnIndex='1' height='300px' :allowTextWrap='true'
:textWrapSettings='wrapSettings'>
            <e-columns>
                <e-column field='taskID' headerText='Task ID' width=90
textAlign='Right'></e-column>
                <e-column field='taskName' headerText='Task Name'
width=75></e-column>
                <e-column field='startDate' headerText='Start Date' width=90
format="yMd" textAlign='Right'></e-column>
                <e-column field='duration' headerText='Duration' width=80
textAlign='Right'></e-column>
            </e-columns>
        </ejs-treegrid>
</div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin } from "@syncfusion/ej2-vue-treegrid";
import { sampleData } from "./datasource.js";
Vue.use(TreeGridPlugin);
export default {
  data() {
    return {
      data: sampleData,
      wrapSettings: { wrapMode: 'Content' }
    };
  },
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/cell/default-cs1" %}

Clip mode in Vue Treegrid component

The clip mode provides options to display its overflow cell content and it can be defined by the columns.clipMode property.

There are three types of clipMode. They are:

- **Clip**: Truncates the cell content when it overflows its area.
- **Ellipsis**: Displays ellipsis when the cell content overflows its area.

Copyright © 2001 -2024 Syncfusion Inc.

- **EllipsisWithTooltip**: Displays ellipsis when the cell content overflows its area, also it will display the tooltip while hover on ellipsis is applied.

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid :dataSource='data' childMapping='subtasks'
:treeColumnIndex='1' height='300px' gridLines='Both'>

    return {
      data: complexData,
    };
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/cell/default-cs5" %}

By default, columns.clipMode value is Ellipsis.

Editing

Edit in Vue Treegrid component

The TreeGrid component has options to dynamically insert, delete and update records. Editing feature is enabled by using editSettings property and it requires a primary key column for CRUD operations.

To define the primary key, set columns.isPrimaryKey to true in particular column.

To use CRUD, inject the Link to the Video module in treegrid.

To get start quickly with Edit Options, you can check on this video:

APP.VUE

```
<template>
```

```
<div id="app">
        <ejs-treegrid :dataSource='data' childMapping='subtasks'
:treeColumnIndex='1' height='270px' :editSettings='editSettings'>
        <e-columns>
                <e-column field='taskID'  :isPrimaryKey='true'
headerText='Task ID'  width=90 textAlign='Right'></e-column>
                <e-column field='taskName' headerText='Task Name'  width=180
></e-column>
                <e-column field='priority' headerText='Priority' width=80
textAlign='Right'></e-column>
                <e-column field='duration' headerText='Duration' width=80
textAlign='Right'></e-column>
                </e-columns>
        </ejs-treegrid>
</div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin, Edit } from "@syncfusion/ej2-vue-treegrid";
import { sampleData } from "./datasource.js";
Vue.use(TreeGridPlugin);
export default {
  data() {
    return {
      data: sampleData,
      editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true }
    };
  },
    provide: {
    treegrid: [ Edit]
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/editing/default-cs7" %}

* You can disable editing for a particular column, by specifying

columns.allowEditing to false.

Toolbar with edit option

The treegrid toolbar has the built-in items to execute Editing actions.

You can define this by using the toolbar property.

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid :dataSource='data' childMapping='subtasks'
:treeColumnIndex='1' height='270px' :editSettings='editSettings'
:toolbar='toolbar'>
        <e-columns>
                <e-column field='taskID'  :isPrimaryKey='true'
headerText='Task ID'  width=90 textAlign='Right'></e-column>
```

```
                <e-column field='taskName' headerText='Task Name'  width=180
></e-column>
                <e-column field='priority' headerText='Priority' width=80
textAlign='Right'></e-column>
                <e-column field='duration' headerText='Duration' width=80
textAlign='Right'></e-column>
                </e-columns>
        </ejs-treegrid>
</div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin, Edit, Toolbar } from "@syncfusion/ej2-vue-
treegrid";
import { sampleData } from "./datasource.js";
Vue.use(TreeGridPlugin);
export default {
  data() {
    return {
      data: sampleData,
      editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true,  mode: 'Row' },
      toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel']
    };
  },
    provide: {
    treegrid: [ Edit, Toolbar ]
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/editing/default-cs8" %}

<!-- markdownlint-disable MD033 -->

<!-- Template context

The Essential JS2 packages has a built-in template engine. Using the template engine, you can access the row information inside the HTML element and bind the attributes, values, or elements based on this row information.

The following properties will be available at the time of template execution.

| Property Name | Usage |

|---------------|--------|

| isAdd | A Boolean property; it defines whether the current row should be a new record or not.

In the following code example, the OrderID textbox has been disabled by using the isAdd property.

`

// The disabled attributes will be added based on the isAdd property.

<input id="taskID" name="taskID" v-model='data.taskID' type="text" :disabled="!data.isAdd">

Copyright © 2001 -2024 Syncfusion Inc.

`

The following code example illustrates rendering the taskID textbox, when a new record is added.

`

${if(isAdd)}

<input id="taskID" name="taskID" v-model='data.taskID' type="text" :disabled="!data.isAdd">

<label class="e-float-text e-label-top" for="OrderID">Task ID</label>

${/if}

`

The dialog template syntax supports the ES6 expression string literals, and you can refer to the Template Engine for more template syntax.

Render editors as components

You can convert the form editors to EJ2 controls in the actionComplete event based on the requestType as beginEdit or add.

The following code example illustrates rendering the drop-down list control in the actionComplete event.

`

<script>

actionComplete: function(args) {

if ((args.requestType === 'beginEdit' || args.requestType === 'add')) {

let priorityData: {}[] = DataUtil.distinct(this.$refs.treegrid.grid.dataSource, 'priority',true);

new DropDownList({value: args.rowData.priority, popupHeight: '200px', floatLabelType: 'Always',

dataSource: priorityData, fields: {text: 'priority', value: 'priority'}, placeholder: 'Priority'},
args.form.elements.namedItem('priority') as HTMLInputElement);

}

}

</script>

`

Get value from editor

Copyright © 2001 -2024 Syncfusion Inc.

You can read, format, and update the current editor value in the actionBegin event at the time of setting requestType to save.

In the following code example, the progress value has been formatted and updated.

` html

<script>

actionBegin: function(args) {

if (args.requestType === 'save') {

// cast string to integer value.

args.data['progress'] = parseFloat(args.form.querySelector("#progress").value);

}

}

</script>

`

Set focus to editor

By default, the first input element in the dialog will be focused while opening the dialog.

If the first input element is in disabled or hidden state, focus the valid input element in the

actionComplete

event based on requestType as beginEdit.

`

<script>

actionComplete: function(args) {

// Set initail Focus

if (args.requestType === 'beginEdit') {

(args.form.elements.namedItem('taskName')).focus();

}

}

</script>

`

Adding validation rules for custom editors

If you have used additional fields that are not present in the column model, then add the validation rules to the actionComplete event.

`

<script>

actionComplete: function(args) {

Copyright © 2001 -2024 Syncfusion Inc.

if ((args.requestType === 'beginEdit' || args.requestType === 'add')) {

// Add Validation Rules

args.form.ej2_instances[0].addRules('progress', {max: 100});

}

}

</script>

`

-->

<!-- markdownlint-disable MD033 -->

Adding row position

The TreeGrid control provides the support to add the new row in the top, bottom, above selected row, below selected row and child position of tree grid content using editSettings.newRowPosition property. By default, a new row will be added at the top of the treegrid.

The following examples shows how to set new row position as Child in tree grid.

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid :dataSource='data' childMapping='subtasks'
:treeColumnIndex='1' height='270px' :editSettings='editSettings'
:toolbar='toolbar'>
        <e-columns>
                <e-column field='taskID'  :isPrimaryKey='true'
headerText='Task ID'  width=90 textAlign='Right'></e-column>
                <e-column field='taskName' headerText='Task Name'
width=180></e-column>
                <e-column field='startDate' headerText='Start Date'
editType= 'datepickeredit' type= 'date' format= 'yMd' textAlign='Right'
width=170></e-column>
                <e-column field='duration' headerText='Duration' width=80
textAlign='Right'></e-column>
                </e-columns>
        </ejs-treegrid>
</div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin, Edit, Toolbar } from "@syncfusion/ej2-vue-
treegrid";
import { sampleData } from "./datasource.js";
Vue.use(TreeGridPlugin);
export default {
  data() {
    return {
      data: sampleData,
      editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true,  mode: 'Cell',  newRowPosition: 'Child' },
      toolbar: ['Add', 'Delete', 'Update', 'Cancel']
```

```
    };
  },
    provide: {
    treegrid: [ Edit, Toolbar ]
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/editing/default-cs9" %}

Confirmation messages

Delete confirmation

The delete confirm dialog can be shown when deleting a record by defining the showDeleteConfirmDialog as true

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid ref='treegrid' :dataSource='data'
childMapping='subtasks' :treeColumnIndex='1' height='270px'
:editSettings='editSettings' :toolbar='toolbar'>
        <e-columns>
        <e-column field='taskID'  :isPrimaryKey='true'  headerText='Task ID'
width=90 textAlign='Right'></e-column>
        <e-column field='taskName' headerText='Task Name' width=180></e-
column>
        <e-column field='startDate' headerText='Start Date' editType=
'datepickeredit' type= 'date' format='yMd' textAlign='Right' width=170></e-
column>
        <e-column field='duration' headerText='Duration' width=80
textAlign='Right'></e-column>
        </e-columns>
        </ejs-treegrid>
</div>
</template>

export default {
  data() {
    return {
      data: sampleData,
      toolbar: ['Add', 'Delete', 'Update', 'Cancel'],
      editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true, mode: 'Cell', showDeleteConfirmDialog: true },
    };
  },
    provide: {
    treegrid: [ Edit, Toolbar ]
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/editing/default-cs11" %}

Disable editing for particular column

You can disable editing for particular columns by using the columns.allowEditing.

Copyright © 2001 -2024 Syncfusion Inc.

In the following demo, editing is disabled for the Start Date column.

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid :dataSource='data' childMapping='subtasks'
:treeColumnIndex='1' height='270px' :editSettings='editSettings'
:toolbar='toolbar'>
        <e-columns>
        <e-column field='taskID'  :isPrimaryKey='true'  headerText='Task ID'
width=90 textAlign='Right'></e-column>
        <e-column field='taskName' headerText='Task Name' width=180></e-
column>
        <e-column field='startDate' headerText='Start Date'
:allowEditing='false' :allowEditing='false' type='date' format= 'yMd'
textAlign='Right' width=170></e-column>
        <e-column field='duration' headerText='Duration' width=80
textAlign='Right'></e-column>
        </e-columns>
        </ejs-treegrid>
</div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin, Edit, Toolbar } from "@syncfusion/ej2-vue-
treegrid";
import { sampleData } from "./datasource.js";
Vue.use(TreeGridPlugin);
export default {
  data() {
    return {
      data: sampleData,
      toolbar: ['Add', 'Delete', 'Update', 'Cancel'],
      editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true, mode: 'Cell' },
    };
  },
    provide: {
    treegrid: [ Edit, Toolbar ]
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/editing/default-cs12" %}

Troubleshoot: Editing works only for first row

The Editing functionalities can be performed based upon the primary key value of the selected row. If primaryKey is not defined in the treegrid, then edit or delete action take places the first row.

Edit types in Vue Treegrid component

Cell edit type and its params

The columns.editType is used to customize the edit type of the particular column.

You can set the columns.editType based on data type of the column.

Copyright © 2001 -2024 Syncfusion Inc.

- numericedit - NumericTextBox component for integers, double, and decimal data types.
- defaultedit - TextBox component for string data type.
- dropdownedit - DropDownList component for list data type.
- booleanedit - CheckBox component for boolean data type.
- datepickeredit - DatePicker component for date data type.
- datetimepickeredit - DateTimePicker component for date time data type.

Also, you can customize model of the columns.editType component through the columns.edit.params.

The following table describes cell edit type component and their corresponding edit params of the column.

Component |Example

NumericTextBox | params: { decimals: 2, value: 5 }

TextBox | -

DropDownList | params: { value: 'Germany' }

Checkbox | params: { checked: true}

DatePicker | params: { format:'dd.MM.yyyy' }

DateTimePicker | params: { value: new Date() }

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid :dataSource='data' childMapping='subtasks'
:treeColumnIndex='1' height='270px' :editSettings='editSettings'

Batch editing in Vue Treegrid component

In Batch edit mode, when you double-click on the tree grid cell, then the target cell changed to edit state. You can bulk save (added, changed and deleted data in the single request) to data source by click on the toolbar's **Update** button or by externally invoking the batchSave method. To enable Batch edit, set the editSettings.mode as **Batch**.

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid ref='treegrid' :dataSource='data' idMapping='TaskID'
parentIdMapping='parentID' :treeColumnIndex='1' height='270px'
:editSettings='editSettings' :toolbar='toolbar'>

Command column editing in Vue Treegrid component

The command column provides an option to add CRUD action buttons in a column. This can be defined by the column.commands property.

The available built-in command buttons are:

| Command Button | Actions |

|----------------|---------|

| Edit | Edit the current row.|

| Delete | Delete the current row.|

| Save | Update the edited row.|

| Cancel | Cancel the edited state. |

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid :dataSource='data' childMapping='subtasks'
:treeColumnIndex='1' height='270px' :editSettings='editSettings'>
        <e-columns>
               <e-column field='taskID'  :isPrimaryKey='true'
headerText='Task ID'  width=90 textAlign='Right'></e-column>
                <e-column field='taskName' headerText='Task Name'
width=180></e-column>
                <e-column field='duration' headerText='Duration' width=80
textAlign='Right'></e-column>
                <e-column  headerText='Manage Records' :commands='commands'
width=80  textAlign='Right'></e-column>
                </e-columns>
        </ejs-treegrid>

  },
    methods: {
    onClick: function(args) {
    let rowIndex: number = (closest(args.target as Element, '.e-
row')).rowIndex;
    let data: Object =
this.$refs.treegrid.ej2Instances.getCurrentViewRecords();
    alert(JSON.stringify(data[rowIndex]));
    }
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/editing/default-cs4" %}

Validation in Vue Treegrid component

Column validation

Column validation allows you to validate the edited or added row data and it display errors for invalid fields before saving data.

TreeGrid uses Form Validator component for column validation. You can set validation rules by defining the columns.validationRules.

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid :dataSource='data' childMapping='subtasks'
:treeColumnIndex='1' height='270px' :editSettings='editSettings'
:toolbar='toolbar'>
        <e-columns>
                <e-column field='taskID'  :isPrimaryKey='true'
headerText='Task ID'  width=90 textAlign='Right'
:validationRules='taskIDRules'></e-column>
                <e-column field='taskName' headerText='Task Name' editType=
'stringedit' :validationRules='taskNameRules' width=170 ></e-column>
                <e-column field='startDate' headerText='Start Date'
editType= 'datetimepickeredit' :validationRules='dateRules'
:edit='dateParams' :format='formatOptions' textAlign='Right' width=170></e-
column>
                <e-column field='approved' headerText='Approved' editType=
'booleanedit' type='boolean' width=110 displayAsCheckBox='true'
textAlign='Right'></e-column>
                <e-column field='progress' headerText='Progress' width=120
editType= 'numericedit' :validationRules='progressRules'
:edit='progressParams' textAlign='Right'></e-column>
                <e-column field='priority' headerText='Priority' editType=
'dropdownedit'  width=110 textAlign='Right'
:validationRules='priorityRules'></e-column>
                </e-columns>
        </ejs-treegrid>
</div>
</template>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
<script>
import Vue from "vue";
import { TreeGridPlugin, Edit, Toolbar } from "@syncfusion/ej2-vue-
treegrid";
import { sampleData } from "./datasource.js";
Vue.use(TreeGridPlugin);
export default {
  data() {
    return {
      data: sampleData,
      editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true,  mode: 'Cell', showDeleteConfirmDialog: true },
      toolbar: ['Add', 'Delete', 'Update', 'Cancel'],
      taskIDRules: { required: true, number: true },
      taskNameRules: { required: true },
      dateRules: { date: true }
      formatOptions: {type:'dateTime', format:'M/d/y hh:mm a'},
      dateParams: { params: {format: 'M/d/y hh:mm a' } },
      progressRules: { min: 0 , number: true },
      progressParams: { params: {format: 'n' } },
      priorityRules: { required: true }
    };
  },
    provide: {
    treegrid: [ Edit, Toolbar ]
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/editing/default-cs14" %}

Custom validation

You can define your own custom validation rules for the specific columns by using Form Validator custom rules.

In the below demo, custom validation applied for Priority column.

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid :dataSource='data' childMapping='subtasks'
:treeColumnIndex='1' height='270px' :editSettings='editSettings'
:toolbar='toolbar'>
        <e-columns>
        <e-column field='taskID'  :isPrimaryKey='true'  headerText='Task ID'
width=90 textAlign='Right'></e-column>
        <e-column field='taskName' headerText='Task Name' width=180></e-
column>
        <e-column field='startDate' headerText='Start Date' editType=
'datepickeredit' type= 'date' format= 'yMd' textAlign='Right' width=170></e-
column>
        <e-column field='priority' headerText='Priority' width=110
:validationRules='priorityRules'></e-column>
        </ejs-treegrid>
</div>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin, Edit, Toolbar } from "@syncfusion/ej2-vue-
treegrid";
import { sampleData } from "./datasource.js";
Vue.use(TreeGridPlugin);
export default {
  data() {
    return {
      data: sampleData,
      toolbar: ['Add', 'Delete', 'Update', 'Cancel'],
      editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true, mode: 'Cell', showDeleteConfirmDialog: true },
      priorityRules: { required: true, minLength: [(args) => {return
args['value'].length <= 8;}, 'Value should be within 8 letters'] }
    };
    },
    provide: {
    treegrid: [ Edit, Toolbar ]
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/editing/default-cs15" %}

Persisting data in server in Vue Treegrid component

Edited data can be persisted in the database using the RESTful web services.

All the CRUD operations in the treegrid are done through DataManager. The DataManager has an option to bind all the CRUD related data in server-side.

For your information, the ODataAdaptor persists data in the server as per OData protocol.

In the following section, we have explained how to perform CRUD operation in server-side using the UrlAdaptor and RemoteSave Adaptor.

URL adaptor

You can use the UrlAdaptor of DataManager when binding data source from remote data. In the initial load of treegrid, data are fetched from remote data and bound to the treegrid using url property of DataManager. You can map The CRUD operation in treegrid can be mapped to server-side Controller actions using the properties insertUrl, removeUrl, updateUrl and batchUrl.

The following code example describes the above behavior.

`

<template>

<ejs-treegrid :dataSource='data' idMapping='TaskID' parentIdMapping='parentID' :treeColumnIndex='1' height='270px' :editSettings='editSettings' :toolbar='toolbar'>

<e-columns>

Copyright © 2001 -2024 Syncfusion Inc.

```
<e-column field='TaskID'  :isPrimaryKey='true'  headerText='Task ID'  width=90 textAlign='Right'></e-column>

<e-column field='TaskName' headerText='Task Name' width=180></e-column>

<e-column field='StartDate' headerText='Start Date' editType= 'datepickeredit' type= 'date' format= 'yMd' textAlign='Right' width=170></e-column>

<e-column field='EndDate' headerText='End Date' editType= 'datepickeredit' type= 'date' format= 'yMd' textAlign='Right' width=170></e-column>

<e-column field='Priority' headerText='Priority' width=110></e-column>

</ejs-treegrid>

</div>

</template>

<script>

import Vue from "vue";

import { TreeGridPlugin, Edit, Toolbar } from "@syncfusion/ej2-vue-treegrid";

import { DataManager, UrlAdaptor } from '@syncfusion/ej2-data';

Vue.use(TreeGridPlugin);

export default {

data() {

return {

data: new DataManager({

url: "Home/DataSource",

updateUrl: "Home/Update",

insertUrl: "Home/Insert",

removeUrl: "Home/Delete",

batchUrl: "Home/Remove",

adaptor: new UrlAdaptor

}),

toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],

editSettings: { allowEditing: true, allowAdding: true, allowDeleting: true, mode: 'Row', newRowPosition: 'Below' }

};

},

provide: {

treegrid: [ Edit, Toolbar ]
```

Copyright © 2001 -2024 Syncfusion Inc.

```
}
}
</script>
```

Also, when using the UrlAdaptor, you need to return the data as JSON from the controller action and the JSON object must contain a property as result with dataSource as its value and one more property count with the dataSource total records count as its value.

The following code example describes the above behavior.

```ts
public ActionResult DataSource(DataManager dm)
{
var DataSource = TreeData.GetTree();
DataOperations operation = new DataOperations();
if (dm.Where != null && dm.Where.Count > 0)
{
DataSource = operation.PerformFiltering(DataSource, dm.Where, "and");   //perform filtering  and maintain child records on Expand/Collapse operation
}
var count = DataSource.ToList<TreeData>().Count();
if (dm.Skip != 0)
{
DataSource = operation.PerformSkip(DataSource, dm.Skip);   //Paging
}
if (dm.Take != 0)
{
DataSource = operation.PerformTake(DataSource, dm.Take);
}
return dm.RequiresCounts ? Json(new { result = DataSource, count = count }) : Json(DataSource);
}
```

Insert record

Using the insertUrl property, you can specify the controller action mapping URL to perform insert operation on the server-side.

The following code example describes the above behavior and also we have inserted new record based on the newRowPosition TreeGrid editSettings as "Below".

```ts
public void Insert(TreeGridData value, int relationalKey)
{
var i = 0;
for (; i < TreeData.tree.Count; i++)
{
if (TreeData.tree[i].TaskID == relationalKey)
{
break;
}
}
i += FindChildRecords(relationalKey); // Inserted new record when newRowPosition API is in "Below".
TreeData.tree.Insert(i + 1, value);
}
public int FindChildRecords(int id)
{
var count = 0;
for (var i = 0; i < TreeData.tree.Count; i++)
{
if (TreeData.tree[i].ParentItem == id)
{
count++;
count += FindChildRecords(TreeData.tree[i].TaskID);
}
}
return count;
}
```

The newly added record details are bound to the value parameter and relationalKey contains primaryKey value of an selected record helps to find out the position of newly added record. Please refer to the following screenshot.

![Insert](images/insert.PNG)

Copyright © 2001 -2024 Syncfusion Inc.

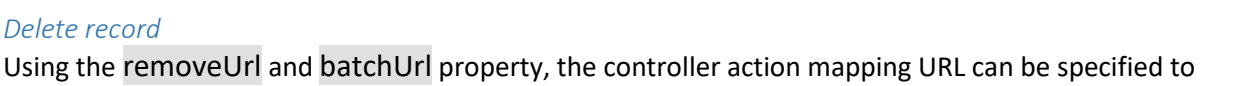
Update record

Using the updateUrl property, the controller action mapping URL can be specified to perform save/update operation on the server-side.

The following code example describes the previous behavior.

```ts
public ActionResult Update(TreeGridData value)
{
var val = TreeData.tree.Where(ds => ds.TaskID == value.TaskID).FirstOrDefault();
val.TaskName = value.TaskName;
val.StartDate = value.StartDate;
val.Duration = value.Duration;
val.Priority = value.Priority;
val.Progress = value.Progress;
return Json(value);
}
```

The updated record details are bound to the value parameter. Please refer to the following screenshot.



Delete record

Using the removeUrl and batchUrl property, the controller action mapping URL can be specified to perform delete operation on the server-side.

The following code example describes the previous behavior.

```ts
public ActionResult Delete(int key)
{
TreeData.tree.Remove(TreeData.tree.Where(ds => ds.TaskID == key).FirstOrDefault());
}
// Remove method (batchUrl) will be triggered when we delete parent record.
public ActionResult Remove(List<TreeGridData> changed, List<TreeGridData> added,
List<TreeGridData> deleted)
{
for (var i = 0; i < deleted.Count; i++)
{
TreeData.tree.Remove(TreeData.tree.Where(ds => ds.TaskID == deleted[i].TaskID).FirstOrDefault());
}
```

Copyright © 2001 -2024 Syncfusion Inc.

}

`

The deleted record primary key value is bound to the key parameter. Please refer to the following screenshot.

![Delete](images/remove.PNG)

While delete parent record, the parent and child records is bound to the deleted parameter. Please refer to the following screenshot.

![Remove](images/delete.PNG)

Remote save adaptor

You may need to perform all Tree Grid Actions in client-side except the CRUD operations, that should be interacted with server-side to persist data. It can be achieved in TreeGrid by using **RemoteSaveAdaptor**.

Datasource must be set to **json** property and set **RemoteSaveAdaptor** to the **adaptor** property. CRUD operations can be mapped to server-side using **updateUrl**, **insertUrl**, **removeUrl** properties.

You can use the following code example to use **RemoteSaveAdaptor** in TreeGrid.

`

<template>

<ejs-treegrid :dataSource='data' idMapping='TaskID' parentIdMapping='parentID' :treeColumnIndex='1' height='270px' :editSettings='editSettings' :toolbar='toolbar'>

<e-columns>

<e-column field='TaskID' :isPrimaryKey='true' headerText='Task ID' width=90 textAlign='Right'></e-column>

<e-column field='TaskName' headerText='Task Name' width=180></e-column>

<e-column field='StartDate' headerText='Start Date' editType= 'datepickeredit' type= 'date' format= 'yMd' textAlign='Right' width=170></e-column>

<e-column field='EndDate' headerText='End Date' editType= 'datepickeredit' type= 'date' format= 'yMd' textAlign='Right' width=170></e-column>

<e-column field='Priority' headerText='Priority' width=110></e-column>

</ejs-treegrid>

</template>

<script>

import Vue from "vue";

import { TreeGridPlugin, Edit, Toolbar } from "@syncfusion/ej2-vue-treegrid";

import { DataManager, RemoteSaveAdaptor } from '@syncfusion/ej2-data';

import { projectData } from "./datasource.js";

Copyright © 2001 -2024 Syncfusion Inc.

```
Vue.use(TreeGridPlugin);
export default {
data() {
return {
data: new DataManager({
data: projectData
updateUrl: "Home/Update",
insertUrl: "Home/Insert",
removeUrl: "Home/Delete",
batchUrl: "Home/Remove",
adaptor: new RemoteSaveAdaptor
}),
toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],
editSettings: { allowEditing: true, allowAdding: true, allowDeleting: true, mode: 'Row', newRowPosition: 'Below' }
};
},
provide: {
treegrid: [ Edit, Toolbar ]
}
}
</script>
`
```

The following code example describes the CRUD operations handled at server-side.

```ts
public void Insert(TreeData value, int relationalKey)
{
var i = 0;
for (; i < TreeData.tree.Count; i++)
{
if (TreeData.tree[i].TaskID == relationalKey)
{
break;
```

```
}
}
i += FindChildRecords(relationalKey); // Inserted new record when newRowPosition API is in "Below".
TreeData.tree.Insert(i + 1, value);
}
public ActionResult Update(TreeData value)
{
var val = TreeData.tree.Where(ds => ds.TaskID == value.TaskID).FirstOrDefault();
val.TaskName = value.TaskName;
val.StartDate = value.StartDate;
val.Duration = value.Duration;
val.Priority = value.Priority;
val.Progress = value.Progress;
return Json(value);
}
public ActionResult Delete(int key)
{
TreeData.tree.Remove(TreeData.tree.Where(ds => ds.TaskID == key).FirstOrDefault());;
}
// Remove method (batchUrl) will be triggered when we delete parent record.
public ActionResult Remove(List<TreeGridData> changed, List<TreeGridData> added,
List<TreeGridData> deleted)
{
for (var i = 0; i < deleted.Count; i++)
{
TreeData.tree.Remove(TreeData.tree.Where(ds => ds.TaskID == deleted[i].TaskID).FirstOrDefault());
}
}
`
```

Sorting in Vue Treegrid component

Sorting enables you to sort data in the Ascending or Descending order.

To sort a column, click the column header.

Copyright © 2001 -2024 Syncfusion Inc.

To sort multiple columns, press and hold the CTRL key and click the column header. You can clear sorting of any one of the multi-sorted columns by pressing and holding the SHIFT key and clicking the specific column header.

To enable sorting in the TreeGrid, set the allowSorting to true. Sorting options can be configured through the sortSettings.

To sort, inject the Sort module in the treegrid.

APP.VUE

```
<template>
    <div id="app">
          <ejs-treegrid  :dataSource='data' :allowSorting='true'
height='315px' childMapping='subtasks' :treeColumnIndex='0'>
            <e-columns>
              <e-column field='Category' headerText='Category'
width='140'></e-column>
                <e-column field='orderName' headerText='Order Name'
width='200'></e-column>
                <e-column field='orderDate' headerText='Order Date'
width='150' format="yMd" textAlign='Right'></e-column>
                <e-column field='units' headerText='Units' width='90'
textAlign='Right'></e-column>
            </e-columns>
        </ejs-treegrid>
        </div>
      </template>
<script>
import Vue from "vue";
import { TreeGridPlugin, Sort } from "@syncfusion/ej2-vue-treegrid";
import { sortData } from "./datasource.js";
Vue.use(TreeGridPlugin);
export default {
  data () {
    return {
      data: sortData
    };
  },
  provide: {
      treegrid: [ Sort ]
    },
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/sorting/default-cs1" %}

* TreeGrid columns are sorted in the Ascending order. If you click the already sorted column, the sort direction toggles.

* You can apply and clear sorting by invoking sortByColumn and

clearSorting methods.

* To disable sorting for a particular column, set the columns.allowSorting to false.

Copyright © 2001 -2024 Syncfusion Inc.

Initial sort

To sort at initial rendering, set the field and direction in the sortSettings.columns.

APP.VUE

```
<template>
    <div id="app">
          <ejs-treegrid  :dataSource='data' :allowSorting='true'
:sortSettings='sortSettings' childMapping='subtasks' :treeColumnIndex='1'>
            <e-columns>
              <e-column field='Category' headerText='Category'
width='140'></e-column>
                <e-column field='orderName' headerText='Order Name'
width='200'></e-column>
                <e-column field='orderDate' headerText='Order Date'
width='120' format="yMd" textAlign='Right'></e-column>
                <e-column field='units' headerText='Units' width='90'
textAlign='Right'></e-column>
            </e-columns>
        </ejs-treegrid>
    </div>
      </template>

  data () {
    return {
      data: sortData,
      sortSettings: { columns: [{ field: 'Category', direction: 'Ascending'
}, { field: 'orderName', direction: 'Ascending' }] }
    };
    },
  provide: {
      treegrid: [ Sort ]
    },
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/sorting/default-cs2" %}

Sorting events

During the sort action, the treegrid component triggers two events. The actionBegin event triggers before the sort action starts, and the actionComplete event triggers after the sort action is completed. Using these events you can perform the needed actions.

APP.VUE

```
<template>
    <div id="app">
          <ejs-treegrid :dataSource='data' :allowSorting='true'
height='315px' childMapping='subtasks' :treeColumnIndex='1'
:actionComplete='actionHandler' :actionBegin='actionHandler'>
            <e-columns>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
                <e-column field='Category' headerText='Category'
width='140'></e-column>
                <e-column field='orderName' headerText='Order Name'
width='200'></e-column>
                <e-column field='orderDate' headerText='Order Date'
width='120' format="yMd" textAlign='Right'></e-column>
                <e-column field='units' headerText='Units' width='90'
textAlign='Right'></e-column>
            </e-columns>
        </ejs-treegrid>
    </div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin, Sort } from "@syncfusion/ej2-vue-treegrid";
import { sortData } from "./datasource.js";
Vue.use(TreeGridPlugin);
export default {
  data () {
    return {
      data: sortData
    };
  },
  provide: {
      treegrid: [ Sort ]
    },
    methods: {
    actionHandler: function(args) {
        alert(args.requestType + ' ' + args.type); // custom Action
    }
  },
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/sorting/default-cs3" %}

The args.requestType is the current action name. For example, in sorting the args.requestType value is 'sorting'.

Touch interaction

When you tap the treegrid header on touchscreen devices, the selected column header is sorted. A popup is displayed for multi-column sorting. To sort multiple columns, tap the popup and then tap the desired treegrid headers.

The following screenshot shows treegrid touch sorting.

<img src="./images/touch-sorting.jpg" alt="Touch interaction image" style="width:320px;height:620px">

Filtering

Filtering in Vue Treegrid component

Filtering allows you to view specific or related records based on filter criteria. To enable filtering in the TreeGrid, set the allowFiltering to true. Filtering options can be configured through filterSettings.

To use filter, inject the Link to the Video module in the treegrid.

To get start quickly with filtering options, you can check on this video:

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid :dataSource='data' childMapping='subtasks'
:treeColumnIndex='1' :allowFiltering='true' height='275px'>
            <e-columns>
                <e-column field='taskID' headerText='Task ID' width='90'
textAlign='Right'></e-column>
                <e-column field='taskName' headerText='Task Name'
width='160'></e-column>
                <e-column field='startDate' headerText='Start Date'
width='90' format="yMd" textAlign='Right'></e-column>
                <e-column field='duration' headerText='Duration' width='80'
textAlign='Right'></e-column>
            </e-columns>
        </ejs-treegrid>
</div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin, Filter } from "@syncfusion/ej2-vue-treegrid";
import { sampleData } from "./datasource.js";
Vue.use(TreeGridPlugin);
export default {
  data ()  {
    return {
      data: sampleData,
    };
  },
  provide: {
      treegrid: [ Filter ]
    }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/filtering/default-cs6" %}

* You can apply and clear filtering by using filterByColumn and clearFiltering methods.

* To disable filtering for a particular column, set

columns.allowFiltering to false.

Filter hierarchy modes

TreeGrid provides support for a set of filtering modes with filterSettings.filterHierarchyMode property.

The below are the type of filter mode available in TreeGrid.

Copyright © 2001 -2024 Syncfusion Inc.

- **Parent** : This is the default filter hierarchy mode in TreeGrid. The filtered records are displayed with its parent records, if the filtered records not have any parent record then the filtered records only displayed.
- **Child** : The filtered records are displayed with its child record, if the filtered records not have any child record then the filtered records only displayed.
- **Both** : The filtered records are displayed with its both parent and child record, if the filtered records not have any parent and child record then the filtered records only displayed.
- **None** : The filtered records are only displayed.

APP.VUE

```
<template>
<div id="app">
 <div style="padding-top: 7px; display: inline-block">Hierarchy Mode</div>
  <div style="display: inline-block; width: 150px">

</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/filtering/default-cs7" %}

Initial filter

To apply the filter at initial rendering, set the filter predicate object in

filterSettings.columns.

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid :dataSource='data' childMapping='subtasks'
:treeColumnIndex='1'  :allowFiltering='true'
:filterSettings='filterOptions' height='275px'>
            <e-columns>
                <e-column field='taskID' headerText='Task ID' width='75'
textAlign='Right'></e-column>
                <e-column field='taskName' headerText='Task Name'
width='180'></e-column>
                <e-column field='startDate' headerText='Start Date'
width='90' format="yMd" textAlign='Right'></e-column>
                <e-column field='duration' headerText='Duration' width='80'
textAlign='Right'></e-column>
            </e-columns>
        </ejs-treegrid>
</div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin, Filter } from "@syncfusion/ej2-vue-treegrid";
import { sampleData } from "./datasource.js";
Vue.use(TreeGridPlugin);
export default {
  data () {
    return {
      data: sampleData,
      filterOptions: {
            columns: [{ field: 'taskName', matchCase: false, operator:
'startswith', predicate: 'and', value: 'plan' },
            { field: 'duration', matchCase: false, operator: 'equal',
predicate: 'and', value: 5 }]
```

```
      }
    };
  },
    provide: {
      treegrid: [ Filter ]
    }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/filtering/default-cs8" %}

Filter operators

The filter operator for a column can be defined in the filterSettings.columns.operator property.

The available operators and its supported data types are:

Operator |Description |Supported Types

startswith |Checks whether the value begins with the specified value. |String

endswith |Checks whether the value ends with the specified value. |String

contains |Checks whether the value contains the specified value. |String

equal |Checks whether the value is equal to the specified value. |String | Number | Boolean | Date

notequal |Checks for values not equal to the specified value. |String | Number | Boolean | Date

greaterthan |Checks whether the value is greater than the specified value. |Number | Date

greaterthanorequal|Checks whether a value is greater than or equal to the specified value. |Number | Date

lessthan |Checks whether the value is less than the specified value. |Number | Date

lessthanorequal |Checks whether the value is less than or equal to the specified value. |Number | Date

By default, the filterSettings.columns.operator value is equal.

Change default filter operator

You can change the default filter operator by extending filterModule.filterOperatorsproperty in dataBound event. In the following sample, we have changed the default operator for string typed columns as contains from startsWith.

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid ref='treegrid':dataSource='data'
childMapping='subtasks' :treeColumnIndex='1'  :allowFiltering='true'
height='275px' :dataBound='dataBound'>
            <e-columns>
                <e-column field='taskID' headerText='Task ID' width='75'
textAlign='Right'></e-column>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
                <e-column field='taskName' headerText='Task Name'
width='180'></e-column>
                <e-column field='startDate' headerText='Start Date'
width='90' format="yMd" textAlign='Right'></e-column>
                <e-column field='duration' headerText='Duration' width='80'
textAlign='Right'></e-column>
            </e-columns>
        </ejs-treegrid>
</div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin, Filter } from "@syncfusion/ej2-vue-treegrid";
import { sampleData } from "./datasource.js";
Vue.use(TreeGridPlugin);
export default {
  data ()  {
    return {
      data: sampleData,
    };
  },
   provide: {
    treegrid: [Filter]
  },
  methods: {
    dataBound(args){

this.$refs.treegrid.ej2Instances.grid.filterModule.filterOperators.startsWit
h="contains"
   }
    }
  }
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/filtering/default-cs9" %}

Diacritics

By default, treegrid ignores diacritic characters while filtering. To include diacritic characters, set the filterSettings.ignoreAccent as true.

In the following sample, type **aero** in Name column to filter diacritic characters.

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid :dataSource='data' childMapping='Children'
:treeColumnIndex='0'  :allowFiltering='true' height='275px'
:filterSettings='filterSettings'>
            <e-columns>
                <e-column field='EmpID' headerText='Employee ID' width='90'
textAlign='Right'></e-column>
                <e-column field='Name' headerText='Name' width='110'></e-
column>
                <e-column field='DOB' headerText='DOB' width='90'
format="yMd" textAlign='Right'></e-column>
```

```
                <e-column field='Country' width='65'></e-column>
            </e-columns>
        </ejs-treegrid>
</div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin, Filter } from "@syncfusion/ej2-vue-treegrid";
import { diacritics } from "./datasource.js";
Vue.use(TreeGridPlugin),
export default {
  data ()  {
    return {
      data: diacritics,
       filterSettings: {
        ignoreAccent: true
       }
    };
    },
  provide: {
    treegrid: [Filter]
  }
  }
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/filtering/default-cs10" %}

Filter bar in Vue Treegrid component

By setting the allowFiltering to true, the filter bar row will render next to the header, which allows you to filter data. You can filter the records with different expressions depending upon the column type.

Filter bar expressions:

You can enter the following filter expressions (operators) manually in the filter bar.

Expression |Example |Description |Column Type

= |=value |equal |Number

!= |!=value |notequal |Number

|>value |greaterthan |Number

< |<value |lessthan |Number

= |>=value |greaterthanorequal |Number

<=|<=value|lessthanorequal |Number

/value |startswith |String

% |%value |endswith |String

N/A |N/A | Equal operator will always be used for date filter. |Date

N/A |N/A |Equal operator will always be used for Boolean filter. |Boolean

  data ()  {
    return {
        data: sampleData,
        toolbarOptions: ['Search'],
        searchOptions: { fields: ['taskName'], operator: 'contains', key:
'plan', ignoreCase: true }
    };
  },
  provide: {
      treegrid: [ Filter, Toolbar ]
    }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/searching/default-cs2" %}

By default, treegrid searches all the bound column values. To customize this behavior define the searchSettings.fields property.

Copyright © 2001 -2024 Syncfusion Inc.

Search operators

The search operator can be defined in the searchSettings.operator property to configure specific searching.

The following operators are supported in searching:

Operator |Description

startsWith |Checks whether a value begins with the specified value.

endsWith |Checks whether a value ends with the specified value.

contains |Checks whether a value contains the specified value.

equal |Checks whether a value is equal to the specified value.

notEqual |Checks for values not equal to the specified value.

By default, the searchSettings.operator value is contains.

Search by external button

To search treegrid records from an external button, invoke the search method.

APP.VUE

```
<template>

{% previewsample "page.domainurl/code-snippet/treegrid/searching/default-cs3" %}

Search specific columns

By default, treegrid searches all visible columns. You can search specific columns by defining the specific column's field names in the searchSettings.fields property.

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid :dataSource='data' childMapping='subtasks'
:treeColumnIndex='1' :toolbar='toolbarOptions' height='270px'
:searchSettings='searchOptions'>
            <e-columns>
                <e-column field='taskID' headerText='Task ID' width='90'
textAlign='Right'></e-column>
                <e-column field='taskName' headerText='Task Name'
width='160'></e-column>
                <e-column field='startDate' headerText='Start Date'
width='90' format="yMd" textAlign='Right'></e-column>
                <e-column field='duration' headerText='Duration' width='80'
textAlign='Right'></e-column>
            </e-columns>
        </ejs-treegrid>
</div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin, Filter, Toolbar } from "@syncfusion/ej2-vue-
treegrid";
import { sampleData } from "./datasource.js";
Vue.use(TreeGridPlugin);
export default {
  data ()  {
    return {
      data: sampleData,
      toolbarOptions: ['Search'],
      searchOptions: {fields: ['taskName', 'duration']}
    };
  },
  provide: {
```

      treegrid: [ Filter, Toolbar ]
    }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/searching/default-cs4" %}

Paging in Vue Treegrid component

Paging provides an option to display TreeGrid data in page segments. To enable paging, set the allowPaging to true. When paging is enabled, pager component renders at the bottom of the treegrid. Paging options can be configured through the pageSettings.

To use paging, inject the Page module in the grid.

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid :dataSource='data' childMapping='subtasks'
:treeColumnIndex='1' :allowPaging='true' :pageSettings='pageSettings'>
            <e-columns>
                <e-column field='taskID' headerText='Task ID' width='90'
textAlign='Right'></e-column>
                <e-column field='taskName' headerText='Task Name'
width='160'></e-column>
                <e-column field='startDate' headerText='Start Date'
width='90' format="yMd" textAlign='Right'></e-column>
                <e-column field='duration' headerText='Duration' width='80'
textAlign='Right'></e-column>
            </e-columns>
        </ejs-treegrid>
</div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin, Page } from "@syncfusion/ej2-vue-treegrid";
import { sampleData } from "./datasource.js";
Vue.use(TreeGridPlugin);
export default {
  data ()  {
    return {
      data: sampleData,
      pageSettings: { pageSize: 7 }
    };
  },
  provide: {
      treegrid: [ Page ]
    }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/paging/default-cs1" %}

You can achieve better performance by using treegrid paging to fetch only a pre-defined number of records from the data source.

Copyright © 2001 -2024 Syncfusion Inc.

Page Size Mode

Two behaviors are available in TreeGrid paging to display certain number of records in a current page. Following are the two types of pageSizeMode.

- **All** : This is the default mode. The number of records in a page is based on pageSize property.
- **Root** : The number of root nodes or the 0th level records to be displayed per page is based on pageSize property.

With pageSizeMode property as Root, only the root level or the 0th level records are considered in records count.

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid :dataSource='data' childMapping='subtasks'
:treeColumnIndex='1' :allowPaging='true' :pageSettings='pageSettings'
height='265px' >
            <e-columns>
                <e-column field='taskID' headerText='Task ID' width='90'
textAlign='Right'></e-column>
                <e-column field='taskName' headerText='Task Name'
width='160'></e-column>
                <e-column field='startDate' headerText='Start Date'
width='90' format="yMd" textAlign='Right'></e-column>
                <e-column field='duration' headerText='Duration' width='80'
textAlign='Right'></e-column>
            </e-columns>
        </ejs-treegrid>
</div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin, Page } from "@syncfusion/ej2-vue-treegrid";
import { sampleData } from "./datasource.js";
Vue.use(TreeGridPlugin);
export default {
  data ()  {
    return {
      data: sampleData,
      pageSettings: { pageSize: 2, pageSizeMode: 'Root'}
    };
  },
  provide: {
      treegrid: [ Page ]
    },
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/paging/default-cs2" %}

Pager with Page Size Dropdown

The pager Dropdown allows you to change the number of records in the TreeGrid dynamically. It can be enabled by defining the pageSettings.pageSizes property as true.

Copyright © 2001 -2024 Syncfusion Inc.

`

pageSettings: {pageSize: 7, pageSizes: true},

`

<!-- markdownlint-disable MD033 -->

<img src="./images/pagesizes.png" alt="Page size dropdown">

<!-- markdownlint-enable MD033 -->

How to render Pager at the Top of the TreeGrid

By default, Pager will be rendered at the bottom of the TreeGrid. You can also render the Pager at the top of the TreeGrid by using the dataBound event.

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid ref='treegrid' :dataSource='data'
childMapping='subtasks' :treeColumnIndex='1' :allowPaging='true'
:pageSettings='pageSettings' :dataBound='ondataBound'>
            <e-columns>
                <e-column field='taskID' headerText='Task ID' width='90'
textAlign='Right'></e-column>
                <e-column field='taskName' headerText='Task Name'
width='160'></e-column>
                <e-column field='startDate' headerText='Start Date'
width='90' format="yMd" textAlign='Right'></e-column>
                <e-column field='duration' headerText='Duration' width='80'
textAlign='Right'></e-column>
            </e-columns>
        </ejs-treegrid>
</div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin, TreeGridComponent,  Page } from "@syncfusion/ej2-
vue-treegrid";
import { sampleData } from "./datasource.js";
Vue.use(TreeGridPlugin);
let initialGridLoad = true;
export default {
  data ()  {
    return {
      data: sampleData,
      pageSettings: { pageSize: 7, pageSizes: true },
      initialGridLoad : true
      };
  },
  provide: {
      treegrid: [ Page ]
    },
     methods: {
    ondataBound: function() {
      if (this.initialGridLoad) {
          this.initialGridLoad = false;
```

```
            let pager = document.getElementsByClassName('e-gridpager e-control
e-pager e-lib');
            let topElement;
           if ( this.$refs.treegrid.toolbar) {
               topElement = document.getElementsByClassName('e-toolbar');
          } else {
            topElement = document.getElementsByClassName('e-gridheader e-lib
e-droppable');
          }
            topElement[0].before(pager[0]);
        }
    }
}
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/paging/default-cs3" %}

During the paging action, the pager component triggers the below three events.

* The created event triggers when Pager is created.

* The click event triggers when the numeric items in the pager is clicked.

* The dropDownChanged event triggers when pageSize DropDownList value is selected.

Scrolling in Vue Treegrid component

The scrollbar will be displayed in the treegrid when content exceeds the element width or height. The vertical and horizontal scrollbars will be displayed based on the following criteria:

- The vertical scrollbar appears when the total height of rows present in the treegrid exceeds its element height.
- The horizontal scrollbar appears when the sum of columns width exceeds the treegrid element width.
- The height and width are used to set the treegrid height and width, respectively.

The default value for height and width is auto.

Set width and height

To specify the width and height of the scroller in the pixel, set the pixel value to a number.

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid :dataSource='data' childMapping='subtasks'
:treeColumnIndex='1' :height='315' :width='400'>
            <e-columns>
                <e-column field='taskID' headerText='Task ID' width='90'

{% previewsample "page.domainurl/code-snippet/treegrid/scroll/selectrow-cs1" %}

Frozen in Vue Treegrid component

Frozen rows and columns

Frozen rows and columns provides an option to make rows and columns always visible in the top and left side of the tree grid while scrolling.

To use frozen rows and columns support, inject the `Freeze` module in the `provide` section.

In this demo, the frozenColumns is set as '2' and the frozenRows

is set as '3'. Hence, the left two columns and top three rows are frozen.

APP.VUE

```
<template>
    <div id="app">
        <ejs-treegrid :dataSource='data' childMapping='subtasks'
:treeColumnIndex='1' height=310 :frozenColumns='2' :frozenRows='3'
:allowSelection='false'>
            <e-columns>
               <e-column field='taskID' headerText='Task ID' width='110'
textAlign='Right'></e-column>
                <e-column field='taskName' headerText='Task Name'
width='230'></e-column>
                <e-column field='startDate' headerText='Start Date'
width='120' format="yMd" textAlign='Right'></e-column>
                <e-column field='endDate' headerText='End Date' width='120'
format="yMd" textAlign='Right'></e-column>
                <e-column field='duration' headerText='Duration' width='110'

import { sampleData } from "./datasource.js";
Vue.use(TreeGridPlugin);
export default {
  data() {
    return {
      data: sampleData
    };
  },
  provide: {
    treegrid: [Freeze]
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/scroll/isfrozen-cs1" %}

Freeze direction

You can freeze the tree grid columns on the left or right side by using the column.freeze property and the remaining columns will be movable. The tree grid will automatically move the columns to the left or right position based on the column.freeze value.

Types of the column.freeze directions:

- **Left**: Allows you to freeze the columns at the left.
- **Right**: Allows you to freeze the columns at the right.

In this demo, the **Task Name** column is frozen at the left and the **Priority** column is frozen at the right side of the content table.

APP.VUE

```
<template>
    <div id="app">
        <ejs-treegrid :dataSource='data' childMapping='subtasks' height=310
:treeColumnIndex='1'  :allowSelection='false'>
            <e-columns>

</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/scroll/freeze-direction-cs1" %}

* Freeze Direction is not compatible with the isFrozen and frozenColumns properties.

Limitations of frozen tree grid

The following features are not supported in frozen rows and columns:

- Row Template
- Detail Template
- Cell Editing

Freeze Direction feature has the below limitations, along with the above mentioned limitations.

- Infinite scroll cache mode
- Freeze direction in the stacked header is not compatible with column reordering.

Virtual scroll in Vue Treegrid component

TreeGrid allows you to load large amount of data without performance degradation.

To use virtualization, you need to inject VirtualScroll module in the provide section.

Row virtualization

Row virtualization allows you to load and render rows only in the content viewport. It is an alternative way of paging in which the rows will be appended while scrolling vertically. To setup the row virtualization, you need to define enableVirtualization as true and content height by height property.

The number of records displayed in the TreeGrid is determined implicitly by height of the content area and a buffer records will be maintained in the TreeGrid content in addition to the original set of rows.

Expand and Collapse state of any child record will be persisted.

      treegrid: [VirtualScroll]
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/scroll/virtualscroll-cs5" %}

Column's width is required for column virtualization. If column's width is not defined then tree grid will consider its value as 200px.

Limitations for virtualization

- Due to the element height limitation in browsers, the maximum number of records loaded by the treegrid is limited by the browser capability.
- Cell selection will not be persisted in row.
- Virtual scrolling is not compatible with detail template,clipboard functionality, Batch editing and row drag and drop features.
- The page size provided must be two times larger than the number of visible rows in the TreeGrid. If the page size is failed to meet this condition then the size will be determined by TreeGrid.
- The virtual height of the treegrid content is calculated using the row height and total number of records in the data source and hence features which changes row height such as text wrapping are not supported. If you want to increase the row height to accommodate the content then you can specify the row height as below to ensure all the table rows are in same height.

Copyright © 2001 -2024 Syncfusion Inc.

`

.e-treegrid .e-row {

height: 2em;

}

`

- Programmatic selection using the **selectRows** method is not supported in virtual scrolling.
- When virtualization is active in a tree grid, the editCell method is unusable for records outside the currently visible viewport.

Infinite scroll in Vue Treegrid component

Infinite scrolling is used to load a huge amount of data without degrading the TreeGrid performance. This feature works like the lazy loading concept, which means the buffer data is loaded only when the scrollbar reaches the end of the scroller.

To enable Infinite scrolling, set `enableInfiniteScrolling` property as true.

* In this feature, TreeGrid will not make a new data request when you visit the same page again.

APP.VUE

```
<template>
    <div id="app">
        <ejs-treegrid ref='treegrid' :dataSource="virtualData"
:enableInfiniteScrolling='true' :treeColumnIndex='1' childMapping='Crew'
:height=317 :pageSettings='pageSettings'>
            <e-columns>
                <e-column field='TaskID' headerText='Player Jersey'
width='140' textAlign='Right'></e-column>
                <e-column field='FIELD1' headerText='Player Name'
width='140'></e-column>
                <e-column field='FIELD2' headerText='Year' width='105'
textAlign='Right'></e-column>
                <e-column field='FIELD3' headerText='Stint' width='90'
textAlign='Right'></e-column>
                <e-column field='FIELD4' headerText='TMID' width='90'
textAlign='Right'></e-column>
            </e-columns>
        </ejs-treegrid>
    </div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin, InfiniteScroll, TreeGridComponent, Page } from
"@syncfusion/ej2-vue-treegrid";
import { DataManager, JsonAdaptor } from '@syncfusion/ej2-data';
import { ButtonPlugin } from "@syncfusion/ej2-vue-buttons";
import { dataSource, virtualData } from './datasource.js';
Vue.use(TreeGridPlugin);
export default {
  data: function() {
    return {
        virtualData: dataSource(),
```

```
        pageSettings: { pageSize: 50 }
    };
  },
  provide: {
      treegrid: [InfiniteScroll, Page]
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/scroll/virtualscroll-cs1" %}

InitialBlocks

You can define the initial loading pages count by using infiniteScrollSettings.initialBlocks property. By default, this feature loads three pages in initial rendering.

In the below demo, we have changed this property value to load five page records instead of three.

APP.VUE

```
<template>
    <div id="app">
        <ejs-treegrid ref='treegrid' :dataSource="virtualData"
:enableInfiniteScrolling='true' :treeColumnIndex='1' childMapping='Crew'
:height=317 :pageSettings='pageSettings'
:infiniteScrollSettings='infiniteScrollSettings'>
            <e-columns>
                <e-column field='TaskID' headerText='Player Jersey'
width='140' textAlign='Right'></e-column>
                <e-column field='FIELD1' headerText='Player Name'
width='140'></e-column>
                <e-column field='FIELD2' headerText='Year' width='105'
textAlign='Right'></e-column>
                <e-column field='FIELD3' headerText='Stint' width='90'
textAlign='Right'></e-column>
                <e-column field='FIELD4' headerText='TMID' width='90'
textAlign='Right'></e-column>
            </e-columns>
        </ejs-treegrid>
    </div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin, InfiniteScroll, TreeGridComponent, Page } from
"@syncfusion/ej2-vue-treegrid";
import { DataManager, JsonAdaptor } from '@syncfusion/ej2-data';
import { ButtonPlugin } from "@syncfusion/ej2-vue-buttons";
import { dataSource, virtualData } from './datasource.js';
Vue.use(TreeGridPlugin);
export default {
  data: function() {
    return {
        virtualData: dataSource(),
        pageSettings: { pageSize: 50 },
        infiniteScrollSettings : { initialBlocks: 5 }
    };
  },
```

```
  provide: {
      treegrid: [InfiniteScroll, Page]
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/scroll/virtualscroll-cs2" %}

Cache Mode

Cache is used to store the loaded rows object in the TreeGrid instance which can be reused for creating the row elements whenever you scroll to already visited page. Also, this mode maintains row elements based on the infiniteScrollSettings.maxBlocks count value, once this limit exceeds then it will remove row elements from DOM for new rows.

To enable the cache mode in Infinite scrolling, set infiniteScrollSettings.enableCache property as true.

APP.VUE

```
<template>
    <div id="app">
        <ejs-treegrid ref='treegrid' :dataSource="virtualData"
:enableInfiniteScrolling='true' :treeColumnIndex='1' childMapping='Crew'
:height=317 :pageSettings='pageSettings'
:infiniteScrollSettings='infiniteScrollSettings'>
            <e-columns>
                <e-column field='TaskID' headerText='Player Jersey'
width='140' textAlign='Right'></e-column>
                <e-column field='FIELD1' headerText='Player Name'
width='140'></e-column>
                <e-column field='FIELD2' headerText='Year' width='105'
textAlign='Right'></e-column>
                <e-column field='FIELD3' headerText='Stint' width='90'
textAlign='Right'></e-column>
                <e-column field='FIELD4' headerText='TMID' width='90'
textAlign='Right'></e-column>
            </e-columns>
        </ejs-treegrid>
    </div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin, InfiniteScroll, TreeGridComponent, Page } from
"@syncfusion/ej2-vue-treegrid";
import { DataManager, JsonAdaptor } from '@syncfusion/ej2-data';
import { ButtonPlugin } from "@syncfusion/ej2-vue-buttons";
import { dataSource, virtualData } from './datasource.js';
Vue.use(TreeGridPlugin);
export default {
  data: function() {
    return {
        virtualData: dataSource(),
        pageSettings: { pageSize: 50 },
        infiniteScrollSettings: { enableCache: true}
    };
  },
  provide: {
```

```
        treegrid: [InfiniteScroll, Page]
    }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/scroll/virtualscroll-cs3" %}

Limitations for Infinite Scrolling

- Due to the element height limitation in browsers, the maximum number of records loaded by the treegrid is limited due to the browser capability.
- Initial loading rows total height must be greater than the viewport height.
- Cell selection will not be persisted in cache mode.
- Infinite scrolling is not compatible with batch editing, cell editing, detail template and hierarchy features.
- The aggregated information and total group items are displayed based on the current view items. To get these information regardless of the view items, refer to the
- Programmatic selection using the selectRows and selectRow method is not supported in infinite scrolling.

Selection

Selection in Vue Treegrid component

Selection provides an option to highlight a row or cell.

Selection can be done through simple Mouse down or Arrow keys.

To disable selection in the TreeGrid, set the allowSelection to false.

The treegrid supports two types of selection that can be set by using the

selectionSettings.type.They are:

- **Single** - The Single value is set by default. Allows you to select only a single row or cell.
- **Link to the Video** - Allows you to select multiple rows or cells.

To perform the multi-selection, press and hold CTRL key and click the desired rows or cells.

To select range of rows or cells, press and hold the SHIFT key and click the rows or cells.

To get start quickly with selection options, you can check on this video:

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid :dataSource='data' childMapping='subtasks'
:treeColumnIndex='1' :allowPaging='true'
:selectionSettings='selectionOptions'>
            <e-columns>
                <e-column field='taskID' headerText='Task ID' width='90'
textAlign='Right'></e-column>
                <e-column field='taskName' headerText='Task Name'
width='160'></e-column>
```

```
                <e-column field='startDate' headerText='Start Date'
width='90' format="yMd" textAlign='Right'></e-column>
                <e-column field='duration' headerText='Duration' width='80'
textAlign='Right'></e-column>
            </e-columns>
        </ejs-treegrid>
</div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin, Page } from "@syncfusion/ej2-vue-treegrid";
import { sampleData } from "./datasource.js";
Vue.use(TreeGridPlugin);
export default {
  data ()  {
    return {
      data: sampleData,
      pageSettings: { pageSize: 7 },
      selectionOptions: { type: 'Multiple' }
    };
  },
  provide: {
      treegrid: [ Page ]
    }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/selection/default-cs5" %}

Selection mode

TreeGrid supports three types of selection mode which can be set by using

selectionSettings.mode. They are:

- **Row** - The row value is set by default. Allows you to select rows only.
- **Cell** - Allows you to select cells only.
- **Both** - Allows you to select rows and cells at the same time.

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid :dataSource='data' childMapping='subtasks'
:treeColumnIndex='1' :allowPaging='true'
:selectionSettings='selectionOptions' >
            <e-columns>

{% previewsample "page.domainurl/code-snippet/treegrid/selection/default-cs4" %}

If multi selection is enabled, then first click on any selected row (without pressing Ctrl key), it will clear the multi selection and in second click on the same row, it will be unselected.

Check box selection in Vue Treegrid component

Checkbox Selection provides an option to select multiple TreeGrid records with help of checkbox in each row.

To render checkbox in each treegrid row, you need to use checkbox column with type as CheckBox using

column type property.

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid ref='treegrid' :dataSource='data'
childMapping='subtasks' :treeColumnIndex='2'>
            <e-columns>
                <e-column type='checkbox' width='50'></e-column>
                <e-column field='taskID' headerText='Task ID' width='90'
textAlign='Right'></e-column>
                <e-column field='taskName' headerText='Task Name'
width='160'></e-column>
                <e-column field='startDate' headerText='Start Date'
width='90' format="yMd" textAlign='Right'></e-column>
                <e-column field='duration' headerText='Duration' width='80'
textAlign='Right'></e-column>
            </e-columns>
        </ejs-treegrid>
</div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin, TreeGridComponent,  Page } from "@syncfusion/ej2-
vue-treegrid";
import { sampleData } from "./datasource.js";
Vue.use(TreeGridPlugin);
export default {
  data ()  {
```

```
    return {
      data: sampleData,
    };
  },
  provide: {
      treegrid: [ Page ]
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/selection/default-cs2" %}

By default selection is allowed by clicking a treegrid row or checkbox in that row. To allow Selection only through checkbox, you can set

selectionSettings.checkboxOnly property to true.

Selection can be persisted on all the operations

using selectionSettings.persistSelection property.

For persisting selection on the TreeGrid, any one of the column should be defined as a primary key

using columns.isPrimaryKey property.

Checkbox selection mode

In checkbox selection, selection can also be done by clicking on rows. This selection provides two types of Checkbox Selection mode which can be set by using the following API,

selectionSettings.checkboxMode. The modes are;

- **Default**: This is the default value of the checkboxMode. In this mode, user can select multiple rows by clicking rows one by one.
- **ResetOnRowClick**: In ResetOnRowClick mode, when user clicks on a row it will reset previously selected row. Also you can perform multiple-selection in this mode by press and hold CTRL key and click the desired rows. To select range of rows, press and hold the SHIFT key and click the rows.

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid ref='treegrid' :dataSource='data'
childMapping='subtasks' :treeColumnIndex='2'
        :selectionSettings='selectionOptions'>
            <e-columns>
                <e-column type='checkbox' width='50'></e-column>
                <e-column field='taskID' headerText='Task ID' width='90'
textAlign='Right'></e-column>

vue-treegrid";
import { sampleData } from "./datasource.js";
Vue.use(TreeGridPlugin);
export default {
  data ()  {
    return {
      data: sampleData,
      selectionOptions: { checkboxMode: 'ResetOnRowClick'}
    };
  },
  provide: {
      treegrid: [ Page ]
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/selection/default-cs3" %}

Checkbox Selection feature is intended for row selection only; it is not compatible with cell selection mode.

Aggregates

Aggregates in Vue Treegrid component

Aggregate values are displayed in the TreeGrid footer and in parent row footer for child row aggregate values. It can be configured through `aggregates` property. field and type are the minimum properties required to represent an aggregate column.

To use the aggregate feature, you have to inject the `Aggregate` module.

By default, the aggregate value can be displayed in the treegrid footer, and footer of child rows. To show the aggregate value in one of the cells, use the Link to the Video.

To get start quickly with aggregates in Vue tree grid component, you can check on this video:

Built-in aggregate types

The aggregate type should be specified in the type property to configure an aggregate column.

The built-in aggregates are,

- Sum
- Average
- Min
- Max
- Count
- Truecount
- Falsecount

* Multiple aggregates can be used for an aggregate column by setting the type property

Copyright © 2001 -2024 Syncfusion Inc.

with an array of aggregate types.

* Multiple types for a column is supported only when one of the aggregate templates is used.

Child aggregate

Aggregate value is calculated for child rows, and it is displayed in the parent row footer. Use the childSummary property to render the child rows aggregate value.

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid :dataSource="data" childMapping='children'
:treeColumnIndex='1' height='260px'>
            <e-columns>
                <e-column field='FreightID' headerText='Freight ID' width=90
textAlign='Right'></e-column>
                <e-column field='FreightName' headerText='Freight Name'

Footer aggregate in Vue Treegrid component

Footer aggregate value is calculated for all the rows, and it is displayed in the footer cells. Use the footerTemplate property to render the aggregate value in footer cells.

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid :dataSource="data" childMapping='children'
:treeColumnIndex='1' height='260px'>
            <e-columns>
                <e-column field='FreightID' headerText='Freight ID' width=90
textAlign='Right'></e-column>
                <e-column field='FreightName' headerText='Freight Name'
width=180></e-column>
                <e-column field='UnitWeight' headerText='Unit Per Weight'
width=90 type='number' textAlign='Right'></e-column>
                <e-column field='TotalUnits' headerText='Total Units'
type='number' width=80 textAlign='Right'></e-column>
            </e-columns>
              <e-aggregates>
                <e-aggregate :showChildSummary='false'>
                    <e-columns>
                        <e-column type="Max" field="UnitWeight"
:footerTemplate='footerMax'></e-column>
                        <e-column type="Min" field="TotalUnits"
:footerTemplate='footerMin'></e-column>
                    </e-columns>
                </e-aggregate>
          </e-aggregates>
        </ejs-treegrid>
</div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin, Aggregate } from "@syncfusion/ej2-vue-treegrid";
import { summaryRowData } from "./datasource.js";
Vue.use(TreeGridPlugin);
export default {
  data() {
    return {
      data: summaryRowData,
            footerMin: function () {
```

```
        return  { template : Vue.component('minTemplate', {
            template: `<span>Min: {{data.Min}}</span>`,
            data () {return { data: {}};}
            })
          }
      },
      footerMax: function () {
        return  { template : Vue.component('maxTemplate', {
            template: `<span>Max: {{data.Max}}</span>`,
            data () {return { data: {}};}
            })
          }
      }
    };
  },
    provide: {
      treegrid: [Aggregate]
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/aggregates/default-cs2" %}

The aggregate values must be accessed inside the template using their corresponding type name.

How to format aggregate value

You can format the aggregate value result by using the format property.

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid :dataSource="data" childMapping='subtasks'
:treeColumnIndex='1' height='260px'>
            <e-columns>
                <e-column field='category' headerText='Category' width=160

```

{% previewsample "page.domainurl/code-snippet/treegrid/aggregates/default-cs3" %}

Print in Vue Treegrid component

To print the TreeGrid, use the print method from treegrid instance. The print option can be displayed on the toolbar by adding the print toolbar item.

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid :dataSource='data' height='265'
childMapping='subtasks' :treeColumnIndex='1' :toolbar='toolbarOptions'>
            <e-columns>
              <e-column field='taskID' headerText='Task ID' width='90'
textAlign='Right'></e-column>
              <e-column field='taskName' headerText='Task Name'
width='160'></e-column>
              <e-column field='startDate' headerText='Start Date' width='90'
format="yMd" textAlign='Right'></e-column>
              <e-column field='duration' headerText='Duration' width='80'
textAlign='Right'></e-column>
            </e-columns>
        </ejs-treegrid>
</div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin, Toolbar } from "@syncfusion/ej2-vue-treegrid";
import { sampleData } from "./datasource.js";
Vue.use(TreeGridPlugin);
export default {
  data ()  {
    return {
      data: sampleData,
```

```
      toolbarOptions: ['Print']
    };
  },
  provide: {
    treegrid: [ Toolbar ]
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/print/default-cs1" %}

Page setup

Some of the print options cannot be configured through JavaScript code. So, you have to customize the layout, paper size, and margin options using the browser page setup dialog. Please refer to the following links to know more about the browser page setup:

- Chrome
- Firefox
- Safari
- IE

Print using an external button

To print the treegrid from an external button, invoke the print method.

APP.VUE

```
<template>
<div id="app">
        <ejs-button id='print' @click.native='print'>Print</ejs-button>
        <ejs-treegrid ref='treegrid' :dataSource='data' height='265'
childMapping='subtasks' :treeColumnIndex='1'>
            <e-columns>
              <e-column field='taskID' headerText='Task ID' width='90'
textAlign='Right'></e-column>
              <e-column field='taskName' headerText='Task Name'
width='160'></e-column>
              <e-column field='startDate' headerText='Start Date' width='90'
format="yMd" textAlign='Right'></e-column>
              <e-column field='duration' headerText='Duration' width='80'
textAlign='Right'></e-column>
            </e-columns>
        </ejs-treegrid>
</div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin } from "@syncfusion/ej2-vue-treegrid";
import { ButtonPlugin } from "@syncfusion/ej2-vue-buttons";
import { sampleData } from "./datasource.js";
Vue.use(TreeGridPlugin);
Vue.use(ButtonPlugin);
export default {
  data ()  {
    return {
```

Copyright © 2001 -2024 Syncfusion Inc.

```
      data: sampleData,
    };
  },
  methods: {
    print: function() {
        this.$refs.treegrid.print();
    }
  },
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/print/default-cs2" %}

Print visible Page

By default, the grid prints all the pages. To print the current page alone, set the printMode to CurrentPage.

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid :dataSource='data' printMode='CurrentPage'
childMapping='subtasks' :treeColumnIndex='1' :toolbar='toolbarOptions'
:allowPaging='true' :pageSettings='pageSettings'>
            <e-columns>
              <e-column field='taskID' headerText='Task ID' width='90'
textAlign='Right'></e-column>
              <e-column field='taskName' headerText='Task Name'
width='160'></e-column>
              <e-column field='startDate' headerText='Start Date' width='90'
format="yMd" textAlign='Right'></e-column>
              <e-column field='duration' headerText='Duration' width='80'
textAlign='Right'></e-column>
            </e-columns>
        </ejs-treegrid>
</div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin, Page, Toolbar } from "@syncfusion/ej2-vue-
treegrid";
import { sampleData } from "./datasource.js";
Vue.use(TreeGridPlugin);
export default {
  data ()  {
    return {
      data: sampleData,
      toolbarOptions: ['Print'],
      pageSettings: { pageSize: 8 },
    };
  },
  provide: {
    treegrid: [ Page, Toolbar ]
  }
}
</script>
```

Copyright © 2001 -2024 Syncfusion Inc.

{% previewsample "page.domainurl/code-snippet/treegrid/print/default-cs3" %}

Print large number of columns

By default, the browser uses A4 as page size option to print pages and to adapt the size of the page the browser print preview will auto-hide the overflowed contents. Hence treegrid with large number of columns will cut off to adapt the print page.

To show large number of columns when printing, adjust the scale option from print option panel based on your content size.

Show or Hide columns while Printing

You can show a hidden column or hide a visible column while printing the treegrid using toolbarClick and printComplete events.

In the toolbarClick event, based on args.item.text as Print. We can show or hide columns by setting column.visible property to true or false respectively.

In the printComplete event, We have reversed the state back to the previous state.

In the below example, we have Duration as a hidden column in the treegrid. While printing, we have changed Duration to visible column and StartDate as hidden column.

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid ref='treegrid' :dataSource='data'
printMode='CurrentPage' childMapping='subtasks' :treeColumnIndex='1'
:toolbar='toolbarOptions' :toolbarClick='toolbarClick'
:printComplete='printComplete'>
            <e-columns>
              <e-column field='taskID' headerText='Task ID' width='90'
textAlign='Right'></e-column>
```

```
                <e-column field='taskName' headerText='Task Name'
width='160'></e-column>
                <e-column field='startDate' headerText='Start Date' width='90'
format="yMd" textAlign='Right'></e-column>
                <e-column field='duration' headerText='Duration' width='80'

{% previewsample "page.domainurl/code-snippet/treegrid/print/default-cs4" %}

Limitations of Printing Large Data

When treegrid contains large number of data, printing all the data at once is not a best option for the browser performance. Because to render all the DOM elements in one page will produce performance issues in the browser. It leads to browser slow down or browser hang.

If printing of all the data is still needed, we suggest to Export the treegrid to Excel or CSV or Pdf and then print it from another non-web based application.

Adaptive in Vue Treegrid component

The TreeGrid user interface (UI) was redesigned to provide an optimal viewing experience and improve usability on small screens. This interface will render the filter, sort, and edit dialogs adaptively.

Render adaptive dialogs

When you enable the enableAdaptiveUI property, the tree grid will render the filter, sort, and edit dialogs in full screen for a better user experience. The following demo demonstrates this behaviour.

APP.VUE

```
<template>
    <div id="app">
    <div class="e-bigger e-adaptive-demo">
    <div class="e-mobile-layout">
        <div class="e-mobile-content">
            <ejs-treegrid ref='treegrid' id='adaptivebrowser'
:dataSource='data' childMapping='subtasks' :treeColumnIndex='1'
height='100%' :enableAdaptiveUI='true' :allowPaging='true'
:allowSorting='true' :allowFiltering='true' :editSettings='editSettings'
:toolbar='toolbar' :filterSettings='filterSettings' :load='load'>
                <e-columns>
                    <e-column field='taskID' headerText='Task ID'

Loading animation in Vue Treegrid component

The Tree Grid displays a loading indicator while the data is being fetched and bound to the tree grid during initial rendering, refreshing, and after performing any tree grid actions like sorting, filtering, and more.

The tree grid supports two indicator types, which can be enabled by setting the `loadingIndicator.indicatorType` property to Spinner or Shimmer. The default value of the indicator type is Spinner.

In the following sample, the Shimmer indicator is displayed while the tree grid is loading and refreshing when using the remote data.

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid :dataSource="data" idMapping='TaskID'
parentIdMapping='ParentItem' hasChildMapping='isParent' :treeColumnIndex='1'

State Persistence

State persistence in Vue Treegrid component

State persistence refers to the TreeGrid's state maintained in the browser's localStorage even if the browser is refreshed or if you move to the next page within the browser.

State persistence stores treegrid's model object in the local storage when the enablePersistence is defined as true.

Get or set local storage value in Vue Treegrid component

If the enablePersistence property is set to true, the treegrid property value is saved in the window.localStorage for reference. You can get/set the localStorage value by using the getItem/setItem method in the window.localStorage.

`ts

//get the TreeGrid model.

let value: string = window.localStorage.getItem('treegridTreeGrid'); //"treegridTreeGrid" is component name + component id.

let model: Object = JSON.parse(model);

`

`ts

//set the TreeGrid model.

Copyright © 2001 -2024 Syncfusion Inc.

window.localStorage.setItem('treegridTreeGrid', JSON.stringify(model)); //"treegridTreeGrid" is component name + component id.

`

Tool Bar

Tool bar in Vue Treegrid component

The TreeGrid provides ToolBar support to handle treegrid actions. The toolbar

property accepts either the collection of built-in toolbar items and ItemModelobjects for custom toolbar items or HTML element ID for toolbar template.

To use ToolBar, inject Toolbar module in the treegrid.

Enable/disable toolbar items

You can enable/disable toolbar items by using the enableItems method.

APP.VUE

```
<template>
<div id="app">
      <ejs-button id='enable' cssClass='e-flat'
@click.native='enable'>Enable</ejs-button>
      <ejs-button id='disable' cssClass='e-flat'

Tool bar items in Vue Treegrid component

Built-in toolbar items

The following table shows built-in toolbar items and its actions.

Built-in Toolbar Items	Actions
ExpandAll	Expands all the rows.
CollapseAll	Collapses all the rows.
Add	Adds a new record.
Edit	Edits the selected record.
Update	Updates the edited record.
Delete	Deletes the selected record.
Cancel	Cancels the edit state.
Search	Searches the records by the given key.
Print	Prints the treegrid.
ExcelExport	Exports the treegrid to Excel.
PdfExport	Exports the treegrid to PDF.

Copyright © 2001 -2024 Syncfusion Inc.

| WordExport | Exports the treegrid to Word.|

| Indent | Indents the record to one level of hierarchy.|

| Outdent | Outdents the record to one level of hierarchy.|

APP.VUE

```

* The toolbar has options to define both built-in and custom toolbar items.

Custom toolbar items

Custom toolbar items can be added by defining the toolbar as a collection of

ItemModels. Actions for this customized toolbar items are defined in the toolbarClick event.

By default, Custom toolbar items are in position Left. You can change the position by using the align property. In the below sample, we have applied position Right for the Quick Filter toolbar item.

Pdf Export

Pdf export in Vue Treegrid component

PDF export allows exporting TreeGrid data to PDF document. You need to use the pdfExport method for exporting. To enable PDF export in the treegrid, set the allowPdfExport as true.

To use PDF export, inject the Link to the Video module in treegrid.

To get start quickly with Pdf export feature, you can check on this video:

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid ref='treegrid' :dataSource='data' height='220'
childMapping='subtasks' :treeColumnIndex='1' :allowPaging='true'
:pageSettings='pageSettings' :allowPdfExport='true'
:toolbar='toolbarOptions' :toolbarClick='toolbarClick'>
            <e-columns>
                <e-column field='taskID' headerText='Task ID' width='90'
textAlign='Right'></e-column>
                <e-column field='taskName' headerText='Task Name'
width='160'></e-column>
                <e-column field='startDate' headerText='Start Date'
width='90' format="yMd" textAlign='Right'></e-column>
                <e-column field='duration' headerText='Duration' width='80'
textAlign='Right'></e-column>
            </e-columns>

                <e-column field='taskName' headerText='Task Name'
width='160'></e-column>
                <e-column field='startDate' headerText='Start Date'
width='90' format="yMd" textAlign='Right'></e-column>
                <e-column field='duration' headerText='Duration'
:visible='false' width='80' textAlign='Right'></e-column>
            </e-columns>
        </ejs-treegrid>
</div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin, Page, Toolbar, PdfExport } from "@syncfusion/ej2-
vue-treegrid";
import { sampleData } from "./datasource.js";
Vue.use(TreeGridPlugin);
export default {
  data ()  {
    return {
      data: sampleData,
      toolbarOptions: ['PdfExport'],
      pageSettings: { pageSize: 7 }
    };
  },
  methods: {
      toolbarClick(args) {
        if (args['item'].text === 'PDF Export') {
          let pdfExportProperties = {
            includeHiddenColumn: true
          }
          this.$refs.treegrid.pdfExport(pdfExportProperties);
        }
    }
  },
  provide: {
      treegrid: [ Page, Toolbar, PdfExport ]
```

```
    }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/pdf/default-cs4" %}

Show or hide columns on exported PDF

You can show a hidden column or hide a visible column while exporting the treegrid using toolbarClick and pdfExportComplete events.

In the toolbarClick event, based on args.item.text as PDF Export. We can show or hide columns by setting column.visible property to true or false respectively.

In the pdfExportComplete event, We have reversed the state back to the previous state.

In the below example, we have Duration as a hidden column in the treegrid. While exporting, we have changed Duration to visible column and StartDate as hidden column.

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid ref='treegrid' :dataSource='data' height='220'
childMapping='subtasks' :treeColumnIndex='1' :allowPaging='true'
:pageSettings='pageSettings' :allowPdfExport='true'
:toolbar='toolbarOptions' :toolbarClick='toolbarClick'
:pdfExportComplete='pdfExportComplete'>
            <e-columns>
                <e-column field='taskID' headerText='Task ID' width='90'
textAlign='Right'></e-column>
                <e-column field='taskName' headerText='Task Name'
width='160'></e-column>
                <e-column field='startDate' headerText='Start Date'
width='90' format="yMd" textAlign='Right'></e-column>
                <e-column field='duration' headerText='Duration' width='80'
:visible='false' textAlign='Right'></e-column>
            </e-columns>
        </ejs-treegrid>
</div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin, Page, Toolbar, PdfExport } from "@syncfusion/ej2-
vue-treegrid";
import { sampleData } from "./datasource.js";
Vue.use(TreeGridPlugin);
export default {
  data ()  {
    return {
      data: sampleData,
      toolbarOptions: ['PdfExport'],
      pageSettings: { pageSize: 7 }
    };
  },
  methods: {
      toolbarClick(args) {
```

```
        if (args['item'].text === 'PDF Export') {
          this.$refs.treegrid.ej2Instances.grid.getColumns()[2].visible =

To customize PDF export

PDF export provides an option to customize mapping of treegrid to exported PDF document.

File name for exported document

You can assign the file name for the exported document by defining `fileName` property in `PdfExportProperties`.

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid ref='treegrid' :dataSource='data' height='220'
childMapping='subtasks' :treeColumnIndex='1' :allowPaging='true'
:pageSettings='pageSettings' :allowPdfExport='true'
:toolbar='toolbarOptions' :toolbarClick='toolbarClick'>
            <e-columns>
                <e-column field='taskID' headerText='Task ID' width='90'
textAlign='Right'></e-column>
                <e-column field='taskName' headerText='Task Name'
width='160'></e-column>
                <e-column field='startDate' headerText='Start Date'
width='90' format="yMd" textAlign='Right'></e-column>
                <e-column field='duration' headerText='Duration' width='80'
textAlign='Right'></e-column>
            </e-columns>
        </ejs-treegrid>
</div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin, Page, Toolbar, PdfExport } from "@syncfusion/ej2-
vue-treegrid";
import { sampleData } from "./datasource.js";
Vue.use(TreeGridPlugin);
export default {
  data ()  {
    return {
      data: sampleData,
      toolbarOptions: ['PdfExport'],
      pageSettings: { pageSize: 7 }
    };
  },
  methods: {
      toolbarClick(args) {
        if (args['item'].text === 'PDF Export') {
          let pdfExportProperties = {
            fileName:"new.xlsx"
          }
          this.$refs.treegrid.pdfExport(pdfExportProperties);
        }
    }
  },
  provide: {
```

```
      treegrid: [ Page, Toolbar, PdfExport ]
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/pdf/default-cs8" %}

Default fonts for PDF exporting

By default, treegrid uses Helvetica font in the exported document. You can change the default font by using pdfExportProperties.theme property. The available default fonts are,

- Helvetica
- TimesRoman
- Courier
- Symbol
- ZapfDingbats

The code example for changing default font,

`ts

import { PdfStandardFont, PdfFontFamily, PdfFontStyle } from '@syncfusion/ej2-pdf-export';

...

let pdfExportProperties: PdfExportProperties = {

theme: {

header: {font: new PdfStandardFont(PdfFontFamily.TimesRoman, 11, PdfFontStyle.Bold),

record: { font: new PdfStandardFont(PdfFontFamily.TimesRoman, 10) }

}

};

`

Add custom font for PDF exporting

You can change the default font of TreeGrid header, content and caption cells in the exported document by using pdfExportProperties.theme property.

In the following example, we have used Advent Pro font to export the treegrid with Hungarian fonts.

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid ref='treegrid' :dataSource='data' height='220'
childMapping='subtasks' :treeColumnIndex='1' :allowPaging='true'
:pageSettings='pageSettings' :allowPdfExport='true'
:toolbar='toolbarOptions' :toolbarClick='toolbarClick'>
            <e-columns>
                <e-column field='taskID' headerText='Task ID' width='90'
textAlign='Right'></e-column>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
                <e-column field='taskName' headerText='Task Name'
width='160'></e-column>
                <e-column field='startDate' headerText='Start Date'
width='90' format="yMd" textAlign='Right'></e-column>
                <e-column field='duration' headerText='Duration' width='80'
textAlign='Right'></e-column>
            </e-columns>
        </ejs-treegrid>
</div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin, Page, Toolbar, PdfExport } from "@syncfusion/ej2-
vue-treegrid";
import { sampleData, adventProFont } from "./datasource.js";
import { PdfTrueTypeFont } from '@syncfusion/ej2-pdf-export';
Vue.use(TreeGridPlugin);
export default {
  data ()  {
    return {
      data: sampleData,
      toolbarOptions: ['PdfExport'],
      pageSettings: { pageSize: 7 }
    };
  },
  methods: {
      toolbarClick(args) {
        if (args['item'].text === 'PDF Export') {
          let pdfExportProperties = {
            theme: {
                header: {font:  new PdfTrueTypeFont(adventProFont, 12) },
                record: { font: new PdfTrueTypeFont(adventProFont, 9) }
            }
          }
          this.$refs.treegrid.pdfExport(pdfExportProperties);
        }
    }
  },
  provide: {
      treegrid: [ Page, Toolbar, PdfExport ]
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/pdf/default-cs9" %}

PdfTrueTypeFont accepts base 64 format of the Custom Font.

Pdf cell style customization in Vue Treegrid component

Conditional cell formatting

TreeGrid cells in the exported PDF can be customized or formatted using pdfQueryCellInfo event. In this event, we can format the treegrid cells of exported PDF document based on the column cell value.

In the below sample, we have set the background color for Duration column in the exported document by args.cell and backgroundColor property.

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid ref='treegrid' :dataSource='data' height='220'
childMapping='subtasks' :treeColumnIndex='1' :allowPaging='true'
:pageSettings='pageSettings' :allowPdfExport='true'
:toolbar='toolbarOptions' :toolbarClick='toolbarClick'
:queryCellInfo='queryCellInfo'
        :pdfQueryCellInfo='pdfQueryCellInfo'>
            <e-columns>
                <e-column field='taskID' headerText='Task ID' width='90'
textAlign='Right'></e-column>
                <e-column field='taskName' headerText='Task Name'
width='160'></e-column>
                <e-column field='startDate' headerText='Start Date'
width='90' format="yMd" textAlign='Right'></e-column>
                <e-column field='duration' headerText='Duration' width='80'
textAlign='Right'></e-column>
            </e-columns>
        </ejs-treegrid>
</div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin, Page, Toolbar, PdfExport } from "@syncfusion/ej2-
vue-treegrid";
import { sampleData } from "./datasource.js";
Vue.use(TreeGridPlugin);
export default {
  data ()  {
    return {
      data: sampleData,
      toolbarOptions: ['PdfExport'],
      pageSettings: { pageSize: 7 }
    };
  },
  methods: {
      toolbarClick(args) {
        if (args['item'].text === 'PDF Export') {
          this.$refs.treegrid.pdfExport();
        }
      }
      pdfQueryCellInfo(args) {
        if(args.column.field == 'duration'){
          if(+args.value === 0 || args.value === "") {
            args.style = {backgroundColor: '#336c12'};
          }
          else if(args.value < 3) {
            args.style = {backgroundColor: '#7b2b1d'};
          }
        }
      }
      queryCellInfo(args) {
        if (args.data['duration'] == 0 && args.column.field === 'duration' )
{
            args.cell.style.background= '#336c12';
```

Copyright © 2001 -2024 Syncfusion Inc.

```
        } else if (args.data['duration'] < 3 && args.column.field ===
'duration') {
            args.cell.style.background= '#7b2b1d';
        }
      }
  },
  provide: {
      treegrid: [ Page, Toolbar, PdfExport ]
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/pdf/default-cs2" %}

Theme

PDF export provides an option to include theme for exported PDF document.

To apply theme in exported PDF, define the theme in exportProperties.

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid ref='treegrid' :dataSource='data' height='220'
childMapping='subtasks' :treeColumnIndex='1' :allowPaging='true'
:pageSettings='pageSettings' :allowPdfExport='true'
:toolbar='toolbarOptions' :toolbarClick='toolbarClick'>
            <e-columns>
                <e-column field='taskID' headerText='Task ID' width='90'
textAlign='Right'></e-column>
                <e-column field='taskName' headerText='Task Name'
width='160'></e-column>
                <e-column field='startDate' headerText='Start Date'
width='90' format="yMd" textAlign='Right'></e-column>
                <e-column field='duration' headerText='Duration' width='80'
textAlign='Right'></e-column>
            </e-columns>
        </ejs-treegrid>
</div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin, Page, Toolbar, PdfExport } from "@syncfusion/ej2-
vue-treegrid";
import { sampleData } from "./datasource.js";
Vue.use(TreeGridPlugin);
export default {
  data ()  {
    return {
      data: sampleData,
      toolbarOptions: ['PdfExport'],
      pageSettings: { pageSize: 7 }
    };
  },
  methods: {
      toolbarClick(args) {
        if (args['item'].text === 'PDF Export') {
```

```
            let pdfExportProperties = {
              theme: {
                  header: {
                      fontColor: '#64FA50', fontName: 'Calibri', fontSize: 17,
bold: true, borders: { color: '#64FA50', lineStyle: 'Thin' }
                  },
                  record: {
                      fontColor: '#64FA50', fontName: 'Calibri', fontSize: 17,
bold: true
                  }
              }
            }
            this.$refs.treegrid.pdfExport(pdfExportProperties);
          }
        }
    },
    provide: {
        treegrid: [ Page, Toolbar, PdfExport ]
    }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/pdf/default-cs3" %}

By default, material theme is applied to exported PDF document.

Adding header and footer in Vue Treegrid component

You can customize text, page number, line, page size and changing orientation in header and footer.

How to write a text in header or footer

You can add text either in Header or Footer of exported PDF document.

`ts

let exportProperties: PdfExportProperties = {

header: {

fromTop: 0,

height: 130,

contents: [

{

type: 'Text',

value: "Task Details",

position: { x: 0, y: 50 },

style: { textBrushColor: '#000000', fontSize: 13 }

},

]

}

`

How to draw a line in header or footer

You can add line either in Header or Footer of the exported PDF document.

Supported line styles:

- dash
- dot
- dashdot
- dashdotdot
- solid

`ts

let exportProperties: PdfExportProperties = {

header: {

fromTop: 0,

height: 130,

contents: [

{

type: 'Line',

style: { penColor: '#000080', penSize: 2, dashStyle: 'Solid' },

points: { x1: 0, y1: 4, x2: 685, y2: 4 }

}

]

}

}

`

Add page number in header or footer

you can add page number either in Header or Footer of exported PDF document.

Supported page number types:

- LowerLatin - a, b, c,
- UpperLatin - A, B, C,
- LowerRoman - i, ii, iii,
- UpperRoman - I, II, III,
- Number - 1,2,3.

`ts

let exportProperties: PdfExportProperties = {

header: {

Copyright © 2001 -2024 Syncfusion Inc.

```
fromTop: 0,
height: 130,
contents: [
{
type: 'PageNumber',
pageNumberType: 'Arabic',
format: 'Page {$current} of {$total}', //optional
position: { x: 0, y: 25 },
style: { textBrushColor: '#ffff80', fontSize: 15, hAlign: 'Center' }
}
]
}
}
```

Insert an image in header or footer

Image (Base64 string) can be added in the exported document in header/footer using the exportProperties.

```ts
let exportProperties: PdfExportProperties = {
header: {
fromTop: 0,
height: 130,
contents: [
{
type: 'Image',
src: image,
position: { x: 40, y: 10 },
size: { height: 100, width: 250 },
}
]
}
}
```

The below code illustrates the pdf export customization.

Exporting tree grid in server in Vue Tree Grid component

The Tree Grid have an option to export the data to PDF in server side using tree grid server export library.

Server dependencies

The Server side export functionality is shipped in the Syncfusion.EJ2.TreeGridExport package, which is available in Essential Studio and nuget.org. The following list of dependencies is required for tree grid server side PDF exporting action.

- Syncfusion.EJ2
- Syncfusion.EJ2.TreeGridExport

Server configuration

The following code snippet shows server configuration using ASP.NET Core Controller Action.

To Export the tree grid in server side, You need to call the serverPdfExport method for passing the tree grid properties to server exporting action.

`ts

public IActionResult ServerSideExporting()

{

var order = TreeData.GetDefaultData();

ViewBag.dataSource = order;

return View();

}

public IActionResult PdfExport(string treeGridModel)

{

```
if (treeGridModel == null)
{
return View();
}
TreeGridPdfExport exp = new TreeGridpdfExport();
Syncfusion.EJ2.TreeGrid.TreeGrid gridProperty = ConvertTreeGridObject(treeGridModel);
return exp.ExportToPdf<TreeData>(gridProperty, TreeData.GetDefaultData());
}
private Syncfusion.EJ2.TreeGrid.TreeGrid ConvertTreeGridObject(string gridProperty)
{
Syncfusion.EJ2.TreeGrid.TreeGrid TreeGridModel =
(Syncfusion.EJ2.TreeGrid.TreeGrid)Newtonsoft.Json.JsonConvert.DeserializeObject(gridProperty,
typeof(Syncfusion.EJ2.TreeGrid.TreeGrid));
TreeGridColumnModel cols =
(TreeGridColumnModel)Newtonsoft.Json.JsonConvert.DeserializeObject(gridProperty,
typeof(TreeGridColumnModel));
TreeGridModel.Columns = cols.columns;
return TreeGridModel;
}
public class TreeGridColumnModel
{
public List<TreeGridColumn> columns { get; set; }
}
`
```

```
`ts
<template>
<div id="app">
<ejs-treegrid ref='treegrid' :dataSource='data' height='220' childMapping='subtasks'
:treeColumnIndex='1' :allowPdfExport='true' :toolbar='toolbarOptions' :toolbarClick='toolbarClick'>
<e-columns>
<e-column field='taskID' headerText='Task ID' width='90' textAlign='Right'></e-column>
<e-column field='taskName' headerText='Task Name' width='160'></e-column>
<e-column field='startDate' headerText='Start Date' width='90' format="yMd" textAlign='Right'></e-
column>
<e-column field='duration' headerText='Duration' width='80' textAlign='Right'></e-column>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
</e-columns>
</ejs-treegrid>
</div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin, Page, Toolbar, PdfExport } from "@syncfusion/ej2-vue-treegrid";
import { sampleData } from "./datasource.js";
Vue.use(TreeGridPlugin);
export default {
data ()  {
return {
data: sampleData,
toolbarOptions: ['PdfExport'],
};
},
methods: {
toolbarClick(args) {
if (args['item'].text === 'Pdf Export') {
this.$refs.treegrid.serverExcelExport('Home/PdfExport');
}
}
},
provide: {
treegrid: [ Page, Toolbar, PdfExport ]
}
}
</script>
`
```

Rotate a header text to a certain degree in the exported tree grid on the server side

The Tree Grid has support to customize the column header styles such as changing text orientation, the font color, and so on in the exported PDF file. To achieve this requirement, define the BeginCellLayout event of the PdfExportProperties with an event handler to perform the required action.

Copyright © 2001 -2024 Syncfusion Inc.

The PdfHeaderCellRendering will be triggered when creating a column header for the pdf document to be exported. Collect the column header details in this event and handle the custom in the BeginCellLayout event handler.

In the following demo, the DrawString method from the Graphics is used to rotate the header text of the column header inside the BeginCellLayout event handler.

A PDF exporting is not supported to rotate the column header on the client side.

`ts

```
public IActionResult PdfExport(string treeGridModel)
{
if (treeGridModel == null)
{
return View();
}
TreeGridPdfExport exp = new TreeGridPdfExport();
TreeGrid gridProperty = ConvertTreeGridObject(treeGridModel);
gridProperty.PdfHeaderCellRendering = PdfHeaderQueryCellInfo;
PdfGrid grid = new PdfGrid();
Syncfusion.EJ2.TreeGridExport.PdfExportProperties pdfExportProperties = new
Syncfusion.EJ2.TreeGridExport.PdfExportProperties();
pdfExportProperties.IsRepeatHeader = true;
exp.BeginCellLayout = new PdfGridBeginCellLayoutEventHandler(BeginCellEvent);
System.Collections.IEnumerable data = Syncfusion.EJ2.Base.Dat.DataTableToJson(ViewBag.dataSource);
var result = exp.PdfExport<dynamic>(gridProperty, data, pdfExportProperties);
return View();
}
public void BeginCellEvent(object sender, PdfGridBeginCellLayoutEventArgs args)
{
PdfGrid grid = (PdfGrid)sender;
var brush = new PdfSolidBrush(new PdfColor(Color.DimGray));
args.Graphics.Save();
args.Graphics.TranslateTransform(args.Bounds.X + 50, args.Bounds.Height + 40); // give the value for
bounds x and Y by the user
args.Graphics.RotateTransform(-60);   // give the rotate degree value by the user
// Draw the text at particular bounds.
```

Copyright © 2001 -2024 Syncfusion Inc.

```
args.Graphics.DrawString(headerValues[args.CellIndex], new PdfStandardFont(PdfFontFamily.Helvetica, 10), brush, new PointF(0, 0));

if (args.IsHeaderRow)

{

grid.Headers[0].Cells[args.CellIndex].Value = string.Empty;

}

args.Graphics.Restore();

}

private void PdfHeaderQueryCellInfo(object pdf)

{

Syncfusion.EJ2.TreeGridExport.PdfHeaderCellEventArgs name = (Syncfusion.EJ2.TreeGridExport.PdfHeaderCellEventArgs)pdf;

PdfGrid grid = new PdfGrid();

headerValues.Add(name.Column.HeaderText);

var longestString = headerValues.Where(s => s.Length == headerValues.Max(m => m.Length)).First();

PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 6);

SizeF size = font.MeasureString(longestString);

name.Headers[0].Height = size.Width * 2;

}
`
```

Excel Export

Excel export in Vue Treegrid component

The excel export allows exporting TreeGrid data to Excel document. You need to use the excelExport method for exporting. To enable Excel export in the treegrid, set the allowExcelExport as true.

To use excel export, You need to inject the Link to the Video module in treegrid.

To get start quickly with excel export feature, you can check on this video:

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid ref='treegrid' :dataSource='data' height='220' childMapping='subtasks' :treeColumnIndex='1' :allowPaging='true' :pageSettings='pageSettings' :allowExcelExport='true' :toolbar='toolbarOptions' :toolbarClick='toolbarClick'>
            <e-columns>
                <e-column field='taskID' headerText='Task ID' width='90' textAlign='Right'></e-column>
                <e-column field='taskName' headerText='Task Name' width='160'></e-column>
```

```
                <e-column field='startDate' headerText='Start Date'
width='90' format="yMd" textAlign='Right'></e-column>
                <e-column field='duration' headerText='Duration' width='80'
textAlign='Right'></e-column>
            </e-columns>
        </ejs-treegrid>
</div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin, Page, Toolbar, ExcelExport } from "@syncfusion/ej2-
vue-treegrid";
import { sampleData } from "./datasource.js";
Vue.use(TreeGridPlugin);
export default {
  data ()  {
    return {
      data: sampleData,
      toolbarOptions: ['ExcelExport'],
      pageSettings: { pageSize: 7 }
    };
  },
  methods: {
      toolbarClick(args) {
        if (args['item'].text === 'Excel Export') {
            this.$refs.treegrid.excelExport();
        }
    }
  },
  provide: {
      treegrid: [ Page, Toolbar, ExcelExport ]
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/excel/default-cs8" %}

Custom data source

The excel export provides an option to define datasource dynamically before exporting. To export data dynamically, define the dataSource in exportProperties.

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid ref='treegrid' :dataSource='data' height='220'
childMapping='subtasks' :treeColumnIndex='1' :allowPaging='true'
:pageSettings='pageSettings' :allowExcelExport='true'
:toolbar='toolbarOptions' :toolbarClick='toolbarClick'>
            <e-columns>
                <e-column field='taskID' headerText='Task ID' width='90'
textAlign='Right'></e-column>
                <e-column field='taskName' headerText='Task Name'
width='160'></e-column>
                <e-column field='startDate' headerText='Start Date'
width='90' format="yMd" textAlign='Right'></e-column>
```

```
                <e-column field='duration' headerText='Duration' width='80'
textAlign='Right'></e-column>
            </e-columns>
        </ejs-treegrid>
</div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin, Page, Toolbar, ExcelExport } from "@syncfusion/ej2-
vue-treegrid";
import { sampleData } from "./datasource.js";
Vue.use(TreeGridPlugin);
export default {
  data ()  {
    return {
      data: sampleData,
      toolbarOptions: ['ExcelExport'],
      pageSettings: { pageSize: 7 }
    };
  },
  methods: {
      toolbarClick(args) {
        if (args['item'].text === 'Excel Export') {
          let excelExportProperties = {
            dataSource: sampleData
          }
          this.$refs.treegrid.excelExport(excelExportProperties);
        }
    }
  },
  provide: {
      treegrid: [ Page, Toolbar, ExcelExport ]
  }
}
</script>
```

Excel export options in Vue Treegrid component

To customize excel export

The excel export provides an option to customize mapping of the treegrid to excel document.

Export hidden columns

The excel export provides an option to export hidden columns of treegrid by defining `includeHiddenColumn` as `true`.

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid ref='treegrid' :dataSource='data' height='220'
childMapping='subtasks' :treeColumnIndex='1' :allowPaging='true'
:pageSettings='pageSettings' :allowExcelExport='true'
:toolbar='toolbarOptions' :toolbarClick='toolbarClick'>
            <e-columns>
```

```
                <e-column field='taskID' headerText='Task ID' width='90'
textAlign='Right'></e-column>
                <e-column field='taskName' headerText='Task Name'
width='160'></e-column>
                <e-column field='startDate' headerText='Start Date'
width='90' format="yMd" textAlign='Right'></e-column>
                <e-column field='duration' headerText='Duration' width='80'
:visible='false' textAlign='Right'></e-column>
            </e-columns>
        </ejs-treegrid>
</div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin, Page, Toolbar, ExcelExport } from "@syncfusion/ej2-
vue-treegrid";
import { sampleData } from "./datasource.js";
Vue.use(TreeGridPlugin);
export default {
  data ()  {
    return {
      data: sampleData,
      toolbarOptions: ['ExcelExport'],
      pageSettings: { pageSize: 7 }
    };
  },
  methods: {
      toolbarClick(args) {
        if (args['item'].text === 'Excel Export') {
          let excelExportProperties = {
            includeHiddenColumn: true
          }
          this.$refs.treegrid.excelExport(excelExportProperties);
        }
    }
  },
  provide: {
      treegrid: [ Page, Toolbar, ExcelExport ]
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/excel/default-cs4" %}

Show or hide columns on exported excel

You can show a hidden column or hide a visible column while printing the treegrid using toolbarClick and excelExportComplete events.

In the toolbarClick event, based on args.item.text as Excel Export. We can show or hide columns by setting column.visible property to true or false respectively.

In the excelExportComplete event, We have reversed the state back to the previous state.

In the below example, we have Duration as a hidden column in the treegrid. While exporting, we have changed Duration to visible column and StartDate as hidden column.

Excel cell style customization in Vue Treegrid component

Conditional cell formatting

TreeGrid cells in the exported Excel can be customized or formatted using excelQueryCellInfo event. In this event, we can format the treegrid cells of exported PDF document based on the column cell value.

In the below sample, we have set the background color for Duration column in the exported excel by args.cell and backgroundColor property.

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid ref='treegrid' :dataSource='data' height='220'
childMapping='subtasks' :treeColumnIndex='1' :allowPaging='true'
:pageSettings='pageSettings' :allowExcelExport='true'
:toolbar='toolbarOptions' :toolbarClick='toolbarClick'
:queryCellInfo='queryCellInfo'
        :excelQueryCellInfo='excelQueryCellInfo'>
            <e-columns>
                <e-column field='taskID' headerText='Task ID' width='90'
textAlign='Right'></e-column>
                <e-column field='taskName' headerText='Task Name'
width='160'></e-column>
                <e-column field='startDate' headerText='Start Date'
width='90' format="yMd" textAlign='Right'></e-column>
                <e-column field='duration' headerText='Duration' width='80'
textAlign='Right'></e-column>
            </e-columns>
        </ejs-treegrid>
</div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin, Page, Toolbar, ExcelExport } from "@syncfusion/ej2-
vue-treegrid";
import { sampleData } from "./datasource.js";
Vue.use(TreeGridPlugin);
export default {
  data ()  {
    return {
      data: sampleData,
      toolbarOptions: ['ExcelExport'],
      pageSettings: { pageSize: 7 }
    };
  },
  methods: {
      toolbarClick(args) {
        if (args['item'].text === 'Excel Export') {
          this.$refs.treegrid.excelExport();
        }
```

```
      }
      excelQueryCellInfo(args) {
        if(args.column.field == 'duration'){
          if(args.value === 0 || args.value === "") {
            args.style = {backColor: '#336c12'};
          }
          else if(args.value < 3) {
            args.style = {backColor: '#7b2b1d'};
          }
        }
      }
      queryCellInfo(args) {
        if (args.data['duration'] == 0 && args.column.field === 'duration' )
{
            args.cell.style.background= '#336c12';
        } else if (args.data['duration'] < 3 && args.column.field ===
'duration') {
            args.cell.style.background= '#7b2b1d';
        }
      }
  },
  provide: {
      treegrid: [ Page, Toolbar, ExcelExport ]
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/excel/default-cs2" %}

Theme

The excel export provides an option to include theme for exported excel document.

To apply theme in exported Excel, define the theme in exportProperties.

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid ref='treegrid' :dataSource='data' height='220'
childMapping='subtasks' :treeColumnIndex='1' :allowPaging='true'
:pageSettings='pageSettings' :allowExcelExport='true'
:toolbar='toolbarOptions' :toolbarClick='toolbarClick'>
            <e-columns>
                <e-column field='taskID' headerText='Task ID' width='90'
textAlign='Right'></e-column>
                <e-column field='taskName' headerText='Task Name'
width='160'></e-column>
                <e-column field='startDate' headerText='Start Date'
width='90' format="yMd" textAlign='Right'></e-column>
                <e-column field='duration' headerText='Duration' width='80'
textAlign='Right'></e-column>
            </e-columns>
        </ejs-treegrid>
</div>
</template>
<script>
import Vue from "vue";
```

```
import { TreeGridPlugin, Page, Toolbar, ExcelExport } from "@syncfusion/ej2-vue-treegrid";
import { sampleData } from "./datasource.js";
Vue.use(TreeGridPlugin);
export default {
  data ()  {
    return {
      data: sampleData,
      toolbarOptions: ['ExcelExport'],
      pageSettings: { pageSize: 7 }
    };
  },
  methods: {
      toolbarClick(args) {
        if (args['item'].text === 'Excel Export') {
          let excelExportProperties = {
            theme:
              {
                header: { fontName: 'Segoe UI', fontColor: '#666666' },
                record: { fontName: 'Segoe UI', fontColor: '#666666' },
                caption: { fontName: 'Segoe UI', fontColor: '#666666' }
              }
          }
          this.$refs.treegrid.excelExport(excelExportProperties);
        }
    }
  },
  provide: {
      treegrid: [ Page, Toolbar, ExcelExport ]
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/excel/default-cs3" %}

By default, material theme is applied to exported excel document.

Adding header and footer in Vue Treegrid component

The excel export provides an option to include header and footer content for exported excel document.

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid ref='treegrid' :dataSource='data' height='220'
childMapping='subtasks' :treeColumnIndex='1' :allowPaging='true'
:pageSettings='pageSettings' :allowExcelExport='true'
:toolbar='toolbarOptions' :toolbarClick='toolbarClick'>
            <e-columns>
                <e-column field='taskID' headerText='Task ID' width='90'
textAlign='Right'></e-column>
                <e-column field='taskName' headerText='Task Name'
width='160'></e-column>
                <e-column field='startDate' headerText='Start Date'
width='90' format="yMd" textAlign='Right'></e-column>
                <e-column field='duration' headerText='Duration' width='80'
textAlign='Right'></e-column>
```

```
            </e-columns>
        </ejs-treegrid>
</div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin, Page, Toolbar, ExcelExport } from "@syncfusion/ej2-vue-treegrid";

{% previewsample "page.domainurl/code-snippet/treegrid/excel/default-cs1" %}

Exporting tree grid in Server in Vue Tree Grid Component

The Tree Grid have an option to export the data to Excel in server side using tree grid server export library.

Server dependencies

The Server side export functionality is shipped in the Syncfusion.EJ2.TreeGridExport package, which is available in Essential Studio and nuget.org.The following list of dependencies is required for tree grid server side Excel exporting action.

- Syncfusion.EJ2
- Syncfusion.EJ2.TreeGridExport

Server configuration

The following code snippet shows server configuration using ASP.NET Core Controller Action.

To Export the tree grid in server side, You need to call the serverExcelExport method for passing the tree grid properties to server exporting action.

`ts

public IActionResult ExcelExport(string treeGridModel)

{

if (treeGridModel == null)

{

return View();

}

TreeGridExcelExport exp = new TreeGridExcelExport();

Syncfusion.EJ2.TreeGrid.TreeGrid gridProperty = ConvertTreeGridObject(treeGridModel);

return exp.ExportToExcel<TreeData>(gridProperty, TreeData.GetDefaultData());

}

private Syncfusion.EJ2.TreeGrid.TreeGrid ConvertTreeGridObject(string gridProperty)

{

Syncfusion.EJ2.TreeGrid.TreeGrid TreeGridModel =
(Syncfusion.EJ2.TreeGrid.TreeGrid)Newtonsoft.Json.JsonConvert.DeserializeObject(gridProperty,
typeof(Syncfusion.EJ2.TreeGrid.TreeGrid));

Copyright © 2001 -2024 Syncfusion Inc.

```
TreeGridColumnModel cols =
(TreeGridColumnModel)Newtonsoft.Json.JsonConvert.DeserializeObject(gridProperty,
typeof(TreeGridColumnModel));

TreeGridModel.Columns = cols.columns;

return TreeGridModel;

}

public class TreeGridColumnModel

{

public List<TreeGridColumn> columns { get; set; }

}
```

`ts

```
<template>

<div id="app">

<ejs-treegrid ref='treegrid' :dataSource='data' height='220' childMapping='subtasks'
:treeColumnIndex='1' :allowExcelExport='true' :toolbar='toolbarOptions' :toolbarClick='toolbarClick'>

<e-columns>

<e-column field='taskID' headerText='Task ID' width='90' textAlign='Right'></e-column>

<e-column field='taskName' headerText='Task Name' width='160'></e-column>

<e-column field='startDate' headerText='Start Date' width='90' format="yMd" textAlign='Right'></e-
column>

<e-column field='duration' headerText='Duration' width='80' textAlign='Right'></e-column>

</e-columns>

</ejs-treegrid>

</div>

</template>

<script>

import Vue from "vue";

import { TreeGridPlugin, Page, Toolbar, ExcelExport } from "@syncfusion/ej2-vue-treegrid";

import { sampleData } from "./datasource.js";

Vue.use(TreeGridPlugin);

export default {

data ()  {

return {
```

```
data: sampleData,
toolbarOptions: ['ExcelExport'],
};
},
methods: {
toolbarClick(args) {
if (args['item'].text === 'Excel Export') {
this.$refs.treegrid.serverExcelExport('Home/ExcelExport');
}
}
},
provide: {
treegrid: [ Page, Toolbar, ExcelExport ]
}
}
</script>
`
```

CSV Export in server side

You can export the tree grid to CSV format by using the serverCsvExport method which will pass the tree grid properties to server.

In the below demo, we have invoked the above method inside the toolbarClick event. In server side, we have deserialized the tree grid properties and passed to the ExportToCsv method which will export the properties to CSV format.

```
`ts
public IActionResult ServerSideExporting()
{
var order = TreeData.GetDefaultData();
ViewBag.dataSource = order;
return View();
}
public IActionResult CsvExport(string treeGridModel)
{
if (treeGridModel == null)
{
```

```
return View();
}
TreeGridExcelExport exp = new TreeGridExcelExport();
Syncfusion.EJ2.TreeGrid.TreeGrid gridProperty = ConvertTreeGridObject(treeGridModel);
return exp.ExportToCsv<TreeData>(gridProperty, TreeData.GetDefaultData());
}
private Syncfusion.EJ2.TreeGrid.TreeGrid ConvertTreeGridObject(string gridProperty)
{
Syncfusion.EJ2.TreeGrid.TreeGrid TreeGridModel =
(Syncfusion.EJ2.TreeGrid.TreeGrid)Newtonsoft.Json.JsonConvert.DeserializeObject(gridProperty,
typeof(Syncfusion.EJ2.TreeGrid.TreeGrid));
TreeGridColumnModel cols =
(TreeGridColumnModel)Newtonsoft.Json.JsonConvert.DeserializeObject(gridProperty,
typeof(TreeGridColumnModel));
TreeGridModel.Columns = cols.columns;
return TreeGridModel;
}
public class TreeGridColumnModel
{
public List<TreeGridColumn> columns { get; set; }
}
`
```

```ts
<template>
<div id="app">
<ejs-treegrid ref='treegrid' :dataSource='data' height='220' childMapping='subtasks'
:treeColumnIndex='1' :toolbar='toolbarOptions' :toolbarClick='toolbarClick'>
<e-columns>
<e-column field='taskID' headerText='Task ID' width='90' textAlign='Right'></e-column>
<e-column field='taskName' headerText='Task Name' width='160'></e-column>
<e-column field='startDate' headerText='Start Date' width='90' format="yMd" textAlign='Right'></e-
column>
<e-column field='duration' headerText='Duration' width='80' textAlign='Right'></e-column>
</e-columns>
</ejs-treegrid>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
</div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin, Page, Toolbar } from "@syncfusion/ej2-vue-treegrid";
import { sampleData } from "./datasource.js";
Vue.use(TreeGridPlugin);
export default {
data ()  {
return {
data: sampleData,
toolbarOptions: ['CsvExport'],
};
},
methods: {
toolbarClick(args) {
if (args['item'].text === 'Csv Export') {
this.$refs.treegrid.serverCsvExport('Home/CsvExport');
}
}
},
provide: {
treegrid: [ Page, Toolbar, CsvExport ]
}
}
</script>
`
```

Rotate a header text to a certain degree in the exported grid on the server side

The TreeGrid has support to customize the column header styles such as changing text orientation, the font color, and so on in the exported Excel file. To achieve this requirement, use the ExcelHeaderCellRendering event of the tree grid.

The ExcelHeaderCellRendering will be triggered when creating a column header for the excel document to be exported in the server side. Customize the column header in this event.

Copyright © 2001 -2024 Syncfusion Inc.

In the following demo, using the HeaderCellRotate method of the TreeGridExcelExport class in the ExcelHeaderCellRendering event, you can rotate the header text of the column header in the excel exported document.

```ts
public IActionResult ExcelExport(string treeGridModel)
{
if (treeGridModel == null)
{
return View();
}
TreeGridExcelExport exp = new TreeGridExcelExport();
Syncfusion.EJ2.TreeGrid.TreeGrid gridProperty = ConvertTreeGridObject(treeGridModel);
gridProperty.ExcelHeaderCellRendering = ExcelHeaderQueryCellInfo;
return (IActionResult)exp.ExcelExport<TreeGridItems>(gridProperty, TreeGridItems.GetDefaultData());
}
private void ExcelHeaderQueryCellInfo(object excel)
{
Syncfusion.EJ2.TreeGridExport.ExcelHeaderCellEventArgs name =
(Syncfusion.EJ2.TreeGridExport.ExcelHeaderCellEventArgs)excel;
List<string> headerValues = new List<string>();
headerValues.Add(name.Column.HeaderText);
var longestString = headerValues.Where(s => s.Length == headerValues.Max(m => m.Length)).First();
TreeGridExcelExport exp = new TreeGridExcelExport();
var size = exp.ExcelTextSize(name.Style.Font.FontName, (float)name.Style.Font.Size, longestString);
name.Cell.RowHeight = size.Width;
exp.HeaderCellRotate(name, 45); // Give the rotate degree value by the user.
name.Style.Borders.LineStyle = Syncfusion.XlsIO.ExcelLineStyle.None;
}
```

Global local in Vue Treegrid component

Localization

The Localization library allows you to localize default text content of the TreeGrid. The treegrid component has static text on some features (like toolbar area text, filter menu text, pager information text, etc.) that can be changed to other cultures (Arabic, Deutsch, French, etc.) by defining the

locale value and translation object.

Copyright © 2001 -2024 Syncfusion Inc.

The following list of properties and its values are used in the treegrid.

Locale keywords |Text

EmptyRecord | No records to display

True | true

False | false

ExpandAll | Expand All

CollapseAll | Collapse All

RowIndent | Indent

RowOutdent | Outdent

InvalidFilterMessage | Invalid Filter Data

FilterbarTitle | \s filter bar cell

Add | Add

Edit| Edit

Cancel| Cancel

Update| Update

Delete | Delete

Print | Print

Pdfexport | PDF Export

Excelexport | Excel Export

Wordexport | Word Export

Csvexport | CSV Export

Search | Search

Save | Save

EditOperationAlert | No records selected for edit operation

DeleteOperationAlert | No records selected for delete operation

SaveButton | Save

OKButton | OK

CancelButton | Cancel

EditFormTitle | Details of

AddFormTitle | Add New Record

ConfirmDelete | Are you sure you want to Delete Record?

SearchColumns | search columns

```
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/local/default-cs2" %}

* In the above sample, Price column is formatted by NumberFormatOptions.

* By default, locale value is en-US. If you want to change the en-US culture to a different culture, you have to change the locale accordingly.

Right to left (RTL)

RTL provides an option to switch the text direction and layout of the TreeGrid component from right to left. It improves the user experiences and accessibility for users who use right-to-left languages (Arabic, Farsi, Urdu, etc.). To enable RTL Grid, set the enableRtl to true.

APP.VUE

```

Accessibility in Vue Treegrid component

The Tree Grid component followed the accessibility guidelines and standards, including ADA, Section 508, WCAG 2.2 standards, and WCAG roles that are commonly used to evaluate accessibility.

The accessibility compliance for the Tree Grid component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| WCAG 2.2 Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/intermediate.png" alt="intermediate"> |

Copyright © 2001 -2024 Syncfusion Inc.

| Section 508 Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Screen Reader Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/intermediate.png" alt="intermediate"> |

| Right-To-Left Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Color Contrast | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Mobile Device Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Keyboard Navigation Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Accessibility Checker Validation | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Axe-core Accessibility Validation | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> - All features of the component meet the requirement.

<img src="https://cdn.syncfusion.com/content/images/landing-page/intermediate.png" alt="Intermediate"> - Some features of the component do not meet the requirement.

<img src="https://cdn.syncfusion.com/content/images/landing-page/no.png" alt="No"> - The component does not meet the requirement.

WAI-ARIA attributes

The Tree Grid component followed the WAI-ARIA patterns to meet the accessibility. The following ARIA attributes are used in the Tree Grid component:

| Attributes | Purpose |

| --- | --- |

| role=treegrid | Used to convey a significant and contextual message to the user. |

| aria-selected | Accurately reflect the selection state, whether it's single-select or multi-select. |

| aria-expanded | It can be used to show whether a node is expanded or collapsed, making it easier for screen reader users to navigate and understand the hierarchy. |

Copyright © 2001 -2024 Syncfusion Inc.

| aria-sort | Indicate the current sorting order of a table column for users with disabilities, facilitating accessible data presentation and interaction. |

| aria-busy | Loading state to improve accessibility for users, particularly those relying on screen readers. |

| aria-invalid | To indicate whether the user's input in a form field is valid or invalid, aiding users, including those with disabilities, in understanding and correcting their input. |

| aria-grabbed | Provides accessibility information for users interacting with draggable elements |

| aria-owns | Establishing relationships between an element and the elements it owns or controls. |

| aria-label | Provides an accessible name for the close icon. |

Keyboard interaction

The Tree Grid component followed the keyboard interaction guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Tree Grid component.

Interaction Keys |Description

PageDown |Goes to the next page.

PageUp |Goes to the previous page.

Ctrl + Alt +PageDown |Goes to the last page.

Ctrl + Alt + PageUp |Goes to the first page.

Alt + PageDown |Goes to the next page.

Alt + PageUp |Goes to the previous page.

Home |Goes to the first cell.

End |Goes to the last cell.

Ctrl + Home |Goes to the first row.

Ctrl + End |Goes to the last row.

DownArrow |Moves the cell focus downward.

UpArrow |Moves the cell focus upward.

LeftArrow |Moves the cell focus left side.

RightArrow |Moves the cell focus right side.

Shift + DownArrow |Extends the row/cell selection downwards.

Shift + UpArrow |Extends the row/cell selection upwards.

Shift + LeftArrow |Extends the cell selection to the left side.

Shift + RightArrow |Extends the cell selection to the right side.

Enter | Moves the row/cell selection downward. If current cell is in edit state, then completes the editing. If the current cell is a header then performs sorting.

Copyright © 2001 -2024 Syncfusion Inc.

Shift + Enter | Moves the row/cell selection upward. If the current cell is a header then clears sorting for the selected column.

Ctrl + Enter | If the current cell is a header then performs multi-sorting.

Tab | Moves the cell selection right side.

Shift + Tab | Moves the cell selection left side.

Esc |Deselects all the rows/cells.

Ctrl + A |Selects all the rows/cells.

UpArrow |Moves up a row/cell selection.

DownArrow |Moves down a row/cell selection.

RightArrow |Moves to the right cell selection.

LeftArrow |Moves to the left cell selection.

Ctrl + Shift + DownArrow |Expands the selected group.

Ctrl + DownArrow |Expands all the visible groups.

Ctrl + Shift + UpArrow |Collapses the selected group.

Ctrl + UpArrow |Collapses all the visible groups.

Ctrl + P |Prints the TreeGrid.

Ensuring accessibility

The Tree Grid component's accessibility levels are ensured through an accessibility-checker and axe-core software tools during automated testing.

The accessibility compliance of the Tree Grid component is shown in the following sample. Open the sample in a new window to evaluate the accessibility of the Tree Grid component with accessibility tools.

{% previewsample "https://ej2.syncfusion.com/accessibility/tree-grid.html" %}

Clipboard in Vue Treegrid component

The clipboard provides an option to copy selected rows or cells data into the clipboard.

The following list of keyboard shortcuts is supported in the Tree Grid to copy selected rows or cells data into clipboard.

Interaction keys |Description

Ctrl + C |Copy selected rows or cells data into clipboard.

Ctrl + Shift + H |Copy selected rows or cells data with header into clipboard.

Copy Hierarchy Modes

Tree Grid provides support for a set of copy modes with copyHierarchyMode property. The below are the type of filter mode available in TreeGrid.

- **Parent** : This is the default copy hierarchy mode in Tree Grid. Clipboard value have the selected records with its parent records. If the selected records not have any parent record then the selected record will be in clipboard.
- **Child** : Clipboard value have the selected records with its child record. If the selected records do not have any child record then the selected records will be in clipboard.

Copyright © 2001 -2024 Syncfusion Inc.

- **Both** : Clipboard value have the selected records with its both parent and child record. If the selected records do not have any parent and child record then the selected records alone in clipboard.
- **None** : Only the Selected records will be in clipboard.

APP.VUE

```
<template>
    <div id="app">
    <div style="padding-top: 7px; float:left">Hierarchy Mode</div><div
style="padding-left: 10px; display: inline-block">
            <ejs-dropdownlist id='ddlelement' :dataSource='dropData'
value='Parent' :fields='fields' :change="onChange"></ejs-dropdownlist></div>

    }
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/clipboard/default-cs3" %}

Limitations of Copy Functionality

- Only current view records will be available in copy clipboard.

AutoFill

AutoFill Feature allows you to copy the data of selected cells and paste it to another cells by just dragging the autofill icon of the selected cells up to required cells. This feature is enabled by defining enableAutoFill property as true.

APP.VUE

```
<template>
    <div id="app">
        <ejs-treegrid :dataSource='treeGridData' :enableAutoFill='true'
childMapping='subtasks' :treeColumnIndex='1' :allowPaging='true'
:pageSettings='pageSettings' height='220px'
:selectionSettings='selectionOptions' :editSettings='editSettings'
:toolbar='toolbar'>
            <e-columns>
                <e-column field='taskID' headerText='Task ID'
:isPrimaryKey='true' width='90' textAlign='Right'></e-column>
                <e-column field='taskName' headerText='Task Name'
width='160'></e-column>
                <e-column field='startDate' headerText='Start Date'
width='90' format="yMd" textAlign='Right'></e-column>
                <e-column field='duration' headerText='Duration' width='80'
textAlign='Right'></e-column>
            </e-columns>
        </ejs-treegrid>
</div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin, Edit, Page, Toolbar } from "@syncfusion/ej2-vue-
treegrid";
import { sampleData } from "./datasource.js";
Vue.use(TreeGridPlugin);
export default {
  data ()  {
    return {
      treeGridData: sampleData,
      pageSettings: { pageSize: 10 },
```

Copyright © 2001 -2024 Syncfusion Inc.

```
      editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true, mode: 'Batch' },
      toolbar: ['Add', 'Update', 'Cancel'],
      selectionOptions: { type: 'Multiple', mode: 'Cell', cellSelectionMode:
'Box' }
    };
  },
  provide: {
      treegrid: [ Edit, Page, Toolbar ]
    }
  }
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/clipboard/default-cs4" %}

* If enableAutoFill is set to true, then the autofill icon will be displayed on cell selection to copy cells.

* It requires the selection mode to be **Cell**, cellSelectionMode to be **Box** and also Batch Editing should be enabled.

Limitations of AutoFill

- Since the string values are not parsed to number and date type, so when the selected string type cells are dragged to number type cells then it will display as **NaN**. For date type cells, when the selected string type cells are dragged to date type cells then it will display as an **empty cell**.
- Linear series and the sequential data generations are not supported in this autofill feature.

Paste

You can able to copy the content of a cell or a group of cells by selecting the cells and pressing Ctrl + C shortcut key and paste it to another set of cells by selecting the cells and pressing Ctrl + V shortcut key.

APP.VUE

```
<template>
    <div id="app">
        <ejs-treegrid :dataSource='treeGridData' childMapping='subtasks'
:treeColumnIndex='1' :allowPaging='true' :pageSettings='pageSettings'
height='220px' :selectionSettings='selectionOptions'
:editSettings='editSettings' :toolbar='toolbar'>
            <e-columns>
                <e-column field='taskID' headerText='Task ID'
:isPrimaryKey='true' width='90' textAlign='Right'></e-column>
                <e-column field='taskName' headerText='Task Name'
width='160'></e-column>
                <e-column field='startDate' headerText='Start Date'
width='90' format="yMd" textAlign='Right'></e-column>
                <e-column field='duration' headerText='Duration' width='80'
textAlign='Right'></e-column>
            </e-columns>
        </ejs-treegrid>
</div>
</template>
<script>
import Vue from "vue";
```

```
import { TreeGridPlugin, Edit, Page, Toolbar } from "@syncfusion/ej2-vue-
treegrid";
import { sampleData } from "./datasource.js";
Vue.use(TreeGridPlugin);
export default {
  data ()  {
    return {
      treeGridData: sampleData,
      pageSettings: { pageSize: 10 },
      editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true, mode: 'Batch' },
      toolbar: ['Add', 'Update', 'Cancel'],
      selectionOptions: { type: 'Multiple', mode: 'Cell', cellSelectionMode:
'Box' }
    };
  },
  provide: {
      treegrid: [ Edit, Page, Toolbar ]
    }
  }
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/clipboard/default-cs5" %}

To perform paste functionality, it requires the selection mode to be **Cell**, cellSelectionMode to be **Box** and also Batch Editing should be enabled.

Limitations of Paste Functionality

- Since the string values are not parsed to number and date type, so when the copied string type cells are pasted to number type cells then it will display as **NaN**. For date type cells, when the copied string format cells are pasted to date type cells then it will display as an **empty cell**.

Context menu in Vue Treegrid component

The TreeGrid has options to show the context menu when right clicked on it. To enable this feature, you need to define either default or custom item in the contextMenuItems.

To use the context menu, inject the ContextMenu module in the treegrid.

The default items are in the following table.

Items| Description

AutoFit| Auto fit the current column.

AutoFitAll | Auto fit all columns.

Edit| Edit the current record.

Delete | Delete the current record.

Save | Save the edited record.

Cancel | Cancel the edited state.

PdfExport | Export the treegrid data as Pdf document.

Copyright © 2001 -2024 Syncfusion Inc.

ExcelExport | Export the treegrid data as Excel document.

CsvExport | Export the treegrid data as CSV document.

SortAscending | Sort the current column in ascending order.

SortDescending | Sort the current column in descending order.

FirstPage | Go to the first page.

PrevPage | Go to the previous page.

LastPage | Go to the last page.

NextPage | Go to the next page.

AddRow | Add new row to the treegrid.

Indent | Indents the record to one level of hierarchy.|

Outdent | Outdents the record to one level of hierarchy.|

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid :dataSource='data' childMapping='subtasks'

Custom context menu items

The custom context menu items can be added by defining the contextMenuItems as a collection of contextMenuItemModel.

Actions for this customized items can be defined in the contextMenuClick event.

In the below sample, we have shown context menu item for parent rows to expand or collapse child rows.

{% previewsample "page.domainurl/code-snippet/treegrid/contextMenu/default-cs3" %}

You can hide or show an item in context menu for specific area inside of treegrid by defining the target property.

Treegrid styling in Vue Treegrid component

To modify the TreeGrid appearance, you need to override the default CSS of treegrid. Please find the list of CSS classes and its corresponding section in treegrid. Also, you have an option to create your own custom theme for all the Vue controls using our Theme Studio.

Section|CSS class|Purpose of CSS class

Root|e-treegrid|This classes are in this root element (div) of the treegrid control.

Header|e-gridheader|This class is added in the root element of header element. In this class, You can override thin line between header and content of the treegrid.

||e-table|This class is added at 'table' of the treegrid header. This CSS class makes table width as 100 %.

||e-columnheader|This class is added at 'tr' of the treegrid header.

||e-headercell|This class is added in 'th' element of treegrid header. You can override background color of header and border color.

||e-headercelldiv|This class is add in div which present 'th' element in the header. we recommend you to use the e-headercelldiv to override skeleton of header.

Body|e-gridcontent|This class is added at root of body content. This is to override background color of the body.

||e-table|This class is added to table of content. This CSS class makes table width as 100 %.

Copyright © 2001 -2024 Syncfusion Inc.

||e-altrow|This class is added to alternate rows of treegrid. This is to override alternate row color of the treegrid.

||e-rowcell|This class is added to all cells in the treegrid. This is to override cells appearance and styling.

||e-groupcaption|This class is added to the 'td' of group caption which is to change the background color of caption cell.

||e-selectionbackground|This class is added to rowcell's of the treegrid. This is override selection.

||e-hover|This class adds to row of treegrid, while hovering the treegrid rows.

Pager|e-pager|This class is added to root element of the pager. This to change appearance of the background color and color of font.

||e-pagercontainer|This class is added to numeric items of the pager.

||e-parentmsgbar|This class is added to pager info of the pager.

Summary|e-gridfooter|This class is added to root of the summary div.

||e-summaryrow|This class is added to rows of treegrid summary.

||e-summarycell|This class is added to cells of summary row. This to override background color of summary.

How To

Refresh the data source in Vue Treegrid component

How to refresh the datasource

You can add/delete the datasource records through an external button. To reflect the datasource changes in Tree Grid, you need to assign the modified data to dataSource property.

Please follow the below steps to refresh the Tree Grid after datasource change.

Step 1:

Add/delete the datasource record by using the following code.

`ts

let customData = {

TaskID: 99,

TaskName: "New Data",

StartDate: new Date("02/03/2017"),

EndDate: new Date("02/03/2017"),

Duration: 10

};

// Added New Record.

this.data.unshift(customData);

// Delete record.

this.data.splice(selectedRow, 1);

Copyright © 2001 -2024 Syncfusion Inc.

`

Step 2:

Refresh the Tree Grid after the datasource change by assign the modified data to dataSource property.

`ts

this.data = [...this.data]; // Refresh the TreeGrid.

`

Enable disable grid and its actions in Vue Treegrid component

You can enable/disable the Tree Grid and its actions by applying/removing corresponding CSS styles.

To enable/disable the Tree Grid and its actions, follow the given steps:

Step 1:

Create CSS class with custom style to override the default style of Tree Grid.

`

.disabletreegrid {

pointer-events: none;

opacity: 0.4;

}

.wrapper {

cursor: not-allowed;

}

`

Step 2:

Copyright © 2001 -2024 Syncfusion Inc.

Add/Remove the CSS class to the Tree Grid in the click event handler of Button.

`ts

btnClick(args) {

if (this.$refs.treegrid.$el.classList.contains('disablegrid')) {

this.$refs.treegrid.$el.classList.remove('disablegrid');

document.getElementById("TreeGridParent").classList.remove('wrapper');

}

else {

this.$refs.treegrid.$el.classList.add('disablegrid');

document.getElementById("TreeGridParent").classList.add('wrapper');

}

}

`

In the below demo, the button click will enable/disable the Tree Grid and its actions.

APP.VUE

```
<template>
    <div id="app">
        <div>
            <ejs-button  iconCss="e-icons e-play-icon" cssClass="e-flat"
:isPrimary="true" :isToggle="true" v-
on:click.native="btnClick">Enable/Disable Grid</ejs-button>
            <div id="TreeGridParent">
              <ejs-treegrid :dataSource="data" :treeColumnIndex="1"
height='210px' childMapping="subtasks" ref="treegrid"
:editSettings="editSettings" :toolbar="toolbar">
                <e-columns>

    cursor: not-allowed;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/treegrid/how-to/default-cs12" %}

Change header text dynamically in Vue Treegrid component

You can change the column headerText dynamically through an external button.

Follow the given steps to change the header text dynamically:

Step 1:

Get the column object corresponding to the field name by using the getColumnByField method.

Then change the header Text value.

`ts

Copyright © 2001 -2024 Syncfusion Inc.

/ get the JSON object of the column corresponding to the field name */

let column = this.$refs.treegrid.getColumnByField("duration");

/ assign a new header text to the column */

column.headerText = "Changed Text";

`

Step 2:

To reflect the changes in the Tree Grid header, invoke the refreshColumns method.

`ts

this.$refs.treegrid.refreshColumns();

`

APP.VUE

```
<template>
<div id="app">
        <ejs-button @click.native='changeHeader'>Change HeaderText</ejs-
button>
        <ejs-treegrid :dataSource="data" :treeColumnIndex="1" height='280px'
childMapping="subtasks" ref="treegrid">
        <e-columns>
          <e-column field="taskID" headerText="Task ID" width="70"
textAlign="Right"></e-column>
          <e-column field="taskName" headerText="Task Name" width="100"></e-
column>
          <e-column field="startDate" headerText="Start Date" format="yMd"
width="90" textAlign="Right"></e-column>
          <e-column field="endDate" headerText="End Date" width="100"
format="yMd" textAlign="Right"></e-column>
          <e-column field="duration" headerText="Duration" width="90"
textAlign="Right" ></e-column>
          <e-column field="progress" headerText="Progress" width="90"

        </e-columns>
       </ejs-treegrid>
</div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin } from "@syncfusion/ej2-vue-treegrid";
import { ButtonPlugin } from "@syncfusion/ej2-vue-buttons";
import { sampleData } from "./datasource.js";
Vue.use(TreeGridPlugin);
Vue.use(ButtonPlugin);
export default {
  data() {
    return {
      data: sampleData,
    };
  },
  methods: {
    changeHeader: function() {
```

```
      let column =  this.$refs.treegrid.getColumnByField("duration");
      column.headerText = "Changed Text";
      this.$refs.treegrid.refreshColumns();
    },
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/how-to/default-cs3" %}

Customize column styles in Vue Treegrid component

You can customise the appearance of header and content of the particular column using the customAttributes property.

To customize the Tree Grid column, follow the given steps:

Step 1:

Create a css class with custom style to override the default style for rowcell and headercell.

`

.e-treegrid .e-rowcell.customcss{

background-color: #ecedee;

font-family: 'Bell MT';

color: 'red';

font-size: '20px';

}

.e-treegrid .e-headercell.customcss{

background-color: #2382c3;

color: white;

font-family: 'Bell MT';

font-size: '20px';

}

`

Step 2:

Add the custom css class to particular column by using customAttributes property.

`ts

<e-column field="taskName" headerText="Task Name" :customAttributes="{class: 'customcss'}" width="100"></e-column>

`

APP.VUE

Custom tool tip for columns in Vue Treegrid component

You can achieve the custom tooltip(EJ2 Tooltip) for Tree Grid by using the queryCellInfo event.

Render the ToolTip component for the Tree Grid cells by using the following code in the queryCellInfo event.

`ts

Copyright © 2001 -2024 Syncfusion Inc.

tooltip (args) {

let tooltip = new Tooltip({

content: args.data[args.column.field].toString();

}, args.cell);

}

`

APP.VUE

```
<template>
<div id="app">
      <ejs-treegrid :dataSource="data" :treeColumnIndex="1" height='300px'
:queryCellInfo='queryCellInfoEvent' childMapping="subtasks" ref="treegrid">
        <e-columns>
          <e-column field="taskID" headerText="Task ID" width="70"
textAlign="Right"></e-column>
          <e-column field="taskName" headerText="Task Name" width="100"></e-
column>
          <e-column field="startDate" headerText="Start Date" format="yMd"
width="90" textAlign="Right"></e-column>
          <e-column field="endDate" headerText="Start Date" format="yMd"
width="90" textAlign="Right"></e-column>
          <e-column field="duration" headerText="Duration" width="90"
textAlign="Right"></e-column>
        </e-columns>
       </ejs-treegrid>
</div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin } from "@syncfusion/ej2-vue-treegrid";
import { Tooltip } from "@syncfusion/ej2-popups";
import { sampleData } from "./datasource.js";
Vue.use(TreeGridPlugin);
export default {
  data() {
    return {
      data: sampleData,
    };
  },
  methods: {
    queryCellInfoEvent: function (args) {
         let tooltip = new Tooltip({
          content: args.data[args.column.field].toString()
        }, args.cell);
      },
  }
}
</script>
```

Change orientation of header text in Vue Treegrid component

You can change the orientation of the header text by using the customAttributes property.

Ensure the following steps:

Step 1:

Create a css class with orientation style for treegrid header cell.

`

.orientationcss .e-headercelldiv {

transform: rotate(90deg);

}

`

Step 2:

Add the custom css class to particular column by using customAttributes property.

`ts

<e-column field='endDate' headerText='End Date' width='90' format="yMd" :customAttributes= "{class: 'orientationcss'}" textAlign='Center'></e-column>

`

Step 3:

Resize the header cell height in create event by using the following code.

`ts

setHeaderHeight: function(args) {

let textWidth = document.querySelector(".orientationcss > div").scrollWidth; //Obtain the width of the headerText content.

let headerCell = document.querySelectorAll(".e-headercell");

for (let i = 0; i < headerCell.length; i++) {

headerCell.item(i).style.height = textWidth + "px"; //Assign the obtained textWidth as the height of the headerCell.

}

}

`

APP.VUE

```
<template>
  <div id="app">
        <ejs-treegrid :dataSource="data" :treeColumnIndex="1" height='210px'
:created='setHeaderHeight' childMapping="subtasks" ref="treegrid">
        <e-columns>
          <e-column field="taskID" headerText="Task ID" width="70"
textAlign="Right"></e-column>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
          <e-column field="taskName" headerText="Task Name" width="100"
></e-column>
          <e-column field="startDate" headerText="Start Date" format="yMd"
textAlign="Right" width="90"></e-column>
          <e-column field="endDate" headerText="End Date" width="90"
format="yMd" :customAttributes= "{class: 'orientationcss'}"
textAlign="Center"></e-column>
          <e-column field="duration" headerText="Duration" width="90"
textAlign="Right"></e-column>
          <e-column field="progress" headerText="progress" width="90"
textAlign="Right"></e-column>
        </e-columns>
       </ejs-treegrid>
  </div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin } from "@syncfusion/ej2-vue-treegrid";
import { sampleData } from "./datasource.js";
Vue.use(TreeGridPlugin);
export default {
  data() {
    return {
      data: sampleData,
    };
  },
  methods: {
    setHeaderHeight: function(args) {
      let textWidth = document.querySelector(".orientationcss >
div").scrollWidth; //Obtain the width of the headerText content.
      let headerCell = document.querySelectorAll(".e-headercell");
      for (let i = 0; i < headerCell.length; i++) {
        headerCell.item(i).style.height = textWidth + "px"; //Assign the
obtained textWidth as the height of the headerCell.
      }
    },
  }
}
</script>
<style>
   .orientationcss .e-headercelldiv {
    transform: rotate(90deg);
    padding-top:5px;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/treegrid/how-to/default-cs4" %}

Customize the icon for column menu in Vue Treegrid component

You can customize the column menu icon by overriding the default Tree Grid class **.e-icons.e-columnmenu** with a custom property **content** as mentioned below,

`

.e-treegrid .e-columnheader .e-icons.e-columnmenu::before {

content: "\e903";

}

`

In the below sample, Tree Grid is rendered with a customized column menu icon.

APP.VUE

```
<template>
  <div id="app">
        <ejs-treegrid :dataSource="data" :treeColumnIndex="1" height='300px'
:showColumnMenu='true' childMapping="subtasks" ref="treegrid">
        <e-columns>
          <e-column field="taskID" headerText="Task ID" width="70"
textAlign="Right"></e-column>
          <e-column field="taskName" headerText="Task Name" width="100"
></e-column>
          <e-column field="startDate" headerText="Start Date" format="yMd"
width="90" textAlign="Right"></e-column>
          <e-column field="endDate" headerText="End Date" width="90"
format="yMd" textAlign="Center"></e-column>
          <e-column field="duration" headerText="Duration" width="90"
textAlign="Right"></e-column>
          <e-column field="progress" headerText="progress" width="90"
textAlign="Right"></e-column>
        </e-columns>
       </ejs-treegrid>
  </div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin, ColumnMenu} from "@syncfusion/ej2-vue-treegrid";
import { sampleData } from "./datasource.js";
Vue.use(TreeGridPlugin);
export default {
  data() {
    return {
      data: sampleData,
    };
  },
   provide: {
    treegrid: [ColumnMenu ]
  }
}
</script>
<style>
   .e-treegrid .e-columnheader .e-icons.e-columnmenu::before {
        content: "\e903";
    }
</style>
```

Customize the edit dialog in Vue Treegrid component

You can customize the appearance of the edit dialog in the actionComplete event based on **requestType** as **beginEdit** or **add**.

In the below example, we have changed the dialog's header text for editing and adding records.

APP.VUE

```
<template>
    <div id="app">
        <div>
            <ejs-treegrid :dataSource="data" :treeColumnIndex="1"
height='250px' :actionComplete='actionComplete' childMapping="subtasks"
ref="treegrid" :editSettings="editSettings" :toolbar="toolbar">
              <e-columns>
               <e-column field="taskID" :isPrimaryKey="true"
headerText="Task ID" width="70" textAlign="Right"></e-column>
               <e-column field="taskName" headerText="Task Name"
width="100"></e-column>
               <e-column field="startDate" headerText="Start Date"
format="yMd" width="90" textAlign="Right"></e-column>
               <e-column field="endDate" headerText="Start Date"
format="yMd" width="90" textAlign="Right"></e-column>
               <e-column field="duration" headerText="Duration" width="90"
textAlign="Right"></e-column>
              </e-columns>
             </ejs-treegrid>
            </div>
        </div>
    </div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin, Page, Toolbar, Edit } from "@syncfusion/ej2-vue-
treegrid";
import { sampleData } from './datasource.js';
Vue.use(TreeGridPlugin);
export default {
  data() {
    return {
      data: sampleData,
      editSettings: { allowAdding:true, allowDeleting:true, allowEditing:
true, mode: 'Dialog' },
      toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel']
    };
  },
  methods: {
    actionComplete(args) {
        if ((args.requestType === 'beginEdit' || args.requestType ===
'add')) {
            let dialog = args.dialog;
            dialog.height = 400;
            // change the header of the dialog
            dialog.header = args.requestType === 'beginEdit' ? 'Record of '
+ args.rowData['taskName'] : 'New Record';
        }
    }
```

```
  },
  provide: {
    treegrid: [Page, Edit, Toolbar]
  }
}
</script>

{% previewsample "page.domainurl/code-snippet/treegrid/how-to/default-cs2" %}

Provide custom data source and enabling filtering to drop down list in Vue Treegrid component

You can provide data source to the DropDownList by using the **params** of columns.edit property.

While setting new data source using edit params, you must specify a new **query** property for the DropDownList as follows,

`ts

priorityParams: {

params: {

allowFiltering: true,

dataSource: priorityData,

fields: { text: "priorityName", value: "priorityName" },

query: new Query(),

actionComplete: () => false

}

};

`

You can also enable filtering for the DropDownList by passing the allowFiltering as **true** to the edit params.

In the below demo, DropDownList is rendered with custom dataSource for the *Priority* column and enabled filtering to search DropDownList items.

APP.VUE

```
<template>
  <div id="app">
```

```
        <ejs-treegrid :dataSource="data" :treeColumnIndex="1" height='250px'
idMapping='TaskID' parentIdMapping='parentID' ref="treegrid"
:editSettings="editSettings" :toolbar="toolbar">
        <e-columns>
          <e-column field="TaskID" headerText="Task ID" :isPrimaryKey='true'
width="70" textAlign="Right"></e-column>
          <e-column field="TaskName" headerText="Task Name" width="100"
></e-column>
          <e-column field="StartDate" headerText="Start Date" format="yMd"
editType= 'datepickeredit' width="100" textAlign="Right"></e-column>
          <e-column field="EndDate" headerText="End Date" width="100"
format="yMd" editType='datepickeredit' textAlign="Right"></e-column>
          <e-column field="Priority" headerText="Priority" width="90"
editType= 'dropdownedit' textAlign="Left" :edit="priorityParams"></e-column>
        </e-columns>
       </ejs-treegrid>
  </div>

Restrict decimal points with treegrid editing in Vue Treegrid component

By default, the number of decimal places will be restricted to two in the NumericTextBox while editing the numeric column. We can restrict to type the decimal points in a NumericTextBox by using the **validateDecimalOnType** and **decimals** properties of NumericTextBox.

In the below demo, while editing the row we have restricted to type the decimal point value in the NumericTextBox of **Price** column.

APP.VUE

```
<template>
  <div id="app">
        <ejs-treegrid :dataSource="data" :treeColumnIndex="1" height='250px'
childMapping='subtasks' ref='treegrid' :editSettings='editSettings'
:toolbar="toolbar">
        <e-columns>
          <e-column field="orderID" headerText="Order ID"
:isPrimaryKey='true' width="70" textAlign="Right"></e-column>
          <e-column field="orderName" headerText="Order Name" width="100"
></e-column>
          <e-column field="orderDate" headerText="Order Date" format="yMd"
editType= 'datepickeredit' width="100" textAlign="Right"></e-column>
          <e-column field="units" headerText="Units" width="90"
textAlign="Right"  editType= "numericedit"></e-column>
          <e-column field="price" headerText="Price" width="100"
:edit="numericParams" editType="numericedit" width="90" format="c2"
textAlign="Right"></e-column>
        </e-columns>

Exporting selected data in Vue Treegrid component

You can export the selected records data by passing it to PdfExportProperties.dataSource or ExcelExportProperties.dataSource property in the toolbarClick event.

In the below exporting demo, we can get the selected records using getSelectedRecords method and pass the selected data to pdfExport or excelExport methods using respective export properties..

APP.VUE

```
<template>
  <div id="app">
        <ejs-treegrid :dataSource="data" :allowPaging='true'
:treeColumnIndex="1" idMapping='TaskID' parentIdMapping='parentID'
ref="treegrid" :toolbar="toolbarOptions"  :allowPdfExport='true'
:allowExcelExport='true' :pageSettings='pageSettings'
:toolbarClick='toolbarClick' :selectionSettings='selectionOption'>
        <e-columns>
          <e-column field="TaskID" headerText="Task ID" :isPrimaryKey='true'
width="70" textAlign="Right"></e-column>
          <e-column field="TaskName" headerText="Task Name" width="100"
></e-column>
          <e-column field="StartDate" headerText="Start Date" format="yMd"
editType= 'datepickeredit' width="100" textAlign="Right"></e-column>
          <e-column field="EndDate" headerText="End Date" width="100"
format="yMd" editType='datepickeredit' textAlign="Right"></e-column>
          <e-column field="Duration" headerText="Duration" width="90"

Show spinner on exporting in Vue Treegrid component

You can show/ hide spinner component while exporting the Tree Grid using showSpinner/ hideSpinner methods. You can use toolbarClick event to show spinner before exporting and hide a spinner in the pdfExportComplete or excelExportComplete event after the exporting.

In the toolbarClick event, based on the parameter **args.item.text** as **PDF Export** or **Excel Export** we can call the showSpinner method from Tree Grid instance.

In the pdfExportComplete or excelExportComplete event, We can call the hideSpinner method.

In the below demo, we have rendered the default spinner component when exporting the Tree Grid.

APP.VUE

```
<template>
  <div id="app">
```

```
        <ejs-treegrid :dataSource="data" :allowPaging='true'
:treeColumnIndex="1" idMapping='TaskID' parentIdMapping='parentID'
ref="treegrid" :toolbar="toolbarOptions"  :allowPdfExport='true'
:allowExcelExport='true' :pageSettings='pageSettings'
:toolbarClick='toolbarClick' :excelExportComplete='excelExportComplete'
:pdfExportComplete='pdfExportComplete'>
        <e-columns>
          <e-column field="TaskID" headerText="Task ID" :isPrimaryKey='true'
width="70" textAlign="Right"></e-column>
          <e-column field="TaskName" headerText="Task Name" width="100"
></e-column>
          <e-column field="StartDate" headerText="Start Date" format="yMd"
editType= 'datepickeredit' width="100" textAlign="Right"></e-column>
          <e-column field="EndDate" headerText="End Date" width="100"
format="yMd" editType='datepickeredit' textAlign="Right"></e-column>
          <e-column field="Duration" headerText="Duration" width="90"
textAlign="Right"></e-column>
          <e-column field="Priority" headerText="Priority" width="90"
textAlign="Left"></e-column>
        </e-columns>
       </ejs-treegrid>
  </div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin, Page, Toolbar, PdfExport, ExcelExport} from
"@syncfusion/ej2-vue-treegrid";
import { projectData } from "./datasource.js";
Vue.use(TreeGridPlugin);
export default {
  data() {
    return {
      data: projectData,
      toolbarOptions: ['PdfExport', 'ExcelExport'],
      pageSettings: { pageSize: 5, pageCount:5 },
      queryClone: ""
    };
  },
  methods: {
    toolbarClick(args){
        if (args.item.text === 'PDF Export') {
            this.$refs.treegrid.showSpinner();
            this.$refs.treegrid.pdfExport();
        }
        else if (args.item.text === 'Excel Export') {
            this.$refs.treegrid.showSpinner();
            this.$refs.treegrid.excelExport();
        }
     },
    pdfExportComplete(args) {
        this.$refs.treegrid.hideSpinner();
     },
     excelExportComplete(args) {
        this.$refs.treegrid.hideSpinner();
     },
  },
  provide: {

Passing parameter to server exporting in Vue Treegrid component

You can pass the additional parameter in the query property by invoking addParams method. In the toolbarClick event, you can define params as key and value pair so it will receive at the server side when exporting.

In the below example, we have passed *recordcount* as *12* using addParams method.

APP.VUE

```
<template>
  <div id="app">
        <ejs-treegrid :dataSource="data" :allowPaging='true'
:treeColumnIndex="1" idMapping='TaskID' parentIdMapping='parentID'
ref="treegrid" :toolbar="toolbarOptions"  :allowPdfExport='true'
:allowExcelExport='true' :pageSettings='pageSettings'
:toolbarClick='toolbarClick' :excelExportComplete='excelExportComplete'
:pdfExportComplete='pdfExportComplete' >
        <e-columns>
          <e-column field="TaskID" headerText="Task ID" :isPrimaryKey='true'
width="70" textAlign="Right"></e-column>
          <e-column field="TaskName" headerText="Task Name" width="100"
></e-column>
          <e-column field="StartDate" headerText="Start Date" format="yMd"
editType= 'datepickeredit' width="100" textAlign="Right"></e-column>
          <e-column field="EndDate" headerText="End Date" width="100"
format="yMd" editType='datepickeredit' textAlign="Right"></e-column>
          <e-column field="Duration" headerText="Duration" width="90"
textAlign="Right"></e-column>
          <e-column field="Priority" headerText="Priority" width="90"
textAlign="Left"></e-column>
        </e-columns>
       </ejs-treegrid>
  </div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin, Page, Toolbar, PdfExport, ExcelExport} from
"@syncfusion/ej2-vue-treegrid";
import { projectData } from "./datasource.js";
import { Query } from '@syncfusion/ej2-data';
Vue.use(TreeGridPlugin);
export default {
  data() {
    return {
      data: projectData,
      toolbarOptions: ['PdfExport', 'ExcelExport'],
      pageSettings: { pageSize: 5, pageCount:5 },
      queryClone: ""
    };
```

```
  },
  methods: {
    toolbarClick(args){
        if (args.item.text === 'PDF Export') {
            this.queryClone = this.$refs.treegrid.query;
            this.$refs.treegrid.query = new Query().addParams("recordcount",
"12")
            this.$refs.treegrid.pdfExport();
        }
        else if (args.item.text === 'Excel Export') {
            this.queryClone = this.$refs.treegrid.query;
            this.$refs.treegrid.query = new Query().addParams("recordcount",
"12")
            this.$refs.treegrid.excelExport();
        }
     },
     pdfExportComplete(args) {
        this.$refs.treegrid.query = this.queryClone();
     }
     excelExportComplete(args) {
        this.$refs.treegrid.query = this.queryClone();
     }

Customize pager drop down in Vue Treegrid component

To customize default values of pager dropdown, you need to define pageSizes as array of strings.

APP.VUE

```
<template>
<div id="app">
        <ejs-treegrid :dataSource="data" :treeColumnIndex="1" height='250px'
childMapping="subtasks" ref="treegrid" :allowPaging="true"
        :pageSettings="pageSettings">
        <e-columns>
          <e-column field="taskID" headerText="Task ID" width="70"
textAlign='Right'></e-column>
          <e-column field="taskName" headerText="Task Name" width="100"
></e-column>
          <e-column field="startDate" headerText="Start Date" format="yMd"
width="90" textAlign='Right'></e-column>
          <e-column field="endDate" headerText="Start Date" format="yMd"
width="90" textAlign='Right'></e-column>
          <e-column field="duration" headerText="Duration" width="90"
textAlign='Right'></e-column>
          <e-column field="progress" headerText="Progress" width="90"
textAlign='Right'></e-column>
          <e-column field="priority" headerText="Priority" width="90"></e-
column>
```

```
        </e-columns>
       </ejs-treegrid>
</div>
</template>
<script>
import Vue from "vue";
import { TreeGridPlugin, Page } from "@syncfusion/ej2-vue-treegrid";
import { sampleData } from "./datasource.js";
Vue.use(TreeGridPlugin);
export default {
  data() {
    return {
      data: sampleData,
      pageSettings: {pageSizes: ['5','10','All']}
    };
  },
  provide: {
    treegrid: [Page]
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treegrid/how-to/default-cs7" %}

Add parameter on filtering in Vue Treegrid component

You can customize the default settings of the components which are used in Menu filter by using params of filter property in column definition.

In the below sample, TaskID and Duration Columns are numeric columns, while open the filter dialog then you can see that NumericTextBox with spin button is displayed to change/set the filter value. Now using the params option we hide the spin button in NumericTextBox for TaskID Column.

APP.VUE

```
<template>
  <div id="app">
      <ejs-treegrid :dataSource="data" :treeColumnIndex="1" height='300px'
idMapping='TaskID' parentIdMapping='parentID' :allowFiltering='true'
:filterSettings='filterOptions' ref="treegrid">
        <e-columns>
          <e-column field="TaskID" headerText="Task ID" :isPrimaryKey='true'
width="70" :filter='filterParams' textAlign="Right"></e-column>
          <e-column field="TaskName" headerText="Task Name" width="100"
></e-column>
          <e-column field="StartDate" headerText="Start Date" format="yMd"
width="100" textAlign="Right"></e-column>
          <e-column field="EndDate" headerText="End Date" width="100"
format="yMd" textAlign="Right"></e-column>
          <e-column field="Duration" headerText="Duration" width="90"
:filter='filterParams' textAlign="Right"></e-column>
          <e-column field="Priority" headerText="Priority" width="90"

Display foreign key column in treegrid in Vue Treegrid component

Since Tree Grid Databinding concept is of hierarchy relationship, we do not provide in-built support for foreignkey datasource.

To display the foreignKey value at initial rendering, we can use the queryCellInfo event of the treegrid and also by using the editType and columns.edit properties of TreeGrid Column, we can render Dropdownlist with external or foreign dataSource.

APP.VUE

```
<template>
  <div id="app">
        <ejs-treegrid :dataSource="data" :treeColumnIndex="1" height='260px'

TreeMap

Getting Started with the Vue TreeMap Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using Vue-CLI and integrating the Syncfusion Vue TreeMap component

Prerequisites

System requirements for Syncfusion Vue UI components

Dependencies

The following list of minimum dependencies are required to use the TreeMap:

```
|-- @syncfusion/ej2-treemap
|-- @syncfusion/ej2-base
|-- @syncfusion/ej2-data
|-- @syncfusion/ej2-pdf-export
|-- @syncfusion/ej2-file-utils
|-- @syncfusion/ej2-compression
|-- @syncfusion/ej2-svg-base
```

Setting up the Vue 2 project

To generate a Vue 2 project using Vue-CLI, use the vue create command. Follow these steps to install Vue CLI and create a new project:

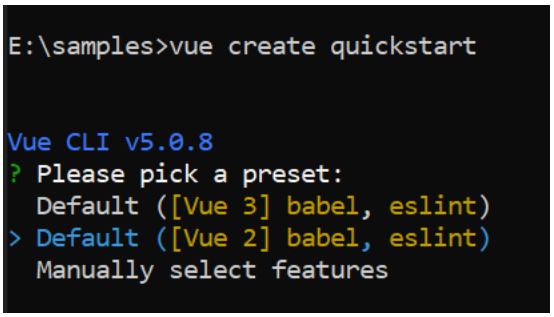
```bash
npm install -g @vue/cli
vue create quickstart
cd quickstart
npm run serve
```

or

```bash
yarn global add @vue/cli
vue create quickstart
cd quickstart
yarn run serve
```

When creating a new project, choose the option `Default ([Vue 2] babel, eslint)` from the menu.

Copyright © 2001 -2024 Syncfusion Inc.



Once the quickstart project is set up with default settings, proceed to add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion packages are available at npmjs.com. To use Vue components, install the required npm package.

This article uses the Vue Treemap component as an example. Install the @syncfusion/ej2-vue-treemap package by running the following command:

`bash

npm install @syncfusion/ej2-vue-treemap --save

`

or

`bash

yarn add @syncfusion/ej2-vue-treemap

`

Adding Syncfusion Vue TreeMap component

Follow the below steps to add the Vue TreeMap component:

1\. First, import and register the TreeMap component in the script section of the **src/App.vue** file.

~/SRC/APP.VUE

```
<script>
import { TreeMapComponent } from "@syncfusion/ej2-vue-treemap";
export default {
components: {
'ejs-treemap': TreeMapComponent
},
data: function() {
return {
dataSource: [
{ Title: 'State wise International Airport count in South America', State:
"Brazil", Count: 25 },
{ Title: 'State wise International Airport count in South America', State:
"Colombia", Count: 12 },
{ Title: 'State wise International Airport count in South America', State:
"Argentina", Count: 9 },
{ Title: 'State wise International Airport count in South America', State:
"Ecuador", Count: 7 },
```

Copyright © 2001 -2024 Syncfusion Inc.

```
{ Title: 'State wise International Airport count in South America', State:
"Chile", Count: 6 },
{ Title: 'State wise International Airport count in South America', State:
"Peru", Count: 3 },
{ Title: 'State wise International Airport count in South America', State:
"Venezuela", Count: 3 },
{ Title: 'State wise International Airport count in South America', State:
"Bolivia", Count: 2 },
{ Title: 'State wise International Airport count in South America', State:
"Paraguay", Count: 2 },
{ Title: 'State wise International Airport count in South America', State:
"Uruguay", Count: 2 },
{ Title: 'State wise International Airport count in South America', State:
"Falkland Islands",Count: 1 },
{ Title: 'State wise International Airport count in South America', State:
"French Guiana", Count:1 },
{ Title: 'State wise International Airport count in South America', State:
"Guyana", Count: 1 },
{ Title: 'State wise International Airport count in South America', State:
"Suriname", Count: 1 },
],
weightValuePath: 'Count',
leafItemSettings: {
labelPath: 'State',
}
}
}
}
</script>
```

2\. In the template section, define the TreeMap component.

~/SRC/APP.VUE

```
<template>
<div id="app">
<ejs-treemap :dataSource='dataSource' :weightValuePath='weightValuePath'
:leafItemSettings='leafItemSettings'></ejs-treemap>
</div>
</template>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

~/SRC/APP.VUE

```
<template>
    <div class="control_wrapper">
         <ejs-treemap :dataSource='dataSource'
:weightValuePath='weightValuePath'
:leafItemSettings='leafItemSettings'></ejs-treemap>
    </div>
</template>
<script>
import { TreeMapComponent } from '@syncfusion/ej2-vue-treemap';
export default {
  components: {
```

Copyright © 2001 -2024 Syncfusion Inc.

```
    'ejs-treemap' : TreeMapComponent
  },
  data: function() {
    return {
        dataSource: [
            { Title: 'State wise International Airport count in South
America', State: "Brazil", Count: 25 },
            { Title: 'State wise International Airport count in South
America', State: "Colombia", Count: 12 },
            { Title: 'State wise International Airport count in South
America', State: "Argentina", Count: 9 },
            { Title: 'State wise International Airport count in South
America', State: "Ecuador", Count: 7 },
            { Title: 'State wise International Airport count in South
America', State: "Chile", Count: 6 },
            { Title: 'State wise International Airport count in South
America', State: "Peru", Count: 3 },
            { Title: 'State wise International Airport count in South
America', State: "Venezuela", Count: 3 },
            { Title: 'State wise International Airport count in South
America', State: "Bolivia", Count: 2 },
            { Title: 'State wise International Airport count in South
America', State: "Paraguay", Count: 2 },
            { Title: 'State wise International Airport count in South
America', State: "Uruguay", Count: 2 },
            { Title: 'State wise International Airport count in South
America', State: "Falkland Islands",Count: 1 },
            { Title: 'State wise International Airport count in South
America', State: "French Guiana", Count:1 },
            { Title: 'State wise International Airport count in South
America', State: "Guyana", Count: 1 },
            { Title: 'State wise International Airport count in South
America', State: "Suriname", Count: 1 },
        ],
        weightValuePath: 'Count',
        leafItemSettings: {
            labelPath: 'State',
        }
    }
  }
}
</script>
```

Run the project

To run the project, use the following command:

`bash

npm run serve

`

or

`bash

yarn run serve

`

{% previewsample "page.domainurl/code-snippet/treemap/getting-started-cs60" %}

Module Injection

The tree map control is segregated into individual feature-wise modules. To use a particular feature, inject its feature module using the provide option on component creation. Find the modules available in tree map and their descriptions as follows.

- TreeMapHighlight - Inject this provider to use highlight feature.
- TreeMapSelection - Inject this provider to use selection feature.
- TreeMapLegend - Inject this provider to use legend feature.
- TreeMapTooltip - Inject this provider to use tooltip series.

In the current application, the above basic tree map is modified to visualize international airport count in South America.

In this demo, the tree map is just rendered with labels. For this, you need not to import any modules.

Render tree map

This section explains how to render the tree map with data source.

~/SRC/APP.VUE

```
<template>
    <div class="control_wrapper">
        <ejs-treemap id="treemap" :height='height' :dataSource='dataSource'
:weightValuePath='weightValuePath'
:leafItemSettings='leafItemSettings'></ejs-treemap>
    </div>
</template>
<script>
import { TreeMapComponent } from "@syncfusion/ej2-vue-treemap";
export default {
  components: {
    'ejs-treemap': TreeMapComponent
  },
  data: function() {
    return {
    height:'350px',
     dataSource: [
        { Title: 'State wise International Airport count in South America',
State: "Brazil", Count: 25 },
        { Title: 'State wise International Airport count in South America',
State: "Colombia", Count: 12 },
        { Title: 'State wise International Airport count in South America',
State: "Argentina", Count: 9 },
        { Title: 'State wise International Airport count in South America',
State: "Ecuador", Count: 7 },
        { Title: 'State wise International Airport count in South America',
State: "Chile", Count: 6 },
        { Title: 'State wise International Airport count in South America',
State: "Peru", Count: 3 },
        { Title: 'State wise International Airport count in South America',
State: "Venezuela", Count: 3 },
```

```
        { Title: 'State wise International Airport count in South America',
State: "Bolivia", Count: 2 },
        { Title: 'State wise International Airport count in South America',
State: "Paraguay", Count: 2 },
        { Title: 'State wise International Airport count in South America',
State: "Uruguay", Count: 2 },
        { Title: 'State wise International Airport count in South America',
State: "Falkland Islands",Count: 1 },
        { Title: 'State wise International Airport count in South America',
State: "French Guiana", Count:1 },
        { Title: 'State wise International Airport count in South America',
State: "Guyana", Count: 1 },
        { Title: 'State wise International Airport count in South America',
State: "Suriname", Count: 1 },
    ],
    weightValuePath: 'Count',
    leafItemSettings: {
        labelPath: 'State',
    }
    }
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treemap/getting-started-cs15" %}

Here, the tree map is created with data source and set with the [weightValuePath] as count. You can customize the leaf level tree map items using the [leafItemSettings]. The properties such as [fill], [border], and [labelPosition] can be changed using the [leafItemSettings].

Apply color mapping

The color mapping feature supports customization of item colors based on the underlying value of item received from bound data source. Specify the field name from the values that have to be compared for the item in the [equalColorValuePath] or [rangeColorValuePath] property.

~/SRC/APP.VUE

```
<template>
    <div class="control_wrapper">
        <ejs-treemap id="treemap" :height='height' :dataSource='dataSource'
:weightValuePath='weightValuePath'
:equalColorValuePath='equalColorValuePath'
:leafItemSettings='leafItemSettings'></ejs-treemap>
    </div>
</template>
<script>
import { TreeMapComponent } from "@syncfusion/ej2-vue-treemap";
export default {
  components: {
    'ejs-treemap': TreeMapComponent
  },
  data: function() {
    return {
     height: '350px',
        dataSource: [
```

America', State: "Falkland Islands", Count: 1 },
            { Title: 'State wise International Airport count in South
America', State: "French Guiana", Count: 1 },
            { Title: 'State wise International Airport count in South
America', State: "Guyana", Count: 1 },
            { Title: 'State wise International Airport count in South
America', State: "Suriname", Count: 1 },
        ],
        weightValuePath: 'Count',
        equalColorValuePath: 'Count',
        leafItemSettings: {
            labelPath: 'State',
            colorMapping: [
                {
                    value: 25,
                    color: '#634D6F'
                },
                {
                    value: 12,
                    color: '#B34D6D'
                },
                {
                    value: 9,
                    color: '#557C5C'
                },
                {
                    value: 7,
                    color: '#44537F'
                },
                {
                    value: 6,
                    color: '#637392'
                },
                {
                    value: 3,
                    color: '#7C754D'
```

```
                },
                {
                    value: 2,
                    color: '#2E7A64'
                },
                {
                    value: 1,
                    color: '#95659A'
                },
            ]
        }
    }
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treemap/getting-started-cs16" %}

Enable legend

You can show legend for the tree map by setting the [visible] property to true in [legendSettings] object and injecting the TreeMapLegend module using the provide option.

~/SRC/APP.VUE

```
<template>
    <div class="control_wrapper">
        <ejs-treemap id="treemap" :dataSource='dataSource'
:legendSettings='legendSettings' :weightValuePath='weightValuePath'
:equalColorValuePath='equalColorValuePath'
:leafItemSettings='leafItemSettings'></ejs-treemap>
    </div>
</template>
<script>
import { TreeMapComponent, TreeMapLegend } from "@syncfusion/ej2-vue-
treemap";
export default {
  components: {
    'ejs-treemap': TreeMapComponent
  },
  data: function() {
    return {
     dataSource: [
            { Title: 'State wise International Airport count in South
America', State: "Brazil", Count: 25 },
            { Title: 'State wise International Airport count in South
America', State: "Colombia", Count: 12 },
            { Title: 'State wise International Airport count in South
America', State: "Argentina", Count: 9 },
            { Title: 'State wise International Airport count in South
America', State: "Ecuador", Count: 7 },
            { Title: 'State wise International Airport count in South
America', State: "Chile", Count: 6 },
            { Title: 'State wise International Airport count in South
America', State: "Peru", Count: 3 },
            { Title: 'State wise International Airport count in South
America', State: "Venezuela", Count: 3 },
```

```
            { Title: 'State wise International Airport count in South
America', State: "Bolivia", Count: 2 },
            { Title: 'State wise International Airport count in South
America', State: "Paraguay", Count: 2 },
            { Title: 'State wise International Airport count in South
America', State: "Uruguay", Count: 2 },
            { Title: 'State wise International Airport count in South
America', State: "Falkland Islands", Count: 1 },
            { Title: 'State wise International Airport count in South
America', State: "French Guiana", Count: 1 },
            { Title: 'State wise International Airport count in South
America', State: "Guyana", Count: 1 },
            { Title: 'State wise International Airport count in South
America', State: "Suriname", Count: 1 },
        ],
        legendSettings: {
            visible: true,
            position: 'Top',
            shape: 'Rectangle'
        },
        weightValuePath: 'Count',
        equalColorValuePath: 'Count',
        leafItemSettings: {
            labelPath: 'State',
            colorMapping: [
                {
                    value: 25,
                    color: '#634D6F'
                },
                {
                    value: 12,
                    color: '#B34D6D'
                },
                {
                    value: 9,
                    color: '#557C5C'
                },
                {
                    value: 7,
                    color: '#44537F'
                },
                {
                    value: 6,
                    color: '#637392'
                },
                {
                    value: 3,
                    color: '#7C754D'
                },
                {
                    value: 2,
                    color: '#2E7A64'
                },
                {
                    value: 1,
                    color: '#95659A'
                },
```

Copyright © 2001 -2024 Syncfusion Inc.

```
            ]
        }
    }
  },
provide:{
     treemap:[TreeMapLegend]
}
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treemap/getting-started-cs17" %}

Getting Started with the Vue TreeMap Component in Vue 3

This article provides a step-by-step guide for setting up a Vite project with a JavaScript environment and integrating the Syncfusion Vue TreeMap component using the Composition API / Options API.

The Composition API is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

The Options API is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

Prerequisites

System requirements for Syncfusion Vue UI components

Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using Vite. To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

`bash

npm create vite@latest

`

or

`bash

yarn create vite

`

Using one of the above commands will lead you to set up additional configurations for the project as below:

1.Define the project name: We can specify the name of the project directly. Let's specify the name of the project as my-project for this article.

`bash

? Project name: » my-project

`

2.Select Vue as the framework. It will create a Vue 3 project.

`bash

? Select a framework: » - Use arrow-keys. Return to submit.

Vanilla

Vue

React

Preact

Lit

Svelte

Others

`

3.Choose JavaScript as the framework variant to build this Vite project using JavaScript and Vue.

`bash

? Select a variant: » - Use arrow-keys. Return to submit.

JavaScript

TypeScript

Customize with create-vue ↗

Nuxt ↗

`

4.Upon completing the aforementioned steps to create the my-project, run the following command to install its dependencies:

`bash

cd my-project

npm install

`

or

`bash

cd my-project

yarn install

`

Now that my-project is ready to run with default settings, let's add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion Vue component packages are available at npmjs.com. To use Syncfusion Vue components in the project, install the corresponding npm package.

Copyright © 2001 -2024 Syncfusion Inc.

This article uses the Vue TreeMap component as an example. To use the Vue TreeMap component in the project, the @syncfusion/ej2-vue-treemap package needs to be installed using the following command:

`bash

npm install @syncfusion/ej2-vue-treemap --save

`

or

`bash

yarn add @syncfusion/ej2-vue-treemap

`

Add Syncfusion Vue component

Follow the below steps to add the Vue TreeMap component using Composition API or Options API:

1.First, import and register the TreeMap component and its child directives in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { TreeMapComponent as EjsTreemap, TreeMapLegend } from
"@syncfusion/ej2-vue-treemap";
import { TreeMap } from '@syncfusion/ej2-treemap';
TreeMap.Inject(TreeMapLegend);
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { TreeMapComponent, TreeMapLegend } from "@syncfusion/ej2-vue-
treemap";
//Component registration
export default {
name: "App",
components: {
'ejs-treemap': TreeMapComponent
}
}
</script>
```

2.In the template section, define the TreeMap component with the dataSource, weightValuePath, leafItemSettings and other property definitions.

~/SRC/APP.VUE

```
<template>
<ejs-treemap id="treemap" :dataSource="dataSource"
:weightValuePath="weightValuePath" :leafItemSettings="leafItemSettings"
```

Copyright © 2001 -2024 Syncfusion Inc.

```
:equalColorValuePath="equalColorValuePath"
:legendSettings="legendSettings"></ejs-treemap>
</template>
```

3.In the script section, declare the values for the properties defined in the template section.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
const dataSource= [
{ Title: 'State wise International Airport count in South America', State:
"Brazil", Count: 25 },
{ Title: 'State wise International Airport count in South America', State:
"Colombia", Count: 12 },
{ Title: 'State wise International Airport count in South America', State:
"Argentina", Count: 9 },
{ Title: 'State wise International Airport count in South America', State:
"Ecuador", Count: 7 },
{ Title: 'State wise International Airport count in South America', State:
"Chile", Count: 6 },
{ Title: 'State wise International Airport count in South America', State:
"Peru", Count: 3 },
{ Title: 'State wise International Airport count in South America', State:
"Venezuela", Count: 3 },
{ Title: 'State wise International Airport count in South America', State:
"Bolivia", Count: 2 },
{ Title: 'State wise International Airport count in South America', State:
"Paraguay", Count: 2 },
{ Title: 'State wise International Airport count in South America', State:
"Uruguay", Count: 2 },
{ Title: 'State wise International Airport count in South America', State:
"Falkland Islands",Count: 1 },
{ Title: 'State wise International Airport count in South America', State:
"French Guiana", Count:1 },
{ Title: 'State wise International Airport count in South America', State:
"Guyana", Count: 1 },
{ Title: 'State wise International Airport count in South America', State:
"Suriname", Count: 1 }
];
const weightValuePath = 'Count';
const equalColorValuePath = "Count";
const leafItemSettings = {
labelPath: "State",
colorMapping: [
{ value: "25", color: "#634D6F" },
{ value: "12", color: "#B34D6D" },
{ value: "9", color: "#557C5C" },
{ value: "7", color: "#44537F" },
{ value: "6", color: "#637392" },
{ value: "3", color: "#7C754D" },
{ value: "2", color: "#2E7A64" },
{ value: "1", color: "#95659A" }
]
};
const legendSettings = {
visible: true
```

Copyright © 2001 -2024 Syncfusion Inc.

```
};
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
data() {
return {
dataSource: [
{ Title: 'State wise International Airport count in South America', State:
"Brazil", Count: 25 },
{ Title: 'State wise International Airport count in South America', State:
"Colombia", Count: 12 },
{ Title: 'State wise International Airport count in South America', State:
"Argentina", Count: 9 },
{ Title: 'State wise International Airport count in South America', State:

Run the project

To run the project, use the following command:

`bash

npm run dev

`

or

`bash

yarn run dev

`

The output will appear as follows:

Data binding in Vue Treemap component

The TreeMap control supports data binding using the dataSource property.

Populate data

The dataSource property accepts collection values as input. For example, a list of objects can be provided as input. Data can be given as either flat or hierarchical collection to the dataSource property.

<!-- markdownlint-disable MD036 -->

Flat collection

The following code shows, how to bind a flat collection as data source to the TreeMap control.

APP.VUE

```
<template>
    <div class="control_wrapper">
        <ejs-treemap id="treemap"  :dataSource='dataSource'
:weightValuePath='weightValuePath'
:leafItemSettings='leafItemSettings'></ejs-treemap>
    </div>
</template>
<script>
import Vue from 'vue';
import { TreeMapPlugin } from "@syncfusion/ej2-vue-treemap";
Vue.use(TreeMapPlugin);
export default {
  data: function() {
    return {
     dataSource: [
        {State:"United States", GDP:17946, percentage:11.08, Rank:1},
    {State:"China", GDP:10866, percentage: 28.42, Rank:2},
    {State:"Japan", GDP:4123, percentage:-30.78, Rank:3},
    {State:"Germany", GDP:3355, percentage:-5.19, Rank:4},
    {State:"United Kingdom", GDP:2848, percentage:8.28, Rank:5},
```

```
    {State:"France", GDP:2421, percentage:-9.69, Rank:6},
    {State:"India", GDP:2073, percentage:13.65, Rank:7},
    {State:"Italy", GDP:1814, percentage:-12.45, Rank:8},
    {State:"Brazil", GDP:1774, percentage:-27.88, Rank:9},
    {State:"Canada", GDP:1550, percentage:-15.02, Rank:10}
    ],
    weightValuePath: 'GDP',
    leafItemSettings: {
        labelPath: 'State'
    }
    }
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treemap/getting-started-cs8" %}

Layout in Vue Treemap component

Determine the visual representation of nodes belonging to all the TreeMap levels using the layoutType property.

Types of layout

The available layout types are,

- Squarified
- SliceAndDiceVertical
- SliceAndDiceHorizontal
- SliceAndDiceAuto

Squarified

The Squarified layout displays the nested rectangles based on aspect ratio in the TreeMap. The rectangles will be split based on the height and width of the parent. The default rendering type of layout is Squarified.

APP.VUE

```
<template>
    <div class="control_wrapper">
        <ejs-treemap id="treemap"  :dataSource='dataSource'
:weightValuePath='weightValuePath'></ejs-treemap>
    </div>
</template>
<script>
import Vue from 'vue';
import { TreeMapPlugin } from "@syncfusion/ej2-vue-treemap";
Vue.use(TreeMapPlugin);
export default {
  data: function() {
      return {
     dataSource: [
         {State:"United States", GDP:17946, percentage:11.08, Rank:1},
    {State:"China", GDP:10866, percentage: 28.42, Rank:2},
    {State:"Japan", GDP:4123, percentage:-30.78, Rank:3},
    {State:"Germany", GDP:3355, percentage:-5.19, Rank:4},
```

```
    {State:"United Kingdom", GDP:2848, percentage:8.28, Rank:5},
    {State:"France", GDP:2421, percentage:-9.69, Rank:6},
    {State:"India", GDP:2073, percentage:13.65, Rank:7},
    {State:"Italy", GDP:1814, percentage:-12.45, Rank:8},
    {State:"Brazil", GDP:1774, percentage:-27.88, Rank:9},
    {State:"Canada", GDP:1550, percentage:-15.02, Rank:10}
    ],
    weightValuePath: 'GDP',
    }
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treemap/getting-started-cs26" %}

SliceAndDiceVertical

The SliceAndDiceVertical layout creates rectangles with high aspect ratio and displays items in a vertically sorted order.

APP.VUE

```
<template>
    <div class="control_wrapper">
        <ejs-treemap id="treemap"  :dataSource='dataSource'
:weightValuePath='weightValuePath' :layoutType='layoutType'></ejs-treemap>
    </div>
</template>
<script>
import Vue from 'vue';
import { TreeMapPlugin } from "@syncfusion/ej2-vue-treemap";
Vue.use(TreeMapPlugin);
export default {
  data: function() {
    return {
     dataSource: [
         {State:"United States", GDP:17946, percentage:11.08, Rank:1},
    {State:"China", GDP:10866, percentage: 28.42, Rank:2},
    {State:"Japan", GDP:4123, percentage:-30.78, Rank:3},
    {State:"Germany", GDP:3355, percentage:-5.19, Rank:4},
    {State:"United Kingdom", GDP:2848, percentage:8.28, Rank:5},
    {State:"France", GDP:2421, percentage:-9.69, Rank:6},
    {State:"India", GDP:2073, percentage:13.65, Rank:7},
    {State:"Italy", GDP:1814, percentage:-12.45, Rank:8},
    {State:"Brazil", GDP:1774, percentage:-27.88, Rank:9},
    {State:"Canada", GDP:1550, percentage:-15.02, Rank:10}
    ],
    weightValuePath: 'GDP',
    layoutType : 'SliceAndDiceVertical',
    }
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treemap/getting-started-cs27" %}

SliceAndDiceHorizontal

The SliceAndDiceHorizontal layout creates rectangles with high aspect ratio and displays items in a horizontally sorted order.

APP.VUE

```
<template>
    <div class="control_wrapper">
        <ejs-treemap id="treemap"  :dataSource='dataSource'
:weightValuePath='weightValuePath' :layoutType='layoutType'></ejs-treemap>
    </div>
</template>
<script>
import Vue from 'vue';
import { TreeMapPlugin } from "@syncfusion/ej2-vue-treemap";
Vue.use(TreeMapPlugin);
export default {
  data: function() {
    return {
     dataSource: [
         {State:"United States", GDP:17946, percentage:11.08, Rank:1},
    {State:"China", GDP:10866, percentage: 28.42, Rank:2},
    {State:"Japan", GDP:4123, percentage:-30.78, Rank:3},
    {State:"Germany", GDP:3355, percentage:-5.19, Rank:4},
    {State:"United Kingdom", GDP:2848, percentage:8.28, Rank:5},
    {State:"France", GDP:2421, percentage:-9.69, Rank:6},
    {State:"India", GDP:2073, percentage:13.65, Rank:7},
    {State:"Italy", GDP:1814, percentage:-12.45, Rank:8},
    {State:"Brazil", GDP:1774, percentage:-27.88, Rank:9},
    {State:"Canada", GDP:1550, percentage:-15.02, Rank:10}
    ],
    layoutType : 'SliceAndDiceHorizontal',
    weightValuePath: 'GDP',
    }
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treemap/getting-started-cs28" %}

SliceAndDiceAuto

The SliceAndDiceAuto layout creates rectangles with high aspect ratio and display items sorted both horizontally and vertically.

APP.VUE

```
<template>
    <div class="control_wrapper">
        <ejs-treemap id="treemap"  :dataSource='dataSource'
:weightValuePath='weightValuePath' :layoutType='layoutType'></ejs-treemap>
    </div>
</template>
<script>
import Vue from 'vue';
import { TreeMapPlugin } from "@syncfusion/ej2-vue-treemap";
Vue.use(TreeMapPlugin);
```

    {State:"Canada", GDP:1550, percentage:-15.02, Rank:10}
    ],
    layoutType : 'SliceAndDiceAuto',
    weightValuePath: 'GDP',
    }
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treemap/getting-started-cs29" %}

Leaf item in Vue Treemap component

A leaf item defines a visualized data element and does not contain child nodes but contains parent node if the levels are specified in the TreeMap.

Leaf label

Label is represented by item name or value. Label will be appeared by specifying the labelPath property and customize the label style using the labelStyle property.

APP.VUE

```
<template>
    <div class="control_wrapper">
        <ejs-treemap id="treemap" :height='height' :dataSource='dataSource'
:weightValuePath='weightValuePath'
:leafItemSettings='leafItemSettings'></ejs-treemap>
    </div>
</template>
<script>
import Vue from 'vue';
import { TreeMapPlugin } from "@syncfusion/ej2-vue-treemap";
Vue.use(TreeMapPlugin);
export default {
  data: function() {
    return {
    height:'350px',
     dataSource: [
        {State:"United States", GDP:17946, percentage:11.08, Rank:1},
    {State:"China", GDP:10866, percentage: 28.42, Rank:2},
    {State:"Japan", GDP:4123, percentage:-30.78, Rank:3},
    {State:"Germany", GDP:3355, percentage:-5.19, Rank:4},
    {State:"United Kingdom", GDP:2848, percentage:8.28, Rank:5},
    {State:"France", GDP:2421, percentage:-9.69, Rank:6},
```

Levels in Vue Treemap component

TreeMap supports **n** number of levels and each level is separated by using the groupPath property.

<!-- markdownlint-disable MD036 -->

Group path

The groupPath property is used to separate each level of the TreeMap by specifying the property from the data source.

In the following example, three levels are added and each level is configured using the groupPath property.

APP.VUE

```
<template>
    <div class="control_wrapper">
        <ejs-treemap id="treemap" :dataSource='dataSource'
:weightValuePath='weightValuePath' :levels='levels' :palette=
'palette'></ejs-treemap>
    </div>
</template>
<script>
import Vue from 'vue';
import { TreeMapPlugin } from "@syncfusion/ej2-vue-treemap";
Vue.use(TreeMapPlugin);
export default {
  data: function() {
    return {
     dataSource: [
    { Category: 'Employees', Country: 'USA', JobDescription: 'Sales',
JobGroup: 'Executive', EmployeesCount: 20 },
    { Category: 'Employees', Country: 'USA', JobDescription: 'Sales',
JobGroup: 'Analyst', EmployeesCount: 30 },
    { Category: 'Employees', Country: 'USA', JobDescription: 'Marketing',
EmployeesCount: 40 },
    { Category: 'Employees', Country: 'USA', JobDescription: 'Management',
EmployeesCount: 80 },
    { Category: 'Employees', Country: 'India', JobDescription: 'Technical',
JobGroup: 'Testers', EmployeesCount: 100 },
    { Category: 'Employees', Country: 'India', JobDescription: 'HR

{% previewsample "page.domainurl/code-snippet/treemap/getting-started-cs50" %}

Color mapping in Vue Treemap component

Color mapping is used to customize the color for each group or item based on the specified types. The following options are available to customize the group and leaf items in the TreeMap.

Range color mapping

Range color mapping is used to apply color to the items by giving specific ranges in the DataSource, and it should be specifying the data source properties to the rangeColorValuePath. The color mapping ranges to be specified in the from and to properties of the colorMapping.

APP.VUE

```
<template>
    <div class="control_wrapper">
        <ejs-treemap id="treemap"  :dataSource='dataSource'
:rangeColorValuePath='rangeColorValuePath'
:weightValuePath='weightValuePath'
:leafItemSettings='leafItemSettings'></ejs-treemap>
    </div>
</template>
<script>
import Vue from 'vue';
import { TreeMapPlugin, TreeMapTooltip } from "@syncfusion/ej2-vue-treemap";
Vue.use(TreeMapPlugin);
export default {
  data: function() {
    return {
     dataSource: [{ fruit:'Apple', count:5000 },
                    { fruit:'Mango', count:3000 },
                    { fruit:'Orange', count:2300 },
                    { fruit:'Banana', count:500 },
                    { fruit:'Grape', count:4300 },
                    { fruit:'Papaya', count:1200 },
                    { fruit:'Melon', count:4500 }
    ],
    weightValuePath: 'count',
    rangeColorValuePath:'count',
    leafItemSettings: {
```

Copyright © 2001 -2024 Syncfusion Inc.

```
        labelPath: 'fruit',
        colorMapping:[
            {
                from:500,
                to:3000,
                color:'orange'
            },
            {
                from:3000,
                to:5000,
                color:'green'
            }
        ]
     },
    }
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treemap/getting-started-cs1" %}

Equal color mapping

Equal color mapping is used to fill colors to each item by specifying equal value present in the data source, that can be specified in the equalColorValuePath property.

APP.VUE

```
<template>
    <div class="control_wrapper">
        <ejs-treemap id="treemap"  :dataSource='dataSource'
:equalColorValuePath='equalColorValuePath'
:weightValuePath='weightValuePath'
:leafItemSettings='leafItemSettings'></ejs-treemap>
    </div>
</template>
<script>
import Vue from 'vue';
import { TreeMapPlugin } from "@syncfusion/ej2-vue-treemap";
Vue.use(TreeMapPlugin);
export default {
  data: function() {
    return {
     dataSource: [{ Car:'Mustang', Brand:'Ford', count:232 },
                    { Car:'EcoSport', Brand:'Ford', count:121 },
                    { Car:'Swift', Brand:'Maruti', count:143 },
                    { Car:'Baleno', Brand:'Maruti', count:454 },
                    { Car:'Vitara Brezza', Brand:'Maruti', count:545 },
                    { Car:'A3 Cabriolet', Brand:'Audi',count:123 },
                    { car:'RS7 Sportback', Brand:'Audi', count:523 }
    ],
    weightValuePath: 'count',
    equalColorValuePath:'Brand',
    leafItemSettings: {
        labelPath: 'Car',
        colorMapping:[
            {
```

```
                value:'Ford',
                color:'green'
            },
            {
                value:'Audi',
                color:'red'
            },
            {
                value:'Maruti',
                color:'orange'
            }
        ]
     },
    }
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treemap/getting-started-cs2" %}

Desaturation color mapping

Desaturation color mapping is used to apply colors to the items based on the minOpacity and maxOpacity properties in the colorMapping.

APP.VUE

```
<template>
    <div class="control_wrapper">
        <ejs-treemap id="treemap"  :dataSource='dataSource'
:rangeColorValuePath='rangeColorValuePath'
:weightValuePath='weightValuePath'
:leafItemSettings='leafItemSettings'></ejs-treemap>
    </div>
</template>
<script>
import Vue from 'vue';
import { TreeMapPlugin } from "@syncfusion/ej2-vue-treemap";
Vue.use(TreeMapPlugin);
export default {
  data: function() {
    return {
    height:'350px',
     dataSource: [
                        { fruit:'Apple', count:5000 },
                        { fruit:'Mango', count:3000 },
                        { fruit:'Orange', count:2300 },
                        { fruit:'Banana', count:500 },
                        { fruit:'Grape', count:4300 },
                        { fruit:'Papaya', count:1200 },
                        { fruit:'Melon', count:4500 }
    ],
    weightValuePath: 'count',
    rangeColorValuePath:'count',
    leafItemSettings: {
        labelPath: 'fruit',
        colorMapping:[
```

```
            {
                from:500,
                to:3000,
                minOpacity:0.2,
                maxOpacity:0.5,
                color:'orange'
            },
            {
                from:3000,
                to:5000,
                minOpacity:0.5,
                maxOpacity:0.8,
                color:'green'
            }
        ]
     }
    }
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treemap/getting-started-cs3" %}

Palette color mapping

The palette color mapping is used to fill the color to each group or leaf item by given colors in the palette property.

APP.VUE

```
<template>
    <div class="control_wrapper">
        <ejs-treemap id="treemap"  :dataSource='dataSource'
:weightValuePath='weightValuePath' :palette='palette'
:leafItemSettings='leafItemSettings'></ejs-treemap>
    </div>
</template>
<script>
import Vue from 'vue';
import { TreeMapPlugin } from "@syncfusion/ej2-vue-treemap";
Vue.use(TreeMapPlugin);
export default {
  data: function() {
    return {
    height:'350px',
     dataSource: [{ Car:'Mustang', Brand:'Ford', count:232 },
                    { Car:'EcoSport', Brand:'Ford', count:121 },
                    { Car:'Swift', Brand:'Maruti', count:143 },
                    { Car:'Baleno', Brand:'Maruti', count:454 },
                    { Car:'Vitara Brezza', Brand:'Maruti', count:545 },
                    { Car:'A3 Cabriolet', Brand:'Audi',count:123 },
                    { car:'RS7 Sportback', Brand:'Audi', count:523 }
                  ],
    palette:['red','green'],
    weightValuePath: 'count',
    leafItemSettings: {
        labelPath: 'Car'
```

Copyright © 2001 -2024 Syncfusion Inc.

```
      }
    }
    }
  }
</script>
```

{% previewsample "page.domainurl/code-snippet/treemap/getting-started-cs4" %}

Desaturation with multiple colors

Multiple colors are used as gradient effect to specific shapes based on the ranges in datasource. By using color property, you can set n number of colors.

APP.VUE

```
<template>
    <div class="control_wrapper">
        <ejs-treemap id="treemap"  :dataSource='dataSource'
:rangeColorValuePath='rangeColorValuePath'
:weightValuePath='weightValuePath'
:leafItemSettings='leafItemSettings'></ejs-treemap>
    </div>
</template>
<script>
import Vue from 'vue';
import { TreeMapPlugin } from "@syncfusion/ej2-vue-treemap";
Vue.use(TreeMapPlugin);
export default {
  data: function() {
    return {
    height:'350px',
     dataSource: [
                        { fruit:'Apple', count:5000 },
                        { fruit:'Mango', count:3000 },
                        { fruit:'Orange', count:2300 },
                        { fruit:'Banana', count:500 },
                        { fruit:'Grape', count:4300 },
                        { fruit:'Papaya', count:1200 },
                        { fruit:'Melon', count:4500 }
    ],
    weightValuePath: 'count',
    rangeColorValuePath:'count',
    leafItemSettings: {
        labelPath: 'fruit',
        colorMapping:[
            {
                from:500,
                to:2500,
                color:['orange','pink']
            },
            {
                from:3000,
                to:5000,
                color:['green','red','blue']
            }
        ]
     }
```

```
    }
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treemap/getting-started-cs5" %}

Color for items excluded from color mapping

Get the excluded ranges from data source using the color mapping and apply the specific color to those items, without specifying the from and to properties.

APP.VUE

```
<template>
    <div class="control_wrapper">
        <ejs-treemap id="treemap"  :dataSource='dataSource'
:rangeColorValuePath='rangeColorValuePath'
:weightValuePath='weightValuePath'
:leafItemSettings='leafItemSettings'></ejs-treemap>
    </div>
</template>
<script>
import Vue from 'vue';
import { TreeMapPlugin } from "@syncfusion/ej2-vue-treemap";
Vue.use(TreeMapPlugin);
export default {
  data: function() {
    return {
    height:'350px',
     dataSource: [
                        { fruit:'Apple', count:5000 },
                        { fruit:'Mango', count:3000 },
                        { fruit:'Orange', count:2300 },
                        { fruit:'Banana', count:500 },
                        { fruit:'Grape', count:4300 },
                        { fruit:'Papaya', count:1200 },
                        { fruit:'Melon', count:4500 }
    ],
    weightValuePath: 'count',
    rangeColorValuePath:'count',
    leafItemSettings: {
        labelPath: 'fruit',
        colorMapping:[
            {
               from:500,
               to:2500,
               color:'orange'
           },
           {
               from:3000,
               to:4000,
               color:'green'
           },
           {
               color:'red'
           }
```

```
        ]
      }
    }
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treemap/getting-started-cs6" %}

Bind the colors to the items from data source

To set the color for each item from the data source, bind the data source property to the colorValuePath.

APP.VUE

```
<template>
    <div class="control_wrapper">
        <ejs-treemap id="treemap"  :dataSource='dataSource'
:colorValuePath='colorValuePath' :palette='palette'
:weightValuePath='weightValuePath'
:leafItemSettings='leafItemSettings'></ejs-treemap>
    </div>
</template>
<script>
import Vue from 'vue';
import { TreeMapPlugin } from "@syncfusion/ej2-vue-treemap";
Vue.use(TreeMapPlugin);
export default {
  data: function() {
    return {
    height:'350px',
     dataSource: [
                        { fruit:'Apple', count:5000, color: 'red'},
                        { fruit:'Mango', count:3000, color:'blue'},
                        { fruit:'Orange', count:2300, color:'green' },
                        { fruit:'Banana', count:500, color:'yellow' },
                        { fruit:'Grape', count:4300, color:'orange' },
                        { fruit:'Papaya', count:1200, color:'pink' },
                        { fruit:'Melon', count:4500, color:'violet' }
    ],
    weightValuePath: 'count',
    colorValuePath:'color',
    palette:[],
    leafItemSettings: {
        labelPath: 'fruit',
     }
    }
  }
}
</script>
```

Data label in Vue Treemap component

Data Labels are used to identify the name of items or groups in the TreeMap component. Data Labels will be shown by specifying the data source properties in the labelPath of the leafItemSettings.

Format

Customize the labels for each item using the labelFormat property in the leafItemSettings.

APP.VUE

```
<template>
    <div class="control_wrapper">
        <ejs-treemap id="treemap"  :dataSource='dataSource'
:weightValuePath='weightValuePath'
:leafItemSettings='leafItemSettings'></ejs-treemap>
    </div>
</template>
<script>
import Vue from 'vue';
import { TreeMapPlugin } from "@syncfusion/ej2-vue-treemap";
Vue.use(TreeMapPlugin);
export default {
  data: function() {
    return {
     dataSource: [
         { Car:'Mustang', Brand:'Ford', count:232 },
                    { Car:'EcoSport', Brand:'Ford', count:121 },
                    { Car:'Swift', Brand:'Maruti', count:143 },
                    { Car:'Baleno', Brand:'Maruti', count:454 },
                    { Car:'Vitara Brezza', Brand:'Maruti', count:545 },
                    { Car:'A3 Cabriolet', Brand:'Audi',count:123 },
                    { Car:'RS7 Sportback', Brand:'Audi', count:523 }
    ],
    weightValuePath: 'count',
    leafItemSettings: {
        labelPath: 'Car',
        labelFormat:'${Car}-${Brand}'
     }
    }
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treemap/getting-started-cs9" %}

Template

The template supports customizing labels of each leaf node using the labelTemplate property. It uses Essential JS2 template engine to render elements and the position of templates can be customize using the templatePosition property.

APP.VUE

```
<template>
    <div class="control_wrapper">
        <ejs-treemap id="treemap"  :dataSource='dataSource'
:weightValuePath='weightValuePath'
:leafItemSettings='leafItemSettings'></ejs-treemap>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
    </div>
</template>
<script>
import Vue from 'vue';
import { TreeMapPlugin } from "@syncfusion/ej2-vue-treemap";
Vue.use(TreeMapPlugin);
let contentVue = Vue.component("contentTemplate", {
  template: '<div>{{data.Car}}-{{data.Brand}}</div>',
  data() {
    return {
      data: {}
    };
  }
});
let contentTemplate = function() {
  return { template: contentVue };
};
export default {
  data: function() {
    return {
     dataSource: [
         { Car:'Mustang', Brand:'Ford', count:232 },
                       { Car:'EcoSport', Brand:'Ford', count:121 },
                       { Car:'Swift', Brand:'Maruti', count:143 },
                       { Car:'Baleno', Brand:'Maruti', count:454 },
                       { Car:'Vitara Brezza', Brand:'Maruti', count:545 },
                       { Car:'A3 Cabriolet', Brand:'Audi',count:123 },
                       { Car:'RS7 Sportback', Brand:'Audi', count:523 }
    ],
    weightValuePath: 'count',
    leafItemSettings: {
       labelPath: 'Car',
       labelTemplate:contentTemplate
     }
    }
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treemap/getting-started-cs10" %}

InterSectAction

When the label size in each item exceeds the actual size, use the interSectAction property in the leafItemSettings to customise the labels.

APP.VUE

```
<template>
    <div class="control_wrapper">
        <ejs-treemap id="treemap"  :dataSource='dataSource'
:weightValuePath='weightValuePath'
:leafItemSettings='leafItemSettings'></ejs-treemap>
    </div>
</template>
<script>
import Vue from 'vue';
```

```
import { TreeMapPlugin } from "@syncfusion/ej2-vue-treemap";
Vue.use(TreeMapPlugin);
export default {
  data: function() {
    return {
     dataSource: [
         { Car:'Mustang', Brand:'Ford', count:232 },
                       { Car:'EcoSport', Brand:'Ford', count:121 },
                       { Car:'Swift', Brand:'Maruti', count:143 },
                       { Car:'Baleno', Brand:'Maruti', count:454 },
                       { Car:'Vitara Brezza', Brand:'Maruti', count:545 },
                       { Car:'A3 Cabriolet', Brand:'Audi',count:123 },
                       { car:'RS7 Sportback', Brand:'Audi', count:523 }
    ],
    weightValuePath: 'count',
    leafItemSettings: {
        labelPath: 'Car',
        labelFormat:'${Car}-${Brand}',
        interSectAction:'WrapByWord'
     }
    }
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treemap/getting-started-cs11" %}

Legend in Vue Treemap component

<!-- markdownlint-disable MD010 -->

Legend is used to provide valuable information for interpreting what the TreeMap displays. The legends can be represented in various colors, shapes or other identifiers based on the data.

Position and alignment

Legend position is used to place legend in various positions. Based on the legend position, the legend item will be aligned. For example, if the position is top or bottom, the legend items are placed by rows. If the position is left or right, the legend items are placed by columns.

The following options are available to customize the legend position:

- Top
- Bottom
- Left
- Right
- Float

APP.VUE

{% previewsample "page.domainurl/code-snippet/treemap/getting-started-cs35" %}

Legend mode

The TreeMap control supports two different types of legend rendering modes such as Default and Interactive.

<!-- markdownlint-disable MD036 -->

Default mode

In default mode, the legends have symbols with legend labels that are used to identify the items in the TreeMap.

APP.VUE

```
<template>

Interactive mode

The legends can be made interactive with an arrow mark that indicates exact range color in the legend when the mouse hovers on the TreeMap item. Enable this option by setting the mode property in the legendSettings to **Interactive**.

APP.VUE

```

    treemap: [TreeMapLegend]
  },
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treemap/getting-started-cs45" %}

Drilldown in Vue Treemap component

The TreeMap supports drill-down to expose the hierarchy, achieved by clicking a node. If an item is clicked in the TreeMap, it will be moved to the next level or sub level hierarchy and returned back to the previous level by clicking the node.

Copyright © 2001 -2024 Syncfusion Inc.

Perform drill-down action

The TreeMap items can be drilled by setting the enableDrillDown property to **true**.

APP.VUE

```
<template>
    <div class="control_wrapper">
        <ejs-treemap id="treemap"  :dataSource='dataSource'
:palette='palette' :enableDrillDown= 'enableDrillDown'
:weightValuePath='weightValuePath' :levels='levels'></ejs-treemap>
    </div>
</template>
<script>
import Vue from 'vue';

On-demand data loading

All the child items are rendered during the normal drill-down process, and visible at the initial rendering of the TreeMap. But on-demand data loading, it will not render child items at initial rendering, and child nodes will be rendered during the drill-down process by setting the drillDownView property to **true**.

Breadcrumb support

TreeMap items are drilled, up to any level of parent using breadcrumb navigation and the level from root parent to current level is displayed at the top of item layout. It can be enabled by using the enableBreadcrumb property to **true** and customize the breadcrumb connector using the breadcrumbConnector property. By default, -(hyphen) is the connector.

Tooltip in Vue Treemap component

Tooltip is used to display details about the items in the TreeMap. When space constraints prevent us from displaying the information using Data Labels, the tooltip comes in handy.

Default tooltip

The tooltip is not visible by default, to make it visible, set the visible property in the tooltipSettings to **true** and injecting the TreeMapTooltip.

APP.VUE

```
<template>
    <div class="control_wrapper">
        <ejs-treemap id="treemap"  :dataSource='dataSource'
:tooltipSettings='tooltipSettings' :weightValuePath='weightValuePath'
:leafItemSettings='leafItemSettings'></ejs-treemap>
    </div>
</template>
<script>
import Vue from 'vue';
import { TreeMapPlugin, TreeMapTooltip } from "@syncfusion/ej2-vue-treemap";
Vue.use(TreeMapPlugin);
export default {
  data: function() {
    return {
     dataSource: [
        { fruit:'Apple', count:5000 },
                        { fruit:'Mango', count:3000 },
                        { fruit:'Orange', count:2300 },
                        { fruit:'Banana', count:500 },
                        { fruit:'Grape', count:4300 },
                        { fruit:'Papaya', count:1200 },
                        { fruit:'Melon', count:4500 }
    ],
   weightValuePath: 'count',
     tooltipSettings: {
            visible: true
    },
    leafItemSettings: {
        labelPath: 'fruit'
     }
    }
  },
  provide:{
    treemap:[TreeMapTooltip]
},
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treemap/getting-started-cs57" %}

Copyright © 2001 -2024 Syncfusion Inc.

Format tooltip

The tooltip content is displayed by default based on the weightValuePath. In addition, to show more information in the tooltip, use the format property and define field from the data source as ${datafield}.

APP.VUE

```
<template>
    <div class="control_wrapper">
        <ejs-treemap id="treemap"  :dataSource='dataSource'
:tooltipSettings='tooltipSettings' :weightValuePath='weightValuePath'
:leafItemSettings='leafItemSettings'></ejs-treemap>
    </div>
</template>
<script>
import Vue from 'vue';
import { TreeMapPlugin, TreeMapTooltip } from "@syncfusion/ej2-vue-treemap";
Vue.use(TreeMapPlugin);
export default {
  data: function() {
    return {
     dataSource: [
        { fruit:'Apple', count:5000 },
                        { fruit:'Mango', count:3000 },
                        { fruit:'Orange', count:2300 },
                        { fruit:'Banana', count:500 },
                        { fruit:'Grape', count:4300 },
                        { fruit:'Papaya', count:1200 },
                        { fruit:'Melon', count:4500 }
    ],
   weightValuePath: 'count',
     tooltipSettings: {
            visible: true,
            format:'Name:${fruit} - TotalCount:${count}'
    },
    leafItemSettings: {
        labelPath: 'fruit'
     }
    }
  },
  provide:{
    treemap:[TreeMapTooltip]
},
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treemap/getting-started-cs58" %}

Tooltip template

Tooltip can be rendered as a custom component using the template property in the tooltipSettings which accepts one or more UI elements as an input, that can be rendered as a part of the tooltip rendering. You can use ${datafield} as placeholder in HTML element to display the values from data source.

Selection and highlight in Vue Treemap component

Selection

Selection is used to select a particular group or item to differentiate from other items. Each item or each group can be selected and deselected while interacting with the items. The corresponding Treemap items are also selected while tapping a specific legend item, and vice versa.

The fill property is used to change the selected item color. The color and the width properties are used to customize the selected item border, and the selection is enabled by using the enable property to **true** in the selectionSettings.

APP.VUE

```
<template>
    <div class="control_wrapper">
        <ejs-treemap id="treemap" :dataSource='dataSource' :levels='levels'

Print and export in Vue Treemap component

Print

To use the print functionality, we should inject the Print module using the provide section and set the allowPrint property to **true**. The rendered treemap can be printed directly from the browser by calling the method print.

APP.VUE

```
<template>
  <div class="control_wrapper">
    <button id="print" @click="clickPrint">Print</button>
    <ejs-treemap ref="treemap" :allowPrint='allowPrint'
:dataSource='dataSource' :weightValuePath='weightValuePath'
      :leafItemSettings='leafItemSettings'></ejs-treemap>
  </div>
</template>
<script>
import Vue from 'vue';
import { TreeMapPlugin, Print } from "@syncfusion/ej2-vue-treemap";
Vue.use(TreeMapPlugin);
export default {
  data: function () {
    return {
      dataSource: [

Export

Image Export

To use the image export functionality, we should inject the ImageExport module using the provide section and set the allowImageExport property to **true**. The rendered treemap can be exported as an image using the export method. The method requires two parameters: image type and file name. The treemap can be exported as an image in the following formats.

- JPEG
- PNG
- SVG

APP.VUE

```
<template>
  <div class="control_wrapper">
    <button id="export" @click="clickExport">Export</button>
    <ejs-treemap id="treemap" ref='treemap'
:allowImageExport='allowImageExport' :dataSource='dataSource'
      :weightValuePath='weightValuePath'
:leafItemSettings='leafItemSettings'></ejs-treemap>
  </div>
</template>
<script>
import Vue from 'vue';

    }
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treemap/getting-started-cs52" %}

We can get the image file as base64 string for the JPEG and PNG formats. The treemap can be exported to image as a base64 string using the export method. There are four parameters required: image type, file name, orientation of the exported PDF document which must be set as **null** for image export and finally **allowDownload** which should be set as **false** to return base64 string.

</script>
```

{% previewsample "page.domainurl/code-snippet/treemap/getting-started-cs54" %}

The exporting of the treemap as base64 string is not supported in the PDF export.

Accessibility in Vue Treemap component

TreeMap has built-in accessibility features like screen reading and WAI-ARIA attributes.

Copyright © 2001 -2024 Syncfusion Inc.

WAI-ARIA attributes

The TreeMap component follows the WAI-ARIA patterns to meet the accessibility. The following ARIA attributes are used in the TreeMap component:

| Attributes | Purpose |

| --- | --- |

| role=region | It specifies the TreeMap areas that do not support interactive functions like selection and highlight. |

| role=button | It specifies the TreeMap areas where interactive functions such as selection and highlight are available. |

| aria-label | Provides an accessible name for the data labels, legend title, and legend item labels. |

Screen reading in TreeMap

Accessibility in the TreeMap component ensures that all users, regardless of ability or disability, can use screen reading. The following TreeMap elements will be read aloud using screen reading software, such as Narrator for Windows.

| Elements | Description |

| --- | --- |

| Data labels | Reads the labels displayed on leaf items of the TreeMap. |

| Legend title | Reads the title of the legend in the TreeMap. |

| Legend item label | Reads the label of the legend item in the TreeMap. |

Ensuring accessibility

The TreeMap component's accessibility levels are ensured through an accessibility-checker and axe-core software tools during automated testing.

The accessibility compliance of the TreeMap component is shown in the following sample. Open the sample in a new window to evaluate the accessibility of the TreeMap component with accessibility tools.

{% previewsample "https://ej2.syncfusion.com/accessibility/tree-map.html" %}

Internationalization in Vue Treemap component

The TreeMap control supports internationalization for the following elements:

- Data label
- Tooltip

For more information about number and date formatter, refer to internationalization.

<!-- markdownlint-disable MD036 -->

Copyright © 2001 -2024 Syncfusion Inc.

Globalization

Globalization is the process of designing and developing a component that works in different cultures/locales. Internationalization library is used to globalize number, date, and time values in the TreeMap control using the format property in the TreeMap.

Numeric format

In the following code example, tooltip is globalized to Deutsch culture.

```
<template>
<div class="control_wrapper">
<ejs-treemap id="treemap" :dataSource='dataSource' :weightValuePath='weightValuePath' :format='format' :leafItemSettings='leafItemSettings' useGroupingSeparator='true'></ejs-treemap>
</div>
</template>
<script>
import Vue from 'vue';
import { TreeMapPlugin } from "@syncfusion/ej2-vue-treemap";
Vue.use(TreeMapPlugin);
export default {
data: function() {
return {
format:'c',
dataSource: [
{State:"United States", GDP:17946, percentage:11.08, Rank:1},
{State:"China", GDP:10866, percentage: 28.42, Rank:2},
{State:"Japan", GDP:4123, percentage:-30.78, Rank:3},
{State:"Germany", GDP:3355, percentage:-5.19, Rank:4},
{State:"United Kingdom", GDP:2848, percentage:8.28, Rank:5},
{State:"France", GDP:2421, percentage:-9.69, Rank:6},
{State:"India", GDP:2073, percentage:13.65, Rank:7},
{State:"Italy", GDP:1814, percentage:-12.45, Rank:8},
{State:"Brazil", GDP:1774, percentage:-27.88, Rank:9},
{State:"Canada", GDP:1550, percentage:-15.02, Rank:10}
],
weightValuePath: 'GDP',
```

Copyright © 2001 -2024 Syncfusion Inc.

leafItemSettings: {

labelPath: 'GDP',

}

}

}

}

</script>

`

Right-to-left rendering

The TreeMap control supports right-to-left rendering for all its elements such as nodes, tooltip, data labels, and legends.

Legend with Rtl support

If the enableRtl property is set to **true**, then the legend icon will be rendered on the right and the legend text will be rendered on the left of the legend icon.

APP.VUE

```
<template>
    <div class="control_wrapper">
        <ejs-treemap id="treemap"  :dataSource='dataSource'
:legendSettings='legendSettings' :colorValuePath ='colorValuePath'
:weightValuePath='weightValuePath'
:leafItemSettings='leafItemSettings'></ejs-treemap>
    </div>
</template>
<script>
import Vue from 'vue';
import { TreeMapPlugin, TreeMapLegend } from "@syncfusion/ej2-vue-treemap";
Vue.use(TreeMapPlugin);
export default {
  data: function() {
    return {
     dataSource: [
                        { Car:'Mustang', Brand:'Ford', count:232, color:
'#71B081' },
                        { Car:'EcoSport', Brand:'Ford', count:121,  color:
'#5A9A77' },
                        { Car:'Swift', Brand:'Maruti', count:143, color:
'#498770' },
                        { Car:'Baleno', Brand:'Maruti', count:454, color:

Treemap Item Rendering Direction

The direction of TreeMap item is `TopLeftBottomRight` by default and customize the rendering direction of the TreeMap item by setting the renderDirection property.

The TreeMap can be rendered in the following directions:

- TopLeftBottomRight
- TopRightBottomLeft
- BottomRightTopLeft
- BottomLeftTopRight

The following example demonstrate, how to render the treemap in the RTL direction with `TopLeftBottomRight`.

APP.VUE

```
<template>
    <div class="control_wrapper">
        <ejs-treemap id="treemap"  :dataSource='dataSource'
:palette='palette' :renderDirection='renderDirection'
:weightValuePath='weightValuePath'
:leafItemSettings='leafItemSettings'></ejs-treemap>
    </div>
</template>
<script>
import Vue from 'vue';
import { TreeMapPlugin, TreeMapLegend } from "@syncfusion/ej2-vue-treemap";
Vue.use(TreeMapPlugin);
export default {
  data: function() {
    return {
     dataSource: [
                        { fruit:'Apple', count:5000 },
                        { fruit:'Mango', count:3000 },
                        { fruit:'Orange', count:2300 },
                        { fruit:'Banana', count:500 },
                        { fruit:'Grape', count:4300 },
                        { fruit:'Papaya', count:1200 },
                        { fruit:'Melon', count:4500 }
    ],

How To

Drilldown in Vue Treemap component

<!-- markdownlint-disable MD033 -->

Customize the header for treemap drilldown

Yon can add a header element as and customize it to show the population of a particular country or continent on treemap drill-down.

To customize the header for treemap drill-down, follow the given steps:

Step 1:

<!-- markdownlint-disable MD031 -->

Initialize the treemap and enable the drill-down option.

`

<template>

Copyright © 2001 -2024 Syncfusion Inc.

```
<div>
<div id="header" style="background-color: #179bd7"></div>
<div class='control_wrapper'>
<ejs-treemap id='container' :dataSource="dataSource" weightValuePath="Population" format="n"
useGroupingSeparator="true" enableDrillDown="true" :palette="palette"
:leafItemSettings='leafItemSettings' :levels='levels'>
</ejs-treemap>
</div>
</div>
</template>
<script>
import Vue from 'vue';
import { TreeMapPlugin } from '@syncfusion/ej2-vue-treemap';
import { data } from './datasource.js';
Vue.use(TreeMapPlugin);
export default {
data () {
return {
dataSource:  data,
palette: ["#9999ff", "#CCFF99", "#FFFF99", "#FF9999", "#FF99FF", "#FFCC66"],
levels: [
{
groupPath: 'Continent', border: { color: 'black', width: 0.5 },
},
{
groupPath: 'States', border: { color: 'black', width: 0.5 },
},
{
groupPath: 'Region', border: { color: 'black', width: 0.5 },
}
],
leafItemSettings: {
labelPath:'Name',
```

Copyright © 2001 -2024 Syncfusion Inc.

showLabels: false

}

}

},

}

</script>

`

Step 2:

Show the population of a particular continent in the treemap loaded event. In this event, you can get the header element.

`javascript

loaded:function(args) {

let header = document.getElementById('header');

var population = 0;

for (let i = 0; i < args.treemap.layout.renderItems[0]['parent'].Continent.length; i++) {

population += +(args.treemap.layout.renderItems[0]['parent'].Continent[i]['data'].Population);

}

header.innerHTML = 'Continent - Population : ' + population

}

`

Step 3:

Customize the population for drilled countries or states in the header element when drill-down the treemap. The drillEnd event will be triggered when treemap is drilled.

APP.VUE

```
<template>
<div>
    <div id="header" style="background-color: #179bd7"></div>
      <div class='control_wrapper'>
         <ejs-treemap id='container' :dataSource="dataSource"
weightValuePath="Population" format="n"
                    useGroupingSeparator="true" enableDrillDown="true"
:palette="palette"
         :leafItemSettings='leafItemSettings' :levels='levels'
:drillEnd='drillEnd' :loaded="loaded">
         </ejs-treemap>
      </div>
  </div>
</template>
<script>
import Vue from 'vue';
```

            },
            {
              groupPath: 'States', border: { color: 'black', width: 0.5 },
            },
            {
              groupPath: 'Region', border: { color: 'black', width: 0.5 },
            }
        ],
        leafItemSettings: {
          labelPath:'Name',
          showLabels: false
        }
    }
  },
  methods:{
    drillEnd:function(args){
        let header = document.getElementById('header');
        let layout =
document.getElementById("container_TreeMap_Squarified_Layout");
        let population = 0;
        if (args.treemap.layout.renderItems[0]['isDrilled']) {
            for (let i = 0; i < args.treemap.layout.renderItems.length; i++)
{
                population +=
+(args.treemap.layout.renderItems[i]['data'].Population);
            }
            header.innerHTML =
layout.children[0].children[1].innerHTML.split(']')[1] + ' - ' + population;
        }
        else if (args.treemap.layout.renderItems[0]['parent'].Continent) {
            for (let i = 0; i <
args.treemap.layout.renderItems[0]['parent'].Continent.length; i++) {
                population +=
+(args.treemap.layout.renderItems[0]['parent'].Continent[i]['data'].Populati
on);
            }
            header.innerHTML = 'Continent - Population : ' + population;
        } else {
            population =
args.treemap.layout.renderItems[0]['data'].Population;
            header.innerHTML =
layout.children[0].children[1].innerHTML.split(']')[1] + ' - Population : '
+ population;
        }
```

Copyright © 2001 -2024 Syncfusion Inc.

```
    },
    loaded:function(args) {
      let header = document.getElementById('header');
        var population = 0;
        for (let i = 0; i <
args.treemap.layout.renderItems[0]['parent'].Continent.length; i++) {
            population +=
+(args.treemap.layout.renderItems[0]['parent'].Continent[i]['data'].Populati
on);
        }
        header.innerHTML = 'Continent - Population : ' + population
    }
}
}
</script>
```

{% previewsample "page.domainurl/code-snippet/treemap/getting-started-cs19" %}

Drilldown with label in Vue Treemap component

Add label template with drill down

Yon can add a label template as element to the treemap control when using the label template. To add a label template to the treemap control, you have to hide another labels by setting the showLabels property to **false** in leafItemSettings to show only the label template.

To add label template to treemap drilldown, follow the given steps:

Step 1:

Create a treemap control and enable the drill-down option.

`

<template>

<ejs-treemap id='container' :dataSource="dataSource" weightValuePath="Sales"
enableDrillDown="true" :palette="palette"

:leafItemSettings='leafItemSettings' :levels='levels' >

</ejs-treemap>

</template>

<script>

import Vue from 'vue';

import { TreeMapPlugin } from '@syncfusion/ej2-vue-treemap';

Vue.use(TreeMapPlugin);

export default {

data () {

return {

Copyright © 2001 -2024 Syncfusion Inc.

```
dataSource:  [
{ Continent: "China", Company: "Volkswagen", Sales: 3005994 },
{ Continent: "China", Company: "General Motors", Sales: 1230044 },
{ Continent: "China", Company: "Honda", Sales: 1197023 },
{ Continent: "United States", Company: "General Motors", Sales: 3042775 },
{ Continent: "United States", Company: "Ford", Sales: 2599193 },
{ Continent: "United States", Company: "Toyota", Sales: 2449587 },
{ Continent: "Japan", Company: "Toyota", Sales: 1527977 },
{ Continent: "Japan", Company: "Honda", Sales: 706982 },
{ Continent: "Japan", Company: "Suzuki", Sales: 623041 },
{ Continent: "Germany", Company: "Volkswagen", Sales: 655977 },
{ Continent: "Germany", Company: "Mercedes", Sales: 310845 },
{ Continent: "Germany", Company: "BMW", Sales: 261931 },
{ Continent: "United Kingdom", Company: "Ford ", Sales: 319442 },
{ Continent: "United Kingdom", Company: "Vauxhall", Sales: 251146 },
{ Continent: "United Kingdom", Company: "Volkswagen", Sales: 206994 }
],
palette: ['white'],
levels: [
{
groupPath: 'Continent', border: { color: 'black', width: 0.5 },
},
{
groupPath: 'Company', border: { color: 'black', width: 0.5 },
}
],
leafItemSettings: {
showLabels: false,
labelTemplate: '<div style="background-color: red">${Company}</div>',
templatePosition: 'Center'
}
}
}
```

Copyright © 2001 -2024 Syncfusion Inc.

}

</script>

`

Step 2:

Add the label template in the leafItemSettings options, and then set the showLabels property to **false** to hide another labels and show only label template.

APP.VUE

```
<template>
      <div class='control_wrapper'>
         <ejs-treemap id='container' :dataSource="dataSource"
weightValuePath="Sales" enableDrillDown="true" :palette="palette"
         :leafItemSettings='leafItemSettings' :levels='levels'
:drillStart='drillStart' >
         </ejs-treemap>
      </div>
</template>
<script>
import Vue from 'vue';
import { TreeMapPlugin } from '@syncfusion/ej2-vue-treemap';
Vue.use(TreeMapPlugin);
export default {
   data () {
    return {
      dataSource:  [
            { Continent: "China", Company: "Volkswagen", Sales: 3005994 },

TreeView

Getting Started with the Vue TreeView Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using Vue-CLI and integrating the Syncfusion Vue TreeView component using the Composition API / Options API.

Prerequisites

System requirements for Syncfusion Vue UI components

Setting up the Vue 2 project

To generate a Vue 2 project using Vue-CLI, use the vue create command. Follow these steps to install Vue CLI and create a new project:

`bash

npm install -g @vue/cli

vue create quickstart

cd quickstart

npm run serve

`

or

`bash

yarn global add @vue/cli

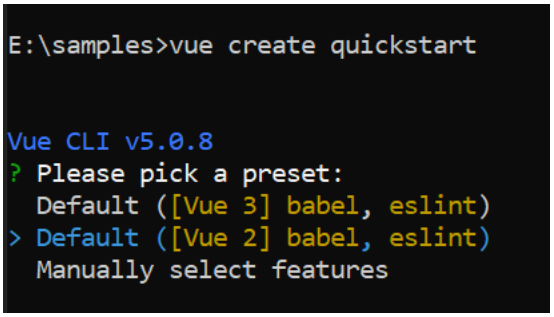
vue create quickstart

cd quickstart

yarn run serve

`

When creating a new project, choose the option Default ([Vue 2] babel, eslint) from the menu.



Once the quickstart project is set up with default settings, proceed to add Syncfusion components to the project.

Adding syncfusion packages

Syncfusion packages are available at npmjs.com. To use Vue components, install the required npm package.

This article uses the Vue TreeView component as an example. Install the @syncfusion/ej2-vue-navigations package by running the following command:

`bash

npm install @syncfusion/ej2-vue-navigations --save

`

or

`bash

yarn add @syncfusion/ej2-vue-navigations

`

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, the Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the TreeView component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
</style>
```

Copyright © 2001 -2024 Syncfusion Inc.

Add Syncfusion Vue component

Follow the below steps to add the Vue TreeView component using Composition API or Options API:

1\. First, import and register the TreeView component in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { TreeViewComponent as EjsTreeview } from "@syncfusion/ej2-vue-
navigations";
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { TreeViewComponent } from "@syncfusion/ej2-vue-navigations";
export default {
components: {
'ejs-treeview': TreeViewComponent
}
}
</script>
```

Binding data source

TreeView can load data either from local data sources or remote data services. This can be done using the dataSource property that is a member of the fields property. The dataSource property supports array of JavaScript objects and DataManager. Here, an array of JSON values is passed to the TreeView component.

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<div id="app">
<div class="control_wrapper">
<ejs-treeview id='treeview' :fields="fields"></ejs-treeview>
</div>
</div>
</template>
<script setup>
import { TreeViewComponent } from "@syncfusion/ej2-vue-navigations";
const data =  [
{
nodeId: '01', nodeText: 'Music',
nodeChild: [
{ nodeId: '01-01', nodeText: 'Gouttes.mp3' }
]
},
{
nodeId: '02', nodeText: 'Videos', expanded: true,
nodeChild: [
{ nodeId: '02-01', nodeText: 'Naturals.mp4' },
```

Copyright © 2001 -2024 Syncfusion Inc.

```
{ nodeId: '02-02', nodeText: 'Wild.mpeg' },
]
},
{
nodeId: '03', nodeText: 'Documents',
nodeChild: [
{ nodeId: '03-01', nodeText: 'Environment Pollution.docx' },
{ nodeId: '03-02', nodeText: 'Global Water, Sanitation, & Hygiene.docx' },
{ nodeId: '03-03', nodeText: 'Global Warming.ppt' },
{ nodeId: '03-04', nodeText: 'Social Network.pdf' },
{ nodeId: '03-05', nodeText: 'Youth Empowerment.pdf' },
]
},
];
const fields = { dataSource: data, id: "nodeId", text: "nodeText", child:
"nodeChild" };
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<div class="control_wrapper">
<ejs-treeview id='treeview' :fields='fields'></ejs-treeview>
</div>
</template>
<script>
import { TreeViewComponent } from "@syncfusion/ej2-vue-navigations";
var dataSource =  [
{
nodeId: '01', nodeText: 'Music',
nodeChild: [
{ nodeId: '01-01', nodeText: 'Gouttes.mp3' }
]
},
{
nodeId: '02', nodeText: 'Videos', expanded: true,
nodeChild: [
{ nodeId: '02-01', nodeText: 'Naturals.mp4' },
{ nodeId: '02-02', nodeText: 'Wild.mpeg' },
]
},
{
nodeId: '03', nodeText: 'Documents',
nodeChild: [
{ nodeId: '03-01', nodeText: 'Environment Pollution.docx' },
{ nodeId: '03-02', nodeText: 'Global Water, Sanitation, & Hygiene.docx' },
{ nodeId: '03-03', nodeText: 'Global Warming.ppt' },
{ nodeId: '03-04', nodeText: 'Social Network.pdf' },
{ nodeId: '03-05', nodeText: 'Youth Empowerment.pdf' },
]
},
];
export default {
data: function() {
return {
```

Copyright © 2001 -2024 Syncfusion Inc.

```
fields: { dataSource: data, id: 'nodeId', text: 'nodeText', child:
'nodeChild' },
};
}
}
</script>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
  <div id="app">
    <div class="control_wrapper">
      <ejs-treeview id='treeview' :fields="fields"></ejs-treeview>
    </div>
  </div>
</template>
<script setup>
import { TreeViewComponent as EjsTreeview } from "@syncfusion/ej2-vue-
navigations";
const data = [
  {
    nodeId: '01', nodeText: 'Music',
    nodeChild: [
      { nodeId: '01-01', nodeText: 'Gouttes.mp3' }
    ]
  },
  {
    nodeId: '02', nodeText: 'Videos', expanded: true,
    nodeChild: [
      { nodeId: '02-01', nodeText: 'Naturals.mp4' },
      { nodeId: '02-02', nodeText: 'Wild.mpeg' },
    ]
  },
  {
    nodeId: '03', nodeText: 'Documents',
    nodeChild: [
      { nodeId: '03-01', nodeText: 'Environment Pollution.docx' },
      { nodeId: '03-02', nodeText: 'Global Water, Sanitation, &

Getting Started with the Vue TreeView Component in Vue 3

This article provides a step-by-step guide for setting up a Vite project with a JavaScript environment and integrating the Syncfusion Vue TreeView component using the Composition API / Options API.

The Composition API is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

The Options API is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

Prerequisites

System requirements for Syncfusion Vue UI components

Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using Vite. To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

`bash

npm create vite@latest

`

or

`bash

yarn create vite

`

Using one of the above commands will lead you to set up additional configurations for the project as below:

Copyright © 2001 -2024 Syncfusion Inc.

1.Define the project name: We can specify the name of the project directly. Let's specify the name of the project as my-project for this article.

`bash

? Project name: » my-project

`

2.Select Vue as the framework. It will create a Vue 3 project.

`bash

? Select a framework: » - Use arrow-keys. Return to submit.

Vanilla

Vue

React

Preact

Lit

Svelte

Others

`

3.Choose JavaScript as the framework variant to build this Vite project using JavaScript and Vue.

`bash

? Select a variant: » - Use arrow-keys. Return to submit.

JavaScript

TypeScript

Customize with create-vue ↗

Nuxt ↗

`

4.Upon completing the aforementioned steps to create the my-project, run the following command to install its dependencies:

`bash

cd my-project

npm install

`

or

`bash

cd my-project

yarn install

`

Now that my-project is ready to run with default settings, let's add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion Vue component packages are available at npmjs.com. To use Syncfusion Vue components in the project, install the corresponding npm package.

This article uses the Vue TreeView component as an example. To use the Vue TreeView component in the project, the @syncfusion/ej2-vue-navigations package needs to be installed using the following command:

`bash

npm install @syncfusion/ej2-vue-navigations --save

`

or

`bash

yarn add @syncfusion/ej2-vue-navigations

`

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the TreeView component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
navigations/styles/material.css";
</style>
```

Note: TreeView component use other Syncfusion components too, the dependent component's CSS references need to be added for using all the TreeView functionalities.

Add Syncfusion Vue component

Follow the below steps to add the Vue TreeView component using Composition API or Options API:

1.First, import and register the TreeView component in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

Copyright © 2001 -2024 Syncfusion Inc.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { TreeViewComponent as EjsTreeview } from "@syncfusion/ej2-vue-
navigations";
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { TreeViewComponent  } from "@syncfusion/ej2-vue-navigations";
//Component registration
export default {
name: "App",
components: {
"ejs-treeview": TreeViewComponent
}
}
</script>
```

2.Add the component definition in template section.

~/SRC/APP.VUE

```
<template>
<ejs-treeview id='treeview' :fields='fields'></ejs-treeview>
</template>
```

3.Declare the values for the dataSource property in the script section.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
const fields = { dataSource: data, id: "nodeId", text: "nodeText", child:
"nodeChild" };
const data =  [
{
nodeId: '01', nodeText: 'Music',
nodeChild: [
{ nodeId: '01-01', nodeText: 'Gouttes.mp3' }
]
},
{
nodeId: '02', nodeText: 'Videos', expanded: true,
nodeChild: [
{ nodeId: '02-01', nodeText: 'Naturals.mp4' },
{ nodeId: '02-02', nodeText: 'Wild.mpeg' },
]
},
{
nodeId: '03', nodeText: 'Documents',
nodeChild: [
{ nodeId: '03-01', nodeText: 'Environment Pollution.docx' },
{ nodeId: '03-02', nodeText: 'Global Water, Sanitation, & Hygiene.docx' },
{ nodeId: '03-03', nodeText: 'Global Warming.ppt' },
{ nodeId: '03-04', nodeText: 'Social Network.pdf' },
```

Copyright © 2001 -2024 Syncfusion Inc.

```
{ nodeId: '03-05', nodeText: 'Youth Empowerment.pdf' },
]
},
];
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
var data =  [
{
nodeId: '01', nodeText: 'Music',
nodeChild: [
{ nodeId: '01-01', nodeText: 'Gouttes.mp3' }
]
},
{
nodeId: '02', nodeText: 'Videos', expanded: true,
nodeChild: [
{ nodeId: '02-01', nodeText: 'Naturals.mp4' },
{ nodeId: '02-02', nodeText: 'Wild.mpeg' },
]
},
{
nodeId: '03', nodeText: 'Documents',
nodeChild: [
{ nodeId: '03-01', nodeText: 'Environment Pollution.docx' },
{ nodeId: '03-02', nodeText: 'Global Water, Sanitation, & Hygiene.docx' },
{ nodeId: '03-03', nodeText: 'Global Warming.ppt' },
{ nodeId: '03-04', nodeText: 'Social Network.pdf' },
{ nodeId: '03-05', nodeText: 'Youth Empowerment.pdf' },
]
},
];
data() {
return {
fields: { dataSource: data, id: 'nodeId', text: 'nodeText', child:
'nodeChild' },
};
}
</script>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<ejs-treeview id='treeview' :fields='fields'></ejs-treeview>
</template>
<script setup>
import { TreeViewComponent as EjsTreeview } from "@syncfusion/ej2-vue-
navigations";
const fields = { dataSource: data, id: "nodeId", text: "nodeText", child:
"nodeChild" };
const data =  [
{
```

Copyright © 2001 -2024 Syncfusion Inc.

```
nodeId: '01', nodeText: 'Music',
nodeChild: [
{ nodeId: '01-01', nodeText: 'Gouttes.mp3' }
]
},
{
nodeId: '02', nodeText: 'Videos', expanded: true,
nodeChild: [
{ nodeId: '02-01', nodeText: 'Naturals.mp4' },
{ nodeId: '02-02', nodeText: 'Wild.mpeg' },
]
},
{
nodeId: '03', nodeText: 'Documents',
nodeChild: [
{ nodeId: '03-01', nodeText: 'Environment Pollution.docx' },
{ nodeId: '03-02', nodeText: 'Global Water, Sanitation, & Hygiene.docx' },
{ nodeId: '03-03', nodeText: 'Global Warming.ppt' },
{ nodeId: '03-04', nodeText: 'Social Network.pdf' },
{ nodeId: '03-05', nodeText: 'Youth Empowerment.pdf' },
]
},
];
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<ejs-treeview id='treeview' :fields='fields'></ejs-treeview>
</template>
<script>
import { TreeViewComponent  } from "@syncfusion/ej2-vue-navigations";
var data =  [
{
nodeId: '01', nodeText: 'Music',
nodeChild: [
{ nodeId: '01-01', nodeText: 'Gouttes.mp3' }
]
},
{
nodeId: '02', nodeText: 'Videos', expanded: true,
nodeChild: [
{ nodeId: '02-01', nodeText: 'Naturals.mp4' },
{ nodeId: '02-02', nodeText: 'Wild.mpeg' },
]
},
{
nodeId: '03', nodeText: 'Documents',
nodeChild: [
```

Copyright © 2001 -2024 Syncfusion Inc.

```
{ nodeId: '03-01', nodeText: 'Environment Pollution.docx' },
{ nodeId: '03-02', nodeText: 'Global Water, Sanitation, & Hygiene.docx' },
{ nodeId: '03-03', nodeText: 'Global Warming.ppt' },
{ nodeId: '03-04', nodeText: 'Social Network.pdf' },
{ nodeId: '03-05', nodeText: 'Youth Empowerment.pdf' },
]
},
];
// Component registration
export default {
name: "App",
// Declaring component and its directives
components: {
"ejs-treeview": TreeViewComponent
},
// Bound properties declarations
data() {
return {
fields: { dataSource: data, id: 'nodeId', text: 'nodeText', child:
'nodeChild' },
};
}
};
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
</style>
```

Run the project

To run the project, use the following command:

`bash

npm run dev

`

or

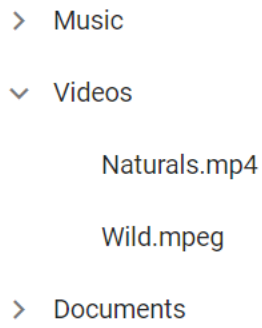
`bash

yarn run dev

`

The output will appear as follows:

Copyright © 2001 -2024 Syncfusion Inc.



CheckBox

The TreeView component allows you to check more than one node in TreeView without affecting the UI's appearance by enabling the showCheckBox property. When this property is enabled, checkbox appears before each TreeView node text.

- If one of the child nodes is not in a checked state, then the parent node will be in an intermediate state.
- If all the child nodes are in checked state, then the parent node's state will also be checked.
- If a parent node is checked, then all the child nodes' state will also be checked.

In the following example, the showCheckBox property is enabled.

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<ejs-treeview id='treeview' :fields='fields' :showCheckBox='true'></ejs-
treeview>
</template>
<script setup>
import { TreeViewComponent as EjsTreeview } from "@syncfusion/ej2-vue-
navigations";
const fields = { dataSource: data, id: "nodeId", text: "nodeText", child:
"nodeChild" };
const data =  [
{
nodeId: '01', nodeText: 'Music',
nodeChild: [
{ nodeId: '01-01', nodeText: 'Gouttes.mp3' }
]
},
{
nodeId: '02', nodeText: 'Videos', expanded: true,
nodeChild: [
{ nodeId: '02-01', nodeText: 'Naturals.mp4' },
{ nodeId: '02-02', nodeText: 'Wild.mpeg' },
]
},
{
nodeId: '03', nodeText: 'Documents',
nodeChild: [
{ nodeId: '03-01', nodeText: 'Environment Pollution.docx' },
{ nodeId: '03-02', nodeText: 'Global Water, Sanitation, & Hygiene.docx' },
```

Data binding in Vue Treeview component

The TreeView component provides the option to load data either from local data sources or from remote data services. This can be done

through `dataSource` property that is a member of the fields property. The `dataSource` property supports array of JavaScript objects and **DataManager**. It also supports different kinds of data services such as OData, OData V4, Web API, URL, and JSON with the help of `DataManager` adaptors.

TreeView has `load on demand` (Lazy load), by default. It reduces the bandwidth size when consuming huge data. It loads first level nodes initially, and when parent node is expanded, loads the child nodes based on the `parentID/child` member.

By default, the `loadOnDemand` is set to true. By disabling this property, all the tree nodes are rendered at the beginning itself.

You can use the dataBound event to perform actions. This event will be triggered once the data source is populated in the TreeView.

Copyright © 2001 -2024 Syncfusion Inc.

Local data

To bind local data to the TreeView, you can assign a JavaScript object array to the dataSource property. The TreeView component requires three fields (ID, text, and parentID) to render local data source. When mapper fields are not specified, it takes the default values as the mapping fields. Local data source can also be provided as an instance of the DataManager. It supports two kinds of local data binding methods.

- Hierarchical data
- Self-referential data

Hierarchical data

TreeView can be populated with hierarchical data source that contains nested array of JSON objects. You can directly assign hierarchical data to the dataSource property, and map all the field members with corresponding keys from the hierarchical data to fields property.

In the following example, **code**, **name**, and **countries** columns from hierarchical data have been mapped to **id**, **child**,

and **text** fields, respectively.

APP.VUE

```
<template>
  <div id="app">
    <div class="control_wrapper">
        <ejs-treeview id='treeview' :fields="fields"></ejs-treeview>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { TreeViewPlugin } from "@syncfusion/ej2-vue-navigations";
Vue.use(TreeViewPlugin);
export default {
  data () {
    var dataSource =  [
        {
            code: 'AF', name: 'Africa', countries: [
                { code: 'NGA', name: 'Nigeria' },
                { code: 'EGY', name: 'Egypt' },
                { code: 'ZAF', name: 'South Africa' }
            ]
        },
        {
            code: 'AS', name: 'Asia', countries: [
                { code: 'CHN', name: 'China' },
                { code: 'IND', name: 'India', selected: true },
                { code: 'JPN', name: 'Japan' }
            ]
        },
        {
            code: 'EU', name: 'Europe', countries: [
                { code: 'DNK', name: 'Denmark' },
                { code: 'FIN', name: 'Finland' },
                { code: 'AUT', name: 'Austria' }
```

```
            ]
        },
        {
            code: 'NA', name: 'North America', countries: [
                { code: 'USA', name: 'United States of America' },
                { code: 'CUB', name: 'Cuba' },
                { code: 'MEX', name: 'Mexico' }
            ]
        },
        {
            code: 'SA', name: 'South America', countries: [
                { code: 'BRA', name: 'Brazil' },
                { code: 'COL', name: 'Colombia' },
                { code: 'ARG', name: 'Argentina' }
            ]
        },
        {
            code: 'OC', name: 'Oceania', countries: [
                { code: 'AUS', name: 'Australia' },
                { code: 'NZL', name: 'New Zealand' },
                { code: 'WSM', name: 'Samoa' }
            ]
        },
        {
            code: 'AN', name: 'Antarctica', countries: [
                { code: 'BVT', name: 'Bouvet Island' },
                { code: 'ATF', name: 'French Southern Lands' }
            ]
        },
    ];
    return {
      fields: { dataSource: dataSource, id: 'code', text: 'name', child:
'countries' }
    }
  }
}
</script>
<style>
  @import
"https://ej2.syncfusion.com/vue/documentation/../node_modules/@syncfusion/ej
2-base/styles/material.css";
  @import "../../node_modules/@syncfusion/ej2-vue-
navigations/styles/material.css";
 .control_wrapper {
        display: block;
        max-width: 350px;
        max-height: 350px;
        margin: auto;
        overflow: auto;
        border: 1px solid #dddddd;
        border-radius: 3px;
    }
</style>
```

Self-referential data

TreeView can be populated from self-referential data structure that contains array of JSON objects with parentID mapping.

You can directly assign self-referential data to the dataSource property, and map all the field members with corresponding keys from self-referential data to fields property.

To render the root level nodes, specify the parentID as null or no need to specify the parentID in dataSource.

In the following example, **ID**, **pid**, **hasChild**, and **name** columns from self-referential data have been mapped to **ID parentID**, **hasChildren**, and **text** fields, respectively.

APP.VUE

```
<template>
  <div id="app">
    <div class="control_wrapper">
        <ejs-treeview id='treeview' :fields="fields"></ejs-treeview>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { TreeViewPlugin } from "@syncfusion/ej2-vue-navigations";
Vue.use(TreeViewPlugin);
export default {
  data () {
    var dataSource =  [
        { id: 1, name: 'Discover Music', hasChild: true, expanded: true },
        { id: 2, pid: 1, name: 'Hot Singles' },
        { id: 3, pid: 1, name: 'Rising Artists' },
        { id: 4, pid: 1, name: 'Live Music' },
        { id: 6, pid: 1, name: 'Best of 2017 So Far' },
        { id: 7, name: 'Sales and Events', hasChild: true },
        { id: 8, pid: 7, name: '100 Albums - $5 Each' },
        { id: 9, pid: 7, name: 'Hip-Hop and R&B Sale' },
        { id: 10, pid: 7, name: 'CD Deals' },
        { id: 11, name: 'Categories', hasChild: true },
        { id: 12, pid: 11, name: 'Songs' },
        { id: 13, pid: 11, name: 'Bestselling Albums' },
        { id: 14, pid: 11, name: 'New Releases' },
        { id: 15, pid: 11, name: 'Bestselling Songs' },
        { id: 16, name: 'MP3 Albums', hasChild: true },
        { id: 17, pid: 16, name: 'Rock' },
        { id: 18, pid: 16, name: 'Gospel' },
        { id: 19, pid: 16, name: 'Latin Music' },
        { id: 20, pid: 16, name: 'Jazz' },
        { id: 21, name: 'More in Music', hasChild: true },
        { id: 22, pid: 21, name: 'Music Trade-In' },
        { id: 23, pid: 21, name: 'Redeem a Gift Card' },
        { id: 24, pid: 21, name: 'Band T-Shirts' },
    ];
    return {
      fields: { dataSource: dataSource, id: 'id', parentID: 'pid', text:
'name', hasChildren: 'hasChild' }
    }
```

<style>
  @import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../../node_modules/@syncfusion/ej2-vue-
navigations/styles/material.css";
 .control_wrapper {
        display: block;
        max-width: 350px;
        max-height: 350px;
        margin: auto;
        overflow: auto;
        border: 1px solid #dddddd;
        border-radius: 3px;
    }
</style>
```

{% previewsample "page.domainurl/code-snippet/treeview/data-binding/self-referential-data-cs1" %}

Remote data

TreeView can also be populated from a remote data service with the help of DataManager component and Query property.

It supports different kinds of data services such as OData, OData V4, Web API, URL, and JSON with the help of DataManager adaptors.

You can assign service data as an instance of DataManager to the dataSource property. To interact with remote data source, you have to provide the endpoint url.

The DataManager that acts as an interface between the service endpoint and the TreeView requires the following information to interact with service endpoint properly.

- DataManager->url: Defines the service endpoint to fetch data.
- DataManager->adaptor: Defines the adaptor option. By default, ODataAdaptor is used for remote binding.

Adaptor is responsible for processing response and request from/to the service endpoint. The @syncfusion/ej2-data package

provides some predefined adaptors designed to interact with service endpoints. They are,

- UrlAdaptor: Used to interact with remote services. This is the base adaptor for all remote based adaptors.
- ODataAdaptor: Used to interact with OData endpoints.
- ODataV4Adaptor: Used to interact with OData V4 endpoints.
- WebApiAdaptor: Used to interact with Web API created under OData standards.
- WebMethodAdaptor: Used to interact with web methods.

In the following example, ODataV4Adaptor is used to fetch data from remote services. The **EmployeeID**, **FirstName**, and **Title**

Copyright © 2001 -2024 Syncfusion Inc.

columns from Employees table have been mapped to **ID**, **text**, and **hasChildren** fields respectively for first level nodes.

The **OrderID**, **EmployeeID**, and **ShipName** columns from orders table have been mapped to **ID**, **parentID**, and **text** fields

respectively for second level nodes.

Check box in Vue Treeview component

The TreeView component allows you to check more than one node in TreeView without affecting the UI's appearance by enabling the showCheckBox property. When this property is enabled, checkboxappears before each TreeView node text.

- If one of the child nodes is not in a checked state, then the parent node will be in an intermediate state.
- If all the child nodes are in checked state, then the parent node's state will also be checked.
- If a parent node is checked, then all the child nodes' state will also be checked.

By default, the checkbox state of parent and child nodes are dependent on each other. If you need independent checked state, you can achieve it using the autoCheck property.

Using the checkedNodes property, you can set the nodes that need to be checked or get the ID of nodes that are currently checked in the TreeView component.

If you need to prevent the node check action for a particular node, the nodeChecking event can be used which is triggered before the TreeView node is checked/unchecked. The nodeChecked event will be triggered when the TreeView node is checked/unchecked successfully.

In the following example, the showCheckBox property is enabled.

APP.VUE

```
<template>
  <div id="app">
    <div class="control_wrapper">
        <ejs-treeview id='treeview' :fields="fields"
:showCheckBox='true'></ejs-treeview>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { TreeViewPlugin } from "@syncfusion/ej2-vue-navigations";
Vue.use(TreeViewPlugin);
export default {
  data () {
    var dataSource =  [
        { id: 1, name: 'Australia', hasChild: true, expanded: true },
        { id: 2, pid: 1, name: 'New South Wales', isChecked: true },
        { id: 3, pid: 1, name: 'Victoria' },
        { id: 4, pid: 1, name: 'South Australia' },
        { id: 6, pid: 1, name: 'Western Australia', isChecked: true },
        { id: 7, name: 'Brazil', hasChild: true },
        { id: 8, pid: 7, name: 'Paraná' },
        { id: 9, pid: 7, name: 'Ceará' },
        { id: 10, pid: 7, name: 'Acre' },
        { id: 11, name: 'China', hasChild: true },
        { id: 12, pid: 11, name: 'Guangzhou' },
        { id: 13, pid: 11, name: 'Shanghai' },
        { id: 14, pid: 11, name: 'Beijing' },
        { id: 15, pid: 11, name: 'Shantou' },
        { id: 16, name: 'France', hasChild: true },
        { id: 17, pid: 16, name: 'Pays de la Loire' },

        border-radius: 3px;
    }
</style>
```

{% previewsample "page.domainurl/code-snippet/treeview/checkbox/checkbox-cs1" %}

Checked nodes

You can get or set the checked nodes in TreeView at initial rendering and dynamically by using the checkedNodes

property. It returns the checked nodes' ID as an array.

In the following example, the **New South Wales** and **Western Australia** nodes are checked at initial rendering. If any more nodes are checked, the checked nodes' IDs will be displayed in alert.

APP.VUE

```
<template>
  <div id="app">
    <div class="control_wrapper">
        <ejs-treeview id='treeview' :fields="fields" :showCheckBox='true'
:checkedNodes='checkedNodes' :nodeChecked='nodeChecked'></ejs-treeview>
    </div>
  </div>
</template>

Node editing in Vue Treeview component

The TreeView allows you to edit nodes by setting the allowEditing property to **true**. To directly edit the nodes in place, **double click** the TreeView node or **select** the node and press **F2** key.

When editing is completed by focus out or by pressing the **Enter** key, the modified node's text saves automatically. If you do not want to save the modified node's text in TreeView node, press **Escape** key. It does not save the edited text to the TreeView node.

Node editing can also be performed programmatically by using the beginEdit method. On passing the node ID or element through this method, the edit textbox will be created for the particular node thus allowing us to edit it.

If you need to validate or prevent editing, the nodeEditing event can be used which is triggered before the TreeView node is renamed. On successfully renaming a node the nodeEdited event will be triggered.

In the following example, the first level node's text cannot be changed, but all other level nodes' text can be changed.

APP.VUE

```
<template>
  <div id="app">
    <div class="control_wrapper">
        <ejs-treeview id='treeview' :fields="fields" :allowEditing='true'
:nodeEditing='editing'></ejs-treeview>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { TreeViewPlugin } from "@syncfusion/ej2-vue-navigations";
Vue.use(TreeViewPlugin);
export default {
  data () {
    var dataSource =  [
        { id: '01', name: 'Local Disk (C:)', expanded: true,
            subChild: [

Multiple selection in Vue Treeview component

Selection provides an interactive support and highlights the node that you select. Selection can be done through simple mouse down or keyboard interaction.

The TreeView also supports selection of multiple nodes by setting allowMultiSelection

to **true**.

To multi-select, press and hold **CTRL** key and click the desired nodes. To select range of nodes, press and hold the

SHIFT key and click the nodes.

In the following example, the allowMultiSelection property is enabled.

Multi selection is not applicable through touch interactions.

{% previewsample "page.domainurl/code-snippet/treeview/multi-selection/selection-cs1" %}

Selected nodes

You can get or set the selected nodes in TreeView at initial rendering and dynamically by using the selectedNodes property. It will return the selected node's ID as an array.

The nodeselecting event is triggered before a node is selected/unselected which can be used to prevent the selection.

The nodeSelected event is triggered once a node is successfully selected/unselected.

In the following example, **New South Wales** and **Western Australia** nodes are selected at initial rendering. When a node is selected, the selected node's ID is displayed in alert.

APP.VUE

```
<template>
  <div id="app">
    <div class="control_wrapper">
        <ejs-treeview id='treeview' :fields="fields"
:allowMultiSelection='true' :selectedNodes="selectedNodes"
:nodeSelected="nodeSelected"></ejs-treeview>
    </div>
  </div>
</template>

Drag and drop in Vue Treeview component

The TreeView component allows you to drag and drop any node by setting allowDragAndDrop to **true**. Nodes can be dragged and dropped at all levels of the same TreeView.

The dragged nodes can be dropped at any level by indicator lines with **plus**, **minus/restrict**, and **in between** icons. It represents the exact position where the node is to be dropped as sibling or child.

If you need to prevent dragging action for a particular node, the nodeDragStart event can be used which is triggered when the node drag is started. If you need to prevent dropping action for a particular node, the nodeDragStop event can be used which is triggered when the drag is stopped.

The nodeDragging event is triggered when the TreeView node is being dragged. You can customize the cloned element in this event.

The nodeDropped event is triggered when the TreeView node is dropped on the target element successfully.

The following table explains the usage of indicator icons.

| Icons | Description |

|------|-------------|

| Plus icon | Indicates that the dragged node is to be added as child of target node. |

| Minus or restrict icon |Indicates that the dragged node is not to be dropped at the hovered region. |

| In between icon | Indicates that the dragged node is to be added as siblings of hovered region. |

In the following sample, the allowDragAndDrop property is enabled.

APP.VUE

```
<template>
  <div id="app">
    <div class="control_wrapper">
        <ejs-treeview id='treeview' :fields="fields"
:allowDragAndDrop='true'></ejs-treeview>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { TreeViewPlugin } from "@syncfusion/ej2-vue-navigations";
Vue.use(TreeViewPlugin);
export default {
  data () {
    var dataSource =  [
        {
        id: 1, name: 'ASP.NET MVC Team', expanded: true,
        child: [
```

```
            { id: 2, pid: 1, name: 'Smith' },
            { id: 3, pid: 1, name: 'Johnson', isSelected: true },
            { id: 4, pid: 1, name: 'Anderson' },
        ]
    },
    {
        id: 5, name: 'Windows Team',
        child: [
            { id: 6, pid: 5, name: 'Clark' },
            { id: 7, pid: 5, name: 'Wright' },
            { id: 8, pid: 5, name: 'Lopez' },
        ]
    },
    {
        id: 9, name: 'Web Team',
        child: [
            { id: 11, pid: 9, name: 'Joshua' },
            { id: 12, pid: 9, name: 'Matthew' },
            { id: 13, pid: 9, name: 'David' },
        ]
    },
    {
        id: 14, name: 'Build Team',
        child: [
            { id: 15, pid: 14, name: 'Ryan' },
            { id: 16, pid: 14, name: 'Justin' },
            { id: 17, pid: 14, name: 'Robert' },
        ]
    },
    {
        id: 18, name: 'WPF Team',
        child: [
            { id: 19, pid: 18, name: 'Brown' },
            { id: 20, pid: 18, name: 'Johnson' },
            { id: 21, pid: 18, name: 'Miller' },
        ]
    }
    ];
    return {
        fields: { dataSource: dataSource, id: 'id', text: 'name', child:
'child', selected: 'isSelected' },
    }
  }
}

Multiple-node drag and drop

To drag and drop more than one node, you should enable the allowMultiSelection property along with the allowDragAndDrop property.

To perform multi-selection, press and hold **CTRL** key and click the desired nodes. To select range of nodes, press and hold the **SHIFT** key and click the nodes.

In the following sample, the allowMultiSelection property is enabled along with the allowDragAndDrop property.

APP.VUE

```
<template>
  <div id="app">
    <div class="control_wrapper">
        <ejs-treeview id='treeview' :fields="fields"
:allowDragAndDrop='true' :allowMultiSelection='true'></ejs-treeview>
    </div>
  </div>
</template>
<script>

Template in Vue Treeview component

The TreeView component allows you to customize the look of TreeView nodes by using the nodeTemplate

property. This property accepts either `template string` or HTML element ID.

In the following sample, employee information such as employee photo, name, and designation have been included using the `nodeTemplate` property.

Copyright © 2001 -2024 Syncfusion Inc.

APP.VUE

```
<template>
  <div id="app">
    <div class="control_wrapper">

Accessibility in Vue Treeview component

The TreeView component followed the accessibility guidelines and standards, including ADA, Section 508, WCAG 2.2 standards, and WCAG roles that are commonly used to evaluate accessibility.

The accessibility compliance for the TreeView component is outlined below.

Copyright © 2001 -2024 Syncfusion Inc.

| Accessibility Criteria | Compatibility |

| -- | -- |

| WCAG 2.2 Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Section 508 Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Screen Reader Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Right-To-Left Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Color Contrast | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Mobile Device Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Keyboard Navigation Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Accessibility Checker Validation | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Axe-core Accessibility Validation | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> - All features of the component meet the requirement.

<img src="https://cdn.syncfusion.com/content/images/landing-page/intermediate.png" alt="Intermediate"> - Some features of the component do not meet the requirement.

<img src="https://cdn.syncfusion.com/content/images/landing-page/no.png" alt="No"> - The component does not meet the requirement.

WAI-ARIA attributes

The TreeView component followed the WAI-ARIA patterns to meet the accessibility. The following ARIA attributes are used in the TreeView component:

| Attributes | Purpose |

| --- | --- |

| role=tree | All tree nodes are contained within the element. |

| role=treeitem | Specifies the role of each tree node in a selectable TreeView and its containment within the tree. |

| role=group | Specifies the role of each parent node container. |

| role=checkbox | Indicates checkbox control along with treeitem element. |

| aria-multiselectable | Indicates whether the TreeView enables multiple selection or not. |

| aria-expanded | Indicates whether the parent node has expanded or not. |

| aria-selected | Indicates the selected node. |

| aria-grabbed | Indicates the selected state on drag-and-drop of node. |

| aria-level | Indicates the level of node in TreeView. |

| aria-checked | Indicates the current checked state of TreeView checkbox. |

| aria-label | Indicates the contextual message for the TreeView checkbox. |

| aria-activedescendant | Identifies the currently active element when focusing on the TreeView. |

| aria-disabled | Indicates element is perceivable but disabled. |

Keyboard interaction

The TreeView component followed the keyboard interaction guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the TreeView component.

| Interaction Keys | Description |

|------|---------|

| Arrow Up | Goes to the previous node. |

| Arrow Down | Goes to the next node. |

| Arrow Right | Expands the current node. |

| Arrow Left | Collapses the current node. |

| Home | Goes to the first node. |

| End | Goes to the last node. |

| F2 | Edits the focused node. |

| Esc | Focuses out the edit state without saving the edited text. |

| Enter | Selects the focused node/saves the edited text. |

| Space | Checks the current node. |

| Ctrl + A | Selects all nodes. |

Copyright © 2001 -2024 Syncfusion Inc.

Ensuring accessibility

The TreeView component's accessibility levels are ensured through an accessibility-checker and axe-core software tools during automated testing.

The accessibility compliance of the TreeView component is shown in the following sample. Open the sample in a new window to evaluate the accessibility of the TreeView component with accessibility tools.

{% previewsample "https://ej2.syncfusion.com/accessibility/treeview.html" %}

How To

Customize the expand and collapse icons in Vue Treeview component

You can customize TreeView expand and collapse icons by using the cssClass property of TreeView.

Refer to the sample to customize expand/collapse icons.

APP.VUE

```
<template>
  <div id="app">
    <div class="control_wrapper">
        <ejs-treeview id='treeview' :fields="fields"
cssClass='custom'></ejs-treeview>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { TreeViewPlugin } from "@syncfusion/ej2-vue-navigations";
Vue.use(TreeViewPlugin);
export default {
  data () {
    var dataSource =  [
        { id: '01', name: 'Local Disk (C:)', expanded: true,
        subChild: [
            {
                id: '01-01', name: 'Program Files',
                subChild: [
                    { id: '01-01-01', name: '7-Zip' },
                    { id: '01-01-02', name: 'Git' },
                    { id: '01-01-03', name: 'IIS Express' },
                ]

Process the tree node operations using context menu in Vue Treeview component

You can integrate the context menu with TreeView component in order to perform the tree view related operations like add, remove and renaming node. Following is an example which demonstrates the above cases which are used to manipulate tree view operations in the 'select ' event of context menu.

APP.VUE

```
<template>
  <div id="app">
    <div class="control_wrapper">
        <ejs-treeview id='treeview' :fields="fields"
:nodeClicked='nodeclicked'>
            <ejs-contextmenu id='contentmenutree' target='#treeview'
:items='menuItems' :beforeOpen='beforeopen' :select='menuclick'></ejs-
contextmenu>
        </ejs-treeview>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { ContextMenuPlugin } from "@syncfusion/ej2-vue-navigations";
Vue.use(ContextMenuPlugin);
import { TreeViewPlugin } from "@syncfusion/ej2-vue-navigations";
Vue.use(TreeViewPlugin);
export default {
  data () {
      var dataSource =  [
        { id: '01', name: 'Local Disk (C:)', expanded: true,
hasAttribute:{class:'remove rename'},
            subChild: [
                {
                    id: '01-01', name: 'Program Files',
                    subChild: [
```

```
                        { id: '01-01-01', name: 'Windows NT' },
                        { id: '01-01-02', name: 'Windows Mail' },
                        { id: '01-01-03', name: 'Windows Photo Viewer' },
                    ]
                },
                {
                    id: '01-02', name: 'Users', expanded: true,
                    subChild: [
                        { id: '01-02-01', name: 'Smith' },

Validate the text when renaming the tree node in Vue Treeview component

You can validate the tree node text while editing using `nodeEdited` event of the TreeView. Following is an example that shows how to validate and prevent empty values in tree node.

APP.VUE

```
<template>
  <div id="app">
    <div class="control_wrapper">
        <ejs-treeview id='treeview' :fields="fields" :allowEditing='true'
:nodeEdited='nodeEdited'></ejs-treeview>
    </div>
    <div id="display"></div>
  </div>
</template>
<script>
import Vue from 'vue';
import { TreeViewPlugin } from "@syncfusion/ej2-vue-navigations";
Vue.use(TreeViewPlugin);
export default {
  data () {
    var dataSource =  [
```

```
        {
            id: 1, name: 'Discover Music', expanded: true,
            child: [
                { id: 2, name: 'Hot Singles' },
                { id: 3, name: 'Rising Artists' },
                { id: 4, name: 'Live Music' }
            ]
        },
        {
            id: 7, name: 'Sales and Events',
            child: [
                { id: 8, name: '100 Albums - $5 Each' },
                { id: 9, name: 'Hip-Hop and R&B Sale' },
                { id: 10, name: 'CD Deals' }
            ]
        },
        {
            id: 11, name: 'Categories',
            child: [
                { id: 12, name: 'Songs' },
                { id: 13, name: 'Bestselling Albums' },
                { id: 14, name: 'New Releases' },
                { id: 15, name: 'Bestselling Songs' }

Customize the tree nodes based on levels in Vue Treeview component

You can customize the tree nodes level wise by adding custom cssClass to the component and enabling styles.

APP.VUE

```
<template>
  <div id="app">
    <div class="control_wrapper">
        <ejs-treeview id='treeview' :fields="fields" :allowEditing='true'
cssClass='mytree'></ejs-treeview>
    </div>
    <div class="details">
        <label>Note:</label>
        <div><b>1. The font-weight "Bold" is applied for all the leaf
nodes</b></div>
        <div><i>2. The font-weight "Italic" is applied for first level
nodes</i></div>
        <div style="color: darkmagenta">3. The color "darkmagenta" is
applied for second level nodes</div>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { TreeViewPlugin } from "@syncfusion/ej2-vue-navigations";
Vue.use(TreeViewPlugin);
export default {
  data () {

Restrict the drag and drop for particular tree nodes in Vue Treeview component

You can able to restrict to drag and drop files under folder only. These can be achieved by using `nodeDragStop` and `nodeDragging` event of TreeView.

APP.VUE

```
<template>
  <div id="app">
    <div class="control_wrapper">
        <ejs-treeview id='treeview' :fields="fields"
:allowDragAndDrop='true' :nodeDragStop='dragStop'
:nodeDragging='nodeDrag'></ejs-treeview>
    </div>
    <div id="display"></div>
  </div>
</template>
<script>
import Vue from 'vue';
import { TreeViewPlugin } from "@syncfusion/ej2-vue-navigations";
Vue.use(TreeViewPlugin);
export default {
  data () {
         var dataSource =  [
        {
```

    }
  },
  methods: {
      nodeDrag: function(args) {
          if (args.droppedNode != null &&
args.droppedNode.getElementsByClassName('folder') &&
args.droppedNode.getElementsByClassName('folder').length === 0) {
            args.dropIndicator = 'e-no-drop';
          }
      }
      dragStop: function(args) {
         if (args.droppedNode != null &&
args.droppedNode.getElementsByClassName('folder') &&
args.droppedNode.getElementsByClassName('folder').length === 0) {
            args.cancel = true;
          }
    }
}
</script>
<style>

Uploader

Getting Started with the Vue Uploader Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using Vue-CLI and integrating the Syncfusion Vue Uploader component using the Composition API / Options API.

Prerequisites

System requirements for Syncfusion Vue UI components

Dependencies

The following are the dependencies required to use the uploader component in your application:

`js

|-- @syncfusion/ej2-vue-inputs

|-- @syncfusion/ej2-inputs

|-- @syncfusion/ej2-vue-base

|-- @syncfusion/ej2-base

|-- @syncfusion/ej2-buttons

`

Setting up the Vue 2 project

To generate a Vue 2 project using Vue-CLI, use the vue create command. Follow these steps to install Vue CLI and create a new project:

`bash

npm install -g @vue/cli

vue create quickstart

cd quickstart

npm run serve

`

or

`bash

yarn global add @vue/cli

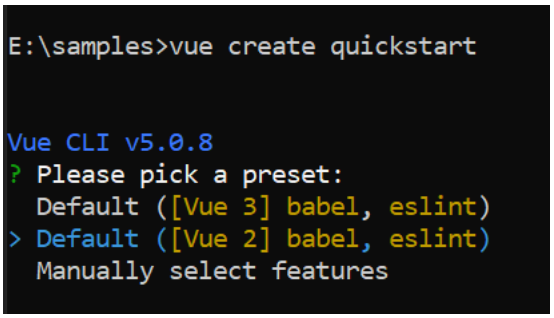
vue create quickstart

cd quickstart

yarn run serve

`

When creating a new project, choose the option Default ([Vue 2] babel, eslint) from the menu.



Once the quickstart project is set up with default settings, proceed to add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion packages are available at npmjs.com. To use Vue components, install the required npm package.

This article uses the Vue Uploader component as an example. Install the @syncfusion/ej2-vue-inputs package by running the following command:

`bash

npm install @syncfusion/ej2-vue-inputs --save

`

or

`bash

yarn add @syncfusion/ej2-vue-inputs

`

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

Copyright © 2001 -2024 Syncfusion Inc.

In this article, the Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the Uploader component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
</style>
```

The Custom Resource Generator (CRG) is an online web tool, which can be used to generate the custom script and styles for a set of specific components.

This web tool is useful to combine the required component scripts and styles in a single file.

Add Syncfusion Vue component

Follow the below steps to add the Vue Uploader component using Composition API or Options API:

1\. First, import and register the Uploader component in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { UploaderComponent as EjsUploader } from '@syncfusion/ej2-vue-
inputs';
</script>
```

OPTIONS API (~SRC/APP.VUE)

```
<script>
import { UploaderComponent } from '@syncfusion/ej2-vue-inputs';
export default {
components: {
'ejs-uploader': UploaderComponent
}
}
</script>
```

2\. In the template section define the Uploader component.

~/SRC/APP.VUE

```
<template>
<div id="app">
<ejs-uploader ref="uploadObj" id='defaultfileupload'
name="UploadFiles"></ejs-uploader>
</div>
</template>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

Copyright © 2001 -2024 Syncfusion Inc.

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
  <div>
    <div id="modalTarget" class="control-section; position:relative"
style="height:350px;">
        <ejs-uploader ref="uploadObj" id='defaultfileupload'
name="UploadFiles"></ejs-uploader>
    </div>
  </div>
</template>
<script setup>
import { UploaderComponent as EjsUploader } from '@syncfusion/ej2-vue-
inputs';
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
    #app {
        color: #008cff;
        height: 40px;
        left: 45%;
        position: absolute;
        top: 45%;
        width: 30%;
    }
    .control-section {
        height: 100%;
        min-height: 200px;
    }
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
  <div>
    <div id="modalTarget" class="control-section; position:relative"
style="height:350px;">
        <ejs-uploader ref="uploadObj" id='defaultfileupload'
name="UploadFiles"></ejs-uploader>
    </div>
  </div>
</template>
<script>
import { UploaderComponent } from '@syncfusion/ej2-vue-inputs';
export default {
    components: {
        'ejs-uploader': UploaderComponent
    },
    data: function() {
        return {  }
    }
}
</script>
<style>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
    #app {
        color: #008cff;
        height: 40px;
        left: 45%;
        position: absolute;
        top: 45%;
        width: 30%;
    }
    .control-section {
        height: 100%;
        min-height: 200px;
    }
</style>
```

Run the project

To run the project, use the following command:

`bash

npm run serve

`

or

`bash

yarn run serve

`

The Essential JS2 AJAX library has been integrated for uploader server requests. Hence, use the third party promise library like blue-bird to use the uploader in Internet Explorer.

{% previewsample "page.domainurl/code-snippet/uploader/getting-started-cs1" %}

Adding drop area

By default, the uploader component allows to upload files by drag the files from file explorer, and drop into the drop area. You can configure any other external element as drop target using dropArea property.

In the following sample, drop target is configured.

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
  <div>
    <div id='droparea'  >
            Drop files here to upload
    </div>
    <ejs-uploader ref="uploadObj" id='defaultfileupload' name="UploadFiles"
:dropArea = "dropElement"></ejs-uploader>
  </div>
</template>
<script setup>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
import { UploaderComponent as EjsUploader } from '@syncfusion/ej2-vue-
inputs';
const dropElement = '#droparea';
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
    #container {
        visibility: hidden;
        padding-left: 5%;
        width: 100%;
    }
    #loader {
        color: #008cff;
        font-family: 'Helvetica Neue','calibiri';
        font-size: 14px;
        height: 40px;
        left: 45%;
        position: absolute;
        top: 45%;
        width: 30%;
    }
    .fileupload {
        margin: 20px auto;
        width: 400px;
    }
    #droparea {
        padding: 50px 25px;
        margin: 30px auto;
        border: 1px solid #c3c3c3;
        text-align: center;
        width: 20%;
        display: inline-flex;
    }
    .e-file-select,
    .e-file-drop {
        display: none;
    }
    body .e-upload-drag-hover {
         outline: 2px dashed brown;
    }
    #uploadfile {
        width: 60%;
        display: inline-flex;
        margin-left: 5%;
    }
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
  <div>
    <div id='droparea'  >
            Drop files here to upload
    </div>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
    <ejs-uploader ref="uploadObj" id='defaultfileupload' name="UploadFiles"
:dropArea = "dropElement"></ejs-uploader>
  </div>
</template>
<script>
import { UploaderComponent } from '@syncfusion/ej2-vue-inputs';
export default {
    components: {
      'ejs-uploader': UploaderComponent
    },
    data: function() {
        return {
        dropElement: '#droparea'
        }
    }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
    #container {
        visibility: hidden;
        padding-left: 5%;
        width: 100%;
    }
    #loader {
        color: #008cff;
        font-family: 'Helvetica Neue','calibiri';
        font-size: 14px;
        height: 40px;
        left: 45%;
        position: absolute;
        top: 45%;
        width: 30%;
    }
    .fileupload {
        margin: 20px auto;
        width: 400px;
    }
    #droparea {
        padding: 50px 25px;
        margin: 30px auto;
        border: 1px solid #c3c3c3;
        text-align: center;
        width: 20%;
        display: inline-flex;
    }
    .e-file-select,
    .e-file-drop {
        display: none;
    }
    body .e-upload-drag-hover {
         outline: 2px dashed brown;
    }
    #uploadfile {
        width: 60%;
```

Copyright © 2001 -2024 Syncfusion Inc.

```
        display: inline-flex;
        margin-left: 5%;
    }
</style>
```

{% previewsample "page.domainurl/code-snippet/uploader/getting-started-cs2" %}

Configure asynchronous settings

The uploader component process the files to upload in Asynchronous mode by default. Define the properties saveUrl and removeUrl to handle the save and remove action as follows.

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
  <div>
    <ejs-uploader ref="uploadObj" id='defaultfileupload' name="UploadFiles"
:asyncSettings= "path" ></ejs-uploader>
  </div>
</template>
<script setup>
import { UploaderComponent as EjsUploader } from '@syncfusion/ej2-vue-
inputs';
const path =  {
            saveUrl:
'https://ej2.syncfusion.com/services/api/uploadbox/Save',
            removeUrl:
'https://ej2.syncfusion.com/services/api/uploadbox/Remove'
        };
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
  <div>
    <ejs-uploader ref="uploadObj" id='defaultfileupload' name="UploadFiles"
:asyncSettings= "path" ></ejs-uploader>
  </div>
</template>
<script>
import { UploaderComponent } from '@syncfusion/ej2-vue-inputs';
export default {
    components: {
      'ejs-uploader': UploaderComponent
    },
    data: function() {
        return {
        path:  {
            saveUrl:
'https://ej2.syncfusion.com/services/api/uploadbox/Save',
            removeUrl:
'https://ej2.syncfusion.com/services/api/uploadbox/Remove'
```

Copyright © 2001 -2024 Syncfusion Inc.

```
        }
        }
    }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/uploader/getting-started-cs3" %}

Handle success and failed upload

You can handle the success and failure actions using the success and failure events. To handle these event, define the function and assign it to corresponding event as follows.

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
  <div>
    <ejs-uploader ref="uploadObj" id='defaultfileupload' name="UploadFiles"
:asyncSettings= "path" :success= "onUploadSuccess" :failure=
"onUploadFailed" ></ejs-uploader>
  </div>
</template>
<script setup>
import { UploaderComponent as EjsUploader } from '@syncfusion/ej2-vue-
inputs';
const path =  {
                saveUrl:
'https://ej2.syncfusion.com/services/api/uploadbox/Save',
                removeUrl:
'https://ej2.syncfusion.com/services/api/uploadbox/Remove'
            };
const onUploadSuccess = (() => {
      console.log('Uploaded successfully');
});
const onUploadFailed = (() => {
      console.log('Upload fails');
});

</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
  <div>
    <ejs-uploader ref="uploadObj" id='defaultfileupload' name="UploadFiles"
:asyncSettings= "path" :success= "onUploadSuccess" :failure=
"onUploadFailed" ></ejs-uploader>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
  </div>
</template>
<script>
import { UploaderComponent } from '@syncfusion/ej2-vue-inputs';
export default {
    components: {
      'ejs-uploader': UploaderComponent
    },
    data: function() {
        return {
            path:  {
                saveUrl:
'https://ej2.syncfusion.com/services/api/uploadbox/Save',
                removeUrl:
'https://ej2.syncfusion.com/services/api/uploadbox/Remove'
            }
        }
    },
      methods:{
        onUploadSuccess: function () {
            console.log('Uploaded successfully');
        },
        onUploadFailed: function () {
            console.log('Upload fails');
        }
      }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
</style>
```

Getting Started with the Vue Uploader Component in Vue 3

This article provides a step-by-step guide for setting up a Vite project with a JavaScript environment and integrating the Syncfusion Vue Uploader component using the Composition API / Options API.

The Composition API is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

Copyright © 2001 -2024 Syncfusion Inc.

The Options API is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

Prerequisites

System requirements for Syncfusion Vue UI components

Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using Vite. To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

`bash

npm create vite@latest

`

or

`bash

yarn create vite

`

Using one of the above commands will lead you to set up additional configurations for the project as below:

1.Define the project name: We can specify the name of the project directly. Let's specify the name of the project as my-project for this article.

`bash

? Project name: » my-project

`

2.Select Vue as the framework. It will create a Vue 3 project.

`bash

? Select a framework: » - Use arrow-keys. Return to submit.

Vanilla

Vue

React

Preact

Lit

Svelte

Others

`

3.Choose JavaScript as the framework variant to build this Vite project using JavaScript and Vue.

`bash

Copyright © 2001 -2024 Syncfusion Inc.

? Select a variant: » - Use arrow-keys. Return to submit.

JavaScript

TypeScript

Customize with create-vue ↗

Nuxt ↗

`

4.Upon completing the aforementioned steps to create the my-project, run the following command to install its dependencies:

`bash

cd my-project

npm install

`

or

`bash

cd my-project

yarn install

`

Now that my-project is ready to run with default settings, let's add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion Vue component packages are available at npmjs.com. To use Syncfusion Vue components in the project, install the corresponding npm package.

This article uses the Vue Uploader component as an example. To use the Vue Uploader component in the project, the @syncfusion/ej2-vue-inputs package needs to be installed using the following command:

`bash

npm install @syncfusion/ej2-vue-inputs --save

`

or

`bash

yarn add @syncfusion/ej2-vue-inputs

`

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

Copyright © 2001 -2024 Syncfusion Inc.

In this article, Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the Uploader component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
</style>
```

The order of importing CSS styles should be in line with its dependency graph.

Add Syncfusion Vue component

Follow the below steps to add the Vue Uploader component using Composition API or Options API:

1.First, import and register the Uploader component in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { UploaderComponent as EjsUploader } from "@syncfusion/ej2-vue-
inputs";
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { UploaderComponent } from "@syncfusion/ej2-vue-inputs";
//Component registeration
export default {
name: "App",
components: {
'ejs-uploader' : UploaderComponent,
}
}
</script>
```

2.In the template section, define the Uploader component with the dataSource property and column definitions.

~/SRC/APP.VUE

```
<template>
<div>
<div id="modalTarget" class="control-section; position:relative"
style="height:350px;">
<ejs-uploader ref="uploadObj" id='defaultfileupload'
name="UploadFiles"></ejs-uploader>
</div>
</div>
</template>
```

Copyright © 2001 -2024 Syncfusion Inc.

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<div>
<div id="modalTarget" class="control-section; position:relative"
style="height:350px;">
<ejs-uploader ref="uploadObj" id='defaultfileupload'
name="UploadFiles"></ejs-uploader>
</div>
</div>
</template>
<script setup>
import { UploaderComponent as EjsUploader } from "@syncfusion/ej2-vue-
inputs";
const data = [];
</script>
<style>

Run the project

To run the project, use the following command:

`bash

npm run dev

`

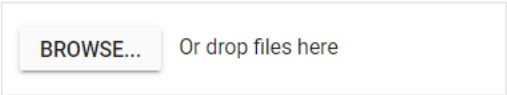
or

`bash

yarn run dev

`

The output will appear as follows:



Adding drop area

By default, the uploader component allows to upload files by drag the files from file explorer, and drop into the drop area. You can configure any other external element as drop target using dropArea property.

In the following sample, drop target is configured.

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<div>
<div id='droparea'>Drop files here to upload</div>
<ejs-uploader ref="uploadObj" id='defaultfileupload' name="UploadFiles"
:dropArea = "data[0].dropElement"></ejs-uploader>
</div>
</template>

The output will appear as follows:

See Also

- How to add additional data on upload
- Achieve file upload programmatically
- Achieve invisible upload

Async in Vue Uploader component

The uploader component allows you to upload the files asynchronously. The upload process requires save and remove action URL to manage the upload process in the server.

- The save action is necessary to handle the upload operation
- The remove action is optional, can handle the removed files from server

The File can be uploaded automatically or manually. For more information, you can refer to the Auto Upload section from the documentation.

Multiple file upload

By Default, the uploader component allows you to select and upload multiple files simultaneously. The selected files are organized in a list for every file selection until you clear it by clicking clear button that is shown in footer.

You can enable the multiple file selection by using `multiple` API.

The following example explains about multiple file upload settings.

In the following example, explains about multiple file upload settings.

APP.VUE

```
<template>
  <div>
    <ejs-uploader ref="uploadObj" id='defaultfileupload' name="UploadFiles"
:asyncSettings= "path" ></ejs-uploader>
  </div>
</template>
<script>
import Vue from 'vue';
import { UploaderPlugin } from '@syncfusion/ej2-vue-inputs';
Vue.use(UploaderPlugin);
export default {
    data: function() {
        return {
```

```
            path:  {
                saveUrl:
'https://ej2.syncfusion.com/services/api/uploadbox/Save',
                removeUrl:
'https://ej2.syncfusion.com/services/api/uploadbox/Remove'
            }
        }
    }
}
</script>
<style>
@import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/uploader/asynchronous-cs1" %}

Single file upload

You can select and upload a single file by disabling the multiple file selection property. The file list item is removed for every selection and it always maintain a single file to upload.

The following example explains about single file upload settings.

APP.VUE

```
<template>
  <div>
    <ejs-uploader ref="uploadObj" id='defaultfileupload' name="UploadFiles"
:asyncSettings= "path" :multiple = 'multiple'></ejs-uploader>
  </div>
</template>
<script>
import Vue from 'vue';
import { UploaderPlugin } from '@syncfusion/ej2-vue-inputs';
Vue.use(UploaderPlugin);
export default {
    data: function() {
        return {
            path:  {
                saveUrl:
'https://ej2.syncfusion.com/services/api/uploadbox/Save',
                removeUrl:
'https://ej2.syncfusion.com/services/api/uploadbox/Remove'
            },
            multiple: false
        }
    }
}
</script>
<style>
@import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/uploader/asynchronous-cs2" %}

Save Action

The save action handler upload the files that needs to be specified in the saveUrl property.

The save handler receives the submitted files and manages the save process in server. After uploading the files to server location, the color of the selected file name changes to green and the remove icon is changed as bin icon.

- When the file is uploaded successfully, the event “success” triggers to handle the operation after upload.
- When the file is failed to upload, the event “failure” triggers with information, which cause this failure.

You can cancel the upload process by setting the upload event argument **eventargs.cancel** to true.

```
<template>
<div>
<ejs-uploader ref="uploadObj" id='defaultfileupload' name="UploadFiles" :asyncSettings= "path" ></ejs-uploader>
</div>
</template>
<script>
import Vue from 'vue';
import { UploaderPlugin } from '@syncfusion/ej2-vue-inputs';
Vue.use(UploaderPlugin);
export default {
data: function() {
return {
path:  {
saveUrl: 'https://ej2.syncfusion.com/services/api/uploadbox/Save'
}
}
}
}
</script>
```

Server-side configuration for save action

This section explains how to handle the server-side action for saving the file from server.

Copyright © 2001 -2024 Syncfusion Inc.

```c#
[AcceptVerbs("Post")]
public void Save()
{
try
{
if (HttpContext.Current.Request.Files.AllKeys.Length > 0)
{
var httpPostedFile = HttpContext.Current.Request.Files["UploadFiles"];
if (httpPostedFile != null)
{
var fileSave = HttpContext.Current.Server.MapPath("UploadedFiles");
var fileSavePath = Path.Combine(fileSave, httpPostedFile.FileName);
if (!File.Exists(fileSavePath))
{
httpPostedFile.SaveAs(fileSavePath);
HttpResponse Response = HttpContext.Current.Response;
Response.Clear();
Response.ContentType = "application/json; charset=utf-8";
Response.StatusDescription = "File uploaded succesfully";
Response.End();
}
else
{
HttpResponse Response = HttpContext.Current.Response;
Response.Clear();
Response.Status = "400 File already exists";
Response.StatusCode = 400;
Response.StatusDescription = "File already exists";
Response.End();
}
}
}
```

Copyright © 2001 -2024 Syncfusion Inc.

```
}
catch (Exception e)
{
HttpResponse Response = System.Web.HttpContext.Current.Response;
Response.Clear();
Response.ContentType = "application/json; charset=utf-8";
Response.StatusCode = 400;
Response.Status = "400 No Content";
Response.StatusDescription = e.Message;
Response.End();
}
}
```

Remove Action

The remove action is optional. Specify the URL to handle remove process from server. The remove handler receives the posted files and handle the remove operation in server.

- When the files are removed successfully from server, the success event triggers to denote the process has completed.
- When remove action fails, the event “failure” triggers with information, which cause failure in remove process.

You can differentiate the file operation whether the success event triggers from save or remove action in its arguments **eventArgs.operation**.

You can remove the files which is not uploaded locally by clicking the remove icon. In this case, the success or failure events will not be triggered.

```
<template>
<div>
<ejs-uploader ref="uploadObj" id='defaultfileupload' name="UploadFiles" :asyncSettings= "path" ></ejs-uploader>
</div>
</template>
<script>
import Vue from 'vue';
import { UploaderPlugin } from '@syncfusion/ej2-vue-inputs';
Vue.use(UploaderPlugin);
```

```
export default {
data: function() {
return {
path:  {
saveUrl: 'https://ej2.syncfusion.com/services/api/uploadbox/Save',
removeUrl: 'https://ej2.syncfusion.com/services/api/uploadbox/Remove'
}
}
}
}
</script>
`
```

Server-side configuration for remove action

This section explains how to handle the server-side action for removing the file from server.

```
`c#
[AcceptVerbs("Post")]
public void Remove()
{
try
{
var fileSave = "";
if (HttpContext.Current.Request.Form["cancel-uploading"] != null)
{
fileSave = HttpContext.Current.Server.MapPath("UploadingFiles");
}
else
{
fileSave = HttpContext.Current.Server.MapPath("UploadedFiles");
}
var fileName = HttpContext.Current.Request.Files["UploadFiles"].FileName;
var fileSavePath = Path.Combine(fileSave, fileName);
if (File.Exists(fileSavePath))
{
```

File.Delete(fileSavePath);

}

}

catch (Exception e)

{

HttpResponse Response = HttpContext.Current.Response;

Response.Clear();

Response.Status = "404 File not found";

Response.StatusCode = 404;

Response.StatusDescription = "File not found";

Response.End();

}

}

`

Auto Upload

By default, the uploader processes the files to upload once the files are selected and added in upload queue. To upload manually, disable the autoUpload property. When you disable this property, you can use the action buttons to call upload all or clear all actions manually. You can change those buttons text using the buttons property in the Uploader component.

APP.VUE

```
<template>
  <div>
    <ejs-uploader ref="uploadObj" id='defaultfileupload' name="UploadFiles"
:asyncSettings= "path" :autoUpload= 'autoUpload'></ejs-uploader>
  </div>
</template>
<script>
import Vue from 'vue';
import { UploaderPlugin } from '@syncfusion/ej2-vue-inputs';
Vue.use(UploaderPlugin);
export default {
    data: function() {
        return {
            path:  {
                saveUrl:
'https://ej2.syncfusion.com/services/api/uploadbox/Save',
                removeUrl:
'https://ej2.syncfusion.com/services/api/uploadbox/Remove'
            },
            autoUpload: false
        }
    }
}
</script>

```

{% previewsample "page.domainurl/code-snippet/uploader/asynchronous-cs3" %}

Sequential Upload

By default, the uploader component process multiple files to upload simultaneously. When you enable the sequentialUpload property, the selected files will process sequentially (one after the other) to the server. If the file uploaded successfully or failed, the next file will upload automatically in this sequential upload. This feature helps to reduce the upload traffic and reduce the failure of file upload.

APP.VUE

```
<template>
  <div>
    <ejs-uploader ref="uploadObj" id='defaultfileupload' name="UploadFiles"
:asyncSettings= "path" :sequentialUpload= 'sequentialUpload'></ejs-uploader>
  </div>
</template>
<script>
import Vue from 'vue';
import { UploaderPlugin } from '@syncfusion/ej2-vue-inputs';
Vue.use(UploaderPlugin);
export default {
    data: function() {
        return {
            path:  {
                saveUrl:
'https://ej2.syncfusion.com/services/api/uploadbox/Save',
                removeUrl:
'https://ej2.syncfusion.com/services/api/uploadbox/Remove'
            },
            sequentialUpload: true
        }
    }
}
</script>
<style>
@import "../../node_modules/@syncfusion/ej2-base/styles/material.css";

Adding additional HTTP headers with upload action

The Uploader component allows you to add the additional headers with save and remove action requests using the uploading and removing events, which helps to send validation token on file upload. Access the current request and set the request header within these events.

The following code block shows how to add the additional headers with save and remove action request.

`

Chunk upload in Vue Uploader component

The Uploader sends the large file split into small chunks and transmits to the server using AJAX. You can also pause, resume, and retry the failed chunk file.

* The chunk upload works in asynchronous upload only.

- This feature is available from the Essential Studio Vol 2, 2018 release.

To enable the chunk upload, set the size to chunkSize option of the upload and it receives the value in bytes.

APP.VUE

```
<template>
    <div class="col-lg-8 control-section uploader chunk">
        <div class="control_wrapper">
            <ejs-uploader id='chunkupload' name="UploadFiles"
:asyncSettings= "path" ref="uploadObj">         </ejs-uploader>
        </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { UploaderPlugin } from '@syncfusion/ej2-vue-inputs';
Vue.use(UploaderPlugin);
export default {
 data: function(){

{% previewsample "page.domainurl/code-snippet/uploader/chunk-upload-cs1" %}

The chunk upload functionality separates the selected files into blobs of the data or chunks. These chunks are transmitted to the server using an AJAX request.

The chunks are sent in **sequential** order, and the next chunk can be sent to the server according to the success of the previous chunk. If any one of the chunk failed, then the remaining chunk cannot be sent to the server. The chunkSuccess or chunkFailure event will be triggered when the chunk is sent to the server successfully or failed. If all the chunks are sent to the server successfully, the uploader success event is triggered.

Chunk upload will work when the selected file size is greater than the specified chunk size. otherwise, it upload the files normally.

Additional configurations

To modify the chunk upload, the following options can be used.

- **RetryAfterDelay** - If error occurs while sending any chunk request from JavaScript, hold the operation for 500 milliseconds (by default), and retry the operation using chunk. This can be achieved by using the asyncSettings.retryAfterDelay property. You can modify the holding time interval in milliseconds.
- **RetryCount** - Specifies the number of retry actions performed when the file fails to upload. By default, retry action is performed 3 times. If the file fails to upload continuously, the request is aborted and the uploader failure event will trigger.

Copyright © 2001 -2024 Syncfusion Inc.

The following sample specifies the chunk upload delay with 3000 milliseconds and the retry count is 5. The failure event is triggered as the wrong saveUrl is used.

Resumable upload

Allows you to resume an upload operation after a network failure or manually interrupts (pause) the upload. You can perform pause and resume upload actions using public methods (pause and resume) and UI interaction. The pause icon is enabled after the upload begins.

This pause and resume features available only when the chunk upload is enabled.

APP.VUE

        width: 30%;
    }
</style>
```

{% previewsample "page.domainurl/code-snippet/uploader/chunk-upload-cs3" %}

Cancel upload

The uploader component allows you to cancel the uploading file. This can be achieved by clicking the cancel icon or using the cancel method. The cancelling event will be fired whenever the file upload request is canceled. While canceling the upload request, the partially uploaded file is removed from the server.

When the request fails, the pause icon is changed to retry icon. By clicking the retry icon, sends the failed chunk request again to the server and upload started from where it is failed. You can retry the canceled upload request again using retry UI or retry methods. But, if you retry this, the file upload action again starts from initial.

The following example explains about chunk upload with cancel support.

APP.VUE

```
<template>
    <div class="col-lg-8 control-section uploader chunk">
        <div class="control_wrapper">
            <ejs-uploader id='chunkupload' name="UploadFiles"
:asyncSettings= "path" ref="uploadObj"></ejs-uploader>
        </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { UploaderPlugin } from '@syncfusion/ej2-vue-inputs';
Vue.use(UploaderPlugin);
export default {
 data: function(){
        return {
          path:  {
            saveUrl:
'https://ej2.syncfusion.com/services/api/uploadbox/Save',
            removeUrl:
'https://ej2.syncfusion.com/services/api/uploadbox/Remove',
            chunkSize: 102400
          }
        }
    }
}
```

        width: 30%;
    }
</style>
```

{% previewsample "page.domainurl/code-snippet/uploader/chunk-upload-cs4" %}

The retry action has different working behavior for chunk upload and default upload.

- Chunk upload - Retries to upload the failed request where it is failed previously.
- Default upload - Retries to upload the failed file again from initial.

Server-Side configurations

The server-side implementation entirely depends on the application requirements and logic. The following code snippet provides the server-side logic to handle the chunk upload using the uploader components.

`c#

// Server configuration for upload a file.

public void Save()

{

try

{

if (HttpContext.Current.Request.Files.AllKeys.Length > 0)

{

var httpPostedChunkFile = HttpContext.Current.Request.Files["chunkFile"];

if (httpPostedChunkFile != null)

{

var saveFile = HttpContext.Current.Server.MapPath("UploadingFiles");

Copyright © 2001 -2024 Syncfusion Inc.

```
// Save the chunk file in temporery location with .part extension
var SaveFilePath = Path.Combine(saveFile, httpPostedChunkFile.FileName + ".part");
var chunkIndex = HttpContext.Current.Request.Form["chunk-index"];
if (chunkIndex == "0")
{
httpPostedChunkFile.SaveAs(SaveFilePath);
}
else
{
// Merge the current chunk file with previous uploaded chunk files
MergeChunkFile(SaveFilePath, httpPostedChunkFile.InputStream);
var totalChunk = HttpContext.Current.Request.Form["total-chunk"];
if (Convert.ToInt32(chunkIndex) == (Convert.ToInt32(totalChunk) - 1))
{
var savedFile = HttpContext.Current.Server.MapPath("UploadedFiles");
var originalFilePath = Path.Combine(savedFile, httpPostedChunkFile.FileName);
// After all the chunk files completely uploaded, remove the .part extension and move this file into save location
System.IO.File.Move(SaveFilePath, originalFilePath);
}
}
HttpResponse ChunkResponse = HttpContext.Current.Response;
ChunkResponse.Clear();
ChunkResponse.ContentType = "application/json; charset=utf-8";
ChunkResponse.StatusDescription = "File uploaded succesfully";
ChunkResponse.End();
}
var httpPostedFile = HttpContext.Current.Request.Files["UploadFiles"];
if (httpPostedFile != null)
{
var fileSave = HttpContext.Current.Server.MapPath("UploadedFiles");
var fileSavePath = Path.Combine(fileSave, httpPostedFile.FileName);
if (!File.Exists(fileSavePath))
```

```
{
httpPostedFile.SaveAs(fileSavePath);
HttpResponse Response = HttpContext.Current.Response;
Response.Clear();
Response.ContentType = "application/json; charset=utf-8";
Response.StatusDescription = "File uploaded succesfully";
Response.End();
}
else
{
HttpResponse Response = HttpContext.Current.Response;
Response.Clear();
Response.Status = "400 File already exists";
Response.StatusCode = 400;
Response.StatusDescription = "File already exists";
Response.End();
}
}
}
}
catch (Exception e)
{
HttpResponse Response = HttpContext.Current.Response;
Response.Clear();
Response.ContentType = "application/json; charset=utf-8";
Response.StatusCode = 400;
Response.Status = "400 No Content";
Response.StatusDescription = e.Message;
Response.End();
}
}
// Server configuration for remove a uploaded file
public void Remove()
```

```
{
try
{
var fileSave = "";
if (HttpContext.Current.Request.Form["cancel-uploading"] != null)
{
fileSave = HttpContext.Current.Server.MapPath("UploadingFiles");
} else
{
fileSave = HttpContext.Current.Server.MapPath("UploadedFiles");
}
var fileName = HttpContext.Current.Request.Files["UploadFiles"].FileName;
var fileSavePath = Path.Combine(fileSave, fileName);
if (File.Exists(fileSavePath))
{
File.Delete(fileSavePath);
}
}
catch (Exception e)
{
HttpResponse Response = HttpContext.Current.Response;
Response.Clear();
Response.Status = "404 File not found";
Response.StatusCode = 404;
Response.StatusDescription = "File not found";
Response.End();
}
}
// Merge the current chunk file with previous uploaded chunk files
public void MergeChunkFile(string fullPath, Stream chunkContent)
{
try
{
```

```
using (FileStream stream = new FileStream(fullPath, FileMode.Append, FileAccess.Write,
FileShare.ReadWrite))
{
using (chunkContent)
{
chunkContent.CopyTo(stream);
}
}
}
catch (IOException ex)
{
throw ex;
}
}
`
```

You can also explore Vue File Upload feature tour page for its groundbreaking features. You can also explore our Vue File Upload example to understand how to browse the files which you want to upload to the server.

File source in Vue Uploader component

Paste to upload

The uploader component allows you to upload the files using the select or drop files option from the file explorer. It also supports pasting to upload the image files. You can upload any currently copied images in the clipboard.

When you paste the image, it will be saved in the server with the filename as image.png. The file name can

be renamed in the server end. You can generate a random name for the file name using getUniqueID method.

Refer to the following example.

APP.VUE

```
<template>
  <div>
    <ejs-uploader ref="uploadObj" id='defaultfileupload' name="UploadFiles"
:asyncSettings= "path" :autoUpload= 'autoUpload'
:uploading="onUploadBegin"></ejs-uploader>
  </div>
</template>
<script>
import Vue from 'vue';
import { UploaderPlugin, UploadingEventArgs } from '@syncfusion/ej2-vue-
inputs';
```

```
import { getUniqueID } from '@syncfusion/ej2-base';
Vue.use(UploaderPlugin);
export default {
    data: function() {
        return {
            path:  {
                saveUrl:
'https://ej2.syncfusion.com/services/api/uploadbox/Save',
                removeUrl:
'https://ej2.syncfusion.com/services/api/uploadbox/Remove'
            },
            autoUpload: false
        }
    },
    methods:{
        onUploadBegin: function(args) {
            // check whether the file is uploading from paste.
            if (args.fileData.fileSource === 'paste') {
                let newName: string =
getUniqueID(args.fileData.name.substring(0,
args.fileData.name.lastIndexOf('.'))) + '.png';
                args.customFormData = [{'fileName': newName}];
            }
        }
    }
}
</script>
<style>
@import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
</style>
```

Save action for paste to upload

`c#

public void Save()

{

var httpPostedFile = System.Web.HttpContext.Current.Request.Files["UploadFiles"];

var fileSave = System.Web.HttpContext.Current.Server.MapPath("UploadedFiles");

var fileSavePath = Path.Combine(fileSave, httpPostedFile.FileName);

if (!System.IO.File.Exists(fileSavePath))

{

httpPostedFile.SaveAs(fileSavePath);

var newName = System.Web.HttpContext.Current.Request.Form["fileName"];

var filePath = Path.Combine(fileSavePath.Substring(0, fileSavePath.LastIndexOf("//")), newName);

// Rename the file

Copyright © 2001 -2024 Syncfusion Inc.

```
System.IO.File.Move(fileSavePath, newName);

HttpResponse Response = System.Web.HttpContext.Current.Response;

Response.Clear();

Response.ContentType = "application/json; charset=utf-8";

Response.StatusDescription = fileSavePath;

Response.End();

}

}
`
```

Directory upload

The uploader component allows you to upload all files in the folders to server by using the directoryUpload property. When this property is enabled, the uploader component processes the files by iterating through the files and sub-directories in a directory. It allows you to select only folders instead of files to upload.

The directory upload is available only in browsers that supports **HTML5 directory**. The uploader will process directory upload by dragging and dropping in the Edge browser. Refer to the following example to upload files to the server.

APP.VUE

```
<template>
  <div>
    <ejs-uploader ref="uploadObj" id='defaultfileupload' name="UploadFiles"
:asyncSettings= "path" :directoryUpload = 'directory'></ejs-uploader>
  </div>
</template>
<script>
import Vue from 'vue';
import { UploaderPlugin } from '@syncfusion/ej2-vue-inputs';
Vue.use(UploaderPlugin);
export default {
    data: function() {
        return {
            path:  {
                saveUrl:
'https://ej2.syncfusion.com/services/api/uploadbox/Save',
                removeUrl:
'https://ej2.syncfusion.com/services/api/uploadbox/Remove'
            },
            directory: true
        }
    }
}
</script>

{% previewsample "page.domainurl/code-snippet/uploader/asynchronous-cs6" %}

Save action for directory upload

```c#
public void Save() {
var httpPostedFile = HttpContext.Current.Request.Files["UploadFiles"];
var fileSave = HttpContext.Current.Server.MapPath("UploadedFiles");
// split the folders by using file name
string[] folders = httpPostedFile.FileName.Split('/');
string fileSavePath = "";
if (folders.Length > 1)
{
for (var i = 0; i < folders.Length - 1; i++)
{
var newFolder = Path.Combine(fileSave, folders[i]);
// create folder
Directory.CreateDirectory(newFolder);
fileSave = newFolder;
}
fileSavePath = Path.Combine(fileSave, folders[folders.Length - 1]);
}
else
{
fileSavePath = Path.Combine(fileSave, httpPostedFile.FileName);
}
if (!System.IO.File.Exists(fileSavePath))
{
// save file in the corresponding server location
httpPostedFile.SaveAs(fileSavePath);
HttpResponse Response = System.Web.HttpContext.Current.Response;
Response.Clear();
Response.ContentType = "application/json; charset=utf-8";
// Sending the file path to client side
```

Copyright © 2001 -2024 Syncfusion Inc.

Response.StatusDescription = fileSavePath;

Response.End();

}

}

`

Drag and drop

The uploader component allows you to drag and drop the files to upload. You can drag the files from file explorer and drop into the drop area. By default, the uploader component act as drop area element. The drop area gets highlighted when you drag the files over drop area.

Custom drop area

The uploader component allows you to set external target element as drop area using the dropArea property. The element can be represented as HTML element or element's id.

APP.VUE

```
<template>
  <div>
    <div id='droparea'  >
            Drop files here to upload
    </div>
    <ejs-uploader ref="uploadObj" id='defaultfileupload' name="UploadFiles"
:asyncSettings= "path" :dropArea= 'dropTarget' ></ejs-uploader>
  </div>
</template>
<script>
import Vue from 'vue';
import { UploaderPlugin } from '@syncfusion/ej2-vue-inputs';
Vue.use(UploaderPlugin);

Validation in Vue Uploader component

The uploader component validate the selected files extension and size using the allowedExtensions, minFileSize and maxFileSize properties. The files can be validated before uploading to the server and can be ignored on uploading. Also, you can validate the files by setting the HTML attributes to the original input element. The validation process occurs on drag-and-drop the files also.

File type

You can allow the specific types of files alone to upload using the allowedExtensions property. The extension can be represented as collection by comma separators. The uploader component filters the selected or dropped files matched against the specified file types and processes the upload operation. The validation happens when you specify value to inline attribute accept to original input element.

</style>
```

{% previewsample "page.domainurl/code-snippet/uploader/file-type-cs1" %}

File size

The uploader component allows you to validate the files based on its size. The validation helps to restrict uploading large files or empty files to the server. The size can be represented in bytes. By default, the uploader component allows you to upload **minimum file size** as 0 byte and **maximum file size** as 28.4 MB using using minFileSize and maxFileSize properties.

Maximum files count

You can restrict uploading the maximum number of files using the **selected** event. In the selected event arguments, you can get the currently selected files details using the getFilesData(). You can modify the files details and assign the modified file list to the eventArgs.modifiedFilesData.

Form support in Vue Uploader component

The uploader component works with HTML form like default file input.

The following configuration is must to make the uploader work inside the form.

- saveUrl and removeUrl must be null.
- autoUpload must be disabled.
- name attribute must be added in input element.

The selected or dropped files are received as a collection in form action when the form is submitted. The form action handles the server-side operations that manage the file upload process. When you reset the form, the file list and data will be cleared.

You can also explore Vue File Upload feature tour page for its groundbreaking features. You can also explore our Vue File Upload example to understand how to browse the files which you want to upload to the server.

Template in Vue Uploader component

You can customize the default appearance of the uploader using a template along with buttons.

File list template

The template property is used to customize the default appearance of each file in the list. It can be represented as the HTML element or string. The selected or dropped files are displayed as per the template layout provided. The remove and progress bar action is handled using the corresponding events when the template is defined.

For example, you can display file type icon along with default UI elements.

APP.VUE

```
<template>
    <div>
        <div class="col-lg-12 control-section uploader customdroparea">
            <div class="control_wrapper">

Custom template

You can design the own template by preventing the default file list including buttons.

when you use custom template to upload or remove the files, pass the custom UI argument as true to call

upload / remove public method as follows:

- UploaderObj.upload(filesData, true);
- UploaderObj.remove(filesData, true);

Refer to the following code sample.

APP.VUE

```
<template>
    <div class="col-lg-8 control-section uploader template-view">
        <div class="control_wrapper">
            <div class="sample_wrapper">
                <div id="dropTarget">
                    <span id="dropElement" class="droparea">Drop files here
or <a href="" id="browse"><u>Browse</u></a> </span>

Localization in Vue Uploader component

The Localization library allows you to localize static text content of the uploader. The static text contains default text content of action buttons, file status, clear icon title, tooltips, and text content of drag area. Define the locale object for a culture and assign it to L10n load method.

The following are the list of keys and its values used in the uploader.

| Key | Description |

|----------|---------|

| Browse | To customize the browse button text.|

| Clear | To customize the clear button text.|

| Upload | To customize the upload button text. |

| dropFilesHint | To customize the drop area text. |

| uploadFailedMessage | To customize the status text when the file is failed to upload.|

| uploadSuccessMessage | To customize the status text when the file is uploaded successfully.|

| removedSuccessMessage | To customize the status text when the file is removed the successfully from the server.|

| removedFailedMessage | To customize the status text while the file is failed to remove.|

| inProgress | To customize the status text while the upload is in progress.|

| pauseUpload | To customize the status text while the uploading is paused.|

| fileUploadCancel | To customize the status text when uploading is cancelled.|

| readyToUploadMessage | To customize the status text when the file is selected and ready to upload.|

| invalidMaxFileSize | To customize the status text when the file size is greater than the maximum file size.|

| invalidFileType | To customize the status text when the file type is invalid.|

| invalidMinFileSize | To customize the status text when the file size is less than the minimum file size. |

| remove | To customize tooltip text for remove icon. |

| cancel | To customize tooltip text for cancel icon. |

| delete | To customize tooltip text for delete icon. |

| totalFiles | To customize tooltip text for total files. |

| size | To customize tooltip text for size. |

Wai aria accessibility in Vue Uploader component

The Uploader component followed the accessibility guidelines and standards, including ADA, Section 508, WCAG 2.2 standards, and WCAG roles that are commonly used to evaluate accessibility.

The accessibility compliance for the Uploader component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| WCAG 2.2 Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Section 508 Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Screen Reader Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Right-To-Left Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Color Contrast | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Mobile Device Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Keyboard Navigation Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Accessibility Checker Validation | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Axe-core Accessibility Validation | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> - All features of the component meet the requirement.

<img src="https://cdn.syncfusion.com/content/images/landing-page/intermediate.png" alt="Intermediate"> - Some features of the component do not meet the requirement.

<img src="https://cdn.syncfusion.com/content/images/landing-page/no.png" alt="No"> - The component does not meet the requirement.

Keyboard interaction

The uploader component characterized with complete ARIA accessibility support that helps to be accessible by on-screen readers and other assistive technology devices.

The following are the standard keys that works on uploader component:

| **Keyboard shortcuts** | **Actions** |

| --- | --- |

| Tab | Move focus to next element. |

| Shift + Tab | Move focus to previous element. |

| Enter | Triggers corresponding action to button element. |

| Esc | Close the file browser dialog alone and cancels the upload on drop the file.

Style appearance in Vue Uploader component

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

Customizing the appearance of File Upload wrapper element

Use the following CSS to customize the appearance of wrapper element.

`

/ *To specify height* /

.e-upload.e-control-wrapper, .e-bigger.e-small .e-upload.e-control-wrapper {

height: 300px;

width: 300px;

}

`

Customizing the File Upload browse button

Use the following CSS to customize the File Upload browse button

`

/ *To specify font size and color* /

.e-upload .e-file-select-wrap .e-btn, .e-upload .e-upload-actions .e-btn, .e-bigger.e-small .e-upload .e-file-select-wrap .e-btn, .e-bigger.e-small .e-upload .e-upload-actions .e-btn {

Copyright © 2001 -2024 Syncfusion Inc.

font-family: cursive;

height: 40px;

background-color: aquamarine;

color: coral;

}

`

Customizing the File Upload content

Use the following CSS to customize the File Upload content

`

/ *To specify font size and color* /

.e-upload .e-file-select-wrap .e-file-drop, .e-bigger.e-small .e-upload .e-file-select-wrap .e-file-drop {

font-size: 20px;

color: aqua;

}

`

Customizing the uploaded file container in File Upload

Use the following CSS to customize the uploaded file container in File Upload

`

/ *To specify background color* /

.e-upload .e-upload-files .e-upload-file-list {

background-color: beige;

}

`

Customize progressbar in Vue Uploader component

You can customize the progress bar by override the styles in uploader component. In the following example, showcase about how to customize the progress bar's size, color and progress background.

APP.VUE

```
<template>
  <div id='upload_container' class='custom_progress'>
    <ejs-uploader ref="uploadObj" id='defaultfileupload' name="UploadFiles"
:asyncSettings= "path"></ejs-uploader>
  </div>
</template>
<script>
import Vue from 'vue';
import { UploaderPlugin, SelectedEventArgs } from '@syncfusion/ej2-vue-
inputs';
Vue.use(UploaderPlugin);
export default {
  data: function(){
        return {
          path:  {
            saveUrl:
'https://ej2.syncfusion.com/services/api/uploadbox/Save',
            removeUrl:
'https://ej2.syncfusion.com/services/api/uploadbox/Remove'
          }
        }
    }
}
</script>
<style>
@import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
 #container {
        visibility: hidden;
        padding-left: 5%;
        width: 100%;
    }
    #loader {
        color: #008cff;
```

```
        font-family: 'Helvetica Neue','calibiri';
        font-size: 14px;
        height: 40px;
        left: 45%;
        position: absolute;
        top: 45%;
        width: 30%;
    }
    .custom_progress .e-upload .e-upload-files .e-upload-file-list .e-file-
container .e-progress-inner-wrap .e-upload-progress-bar.e-upload-progress {
      background: yellow;
      height: 4px;
    }
     .custom_progress .e-upload .e-upload-files .e-upload-file-list .e-file-
container .e-progress-inner-wrap {

Sort the selected files in Vue Uploader component

You can sort the selected files list and shown the list items in meaningful order. By using selected event, you can achieve this behavior in uploader component.

In the following example, explains about how to sort the file list in uploader component.

APP.VUE

```
<template>
  <div>
    <ejs-uploader ref="uploadObj" id='defaultfileupload' name="UploadFiles"
:selected = "onSelect" :asyncSettings= "path"></ejs-uploader>
  </div>
</template>
<script>
import Vue from 'vue';
import { UploaderPlugin, SelectedEventArgs } from '@syncfusion/ej2-vue-
inputs';
Vue.use(UploaderPlugin);
let initial: boolean = true;
export default {
  data: function(){
        return {
          path:  {
            saveUrl:
'https://ej2.syncfusion.com/services/api/uploadbox/Save',
            removeUrl:
'https://ej2.syncfusion.com/services/api/uploadbox/Remove'
          }
        }
```

Copyright © 2001 -2024 Syncfusion Inc.

```
    },
    methods: {
 onSelect: function(args: SelectedEventArgs): void {
    if (initial) { initial = false; return; }
    args.isModified = true;
    let oldFiles: FileInfo[] = this.$refs.uploadObj.getFilesData();
    let filesData: FileInfo[] = args.filesData.concat(oldFiles);
    let modifiedData: FileInfo[] = this.sortFileList(filesData);
    args.modifiedFilesData = modifiedData;
},
 sortFileList: function(filesData: FileInfo[]): FileInfo[] {
    let files: FileInfo[] = filesData;
    let fileNames: string[] = [];
    for (let i: number = 0; i < files.length; i++) {
        fileNames.push(files[i].name);
    }
    let sortedFileNames: string[] = fileNames.sort();
    let sortedFilesData: FileInfo[] = [];
    let index: number = 0;
    for (let name of sortedFileNames) {
        for (let i: number = 0; i < files.length; i++) {
            if (name === files[i].name) {
                sortedFilesData.push(files[i]);
            }
        }
    }
    return sortedFilesData;
}
    }
}
</script>
<style>

Customize button with html element in Vue Uploader component

The uploader component allows you to customize the action buttons by using buttons property.

In the following example explains about how to customize the action buttons.

APP.VUE

```
<template>
  <div>
    <ejs-uploader ref="uploadObj" id='defaultfileupload' name="UploadFiles"
:buttons="buttons" :autoUpload="autoUpload" :asyncSettings= "path"></ejs-
uploader>
  </div>
</template>
<script>
import Vue from 'vue';
import { UploaderPlugin, SelectedEventArgs } from '@syncfusion/ej2-vue-
inputs';
import { createElement } from '@syncfusion/ej2-base';
Vue.use(UploaderPlugin);
let uploadEle = createElement('span', { className: 'upload e-icons' });
uploadEle.innerHTML = 'Upload All';
let clearEle = createElement('span', { className: 'remove e-icons' });
clearEle.innerHTML = 'Clear All';
export default {
  data: function(){
        return {
          path:  {
            saveUrl:
'https://ej2.syncfusion.com/services/api/uploadbox/Save',
            removeUrl:
'https://ej2.syncfusion.com/services/api/uploadbox/Remove'
          },
        autoUpload: false,
        buttons: {
        browse: 'Choose file',
        clear: clearEle,
        upload: uploadEle
        }
        }
```

```
    }
}
</script>
<style>
@import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
 #container {
        visibility: hidden;
        padding-left: 5%;
        width: 100%;
    }
    #loader {
        color: #008cff;
        font-family: 'Helvetica Neue','calibiri';
        font-size: 14px;
        height: 40px;
        left: 45%;
        position: absolute;

Add confirm dialog to remove the files in Vue Uploader component

You can customize the uploader component for use confirm dialog before remove the files. In the following example, used ej2 dialog as confirm dialog which is used for making confirmation on removing the files by using remove method.

APP.VUE

```
<template>
  <div>
    <ejs-uploader ref="uploadObj" id='defaultfileupload'
:removing="onremove" name="UploadFiles"  :asyncSettings= "path"></ejs-
uploader>
    <div id="dlgContainer">
     <ejs-dialog ref="dialogObj" :buttons="dlgButtons"
:target="dlgContainer" :visible="false" :width='width'
:content='dialogContent'>
     </ejs-dialog>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { UploaderPlugin, SelectedEventArgs } from '@syncfusion/ej2-vue-
inputs';
import { createElement } from '@syncfusion/ej2-base';
import { DialogPlugin } from '@syncfusion/ej2-vue-popups';
Vue.use(DialogPlugin);
Vue.use(UploaderPlugin);
let removeFile: FileInfo[];
export default {
  data: function(){
        return {
          dlgContainer: "#dlgContainer",
          path:  {
            saveUrl:
'https://ej2.syncfusion.com/services/api/uploadbox/Save',
            removeUrl:
'https://ej2.syncfusion.com/services/api/uploadbox/Remove'
          },
            allowedExtensions: 'image/*',
            dialogContent: 'Confirm to remove the file?',
            width: '250px',
            dlgButtons: [{ click: this.dlgButtonClick, buttonModel: {
content: 'OK', isPrimary: true } },
            { click: this.cancelClick, buttonModel: { content: 'Cancel' }}]
        }
    },
    methods: {
        onremove:function(args: SelectedEventArgs): void {
            this.removeFile=[];
            args.cancel = true;
            this.removeFile.push(args.filesData);
            this.$refs.dialogObj.show();
        },
        dlgButtonClick: function() {
            this.$refs.dialogObj.hide();
            this.$refs.uploadObj.remove(this.removeFile[0], false, true);
```

```
            this.removeFile = [];
        },
        cancelClick: function(){
            this.$refs.dialogObj.hide()
        }
    }
}
</script>
<style>
@import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
 #container {
        visibility: hidden;
        padding-left: 5%;
        width: 100%;
    }
    #loader {
        color: #008cff;

Add additional data on upload in Vue Uploader component

The uploader component allows you to add the additional data on file upload which is used to get in the server end. By using uploading event and its customFormData argument, you can achieve this behavior.

In the following code snippet, explains about how to add additional data on file upload.

`

<template>

<ejs-uploader ref="uploadObj" id='defaultfileupload' :uploading="onFileUpload" name="UploadFiles" :autoUpload="autoUpload" :asyncSettings= "path"></ejs-uploader>

</template>

Copyright © 2001 -2024 Syncfusion Inc.

```
<script>
import Vue from 'vue';
import { UploaderPlugin, SelectedEventArgs } from '@syncfusion/ej2-vue-inputs';
import { createElement } from '@syncfusion/ej2-base';
Vue.use(UploaderPlugin);
export default {
data: function(){
return {
path:  {
saveUrl: 'https://ej2.syncfusion.com/services/api/uploadbox/Save',
removeUrl: 'https://ej2.syncfusion.com/services/api/uploadbox/Remove'
},
autoUpload: false,
allowedExtensions: 'image/*'
}
},
methods: {
onFileUpload:function(args) {
// add addition data as key-value pair.
args.customFormData = [{'name': 'Syncfusion INC'}];
}
}
}
</script>
<style>
@import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
container {
visibility: hidden;
padding-left: 5%;
width: 100%;
}
```

loader {
color: #008cff;

font-family: 'Helvetica Neue','calibiri';

font-size: 14px;

height: 40px;

left: 45%;

position: absolute;

top: 45%;

width: 30%;

}

</style>

`

Server side for adding additional data

`c#

// Get the additional data in server end by corresponding key.

var data = HttpContext.Current.Request.Form["name"];

`

You can also explore Vue File Upload feature tour page for its groundbreaking features. You can also explore our Vue File Upload example to understand how to browse the files which you want to upload to the server.

Validate image on drop in Vue Uploader component

The uploader component allows you to upload all type of images by setting image/* to allowedExtensions property or directly you can set it to accept attribute of uploader element.

By default, the behavior is working with select a file using browse button. But, this behavior doesn't support on drag and drop the files. You can handle this behavior manually using selected event by filtering the file types from application.

In the following example, validated image files using images/*. You are able to drag and drop the image files with extension of png, jpg, bpg, gif and tiff to upload it.

APP.VUE

```
<template>
  <div>
    <ejs-uploader ref="uploadObj" id='defaultfileupload'
:selected="onSelect" name="UploadFiles" :autoUpload="autoUpload"
:asyncSettings= "path" :allowedExtensions="extensions"></ejs-uploader>
  </div>
</template>
<script>
import Vue from 'vue';
import { UploaderPlugin, SelectedEventArgs } from '@syncfusion/ej2-vue-
inputs';
```

```
import { DialogPlugin } from '@syncfusion/ej2-vue-popups';
import { createElement, detach } from '@syncfusion/ej2-base';
Vue.use(UploaderPlugin);
Vue.use(DialogPlugin);
export default {
  data: function(){
        return {
          path:  {
            saveUrl:
'https://ej2.syncfusion.com/services/api/uploadbox/Save',
            removeUrl:
'https://ej2.syncfusion.com/services/api/uploadbox/Remove'
          },
            autoUpload: false,
            extensions: 'image/*'
        }
    },
    methods: {
          onSelect:function(args: SelectedEventArgs): void {
               if (args.event.type === 'drop') {
            let allImages: Array<string> = ['png', 'jpg', 'jpeg', 'gif',
'tiff', 'bpg'];
            let files = args.filesData;
            let modifiedFiles = [];
            for (let file of files) {
            if (allImages.indexOf(file.type) === -1) {
                file.status = 'File type is not allowed';
                file.statusCode = '0';
            }
            modifiedFiles.push(file);
            }
            args.isModified = true;
        }
        }
    }
}
</script>

Determine whether uploader has file input in Vue Uploader component

By setting **required** attribute to uploader input element, you can validate the file input has any value in it. In the below sample, set required attribute to the uploader input element and showcase the validation failure message using data-required-message attribute.

APP.VUE

```
<template>
        <div class="col-lg-12 control-section">
            <h4 class="form-title">Photo Contest</h4>
        <div class="control_wrapper" id ="control_wrapper">
            <form id="form1" method="post">
                <div class="form-group" style="padding-top: 40px; float:
left">
                    <div class="e-float-input">
                        <input type="text" id="name" name="name" data-
required-message="* Enter your name" required="" data-msg-
containerid="nameError">
                        <span class="e-float-line"></span>
                        <label class="e-float-text e-label-top"
for="name">Name</label>
                    </div>
                    <div id="nameError"></div>
                </div>
                <div id="dropArea">
                    <div id="uploadError" style='float: right;'></div>
                    <div id='customBrowse' class="form-group dropUpload">

Check file size before uploading it in Vue Uploader component

By using uploading event, you can get the file size before upload it to server. File object contains the file size in bytes only. You can convert the size to standard formats (KB or MB) using bytesToSize method.

APP.VUE

```
<template>
  <div>
    <ejs-uploader ref="uploadObj" id='defaultfileupload' name="UploadFiles"
:autoUpload="autoUpload" :asyncSettings= "path"
:uploading="onBeforeUpload"></ejs-uploader>
  </div>
</template>
<script>
import Vue from 'vue';
import { UploaderPlugin } from '@syncfusion/ej2-vue-inputs';
Vue.use(UploaderPlugin);
export default {
  data: function(){
        return {
          path:  {
            saveUrl:
'https://ej2.syncfusion.com/services/api/uploadbox/Save',
            removeUrl:
'https://ej2.syncfusion.com/services/api/uploadbox/Remove'
          },
            autoUpload: false
        }
    },
    methods: {
onBeforeUpload: function(args): void {
    // get the file size in bytes
    let sizeInBytes: number = args.fileData.size;
    // get the file size in standard format
    alert("File size is: " + this.$refs.uploadObj.bytesToSize(sizeInBytes))
}
    }

Open and edit the uploaded files in Vue Uploader component

The uploader component allows you to modify the file after uploading to the server, which can be achieved using success event of the uploader.

You can retrieve the saved file path in the uploader success event and assign it to custom attribute (data-file-name) value of the respective file list element to open the uploaded file. Click the respective file element to create a new request along with saved file path using http header. In the server-side, get the file path from the header and open the file using process.start method

`

<script>
import Vue from 'vue';
import { UploaderPlugin, SelectedEventArgs } from '@syncfusion/ej2-vue-inputs';
import { createElement } from '@syncfusion/ej2-base';
Vue.use(UploaderPlugin);
export default {
data: function(){
return {
path:  {
saveUrl: 'YourHosedService/Home/Save',
removeUrl: 'YourHosedService/Home/Remove'
}
}
},
methods: {
onUploadSuccess: function(args) {
let liElements = document.body.querySelectorAll('.e-upload-file-list');
for (let i = 0; i < liElements.length; i++) {
if (liElements[i].getAttribute('data-file-name') == args.file.name) {
liElements[i].addEventListener('click', () => { this.openFile(args, event); });
// File path have to update from server end in response status description.
liElements[i].setAttribute('file-path', args.e.target.statusText);
}
}
},
openFile: function(args, e) {
if (!e.target.classList.contains('e-file-delete-btn') && !e.target.classList.contains('e-file-remove-btn'))
{
let ajax = new XMLHttpRequest();
// create new request for open the selected file
ajax.open("POST", "YourHosedService/Home/openFile');
let liElements = document.getElementsByClassName('e-upload')[0].querySelectorAll('.e-upload-file-list');
```

```
for (let i = 0; i < liElements.length; i++) {
if (liElements[i].getAttribute('data-file-name') == args.file.name) {
// Added the file path in header to get it in server side.
ajax.setRequestHeader('filePath', liElements[i].getAttribute('file-path').toString());
}
}
ajax.send();
}
}
}
}

Server side for open and edit the uploaded files

```c#
public void Save()
{
var httpPostedFile = System.Web.HttpContext.Current.Request.Files["UploadFiles"];
var currentPath = System.Web.HttpContext.Current.Server;
var fileSave = currentPath.MapPath("UploadedFiles");
var fileSavePath = System.IO.Path.Combine(fileSave, httpPostedFile.FileName);
if (!System.IO.File.Exists(fileSavePath))
{
httpPostedFile.SaveAs(fileSavePath);
HttpResponse Response = System.Web.HttpContext.Current.Response;
Response.Clear();
Response.ContentType = "application/json; charset=utf-8";
Response.StatusDescription = fileSavePath;
Response.End();
}
}
[AcceptVerbs("Post")]
public void openFile()
{
// Check whether the file is available in the corresponding location
if (System.IO.File.Exists(Request.Headers.GetValues("filePath").First()))
{
// This will open the selected file from server location in desktop
Process.Start(Request.Headers.GetValues("filePath").First());
}
}
```

Add the `filePath` in allow-headers in `web.config` file.

```c#
<customHeaders>
<add name="Access-Control-Allow-Headers" value="accept, maxdataserviceversion, origin, x-requested-with, dataserviceversion,content-type, chunk-index, Authorization, filePath" />
```

</customHeaders>

Resize images before uploading it to the server in Vue Uploader component

You can customize the dimension of the images before uploading it to the server. By using selected event, you can get the selected file information as type of an object. From the obtained image file information, create a new canvas and render an image with the custom dimensions. Refer the corresponding code snippet as follows.

Convert image into binary format after uploading in Vue Uploader component

By default, the file upload component saves the uploaded image files in physical directories. Also, you can convert the images into binary format at server-side before saving the uploaded images. To retrieve binary format of image files, convert the posted file's input stream into binary reader and read as bytes using ReadBytes method.

Refer to the below server-side code snippet

```
`c#
[AcceptVerbs("Post")]
public void Save()
{
try
{
if (System.Web.HttpContext.Current.Request.Files.AllKeys.Length > 0)
```

```
{
var httpPostedFile = System.Web.HttpContext.Current.Request.Files["UploadFiles"];
if (httpPostedFile != null)
{
byte[] fileBytes;
using (BinaryReader br = new BinaryReader(httpPostedFile.InputStream))
{
fileBytes = br.ReadBytes((int)httpPostedFile.InputStream.Length);
// bytes will be stored in variable fileBytes
}
HttpResponse Response = System.Web.HttpContext.Current.Response;
Response.Clear();
Response.ContentType = "application/json; charset=utf-8";
Response.StatusCode = 200;
Response.Status = "200 Success";
Response.End();
}
}
}
catch (Exception e)
{
HttpResponse Response = System.Web.HttpContext.Current.Response;
Response.Clear();
Response.ContentType = "application/json; charset=utf-8";
Response.StatusCode = 204;
Response.Status = "204 No Content";
Response.StatusDescription = e.Message;
Response.End();
}
}
`
```
