USER GUIDE

Essential Studio

for EJ2 Vue

Version - v24.1.41 | Release Date - December 18, 2023

Syncfusion

Linear Gauge 95
Getting Started with the Vue Linear Gauge Component in Vue 2 95
Prerequisites 95
Dependencies 95
Setting up the Vue 2 project 95
Add Syncfusion Vue packages 96
Adding Syncfusion Vue Linear Gauge component 96
Run the project 97
Module Injection 97
Adding the Linear Gauge Title 98
Axis Range 98
Set Pointer Value 100
Getting Started with the Vue Linear Gauge Component in Vue 3 101
Prerequisites 101
Set up the Vite project 101
Add Syncfusion Vue packages 103
Add Syncfusion Vue component 103
Run the project 106

Customizing Maps area 377
Customizing the shapes 378

Setting color to the shapes from the data source 379
Applying border to individual shapes 380
Projection type 381
Color mapping in Vue Maps component 382
Types of color mapping 383
Multiple colors for a single shape 388
Color for items excluded from color mapping 389
Color mapping for bubbles 390
Data labels in Vue Maps component 391
Adding data labels 391
Customization 394
Label animation 395
Smart labels 396
Intersect action 397
Adding data label as a template 398
Polygon shape in Vue Maps component 399
Markers in Vue Maps component 402
Adding marker 403
Adding marker template 404
Customization 405
Marker shapes 407
Multiple marker groups 408
Customize marker shapes from data source 409
Repositioning the marker using drag and drop 411
Marker zooming 415
Marker Clustering 416
Customization of marker cluster 417
Expanding the marker cluster 419
Tooltip for marker 421
Bubble in Vue Maps component 422
Bubble shapes 423
Customization 424
Setting colors to the bubbles from the data source 425
Setting the range of the bubble size 426
Multiple bubble groups 427

Enable tooltip for bubble 429
Legend in Vue Maps component 430
Modes of legend 431
Positioning of the legend 432
Legend for shapes 434
Enable legend for bubbles 445
Enable legend for markers 446
Annotations in Vue Maps component 448
Annotation 448
Annotation customization 450
Multiple Annotation 453
Navigation line in Vue Maps component 454
Customization 454
Enabling the arrows 455
User interactions in Vue Maps component 457
Zooming 457
Selection 473
Highlight 483
Tooltip 489
Print in Vue Maps component 493
Print 493
Export 495
State persistence in Vue Maps component 501
State Persistence 501

Two way binding in Vue Maskedtextbox component 538
Style appearance in Vue Maskedtextbox component 539
Customizing the appearance of MaskedTextBox wrapper element 539
Customizing the MaskedTextBox element on hovering 539
How To 539
Perform custom validation using form validator in Vue Maskedtextbox component 539
Set cursor position while focus on the input textbox in Vue Maskedtextbox component 541
Display numeric keypad when focus on mobile devices in Vue Maskedtextbox component 542
Customize the ui appearance of the control in Vue Maskedtextbox component 543
Mention 544
Getting Started with the Vue Mention Component in Vue 2 544
Prerequisites 544
Dependencies 544
Setting up the Vue 2 project 545
Add Syncfusion Vue packages 545
Import Syncfusion CSS styles 546
Add Syncfusion Vue component 546
Adding Mention component 547
Binding data source 549
Run the project 553
Display Mention character 553
Getting Started with the Vue Mention Component in Vue 3 555
Prerequisites 555
Set up the Vite project 555
Add Syncfusion Vue packages 557
Import Syncfusion CSS styles 557
Add Syncfusion Vue component 557
Run the project 560
Display Mention character 560
Working with data in Vue Mention component 562
Binding local data 563

Binding remote data 567
Filtering data in Vue Mention component 569
Limit the minimum filter character 569
Change the filter type 571
Allow spacing between search 572
Customize the suggestion item count 573
Sorting in Vue Mention component 575
Template in Vue Mention component 576
Item template 576
Display template 578
No records template 579
Spinner template 580
Localization in Vue Mention component 582
Loading translations 582
Customization in Vue Mention component 583
Show or hide mention character 583
Adding the suffix character after selection 585
Configure the popup list 586
Trigger character 587
Accessibility in Vue Mention component 587
WAI-ARIA attributes 588
Keyboard interaction 589
Ensuring accessibility 590

Linear Gauge

Getting Started with the Vue Linear Gauge Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using Vue-CLI and integrating the Syncfusion Vue Linear Gauge component

Prerequisites

System requirements for Syncfusion Vue UI components

Dependencies

The list of dependencies required to use the Linear Gauge component in your application is given below:

```
|-- @syncfusion/ej2-vue-lineargauge
|-- @syncfusion/ej2-base
|-- @syncfusion/ej2-vue-base
|-- @syncfusion/ej2-svg-base
|-- @syncfusion/ej2-lineargauge
```

Setting up the Vue 2 project

To generate a Vue 2 project using Vue-CLI, use the vue create command. Follow these steps to install Vue CLI and create a new project:

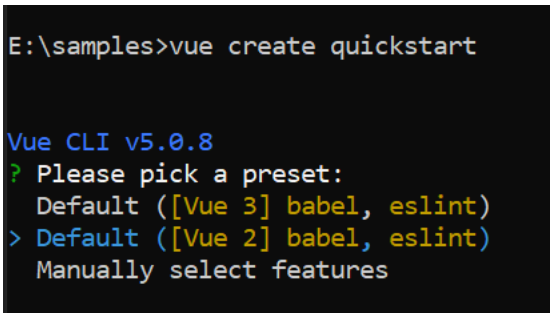
```bash
npm install -g @vue/cli
vue create quickstart
cd quickstart
npm run serve
```

or

```bash
yarn global add @vue/cli
vue create quickstart
cd quickstart
yarn run serve
```

When creating a new project, choose the option Default ([Vue 2] babel, eslint) from the menu.

Copyright © 2001 -2024 Syncfusion Inc.



Once the quickstart project is set up with default settings, proceed to add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion packages are available at npmjs.com. To use Vue components, install the required npm package.

This article uses the Vue Linear Gauge component as an example. Install the @syncfusion/ej2-vue-lineargauge package by running the following command:

`bash

npm install @syncfusion/ej2-vue-lineargauge --save

`

or

`bash

yarn add @syncfusion/ej2-vue-lineargauge

`

Adding Syncfusion Vue Linear Gauge component

Follow the below steps to add the Vue Linear Gauge component:

1\. First, import and register the Linear Gauge component in the script section of the **src/App.vue** file.

~/SRC/APP.VUE

```
<script>
import { LinearGaugeComponent } from '@syncfusion/ej2-vue-lineargauge';
export default {
components: {
'ejs-lineargauge': LinearGaugeComponent
}
}
</script>
```

2\. In the template section, define the Linear Gauge component.

~/SRC/APP.VUE

```
<template>
<div id="app">
<ejs-lineargauge></ejs-lineargauge>
</div>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
</template>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

~/SRC/APP.VUE

```
<template>
    <div>
        <div class="content-wrapper">
            <div align='center'>
                <ejs-lineargauge ></ejs-lineargauge>
            </div>
        </div>
  </div>
</template>
<script>
import { LinearGaugeComponent } from '@syncfusion/ej2-vue-lineargauge';
export default {
    components: {
        'ejs-lineargauge': LinearGaugeComponent
    }
}
</script>
<style>
#content-wrapper {
    padding: 0px !important;
}
</style>
```

Run the project

To run the project, use the following command:

`bash

npm run serve

`

or

`bash

yarn run serve

`

{% previewsample "page.domainurl/code-snippet/linear-gauge/getting-started-cs34" %}

Module Injection

LinearGauge component is segregated into the individual feature-wise modules. In order to use a particular feature, inject its feature module using the provide: {}. Please find the feature module name and description as follows.

- Annotation - Inject this module to use the annotation features.
- GaugeTooltip - Inject this module to use the tooltip features.

Copyright © 2001 -2024 Syncfusion Inc.

Now import the above mentioned modules from linear gauge package and inject it into the LinearGauge component using provide: {} .

`ts

import { LinearGaugeComponent, Annotations, GaugeTooltip } from "@syncfusion/ej2-vue-lineargauge";

provide: {

lineargauge: [Annotations, GaugeTooltip]

},

`

Adding the Linear Gauge Title

The title can be added to the Linear Gauge component using the title property in the Linear Gauge.

~/SRC/APP.VUE

```
<template>
    <div>
        <div class="content-wrapper">
            <ejs-lineargauge style='display:block' :title ='title' ></ejs-
lineargauge>
        </div>
    </div>
</template>
<script>
import { LinearGaugeComponent } from "@syncfusion/ej2-vue-lineargauge";
export default {
    components: {
        'ejs-lineargauge': LinearGaugeComponent
    },
    data: function () {
        return {
            title: 'linear gauge',
        }
    }
};
</script>
<style>
#content-wrapper {
    padding: 0px !important;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/linear-gauge/getting-started-cs35" %}

Axis Range

The range of the axis can be set using the minimum and maximum properties in the Linear Gauge.

~/SRC/APP.VUE

```
<template>
   <div>
    <div class="content-wrapper">
        <ejs-lineargauge >
```

```
            <e-axes>
                <e-axis minimum = 0 maximum = 200 ></e-axis>
            </e-axes>
        </ejs-lineargauge>
    </div>
  </div>
</template>
<script>
import { LinearGaugeComponent, AxesDirective, AxisDirective } from
"@syncfusion/ej2-vue-lineargauge";
export default {
    components: {
        'ejs-lineargauge': LinearGaugeComponent,
        'e-axes': AxesDirective,
        'e-axis': AxisDirective
    }
};
</script>
<style>
#content-wrapper {
    padding: 0px !important;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/linear-gauge/getting-started-cs36" %}

Customizing the axis labels

To denote the axis labels with temperature units, add the °C as suffix to each label. This can be achieved by setting the **{value}°C** to the format property in the labelStyle object of the axis. Here, **{value}** acts as a placeholder for each axis label.

To change the pointer value from the default value of the gauge, set the value property in pointers object of the axis.

~/SRC/APP.VUE

```
<template>
    <div>
        <div class="content-wrapper">
            <div align='center'>
                <ejs-lineargauge>
                    <e-axes>
                        <e-axis minimum = 0 maximum = 200  :ranges='ranges'>
                            <e-pointers>
                                <e-pointer value=140 ></e-pointer>
                            </e-pointers>
                        </e-axis>
                    </e-axes>
                </ejs-lineargauge>
            </div>
        </div>
    </div>
</template>
<script>
import { LinearGaugeComponent, AxesDirective, AxisDirective } from
"@syncfusion/ej2-vue-lineargauge";
```

```
export default {
    components: {
        'ejs-lineargauge': LinearGaugeComponent,
        'e-axes': AxesDirective,
        'e-axis': AxisDirective
    },
    data: function () {
        return {
            labelStyle: {
            format: '{value}°C'
        },
            ranges: [{
            start: 0,
            end: 80,
            startWidth:15,
            endWidth:15
        }, {
            start: 80,
            end: 120,
            startWidth:15,
            endWidth:15
        }, {
            start: 120,
            end: 140,
            startWidth:15,
            endWidth:15
        }, {
            start: 140,
            end: 200,
            startWidth:15,
            endWidth:15
        }]
        }
    }
};
</script>
<style>
#content-wrapper {
    padding: 0px !important;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/linear-gauge/getting-started-cs37" %}

Set Pointer Value

The pointer value is changed in the below sample using the value property in pointers object of the axis.

~/SRC/APP.VUE

```
<template>
   <div>
    <div class="content-wrapper">
        <div align='center'>
            <ejs-lineargauge>
                <e-axes>
                    <e-axis minimum=0 maximum=200>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
                        <e-pointers>
                            <e-pointer value=40 color='green'></e-pointer>
                        </e-pointers>
                    </e-axis>
                </e-axes>
            </ejs-lineargauge>
        </div>
    </div>
  </div>
</template>
<script>
import { LinearGaugeComponent, AxesDirective, AxisDirective,
PointerDirective, PointersDirective } from "@syncfusion/ej2-vue-
lineargauge";
export default {
    components: {
        'ejs-lineargauge': LinearGaugeComponent,
        'e-axes': AxesDirective,
        'e-axis': AxisDirective,
        'e-pointer': PointerDirective,
        'e-pointers': PointersDirective
    }
};
</script>
<style>
#content-wrapper {
    padding: 0px !important;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/linear-gauge/getting-started-cs38" %}

Getting Started with the Vue Linear Gauge Component in Vue 3

This article provides a step-by-step guide for setting up a Vite project with a JavaScript environment and integrating the Syncfusion Vue Linear Gauge component using the Composition API / Options API.

The Composition API is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

The Options API is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

Prerequisites

System requirements for Syncfusion Vue UI components

Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using Vite. To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

`bash

npm create vite@latest

`

or

`bash

yarn create vite

`

Using one of the above commands will lead you to set up additional configurations for the project as below:

1.Define the project name: We can specify the name of the project directly. Let's specify the name of the project as my-project for this article.

`bash

? Project name: » my-project

`

2.Select Vue as the framework. It will create a Vue 3 project.

`bash

? Select a framework: » - Use arrow-keys. Return to submit.

Vanilla

Vue

React

Preact

Lit

Svelte

Others

`

3.Choose JavaScript as the framework variant to build this Vite project using JavaScript and Vue.

`bash

? Select a variant: » - Use arrow-keys. Return to submit.

JavaScript

TypeScript

Customize with create-vue ↗

Nuxt ↗

`

4.Upon completing the aforementioned steps to create the my-project, run the following command to install its dependencies:

`bash

cd my-project

npm install

`

or

`bash

cd my-project

yarn install

`

Now that my-project is ready to run with default settings, let's add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion Vue component packages are available at npmjs.com. To use Syncfusion Vue components in the project, install the corresponding npm package.

This article uses the Vue Linear Gauge component as an example. To use the Vue Linear Gauge component in the project, the @syncfusion/ej2-vue-lineargauge package needs to be installed using the following command:

`bash

npm install @syncfusion/ej2-vue-lineargauge --save

`

or

`bash

yarn add @syncfusion/ej2-vue-lineargauge

`

Add Syncfusion Vue component

Follow the below steps to add the Vue Linear Gauge component using Composition API or Options API:

1.First, import and register the Linear Gauge component and its child directives in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { LinearGaugeComponent as EjsLineargauge, AxesDirective as EAxes,
AxisDirective as EAxis, PointersDirective as EPointers, PointerDirective as
EPointer, RangesDirective as ERanges, RangeDirective as ERange } from
'@syncfusion/ej2-vue-lineargauge';
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
import { LinearGaugeComponent, AxesDirective, AxisDirective,
PointersDirective, PointerDirective, RangesDirective, RangeDirective } from
'@syncfusion/ej2-vue-lineargauge';
//Component registration
export default {
name: "App",
components: {
'ejs-lineargauge' : LinearGaugeComponent,
'e-axes' : AxesDirective,
'e-axis' : AxisDirective,
'e-pointers': PointersDirective,
'e-pointer' : PointerDirective,
'e-ranges' : RangesDirective,
'e-range' : RangeDirective
}
}
</script>
```

2.In the template section, define the Linear Gauge component with the axis, pointer and range property definitions.

~/SRC/APP.VUE

```
<template>
<ejs-lineargauge :title ='title' orientation='Horizontal'>
<e-axes>
<e-axis minimum=0 maximum=200>
<e-pointers>
<e-pointer value=140 color='red'></e-pointer>
</e-pointers>
<e-ranges>
<e-range start=0 end=80 startWidth=15 endWidth=15></e-range>
<e-range start=80 end=120 startWidth=15 endWidth=15></e-range>
<e-range start=120 end=140 startWidth=15 endWidth=15></e-range>
<e-range start=140 end=200 startWidth=15 endWidth=15></e-range>
</e-ranges>
</e-axis>
</e-axes>
</ejs-lineargauge>
</template>
```

3.In the script section, declare the values for the properties defined in the template section.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
const title = "Linear Gauge";
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
data() {
return {
title: 'Linear Gauge'
```

Copyright © 2001 -2024 Syncfusion Inc.

```
};
}
</script>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<ejs-lineargauge :title ='title' orientation='Horizontal'>
<e-axes>
<e-axis minimum=0 maximum=200>
<e-pointers>
<e-pointer value=140 color='red'></e-pointer>
</e-pointers>
<e-ranges>
<e-range start=0 end=80 startWidth=15 endWidth=15></e-range>
<e-range start=80 end=120 startWidth=15 endWidth=15></e-range>
<e-range start=120 end=140 startWidth=15 endWidth=15></e-range>
<e-range start=140 end=200 startWidth=15 endWidth=15></e-range>
</e-ranges>
</e-axis>
</e-axes>
</ejs-lineargauge>
</template>
<script setup>
import { LinearGaugeComponent as EjsLineargauge, AxesDirective as EAxes,
AxisDirective as EAxis, PointersDirective as EPointers, PointerDirective as
EPointer, RangesDirective as ERanges, RangeDirective as ERange } from
'@syncfusion/ej2-vue-lineargauge';
const title = "Linear Gauge";
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<ejs-lineargauge :title ='title' orientation='Horizontal'>
<e-axes>
<e-axis minimum=0 maximum=200>
<e-pointers>
<e-pointer value=140 color='red'></e-pointer>
</e-pointers>
<e-ranges>
<e-range start=0 end=80 startWidth=15 endWidth=15></e-range>
<e-range start=80 end=120 startWidth=15 endWidth=15></e-range>
<e-range start=120 end=140 startWidth=15 endWidth=15></e-range>
<e-range start=140 end=200 startWidth=15 endWidth=15></e-range>
</e-ranges>
</e-axis>
</e-axes>
</ejs-lineargauge>
</template>
<script>
import { LinearGaugeComponent, AxesDirective, AxisDirective,
PointersDirective, PointerDirective, RangesDirective, RangeDirective } from
'@syncfusion/ej2-vue-lineargauge';
```

Copyright © 2001 -2024 Syncfusion Inc.

```
// Component registration
export default {
name: "App",
// Declaring component and its directives
components: {
'ejs-lineargauge' : LinearGaugeComponent,
'e-axes' : AxesDirective,
'e-axis' : AxisDirective,
'e-pointers': PointersDirective,
'e-pointer' : PointerDirective,
'e-ranges' : RangesDirective,
'e-range' : RangeDirective
},
// Bound properties declarations
data() {
return {
title: 'Linear Gauge'
};
}
};
</script>
```

Run the project

To run the project, use the following command:

`bash

npm run dev

`

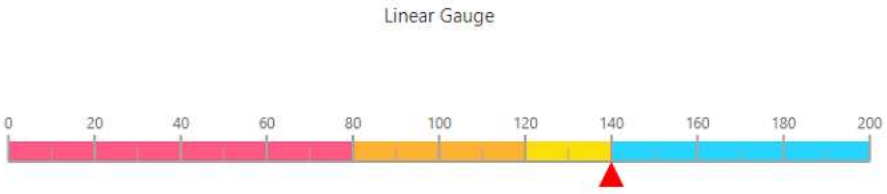
or

`bash

yarn run dev

`

The output will appear as follows:



Sample: vue3-lineargauge-getting-started.

For migrating from Vue 2 to Vue 3, refer to the migration documentation.

Linear gauge dimensions in Vue Linear gauge component

Size for Linear Gauge

The height and width of the Linear Gauge can be set using the width and height properties in ejs-lineargauge.

In Pixel

The size of the Linear Gauge can be set in pixel as demonstrated below.

APP.VUE

```
<template>
  <div class="content-wrapper">
    <div align='center'>
      <ejs-lineargauge  width= '650px' height= '200px'></ejs-lineargauge>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { LinearGaugePlugin } from '@syncfusion/ej2-vue-lineargauge';
Vue.use(LinearGaugePlugin);
export default { }
</script>
<style>
#content-wrapper {
    padding: 0px !important;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/linear-gauge/getting-started-cs46" %}

In Percentage

By setting value in percentage, Linear Gauge receives its dimension matching to its parent. For example, when the height is set as **50%**, Linear Gauge renders to half of the parent height. The Linear Gauge will be responsive when the width is set as **100%**.

APP.VUE

```
<template>
  <div class="content-wrapper">
    <div align='center'>
      <ejs-lineargauge  width= '100%' height= '50%'></ejs-lineargauge>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { LinearGaugePlugin } from '@syncfusion/ej2-vue-lineargauge';
Vue.use(LinearGaugePlugin);
export default { }
</script>
<style>
#content-wrapper {
```

Copyright © 2001 -2024 Syncfusion Inc.

```
    padding: 0px !important;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/linear-gauge/getting-started-cs47" %}

Note: When the component's size is not specified, the height will be **450px** and the width will be the same as the parent element's width.

Axis in Vue Linear gauge component

Axis is used to indicate the numeric values in the linear scale. The Linear Gauge component can have any number of axes. The sub-elements of an axis are line, ticks, labels, ranges, and pointers.

Setting the start value and end value of the axis

The start value and end value for the Linear Gauge can be set using the minimum and maximum properties in the e-axis respectively. By default, the start value of the axis is **0** and the end value of the axis is **100**.

APP.VUE

```
<template>
  <div class="content-wrapper">
    <div align='center'>
      <ejs-lineargauge >
        <e-axes>
          <e-axis :minimum=20 :maximum=200></e-axis>
        </e-axes>
      </ejs-lineargauge>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { LinearGaugePlugin } from "@syncfusion/ej2-vue-lineargauge";
Vue.use(LinearGaugePlugin);
export default {
  data: function () {
    return {
    }
  }
};
</script>
<style>
#content-wrapper {
    padding: 0px !important;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/linear-gauge/getting-started-cs5" %}

Line Customization

The following properties in the line can be used to customize the axis line in the Linear Gauge.

- height - To set the length of the axis line.

Copyright © 2001 -2024 Syncfusion Inc.

- width - To set the thickness of the axis line.
- color - To set the color of the axis line.
- offset - To render the axis line with the specified distance from the Linear Gauge.

APP.VUE

```
<template>
  <div class="content-wrapper">
    <div align='center'>
      <ejs-lineargauge >
        <e-axes>
          <e-axis :line='line'></e-axis>
        </e-axes>
      </ejs-lineargauge>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { LinearGaugePlugin } from "@syncfusion/ej2-vue-lineargauge";
Vue.use(LinearGaugePlugin);
export default {
  data: function () {
    return {
      line: {
        height: 150,
        width: 2,
        color: '#4286f4',
        offset: 2
      }
    }
  }
};
</script>
<style>
#content-wrapper {
    padding: 0px !important;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/linear-gauge/getting-started-cs6" %}

Ticks Customization

Ticks are used to specify the interval in the axis. Ticks are of two types, major ticks and minor ticks. The following properties in the majorTicks and minorTicks can be used to customize the major ticks and minor ticks respectively.

- height - To set the length of the major and minor ticks in pixel values.
- color - To set the color of the major and minor ticks of the Linear Gauge.
- width - To set the thickness of the major and minor ticks in pixel values.
- interval - To set the interval for the major ticks and minor ticks in the Linear Gauge.

APP.VUE

Copyright © 2001 -2024 Syncfusion Inc.

```
<template>
  <div class="content-wrapper">
    <div align='center'>
      <ejs-lineargauge >
        <e-axes>
          <e-axis minimum= 20  maximum= 140 :majorTicks='majorTicks'
:minorTicks='minorTicks'>
          </e-axis>
        </e-axes>
      </ejs-lineargauge>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { LinearGaugePlugin } from "@syncfusion/ej2-vue-lineargauge";
Vue.use(LinearGaugePlugin);
export default {
  data: function () {
    return {
      majorTicks: {
        interval: 20,
        color: "Orange"
      },
      minorTicks: {
        interval: 5,
        color: 'red'
      }
    }
  }
};
</script>
<style>
#content-wrapper {
    padding: 0px !important;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/linear-gauge/getting-started-cs7" %}

Positioning the ticks

The minor and major ticks can be positioned by using the offset and position properties. The offset is used to render the ticks with the specified distance from the axis. By default, the offset value is **0**. The possible values of the position property are **Inside**, **Outside**, **Cross**, and **Auto**. By default, the ticks will be placed inside the axis.

APP.VUE

```
<template>
  <div class="content-wrapper">
    <div align='center'>
      <ejs-lineargauge>
        <e-axes>
          <e-axis minimum= 20  maximum= 140 :majorTicks='majorTicks'
:minorTicks='minorTicks'>
          </e-axis>
```

```
        </e-axes>
      </ejs-lineargauge>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { LinearGaugePlugin } from "@syncfusion/ej2-vue-lineargauge";
Vue.use(LinearGaugePlugin);
export default {
  data: function () {
    return {
      majorTicks: {
        interval: 20,
        color: "Orange",
        position: "Outside"
      },
      minorTicks: {
        interval: 5,
        color: 'red',
        position: "Cross"
      }
    }
  }
};
</script>
<style>
#content-wrapper {
    padding: 0px !important;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/linear-gauge/getting-started-cs8" %}

Labels Customization

The style of the labels can be customized using the following properties in the font property in labelStyle.

- color - To set the color of the axis label.
- fontFamily - To set the font family of the axis label.
- fontStyle - To set the font style of the axis label.
- fontWeight - To set the font weight of the axis label.
- opacity - To set the opacity of the axis label.
- size - To set the size of the axis label.

APP.VUE

```
<template>
  <div class="content-wrapper">
    <div align='center'>
      <ejs-lineargauge >
        <e-axes>
          <e-axis :labelStyle='labelStyle2'>
          </e-axis>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
        </e-axes>
      </ejs-lineargauge>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { LinearGaugePlugin } from "@syncfusion/ej2-vue-lineargauge";
Vue.use(LinearGaugePlugin);
export default {
  data: function () {
    return {
      labelStyle2: {
        font: {
          color: 'red'
        }
      }
    }
  }
};
</script>
<style>
#content-wrapper {
    padding: 0px !important;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/linear-gauge/getting-started-cs9" %}

Positioning the axis label

Labels can be positioned by using offset and position properties in the labelStyle. The offset defines the distance between the labels and ticks. By default, the offset value is **0**. The possible values of the position are **Inside**, **Outside**, **Cross**, and **Auto**. By default, the labels will be placed inside the axis.

APP.VUE

```
<template>
  <div class="content-wrapper">
    <div align='center'>
      <ejs-lineargauge >
        <e-axes>
          <e-axis :labelStyle='labelStyle2'>
          </e-axis>
        </e-axes>
      </ejs-lineargauge>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { LinearGaugePlugin } from "@syncfusion/ej2-vue-lineargauge";
Vue.use(LinearGaugePlugin);
export default {
  data: function () {
    return {
      labelStyle2: {
```

Copyright © 2001 -2024 Syncfusion Inc.

```
        position: "Cross"
      }
    }
  }
};
</script>
<style>
#content-wrapper {
    padding: 0px !important;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/linear-gauge/getting-started-cs10" %}

Customizing the display of the last label

If the last label is not in the visible range, it will be hidden by default. The last label can be made visible by setting the showLastLabel property as **true** in the e-axis.

APP.VUE

```
<template>
  <div class="content-wrapper">
    <div align='center'>
      <ejs-lineargauge >
        <e-axes>
          <e-axis :showLastLabel=true maximum=115>
            <e-pointers>
              <e-pointer value=20 height=15 width=15 color='#757575'
offset=30></e-pointer>
            </e-pointers>
          </e-axis>
        </e-axes>
      </ejs-lineargauge>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { LinearGaugePlugin } from "@syncfusion/ej2-vue-lineargauge";
Vue.use(LinearGaugePlugin);
export default {
  data: function () {
    return {
    }
  }
};
</script>
<style>
#content-wrapper {
    padding: 0px !important;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/linear-gauge/getting-started-cs11" %}

Copyright © 2001 -2024 Syncfusion Inc.

Label Format

Axis labels in the Linear Gauge control can be formatted using the format property in labelStyle. It is used to render the axis labels in a certain format or to add a user-defined unit in the label. It works with the help of placeholder like **{value}°C**, where **value** represents the axis value. For example, 20°C.

APP.VUE

```
<template>
  <div class="content-wrapper">
    <div align='center'>
      <ejs-lineargauge >
        <e-axes>
          <e-axis :labelStyle='labelStyle'>
          </e-axis>
        </e-axes>
      </ejs-lineargauge>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { LinearGaugePlugin } from "@syncfusion/ej2-vue-lineargauge";
Vue.use(LinearGaugePlugin);
export default {
  data: function () {
    return {
      labelStyle: {
        format: "{value}°C"
      }
    }
  }
};
</script>
<style>
#content-wrapper {
    padding: 0px !important;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/linear-gauge/getting-started-cs12" %}

Displaying numeric format in labels

The numeric formats such as currency, percentage, and so on can be displayed in the labels of the Linear Gauge using the format property in the Linear Gauge component. The following table describes the result of applying some commonly used label formats on numeric values.

<!-- markdownlint-disable MD033 -->

Label Value	Label Format property value	Result	Description
1000	n1	1000.0	The number is rounded to 1 decimal place.
1000	n2	1000.00	The number is rounded to 2 decimal place.
1000	n3	1000.000	The number is rounded to 3 decimal place.

Copyright © 2001 -2024 Syncfusion Inc.

0.01	p1	1.0%	The number is converted to percentage with 1 decimal place.
0.01	p2	1.00%	The number is converted to percentage with 2 decimal place.
0.01	p3	1.000%	The number is converted to percentage with 3 decimal place.
1000	c1	$1,000.0	The currency symbol is appended to number and number is rounded to 1 decimal place.
1000	c2	$1,000.00	The currency symbol is appended to number and number is rounded to 2 decimal place.

APP.VUE

```
<template>
    <div class="content-wrapper">
        <div align='center'>
            <ejs-lineargauge :format='format'>
            </ejs-lineargauge>
        </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { LinearGaugePlugin } from "@syncfusion/ej2-vue-lineargauge";
Vue.use(LinearGaugePlugin);
export default {
    data: function () {
        return {
            format: 'c'
        }
    }
};
</script>
<style>
#content-wrapper {
    padding: 0px !important;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/linear-gauge/getting-started-cs13" %}

Orientation

By default, the Linear Gauge is rendered vertically. To change its orientation, the orientation property must be set to **Horizontal**.

APP.VUE

```
<template>
  <div class="content-wrapper">
    <div align='center'>
```

```
      <ejs-lineargauge :orientation='orientation' :axes= 'axes' >
      </ejs-lineargauge>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { LinearGaugePlugin } from "@syncfusion/ej2-vue-lineargauge";
Vue.use(LinearGaugePlugin);
export default {
  data: function () {
    return {
      orientation: "Horizontal",
      axes: [{
        minimum: 20,
        maximum: 140,
      }]
    }
  }
};
</script>
```

{% previewsample "page.domainurl/code-snippet/linear-gauge/getting-started-cs14" %}

Inverted Axis

The axis of the Linear Gauge component can be inversed by setting the isInversed property to **true** in the e-axis.

APP.VUE

```
<template>
  <div class="content-wrapper">
    <div align='center'>
      <ejs-lineargauge >
        <e-axes>
          <e-axis isInversed=true>
          </e-axis>
        </e-axes>
      </ejs-lineargauge>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { LinearGaugePlugin } from "@syncfusion/ej2-vue-lineargauge";
Vue.use(LinearGaugePlugin);
export default {
  data: function () {
    return {
    }
  }
};
</script>
<style>
#content-wrapper {
    padding: 0px !important;
```

Copyright © 2001 -2024 Syncfusion Inc.

```
}
</style>
```

{% previewsample "page.domainurl/code-snippet/linear-gauge/getting-started-cs15" %}

Opposed Axis

To place an axis opposite from its original position, opposedPosition property in the e-axis must be set as **true**.

APP.VUE

```
<template>
  <div class="content-wrapper">
    <div align='center'>
      <ejs-lineargauge >
        <e-axes>
          <e-axis opposedPosition= true></e-axis>
        </e-axes>
      </ejs-lineargauge>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { LinearGaugePlugin } from "@syncfusion/ej2-vue-lineargauge";
Vue.use(LinearGaugePlugin);
export default { };
</script>
<style>
#content-wrapper {
    padding: 0px !important;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/linear-gauge/getting-started-cs16" %}

Multiple Axes

Multiple axes can be added to the Linear Gauge by adding multiple e-axis in the e-axes and customization can be done with the e-axis. Each axis can be customized separately as shown in the following example.

APP.VUE

```
<template>
  <div class="content-wrapper">
    <div align='center'>
      <ejs-lineargauge >
        <e-axes>
          <e-axis :labelStyle='labelStyle'></e-axis>
          <e-axis :opposedPosition='opposedPosition'
:labelStyle='labelStyle1'></e-axis>
        </e-axes>
      </ejs-lineargauge>
    </div>
  </div>
</template>
```

    padding: 0px !important;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/linear-gauge/getting-started-cs17" %}

Ranges in Vue Linear gauge component

Range is the set of values in the axis. The range can be defined using the start and end properties in the e-range. Any number of ranges can be added to the Linear Gauge using the e-ranges.

APP.VUE

```
<template>
    <div class="content-wrapper">
        <div align='center'>
            <ejs-lineargauge>
                <e-axes>
                    <e-axis>
                        <e-ranges>
                           <e-range start=50 end=80></e-range>
                        </e-ranges>
                    </e-axis>
                </e-axes>
            </ejs-lineargauge>
        </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { LinearGaugePlugin } from "@syncfusion/ej2-vue-lineargauge";
Vue.use(LinearGaugePlugin);
export default {
    data: function () {
        return {
        }
    }
```

```
};
</script>
<style>
#content-wrapper {
    padding: 0px !important;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/linear-gauge/getting-started-cs64" %}

Customizing the range

Ranges can be customized using the following properties in e-range.

- startWidth - Customize the range thickness at the start axis value.
- endWidth - Customize the range thickness at the end axis value.
- color - Customize the range color.
- position - To place the range. By default, the range is placed outside of the axis. To change the position, this property can be set as "**Inside**", "**Outside**", "**Cross**", or "**Auto**".
- Offset - To place the range with specified distance from the axis.
- border - Customize color and width of range border.

APP.VUE

```
<template>
    <div class="content-wrapper">
        <div align='center'>
            <ejs-lineargauge>
                <e-axes>
                    <e-axis>
                        <e-ranges>
                           <e-range start=50 end=80 startWidth=10
endWidth=20 color="red"></e-range>
                        </e-ranges>
                    </e-axis>
                </e-axes>
            </ejs-lineargauge>
        </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { LinearGaugePlugin } from "@syncfusion/ej2-vue-lineargauge";
Vue.use(LinearGaugePlugin);
export default {
    data: function () {
        return {
        }
    }
};
</script>
<style>
#content-wrapper {
    padding: 0px !important;
}
```

```
</style>
```

{% previewsample "page.domainurl/code-snippet/linear-gauge/getting-started-cs65" %}

Setting the range color for the labels

To set the color of the labels like the range color, set the useRangeColor property as **true** in the labelStyle.

APP.VUE

```
<template>
    <div class="content-wrapper">
        <div align='center'>
            <ejs-lineargauge>
                <e-axes>
                    <e-axis :labelStyle='labelStyle'>
                        <e-ranges>
                            <e-range start=50 end=80 color="red"></e-range>
                        </e-ranges>
                    </e-axis>
                </e-axes>
            </ejs-lineargauge>
        </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { LinearGaugePlugin } from "@syncfusion/ej2-vue-lineargauge";
Vue.use(LinearGaugePlugin);
export default {
    data: function () {
        return {
            labelStyle: {
                useRangeColor: true
            }
        }
    }
};
</script>
<style>
#content-wrapper {
    padding: 0px !important;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/linear-gauge/getting-started-cs66" %}

Multiple ranges

Multiple ranges can be added to the Linear Gauge by adding collections e-range in the e-ranges and customization of ranges can be done with the e-range.

APP.VUE

```
<template>
    <div class="content-wrapper">
        <div align='center'>

    padding: 0px !important;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/linear-gauge/getting-started-cs67" %}

Gradient Color

Gradient support allows the addition of multiple colors in the range. The following gradient types are supported in the Linear Gauge.

- Linear Gradient
- Radial Gradient

Linear Gradient

Using linear-gradient, colors will be applied in a linear progression. The start value of the linear gradient can be set using the startValue property. The end value of the linear gradient will be set using the endValue property. The color stop values such as color, opacity, and offset to be defined in colorStop.

APP.VUE

'labelStyle'></e-axis>
                </e-axes>
            </ejs-lineargauge>
        </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { LinearGaugePlugin, Gradient } from "@syncfusion/ej2-vue-
lineargauge";
Vue.use(LinearGaugePlugin);
export default {
    data: function () {
        return {
            orientation: 'Horizontal',
            container: {
                width: 30, offset: 30
            },
            line: { width: 0 },
            majorTicks: { interval: 25, height: 0 },
            minorTicks: { height: 0 },
            labelStyle: {
                font: { color: '#424242',
                }, offset: 55
            },
            pointers: [{
                value: 80, height: 25,
                width: 35, placement: 'Near',
                offset: -44, markerType: 'Triangle',
                color: '#f54ea2'
            }],
            ranges: [{
                start: 0, end: 80,
                startWidth: 30, endWidth: 30,
                offset: 30,
                radialGradient: {
                    radius: '65%',
                    outerPosition: { x: '50%', y: '70%' },
                    innerPosition: { x: '60%', y: '60%' },
                    colorStop: [
```

```
                        { color: '#fff5f5', offset: '5%', opacity: 0.9 },
                        { color: '#f54ea2', offset: '100%', opacity: 0.9 }]
                }
            }]
        }
    },
    provide: {
        lineargauge: [Gradient]
    }
};
</script>
<style>
#content-wrapper {
    padding: 0px !important;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/linear-gauge/getting-started-cs69" %}

If we set both gradients for the range, only the linear gradient gets rendered. If we set the startValue and endValue of the linearGradient as empty strings, then the radial gradient gets rendered in the pointer of the Linear Gauge.

Pointers in Vue Linear gauge component

Pointers are used to indicate values on an axis. The value of the pointer can be modified using the value property in e-pointer.

APP.VUE

```
<template>
  <div class="content-wrapper">
    <div align='center'>
      <ejs-lineargauge>
        <e-axes>
          <e-axis>
            <e-pointers>
              <e-pointer value=80></e-pointer>
            </e-pointers>
          </e-axis>
        </e-axes>
      </ejs-lineargauge>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { LinearGaugePlugin } from "@syncfusion/ej2-vue-lineargauge";
Vue.use(LinearGaugePlugin);
export default { };
</script>
<style>
#content-wrapper {
    padding: 0px !important;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/linear-gauge/getting-started-cs55" %}

Types of pointer

The Linear Gauge supports the following types of pointers:

- Bar
- Marker

The type of pointer can be modified by using the type property in e-pointer.

Marker pointer

A marker pointer is a shape that can be used to mark the pointer value in the Linear Gauge.

Types of marker shapes

By default, the marker shape for the pointer is **InvertedTriangle**. To change the shape of the pointer, use the markerType property in e-pointer. The following marker types are available in Linear Gauge.

- Circle
- Rectangle
- Triangle
- InvertedTriangle
- Diamond
- Image
- Text

APP.VUE

```
<template>
  <div class="content-wrapper">
    <div align='center'>
      <ejs-lineargauge>
        <e-axes>
          <e-axis>
            <e-pointers>
              <e-pointer value=80 type= 'Marker'  markerType= 'Circle'></e-
pointer>
            </e-pointers>
          </e-axis>
        </e-axes>
      </ejs-lineargauge>
    </div>
  </div>

</style>
```

{% previewsample "page.domainurl/code-snippet/linear-gauge/getting-started-cs56" %}

Image can be rendered instead of rendering a shape as a pointer. It can be achieved by setting the markerType property to **Image** and setting the source URL of image to imageUrl property in e-pointer.

APP.VUE

```
<template>
    <div id="app">
        <div class='wrapper'>
           <ejs-lineargauge style='display:block' align='center' id='gauge'
orientation="Horizontal">
            <e-axes>
                <e-axis  :majorTicks='majorTicks' :minorTicks='minorTicks'
:labelStyle='labelStyle'>
                    <e-pointers>
                    <e-pointer :value='value' markerType="Image"
imageUrl="https://ej2.syncfusion.com/vue/demos/src/linear-gauge/images/step-
count.png" width="40" height="40" offset="-27"></e-pointer>
                    </e-pointers>
                </e-axis>
            </e-axes>
        </ejs-lineargauge>
        </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { LinearGaugePlugin } from '@syncfusion/ej2-vue-lineargauge';
Vue.use(LinearGaugePlugin);
export default {
    data() {
        return {
            minorTicks: {
                position:'Outside'
            },
            majorTicks:{
              interval:20,
              position:'Outside'
            },
            labelStyle: {
                font: {
                    fontFamily: 'inherit'
                },
                position:'Outside'
            },
            value:60
        }
    }
}
</script>
<style>
.wrapper {
    max-width: 400px;
```

```
    margin: 0 auto;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/linear-gauge/getting-started-cs77" %}

Text can be added instead of rendering a shape as a pointer. It can be achieved by setting the markerType property to **Text**, and the text content can be set using the text property in e-pointer.

The following properties in the textStyle property can be used to set the text style for the text pointer.

- fontFamily - It is used to set the font family for the text pointer.
- fontStyle - It is used to set the font style for the text pointer.
- fontWeight - It is used to set the font weight for the text pointer.
- size - It is used to set the font size for the text pointer.

APP.VUE

Marker Pointer Customization

The marker pointer can be customized using the following properties.

- height - To set the height of the pointer.
- position - The position of the pointer can be changed by setting the value as **Inside**, **Outside**, **Cross**, or **Auto**.
- width - To set the width of the pointer.
- color - To set the color of the pointer.
- placement - To place the pointer in the specified position. By default, the pointer is placed **Far** from the axis. To change the placement, set the placement property as **Near**, **Center**, or **None**.
- offset - To place the pointer with specified distance from the axis.
- opacity - To set the opacity of the pointer.
- animationDuration - To specify the duration of the animation in pointer.
- border - To set the color and width for the border of the pointer.

APP.VUE

```

#content-wrapper {
    padding: 0px !important;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/linear-gauge/getting-started-cs58" %}

Bar pointer customization

The bar pointer can be customized using the following properties.

- width - To set the thickness of the bar pointer.

Copyright © 2001 -2024 Syncfusion Inc.

- color - To set the color of the bar pointer.
- offset - To place the bar pointer with the specified distance from it's default position.
- opacity - To set the opacity of the bar pointer.
- roundedCornerRadius - To set the corner radius for the bar pointer.
- border - To set the color and width for the border of the pointer.
- animationDuration - To set the duration of the animation in bar pointer.

The placement property is not applicable for the bar pointer.

APP.VUE

{% previewsample "page.domainurl/code-snippet/linear-gauge/getting-started-cs61" %}

Gradient Color

Gradient support allows the addition of multiple colors in the pointers of the Linear Gauge. The following gradient types are supported in the Linear Gauge.

- Linear Gradient
- Radial Gradient

Linear Gradient

Using linear gradient, colors will be applied in a linear progression. The start value of the linear gradient can be set using the startValue property. The end value of the linear gradient will be set using the endValue property. The color stop values such as color, opacity, and offset are set using colorStop property.

APP.VUE

```
<template>
  <div class="content-wrapper">
    <div align='center'>
      <ejs-lineargauge :orientation= 'orientation' :container= 'container'>
        <e-axes>
          <e-axis :ranges='ranges' :pointers= 'pointers' :line= 'line'
:majorTicks= 'majorTicks' :minorTicks= 'minorTicks' :labelStyle=
'labelStyle'></e-axis>
        </e-axes>
      </ejs-lineargauge>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { LinearGaugePlugin, Gradient } from "@syncfusion/ej2-vue-
lineargauge";
Vue.use(LinearGaugePlugin);
export default {
  data: function () {
    return {
      orientation: 'Horizontal',
      container: {
        width: 30, offset: 30
      },
      line: { width: 0 },
      majorTicks: { interval: 25, height: 0 },
      minorTicks: { height: 0 },
      labelStyle: {
        font: { color: '#424242'},
        offset: 55
      },
      pointers: [{
        value: 80, height: 25,
        width: 35, placement: 'Near',
        offset: -44, markerType: 'Triangle',
        linearGradient: {
          startValue: '0%',
```

Copyright © 2001 -2024 Syncfusion Inc.

```
          endValue: '100%',
          colorStop: [
            { color: '#fef3f9', offset: '0%', opacity: 1 },
            { color: '#f54ea2', offset: '100%', opacity: 1 }]
          }
      }],
      ranges: [{
        start: 0, end: 80,
        startWidth: 30, endWidth: 30,
        color: '#f54ea2', offset: 30,
      }]
    }
  },
  provide: {
    lineargauge: [Gradient]
  }
};
</script>
<style>
#content-wrapper {
  padding: 0px !important;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/linear-gauge/getting-started-cs62" %}

Radial Gradient

Using radial gradient, colors will be applied in circular progression. The inner circle position of the radial gradient will be set using the innerPosition property. The outer circle position of the radial gradient can be set using the outerPosition property. The color stop values such as color, opacity, and offset are set using colorStop property.

APP.VUE

```
<template>
  <div class="content-wrapper">
    <div align='center'>
      <ejs-lineargauge :orientation= 'orientation' :container= 'container'>

lineargauge";
Vue.use(LinearGaugePlugin);
export default {
  data: function () {
    return {
      orientation: 'Horizontal',
```

```
      container: {
        width: 30, offset: 30
      },
      line: { width: 0 },
      majorTicks: { interval: 25, height: 0 },
      minorTicks: { height: 0 },
      labelStyle: {
        font: { color: '#424242'},
        offset: 55
      },
      pointers: [{
        value: 80, height: 25,
        width: 35, placement: 'Near',
        offset: -44, markerType: 'Triangle',
        radialGradient: {
          radius: '60%',
          outerPosition: { x: '50%', y: '50%' },
          innerPosition: { x: '50%', y: '50%' },
          colorStop: [
            { color: '#fff5f5', offset: '0%', opacity: 0.9 },
            { color: '#f54ea2', offset: '100%', opacity: 0.8 }]
          }
      }],
      ranges: [{
        start: 0, end: 80,
        startWidth: 30, endWidth: 30,
        color: '#f54ea2', offset: 30,
      }]
    }
  },
  provide: {
    lineargauge: [Gradient]
  }
};
</script>
<style>
#content-wrapper {
    padding: 0px !important;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/linear-gauge/getting-started-cs63" %}

If we set both gradients, only the linear gradient gets rendered. If we set the startValue and endValue of the linearGradient as empty strings, then the radial gradient gets rendered in the pointer of the Linear Gauge.

Annotations in Vue Linear gauge component

<!-- markdownlint-disable MD013 -->

Annotations are used to mark the specific area of interest in the Linear Gauge with text, HTML elements, or images. Any number of annotations can be added to the Linear Gauge component.

Copyright © 2001 -2024 Syncfusion Inc.

Adding annotation

To render the custom HTML elements in the Linear Gauge component, use the content property in the e-annotation. The annotation can be rendered either by specifying the id of the element or specifying the code to create a new element that needs to be displayed in the gauge area.

<!-- markdownlint-disable MD036 -->

`ts

<template>

<ejs-lineargauge ref='lineargauge' style='display:block' align='center'>

<e-annotations>

<e-annotation :content='contentTemplate' :zIndex='zindex' :axisValue=50>

</e-annotation>

</e-annotations>

</ejs-lineargauge>

</template>

<style>

control-container {

padding: 0px !important;

}

</style>

<script>

import Vue from "vue";

import { LinearGaugePlugin, Annotations } from "@syncfusion/ej2-vue-lineargauge";

Vue.use(LinearGaugePlugin);

export default {

data:function() {

return {

zindex: 1,

contentTemplate: ' <h1>Gauge</h1> ',

}

},

provide: {

lineargauge: [Annotations]

},

};

</script>

`

Customization

The following properties are used to customize the annotation.

- zIndex - Bring the annotation to the front or back, when annotation overlaps with another element.
- axisValue - To place the annotation in the specified axis value with respect to the provided axis index.
- axisIndex - To place the annotation in the specified axis with respect to the provided axis value.
- horizontalAlignment - To place the annotation horizontally.
- verticalAlignment - To place the annotation vertically.
- x, y - To place the annotation in the specified location.

Changing the z-index

To change the stack order of an annotation element, the zIndex property of the e-annotation can be used.

APP.VUE

```
<template>
  <div class="control-section">
    <div align='center'>
      <ejs-lineargauge style='display:block' align='center'>
        <e-annotations>
          <e-annotation :content='contentTemplate' :zIndex='zindex'
horizontalAlignment='Center' verticalAlignment='Center'>
          </e-annotation>
        </e-annotations>
      </ejs-lineargauge>
    </div>
  </div>
</template>
<script>
import Vue from "vue";
import { LinearGaugePlugin, Annotations } from "@syncfusion/ej2-vue-
lineargauge";
Vue.use(LinearGaugePlugin);
export default {
  data:function(){
    return{
      zindex: 1,
      contentTemplate: '<div id="first"><h1>Gauge</h1></div>',
    }
  },
  provide: {
```

```
    lineargauge: [Annotations]
  },
};
</script>
```

{% previewsample "page.domainurl/code-snippet/linear-gauge/getting-started-cs1" %}

Positioning an annotation

The annotation can be placed anywhere in the Linear Gauge by setting the pixel value to the x and y properties in the e-annotation.

APP.VUE

```
<template>
  <div class="control-section">
    <div align='center'>
      <ejs-lineargauge style='display:block' align='center'>
        <e-annotations>
          <e-annotation :content='contentTemplate' :zIndex='zindex' x=100
y=100>
          </e-annotation>
        </e-annotations>
      </ejs-lineargauge>
    </div>
  </div>
</template>
<script>
import Vue from "vue";
import { LinearGaugePlugin, Annotations } from "@syncfusion/ej2-vue-
lineargauge";
Vue.use(LinearGaugePlugin);
export default {
  data:function() {
    return{
      zindex: 1,
      contentTemplate: '<div id="first"><h1>Gauge</h1></div>',
    }
  },
  provide: {
    lineargauge: [Annotations]
  },
};
</script>
```

{% previewsample "page.domainurl/code-snippet/linear-gauge/getting-started-cs2" %}

Alignment of annotation

The annotation can be aligned horizontally and vertically by using the horizontalAlignment and verticalAlignment properties respectively. The possible values can be **Center**, **Far**, **Near**, and **None**. The horizontalAlignment and verticalAlignment properties are not applicable when the x and y properties are set in the e-annotation.

      contentTemplate: '<div><h1 style="color:red;">Speed</h1></div>',
      contentTemplate1: '<div><h1 style="color:blue;">Meter</h1></div>',
      x1:290,
      y1:250,
      x2:10,
      y2:-190,
    }
  },
  provide: {
    lineargauge: [Annotations]
  },
};
</script>
```

{% previewsample "page.domainurl/code-snippet/linear-gauge/getting-started-cs4" %}

Animation in Vue Linear Gauge component

All of the elements in the Linear Gauge, such as the axis lines, ticks, labels, ranges, pointers, and annotations, can be animated sequentially by using the animationDuration property. The animation for the Linear Gauge is enabled when the animationDuration property is set to an appropriate value in milliseconds, providing a smooth rendering effect for the component. If the animationDuration property is set to **0**, which is the default value, the animation effect is disabled. If the animation is enabled, the component will behave in the following order.

1. The axis line, ticks, labels, and ranges will all be animated at the same time.
2. If available, pointers will be animated in the same way as pointer animation.
3. If available, annotations will be animated.

The animation of the Linear Gauge is demonstrated in the following example.

APP.VUE

```
<template>
    <div id="app">
        <div class='wrapper'>
            <ejs-lineargauge animationDuration='3000'
style='display:block' align='center' id='defaultContainer'
:orientation='orientation'>
                <e-annotations>
                    <e-annotation :axisIndex='axisIndex'

{% previewsample "page.domainurl/code-snippet/linear-gauge/getting-started-cs76" %}

Only the pointer of the Linear Gauge can be animated individually, not the axis lines, ticks, labels, ranges, and annotations. You can refer this link to enable only pointer animation.

User interaction in Vue Linear gauge component

Tooltip

<!-- markdownlint-disable MD036 -->

Linear gauge displays the details about a pointer value through tooltip, when the mouse hovers over the pointer. To enable the tooltip, set the enable property to **true** and inject the **GaugeTooltip** module in **provide** section.

APP.VUE

```
<template>
  <div class="content-wrapper">
    <div align='center'>
      <ejs-lineargauge   :tooltip='tooltip' >
        <e-axes>
          <e-axis >
            <e-pointers>
              <e-pointer value=80 ></e-pointer>
            </e-pointers>
          </e-axis>
        </e-axes>
      </ejs-lineargauge>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { LinearGaugePlugin, GaugeTooltip } from "@syncfusion/ej2-vue-
lineargauge";
Vue.use(LinearGaugePlugin);
export default {
  data: function () {
    return{
      tooltip: {
        enable: true
      }
    }
  },
  provide: {
    lineargauge: [ GaugeTooltip]
  },
```

```
};
</script>
<style>
#content-wrapper {
    padding: 0px !important;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/linear-gauge/getting-started-cs70" %}

Tooltip Format

Tooltip in the Linear Gauge control can be formatted using the format property in tooltip object. It is used to render the tooltip in certain format or to add a user-defined unit in the tooltip. By default, the tooltip shows the pointer value only. In addition to that, more information can be added in the tooltip. For example, the format **{value}km** shows pointer value with kilometer unit in the tooltip.

APP.VUE

```
<template>
  <div class="content-wrapper">
    <div align='center'>
      <ejs-lineargauge :tooltip='tooltip'>
        <e-axes>
          <e-axis>
            <e-pointers>
              <e-pointer value=80 ></e-pointer>
            </e-pointers>
          </e-axis>
        </e-axes>
      </ejs-lineargauge>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { LinearGaugePlugin, GaugeTooltip } from "@syncfusion/ej2-vue-
lineargauge";
Vue.use(LinearGaugePlugin);
export default {
  data: function () {
    return{
      tooltip: {
        enable: true,
        format: '{value}km'
      }
    }
  },
  provide: {
    lineargauge: [ GaugeTooltip]
  },
};
</script>
<style>
#content-wrapper {
    padding: 0px !important;
}
```

```
</style>
```

{% previewsample "page.domainurl/code-snippet/linear-gauge/getting-started-cs71" %}

Tooltip Template

The HTML element can be rendered in the tooltip of the Linear Gauge using the template property in the tooltip. The **${value}** can be used as placeholders in the HTML element to display the pointer values of the corresponding axis.

APP.VUE

```
<template>
  <div class="content-wrapper">
    <div align='center'>
      <ejs-lineargauge :tooltip='tooltip'>
        <e-axes>
          <e-axis >
            <e-pointers>
              <e-pointer value=80></e-pointer>
            </e-pointers>
          </e-axis>
        </e-axes>
      </ejs-lineargauge>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { LinearGaugePlugin, GaugeTooltip } from "@syncfusion/ej2-vue-
lineargauge";
Vue.use(LinearGaugePlugin);
export default {
  data: function () {
    return{
      tooltip: {
        enable: true,
        template: '<div>Pointer: 80 </div>'
      }
    }
  },
  provide: {
    lineargauge: [GaugeTooltip]
  },
};
</script>
<style>
#content-wrapper {
    padding: 0px !important;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/linear-gauge/getting-started-cs72" %}

Customize the appearance of the tooltip

The tooltip can be customized using the following properties in tooltip.

- fill - To fill the color for tooltip.
- enableAnimation - To enable or disable the tooltip animation.
- border - To set the border color and width of the tooltip.
- textStyle - To customize the style of the text in tooltip.
- showAtMousePosition - To show the tooltip at the mouse position.

APP.VUE

```
<template>
  <div class="content-wrapper">
    <div align='center'>
      <ejs-lineargauge :tooltip='tooltip'>
        <e-axes>
          <e-axis >
            <e-pointers>
              <e-pointer value=80></e-pointer>
            </e-pointers>
          </e-axis>
        </e-axes>
      </ejs-lineargauge>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { LinearGaugePlugin, GaugeTooltip } from "@syncfusion/ej2-vue-
lineargauge";
Vue.use(LinearGaugePlugin);
export default {
  data: function () {
    return{
      tooltip: {
        enable: true,
        fill: '#e5bcbc',
        border: {
          color: '#d80000',
          width: 2
        }
      }
    }
  },
  provide: {
    lineargauge: [ GaugeTooltip]
  },
};
</script>
<style>
#content-wrapper {
    padding: 0px !important;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/linear-gauge/getting-started-cs73" %}

Positioning the tooltip

The tooltip is positioned at the **End** of the pointer. To change the position of the tooltip at the start, or center of the pointer, set the position property to **Start** or **Center**.

APP.VUE

```
<template>
  <div class="content-wrapper">
    <div align='center'>
      <ejs-lineargauge :tooltip='tooltip'>
        <e-axes>
          <e-axis >
            <e-pointers>
              <e-pointer value=80 type="Bar" color="blue"></e-pointer>
            </e-pointers>
          </e-axis>
        </e-axes>
      </ejs-lineargauge>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { LinearGaugePlugin, GaugeTooltip } from "@syncfusion/ej2-vue-
lineargauge";
Vue.use(LinearGaugePlugin);
export default {
  data: function () {
    return{
      tooltip: {
        enable: true,
        position: "Center"
      }
    }
  },
  provide: {
    lineargauge: [ GaugeTooltip]
  },
};
</script>
<style>
#content-wrapper {
    padding: 0px !important;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/linear-gauge/getting-started-cs74" %}

Pointer Drag

To drag either marker or bar pointer to the desired axis value, set the enableDrag property as **true** in the e-pointer.

APP.VUE

```
<template>
  <div class="content-wrapper">
```

```
    <div align='center'>
      <ejs-lineargauge >
        <e-axes>
          <e-axis >
            <e-pointers>
              <e-pointer value=80  enableDrag= 'true' ></e-pointer>
            </e-pointers>
          </e-axis>
        </e-axes>
      </ejs-lineargauge>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { LinearGaugePlugin } from "@syncfusion/ej2-vue-lineargauge";
Vue.use(LinearGaugePlugin);
export default { };
</script>
<style>
#content-wrapper {
    padding: 0px !important;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/linear-gauge/getting-started-cs75" %}

Linear gauge print and export in Vue Linear gauge component

Print

The rendered Linear Gauge can be printed directly from the browser by calling the print method. To use the print functionality, set the allowPrint property as **true** and inject the **Print** module in **provide** section.

APP.VUE

```
<template>
  <div class="content-wrapper">
    <div align='center'>
      <button v-on:click="print">Print</button>
      <ejs-lineargauge id="container" ref='gauge' :allowPrint='allowPrint'>
      </ejs-lineargauge>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { LinearGaugePlugin, Print } from "@syncfusion/ej2-vue-lineargauge";
Vue.use(LinearGaugePlugin);
export default {
  data () {
    return {
      allowPrint: true
    }
  },
  methods: {
```

```
    print: function (event) {
      this.$refs.gauge.ej2Instances.print();
    }
  },
  provide: {
    lineargauge: [Print]
  }
};
</script>
<style>
#content-wrapper {
    padding: 0px !important;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/linear-gauge/getting-started-cs48" %}

Export

Image Export

To use the image export functionality, set the allowImageExport property as **true** and inject the **ImageExport** module in **provide** section. The rendered Linear Gauge can be exported as an image using the export method. This method requires two parameters: export type and file name. The Linear Gauge can be exported as an image with the following formats.

- JPEG
- PNG
- SVG

APP.VUE

```
<template>
  <div class="content-wrapper">
    <div align='center'>
      <button v-on:click="clickExport">Image Export</button>
      <ejs-lineargauge id="container" ref='gauge'
:allowImageExport='allowImageExport'>
      </ejs-lineargauge>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { LinearGaugePlugin, ImageExport } from "@syncfusion/ej2-vue-
lineargauge";
Vue.use(LinearGaugePlugin);
export default {
  data () {
    return {
      allowImageExport: true
    }
  },
  methods: {
    clickExport: function (event) {
      this.$refs.gauge.ej2Instances.export("PNG", "Gauge");
```

Copyright © 2001 -2024 Syncfusion Inc.

```
    }
  },
  provide: {
    lineargauge: [ImageExport]
  }
};
</script>
<style>
#content-wrapper {
    padding: 0px !important;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/linear-gauge/getting-started-cs49" %}

PDF Export

To use the PDF export functionality, set the allowPdfExport property as **true** and inject the **PdfExport** module in **provide** section. The rendered Linear Gauge can be exported as PDF using the export method. The export method requires three parameters: file type, file name, and orientation of the PDF document. The orientation of the PDF document can be set as **Portrait** or **Landscape**.

APP.VUE

```
<template>
  <div class="content-wrapper">
    <div align='center'>
      <button v-on:click="clickExport">PDF Export</button>
      <ejs-lineargauge id="container" ref='gauge'
:allowPdfExport='allowPdfExport'>
      </ejs-lineargauge>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { LinearGaugePlugin, PdfExport } from "@syncfusion/ej2-vue-
lineargauge";
Vue.use(LinearGaugePlugin);
export default {
  data () {
    return {
      allowPdfExport: true
    }
  },
  methods: {
    clickExport: function (event) {
      this.$refs.gauge.ej2Instances.export("PNG", "Gauge");
    }
  },
  provide: {
    lineargauge: [PdfExport]
  }
};
</script>
<style>
#content-wrapper {
```

```
    padding: 0px !important;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/linear-gauge/getting-started-cs50" %}

Exporting Linear Gauge as base64 string of the file

The Linear Gauge can be exported as base64 string for the JPEG, PNG and PDF formats. The rendered Linear Gauge can be exported as base64 string of the exported image or PDF document used in the export method. The arguments that are required for this method is export type, file name, orientation of the exported PDF document and **allowDownload** boolean value that is set as **false** to return base64 string. The value for the orientation of the exported PDF document is set as **null** for image export and **Portrait** or **Landscape** for the PDF document.

APP.VUE

```
<template>
  <div class="content-wrapper">
    <div align='center'>
      <button v-on:click="clickExport">Export</button>
      <ejs-lineargauge id="container" ref='gauge'
:allowImageExport='allowImageExport'>
      </ejs-lineargauge>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { LinearGaugePlugin, ImageExport } from "@syncfusion/ej2-vue-
lineargauge";
Vue.use(LinearGaugePlugin);
export default {
  data () {
    return {
      allowImageExport: true
    }
  },
  methods: {
    clickExport: function (event) {
      this.$refs.gauge.ej2Instances.export('JPEG', 'Gauge', null,
false).then((data) => {
            let base64 = data;
            document.writeln(base64);
        });
    }
  },
  provide: {
    lineargauge: [ImageExport]
  }
};
</script>
<style>
#content-wrapper {
    padding: 0px !important;
}
</style>
```

Copyright © 2001 -2024 Syncfusion Inc.

{% previewsample "page.domainurl/code-snippet/linear-gauge/getting-started-cs51" %}

The exporting of the Linear Gauge as base64 string is not applicable for the SVG format.

Linear gauge appearance in Vue Linear gauge component

Customizing the Linear Gauge area

The following properties are available in the ejs-lineargauge to customize the Linear Gauge area.

- background - Applies the background color for the Linear gauge.
- border - To customize the color and width of the border in Linear Gauge.
- margin - To customize the margins of the Linear Gauge.

APP.VUE

```
<template>
    <div class="content-wrapper">
        <div align='center'>
            <ejs-lineargauge :margin='margin' background= 'skyblue':border
='border'>
            </ejs-lineargauge>
        </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { LinearGaugePlugin } from "@syncfusion/ej2-vue-lineargauge";
Vue.use(LinearGaugePlugin);
export default {
    data: function () {
        return {
            border: { color: "#FF0000", width: 2 },
            margin: {
                left: 20,
                top: 20,
                right: 20,
                bottom: 20
             }
        }
    }
};
</script>
<style>
#content-wrapper {
    padding: 0px !important;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/linear-gauge/getting-started-cs40" %}

Setting up the Linear Gauge title

The title for the Linear Gauge can be set using title property in Linear Gauge. Its appearance can be customized using the titleStyle with the below properties.

Copyright © 2001 -2024 Syncfusion Inc.

- color - Specifies the text color of the title.
- fontFamily - Specifies the font family of the title.
- fontStyle - Specifies the font style of the title.
- fontWeight - Specifies the font weight of the title.
- opacity - Specifies the opacity of the title.
- size - Specifies the font size of the title.

APP.VUE

```
<template>
    <div class="content-wrapper">
        <div align='center'>
            <ejs-lineargauge :title ='title' :titleStyle ='titleStyle'>
            </ejs-lineargauge>
        </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { LinearGaugePlugin } from "@syncfusion/ej2-vue-lineargauge";
Vue.use(LinearGaugePlugin);
export default {
    data: function () {
        return {
            title: 'linear gauge',
            titleStyle: {
                fontFamily: "Arial",
                fontStyle: 'italic',
                fontWeight: 'regular',
                color: "#E27F2D",
                size: '23px'
            }
        }
    }
};
</script>
<style>
#content-wrapper {
    padding: 0px !important;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/linear-gauge/getting-started-cs41" %}

Customizing the Linear Gauge container

The area used to render the ranges and pointers at the center position of the gauge is called container. The following types of container to be applicable for Linear Gauge.

- Normal
- Rounded Rectangle
- Thermometer

Copyright © 2001 -2024 Syncfusion Inc.

The type of the container can be modified by using the type property in container. The container can be customized by using the following properties in container.

- offset - To place the container with the specified distance from the axis of the Linear Gauge.
- width - To set the thickness of the container.
- height - To set the length of the container.
- backgroundColor - To set the background color of the container.
- border - To set the color and width for the border of the container.

Normal

The **Normal** type will render the container as a rectangle and this is the default container type.

APP.VUE

```
<template>
    <div class="content-wrapper">
        <div align='center'>
            <ejs-lineargauge :container='container'>
                <e-axes>
                    <e-axis >
                        <e-pointers>
                            <e-pointer value= 50 width= 15 type= 'Bar'></e-
pointer>
                        </e-pointers>
                    </e-axis>
                </e-axes>
            </ejs-lineargauge>
        </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { LinearGaugePlugin } from "@syncfusion/ej2-vue-lineargauge";
Vue.use(LinearGaugePlugin);
export default {
    data: function () {
        return {
            container: {
               width: 30
            }
        }
    }
};
</script>
<style>
#content-wrapper {
    padding: 0px !important;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/linear-gauge/getting-started-cs42" %}

Copyright © 2001 -2024 Syncfusion Inc.

Rounded Rectangle

The **RoundedRectangle** type will render the container as a rectangle with rounded corner radius. The rounded corner radius of the container can be customized using the roundedCornerRadius property in container.

APP.VUE

```
<template>
    <div class="content-wrapper">
        <div align='center'>
            <ejs-lineargauge :container='container'>
                <e-axes>
                    <e-axis>
                        <e-pointers>
                            <e-pointer value= 50  type= 'Bar'></e-pointer>
                        </e-pointers>
                    </e-axis>
                </e-axes>
            </ejs-lineargauge>
        </div>
  </div>
</template>
<script>
import Vue from 'vue';

Vue.use(LinearGaugePlugin);
export default {
    data: function () {
        return {
            container: {
               width: 30,
               type: 'RoundedRectangle'
            }
        }
    }
};
</script>
<style>
#content-wrapper {
    padding: 0px !important;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/linear-gauge/getting-started-cs43" %}

Thermometer

The **Thermometer** type will render the container similar to the appearance of thermometer.

APP.VUE

```
<template>
    <div class="content-wrapper">
        <div align='center'>
            <ejs-lineargauge :container='container'>
                <e-axes>
                    <e-axis >
```

Copyright © 2001 -2024 Syncfusion Inc.

```
                        <e-pointers>
                            <e-pointer value= 50  type= 'Bar'></e-pointer>
                        </e-pointers>
                    </e-axis>
                </e-axes>
            </ejs-lineargauge>
        </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { LinearGaugePlugin } from "@syncfusion/ej2-vue-lineargauge";
Vue.use(LinearGaugePlugin);
export default {
    data: function () {
        return {
            container: {
               width: 30,
               type: 'Thermometer'
            }
        }
    }
};
</script>
<style>
#content-wrapper {
    padding: 0px !important;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/linear-gauge/getting-started-cs44" %}

Fitting Linear Gauge to the control

The Linear Gauge component is rendered with margin by default. To remove the margin around the Linear Gauge, the allowMargin property in the ejs-lineargauge is set as **false**.

APP.VUE

```
<template>
    <div class="content-wrapper">
        <div align='center'>
            <ejs-lineargauge orientation='Horizontal' :allowMargin=false
:margin='margin' background='skyblue':border ='border'>
            </ejs-lineargauge>
        </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { LinearGaugePlugin } from "@syncfusion/ej2-vue-lineargauge";
Vue.use(LinearGaugePlugin);
export default {
    data: function () {
        return {
            border: { color: "#FF0000", width: 2 },
            margin: {
```

Copyright © 2001 -2024 Syncfusion Inc.

```
                left: 0,
                top: 0,
                right: 0,
                bottom: 0
            }
        }
    }
};
</script>
<style>
#content-wrapper {
    padding: 0px !important;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/linear-gauge/getting-started-cs45" %}

To use this feature, set the allowMargin property to **false**, the width property to **100%** and the properties of margin to **0**.

Accessibility in Vue Linear Gauge component

Linear Gauge has built-in accessibility features like screen reading and WAI-ARIA attributes.

WAI-ARIA attributes

The Linear Gauge component followed the WAI-ARIA patterns to meet the accessibility. The following ARIA attributes are used in the Linear Gauge component:

| Attributes | Purpose |

| --- | --- |

| role=region | It is specified in the pointer where the interactive drag and drop function is supported to update the pointer value. |

| aria-label | Provides an accessible name for the axis labels, text pointer and annotation. |

Screen reading in Linear Gauge

Accessibility in the Linear Gauge component ensures that all users, regardless of ability or disability, can use screen reading. The following Linear Gauge elements will be read aloud using screen reading software, such as Narrator for Windows.

| Elements | Description |

| --- | --- |

| Axis labels | Reads the axis labels of the Linear Gauge.|

| Text pointer | Reads the text content shown as a pointer in Linear Gauge. |

| Annotation | Reads the content specified in the annotation. |

Ensuring accessibility

The Linear Gauge component's accessibility levels are ensured through an accessibility-checker and axe-core software tools during automated testing.

Copyright © 2001 -2024 Syncfusion Inc.

The accessibility compliance of the Linear Gauge component is shown in the following sample. Open the sample in a new window to evaluate the accessibility of the Linear Gauge component with accessibility tools.

Internationalization in Vue Linear gauge component

Globalization is the process of designing and developing a component that works in different cultures. Internationalization is used to globalize the number content in Linear Gauge component using format property in Linear Gauge. It has static text on some features such as

- Axis label
- Tooltip

The static text on above features can be changed to any culture such as Arabic, Deutsch and French. To know more about the globalization in Vue components, refer here.

Numeric Format

The text in axis labels and tooltip can be displayed in the numeric format such as currency, percentage and so on. To know more about the numeric formats in axis labels, refer here. In the below example, the axis label is displayed in the currency format.

Events in Vue Linear gauge component

This section describes the Linear Gauge component's event that gets triggered when corresponding operations are performed.

animationComplete

When the pointer animation is completed, the animationComplete event will be triggered. To know more about the arguments of this event, refer here.

APP.VUE

```
<template>
  <div class="content-wrapper">
    <div align='center'>
      <ejs-lineargauge :animationComplete='animationComplete'>
        <e-axes>
          <e-axis>
            <e-pointers>
              <e-pointer value=10></e-pointer>
            </e-pointers>
          </e-axis>
        </e-axes>
      </ejs-lineargauge>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { LinearGaugePlugin } from "@syncfusion/ej2-vue-lineargauge";
Vue.use(LinearGaugePlugin);
export default {
  methods: {
    animationComplete: function (event) {
    }
  }
 };
</script>
<style>
#content-wrapper {
    padding: 0px !important;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/linear-gauge/getting-started-cs18" %}

annotationRender

Before the annotation is rendered in the Linear Gauge, the annotationRender event will be triggered. To know more about the arguments of this event, refer here.

APP.VUE

```
<template>
  <div class="content-wrapper">
    <div align='center'>
      <ejs-lineargauge :annotationRender='annotationRender'>
```

```

```
            <e-pointers>
              <e-pointer></e-pointer>
            </e-pointers>
          </e-axis>
        </e-axes>
      </ejs-lineargauge>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { LinearGaugePlugin } from "@syncfusion/ej2-vue-lineargauge";
Vue.use(LinearGaugePlugin);
export default {
  methods: {
    resized: function (event) {
    }
  }
 };
</script>
<style>
#content-wrapper {
    padding: 0px !important;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/linear-gauge/getting-started-cs31" %}

tooltipRender

The tooltipRender event is fired before the tooltip is rendered. To know more about the arguments of this event, refer here.

APP.VUE

```
<template>
  <div class="content-wrapper">
    <div align='center'>
      <ejs-lineargauge :tooltip='tooltip' :tooltipRender='tooltipRender'>
        <e-axes>
          <e-axis>
            <e-pointers>
              <e-pointer></e-pointer>
            </e-pointers>
          </e-axis>
        </e-axes>
      </ejs-lineargauge>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { LinearGaugePlugin, GaugeTooltip  } from "@syncfusion/ej2-vue-
lineargauge";
Vue.use(LinearGaugePlugin);
export default {
  data:function(){
```

```
    return {
      tooltip: {
        enable: true,
      }
    }
  },
  methods: {
    tooltipRender: function (event) {
    }
  },
  provide: {
    lineargauge: [GaugeTooltip]
  }
 };
</script>
<style>
#content-wrapper {
    padding: 0px !important;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/linear-gauge/getting-started-cs32" %}

valueChange

The valueChange event is triggered when the pointer is dragged from one value to another. To know more about the arguments of this event, refer here.

APP.VUE

```
<template>
  <div class="content-wrapper">
    <div align='center'>
      <ejs-lineargauge :valueChange='valueChange'>
        <e-axes>
          <e-axis>
            <e-pointers enableDrag=true>
              <e-pointer></e-pointer>
            </e-pointers>
          </e-axis>
        </e-axes>
      </ejs-lineargauge>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { LinearGaugePlugin } from "@syncfusion/ej2-vue-lineargauge";
Vue.use(LinearGaugePlugin);
export default {
  methods: {
    valueChange: function (event) {
    }
  }
 };
</script>
<style>
```

```
#content-wrapper {
    padding: 0px !important;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/linear-gauge/getting-started-cs33" %}

Methods in Vue Linear gauge component

The following methods are available in the Linear Gauge component.

setPointerValue

To change the pointer value dynamically, use the setPointerValue method in the Linear Gauge component. The following are the arguments for this method.

Argument name	Description
axisIndex	Specifies the index of the axis in which the pointer value is to be updated.
pointerIndex	Specifies the index of the pointer to be updated.
pointerValue	Specifies the value of the pointer to be updated.

APP.VUE

```
<template>
  <div class="content-wrapper">
    <div align='center'>
      <button v-on:click="clicked">Click</button>
      <ejs-lineargauge ref='gauge'>
        <e-axes>
          <e-axis>
            <e-pointers>
              <e-pointer value=80></e-pointer>
            </e-pointers>
          </e-axis>
        </e-axes>
      </ejs-lineargauge>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { LinearGaugePlugin } from "@syncfusion/ej2-vue-lineargauge";
Vue.use(LinearGaugePlugin);
export default {
  methods: {
    clicked: function (event) {
      this.$refs.gauge.ej2Instances.setPointerValue(0, 0, 30);
    }
  }
 };
</script>
<style>
#content-wrapper {
    padding: 0px !important;
```

Copyright © 2001 -2024 Syncfusion Inc.

```
}
</style>
```

{% previewsample "page.domainurl/code-snippet/linear-gauge/getting-started-cs52" %}

setAnnotationValue

To change the annotation content dynamically, use the setAnnotationValue method in the Linear Gauge component. The following are the arguments for this method.

Argument name	Description
annotationIndex	Specifies the index number of the annotation to be updated.
content	Specifies the text for the annotation to be updated.
axisValue	Specifies the value of the axis where the annotation is to be placed.

APP.VUE

```
<template>
  <div class="content-wrapper">
    <div align='center'>
      <button v-on:click="clicked">Click</button>
      <ejs-lineargauge ref='gauge'>
        <e-annotations>
            <e-annotation :content='contentTemplate' :zIndex='zindex'
:axisValue='axisValue'>
            </e-annotation>
        </e-annotations>
        <e-axes>
          <e-axis>
            <e-pointers>
              <e-pointer value=10></e-pointer>
            </e-pointers>
          </e-axis>
        </e-axes>
      </ejs-lineargauge>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { LinearGaugePlugin, Annotations } from "@syncfusion/ej2-vue-
lineargauge";
Vue.use(LinearGaugePlugin);
export default {
  data:function(){
    return{
        zindex: 1,
        contentTemplate : '10',
        axisValue: 0
    }
  },
  methods: {
    clicked: function (event) {
      this.$refs.gauge.ej2Instances.setAnnotationValue(0, '50', 50);
```

```
    }
  },
  provide: {
    lineargauge: [Annotations]
  }
 };
</script>
<style>
#content-wrapper {
    padding: 0px !important;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/linear-gauge/getting-started-cs53" %}

refresh

The refresh method can be used to change the state of the component and render it again.

APP.VUE

```
<template>
  <div class="content-wrapper">
    <div align='center'>
      <button v-on:click="clicked">Click</button>
      <ejs-lineargauge ref='gauge'>
        <e-axes>
          <e-axis>
            <e-pointers>
              <e-pointer value=10></e-pointer>
            </e-pointers>
          </e-axis>
        </e-axes>
      </ejs-lineargauge>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { LinearGaugePlugin } from "@syncfusion/ej2-vue-lineargauge";
Vue.use(LinearGaugePlugin);
export default {
  methods: {
    clicked: function (event) {
      this.$refs.gauge.ej2Instances.refresh();
    }
  }
 };
</script>
<style>
#content-wrapper {
    padding: 0px !important;
}
</style>
```

ListBox

Getting Started with the Vue List box Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using Vue-CLI and integrating the Syncfusion Vue List box component using the Composition API / Options API.

Prerequisites

System requirements for Syncfusion Vue UI components

Setting up the Vue 2 project

To generate a Vue 2 project using Vue-CLI, use the vue create command. Follow these steps to install Vue CLI and create a new project:

`bash

npm install -g @vue/cli

vue create quickstart

cd quickstart

npm run serve

`

or

`bash

yarn global add @vue/cli

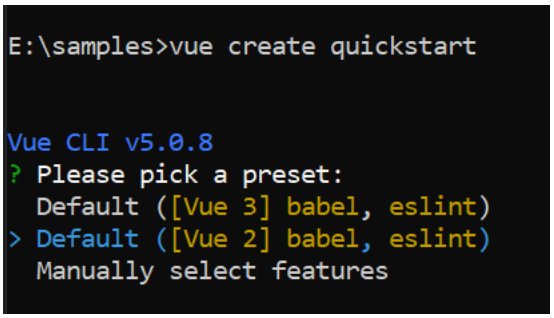
vue create quickstart

cd quickstart

yarn run serve

`

When creating a new project, choose the option `Default ([Vue 2] babel, eslint)` from the menu.



Once the `quickstart` project is set up with default settings, proceed to add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion packages are available at npmjs.com. To use Vue components, install the required npm package.

This article uses the Vue List box component as an example. Install the @syncfusion/ej2-vue-dropdowns package by running the following command:

`bash

npm install @syncfusion/ej2-vue-dropdowns --save

`

or

`bash

yarn add @syncfusion/ej2-vue-dropdowns

`

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, the Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the List box component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-dropdowns/styles/material.css";
</style>
```

Add Syncfusion Vue component

Follow the below steps to add the Vue List box component using Composition API or Options API:

1\. First, import and register the List box component in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { ListBoxComponent as EjsListbox } from "@syncfusion/ej2-vue-
dropdowns";
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { ListBoxComponent } from "@syncfusion/ej2-vue-dropdowns";
export default {
components: {
'ejs-listbox': ListBoxComponent
}
```

Copyright © 2001 -2024 Syncfusion Inc.

```
}
</script>
```

2\. In the template section, define the List box component with the dataSource property.

~/SRC/APP.VUE

```
<template>
<div id="app">
<div id='container' style="margin:10px auto 0; width:250px;">
<ejs-listbox :dataSource='data' ></ejs-listbox>
</div>
</div>
</template>
```

Binding data source

After initialization, populate the ListBox with data using the dataSource property. Here, an array of object is passed to the ListBox component.

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<div id="app">
<div id='container' style="margin:10px auto 0; width:250px;">
<ejs-listbox :dataSource='data' ></ejs-listbox>
</div>
</div>
</template>
<script setup>
import { ListBoxComponent as EjsListbox } from "@syncfusion/ej2-vue-
dropdowns";
const data = [
{ text: 'Hennessey Venom', id: 'list-01' },
{ text: 'Bugatti Chiron', id: 'list-02' },
{ text: 'Bugatti Veyron Super Sport', id: 'list-03' },
{ text: 'SSC Ultimate Aero', id: 'list-04' },
{ text: 'Koenigsegg CCR', id: 'list-05' },
{ text: 'McLaren F1', id: 'list-06' },
{ text: 'Aston Martin One- 77', id: 'list-07' },
{ text: 'Jaguar XJ220', id: 'list-08' },
{ text: 'McLaren P1', id: 'list-09' },
{ text: 'Ferrari LaFerrari', id: 'list-10' },
];
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<div id="app">
<div id='container' style="margin:10px auto 0; width:250px;">
<ejs-listbox :dataSource='data' ></ejs-listbox>
</div>
</div>
</template>
<script>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
import { ListBoxComponent } from "@syncfusion/ej2-vue-dropdowns";
export default {
components: {
'ejs-listbox': ListBoxComponent
},
data (){
return {
data: [
{ text: 'Hennessey Venom', id: 'list-01' },
{ text: 'Bugatti Chiron', id: 'list-02' },
{ text: 'Bugatti Veyron Super Sport', id: 'list-03' },
{ text: 'SSC Ultimate Aero', id: 'list-04' },
{ text: 'Koenigsegg CCR', id: 'list-05' },
{ text: 'McLaren F1', id: 'list-06' },
{ text: 'Aston Martin One- 77', id: 'list-07' },
{ text: 'Jaguar XJ220', id: 'list-08' },
{ text: 'McLaren P1', id: 'list-09' },
{ text: 'Ferrari LaFerrari', id: 'list-10' },
]
}
}
}
</script>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
  <div id="app">
    <div id='container' style="margin:10px auto 0; width:250px;">
        <ejs-listbox :dataSource='data' ></ejs-listbox>
    </div>
  </div>
</template>
<script setup>
import { ListBoxComponent as EjsListbox } from "@syncfusion/ej2-vue-
dropdowns";
const data = [
    { text: 'Hennessey Venom', id: 'list-01' },
    { text: 'Bugatti Chiron', id: 'list-02' },
    { text: 'Bugatti Veyron Super Sport', id: 'list-03' },
    { text: 'SSC Ultimate Aero', id: 'list-04' },
    { text: 'Koenigsegg CCR', id: 'list-05' },
    { text: 'McLaren F1', id: 'list-06' },
    { text: 'Aston Martin One- 77', id: 'list-07' },
    { text: 'Jaguar XJ220', id: 'list-08' },
    { text: 'McLaren P1', id: 'list-09' },
    { text: 'Ferrari LaFerrari', id: 'list-10' },
];
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-dropdowns/styles/material.css";
</style>
```

Copyright © 2001 -2024 Syncfusion Inc.

OPTIONS API (~/SRC/APP.VUE)

```
<template>
  <div id="app">
    <div id='container' style="margin:10px auto 0; width:250px;">
        <ejs-listbox :dataSource='data' ></ejs-listbox>
    </div>
  </div>
</template>
<script>
import { ListBoxComponent } from "@syncfusion/ej2-vue-dropdowns";
export default {
  components: {
    'ejs-listbox': ListBoxComponent
  },
  data (){
    return {
       data: [
    { text: 'Hennessey Venom', id: 'list-01' },
    { text: 'Bugatti Chiron', id: 'list-02' },
    { text: 'Bugatti Veyron Super Sport', id: 'list-03' },
    { text: 'SSC Ultimate Aero', id: 'list-04' },
    { text: 'Koenigsegg CCR', id: 'list-05' },
    { text: 'McLaren F1', id: 'list-06' },
    { text: 'Aston Martin One- 77', id: 'list-07' },
    { text: 'Jaguar XJ220', id: 'list-08' },
    { text: 'McLaren P1', id: 'list-09' },
    { text: 'Ferrari LaFerrari', id: 'list-10' },
]
    }
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-dropdowns/styles/material.css";
</style>
```

Run the project

To run the project, use the following command:

`bash

npm run serve

`

or

`bash

yarn run serve

`

Getting Started with the Vue ListBox Component in Vue 3

This article provides a step-by-step guide for setting up a Vite project with a JavaScript environment and integrating the Syncfusion Vue ListBox component using the Composition API / Options API.

The Composition API is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

The Options API is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

Prerequisites

System requirements for Syncfusion Vue UI components

Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using Vite. To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

`bash

npm create vite@latest

`

or

`bash

yarn create vite

`

Using one of the above commands will lead you to set up additional configurations for the project as below:

1.Define the project name: We can specify the name of the project directly. Let's specify the name of the project as my-project for this article.

`bash

? Project name: » my-project

`

2.Select Vue as the framework. It will create a Vue 3 project.

`bash

? Select a framework: » - Use arrow-keys. Return to submit.

Vanilla

Vue

React

Preact

Copyright © 2001 -2024 Syncfusion Inc.

Lit

Svelte

Others

`

3.Choose JavaScript as the framework variant to build this Vite project using JavaScript and Vue.

`bash

? Select a variant: » - Use arrow-keys. Return to submit.

JavaScript

TypeScript

Customize with create-vue ↗

Nuxt ↗

`

4.Upon completing the aforementioned steps to create the my-project, run the following command to install its dependencies:

`bash

cd my-project

npm install

`

or

`bash

cd my-project

yarn install

`

Now that my-project is ready to run with default settings, let's add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion Vue component packages are available at npmjs.com. To use Syncfusion Vue components in the project, install the corresponding npm package.

This article uses the Vue ListBox component as an example. To use the Vue ListBox component in the project, the @syncfusion/ej2-vue-dropdowns package needs to be installed using the following command:

`bash

npm install @syncfusion/ej2-vue-dropdowns --save

`

or

`bash

yarn add @syncfusion/ej2-vue-dropdowns

`

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the ListBox component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-dropdowns/styles/material.css";
</style>
```

The order of importing CSS styles should be in line with its dependency graph.

Add Syncfusion Vue component

Follow the below steps to add the Vue ListBox component using Composition API or Options API:

1.First, import and register the ListBox component and its child directives in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { ListBoxComponent as EjsListbox } from "@syncfusion/ej2-vue-
dropdowns";
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { ListBoxComponent } from "@syncfusion/ej2-vue-dropdowns";
//Component registration
export default {
name: "App",
components: {
"ejs-listbox": ListBoxComponent
}
}
</script>
```

2.In the template section, define the ListBox component with the dataSource property.

~/SRC/APP.VUE

Copyright © 2001 -2024 Syncfusion Inc.

```
<template>
<div class="control_wrapper">
<ejs-listbox :dataSource='data'></ejs-listbox>
</div>
</template>
```

3.Declare the values for the dataSource property in the script section.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
const data = [
{ text: 'Hennessey Venom', id: 'list-01' },
{ text: 'Bugatti Chiron', id: 'list-02' },
{ text: 'Bugatti Veyron Super Sport', id: 'list-03' },
{ text: 'SSC Ultimate Aero', id: 'list-04' },
{ text: 'Koenigsegg CCR', id: 'list-05' },
{ text: 'McLaren F1', id: 'list-06' },
{ text: 'Aston Martin One- 77', id: 'list-07' },
{ text: 'Jaguar XJ220', id: 'list-08' },
{ text: 'McLaren P1', id: 'list-09' },
{ text: 'Ferrari LaFerrari', id: 'list-10' }
]
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
data() {
return {
data:[
{ text: 'Hennessey Venom', id: 'list-01' },
{ text: 'Bugatti Chiron', id: 'list-02' },
{ text: 'Bugatti Veyron Super Sport', id: 'list-03' },
{ text: 'SSC Ultimate Aero', id: 'list-04' },
{ text: 'Koenigsegg CCR', id: 'list-05' },
{ text: 'McLaren F1', id: 'list-06' },
{ text: 'Aston Martin One- 77', id: 'list-07' },
{ text: 'Jaguar XJ220', id: 'list-08' },
{ text: 'McLaren P1', id: 'list-09' },
{ text: 'Ferrari LaFerrari', id: 'list-10' }
],
};
}
</script>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<div class="control_wrapper">
<ejs-listbox :dataSource='data'></ejs-listbox>
</div>
</template>
<script setup>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
import { ListBoxComponent as EjsListbox } from "@syncfusion/ej2-vue-
dropdowns";
const data = [
{ text: 'Hennessey Venom', id: 'list-01' },
{ text: 'Bugatti Chiron', id: 'list-02' },
{ text: 'Bugatti Veyron Super Sport', id: 'list-03' },
{ text: 'SSC Ultimate Aero', id: 'list-04' },
{ text: 'Koenigsegg CCR', id: 'list-05' },
{ text: 'McLaren F1', id: 'list-06' },
{ text: 'Aston Martin One- 77', id: 'list-07' },
{ text: 'Jaguar XJ220', id: 'list-08' },
{ text: 'McLaren P1', id: 'list-09' },
{ text: 'Ferrari LaFerrari', id: 'list-10' }
]
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-dropdowns/styles/material.css";
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<div class="control_wrapper">
<ejs-listbox :dataSource='data'></ejs-listbox>
</div>
</template>
<script>
import { ListBoxComponent } from "@syncfusion/ej2-vue-dropdowns";
// Component registration
export default {
name: "App",
// Declaring component and its directives
components: {
"ejs-listbox": ListBoxComponent
},
// Bound properties declarations
data() {
return {
data:[
{ text: 'Hennessey Venom', id: 'list-01' },
{ text: 'Bugatti Chiron', id: 'list-02' },
{ text: 'Bugatti Veyron Super Sport', id: 'list-03' },
{ text: 'SSC Ultimate Aero', id: 'list-04' },
{ text: 'Koenigsegg CCR', id: 'list-05' },
{ text: 'McLaren F1', id: 'list-06' },
{ text: 'Aston Martin One- 77', id: 'list-07' },
{ text: 'Jaguar XJ220', id: 'list-08' },
{ text: 'McLaren P1', id: 'list-09' },
{ text: 'Ferrari LaFerrari', id: 'list-10' }
],
};

Run the project

To run the project, use the following command:

`bash

npm run dev

`

or

`bash

yarn run dev

`

The output will appear as follows:

![vue-3-js-listbox](images/vue-3-js-listbox.PNG)

For migrating from Vue 2 to Vue 3, refer to the migration documentation.

Accessibility in Vue List box component

The List box component followed the accessibility guidelines and standards, including ADA, Section 508, WCAG 2.2 standards, and WCAG roles that are commonly used to evaluate accessibility.

The accessibility compliance for the List box component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| WCAG 2.2 Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Section 508 Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Screen Reader Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Right-To-Left Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Color Contrast | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

Copyright © 2001 -2024 Syncfusion Inc.

| Mobile Device Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Keyboard Navigation Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Accessibility Checker Validation | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Axe-core Accessibility Validation | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> - All features of the component meet the requirement.

<img src="https://cdn.syncfusion.com/content/images/landing-page/intermediate.png" alt="Intermediate"> - Some features of the component do not meet the requirement.

<img src="https://cdn.syncfusion.com/content/images/landing-page/no.png" alt="No"> - The component does not meet the requirement.

WAI-ARIA attributes

The List box component followed the WAI-ARIA patterns to meet the accessibility. The following ARIA attributes are used in the List box component:

| Attributes | Purpose |

| --- | --- |

| role | Indicates the List box component wrapper element as List box, the UL element as presentation, and its list item as option. |

| aria-label | Provides an accessible name for the List box component. |

| aria-multiselectable | Applied to the element with the List box role, tells assistive technologies that the list supports multiple selection. The default value is true. |

| aria-selected | Applied to elements with role option that are visually styled as selected to inform assistive technologies that the options are selected. |

Keyboard interaction

The List box component followed the keyboard interaction guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the List box component.

| **Press** | **To do this** |

| --- | --- |

| Up arrow | Moves focus to the previous option. |

| Down arrow | Moves focus to the next option. |

| Home | Moves focus to first option. |

| End | Moves focus to last option. |

| Space | Changes the selection state of the focused option. |

| Ctrl + A | Selects all options in the list. |

| Ctrl + Shift + Home | Selects the focused option and all options up to the first option. |

| Ctrl + Shift + End | Selects the focused option and all options down to the last option. |

| Ctrl + (Up or Down) | Press Ctrl key with up / down arrow or mouse to select multiple items. |

Ensuring accessibility

The List box component's accessibility levels are ensured through an accessibility-checker and axe-core software tools during automated testing.

The accessibility compliance of the List box component is shown in the following sample. Open the sample in a new window to evaluate the accessibility of the List box component with accessibility tools.

{% previewsample "page.domainurl/code-snippet/list-box/getting-started/getting-started-cs1" %}

Data binding in Vue List box component

The ListBox loads the data either from local data sources or remote data services using the dataSourceproperty. It supports the data type of `array` or `DataManager`.

| Fields | Type | Description |

|------|------|-------------|

| text | `string` | Specifies the display text of each list item. |

| value | `string` | Specifies the hidden data value mapped to each list item that should contain a unique value. |

| groupBy | `string` | Specifies the category under which the list item has to be grouped. |

| iconCss | `string` | Specifies the iconCss class that needs to be mapped. |

| htmlAttributes | `string` | Allows additional attributes to configure the elements in various ways to meet the criteria. |

When binding complex data to the ListBox, fields should be mapped correctly. Otherwise, the selected item remains undefined.

Local Data

Local data can be represented by the following ways as described below.

Copyright © 2001 -2024 Syncfusion Inc.

Array of string

The ListBox has support to load array of primitive data such as strings or numbers. Here, both value and text field acts as same.

APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:10px auto 0; width:250px;">
        <ejs-listbox :dataSource='data' ></ejs-listbox>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { ListBoxPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(ListBoxPlugin);
export default {
  data (){
    return {
       data: ["Hennessey Venom", "Bugatti Chiron", "Bugatti Veyron Super
Sport", "SSC Ultimate Aero", "Koenigsegg CCR", "McLaren F1", "Aston Martin
One- 77", "Jaguar XJ220", "McLaren P1", "Ferrari LaFerrari"];
    }
  }
}
</script>
<style>
@import
"https://ej2.syncfusion.com/vue/documentation/../node_modules/@syncfusion/ej
2-base/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/list-box/getting-started/getting-started-cs2" %}

Array of object

The ListBox can generate its list items through an array of object data. For this, the appropriate columns should be mapped to the fields property.

In the following example, id and sports column from complex data have been mapped to the value field and text field, respectively.

APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:10px auto 0; width:250px;">
        <ejs-listbox :dataSource='data' ></ejs-listbox>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
```

```
import { ListBoxPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(ListBoxPlugin);
export default {
  data (){
    return {
       data: [
            { id: 'game1', sports: 'Badminton' },
            { id: 'game2', sports: 'Cricket'},
            { id: 'game3', sports: 'Football'},
            { id: 'game4', sports: 'Golf'},
            { id: 'game5', sports: 'Tennis'},
            { id: 'game6', sports: 'Basket Ball'},
            { id: 'game7', sports: 'Base Ball'},
            { id: 'game8', sports: 'Hockey'},
            { id: 'game9', sports: 'Volley Ball'}
        ];
    fields:{ text:"sports" }
    }
  }
}
</script>
<style>
@import
"https://ej2.syncfusion.com/vue/documentation/../node_modules/@syncfusion/ej
2-base/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/list-box/getting-started/getting-started-cs3" %}

Array of complex object

The ListBox can generate its list items through an array of complex data. For this, the appropriate columns should be mapped to the fields property.

In the following example, Sports.Name column from complex data have been mapped to the text field.

APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:10px auto 0; width:250px;">
        <ejs-listbox :dataSource='data' :fields="fields" ></ejs-listbox>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { ListBoxPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(ListBoxPlugin);
export default {
  data (){
    return {
       data: [
    { Id: 'game1', Sports: { Name: 'Badminton'} },
```

```
    { Id: 'game2', Sports: { Name: 'Cricket'} },
    { Id: 'game3', Sports: { Name: 'Football'} },
    { Id: 'game4', Sports: { Name: 'Golf'} },
    { Id: 'game5', Sports: { Name: 'Tennis'} },
    { Id: 'game6', Sports: { Name: 'Basket Ball'} },
    { Id: 'game7', Sports: { Name: 'Base Ball'} },
    { Id: 'game8', Sports: { Name: 'Hockey'} },
    { Id: 'game9', Sports: { Name: 'Volley Ball'} }
];
fields:{ text:"Sports.Name" }
    }
  }
}
</script>
<style>
@import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/list-box/getting-started/getting-started-cs4" %}

Remote Data

The ListBox supports retrieval of data from remote data services with the help of DataManager component. The Query property is used to fetch data from the database and bind it to the ListBox.

The following sample displays the first 10 products from Products table of the Northwind Data Service.

APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:10px auto 0; width:250px;">
        <ejs-listbox :dataSource='data' :query="query" :fields="fields"
></ejs-listbox>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { ListBoxPlugin } from "@syncfusion/ej2-vue-dropdowns";
import { Query, DataManager, ODataV4Adaptor } from '@syncfusion/ej2-data';
Vue.use(ListBoxPlugin);
export default {
  data (){
    return {
    data : new DataManager({
        url: 'https://services.odata.org/V4/Northwind/Northwind.svc/',
        adaptor: new ODataV4Adaptor
      }),
      query : new
Query().from('Products').select('ProductID,ProductName').take(10),
      fields : { text: 'ProductName', value: 'ProductID' }
    }
  }
```

```
}
</script>
<style>
@import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/list-box/getting-started/getting-started-cs5" %}

Drag and drop in Vue List box component

The ListBox has support to drag an item or a group of selected items and drop it within the same list box or into another list box.

The elements can be customized on drag and drop by using the following events,

| Events | Description |

|------|------|

| dragStart | Triggers when the selected element is being dragged. |

| drag | Triggers when the selected element is being dragged. |

| drop | Triggers when the selected element is being dropped. |

Single listbox

To drag and drop an item or group of item within the list box can be achieved by setting allowDragAndDrop property as true.

The following sample illustrates how to drag and drop an item within the same list box by enabling allowDragAndDrop property.

APP.VUE

```
<template>
  <div id='container' style="margin:10px auto 0; width:250px;">
      <ejs-listbox :dataSource='data' :allowDragAndDrop="true"
:fields="fields"></ejs-listbox>
  </div>
</template>
<script>
import Vue from 'vue';
import { ListBoxPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(ListBoxPlugin);
export default {
  data (){
    return {
       data: [
    { "Name": "Australia", "Code": "AU" },
    { "Name": "Bermuda", "Code": "BM" },
    { "Name": "Canada", "Code": "CA" },
    { "Name": "Cameroon", "Code": "CM" },
    { "Name": "Denmark", "Code": "DK" },
    { "Name": "France", "Code": "FR" },
    { "Name": "Finland", "Code": "FI" },
```

Copyright © 2001 -2024 Syncfusion Inc.

```
    { "Name": "Germany", "Code": "DE" },
    { "Name": "Hong Kong", "Code": "HK" }
];
fields: { text: "Name" }
    }
  }
}
</script>
<style>
@import
"https://ej2.syncfusion.com/vue/documentation/../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-vue-dropdowns/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/list-box/getting-started/getting-started-cs6" %}

Multiple listbox

To drag and drop an item or group of item between two list boxes can be achieved by setting allowDragAndDrop property as true and scope property should be set to both the list boxes.

In the following sample, the allowDragAndDrop property is set as true and scope is set as combined-list to enable drop and drop in both list boxes.

APP.VUE

```
<template>
<div id='container' style="margin:10px auto 0; width:250px;">
  <div class="listbox1">
    <h4>Group A</h4>
      <ejs-listbox id="listbox1" :dataSource='groupA'
:allowDragAndDrop="true" :fields="fields" scope="combined-list"></ejs-listbox>
  </div>
  <div class="listbox2">
    <h4>Group B</h4>
      <ejs-listbox id="listbox2" :dataSource='groupB'
:allowDragAndDrop="true" :fields="fields" scope="combined-list"></ejs-listbox>
  </div>
</div>
</template>
<script>
import Vue from 'vue';
import { ListBoxPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(ListBoxPlugin);
export default {
  data (){
  return {
  groupA: [
    { "Name": "Australia", "Code": "AU" },
    { "Name": "Bermuda", "Code": "BM" },
    { "Name": "Canada", "Code": "CA" },
    { "Name": "Cameroon", "Code": "CM" },

Dual list box in Vue List box component

The dual list box allows the user to move items between two list boxes by clicking the toolbar buttons. Dual list box can be created by listing items in the toolbarSettings along with the scope property.

The following operations can be performed in dual list box,

| Options | Description |

|------|------------|

| moveUp | Move the selected item in the upward direction within the list box. |

| moveDown | Move the selected item in the downward direction within the list box. |

| moveTo | Move the selected item to the another list box. |

| moveFrom | Move the selected item from one list box to the another list box. |

| moveAllTo | Move all the items to the another list box. |

Copyright © 2001 -2024 Syncfusion Inc.

| moveAllFrom | Move all the items from one list box to the another list box. |

The following example illustrates how to move items from Group A to Group B list box.

APP.VUE

```
<template>
  <div id='container' style="margin:10px auto 0; width:430px;">
  <div class="listbox1">
    <h4>Group A</h4>
      <ejs-listbox :dataSource='groupA' :fields="fields" scope="#listbox"
:toolbarSettings="toolbarSettings"></ejs-listbox>
  </div>
  <div class="listbox2">
    <h4>Group B</h4>
      <ejs-listbox id="listbox" :dataSource='groupB' :fields="fields"
scope="combined-list"></ejs-listbox>
  </div>
</div>
</template>
<script>
import Vue from 'vue';
import { ListBoxPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(ListBoxPlugin);
export default {
  data (){
    return {
groupA: [
    { "Name": "Australia", "Code": "AU" },
    { "Name": "Bermuda", "Code": "BM" },
    { "Name": "Canada", "Code": "CA" },
    { "Name": "Cameroon", "Code": "CM" },
    { "Name": "Denmark", "Code": "DK" },
    { "Name": "France", "Code": "FR" },
    { "Name": "Finland", "Code": "FI" },
    { "Name": "Germany", "Code": "DE" },
    { "Name": "Hong Kong", "Code": "HK" }
];
groupB: [
    { "Name": "India", "Code": "IN" },
    { "Name": "Italy", "Code": "IT" },
    { "Name": "Japan", "Code": "JP" },
    { "Name": "Mexico", "Code": "MX" },
    { "Name": "Norway", "Code": "NO" },
    { "Name": "Poland", "Code": "PL" },
    { "Name": "Switzerland", "Code": "CH" },
    { "Name": "United Kingdom", "Code": "GB" },
    { "Name": "United States", "Code": "US" }
];
fields: { text: "Name" }
toolbarSettings: { items: ['moveUp', 'moveDown', 'moveTo', 'moveFrom',
'moveAllTo', 'moveAllFrom'] }
    }
  }
}
</script>
<style>
```

```

Icons and templates in Vue List box component

Icons

To place the icon on a list box, set the iconCss property to e-icons with the required icon CSS. By default, the icon is positioned to the left side of the list.

In the following sample, icon classes are mapped with iconCss field.

APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:10px auto 0; width:250px;">
        <ejs-listbox :dataSource='data' :fields="fields" ></ejs-listbox>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { ListBoxPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(ListBoxPlugin);
export default {
  data (){
    return {
       data: [
    { text: 'Account Settings', iconCss: 'e-list-icons e-list-user-settings'
},
    { text: 'Address Book', iconCss: 'e-list-icons e-list-address-book' },
    { text: 'Delete', iconCss: 'e-list-icons e-list-delete' },
    { text: 'Forward', iconCss: 'e-list-icons e-list-forward' },
    { text: 'Reply', iconCss: 'e-list-icons e-list-reply' },
    { text: 'Reply All', iconCss: 'e-list-icons e-list-reply-all' },
    { text: 'Save All Attachments', iconCss: 'e-list-icons e-list-save-all-
attachments' },
    { text: 'Save As', iconCss: 'e-list-icons e-list-icon-save-as' },
    { text: 'Touch/Mouse Mode', iconCss: 'e-list-icons e-list-touch' },
    { text: 'Undo', iconCss: ' e-list-icons e-list-undo' }
];
fields: { text: "text", iconCss: "iconCss" }
    }
  }
```

Templates

ListBox items can be customized according to the requirement using itemTemplate property.

In the following sample, the items in the cart are displayed using list box template,

APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:10px auto 0; width:250px;">
        <ejs-listbox :dataSource='data' :itemTemplate= "itemtemplate"
></ejs-listbox>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { ListBoxPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(ListBoxPlugin);
export default {
```

Selection in Vue List box component

The ListBox provides support to select an item or a group of item by mouse or keyboard action. There are two selection modes available in list box,

- Single - To select single item in the list box.
- Multiple - To select multiple items in the list box.

On selection of each list box item, change event is triggered.

Copyright © 2001 -2024 Syncfusion Inc.

Single selection

To enable single selection in the list box, mode should be set as Single in selectionSettings property.

APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:10px auto 0; width:250px;">
        <ejs-listbox :dataSource='data'
:selectionSettings="selectionSettings" ></ejs-listbox>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { ListBoxPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(ListBoxPlugin);
export default {
  data (){
    return {
       data: [
    { text: 'Hennessey Venom', id: 'list-01' },
    { text: 'Bugatti Chiron', id: 'list-02' },
    { text: 'Bugatti Veyron Super Sport', id: 'list-03' },
    { text: 'SSC Ultimate Aero', id: 'list-04' },
    { text: 'Koenigsegg CCR', id: 'list-05' },
    { text: 'McLaren F1', id: 'list-06' },
    { text: 'Aston Martin One- 77', id: 'list-07' },
    { text: 'Jaguar XJ220', id: 'list-08' },
    { text: 'McLaren P1', id: 'list-09' },
    { text: 'Ferrari LaFerrari', id: 'list-10' },
];
selectionSettings: { mode: "Single" }
    }
  }
}
</script>
<style>
@import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/list-box/getting-started/getting-started-cs17" %}

Multiple selection

To enable multiple selection in the list box, mode should be set as Multiple in selectionSettings property.

To select multiple items, use the SHIFT, CTRL, and arrow keys to make selections.

By default, the selection mode is set as Multiple.

Sorting and grouping in Vue List box component

Sorting

The ListBox supports sorting of available items in the alphabetical order that can be either ascending or descending. This can achieved using sortOrder property. Sort order can be `None`, `Ascending` or `Descending`.

In the following example, the `SortOrder` is set as `Descending`.

APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:10px auto 0; width:250px;">
        <ejs-listbox :dataSource='groupA' sortOrder="Descending"
:fields="fields" ></ejs-listbox>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { ListBoxPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(ListBoxPlugin);
export default {
  data (){
    return {
groupA: [
    { "Name": "Australia", "Code": "AU" },
    { "Name": "Bermuda", "Code": "BM" },
    { "Name": "Canada", "Code": "CA" },
    { "Name": "Cameroon", "Code": "CM" },
    { "Name": "Denmark", "Code": "DK" },
    { "Name": "France", "Code": "FR" },
    { "Name": "Finland", "Code": "FI" },
    { "Name": "Germany", "Code": "DE" },
    { "Name": "Hong Kong", "Code": "HK" }
];
fields: { text:"Name"}
    }
  }
}
</script>
<style>
@import
"https://ej2.syncfusion.com/vue/documentation/../node_modules/@syncfusion/ej
2-base/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/list-box/getting-started/getting-started-cs19" %}

Grouping

To get start quickly about how to Link to the Video the Vue ListBox items, you can check on this video:

The ListBox supports to wrap the nested element into a group based on its category. The category of each list item can be mapped with groupBy field in the data table.

In the following example, vegetables are grouped based on its category.

APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:10px auto 0; width:250px;">
        <ejs-listbox :dataSource='data' :fields="fields" ></ejs-listbox>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { ListBoxPlugin } from "@syncfusion/ej2-vue-dropdowns";
```

```
Vue.use(ListBoxPlugin);
export default {
  data (){
    return {
data: [
    { "Vegetable": "Cabbage", "Category": "Leafy and Salad", "Id": "item1"
},
    { "Vegetable": "Spinach", "Category": "Leafy and Salad", "Id": "item2"
},
    { "Vegetable": "Wheat grass", "Category": "Leafy and Salad", "Id":
"item3" },
    { "Vegetable": "Yarrow", "Category": "Leafy and Salad", "Id": "item4" },
    { "Vegetable": "Pumpkins", "Category": "Leafy and Salad", "Id": "item5"
},
    { "Vegetable": "Chickpea", "Category": "Beans", "Id": "item6" },
    { "Vegetable": "Green bean", "Category": "Beans", "Id": "item7" },
    { "Vegetable": "Horse gram", "Category": "Beans", "Id": "item8" },
    { "Vegetable": "Garlic", "Category": "Bulb and Stem", "Id": "item9" },
    { "Vegetable": "Nopal", "Category": "Bulb and Stem", "Id": "item10" },
    { "Vegetable": "Onion", "Category": "Bulb and Stem", "Id": "item11" }
];
fields: { groupBy:"Category", text:"Vegetable", value:"Id" }
    }
  }
}
</script>
<style>
@import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/list-box/getting-started/getting-started-cs20" %}

Style and appearance in Vue List box component

To modify the ListBox appearance, you need to override the default CSS of ListBox component. Please find the list of CSS classes and its corresponding section in ListBox component. Also, you have an option to create your own custom theme for the controls using our Theme Studio.

CSS Class | Purpose of Class

|.e-listbox-wrapper|To customize the listbox wrapper

|.e-list-parent .e-list-item|To customize the listbox list items

|.e-list-parent .e-list-item:hover|To customize the listbox list items on hover

|.e-list-parent .e-list-item.e-selected|To customize the listbox selected list item

|.e-listboxtool-wrapper .e-listbox-tool|To customize the listbox toolbar

|.e-listboxtool-wrapper .e-listbox-tool .e-btn|To customize the listbox toolbar button

|.e-listboxtool-wrapper .e-listbox-tool .e-btn .e-btn-icon.e-icons::before|To customize the listbox toolbar icon

Copyright © 2001 -2024 Syncfusion Inc.

Horizontal ListBox

You can use cssClass property to display the Listbox horizontally.

APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:10px auto 0; width:250px;">
        <ejs-listbox :dataSource='data' cssClass='e-horizontal-listbox'
></ejs-listbox>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { ListBoxPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(ListBoxPlugin);
export default {
  data (){
    return {
       data: [
    { text: 'Hennessey Venom', id: 'list-01' },
    { text: 'Bugatti Chiron', id: 'list-02' },
    { text: 'Bugatti Veyron Super Sport', id: 'list-03' },
    { text: 'SSC Ultimate Aero', id: 'list-04' },
    { text: 'Koenigsegg CCR', id: 'list-05' },
    { text: 'McLaren F1', id: 'list-06' },
    { text: 'Aston Martin One- 77', id: 'list-07' },
    { text: 'Jaguar XJ220', id: 'list-08' },
    { text: 'McLaren P1', id: 'list-09' },
    { text: 'Ferrari LaFerrari', id: 'list-10' },
];
    }
  }
}
</script>
<style>
@import "../../node_modules/@syncfusion/ej2-base/styles/material.css";

How To

Add items in Vue List box component

To add an item or multiple items, addItems method can be used. In the following example, the Bugatti Veyron Super Sport and SSC Ultimate Aero items will be added while clicking Add Items button.

APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:10px auto 0; width:250px;">
        <ejs-listbox id="listbox" :dataSource='data'  ></ejs-listbox>
        <button id="additem" class="e-btn" v-on:click="additem">Add
Items</button>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { ListBoxPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(ListBoxPlugin);
export default {
  data (){
    return {
       data: [
    { text: 'Hennessey Venom', id: 'list-01' },
    { text: 'Bugatti Chiron', id: 'list-02' },
    { text: 'Koenigsegg CCR', id: 'list-05' },
    { text: 'McLaren F1', id: 'list-06' },
    { text: 'Aston Martin One- 77', id: 'list-07' },
    { text: 'Jaguar XJ220', id: 'list-08' },
    { text: 'McLaren P1', id: 'list-09' },
    { text: 'Ferrari LaFerrari', id: 'list-10' },
];
    }
  },
  methods:{
    additem: function(e){
        var items = ["Bugatti Veyron Super Sport", "SSC Ultimate Aero"]
        var listboxobj =
document.getElementById("listbox").ej2_instances[0];
        if (!listboxobj.getDataByValue('Bugatti Veyron Super Sport')) {
        listboxobj.addItems([{ text: 'Bugatti Veyron Super Sport', id:
'list-03' }, { text: 'SSC Ultimate Aero', id: 'list-04' }]);
    }
  }
}
</script>
<style>
@import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/list-box/getting-started/getting-started-cs10" %}

Enable or disable items in Vue List box component

To enable or disable items in the list box, enableItems method can be used. In the following example, the Bugatti Veyron Super Sport and SSC Ultimate Aero items are disabled by default and by clicking Enable Items buttons, the disabled items will be enabled.

APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:10px auto 0; width:250px;">
        <ejs-listbox id="listbox" :dataSource='data' :created="onCreated"
></ejs-listbox>
        <button id="enableitem" class="e-btn" v-on:click="enableitem">Enable
Items</button>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { ListBoxPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(ListBoxPlugin);
export default {
  data (){
    return {
       data: [
    { text: 'Hennessey Venom', id: 'list-01' },
    { text: 'Bugatti Chiron', id: 'list-02' },
    { text: 'Bugatti Veyron Super Sport', id: 'list-03' },
    { text: 'SSC Ultimate Aero', id: 'list-04' },
    { text: 'Koenigsegg CCR', id: 'list-05' },
    { text: 'McLaren F1', id: 'list-06' },
    { text: 'Aston Martin One- 77', id: 'list-07' },
    { text: 'Jaguar XJ220', id: 'list-08' },
    { text: 'McLaren P1', id: 'list-09' },
    { text: 'Ferrari LaFerrari', id: 'list-10' },
];
    }
  },
  methods:{
  onCreated: function(e){
    var listboxobj= document.getElementById("listbox").ej2_instances[0];
    listboxobj.enableItems(["Bugatti Veyron Super Sport", "SSC Ultimate
Aero"],false)
}
  enableitem: function(e){
    var listboxobj1= document.getElementById("listbox").ej2_instances[0];
    listboxobj1.enableItems(["Bugatti Veyron Super Sport", "SSC Ultimate
Aero"],true)
  }
}
}
</script>
<style>
@import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-inputs/styles/material.css";

</style>
```

{% previewsample "page.domainurl/code-snippet/list-box/getting-started/getting-started-cs11" %}

Enable scroller in Vue List box component

The ListBox supports scrolling and it can be achieved by restricting the height of the list box using height property.

In the following sample, height of the list box is restricted to 290px.

APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:10px auto 0; width:250px;">
        <ejs-listbox :dataSource='data' height="290px" ></ejs-listbox>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { ListBoxPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(ListBoxPlugin);
export default {
  data (){
    return {
       data: [
    { text: 'Hennessey Venom', id: 'list-01' },
    { text: 'Bugatti Chiron', id: 'list-02' },
    { text: 'Bugatti Veyron Super Sport', id: 'list-03' },
    { text: 'SSC Ultimate Aero', id: 'list-04' },
    { text: 'Koenigsegg CCR', id: 'list-05' },
    { text: 'McLaren F1', id: 'list-06' },
    { text: 'Aston Martin One- 77', id: 'list-07' },
    { text: 'Jaguar XJ220', id: 'list-08' },
    { text: 'McLaren P1', id: 'list-09' },
    { text: 'Ferrari LaFerrari', id: 'list-10' },
];
    }
  }
}
</script>
<style>
@import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
</style>
```

ListView

Getting Started with the Vue Listview Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using Vue-CLI and integrating the Syncfusion Vue Listview component using the Composition API / Options API.

Prerequisites

System requirements for Syncfusion Vue UI components

Setting up the Vue 2 project

To generate a Vue 2 project using Vue-CLI, use the vue create command. Follow these steps to install Vue CLI and create a new project:

`bash

npm install -g @vue/cli

vue create quickstart

cd quickstart

npm run serve

`

or

`bash

yarn global add @vue/cli

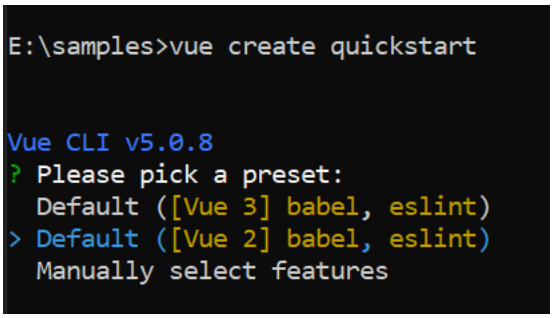
vue create quickstart

cd quickstart

yarn run serve

`

When creating a new project, choose the option Default ([Vue 2] babel, eslint) from the menu.



Once the quickstart project is set up with default settings, proceed to add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion packages are available at npmjs.com. To use Vue components, install the required npm package.

This article uses the Vue Listview component as an example. Install the @syncfusion/ej2-vue-lists package by running the following command:

`bash

npm install @syncfusion/ej2-vue-lists --save

`

or

`bash

yarn add @syncfusion/ej2-vue-lists

`

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

Copyright © 2001 -2024 Syncfusion Inc.

In this article, the Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the Listview component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-lists/styles/material.css";
</style>
```

Add Syncfusion Vue component

Follow the below steps to add the Vue Listview component using Composition API or Options API:

1\. First, import and register the Listview component in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { ListViewComponent as EjsListview } from '@syncfusion/ej2-vue-
lists';
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { ListViewComponent } from '@syncfusion/ej2-vue-lists';
export default {
components: {
'ejs-listview': ListViewComponent
}
}
</script>
```

2\. In the template section, define the Listview component with the dataSource property.

~/SRC/APP.VUE

```
<template>
<div id="app">
<ejs-listview id='flat-list' :dataSource='dataSource' width="330px"></ejs-
listview>
</div>
</template>
```

Bind data source

Populate the data in ListView by using the dataSource property. Here, an array of JSON values are passed to the ListView component as dataSource in data option inside the <script> section.

COMPOSITION API (~/SRC/APP.VUE)

Copyright © 2001 -2024 Syncfusion Inc.

```
<template>
<div id="app">
<ejs-listview id='flat-list' :dataSource='dataSource' width="330px"></ejs-
listview>
</div>
</template>
<script setup>
import { ListViewComponent as EjsListview } from '@syncfusion/ej2-vue-
lists';
const dataSource = [
{ text: 'Hennessey Venom', id: 'list-01' },
{ text: 'Bugatti Chiron', id: 'list-02' },
{ text: 'Bugatti Veyron Super Sport', id: 'list-03' },
{ text: 'SSC Ultimate Aero', id: 'list-04' },
{ text: 'Koenigsegg CCR', id: 'list-05' },
{ text: 'McLaren F1', id: 'list-06' },
{ text: 'Aston Martin One- 77', id: 'list-07' },
{ text: 'Jaguar XJ220', id: 'list-08' },
{ text: 'McLaren P1', id: 'list-09' },
{ text: 'Ferrari LaFerrari', id: 'list-10' },
];
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<div id="app">
<ejs-listview id='flat-list' :dataSource='dataSource' width="330px"></ejs-
listview>
</div>
</template>
<script>
import { ListViewComponent } from '@syncfusion/ej2-vue-lists';
export default {
components: {
'ejs-listview': ListViewComponent
},
name: 'app',
data () {
return {
dataSource : [
{ text: 'Hennessey Venom', id: 'list-01' },
{ text: 'Bugatti Chiron', id: 'list-02' },
{ text: 'Bugatti Veyron Super Sport', id: 'list-03' },
{ text: 'SSC Ultimate Aero', id: 'list-04' },
{ text: 'Koenigsegg CCR', id: 'list-05' },
{ text: 'McLaren F1', id: 'list-06' },
{ text: 'Aston Martin One- 77', id: 'list-07' },
{ text: 'Jaguar XJ220', id: 'list-08' },
{ text: 'McLaren P1', id: 'list-09' },
{ text: 'Ferrari LaFerrari', id: 'list-10' },
]
}
}
}
</script>
```

Copyright © 2001 -2024 Syncfusion Inc.

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSTION API (~/SRC/APP.VUE)

```
<template>
    <div id="app">
    <ejs-listview id='flat-list' :dataSource='dataSource'
width="330px"></ejs-listview>
  </div>
</template>
<script setup>
import { ListViewComponent as EjsListview } from '@syncfusion/ej2-vue-
lists';
const dataSource = [
        { text: 'Hennessey Venom', id: 'list-01' },
        { text: 'Bugatti Chiron', id: 'list-02' },
        { text: 'Bugatti Veyron Super Sport', id: 'list-03' },
        { text: 'SSC Ultimate Aero', id: 'list-04' },
        { text: 'Koenigsegg CCR', id: 'list-05' },
        { text: 'McLaren F1', id: 'list-06' },
        { text: 'Aston Martin One- 77', id: 'list-07' },
        { text: 'Jaguar XJ220', id: 'list-08' },
        { text: 'McLaren P1', id: 'list-09' },
        { text: 'Ferrari LaFerrari', id: 'list-10' },
      ];
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-lists/styles/material.css";
  #flat-list {
        border: 1px solid #dddddd;
        border-radius: 3px;
    }
  #app {
    color: #008cff;
    height: 40px;
    left: 30%;
    position: absolute;
  }
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
    <div id="app">
    <ejs-listview id='flat-list' :dataSource='dataSource'
width="330px"></ejs-listview>
  </div>
</template>
<script>
import { ListViewComponent } from '@syncfusion/ej2-vue-lists';
export default {
  components: {
    'ejs-listview': ListViewComponent
  },
  name: 'app',
```

Copyright © 2001 -2024 Syncfusion Inc.

```
    data () {
     return {
        dataSource : [
         { text: 'Hennessey Venom', id: 'list-01' },
         { text: 'Bugatti Chiron', id: 'list-02' },
         { text: 'Bugatti Veyron Super Sport', id: 'list-03' },
         { text: 'SSC Ultimate Aero', id: 'list-04' },
         { text: 'Koenigsegg CCR', id: 'list-05' },
         { text: 'McLaren F1', id: 'list-06' },
         { text: 'Aston Martin One- 77', id: 'list-07' },
         { text: 'Jaguar XJ220', id: 'list-08' },
         { text: 'McLaren P1', id: 'list-09' },
         { text: 'Ferrari LaFerrari', id: 'list-10' },
       ]
     }
   }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-vue-lists/styles/material.css";
  #flat-list {
        border: 1px solid #dddddd;
        border-radius: 3px;
    }
  #app {
    color: #008cff;
    height: 40px;
    left: 30%;
    position: absolute;
  }
</style>
```

Run the project

To run the project, use the following command:

`bash

npm run serve

`

or

`bash

yarn run serve

`

Getting Started with the Vue ListView Component in Vue 3

This article provides a step-by-step guide for setting up a Vite project with a JavaScript environment and integrating the Syncfusion Vue ListView component using the Composition API / Options API.

The Composition API is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

The Options API is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

Prerequisites

System requirements for Syncfusion Vue UI components

Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using Vite. To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

`bash

npm create vite@latest

`

or

`bash

yarn create vite

`

Using one of the above commands will lead you to set up additional configurations for the project as below:

1.Define the project name: We can specify the name of the project directly. Let's specify the name of the project as my-project for this article.

`bash

? Project name: » my-project

`

2.Select Vue as the framework. It will create a Vue 3 project.

`bash

? Select a framework: » - Use arrow-keys. Return to submit.

Vanilla

Vue

React

Preact

Lit

Copyright © 2001 -2024 Syncfusion Inc.

Svelte

Others

`

3.Choose JavaScript as the framework variant to build this Vite project using JavaScript and Vue.

`bash

? Select a variant: » - Use arrow-keys. Return to submit.

JavaScript

TypeScript

Customize with create-vue ↗

Nuxt ↗

`

4.Upon completing the aforementioned steps to create the my-project, run the following command to install its dependencies:

`bash

cd my-project

npm install

`

or

`bash

cd my-project

yarn install

`

Now that my-project is ready to run with default settings, let's add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion Vue component packages are available at npmjs.com. To use Syncfusion Vue components in the project, install the corresponding npm package.

This article uses the Vue ListView component as an example. To use the Vue ListView component in the project, the @syncfusion/ej2-vue-lists package needs to be installed using the following command:

`bash

npm install @syncfusion/ej2-vue-lists --save

`

or

`bash

yarn add @syncfusion/ej2-vue-lists

`

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the ListView component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-lists/styles/material.css";
</style>
```

Add Syncfusion Vue component

Follow the below steps to add the Vue ListView component using Composition API or Options API:

1.First, import and register the ListView component in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { ListViewComponent as EjsListview } from '@syncfusion/ej2-vue-
lists';
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { ListViewComponent } from '@syncfusion/ej2-vue-lists';
//Component registration
export default {
name: "App",
components: {
"ejs-listview": ListViewComponent
}
}
</script>
```

2.Add the component definition in template section.

~/SRC/APP.VUE

```
<template>
<ejs-listview id='sample-list-flat' :dataSource='data'
showCheckBox='true'></ejs-listview>
</template>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<ejs-listview id='sample-list-flat' :dataSource='data'
showCheckBox='true'></ejs-listview>
</template>
<script setup>
import { ListViewComponent as EjsListview } from '@syncfusion/ej2-vue-
lists';
const data = [
{ text: 'Hennessey Venom', id: 'list-01' },
{ text: 'Bugatti Chiron', id: 'list-02' },
{ text: 'Bugatti Veyron Super Sport', id: 'list-03' },
{ text: 'SSC Ultimate Aero', id: 'list-04' },
{ text: 'Koenigsegg CCR', id: 'list-05' },
{ text: 'McLaren F1', id: 'list-06' },
{ text: 'Aston Martin One- 77', id: 'list-07' },
{ text: 'Jaguar XJ220', id: 'list-08' },
{ text: 'McLaren P1', id: 'list-09' },
{ text: 'Ferrari LaFerrari', id: 'list-10' },
];
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-lists/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-buttons/styles/material.css";
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<ejs-listview id='sample-list-flat' :dataSource='data'
showCheckBox='true'></ejs-listview>
</template>
<script>
import { ListViewComponent } from '@syncfusion/ej2-vue-lists';
//Component registration
export default {
name: "App",
components: {
"ejs-listview": ListViewComponent
},
data() {
return {
data: [
{ text: 'Hennessey Venom', id: 'list-01' },
{ text: 'Bugatti Chiron', id: 'list-02' },
{ text: 'Bugatti Veyron Super Sport', id: 'list-03' },
{ text: 'SSC Ultimate Aero', id: 'list-04' },
{ text: 'Koenigsegg CCR', id: 'list-05' },
{ text: 'McLaren F1', id: 'list-06' },
{ text: 'Aston Martin One- 77', id: 'list-07' },
{ text: 'Jaguar XJ220', id: 'list-08' },
```

Copyright © 2001 -2024 Syncfusion Inc.

```
{ text: 'McLaren P1', id: 'list-09' },
{ text: 'Ferrari LaFerrari', id: 'list-10' },
],
};
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-lists/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-buttons/styles/material.css";
</style>
```

Run the project

To run the project, use the following command:

`bash

npm run dev

`

or

`bash

yarn run dev

`

The output will appear as follows:

Copyright © 2001 -2024 Syncfusion Inc.

For migrating from Vue 2 to Vue 3, refer to the migration documentation.

Data binding in Vue Listview component

ListView provides an option to load the data either from local dataSource or remote data services.

This can be done through the dataSource property that supports the data type of array or DataManager.

ListView supports different kind of data services such as OData, OData V4, and Web API, and

data formats like XML, JSON, and, JSONP with the help of DataManager Adaptors.

| Fields | Type | Description |

|------|------|-------------|

| id | string | Specifies ID attribute of list item, mapped in dataSource. |

Copyright © 2001 -2024 Syncfusion Inc.

| text | string | Specifies list item display text field. |

| isChecked | string | Specifies checked status of list item. |

| isVisible | string | Specifies visibility state of list item. |

| enabled | string | Specifies enabled state of list item. |

| iconCss | string | Specifies the icon class of each list item that will be added before to the list item text. |

| child | string | Specifies child dataSource fields. |

| tooltip | string | Specifies tooltip title text field. |

| groupBy | string | Specifies category of each list item. |

| sortBy | string | Specifies sorting field, that is used to sort the listview data. |

| htmlAttributes | string | Specifies list item html attributes field. |

When complex data bind to ListView, you should map the fields properly. Otherwise, the ListView properties remain as undefined or null.

Bind to local data

Local data can be represented in two ways, they are as follows:

- Array of simple data.
- Array of JSON data.

Array of simple data

ListView supports to load the array of primitive data like string and numbers. Here, both value and text field act as same.

APP.VUE

```
<template>
  <div class="control-section">
    <div id = 'flat-list'>
    <!-- ListView element -->
    <ejs-listview id='sample-list-flat' :dataSource='arts'></ejs-listview>
    </div>
  </div>
</template>
<style>
#sample-list-flat {
    border: 1px solid #dddddd;
    border-radius: 3px;
    margin: auto;
}
#flat-list {
    width: 50%;
    padding: 10px;
    margin: auto;
}
</style>
<script>
import Vue from "vue";
```

Copyright © 2001 -2024 Syncfusion Inc.

```
import { ListViewPlugin } from "@syncfusion/ej2-vue-lists";
Vue.use(ListViewPlugin);
export default {
  data: function() {
    return {
      arts: ["Artwork", "Abstract", "Modern Painting", "Ceramics",
"Animation Art", "Oil Painting"];
    };
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/listview/data-binding/simple-data-cs1" %}

Array of JSON data

ListView can generate its list items through an array of complex data. To get it work properly, you should map the appropriate columns to the field property.

In the following example, role column is mapped with the text field.

APP.VUE

```
<template>
  <div class="control-section">
    <div id = 'flat-list'>
    <!-- ListView element -->
    <ejs-listview id='sample-list-flat' :dataSource='settings'
:fields='fields' :headerTitle='headerTitle' showHeader='true'></ejs-
listview>
    </div>
  </div>
</template>
<style>
#sample-list-flat {
    border: 1px solid #dddddd;
    border-radius: 3px;
    margin: auto;
}
#flat-list {
    width: 50%;
    padding: 10px;
    margin: auto;
}
</style>
<script>
import Vue from "vue";
import { ListViewPlugin } from "@syncfusion/ej2-vue-lists";
Vue.use(ListViewPlugin);
export default {
  data: function() {
    return {
      settings: [
    {
        'Name': 'Display',
        'id': 'list-01'
    },
    {
```

Copyright © 2001 -2024 Syncfusion Inc.

```
        'Name': 'Notification',
        'id': 'list-02'
    },
    {
        'Name': 'Sound',
        'id': 'list-03'
    },
    {
        'Name': 'Apps',
        'id': 'list-04'
    },
    {
        'Name': 'Storage',
        'id': 'list-05'
    },
    {
        'Name': 'Battery',
        'id': 'list-06'
    }
],
fields: { text: 'Name', tooltip: 'Name', id:'id'},
    //set the header tittle for the list
    headerTitle: 'Device settings',
    };
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/listview/data-binding/array-data-cs1" %}

Bind to remote data

The ListView supports to retrieve the data from remote data services with the help of DataManager component.

The Query property allows to fetch data and return it to the ListView from the database.

In the following sample, first 10 Employees from the ListView table are displayed.

APP.VUE

```
<template>
  <div class="control-section">
  <div id="flat-list">
    <!-- ListView element -->
    <ejs-listview id='sample-list' :dataSource='data' :query='query'
:fields='fields' :headerTitle='headerTitle' showHeader='true'></ejs-
listview>
    </div>
</div>
</template>
<style>
#sample-list {
    border: 1px solid #dddddd;
    border-radius: 3px;
    margin: auto;
}
#flat-list {
```

Copyright © 2001 -2024 Syncfusion Inc.

```
    width: 50%;
    padding: 10px;
    margin: auto;
}
</style>
<script>
import Vue from "vue";
import { ListViewPlugin } from "@syncfusion/ej2-vue-lists";
Vue.use(ListViewPlugin);
import { DataManager, Query } from '@syncfusion/ej2-data';
export default {
  data: function() {
    return {
      data: new DataManager({
        url: 'https://services.syncfusion.com/js/production/api/',
        crossDomain: true
      }),
      query: new
Query().from("ListView").select("EmployeeID,FirstName").take(10),
      fields:  { id: "EmployeeID", text: "FirstName" },
      headerTitle: 'Employees',
    };
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/listview/data-binding/remote-data-cs1" %}

Grouping in Vue Listview component

The ListView supports to wrap the nested element into a group based on the category. The category of each list item can be mapped with groupBy field in the data table, that also supports single-level navigation.

In the following sample, The cars are grouped based on its category by using the groupBy field.

APP.VUE

```
<template>
  <div class="control-section">
     <div id = 'group-list'>
    <!-- Group ListView element -->
    <ejs-listview id='sample-list-group' :dataSource='cars'
:fields='fields'></ejs-listview>
    </div>
  </div>
</template>
<style>
#sample-list-group {
    border: 1px solid #dddddd;
    border-radius: 3px;
    margin: auto;
}
#group-list {
    width: 50%;
    padding: 10px;
    margin: auto;
```

Copyright © 2001 -2024 Syncfusion Inc.

```
}
</style>
<script>
import Vue from "vue";
import { ListViewPlugin } from "@syncfusion/ej2-vue-lists";
Vue.use(ListViewPlugin);
export default {
  data: function() {
    return {
      cars: [
    {
        'text': 'Audi A4',
        'id': '9bdb',
        'category': 'Audi'
    },
    {
        'text': 'Audi A5',
        'id': '4589',
        'category': 'Audi'
    },
    {
        'text': 'BMW 501',
        'id': 'f849',
        'category': 'BMW'
    },
    {
        'text': 'BMW 502',
        'id': '7aff',
        'category': 'BMW'
    }
],
fields: { groupBy: 'category', tooltip: 'text' }
    };
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/listview/grouping-cs1" %}

Customization

The grouping header can be customized by using the groupTemplate property for both inline and fixed group header. The complete customization description and explanation with an example is given in the following link.

Group Template.

Check list in Vue Listview component

The ListView supports checkbox in default and group-lists which is used to select multiple items. The checkbox can be enabled by the showCheckBoxproperty.

The Checkbox will be useful in the scenario where we need to select multiple options.For Example, In Shipping cart we can be able to select or unselect the desired items before checkout. It will be useful in selecting multiple items that belongs to same category using the group list.

```
<template>
  <div class="control-section">
    <div id = 'flat-list'>
    <!-- ListView element -->
    <ejs-listview id='sample-list-flat' :dataSource='data'
showCheckBox='true' headerTitle='To Do List' showHeader='true'></ejs-
listview>
    </div>
  </div>
</template>
<style>
#sample-list-flat {
    border: 1px solid #dddddd;
    border-radius: 3px;
    margin: auto;
}
#flat-list {
    max-width: 350px;
    padding: 10px;
    margin: auto;
}
</style>
<script>
import Vue from "vue";
import { ListViewPlugin } from "@syncfusion/ej2-vue-lists";
Vue.use(ListViewPlugin);
export default {
  data: function() {
    return {
      data: [
        {text: 'Do Meditation', id: '1'},
        {text: 'Go Jogging', id: '2'},
        {text: 'Buy Groceries', id: '3'},
        {text: 'Pay Phone bill', id: '4'},
        {text: 'Play Football with your friends', id: '5'},
    ],
    };
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/listview/checklist-cs1" %}

Checkbox Position

In ListView the checkbox can be positioned into either Left or Right side of the list-item text. This can be achieved by checkBoxPositon property. By default, checkbox will be positioned to Left of list-item text.

APP.VUE

```
<template>
  <div class="control-section">
    <div id = 'flat-list'>
    <!-- ListView element -->
    <ejs-listview id='sample-list-flat' :dataSource='data'
showCheckBox='true' checkBoxPosition='Right'></ejs-listview>
    </div>
```

```
  </div>
</template>
<style>
#sample-list-flat {
    border: 1px solid #dddddd;
    border-radius: 3px;
    margin: auto;
}
#flat-list {
    width: 50%;
    padding: 10px;
    margin: auto;
}
</style>
<script>
import Vue from "vue";
import { ListViewPlugin } from "@syncfusion/ej2-vue-lists";
Vue.use(ListViewPlugin);
export default {
  data: function() {
    return {
      data: [
        { text: 'Hennessey Venom', id: 'list-01' },
        { text: 'Bugatti Chiron', id: 'list-02' },
        { text: 'Bugatti Veyron Super Sport', id: 'list-03' },
        { text: 'SSC Ultimate Aero', id: 'list-04' },
        { text: 'Koenigsegg CCR', id: 'list-05' },
        { text: 'McLaren F1', id: 'list-06' },
        { text: 'Aston Martin One- 77', id: 'list-07' },
        { text: 'Jaguar XJ220', id: 'list-08' },
        { text: 'McLaren P1', id: 'list-09' },
        { text: 'Ferrari LaFerrari', id: 'list-10' },
      ],
    };
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/listview/checklist-cs2" %}

Nested list in Vue Listview component

The ListView component supports Nested list. For that, the child property should be defined for the nested list in the array of JSON.

APP.VUE

```
<template>
  <div class="control-section">
    <!-- ListView element -->
    <ejs-listview id='listview' :dataSource='continent' :fields='fields'
:headerTitle='headerTitle' showHeader='true'></ejs-listview>
</div>
</template>
<style>
#listview {
    max-width: 400px;
```

Copyright © 2001 -2024 Syncfusion Inc.

```
    margin: auto;
    border: 1px solid #dddddd;
    border-radius: 3px;
}
</style>
<script>
import Vue from "vue";
import { ListViewPlugin } from "@syncfusion/ej2-vue-lists";
Vue.use(ListViewPlugin);
export default {
  data: function() {
    return {
    continent: [
    {
        'text': 'Asia',
        'id': '01',
        'category': 'Continent',
        'child': [{
            'text': 'India',
            'id': '1',
            'category': 'Asia',
            'child': [{
                'text': 'Delhi',
                'id': '1001',
                'category': 'India',
            },
            {
                'text': 'Kashmir',
                'id': '1002',
                'category': 'India',
            },
            {
                'text': 'Goa',
                'id': '1003',
                'category': 'India',
            },
            ]
        },
        {
            'text': 'China',
            'id': '2',
            'category': 'Asia',
            'child': [{
                'text': 'Zhejiang',
                'id': '2001',
                'category': 'China',
            },
            {
                'text': 'Hunan',
                'id': '2002',
                'category': 'China',
            },
            {
                'text': 'Shandong',
                'id': '2003',
                'category': 'China',
            }]
```

```
        }]
    },
    {
        'text': 'North America',
        'id': '02',
        'category': 'Continent',
        'child': [{
            'text': 'USA',
            'id': '3',
            'category': 'North America',
            'child': [{
                'text': 'California',
                'id': '3001',
                'category': 'USA',

{% previewsample "page.domainurl/code-snippet/listview/nested-list-cs1" %}

Customizing templates in Vue Listview component

The ListView component is designed to customize each list items and group title.

Header template

The ListView header can be customized with the help of headerTemplate property.

To customize header template in your application, set your customized template string to headerTemplate property along with showHeader property as true to display the ListView header.

`ts

let listviewInstance: ListView = new ListView({

data: listData,

headerTemplate: ' Header ',

showHeader: true

})

`

In the below example, we have rendered Listview with customized header which contains search, add and sort buttons.

APP.VUE

```
<template>
  <div class="control-section">
    <div id = 'flat-list'>
    <!-- ListView element -->
    <ejs-listview id='element' :dataSource='data' :headerTemplate='template'
showHeader='true'></ejs-listview>
    </div>
  </div>
</template>
<style>
#element {
    display: block;
```

```
    max-width: 353px;
    margin: auto;
    border: 1px solid #dddddd;
    border-radius: 3px;
}
#element .e-list-header {
    padding: 0;
}
#element .headerContainer {
    width: 350px;
    height: 48px;
    line-height: 48px;
    background: rgb(2, 120, 215);
    color: white;
    margin-bottom: 3px;
}
.headerContainer .fruitHeader {
    margin-left: 20px;
    font-weight: 500;
    font-size: 22px;
}
.headerContainer #add,
.headerContainer #sort,
.headerContainer #search {
    float: right;
    margin-right: 15px;
    margin-top: 7px;
    background: white;
    color: black
}
.headerContainer .e-search-icon::before {
    content: '\e961';
    color: lightslategray;
}
.headerContainer .e-add-icon::before {
    content: '\e823';
}
.headerContainer .e-sort-icon::before {
    content: '\e840';
}
</style>
<script>
import Vue from "vue";
import { ListViewPlugin } from "@syncfusion/ej2-vue-lists";
import { ButtonPlugin } from '@syncfusion/ej2-vue-buttons';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(ListViewPlugin);
Vue.use(ButtonPlugin);
var demoVue = Vue.component("demo", {
  template: `<div class="headerContainer"><span
class="fruitHeader">Fruits</span><ejs-button id="search" iconCss='e-icons e-
search-icon' cssClass='e-small e-round' isPrimary='true'></ejs-button><ejs-
button id="add" iconCss='e-icons e-add-icon' cssClass='e-small e-round'
isPrimary='true'></ejs-button><ejs-button id="sort" iconCss='e-icons e-sort-
icon' cssClass='e-small e-round' isPrimary='true'></ejs-button></div>`,
  data() {
```

```
    return {
      data: {}
    };
  }
});
export default {
  data: function() {
    return {
      data: [
    { text: 'Date', id: '1', imgUrl: './dates.jpg' },
    { text: 'Fig', id: '2', imgUrl: './fig.jpg' },
    { text: 'Apple', id: '3', imgUrl: './apple.png' },
    { text: 'Apricot', id: '4', imgUrl: './apricot.jpg' },
    { text: 'Grape', id: '5', imgUrl: './grape.jpg' },
    { text: 'Strawberry', id: '6', imgUrl: './strawberry.jpg' },
    { text: 'Pineapple', id: '7', imgUrl: './pineapple.jpg' },
    { text: 'Melon', id: '8', imgUrl: './melon.jpg' },
    { text: 'Lemon', id: '9', imgUrl: './lemon.jpg' },
    { text: 'Cherry', id: '10', imgUrl: './cherry.jpg' },
    ],
    template: function () {
                return { template : demoVue}
            }
    };
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/listview/templates/customizing-templates-cs1" %}

Template

The ListView items can be customized with the help of template property.

To customize list items in your application, set your customized template string to template property.

`ts

var demoVue = Vue.component("demo", {

template: `

${text} `,

data() {

return {

data: {}

};

}

});

`

We provided the following built-in CSS classes to customize the list-items. Refer to the following table.

| CSS class | Description |

| ---------- |----------|

| e-list-template, e-list-wrapper | These classes are used to differentiate normal and template rendering, which are mandatory for template rendering. The e-list-template class should be added to the root of the ListView element and e-list-wrapper class should be added to the template element wrapper

 <ejs-listview :cssClass="e-list-template" :template="template"></ejs-listview>
 template: ' '

| e-list-content | This class is used to align list content and it should be added to the content element

 template: ' ' +
 'ListItem' +
 ' '|

| e-list-avatar | This class is used for avatar customization. It should be added to the template element wrapper. After adding it, we can customize our element with Avatar classes

 template: ' ' +
 'MR' +
 'ListItem' +
 ' '|

| e-list-avatar-right | This class is used to align avatar to right side of the list item. It should be added to the template element wrapper. After adding it, we can customize our element with Avatar classes

 template: ' ' +
 'ListItem' +
 'MR' +
 ' '|

| e-list-badge | This class is used for badge customization .It should be added to the template element wrapper. After adding it, we can customize our element with Badge classes

 template: ' '
'ListItem'
'MR'
' '|

| e-list-multi-line | This class is used for multi-line customization. It should be added to the template element wrapper. After adding it, we can customize List item's header and description

template: ' ' +
'ListItem' +
' '|

| e-list-item-header |This class is used to align a list header and it should be added to the header element along with the multi-line class

 template: ' ' +
'ListItem Header' +
'ListItem' +
' '|

In the following example, we have customized list items like Contact app with our avatar component.

APP.VUE

```
{%  raw %}
<template>
<div class="control-section">
<div id = 'flat-list'>
<!-- ListView element -->
<ejs-listview id='List' :dataSource='data' headerTitle='Contacts'
showHeader='true' cssClass='e-list-template' :template='template'
sortOrder='Ascending' width='350px'></ejs-listview>
</div>
</div>
```

pic: ""
}
],
fields: {text: 'text'},
template: function () {
return { template : demoVue};
}
};
},
}
</script>
{% endraw %}
```

{% previewsample "page.domainurl/code-snippet/listview/templates/customizing-templates-cs2" %}

Group template

The ListView group header can be customized with the help of groupTemplate property.

To customize the group template in your application, set your customized template string to groupTemplate property.

`ts

var tempVue = Vue.component("demo", {

template: ${items[0].category} ,

data() {

return {

data: {}

};

}

});

`

Copyright © 2001 -2024 Syncfusion Inc.

In the below example, we have grouped Listview based on the category. The category of each list item should be mapped with groupBy field of the data. We have alsodisplayed grouped list items count in the group list header.

APP.VUE

```
{%  raw %}
<template>
<div class="control-section">
<div id = 'flat-list'>
<!-- ListView element -->
<ejs-listview id='List' ref='list' :dataSource='data' :fields='fields'
:template="demoTemplate" :groupTemplate="groupTemplate" cssClass='e-list-
template' width='350px'>
</ejs-listview>
</div>
</div>
</template>
<style>
#List {
display: block;
margin: auto;
border: 1px solid;
border-color: #ccc;
border-color: rgba(0, 0, 0, 0.12);
width: 60%;
}
#List .settings {
height: auto;
}
#List .e-list-item {
height: auto;
padding: 0;
cursor: pointer;
box-sizing: border-box;
}
#List .e-list-header .e-text {
font-family: sans-serif;
font-size: 18px;
line-height: 26px;
}
</style>
<script>
import Vue from "vue";
import { ListViewPlugin } from "@syncfusion/ej2-vue-lists";
Vue.use(ListViewPlugin);
var demoVue = Vue.component("demo", {
template:
`<div class="e-list-wrapper e-list-multi-line e-list-avatar">
<img class="e-avatar e-avatar-circle" :src='data.image'
style="background:#BCBCBC" />
<span class="e-list-item-header">{{data.Name}}</span>
<span class="e-list-content">{{data.contact}}</span>
</div>`,
data() {
return {
data: {}
```

```
};
}
});
var tempVue = Vue.component("demo", {
template:
`<div>
<span class="category">{{data.items[0].category}}</span>
<span class="count"> {{data.items.length}} Item(s)</span>
</div>`,
data() {
return {
data: {}
};
}
});
export default {
data: function() {

Virtualization in Vue Listview component

UI virtualization loads only viewable list items in a view port, which will improve the ListView performance while loading a large number of data.

Module injection

In order to use UI Virtualization, `virtualization` module should be injected into the provide section and use `listview` as a key of the object.

```ts
export default {
data: function() {
return {
listData: listData,
enableUi: true
};
},
provide: {
listview: [Virtualization]
}
}
```

Getting started

UI virtualization can be enabled in the ListView by setting the enableVirtualization property to true.

It has two types of scrollers as follows:

Window scroll: This scroller is used in the ListView by default.

Container scroll: This scroller is used, when the height property of the ListView is set.

APP.VUE

```
<template>
  <div class="control-section">
     <ejs-listview id='ui-list' :dataSource='listData'
:enableVirtualization='enableUi' >
    </ejs-listview>
  </div>
</template>
<style>
#app {
    color: #008cff;
    height: 40px;
```

Copyright © 2001 -2024 Syncfusion Inc.

```
    left: 30%;
    position: absolute;
}
#ui-list {
  display: block;
  max-width: 400px;
  margin: auto;
  border-radius: 3px;
  cursor: pointer;
}
</style>
<script>
import Vue from "vue";
import { ListViewPlugin, Virtualization } from "@syncfusion/ej2-vue-lists";
Vue.use(ListViewPlugin);
let listData = [];
export default {
  beforeCreate: function() {
    listData = [
      { text: "Nancy", id: "0" },
      { text: "Andrew", id: "1" },
      { text: "Janet", id: "2" },
      { text: "Margaret", id: "3" },
      { text: "Steven", id: "4" },
      { text: "Laura", id: "5" },
      { text: "Robert", id: "6" },
      { text: "Michael", id: "7" },
      { text: "Albert", id: "8" },
      { text: "Nolan", id: "9" }
    ];
    for (let i = 10; i <= 1000; i++) {
      let index = parseInt((Math.random() * 10).toString());
      listData.push({ text: listData[index].text, id: i.toString() });
    }
  },
  data: function() {
    return {
      listData: listData,
      enableUi: true
    };
  },
  provide: {
    listview: [Virtualization]
  }
};
</script>
```

{% previewsample "page.domainurl/code-snippet/listview/virtualization/flat-list-cs1" %}

Template

We can use template property to customize list items in UI virtualization.

APP.VUE

```
<template>
  <div class="control-section">
```

```
    <ejs-listview id='ui-list' ref="list" :dataSource='listData'
:showHeader='header' :fields='fields' :headerTitle='title'
        :height='height' :cssClass='cssClass'
:enableVirtualization='enableUi' :template="'gTemplate'">
            <template v-slot:gTemplate="{ data }">
                <div class="e-list-wrapper e-list-avatar" >
                    <span :class="['e-avatar e-avatar-circle ' + data.icon +
' showUI']" v-if="data.imgUrl == undefined">{{ data.icon }}</span>
                    <span :class="['e-avatar e-avatar-circle ' + data.icon +
' hideUI']" v-if="data.imgUrl !== undefined">{{ data.icon }}</span>
                    <img :class="['e-avatar e-avatar-circle showUI']"
:src="data.imgUrl" v-if="data.imgUrl !== undefined" />
                    <img :class="['e-avatar e-avatar-circle hideUI']"
:src="data.imgUrl" v-if="data.imgUrl == undefined" />
                    <span class="e-list-content">{{ data.name }}</span>
                </div>
            </template>
        </ejs-listview>
  </div>
</template>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-lists/styles/material.css";
#app {
    color: #008cff;
    height: 40px;
    left: 30%;
    position: absolute;
}
#ui-list.e-listview {
        margin: auto;
        max-width: 325px;
        line-height: initial;
        border: 1px solid lightgray;
    }
    /* ListView header alignment */
    #ui-list.e-listview .e-list-header {
        height: 50px
    }
    #ui-list.e-listview .e-list-header .e-text {
        line-height: 18px
    }
    /* ListView template customization */
    #ui-list.e-listview .showUI {
        display: flex;
        align-items: center;
        justify-content: center;
        border-radius: 50%;

Conditional rendering

The following conditional rendering support is provided for the template and groupTemplate.

| Name | Syntax |

| --- | --- | --- |

| conditional class | |

| conditional attribute | |

| conditional text content | ${ $id % 2 === 0 ? 'even-list' : 'odd-list'} |

In the following sample, the light blue is applied for the even list and light coral is applied for the odd list based on the conditional class.

APP.VUE

```
<template>
  <div class="control-section">
     <ejs-listview id='ui-list' :dataSource='listData'
:enableVirtualization='enableUi'  :template='gTemplate' :height='height' >
    </ejs-listview>
  </div>
</template>
<style>
#app {
    color: #008cff;
    height: 40px;
    left: 30%;
    position: absolute;
}
#ui-list {
    display: block;
    max-width: 400px;
    margin: auto;
    border: 1px solid #dddddd;
    border-radius: 3px;
    cursor: pointer;
}
#list-container{
    height: inherit;

Scrolling in Vue Listview component

Scrolling is a technique that allows you to load more items as the user scrolls through a list, providing a seamless and dynamic user experience.

Copyright © 2001 -2024 Syncfusion Inc.

Render the ListView with dataSource, and bind the scroll event. Within the scroll event, you can access information such as the scroll direction, event name and the distance from the scrollbar to the top and bottom ends through the distanceY parameter.

In the given example, new data is seamlessly added while scrolling. When you scrolls to the bottom and the distance scrolled is less than 100 pixels, it dynamically loads a batch of items into the list as long as there are more items to render.

APP.VUE

```
<template>
  <div class="control-section">
    <div class="grid-container"><div><h3>Chat</h3>
    <!-- ListView element -->
    <ejs-listview id='List' ref='list' :dataSource='visibleData'
cssClass='e-list-template' :template='template' width='400px' height='320px'
:scroll="onListScrolled"></ejs-listview>
    </div>
    </div>
  </div>
</template>
<style>
.grid-container {
    display: grid;

Accessibility in Vue Listview component

The ListView component followed the accessibility guidelines and standards, including ADA, Section 508, WCAG 2.2 standards, and WCAG roles that are commonly used to evaluate accessibility.

The accessibility compliance for the ListView component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

Copyright © 2001 -2024 Syncfusion Inc.

| WCAG 2.2 Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/intermediate.png" alt="Intermediate"> |

| Section 508 Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/intermediate.png" alt="Intermediate"> |

| Screen Reader Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Right-To-Left Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Color Contrast | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Mobile Device Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Keyboard Navigation Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Accessibility Checker Validation | <img src="https://cdn.syncfusion.com/content/images/landing-page/intermediate.png" alt="Intermediate"> |

| Axe-core Accessibility Validation | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> - All features of the component meet the requirement.

<img src="https://cdn.syncfusion.com/content/images/landing-page/intermediate.png" alt="Intermediate"> - Some features of the component do not meet the requirement.

<img src="https://cdn.syncfusion.com/content/images/landing-page/no.png" alt="No"> - The component does not meet the requirement.

WAI-ARIA attributes

The ListView component followed the WAI-ARIA patterns to meet the accessibility. The following ARIA attributes are used in the ListView component:

| Attributes | Purpose |

| --- | --- |

| `role=list` | Specifies the non selectable list container. |

| `role=listitem`| Specifies the role of each item in a selectable ListView and its containment within the list. |

| role=presentation | Specifies the role of non selectable list element. |

| role=checkbox | Indicates checkbox control along with listitem element. |

| aria-checked | Indicates the current checked state of checkbox. |

| aria-label | Provides an accessible name for the ListView Checkbox. |

| aria-disabled | Indicates element is perceivable but disabled. |

Keyboard interaction

The ListView component followed the keyboard interaction guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the ListView component.

| Keyboard shortcuts | Actions |

|------------|-------------------|

| Arrow Up | Move to the previous list item |

| Arrow Down | Move to the next list item |

| Space | Check and uncheck the targeted list from the whole list |

| BackSpace | Get back to the previous lists if it is nested list |

| Home | Moves focus to first list item |

| End | Moves focus to last list item |

Ensuring accessibility

The ListView component's accessibility levels are ensured through an accessibility-checker and axe-core software tools during automated testing.

The accessibility compliance of the ListView component is shown in the following sample. Open the sample in a new window to evaluate the accessibility of the ListView component with accessibility tools.

Style in Vue Listview component

The following content provides the exact CSS structure that can be used to modify the control’s appearance based on user preference.

Customizing ListView

Use the following CSS to customize the ListView.

`css

.e-listview {

border: 5px solid rgb(173, 255, 47);

}

Copyright © 2001 -2024 Syncfusion Inc.

`

Customizing the list items

Use the following CSS to customize the items of ListView.

`css

.e-listview .e-list-item {

text-align: center;

color: pink;

background-color: #2fa1ff;

}

`

Customizing ListView's header

Use the following CSS to customize the header of ListView control.

`css

.e-listview .e-list-header{

color: #2fa1ff;

justify-content: center;

}

`

Customizing group header of ListView

Use the following CSS to customize the category of the group items.

`css

.e-listview .e-list-group-item {

color: rgb(173, 255, 47);

background-color: maroon;

text-align: end;

}

`

Customizing the hover state of ListView control

Use the following CSS to customize the list item when hovering.

Customizing ListView hover state with the checkbox checked

`css

.e-listview .e-list-item.e-hover.e-active.e-checklist {

color: rgb(83, 5, 79);

background-color: rgb(173, 255, 47);

Copyright © 2001 -2024 Syncfusion Inc.

}
`

Customizing ListView hover state
`css
.e-listview .e-list-item.e-hover {
color:red;
background-color: rgb(173, 255, 47);
}
`

Customizing selected item of ListView control

Use the following CSS to customize the selected list item.

Customizing ListView's selected item with the checkbox checked
`css
.e-listview .e-list-item.e-checklist.e-focused.e-active {
color: rgb(83, 5, 79);
background-color: rgb(0, 15, 100);
}
`

Customizing ListView's selected item
`css
.e-listview .e-list-item.e-focused {
color: #2fa1ff;
background-color: rgb(0, 15, 100);
}
`

How To

Get selected items from listview in Vue Listview component

Single or many items can be selected by users in the ListView component. An API is used to get selected items from the list items. This is called as the getSelectedItems method.

getSelectedItems method

This is used to get the details of the currently selected item from the list items. It returns the SelectedItem | SelectedCollection

The getSelectedItems method returns the following items from the selected list items.

Return type	Purpose

| text | Returns the text of selected item lists |

| data | Returns the whole data of selected list items, i.e., returns the fields data of selected li.|

| item | Returns the collections of list items |

Use dynamic templates in listview based on device in Vue Listview component

The Syncfusion Essential JS2 components are desktop and mobile-friendly. So, you can use Syncfusion components in both modes. The component templates are not always fixed. Applications may need to load various templates depending upon the device.

Integration

In the ListView component, template support is being used. In some cases, the component wrapper is always responsive across all devices, but the template contents are dynamically changed with unspecified (sample side) dimensions. CSS customization is also needed in sample-side to align template content responsively in both mobile and desktop modes. Here, two templates have been loaded for mobile and desktop modes. To check the device mode, a browser module has been imported from the ej2-base package.

APP.VUE

```
<template>
  <div class="control-section">
    <div id = 'flat-list'>
    <!-- ListView element -->
    <ejs-listview id='List' ref='list' :dataSource='data' :fields='fields'
:template="templatecheck ? mobtemplate : wintemplate"
headerTitle='Syncfusion Blog' showHeader='true'>
    </ejs-listview>
    </div>
  </div>
</template>
<style>
@import './template.css';
</style>
<script>
import Vue from "vue";
import { ListViewPlugin } from "@syncfusion/ej2-vue-lists";
import { Browser } from '@syncfusion/ej2-base';
Vue.use(ListViewPlugin);
var demoVue = Vue.component("demo", {
  template: `<div class="settings">
        <div id="postContainer">
            <div id="postImg">
                <img :src='data.image' /></div>
```

```
            <div id="content">
                <div id="info">
                    <div id="logo">
                        <div id="share">
                            <span class="share"></span> </div>
                        <div id="comments"> <span class="comments"></span>
</div>
                        <div id="bookmark"> <span class="bookmark"></span>
</div>
                    </div>

Create dual list from listview in Vue Listview component

The dual list contains two ListView. This allows you to move list items from one list to another using the client-side

events. This section explains how to integrate the ListView component to achieve dual list.

Use cases

- Stock exchanges of two different countries
- Job applications (skill sets)

Integration of Dual List

Here, two ListView components have been used to display the list items. An ej2-button is used to transfer data between the ListView, and a textbox is used to achieve the UI of filtering support.

The dual list supports:

- Moving whole data from one list to another.
- Moving selected data from one list to another.
- Filtering the list by using a client-side typed character.

Copyright © 2001 -2024 Syncfusion Inc.

In the ListView component, sorting is enabled using the sortOrder property, and the select event is triggered while selecting an item. Here, the select event is triggered to enable and disable button states.

Manipulating data

Moving whole data from the first list to the second list(>>)

- Here, the whole data can be moved from the first ListView to the second by clicking the first button. When clicking the button, the whole list items are sliced, and concat with the second ListView. This button is enabled only when the data source of the first ListView is not empty.

Moving whole data from the second list to the first list(<<)

- The functionality of the second button is the same as above, and data is transferred from the second list to the first list. This button is enabled only when the data source of the second ListView is not empty.

Moving selected item from one list to another list (>) and (<)

- The Select event is triggered when selecting a list item in the ListView. The selected items can be transferred between two lists. These buttons will be enabled when selecting an item in lists.

Filtering method

- The filtering method is used to filter list items when typing a character in the text box. In this method, the dataManager has been used to fetch data from the data source and display in ListView.

Sorting

- By using the dual list, list items can be sorted in the ListView component using the sortOrder property. You can enable sorting in one ListView; in the same order, data can be transferred to another ListView.

Load list items in child list dynamically in Vue Listview component

To load list items in child list dynamically, push the new list item data into the existing dataSource using the select event.

Refer to the following steps to load list item into the child list:

1. Initially, render the ListView with the required data source.
2. Bind the select event that triggers selecting list item in the ListView component. By using the select event, you can push the new list item to the child list of the data source on specifying its item index. Item index can be obtained from the SelectEventArgs of the select event.

Customize listview with dynamic tags in Vue Listview component

You can customize the ListView items using the template property. Here, the dynamic tags are added and removed in the list item from another ListView. Refer to the following steps to achieve this.

*Initialize dynamic ListView with required property that holds the tags of parent ListView, and bind the select event (triggers when the list item is selected), in which you can get and add the selected item value as tags into parent ListView. Refer to the following code sample.

`ts

//Select the event that is is rendered inside dialog for ListView

addTag: function(e) {

let listTag = document.createElement('span');

listTag.className = 'advanced-option';

let labelElem = document.createElement('span');

labelElem.className = 'label';

let deleteElem = document.createElement('span');

deleteElem.className = 'delete';

deleteElem.onclick = this.removeTag;

labelElem.innerHTML = e.target.textContent;

Copyright © 2001 -2024 Syncfusion Inc.

```
listTag.appendChild(labelElem);
listTag.appendChild(deleteElem);
let tag = document.createElement('span');
tag.className = 'advanced-option-list';
tag.appendChild(listTag);
this.$refs.listviewInstance.$el.ej2_instances[0].element.querySelector('.e-active').appendChild(tag);
}
`
```

- Render the dialog component with empty content and append the created dynamic ListView object to the dialog on created event.
- Bind the click event for button icon (+) to update the ListView data source with tags, and open the dialog with this dynamic ListView. Refer to the following code sample.

```ts
//Method to hide/show the dialog and update the ListView data source
renderDialog: function(id){
if (document.getElementsByClassName('e-popup-open').length !== 0) {
this.$refs.dialogInstance.hide();
}
else {
this.listObj = document.getElementById('dialog').querySelector("#list").ej2_instances[0];
this.listObj.dataSource = this.datasource[id];
this.listObj.dataBind();
this.$refs.dialogInstance.position = { X: document.querySelector('.e-add-icon').getBoundingClientRect().left + 50, Y: document.querySelector('.e-add-icon').getBoundingClientRect().top - 5 };
this.$refs.dialogInstance.show();
}
}
`
```

- Bind the click event with added dynamic tags to remove it. Refer to the following code sample.

```ts
//Method to remove the list item
removeTag() {
```

this.$refs.listviewInstance.$el.ej2_instances[0].selectedLI.children[1].remove();

}

`

Show items count in group header in Vue Listview component

The ListView component supports wrapping list items into a group based on the category. The category of each list item can be mapped with groupBy field of the data source. You can display grouped list items count in the list-header using the group header template. Refer to the following code sample to display grouped list item count.

APP.VUE

```
<template>
  <div class="control-section">
    <div id = 'flat-list'>
    <!-- ListView element -->
    <ejs-listview id='List' ref='list' :dataSource='data' :fields='fields'
:template="demotemplate" :groupTemplate="grouptemplate" >
    </ejs-listview>
    </div>
  </div>
</template>
<style>
  .count{
    float:right;
  }
  #List {
      display: block;
      margin: auto;
      border: 1px solid;
      border-color: #ccc;
      border-color: rgba(0, 0, 0, 0.12);
      width: 60%;
  }
  #List .settings {
      height: auto;
  }
  #List .e-list-item {
      height: auto;
      padding: 0;
      cursor: pointer;
      box-sizing: border-box;
      border: 0.1px solid #ccc;
  }
  #List .e-list-header .e-text {
      font-family: sans-serif;
      font-size: 18px;
      line-height: 26px;
  }
  #List #content {
    margin: 3px;
  }
  #List .name {
      font-size: 12px;
      line-height: 25px;
  }
  #info {
    line-height: 20px;
    font-size: 12px;
  }
  #postImg {
     margin: 9px;
 }
  #postContainer {
  width: inherit;
  margin: auto;
  display: inline-flex;
}
</style>
```

Filter list items in the listview in Vue Listview component

The filtered data can be displayed in the ListView component depending upon on user inputs using the DataManager. Refer to the following steps to render the ListView with filtered data.

- Render a textbox to get input for filtering data.
- Render ListView with dataSource, and set the sortOrder property.
- Bind the keyup event for textbox to perform filtering operation. To filter list data, pass the list data source to the DataManager, manipulate the data using the executeLocal method, and then update filtered data as ListView dataSource.

APP.VUE

```
<template>
  <div class="control-section">
    <div id = 'sample'>
      <input class="e-input" type="text" id='textbox' ref='textboxEle'
placeholder="Filter" title="Type in a name" @keyup='onkeyup' />
      <!-- ListView element -->
      <ejs-listview id='list' ref='listObj' :dataSource='data'
:fields='fields' sortOrder='Ascending'>
      </ejs-listview>
    </div>
  </div>
</template>
<style>
#list {
  box-shadow: 0 1px 4px #ddd;
  border-bottom: 1px solid #ddd;
}
#sample {
  height: 220px;
  margin: 0 auto;
  display: table;
}
</style>
<script>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
import Vue from "vue";
import { ListViewPlugin } from "@syncfusion/ej2-vue-lists";
import { DataManager, Query, ODataV4Adaptor } from "@syncfusion/ej2-data";
Vue.use(ListViewPlugin);
export default {
  data: function() {
    return {
      data: [
        { text: "Hennessey Venom", id: "list-01" },
        { text: "Bugatti Chiron", id: "list-02" },
        { text: "Bugatti Veyron Super Sport", id: "list-03" },
        { text: "SSC Ultimate Aero", id: "list-04" },
        { text: "Koenigsegg CCR", id: "list-05" },
        { text: "McLaren F1", id: "list-06" }],
      fields: { text: "text", id: "id" },
    };
  },
  methods:{
   onkeyup: function(event){
      let keyupvalue = this.$refs.textboxEle.value;
      let data = new DataManager(this.data).executeLocal(new
Query().where("text", "startswith", keyupvalue, true));
      if (!keyupvalue) {
        this.$refs.listObj.dataSource = this.data.slice();
      } else {
        this.$refs.listObj.dataSource = data;
      }
    }
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/listview/checklist-cs4" %}

In this demo, data has been filtered with starting character of the list items. You can also filter list items with ending character by passing the endswith in where clause instead of startswith.

Add and remove list items from listview in Vue Listview component

You can add or remove list items from the ListView component using the addItem and removeItem methods.

Refer to the following steps to add or remove a list item.

- Render the ListView with data source, and use the template property to append the delete icon for each list item. Also, bind the click event for the delete icon using the actionComplete handler.
- Render the Add Item button, and bind the click event. On the click event handler, pass data with random id to the addItem method to add a new list item on clicking the Add Item button.
- Bind the click handler to the delete icon created in step 1. Within the click event, remove the list item by passing the delete icon list item to removeItem method.

APP.VUE

```
<template>
```

```
  <div class="control-section">
    <div id = 'flat-list'>
    <!-- ListView element -->
    <ejs-listview id='sample-list-flat' ref='list' :dataSource='data'
:fields='fields' :template='datatemplate' :actionComplete='onComplete' >
    </ejs-listview>
    </div>
   <ejs-button id="btn" v-on:click.native="onClick">Add Item</ejs-button>
  </div>

```

{% previewsample "page.domainurl/code-snippet/listview/add-item-cs1" %}

Trace all events in listview in Vue Listview component

The ListView component triggers events based on its actions. The events can be used as extension points to perform custom operations. Refer to the following steps to trace the ListView events:

1. Render the ListView with dataSource, and bind the actionBegin, actionComplete, and select events.
2. Perform custom operations in actionBegin, actionComplete, and select events.
3. Provide event log details for actionBegin and actionComplete events, and they will be displayed in the event trace panel when the ListView action starts and the dataSource bound successfully.
4. Get the selected item details from the SelectEventArgs in the select event, and display the selected list item text in the event trace panel while selecting list items.
5. Use clear button to remove event trace information.

APP.VUE

```
<template>
  <div id="sample">
    <div class="content-wrapper">
    <!-- ListView element -->
      <ejs-listview id='listview-def' ref='listviewInstance'
:dataSource='data' width=250 :actionBegin='onBegin'
:actionComplete='onComplete' :select='onSelect'>
      </ejs-listview>
    </div>
    <div id="list_event">
      <h4><b>Event Trace</b></h4>
      <div id="evt">
        <div class="eventarea" style="height:273px;overflow: auto">

Create mobile contact layout from listview in Vue Listview component

You can customize the ListView using the template property. Refer to the following steps to customize ListView as mobile contact view with our ej2-avatar.

- Render the ListView with dataSource that has avatar data. You can set avatar data as either text or class names. Refer to the following codes.

`ts

dataSource: [

{

text: "Jenifer", contact: "(206) 555-985774", id: "1", avatar: "", pic: "pic01"

},

{

text: "Amenda", contact: "(206) 555-3412", id: "2", avatar: "A", pic: ""

}

];

`

- Set avatar classes in ListView template to customize contact icon. In the following codes, medium size avatar has been set using the class name e-avatar e-avatar-circle from data source.

Copyright © 2001 -2024 Syncfusion Inc.

`ts

<span :class="['e-avatar e-avatar-small e-avatar-circle']" v-if="data.avatar !== ''">{{data.avatar}}

<span :class="[data.pic + ' e-avatar e-avatar-small e-avatar-circle']" v-if="data.pic !== '' ">

{{data.text}}

`

Avatars can be set in different sizes in avatar classes. To know more about avatar classes, refer to Avatar.

- Sort the contact names using the sortOder property of ListView.
- Enable the showHeader property, and set the headerTitle as Contacts.

APP.VUE

```
<template>
    <div id="sample">
       <ejs-listview id='List' :dataSource='data' :fields='fields'
:template='template' width="350px" showHeader='true' headerTitle='Contacts'
sortOrder='Ascending'></ejs-listview>
    </div>
</template>
<style>
#List {
  margin: 0 auto;
  border: 1px solid #ccc;
}
#List .e-list-item {
  height: 60px;
  cursor: pointer;
}
#List .e-list-header .e-text {
  font-family: sans-serif;
  font-size: 18px;
  line-height: 16px;
}
#List #content {
  margin: 0;
}
#List .e-list-header{
  background: rgb(2, 120, 215);
  color: white;
}
#List #info,
#List .name {
  font-size: 14px;
  margin: 0 60px;
  line-height: 20px;
}
#List .name {
```

```
  padding-top: 8px;
  font-weight: 500;
}
.pic01 {
  background-image:

Display spinner until list items are loaded in Vue Listview component

The features of the ListView component such as remote data-binding take more time to fetch data from corresponding dataSource/remote URL. In this case, you can use EJ2 Spinner to enhance the appearance of the UI. This section explains how to load a spinner component to groom the appearance.

Refer to the following code sample to render the spinner component.

`ts

createSpinner({

target: this.spinnerEle.nativeElement

});

showSpinner(this.spinnerEle.nativeElement);

`

Here, the data is fetched from Northwind Service URL; it takes a few seconds to load the data. To enhance the UI, the spinner component has been rendered initially. After the data is loaded from remote URL, the spinner component will be hidden in ListView actionComplete event.

APP.VUE

```
<template>
 <div class="control-section">
    <div id="flat-list">
    <!-- ListView element -->
    <ejs-listview id='sample-list' :dataSource='data' :query='query'
:fields='fields' :headerTitle='headerTitle' showHeader='true'
:actionComplete='onComplete'></ejs-listview>
    </div>
    <div ref='spinnerEle' id="spinner" ></div>
  </div>
</template>
<style>
#sample-list {
    border: 1px solid #dddddd;
    border-radius: 3px;
    margin: auto;
}
#flat-list {
    width: 50%;
    padding: 10px;
    margin: auto;
}
</style>
<script>
import Vue from "vue";
import { ListViewPlugin } from "@syncfusion/ej2-vue-lists";
```

```
import { DataManager, Query } from '@syncfusion/ej2-data';
import { createSpinner, showSpinner, setSpinner } from '@syncfusion/ej2-vue-
popups';
Vue.use(ListViewPlugin);
export default {
  data: function() {
    return {
      data: new DataManager({
        url: 'https://services.syncfusion.com/js/production/api/',
        crossDomain: true
      }),
      query: new
Query().from("ListView").select("EmployeeID,FirstName").take(10),
      fields:  { id: "EmployeeID", text: "FirstName" },
      headerTitle: 'Employees',
    };
  },
  mounted: function(){
     createSpinner({ target: this.$refs.spinnerEle });
    showSpinner(this.$refs.spinnerEle);
  },
  methods: {
    onComplete: function(){
      this.$refs.spinnerEle.style.display = "none";
    }
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/listview/data-binding/remote-data-cs3" %}

Hide checkbox in listview in Vue Listview component

The checkbox of the any list item can be hidden by using[htmlAttributes](https://ej2.syncfusion.com/vue/documentation/api/list-view/#h tmlattributes) of fields object. With the help of htmlAttributes we can add unique class to each list item that will be rendered from the data source, from the CSS class we can hide the checkbox of the list item.

In this sample, we had hidden the multiple leaf node of nested list. The e-checkbox-hidden class has been added in the data source where the checkbox needs to be hidden. Refer the below snippet for simple data source.

`ts

{

'text': 'New York',

'id': '3002',

'category': 'USA',

'htmlAttributes': { 'class': 'e-file e-checkbox-hidden' }

}

`

Copyright © 2001 -2024 Syncfusion Inc.

Even though we have hidden the checkbox the functionality will be same for the list item which might affect the getSelectedItems method. So, to counteract that we will follow certain logic in the select event. The Logic here is to remove the e-active class from the other checkbox hidden list item which will be added when we select on that item and retain e-active on currently selected item.

In this process we will exclude the visible checkbox list items and only consider the hidden checkbox items.

APP.VUE

```
<template>
  <div class="control-section">
    <div id = 'flat-list'>
      <!-- ListView element -->
       <ejs-listview id='folderCheckbox' ref='listviewInstance'
:dataSource='data' :fields='fields' sortOrder='Ascending' showHeader=true
headerTitle='Mixed Leaf Checkbox Hidden List' showCheckBox=true
:select='onSelect'>
       </ejs-listview>
    </div>
  </div>
</template>
<style>
  #folderCheckbox {
    border: 1px solid #dddddd;
    border-radius: 3px;
    margin: 5px;
    width: 400px;
  }
  #folderCheckbox .e-checkbox-hidden .e-checkbox-wrapper {
    visibility: hidden;
  }
</style>

Manipulate listview as grid layout in Vue Listview component

In Listview, list items can be rendered in grid layout with following data manipulations.

- Add Item
- Remove Item
- Sort Items
- Filter Items

Grid Layout

In this section, we will discuss about rendering of list items in grid layout.

- Initialize and render ListView with dataSource which will render list items in list layout.
- Now, add the below CSS to list item. This will make list items to render in grid layout

`

element .e-list-item {
height: 100px;

width: 100px;

float: left;

}

`

In the below sample, we have rendered List items in grid layout.

APP.VUE

```
<template>
  <div id="sample">
    <ejs-listview id='element' :dataSource='data' :template='listTemplate'>
    </ejs-listview>
  </div>
</template>
<style>
#element {
    display: block;
    max-width: 303px;
    margin: auto;
    border: 1px solid #dddddd;
    border-radius: 3px;
}
#element .e-list-item {
    height: 100px;
    width: 100px;
    float: left;
    padding: 0;
}
#listImage {
    width: 55px;
    height: 55px;
    margin-left: 20px;
    margin-top: 20px;
}
</style>
<script>
import Vue from "vue";
import { ListViewPlugin } from "@syncfusion/ej2-vue-lists";
Vue.use(ListViewPlugin);
var listVue = Vue.component("demo", {
  template: `<img id="listImage"
src="https://ej2.syncfusion.com/documentation/code-snippet/listview/grid-
layout-cs1/apple.png" alt="apple" />`,
  data() {
    return {
      data: {}
    };
  }
});
export default {
```

```
  data: function() {
          return {
    data: [1, 2, 3, 4, 5, 6, 7, 8, 9],
    listTemplate: function () {
      return { template : listVue}
    },
  };
}
}
</script>
```

{% previewsample "page.domainurl/code-snippet/listview/grid-layout-cs1" %}

Data manipulation

In this section, we will discuss about ListView data manipulations.

Add Item

We can add list item using addItem API. This will accept array of data as argument.

`ts

this.$refs.listViewInstance.addItem([{text: 'Apricot', id: '32'}]);

`

In the below sample, you can add new fruit item by clicking add button which will open dialog box with fruit name and image URL text box. After entering the item details, click the add button. This will add your new fruit item.

Remove item

We can remove list item using removeItem API. This will accept fields with id or list item element as argument.

`ts

this.$refs.listViewInstance.removeItem({id: '32'});

`

In the below sample, you can remove fruit by hovering the fruit item which will show delete button and click that delete button to delete that fruit from your list.

Sort Items

Listview can be sorted either in Ascending or Descending order. To enable sorting in your ListView, set sortOrder as Ascending or Descending.

`ts

<ejs-listview sortOrder='Ascending'></ejs-listview>

`

We can also set sorting after component initialization.

`ts

this.$refs.listViewInstance.sortOrder = 'Ascending'

`

Copyright © 2001 -2024 Syncfusion Inc.

In the below sample, we have sorted fruits in Ascending order. To sort it in descending, click on sort order icon and vice versa.

Filter Items

Listview data can be filtered with the help of dataManager. After filtering the data, update ListView dataSource with filtered data.

`ts

let value = this.$refs.textboxEle.value; //input text box value

let filteredData = new DataManager(this.listdata).executeLocal(

new Query().where("text", "startswith", value, true)

);

listViewInstance.dataSource = filteredData;

`

In the below sample, we can filter fruit items with the help of search text box. This will filter fruit items based on your input. Here we used startswith of input text to filter data in DataManager.

APP.VUE

```
<template>
    <div id="sample">
        <div class="headerContainer">
            <div class="e-input-group">
                <input id="search" ref='searchEle' class="e-input"
type="text" placeholder="Search fruits" @keyup='onKeyUp'/>
                <span class="e-input-group-icon e-input-search"></span>
            </div>

Drag and drop list items in Vue Listview component

In ListView component, we don't have drag and drop support. But we can achieve this requirement using TreeView component with ListView appearance.

Drag and Drop in TreeView component was enabled by setting allowDragAndDrop to true.

`ts

<ejs-treeview id='element' :fields='fields' allowDragAndDrop='true'></ejs-treeview>

`

The TreeView component is used to represent hierarchical data in a tree like structure. So, list items in TreeView can be dropped to child of target element. we can prevent this behaviour by cancelling the nodeDragStop and nodeDragging events.

`ts

<ejs-treeview id='element' :fields='fields' allowDragAndDrop='true' :nodeDragging='onDragStop' :nodeDragStop='onDragStop'></ejs-treeview>

fields: { dataSource: data, id: 'id', text: 'text' },

onDragStop: function(args) {

//Block the Child Drop operation in TreeView

let draggingItem = document.getElementsByClassName("e-drop-in");

if (draggingItem.length == 1) {

draggingItem[0].classList.add('e-no-drop');

args.cancel = true;

}

}

`

In the below sample, we have rendered draggable list items.

APP.VUE

```
<template>
   <div id="sample">
    <ejs-treeview id='element' :fields='fields' allowDragAndDrop='true'
:nodeDragging='onDragStop' :nodeDragStop='onDragStop'></ejs-treeview>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
    </div>
</template>
<style>
#sample {
    display: block;
    max-width: 280px;
    margin: auto;
    border: 1px solid #dddddd;
    border-radius: 3px;
}
#element.e-treeview .e-ul {
    padding: 0;
}
#element.e-treeview .e-list-item {
    padding: 0 16px;
}
#element.e-treeview .e-text-content {
    padding: 0;
}
#element.e-treeview .e-fullrow {
    height: 36px;
}
#element.e-treeview .e-list-text {
    line-height: 34px;
}
#element.e-treeview .e-list-item:last-child {
    margin-bottom: 9px;
}
#element.e-treeview .e-list-item:first-child {
    margin-top: 9px;
}
</style>
<script>
import Vue from "vue";
import { TreeViewPlugin } from "@syncfusion/ej2-vue-navigations";
Vue.use(TreeViewPlugin);
export default {
  data: function() {
         var  data =[

Load html content via ajax in Vue Listview component

We can set external HTML page content as template for our ListView component by making use of AJAX call.

`ts

let ajax = new Ajax('./template.html', 'GET', false);

ajax.onSuccess = (e)=>{

this.template = e;

}

ajax.send();

`

In the below sample, we have rendered smartphone settings template from external HTML file.

APP.VUE

```
<template>
   <div id="sample">
    <ejs-listview id='element' :dataSource='data' headerTitle='Settings'
showHeader='true' :template='template'>
    </ejs-listview>
  </div>
</template>
<style>
  #element {
    display: block;
    max-width: 300px;
    margin: auto;
    border: 1px solid #dddddd;
    border-radius: 3px;
}
#element .e-list-header {
    background: rgb(2, 120, 215);
    color: white;
    font-size: 19px;
    font-weight: 500;
}
#element.e-listview .e-list-item {
    padding: 10px 16px;
    height: 61px;
```

```
}
#element .e-list-item-header {
    font-size: 15px;
    font-weight: 500;
    line-height: 20px;
    height: 20px;
}
#element .e-list-content {
    line-height: 20px;
    height: 20px;
    font-size: 10px;
    font-style: italic;
    margin-top: -2px;
}
</style>
<script>
import Vue from "vue";
import { ListViewPlugin } from "@syncfusion/ej2-vue-lists";
import { Ajax } from '@syncfusion/ej2-base';
Vue.use(ListViewPlugin);
export default {
  data: function() {
    return {
      data: [
    { name: 'Network & Internet', id: '0', description: 'Wi-Fi, mobile, data
usage, hotspot' },
    { name: 'Connected devices', id: '1', description: 'Bluetooth, cast,
NFC' },
    { name: 'Battery', id: '2', description: '18% -4h 12m left' },
    { name: 'Display', id: '3', description: 'Wallpaper, sleep, font size'
},
    { name: 'Sound', id: '4', description: 'Volume, vibration, Do Not
Disturb' },
    { name: 'Storage', id: '5', description: '52% used - 15.48 GB free' }
],
    template:{}
    };
  },
  created: function() {
    let ajax = new Ajax('./template.html', 'GET', false);
    ajax.onSuccess = (e)=>{
    this.template = e;
    };
    ajax.send();
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/listview/ajax-cs1" %}

Render listview with hyper link navigation in Vue Listview component

We can use anchor tag along with href attribute in our ListView template property for navigation.

`ts

var listVue = Vue.component("demo", {

template: {{data.name}},

data() {

return {

data: {}

};

}

});

`

In the below sample, we have rendered ListView with search engines URL.

APP.VUE

```
<template>
   <div id="sample">
    <ejs-listview id='List' :dataSource='data' headerTitle='Search engines'
showHeader='true' :template='anchortemplate'>
    </ejs-listview>
  </div>
</template>
<style>
 #List {
        max-width: 300px;
        margin: auto;
        border: 1px solid #dddddd;
        border-radius: 3px;
    }
    #List a {
      text-decoration: none;
    }
    #List .e-list-header {
        background: rgb(2, 120, 215);
        color: white;
        font-size: 19px;
        font-weight: 500;
    }
</style>
<script>
import Vue from "vue";
import { ListViewPlugin } from "@syncfusion/ej2-vue-lists";
Vue.use(ListViewPlugin);
var listVue = Vue.component("demo", {
  template: `<a target='_blank' v-bind:href='data.url'>{{data.name}}</a>`,
  data() {
    return {
      data: {}
    };
  }
});
export default {
  data: function() {
       return {
```

```
      data: [
        {name: 'Google', url: 'https://www.google.com'},
        {name: 'Bing', url: 'https://www.bing.com' },
        {name: 'Yahoo', url: 'https://www.yahoo.com'},
        {name: 'Ask.com', url: 'https://www.ask.com'},
        {name: 'AOL.com', url: 'https://www.aol.com'},
    ],
    anchortemplate: function () {
        return { template : listVue};
    },
    };
  },
}
</script>
```

{% previewsample "page.domainurl/code-snippet/listview/checklist-cs8" %}

Customize listview as chat window in Vue Listview component

ListView can be customized as chat window. To achieve that, use the ListView template property and Avatar component.

- The Listview template property is used to showcase the ListView as chat window.
- Avatar component is used to design the image of contact person.

Refer the below template code snippet for Template of chat window.

`ts

var demoVue = Vue.component("demo", {

template: `

{{data.text}}

{{data.contact}}

{{data.avatar}}

<span :class="[data.pic + ' img1 e-avatar e-avatar-circle']">

<div class='settings' v-else>

{{data.avatar}}

<span :class="[data.pic +' img2 e-avatar e-avatar-circle']">

{{data.text}}

{{data.contact}}

`,

data() {

return {

data: {}

};

}

});

`

Chat order in template

In ListView template, we have rendered the list items based on receiver and sender information from dataSource of listview.

Adding messages to chat window

- Use textbox to get message from user.
- Add the textbox message to ListView dataSource using addItem method.

`ts

btnClick: function() {

let value = this.$refs.textbox.value;

this.$refs.listObj.addItem([{ text: "Amenda", contact: value, id: "2", avatar: "A", pic: "", chat: "receiver" }]);

this.$refs.textbox.value = "";

}

`

APP.VUE

```
<template>
   <div class="control-section">
    <!-- ListView element -->
    <ejs-listview id='List' ref='listObj' :dataSource='data'
:headerTitle='headerTitle' :template='Template' :showHeader='true'
:fields='fields' :width='width'></ejs-listview>
  <div style="width: 350px;margin: 0 auto;"><input id="name" ref="textbox"
style="width: 275px" class="e-input" type="text" placeholder="Type your
message"/>
    <ejs-button id="btn" style="float:right" v-
on:click.native="btnClick">Send</ejs-button></div>
  </div>
</template>
```

Maps

Getting Started with the Vue Maps Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using Vue-CLILink to the Video and integrating the Syncfusion Vue Maps component

You can explore some useful features in the Maps component using the following video.

Prerequisites

System requirements for Syncfusion Vue UI components

Dependencies

Below is the list of minimum dependencies required to use the Maps.

`javascript

|-- @syncfusion/ej2-vue-maps

|-- @syncfusion/ej2-base

|-- @syncfusion/ej2-data

|-- @syncfusion/ej2-buttons

|-- @syncfusion/ej2-popups

|-- @syncfusion/ej2-splitbuttons

|-- @syncfusion/ej2-vue-base

|-- @syncfusion/ej2-svg-base

|-- @syncfusion/ej2-maps

`

Copyright © 2001 -2024 Syncfusion Inc.

Setting up the Vue 2 project

To generate a Vue 2 project using Vue-CLI, use the vue create command. Follow these steps to install Vue CLI and create a new project:

`bash

npm install -g @vue/cli

vue create quickstart

cd quickstart

npm run serve

`

or

`bash

yarn global add @vue/cli

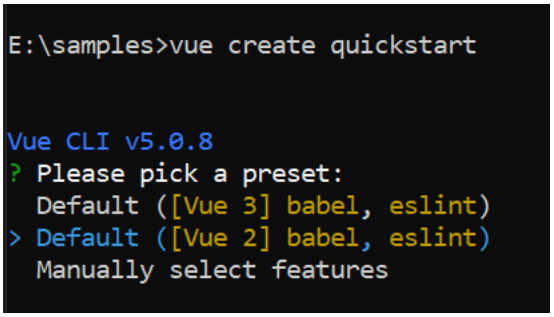
vue create quickstart

cd quickstart

yarn run serve

`

When creating a new project, choose the option Default ([Vue 2] babel, eslint) from the menu.



Once the quickstart project is set up with default settings, proceed to add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion packages are available at npmjs.com. To use Vue components, install the required npm package.

This article uses the Vue Maps component as an example. Install the @syncfusion/ej2-vue-maps package by running the following command:

`bash

npm install @syncfusion/ej2-vue-maps --save

`

or

`bash

yarn add @syncfusion/ej2-vue-maps

`

Adding Syncfusion Vue Maps component

Follow the below steps to add the Vue Maps component:

1\. First, import and register the Maps component in the script section of the **src/App.vue** file.

~/SRC/APP.VUE

```
<script>
import { MapsComponent, LayerDirective, LayersDirective } from
'@syncfusion/ej2-vue-maps';
import { world_map } from './world-map.js';
export default {
components: {
'ejs-maps' : MapsComponent,
'e-layers' : LayersDirective,
'e-layer' : LayerDirective
},
data () {
return {
shapeData: world_map
}
}
}
</script>
```

2\. In the template section, define the Maps component.

~/SRC/APP.VUE

```
<template>
<div class="wrapper">
<ejs-maps id='maps'>
<e-layers>
<e-layer :shapeData='shapeData'></e-layer>
</e-layers>
</ejs-maps>
</div>
</template>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

~/SRC/APP.VUE

```
<template>
    <div id="app">
        <div class='wrapper'>
            <ejs-maps id='maps'>
               <e-layers>
                    <e-layer :shapeData='shapeData'></e-layer>
                </e-layers>
            </ejs-maps>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
        </div>
    </div>
</template>
<script>
import { MapsComponent, LayersDirective, LayerDirective } from
'@syncfusion/ej2-vue-maps';
import { world_map } from './world-map.js';
export default {
  components: {
    'ejs-maps' : MapsComponent,
    'e-layers' : LayersDirective,
    'e-layer' : LayerDirective
  },
  data () {
    return {
        shapeData: world_map
    }
  }
}
</script>
<style>
  .wrapper {
    max-width: 400px;
    margin: 0 auto;
  }
</style>
```

Run the project

To run the project, use the following command:

`bash

npm run serve

`

or

`bash

yarn run serve

`

{% previewsample "page.domainurl/code-snippet/maps/getting-started-cs105" %}

Module Injection

Maps component are segregated into individual feature-wise modules. In order to use a particular feature,

you need to inject its feature module using provide option. Find the modules available in Maps and its description as follows.

- Annotations - Inject this provider to use annotations feature.
- Bubble - Inject this provider to use bubble feature.
- DataLabel - Inject this provider to use data label feature.
- Highlight - Inject this provider to use highlight feature.

Copyright © 2001 -2024 Syncfusion Inc.

- Legend - Inject this provider to use legend feature.
- Marker - Inject this provider to use marker feature.
- MapsTooltip - Inject this provider to use tooltip series.
- NavigationLine - Inject this provider to use navigation lines feature.
- Selection - Inject this provider to use selection feature.
- Zoom - Inject this provider to use zooming and panning feature.

In the current application, we are going to modify the above basic Maps to visualize 2016 USA president election results.

For this application we are going to use tooltip, data label and legend features of the Maps. Now import the MapsTooltip, DataLabel and Legend modules from Maps package and inject it into the Maps component using provide option.

```
<template>
<div class="wrapper">
<ejs-maps id='maps'></ejs-maps>
</div>
</template>
<script>
import { MapsComponent, Legend, DataLabel, MapsTooltip } from '@syncfusion/ej2-vue-maps';
export default {
components: {
'ejs-maps': MapsComponent
}
data:function(){
return{ };
},
provide: {
maps: [Legend, DataLabel, MapsTooltip]
}
}
</script>
```

Render shapes from GeoJSON data

This section explains how to bind GeoJSON data to the map.

```javascript
```

Copyright © 2001 -2024 Syncfusion Inc.

let usMap: Object =

{

"type": "FeatureCollection",

"crs": { "type": "name", "properties": { "name": "urn:ogc:def:crs:OGC:1.3:CRS84" } },

"features": [

{ "type": "Feature", "properties": { "iso*31662*": "MA", "name": "Massachusetts", "admin": "United States of America" }, "geometry": { "type": "MultiPolygon", "coordinates": [[[[-70.801756294617277, 41.248076234530558]]]] }

}

]

//https://ej2.syncfusion.com/vue/documentation

};

`

Elements in the Maps will get rendered in the layers. So add a layer collection to the Maps by using layers property. Now bind the GeoJSON data to the shapeData property.

~/SRC/APP.VUE

```
<template>
    <div id="map">
        <div class='wrapper'>
            <ejs-maps >
                <e-layers>
                    <e-layer :shapeData='shapeData' ></e-layer>
                </e-layers>
            </ejs-maps>
        </div>
    </div>
</template>
<script>
import { MapsComponent, LayerDirective, LayersDirective } from
'@syncfusion/ej2-vue-maps';
import { world_map } from './world-map.js';
export default {
components: {
    'ejs-maps': MapsComponent,
    'e-layer': LayerDirective,
    'e-layers': LayersDirective
},
data (){
    return{
        shapeData: world_map
    }
}
}
</script>
<style>
  .wrapper {
    max-width: 400px;
```

Copyright © 2001 -2024 Syncfusion Inc.

```
    margin: 0 auto;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/maps/getting-started-cs34" %}

Note: Refer the data values for world_map here.

Bind data source to map

The following properties in layers are used for binding data source to map.

- [dataSource]
- [shapeDataPath]
- [shapePropertyPath]

The dataSource property takes collection value as input. For example, the list of objects can be provided as input. This data is further used in tooltip, data label, bubble, legend and in color mapping.

The shapeDataPath property used to refer the data ID in dataSource. Where as, the shapePropertyPath property is used to refer the column name in shapeData to identify the shape. Both the properties are related to each other. When the values of the shapeDataPath property in the dataSource property and the value of shapePropertyPath in the shapeData property match, then the associated object from the dataSource is bound to the corresponding shape.

The JSON object "permanent and non-permanent countries in the UN security council" is used as data source below.

~/SRC/APP.VUE

```
<template>
    <div id="map">
        <div class='wrapper'>
            <ejs-maps >
                <e-layers>
                    <e-layer :shapeData='shapeData'
:shapePropertyPath='shapePropertyPath' :shapeDataPath='shapeDataPath'
:dataSource='dataSource' ></e-layer>
                </e-layers>
            </ejs-maps>
        </div>
    </div>
</template>
<script>
import { MapsComponent, LayerDirective, LayersDirective } from
'@syncfusion/ej2-vue-maps';
import { world_map } from './world-map.js';
export default {
components: {
    'ejs-maps': MapsComponent,
    'e-layer': LayerDirective,
    'e-layers': LayersDirective
},
data (){
    return{
```

Copyright © 2001 -2024 Syncfusion Inc.

```
        shapeData: world_map,
        dataSource: [{  "Country": "China", "Membership": "Permanent"},
            {"Country": "France","Membership": "Permanent" },
            { "Country": "Russia","Membership": "Permanent"},
            {"Country": "Kazakhstan","Membership": "Non-Permanent"},
            { "Country": "Poland","Membership": "Non-Permanent"},
            {"Country": "Sweden","Membership": "Non-Permanent"}],
        shapePropertyPath: 'name',
        shapeDataPath: 'Country'
    }
}
}
</script>
<style>
  .wrapper {
    max-width: 400px;
    margin: 0 auto;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/maps/getting-started-cs35" %}

Note: Refer the data values for world_map here.

Apply Color Mapping

The Color Mapping feature supports customization of shape colors based on the underlying value of shape received from bounded data. Specify the field name from which the values have to be compared for the shapes in [colorValuePath] property in [shapeSettings].

Specify color and value in colorValuePath property. Here '#D84444' is specified for 'Permanent' and '#316DB5' is specified for 'Non-Permanent'.

~/SRC/APP.VUE

```
<template>
    <div id="map">
        <div class='wrapper'>
            <ejs-maps >
                <e-layers>
                    <e-layer :shapeData='shapeData'
:shapePropertyPath='shapePropertyPath' :shapeDataPath='shapeDataPath'
:dataSource='dataSource' :shapeSettings='shapeSettings' ></e-layer>
                </e-layers>

{% previewsample "page.domainurl/code-snippet/maps/getting-started-cs36" %}

Add Title for Maps

You can add a title using titleSettings property to the map to provide quick

information to the user about the shapes rendered in the map.

~/SRC/APP.VUE

```
<template>
    <div id="map">
        <div class='wrapper'>
            <ejs-maps  :titleSettings='titleSettings' >
                <e-layers>
                    <e-layer :shapeData='shapeData'
:shapePropertyPath='shapePropertyPath' :shapeDataPath='shapeDataPath'
:dataSource='dataSource' :shapeSettings='shapeSettings' ></e-layer>
                </e-layers>
            </ejs-maps>
        </div>
    </div>
</template>
<script>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
import { MapsComponent, LayerDirective, LayersDirective } from
'@syncfusion/ej2-vue-maps';
import { world_map } from './world-map.js';
export default {
components: {
    'ejs-maps': MapsComponent,
    'e-layer': LayerDirective,
    'e-layers': LayersDirective
},
data (){
    return{
        titleSettings: {
            text: 'UN security council countries'
        },
        shapeData: world_map,
        dataSource: [{  "Country": "China", "Membership": "Permanent"},
            {"Country": "France","Membership": "Permanent" },
            { "Country": "Russia","Membership": "Permanent"},
            {"Country": "Kazakhstan","Membership": "Non-Permanent"},
            { "Country": "Poland","Membership": "Non-Permanent"},
            {"Country": "Sweden","Membership": "Non-Permanent"}],
        shapePropertyPath: 'name',
        shapeDataPath: 'Country',
        shapeSettings: {
            colorValuePath: 'Membership',
                colorMapping: [
                {
                    value: 'Permanent', color: '#D84444'
                },
                {
                    value: 'Non-Permanent', color: '#316DB5'
                }]
        }
    }
}
}

    max-width: 400px;
    margin: 0 auto;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/maps/getting-started-cs37" %}

Enable Legend

You can show legend for the Maps by setting true to the visible property in legendSettings object and by injecting the Legend

module using provide option.

~/SRC/APP.VUE

```
<template>
    <div id="map">
```

```
        <div class='wrapper'>
            <ejs-maps :legendSettings='legendSettings' >
                <e-layers>
                    <e-layer :shapeData='shapeData'
:shapePropertyPath='shapePropertyPath' :shapeDataPath='shapeDataPath'
:dataSource='dataSource' :shapeSettings='shapeSettings' ></e-layer>
                </e-layers>
            </ejs-maps>
        </div>
    </div>
</template>
<script>
import { MapsComponent, LayerDirective, LayersDirective, Legend } from
'@syncfusion/ej2-vue-maps';
import { world_map } from './world-map.js';
export default {
components: {
    'ejs-maps': MapsComponent,
    'e-layer': LayerDirective,
    'e-layers': LayersDirective
},
data () {
    return{
        shapeData: world_map,
        dataSource: [{  "Country": "China", "Membership": "Permanent"},
            {"Country": "France","Membership": "Permanent" },
            { "Country": "Russia","Membership": "Permanent"},
            {"Country": "Kazakhstan","Membership": "Non-Permanent"},
            { "Country": "Poland","Membership": "Non-Permanent"},
            {"Country": "Sweden","Membership": "Non-Permanent"}],
        shapePropertyPath: 'name',
        shapeDataPath: 'Country',
        shapeSettings: {
            colorValuePath: 'Membership',
                colorMapping: [
                {
                    value: 'Permanent', color: '#D84444'
                },
                {
                    value: 'Non-Permanent', color: '#316DB5'
                }]
        },
        legendSettings: {
            visible: true
        }
    }
},
provide: {
    maps: [Legend]
}
}
</script>
<style>
  .wrapper {
    max-width: 400px;
    margin: 0 auto;
  }
```

Copyright © 2001 -2024 Syncfusion Inc.

```
</style>
```

{% previewsample "page.domainurl/code-snippet/maps/getting-started-cs38" %}

Add Data Label

You can add data labels to show additional information of the shapes in map. This can be achieved by setting visible property to true in the dataLabelSettings object and by injecting DataLabel module using provide option.

~/SRC/APP.VUE

```
<template>
    <div id="app">
        <div class='wrapper'>
            <ejs-maps :legendSettings='legendSettings' >
                <e-layers>
                    <e-layer :shapeData='shapeData'
:shapeSettings='shapeSettings' :dataLabelSettings='dataLabelSettings'></e-
layer>
                </e-layers>
            </ejs-maps>
        </div>
    </div>
</template>
<script>
import { MapsComponent, LayerDirective, LayersDirective, Legend, DataLabel }
from '@syncfusion/ej2-vue-maps';
import { world_map } from './world-map.js';
export default {
components: {
    'ejs-maps': MapsComponent,
    'e-layer': LayerDirective,
    'e-layers': LayersDirective
},
data () {
    return{
        shapeData: world_map,
        shapeSettings:{
            autofill: true
        },
        dataLabelSettings: {
            visible: true,
                labelPath: 'name',
                smartLabelMode: 'Trim'
        },
        legendSettings: {
            visible: true
        }
    }
},
provide: {
    maps: [Legend, DataLabel]
}
}
</script>
<style>
```

```
  .wrapper {
    max-width: 400px;
    margin: 0 auto;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/maps/getting-started-cs39" %}

Enable Tooltip

The tooltip is useful when you cannot display information by using the data labels due to space constraints.

You can enable tooltip by setting the visible property as true

in tooltipSettings object and by injecting `MapsTooltip` module using

`provide` option.

~/SRC/APP.VUE

```
<template>
    <div id="app">
          <div class='wrapper'>
            <ejs-maps  :titleSettings='titleSettings'
:legendSettings='legendSettings' >
                <e-layers>
                    <e-layer :shapeData='shapeData'
:shapePropertyPath='shapePropertyPath' :shapeDataPath='shapeDataPath'
:dataSource='dataSource' :shapeSettings='shapeSettings'
:tooltipSettings='tooltipSettings'
:dataLabelSettings='dataLabelSettings'></e-layer>
                </e-layers>
            </ejs-maps>
        </div>
    </div>
</template>
<script>
import { MapsComponent, LayerDirective, LayersDirective, Legend, DataLabel,
MapsTooltip } from '@syncfusion/ej2-vue-maps';
import { usMap } from './usa.js';
import { electionData } from './election-data.js';
export default {
components: {
    'ejs-maps': MapsComponent,
    'e-layer': LayerDirective,
    'e-layers': LayersDirective
},
data () {
    return{
        titleSettings: {
            text: 'USA Election Results - 2016'
        },
        shapeData: usMap,
        dataSource: electionData,
        shapePropertyPath: 'name',
        shapeDataPath: 'State',
        shapeSettings: {
```

```
            colorValuePath: 'Candidate',
            colorMapping: [
            {
                value: 'Trump', color: '#D84444'
            },
            {
                value: 'Clinton', color: '#316DB5'
            }]
        },
        dataLabelSettings: {
            visible: true,
            labelPath: 'State',
            smartLabelMode: 'Trim'
        },
        tooltipSettings: {
            visible: true,
            valuePath: 'State'
        },
        legendSettings: {
            visible: true
        }
    }
},
provide: {
    maps: [Legend, DataLabel, MapsTooltip]
}
}
</script>
<style>
  .wrapper {
    max-width: 400px;
    margin: 0 auto;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/maps/getting-started-cs40" %}

Getting Started with the Vue Maps Component in Vue 3

This article provides a step-by-step guide for setting up a Vite project with a JavaScript environment and integrating the Syncfusion Vue Maps component using the Composition API / Options API.

The Composition API is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

The Options API is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

Prerequisites

System requirements for Syncfusion Vue UI components

Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using Vite. To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

Copyright © 2001 -2024 Syncfusion Inc.

`bash
npm create vite@latest
`

or

`bash
yarn create vite
`

Using one of the above commands will lead you to set up additional configurations for the project as below:

1.Define the project name: We can specify the name of the project directly. Let's specify the name of the project as `my-project` for this article.

`bash
? Project name: » my-project
`

2.Select `Vue` as the framework. It will create a Vue 3 project.

`bash
? Select a framework: » - Use arrow-keys. Return to submit.
Vanilla
Vue
React
Preact
Lit
Svelte
Others
`

3.Choose `JavaScript` as the framework variant to build this Vite project using JavaScript and Vue.

`bash
? Select a variant: » - Use arrow-keys. Return to submit.
JavaScript
TypeScript
Customize with create-vue ↗
Nuxt ↗
`

Copyright © 2001 -2024 Syncfusion Inc.

4.Upon completing the aforementioned steps to create the my-project, run the following command to install its dependencies:

`bash

cd my-project

npm install

`

or

`bash

cd my-project

yarn install

`

Now that my-project is ready to run with default settings, let's add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion Vue component packages are available at npmjs.com. To use Syncfusion Vue components in the project, install the corresponding npm package.

This article uses the Vue Maps component as an example. To use the Vue Maps component in the project, the @syncfusion/ej2-vue-maps package needs to be installed using the following command:

`bash

npm install @syncfusion/ej2-vue-maps --save

`

or

`bash

yarn add @syncfusion/ej2-vue-maps

`

Add Syncfusion Vue component

Follow the below steps to add the Vue Maps component using Composition API or Options API:

1.First, import and register the Maps component and its child directives in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { MapsComponent as EjsMaps, LayersDirective as ELayers,
LayerDirective as ELayer, MapAjax , Legend , DataLabel , MapsTooltip } from
'@syncfusion/ej2-vue-maps';
import { Maps } from '@syncfusion/ej2-maps';
Maps.Inject(Legend, DataLabel, MapsTooltip);
</script>
```

Copyright © 2001 -2024 Syncfusion Inc.

OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { MapsComponent, LayersDirective, LayerDirective, MapAjax, Legend,
MapAjax, DataLabel, MapsTooltip } from '@syncfusion/ej2-vue-maps'
//Component registration
export default {
name: "App",
components: {
'ejs-maps' : MapsComponent,
'e-layers' : LayersDirective,
'e-layer' : LayerDirective
}
}
</script>
```

2.In the template section, define the Maps component with the layer, title, legend and other settings definitions.

~/SRC/APP.VUE

```
<template>
<ejs-maps :titleSettings='titleSettings' :legendSettings='legendSettings'>
<e-layers>
<e-layer :shapeData='shapeData' :shapePropertyPath='shapePropertyPath'
:shapeDataPath='shapeDataPath' :dataSource='dataSource'
:shapeSettings='shapeSettings' :dataLabelSettings='dataLabelSettings'
:tooltipSettings='tooltipSettings'></e-layer>
</e-layers>
</ejs-maps>
</template>
```

3.In the script section, declare the values for the properties defined in the template section.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
const titleSettings =  {
text: 'UN security council countries'
};
const shapeData = new MapAjax('https://cdn.syncfusion.com/maps/map-
data/world-map.json');
const dataSource =  [{  "Country": "China", "Membership": "Permanent"},
{"Country": "France","Membership": "Permanent" },
{ "Country": "Russia","Membership": "Permanent"},
{"Country": "Kazakhstan","Membership": "Non-Permanent"},
{ "Country": "Poland","Membership": "Non-Permanent"},
{"Country": "Sweden","Membership": "Non-Permanent"}];
const shapePropertyPath = 'name';
const shapeDataPath = 'Country';
const shapeSettings = {
colorValuePath: 'Membership',
colorMapping: [
{
```

Copyright © 2001 -2024 Syncfusion Inc.

```
value: 'Permanent', color: '#D84444'
},
{
value: 'Non-Permanent', color: '#316DB5'
}
]
};
const dataLabelSettings = {
visible: true,
labelPath: 'name',
smartLabelMode: 'Trim'
};
const legendSettings = {
visible: true
};
const tooltipSettings = {
visible: true,
valuePath: 'Country'
};
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
data() {
return {
titleSettings: {
text: 'UN security council countries'
},
shapeData: new MapAjax('https://cdn.syncfusion.com/maps/map-data/world-
map.json'),
dataSource: [{  "Country": "China", "Membership": "Permanent"},
{"Country": "France","Membership": "Permanent" },
{ "Country": "Russia","Membership": "Permanent"},
{"Country": "Kazakhstan","Membership": "Non-Permanent"},
{ "Country": "Poland","Membership": "Non-Permanent"},
{"Country": "Sweden","Membership": "Non-Permanent"}],
shapePropertyPath: 'name',
shapeDataPath: 'Country',
shapeSettings: {
colorValuePath: 'Membership',
colorMapping: [
{
value: 'Permanent', color: '#D84444'
},
{
value: 'Non-Permanent', color: '#316DB5'
}
]
},
dataLabelSettings: {
visible: true,
labelPath: 'name',
smartLabelMode: 'Trim'
},
legendSettings: {
```

Copyright © 2001 -2024 Syncfusion Inc.

```
visible: true
},
tooltipSettings: {
visible: true,
valuePath: 'Country'
}
};
}
</script>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<ejs-maps :titleSettings='titleSettings' :legendSettings='legendSettings'>
<e-layers>
<e-layer :shapeData='shapeData' :shapePropertyPath='shapePropertyPath'
:shapeDataPath='shapeDataPath' :dataSource='dataSource'
:shapeSettings='shapeSettings' :dataLabelSettings='dataLabelSettings'
:tooltipSettings='tooltipSettings'></e-layer>
</e-layers>
</ejs-maps>
</template>
<script setup>
import { MapsComponent as EjsMaps, LayersDirective as ELayers,
LayerDirective as ELayer, MapAjax , Legend , DataLabel , MapsTooltip } from
'@syncfusion/ej2-vue-maps';
import { Maps } from '@syncfusion/ej2-maps';
Maps.Inject(Legend, DataLabel, MapsTooltip);
const titleSettings =  {
text: 'UN security council countries'
};
const shapeData = new MapAjax('https://cdn.syncfusion.com/maps/map-
data/world-map.json');
const dataSource =  [{  "Country": "China", "Membership": "Permanent"},
{"Country": "France","Membership": "Permanent" },
{ "Country": "Russia","Membership": "Permanent"},
{"Country": "Kazakhstan","Membership": "Non-Permanent"},
{ "Country": "Poland","Membership": "Non-Permanent"},
{"Country": "Sweden","Membership": "Non-Permanent"}];
const shapePropertyPath = 'name';
const shapeDataPath = 'Country';
const shapeSettings = {
colorValuePath: 'Membership',
colorMapping: [
{
value: 'Permanent', color: '#D84444'
},
{
value: 'Non-Permanent', color: '#316DB5'
}
]
};
const dataLabelSettings = {
visible: true,
```

Copyright © 2001 -2024 Syncfusion Inc.

```
labelPath: 'name',
smartLabelMode: 'Trim'
};
const legendSettings = {
visible: true
};
const tooltipSettings = {
visible: true,
valuePath: 'Country'
};
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<ejs-maps :titleSettings='titleSettings' :legendSettings='legendSettings'>
<e-layers>
<e-layer :shapeData='shapeData' :shapePropertyPath='shapePropertyPath'
:shapeDataPath='shapeDataPath' :dataSource='dataSource'
:shapeSettings='shapeSettings' :dataLabelSettings='dataLabelSettings'
:tooltipSettings='tooltipSettings'></e-layer>
</e-layers>
</ejs-maps>
</template>
<script>
import { MapsComponent, LayersDirective, LayerDirective, MapAjax, Legend,
DataLabel, MapsTooltip } from '@syncfusion/ej2-vue-maps';
// Component registration
export default {
name: "App",
// Declaring component and its directives
components: {
'ejs-maps' : MapsComponent,
'e-layers' : LayersDirective,
'e-layer' : LayerDirective
},
// Bound properties declarations
data() {
return {
titleSettings: {
text: 'UN security council countries'
},
shapeData: new MapAjax('https://cdn.syncfusion.com/maps/map-data/world-
map.json'),
dataSource: [{  "Country": "China", "Membership": "Permanent"},
{"Country": "France","Membership": "Permanent" },
{ "Country": "Russia","Membership": "Permanent"},
{"Country": "Kazakhstan","Membership": "Non-Permanent"},
{ "Country": "Poland","Membership": "Non-Permanent"},
{"Country": "Sweden","Membership": "Non-Permanent"}],
shapePropertyPath: 'name',
shapeDataPath: 'Country',
shapeSettings: {
colorValuePath: 'Membership',
colorMapping: [
{
```

Copyright © 2001 -2024 Syncfusion Inc.

```
value: 'Permanent', color: '#D84444'
},
{
value: 'Non-Permanent', color: '#316DB5'
}
]
},
dataLabelSettings: {
visible: true,
labelPath: 'name',
smartLabelMode: 'Trim'
},
legendSettings: {
visible: true
},
tooltipSettings: {
visible: true,
valuePath: 'Country'
}
};
},
provide: {
maps:[Legend, DataLabel, MapsTooltip]
}
};
</script>
```

Run the project

To run the project, use the following command:

`bash

npm run dev

`

or

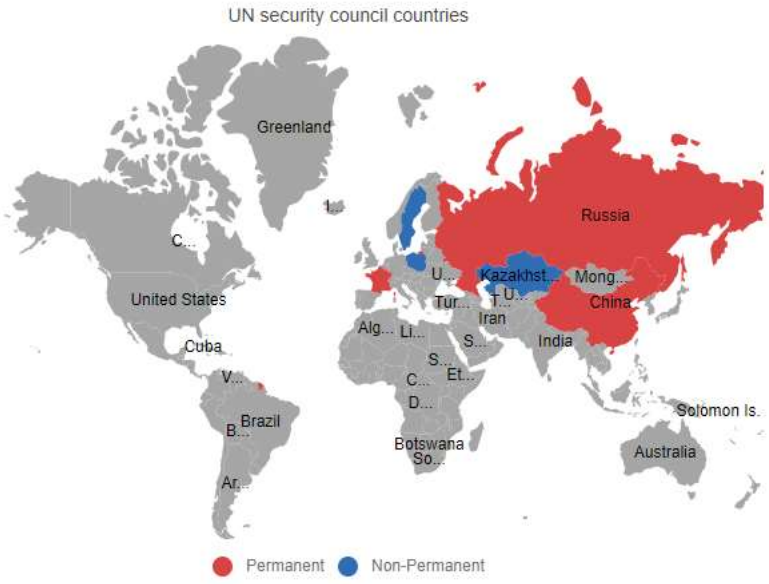
`bash

yarn run dev

`

The output will appear as follows:

Copyright © 2001 -2024 Syncfusion Inc.



Sample: vue3-maps-getting-started.

For migrating from Vue 2 to Vue 3, refer to the migration documentation.

Populate data in Vue Maps component

Geometry types

GeoJSON data contains geometry objects with properties such as geometry types and coordinates. The geometry types are the values present in the geometry objects of the GeoJSON data that specify the type of shape to be rendered, as well as the coordinates that help to draw the shape's boundary line. The supportive geometry types are:

| **Shapes** | **Supported** |

| --- | --- |

|Polygon| Yes |

|MultiPolygon| Yes |

|LineString| Yes |

|MultiLineString| Yes |

|Point| Yes |

|MultiPoint| Yes |

|GeometryCollection| Yes |

Copyright © 2001 -2024 Syncfusion Inc.

Shape data

The shape data collection describes geographical shape information that is available in GeoJSON format. The Map shapes are rendered with this data. The custom shapes such as seat selection in bus, seat selection in a cricket stadium and more useful information can be also added as shapeData in the layer of the Maps.

```ts
export let worldMap = // Paste all the content copied from the JSON file.
```

Data source

The dataSource property is used to represent statistical data in the Maps component, and it accepts a collection of values as input. For example, a list of objects as input can be provided to the data source. This data source will be used to color the map, display data labels, and display tooltip, among other things.

The data source is populated with JSON data relative to shape data and stored as JSON object. In the below example, **populationData** can be used as data source in Maps.

```ts
export let populationData: object[] = [
{
'code': 'AF',
'value': 53,
'name': 'Afghanistan',
'population': 29863010,
'density': 119
},
{
'code': 'AL',
'value': 117,
'name': 'Albania',
'population': 3195000,
'density': 111

`
```

Data binding

The following properties in the layers are used for binding data in the Maps component. Both the properties are related to each other.

- shapePropertyPath
- shapeDataPath

shapePropertyPath

The shapePropertyPath property is used to refer the field name in the shapeData property of shape layers to identify the shape. When the values of shapeDataPath property from the dataSource property

and shapePropertyPath property from the shapeData property match, then the associated object from the data source is bound to the corresponding shape.

world-map.js file contains following data and its field **name** value is used to map the corresponding shape with the provided data source.

`javascript

export var world_map = {

"type": "Feature",

"properties": {

"admin": "Afghanistan",

"name": "Afghanistan",

"continent": "Asia"

},

"geometry": { "type": "Polygon", "coordinates": [[[61.21081709172573, https://ej2.syncfusion.com/vue/documentation. },

...

`

shapeDataPath

The shapeDataPath property is similar to the shapePropertyPath property, but it refers to the field name in the dataSource property. For example, populationData contains the **code**, **value**, **name**, **population** and **density** fields. Here, the **name** field is set to the shapeDataPath to map the corresponding value of field name in shape data.

In the below example, both **name** fields contain the same value as **Afghanistan**, this value is matched in both shape data and data source, so that the details associated with **Afghanistan** will be mapped to the corresponding shape and used to color the corresponding shape, display data labels, display tooltips, and more.

{% previewsample "page.domainurl/code-snippet/maps/getting-started-cs75" %}

Binding complex data source

Data from data source can be bind to the Maps in two different ways.

1. Bind the field name directly to the properties as shapeDataPath, colorValuePath,

valuePath and shapeValuePath.

2. Bind the field name as data.field to the properties as shapeDataPath, colorValuePath,

valuePath and shapeValuePath.

{% previewsample "page.domainurl/code-snippet/maps/getting-started-cs76" %}

Layers in Vue Maps component

The Maps component is rendered through layers and any number of layers can be added to the Maps.

Multilayer

The Multilayer support allows loading multiple shape files and map providers in a single container, enabling Maps to display more information. The shape layer or map providers are the main layers of the Maps. Multiple layers can be added as **SubLayer** over the main layers using the type property of layers.

Copyright © 2001 -2024 Syncfusion Inc.

Sublayer

Sublayer is a type of shape file layer. It allows loading multiple shape files in a single map view. For example, a sublayer can be added over the main layer to view geographic features such as rivers, valleys and cities in a map of a country. Similar to the main layer, elements in the Maps such as markers, bubbles, color mapping and legends can be added to the sub-layer.

In this example, the United States map shape is used as shape data by utilizing **usa.ts** file, and **texas.ts** and **california.ts** files are used as sub-layers in the United States map.

APP.VUE

```
<template>
    <div id="app">
          <div class='wrapper'>
            <ejs-maps >
                <e-layers>
                    <e-layer :shapeData='shapeData'
:shapeSettings='shapeSettings' ></e-layer>
                     <e-layer :shapeData='shapeData1' :type = 'type'
:shapeSettings='shapeSettings1' ></e-layer>
                     <e-layer :shapeData='shapeData2' :type = 'type'
:shapeSettings='shapeSettings2' ></e-layer>
                </e-layers>
            </ejs-maps>
        </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { MapsPlugin } from '@syncfusion/ej2-vue-maps';
import { usMap } from './usa.js';
import { california } from './california.js';
import { texas } from './texas.js';
Vue.use(MapsPlugin);
export default {
data () {
    return{
        shapeData: usMap,
        shapeSettings: {
            fill: '#E5E5E5',
            border: {
                color: 'black',
                width: 0.1
            }
        },
        shapeData1: texas,
        type: 'SubLayer',
        shapeSettings1: {
            fill: 'rgba(141, 206, 255, 0.6)',
            border: {
                color: '#1a9cff',
                width: 0.25
            }
        },
        shapeData2: california,
        shapeSettings2: {
```

```
            fill: 'rgba(141, 206, 255, 0.6)',
            border: {
                color: '#1a9cff',
                width: 0.25
            }
        }
    }
},
}
</script>
<style>
  .wrapper {
    max-width: 400px;
    margin: 0 auto;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/maps/getting-started-cs49" %}

Displaying different layer in the view

Multiple shape files and map providers can be loaded simultaneously in Maps. The baseLayerIndex property is used to determine which layer on the user interface should be displayed. This property is used for the Maps drill-down feature, so when the baseLayerIndex value is changed, the corresponding shape is loaded. In this example, two layers can be loaded with the World map and the United States map. Based on the given baseLayerIndex value the corresponding shape will be loaded in the user interface. If the baseLayerIndex value is set to **0**, then the world map will be loaded.

APP.VUE

```
<template>
    <div id="app">
          <div class='wrapper'>
            <ejs-maps :baseLayerIndex= "baseLayerIndex">
                <e-layers>
                    <e-layer :shapeData='shapeData'></e-layer>
                    <e-layer :shapeData='shapeData1'></e-layer>
                </e-layers>
            </ejs-maps>
        </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { MapsPlugin } from '@syncfusion/ej2-vue-maps';
import { usMap } from './usa.js';
import { world_map } from './world-map.js';
Vue.use(MapsPlugin);
export default {
data () {
    return{
        baseLayerIndex: 1,
        shapeData: world_map,
        shapeData1: usMap,
    }
},
```

```
}
</script>
<style>
  .wrapper {
    max-width: 400px;
    margin: 0 auto;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/maps/getting-started-cs50" %}

Rendering custom shapes

Custom shapes (also known as custom maps) can be rendered in Maps to represent bus seat booking, cricket stadium, basic home plan/sketch, and so on. To accomplish this, a JSON file in GeoJSON format with proper geometries must be created manually or with the assistance of any online map vendor. The GeoJSON file created must be set to the shapeData in the Maps layer, and the geometryType must be set as **Normal**.

Please refer this link for an example GeoJSON file containing information about bus seat selection.

Please refer this link for more information and a live demonstration.

Providers

Map provider in Vue Maps component

The OpenStreetMap (OSM) is the online Maps provider built by a community of developers; it is free to use under an open license. It allows to view geographical data in a collaborative way from anywhere on the earth. The OSM Maps provides small tile images based on our requests and combines those images into a single image to display the Maps area in the Maps component.

Adding OpenStreetMap

The OSM Maps can be rendered using the urlTemplate property.

APP.VUE

```
<template>
    <div id="app">
          <div class='wrapper'>
            <ejs-maps >
                <e-layers>
                    <e-layer :urlTemplate= 'urlTemplate'>
                    </e-layer>
                </e-layers>
            </ejs-maps>
        </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { MapsPlugin, MapsComponent } from '@syncfusion/ej2-vue-maps';
Vue.use(MapsPlugin);
export default {
data () {
    return{
       urlTemplate: 'https://tile.openstreetmap.org/level/tileX/tileY.png'
    }
```

```
},
}
</script>
<style>
  .wrapper {
    max-width: 400px;
    margin: 0 auto;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/maps/getting-started-cs82" %}

Changing the tile server of the OpenStreetMap

The OSM tile server can be changed by setting the tile URL in the urlTemplate property. For more details about the OSM tile server, refer here.

Enabling zooming and panning

The OSM Maps layer can be zoomed and panned. Zooming helps to get a closer look at a particular area on a Maps for in-depth analysis. Panning helps to move a Maps around to focus the targeted area.

APP.VUE

```
<template>
    <div id="app">
          <div class='wrapper'>
            <ejs-maps :zoomSettings= 'zoomSettings'>
                <e-layers>
                    <e-layer :urlTemplate= 'urlTemplate'>
                    </e-layer>
                </e-layers>
            </ejs-maps>
        </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { MapsPlugin, MapsComponent, Zoom } from '@syncfusion/ej2-vue-maps';
Vue.use(MapsPlugin);
export default {
data () {
    return{
       zoomSettings: {
           enable: true,
           toolBars: ["Zoom", "ZoomIn", "ZoomOut", "Pan", "Reset"]
       },
       urlTemplate: 'https://tile.openstreetmap.org/level/tileX/tileY.png'
    }
},
provide: {
    maps: [ Zoom ]
}
}
</script>
<style>
  .wrapper {
    max-width: 400px;
```

```
    margin: 0 auto;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/maps/getting-started-cs83" %}

Adding markers and navigation line

Markers can be added to the layers of OSM Maps by setting the corresponding location's coordinates of latitude and longitude using e-markerSetting tag. Navigation lines can be added on top of an OSM Maps layer for highlighting a path among various places by setting the corresponding location's coordinates of latitude and longitude in the e-navigationLineSetting tag.

APP.VUE

```
<template>
    <div id="app">
          <div class='wrapper'>
            <ejs-maps :zoomSettings= 'zoomSettings' :centerPosition=
'centerPosition'>
                <e-layers>
                    <e-layer :urlTemplate= 'urlTemplate'>

{% previewsample "page.domainurl/code-snippet/maps/getting-started-cs84" %}

Adding sublayer

Any GeoJSON shape can be rendered as a sublayer on top of the OSM Maps layer for highlighting a particular continent or country in OSM Maps by adding another layer and specifying the type property of Maps layer to "**SubLayer**".

APP.VUE

```
<template>
    <div id="app">
          <div class='wrapper'>
            <ejs-maps >
                <e-layers>
                    <e-layer :urlTemplate= 'urlTemplate'></e-layer>
                    <e-layer :shapeData='shapeData1' :type = 'type'
:shapeSettings='shapeSettings1' ></e-layer>
                </e-layers>
            </ejs-maps>
        </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { MapsPlugin } from '@syncfusion/ej2-vue-maps';
import { africa } from './africa.js';
```

```
Vue.use(MapsPlugin);
export default {
data () {
    return{
       urlTemplate: 'https://tile.openstreetmap.org/level/tileX/tileY.png',
       shapeData1: africa,
       type: 'SubLayer',
       shapeSettings1: {
           fill: 'blue'
       }
    }
}
}
</script>
<style>
  .wrapper {
    max-width: 400px;
    margin: 0 auto;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/maps/getting-started-cs85" %}

Enabling legend

The legend can be added to the tile Maps by setting the visible property of legendSettings to **true**.

APP.VUE

```
<template>
    <div id="app">
        <div class='wrapper'>
            <ejs-maps id='container' :legendSettings='legendSettings'>

    margin: 0 auto;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/maps/getting-started-cs86" %}

Bing maps in Vue Maps component

Bing Maps is a online Maps provider, owned by Microsoft. As like OSM, it provide Maps tile images based on our requests and combines those images into a single one to display Maps area.

Adding Bing Maps

The Bing Maps can be rendered using the urlTemplate property, which is based on the URL generated by the getBingUrlTemplate method in the Maps. The format of the required URL of Bing Maps varies from other online map providers. As a result, a built-in getBingUrlTemplate method has been included that returns the URL in a generic format. In the meantime, a subscription key is required for Bing Maps. The Bing Maps key can be obtained from here, then append it to the Bing Maps URL before passing it to the getBingUrlTemplate method. The URL returned by this method must be passed to the urlTemplate property.

`ts

<template>

<ejs-maps id='container' :layers='layers' :load='load'>

```
</ejs-maps>
</div>
</div>
</template>
<script>
import Vue from 'vue';
import { MapsPlugin } from '@syncfusion/ej2-vue-maps';
Vue.use(MapsPlugin);
export default {
data () {
return {
layers: [
{
}
]
}
},
methods:{
load: function (args) {
let map=document.getElementById('container');
map.ej2_instances[0].getBingUrlTemplate("https://dev.virtualearth.net/REST/V1/Imagery/Metadata/Aerial?output=json&uriScheme=https&key=?").then(function(url) {
map.ej2_instances[0].layers[0].urlTemplate= url;
});
}
}
}
</script>
<style>
.wrapper {
max-width: 400px;
margin: 0 auto;
}
```

</style>
`

Types of Bing Maps

Bing Maps provides different types of Maps and it is supported in the Maps component.

- **Aerial** - Displays satellite images to highlight roads and major landmarks for easy identification.
- **AerialWithLabel** - Displays aerial Maps with labels for the continent, country, ocean, etc.
- **Road** - Displays the default Maps view of roads, buildings, and geography.
- **CanvasDark** - Displays dark version of the road Maps.
- **CanvasLight** - Displays light version of the road Maps.
- **CanvasGray** - Displays grayscale version of the road Maps.

To render the light version of the road Maps, set the **CanvasLight** value is passed via the URL into the getBingUrlTemplate method demonstrated in the following code sample.

```ts
<template>
<div id="app">
<div class='wrapper'>
<ejs-maps id='container' :centerPosition="centerPosition" :layers='layers' :load='load'>
</ejs-maps>
</div>
</div>
</template>
<script>
import Vue from 'vue';
import { MapsPlugin} from '@syncfusion/ej2-vue-maps';
Vue.use(MapsPlugin);
export default {
data () {
return{
layers: [{
}],
centerPosition: {
latitude: 38.8951,
longitude: -77.0364
}
}
```

```
},
methods:{
load: function (args) {
let map=document.getElementById('container');
map.ej2_instances[0].getBingUrlTemplate("https://dev.virtualearth.net/REST/V1/Imagery/Metadata/CanvasLight?output=json&uriScheme=https&key=?").then(function(url) {
map.ej2_instances[0].layers[0].urlTemplate= url;
});
}
}
}
</script>
<style>
.wrapper {
max-width: 400px;
margin: 0 auto;
}
</style>
`
```

Enabling zooming and panning

Bing Maps layer can be zoomed and panned. Zooming helps to get a closer look at a particular area on a Maps for in-depth analysis. Panning helps to move a Maps around to focus the targeted area.

```
`ts
<template>
<div id="app">
<div class='wrapper'>
<ejs-maps  id='container' :zoomSettings='zoomSettings' :layers='layers' :load='load'>
</ejs-maps>
</div>
</div>
</template>
<script>
import Vue from 'vue';
import { MapsPlugin, Zoom } from '@syncfusion/ej2-vue-maps';
```

```
Vue.use(MapsPlugin);
export default {
data () {
return{
zoomSettings: {
enable: true,
toolBars: ["Zoom", "ZoomIn", "ZoomOut", "Pan", "Reset"]
},
layers: [{
}]
}
},
provide: {
maps: [Zoom]
},
methods:{
load: function (args) {
let map=document.getElementById('container');
map.ej2_instances[0].getBingUrlTemplate("https://dev.virtualearth.net/REST/V1/Imagery/Metadata/Aerial?output=json&uriScheme=https&key=?").then(function(url) {
map.ej2_instances[0].layers[0].urlTemplate= url;
});
}
}
}
</script>
<style>
.wrapper {
max-width: 400px;
margin: 0 auto;
}
</style>
`
```

Adding markers and navigation line

Markers can be added to the layers of Bing Maps by setting the corresponding location's coordinates of latitude and longitude using e-markerSetting tag. Navigation lines can be added on top of an Bing Maps layer for highlighting a path among various places by setting the corresponding location's coordinates of latitude and longitude in the e-navigationLineSetting tag.

```ts
<template>
<div id="app">
<div class='wrapper'>
<ejs-maps id='container' :zoomSettings='zoomSettings' :load='load' :centerPosition= 'centerPosition'>
<e-layers>
<e-layer>
<e-markerSettings>
<e-markerSetting visible= true height=25 width=15 :dataSource ="dataSource" ></e-markerSetting>
<e-markerSetting visible= true height=25 width=15 :dataSource ="dataSource1"></e-markerSetting>
</e-markerSettings>
<e-navigationLineSettings>
<e-navigationLineSetting visible = true :latitude ='latitude' :longitude ='longitude' :color ='color' :angle ='angle' :width="width">
</e-navigationLineSetting>
</e-navigationLineSettings>
</e-layer>
</e-layers>
</ejs-maps>
</div>
</div>
</template>
<script>
import Vue from 'vue';
import { MapsPlugin, Zoom, Marker, NavigationLine } from '@syncfusion/ej2-vue-maps';
Vue.use(MapsPlugin);
export default {
data () {
return{
zoomSettings: {
```

```
zoomFactor: 4
},
centerPosition: {
latitude: 29.394708,
longitude: -94.954653
},
dataSource: [
{
latitude: 34.060620,
longitude: -118.330491,
name: "California"
}],
dataSource1: [
{
latitude: 40.724546,
longitude: -73.850344,
name: "New York"
}],
color: "blue",
width: 5,
angle: 0.1,
latitude: [34.060620, 40.724546],
longitude: [-118.330491,-73.850344]
}
},
provide: {
maps: [Zoom, Marker, NavigationLine]
},
methods:{
load: function (args) {
let map=document.getElementById('container');
map.ej2_instances[0].getBingUrlTemplate("https://dev.virtualearth.net/REST/V1/Imagery/Metadata/Aerial?output=json&uriScheme=https&key=?").then(function(url) {
```

```
map.ej2_instances[0].layers[0].urlTemplate= url;
});
}
}
}
</script>
<style>
.wrapper {
max-width: 400px;
margin: 0 auto;
}
</style>
`
```

Adding sublayer

Any GeoJSON shape can be rendered as a sublayer on top of the Bing Maps layer for highlighting a particular continent or country in Bing Maps by adding another layer and specifying the type property of Maps layer to **SubLayer**.

```
`
<template>
<div id="app">
<div>
<ejs-maps id='container' :layers='layers' :load='load'>
</ejs-maps>
</div>
</div>
</template>
<script>
import Vue from 'vue';
import { MapsPlugin } from '@syncfusion/ej2-vue-maps';
import { africa } from './africa.js';
Vue.use(MapsPlugin);
export default {
data () {
return {
```

```
layers: [{
},
{
layerType: 'Geometry',
type: 'SubLayer',
shapeData: africa,
shapeSettings: {
fill: 'blue'
}
}
]
}
},
methods:{
load: function (args) {
let map=document.getElementById('container');
map.ej2_instances[0].getBingUrlTemplate("https://dev.virtualearth.net/REST/V1/Imagery/Metadata/Aerial?output=json&uriScheme=https&key=?").then(function(url) {
map.ej2_instances[0].layers[0].urlTemplate= url;
});
}
}
}
</script>
```

Enabling legend

The legend can be added to the tile Maps by setting the visible property of legendSettings to **true**.

```
<template>
<div id="app">
<div class='wrapper'>
<ejs-maps id='container' :legendSettings='legendSettings' :load='load'>
<e-layers>
<e-layer :shapeSettings='shapeSettings' :markerSettings='markerSettings'></e-layer>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
</e-layers>
</ejs-maps>
</div>
</div>
</template>
<script>
import Vue from 'vue';
import { MapsPlugin, Marker, Legend } from '@syncfusion/ej2-vue-maps';
import { markerDataSource } from './marker-data.js';
Vue.use(MapsPlugin);
export default {
data () {
return {
legendSettings: {
visible: true,
type: 'Markers',
useMarkerShape:true,
toggleLegendSettings: {
enable: true,
applyShapeSettings: false,
border: {
color: 'green',
width: 2
}
}
},
shapeSettings: {
fill: '#E5E5E5'
},
markerSettings: [
{
colorValuePath: 'color',
shapeValuePath:'shape',
```

Copyright © 2001 -2024 Syncfusion Inc.

```
legendText: 'country',
visible: true,
dataSource: markerDataSource
}
]
}
},
provide: {
maps: [Legend, Marker]
},
methods:{
load: function (args) {
let map=document.getElementById('container');
map.ej2_instances[0].getBingUrlTemplate("https://dev.virtualearth.net/REST/V1/Imagery/Metadata/Aerial?output=json&uriScheme=https&key=?").then(function(url) {
map.ej2_instances[0].layers[0].urlTemplate= url;
});
}
}
}
</script>
<style>
.wrapper {
max-width: 400px;
margin: 0 auto;
}
</style>
`
```

Azure maps in Vue Maps component

Azure Maps is yet another online Maps provider, owned by Microsoft. As like OSM and Bing Maps, it provides Maps tile images based on our requests and combines those images into a single one to display Maps area.

Copyright © 2001 -2024 Syncfusion Inc.

Adding Azure Maps

The Azure Maps can be rendered using the urlTemplate property with the tile server URL provided by online map providers. In the meantime, a subscription key is required for Azure Maps. Follow the steps in this link to generate an API key, and then added the key to the URL.

Refer to Azure Maps Licensing.

```ts
<template>
<div id="app">
<div class='wrapper'>
<ejs-maps >
<e-layers>
<e-layer :urlTemplate= 'urlTemplate'>
</e-layer>
</e-layers>
</ejs-maps>
</div>
</div>
</template>
<script>
import Vue from 'vue';
import { MapsPlugin, MapsComponent } from '@syncfusion/ej2-vue-maps';
Vue.use(MapsPlugin);
export default {
data () {
return{
urlTemplate: 'https://atlas.microsoft.com/map/imagery/png?subscription-key=Your-Key &api-version=1.0&style=satellite&zoom=level&x=tileX&y=tileY'
}
},
}
</script>
<style>
.wrapper {
max-width: 400px;
```

```
margin: 0 auto;
}
</style>
`
```

Enabling zooming and panning

The Azure Maps layer can be zoomed and panned. Zooming helps to get a closer look at a particular area on a map for in-depth analysis. Panning helps to move a map around to focus the targeted area.

```ts
<template>
<div id="app">
<div class='wrapper'>
<ejs-maps :zoomSettings= 'zoomSettings'>
<e-layers>
<e-layer :urlTemplate= 'urlTemplate'>
</e-layer>
</e-layers>
</ejs-maps>
</div>
</div>
</template>
<script>
import Vue from 'vue';
import { MapsPlugin, MapsComponent, Zoom } from '@syncfusion/ej2-vue-maps';
Vue.use(MapsPlugin);
export default {
data () {
return{
zoomSettings: {
enable: true,
toolBars: ["Zoom", "ZoomIn", "ZoomOut", "Pan", "Reset"]
},
urlTemplate: 'https://atlas.microsoft.com/map/imagery/png?subscription-key=Your-Key &api-version=1.0&style=satellite&zoom=level&x=tileX&y=tileY'
}
```

Copyright © 2001 -2024 Syncfusion Inc.

```
},
provide: {
maps: [ Zoom ]
}
}
</script>
<style>
.wrapper {
max-width: 400px;
margin: 0 auto;
}
</style>
`
```

Adding markers and navigation line

Markers can be added to the layers of Azure Maps by setting the corresponding location's coordinates of latitude and longitude using e-markerSetting tag. Navigation lines can be added on top of the Azure Maps layer for highlighting a path among various places by setting the corresponding location's coordinates of latitude and longitude in the e-navigationLineSetting tag.

```
`ts
<template>
<div id="app">
<div class='wrapper'>
<ejs-maps :zoomSettings= 'zoomSettings' :centerPosition= 'centerPosition'>
<e-layers>
<e-layer :urlTemplate= 'urlTemplate'>
<e-markerSettings>
<e-markerSetting visible= true height=25 width=15 :dataSource ="dataSource" ></e-markerSetting>
<e-markerSetting visible= true height=25 width=15 :dataSource ="dataSource1"></e-markerSetting>
</e-markerSettings>
<e-navigationLineSettings>
<e-navigationLineSetting visible = true :latitude ='latitude' :longitude ='longitude' :color ='color' :angle ='angle' :width="width">
</e-navigationLineSetting>
</e-navigationLineSettings>
</e-layer>
```

```
</e-layers>
</ejs-maps>
</div>
</div>
</template>
<script>
import Vue from 'vue';
import { MapsPlugin, MapsComponent, NavigationLine, Marker, Zoom } from '@syncfusion/ej2-vue-maps';
Vue.use(MapsPlugin);
export default {
data () {
return{
zoomSettings: {
zoomFactor: 4
},
centerPosition: {
latitude: 29.394708,
longitude: -94.954653
},
urlTemplate: 'https://atlas.microsoft.com/map/imagery/png?subscription-key=Your-Key &api-version=1.0&style=satellite&zoom=level&x=tileX&y=tileY',
dataSource: [
{
latitude: 34.060620,
longitude: -118.330491,
name: "California"
}],
dataSource1: [
{
latitude: 40.724546,
longitude: -73.850344,
name: "New York"
}],
```

```
color: "blue",
width: 5,
angle: 0.1,
latitude: [34.060620, 40.724546],
longitude: [-118.330491,-73.850344]
}
},
provide: {
maps: [ NavigationLine, Marker, Zoom ]
}
}
</script>
<style>
.wrapper {
max-width: 400px;
margin: 0 auto;
}
</style>
`
```

Adding sublayer

Any GeoJSON shape can be rendered as a sublayer on top of the Azure Maps layer for highlighting a particular continent or country in Azure Maps by adding another layer and specifying the type property of Maps layer to **SubLayer**.

```
`
<template>
<div id="app">
<div class='wrapper'>
<ejs-maps >
<e-layers>
<e-layer :urlTemplate= 'urlTemplate'></e-layer>
<e-layer :shapeData='shapeData1' :type = 'type' :shapeSettings='shapeSettings1' ></e-layer>
</e-layers>
</ejs-maps>
</div>
```

```
</div>
</template>
<script>
import Vue from 'vue';
import { MapsPlugin, MapsComponent } from '@syncfusion/ej2-vue-maps';
import { africa } from './africa.js';
Vue.use(MapsPlugin);
export default {
data () {
return{
urlTemplate: 'https://atlas.microsoft.com/map/imagery/png?subscription-key=Your-Key &api-version=1.0&style=satellite&zoom=level&x=tileX&y=tileY',
shapeData1: africa,
type: 'SubLayer',
shapeSettings1: {
fill: 'blue'
}
}
}
}
</script>
<style>
.wrapper {
max-width: 400px;
margin: 0 auto;
}
</style>
`
```

Enabling legend

The legend can be added to the Azure Maps by setting the visible property of legendSettings to **true**.

```
`
<template>
<div id="app">
<div class='wrapper'>
```

```
<ejs-maps id='container' :legendSettings='legendSettings'>
<e-layers>
<e-layer :urlTemplate='urlTemplate' :shapeSettings='shapeSettings'
:markerSettings='markerSettings'></e-layer>
</e-layers>
</ejs-maps>
</div>
</div>
</template>
<script>
import Vue from 'vue';
import { MapsPlugin, Marker, Legend } from '@syncfusion/ej2-vue-maps';
import { markerDataSource } from './marker-data.js';
Vue.use(MapsPlugin);
export default {
data () {
return {
urlTemplate: 'https://atlas.microsoft.com/map/imagery/png?subscription-key=Your-Key &api-
version=1.0&style=satellite&zoom=level&x=tileX&y=tileY',
legendSettings: {
visible: true,
type: 'Markers',
useMarkerShape:true,
toggleLegendSettings: {
enable: true,
applyShapeSettings: false,
border: {
color: 'green',
width: 2
}
}
},
shapeSettings: {
fill: '#E5E5E5'
```

```
},
markerSettings: [
{

max-width: 400px;
margin: 0 auto;
}
</style>
`
```

Other maps in Vue Maps component

Apart from OpenStreetMap and Bing Maps, you can also render Maps from other online map service providers by specifying the URL provided by those providers in the urlTemplate property. The URL template concept has been implemented in such a way that any online map service providers using the following template can benefit from previewing their Map in the Syncfusion Vue Maps component.

<!-- markdownlint-disable MD034 -->

Sample Template: https://< domain_name >/maps/basic/{z}/{x}/{y}.png

- "${z}" - It represents zoom factor (level).
- "${x}" - It indicates tile image x-position (tileX).
- "${y}" - It indicates tile image y-position (tileY).

Copyright © 2001 -2024 Syncfusion Inc.

In this case, the key generated for those online map service providers can also be appended to the URL. This allows to create personalized Maps with your own content and imagery.

Following is an example of how to add a TomTom map. You can generate an API key by following the steps in this link and then adding the key to the URL.

```
<template>
<div id="app">
<div class='wrapper'>
<ejs-maps >
<e-layers>
<e-layer :urlTemplate= 'urlTemplate'>
</e-layer>
</e-layers>
</ejs-maps>
</div>
</div>
</template>
<script>
import Vue from 'vue';
import { MapsPlugin, MapsComponent } from '@syncfusion/ej2-vue-maps';
Vue.use(MapsPlugin);
export default {
data () {
return{
urlTemplate:
"http://api.tomtom.com/map/1/tile/basic/main/level/tileX/tileY.png?key=subscription_key"
}
},
}
</script>
<style>
.wrapper {
max-width: 400px;
margin: 0 auto;
```

}

</style>

`

Enabling zooming and panning

Tile Maps layer can be zoomed and panned. Zooming helps to get a closer look at a particular area on a Maps for in-depth analysis. Panning helps to move a Maps around to focus the targeted area.

`

<template>

<ejs-maps :zoomSettings= 'zoomSettings'>

<e-layers>

<e-layer :urlTemplate= "urlTemplate">

Copyright © 2001 -2024 Syncfusion Inc.

```
</e-layer>
</e-layers>
</ejs-maps>
</div>
</div>
</template>
<script>
import Vue from 'vue';
import { MapsPlugin, MapsComponent, Zoom } from '@syncfusion/ej2-vue-maps';
Vue.use(MapsPlugin);
export default {
data () {
return{
zoomSettings: {
enable: true,
toolBars: ["Zoom", "ZoomIn", "ZoomOut", "Pan", "Reset"]
},
urlTemplate:
"http://api.tomtom.com/map/1/tile/basic/main/level/tileX/tileY.png?key=subscription_key"
}
},
provide: {
maps: [ Zoom ]
}
}
</script>
<style>
.wrapper {
max-width: 400px;
margin: 0 auto;
}
</style>
`
```

Adding markers and navigation line

Markers can be added to the layers of tile Maps by setting the corresponding location's coordinates of latitude and longitude using e-markerSetting tag. Navigation lines can be added on top of an tile Maps layer for highlighting a path among various places by setting the corresponding location's coordinates of latitude and longitude in the e-navigationLineSetting tag.

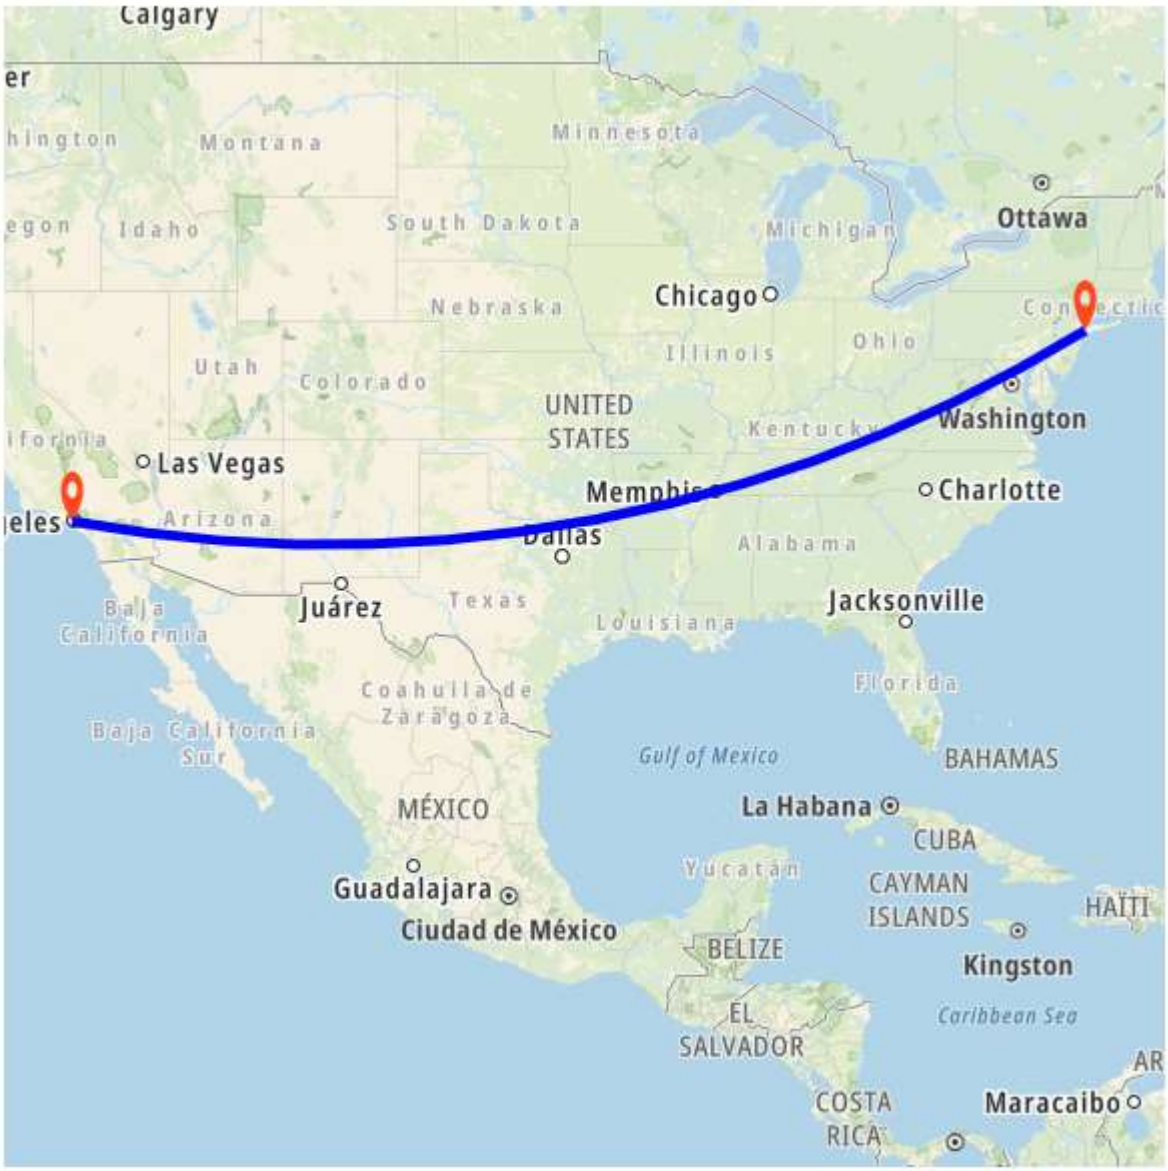
`

```
<template>
<div id="app">
<div class='wrapper'>
<ejs-maps :zoomSettings= 'zoomSettings' :centerPosition="centerPosition">
<e-layers>
<e-layer :urlTemplate= "urlTemplate">
<e-markerSettings>
```

```
<e-markerSetting visible= true height=25 width=15 :dataSource ="dataSource" ></e-markerSetting>
<e-markerSetting visible= true height=25 width=15 :dataSource ="dataSource1"></e-markerSetting>
</e-markerSettings>
<e-navigationLineSettings>
<e-navigationLineSetting visible = true :latitude ='latitude' :longitude ='longitude' :color ='color' :angle ='angle' :width="width">
</e-navigationLineSetting>
</e-navigationLineSettings>
</e-layer>
</e-layers>
</ejs-maps>
</div>
</div>
</template>
<script>
import Vue from 'vue';
import { MapsPlugin, MapsComponent, NavigationLine, Marker, Zoom } from '@syncfusion/ej2-vue-maps';
Vue.use(MapsPlugin);
export default {
data () {
return{
zoomSettings: {
zoomFactor: 4
},
centerPosition: {
latitude: 29.394708,
longitude: -94.954653
},
urlTemplate: "http://api.tomtom.com/map/1/tile/basic/main/level/tileX/tileY.png?key=subscription_key",
dataSource: [
{
latitude: 34.060620,
```

```
longitude: -118.330491,
name: "California"
}],
dataSource1: [
{
latitude: 40.724546,
longitude: -73.850344,
name: "New York"
}],
color: "blue",
width: 5,
angle: 0.1,
latitude: [34.060620, 40.724546],
longitude: [-118.330491,-73.850344]
}
},
provide: {
maps: [ Zoom, NavigationLine, Marker ]
}
}
</script>
<style>
.wrapper {
max-width: 400px;
margin: 0 auto;
}
</style>
`
```

Copyright © 2001 -2024 Syncfusion Inc.



Adding sublayer

Any GeoJSON shape can be rendered as a sublayer on top of the tile Maps layer for highlighting a particular continent or country in tile Maps by adding another layer and specifying the type property of Maps layer to **SubLayer**.

`

```
<template>
<div id="app">
<div class='wrapper'>
<ejs-maps >
<e-layers>
<e-layer :urlTemplate="urlTemplate"></e-layer>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
<e-layer :shapeData='shapeData1' :type = 'type' :shapeSettings='shapeSettings1' ></e-layer>
</e-layers>
</ejs-maps>
</div>
</div>
</template>
<script>
import Vue from 'vue';
import { MapsPlugin, MapsComponent } from '@syncfusion/ej2-vue-maps';
import { africa } from './africa.js';
Vue.use(MapsPlugin);
export default {
data () {
return{
urlTemplate:
"http://api.tomtom.com/map/1/tile/basic/main/level/tileX/tileY.png?key=subscription_key",
shapeData1: africa,
type: 'SubLayer',
shapeSettings1: {
fill: 'blue'
}
}
}
}
</script>
<style>
.wrapper {
max-width: 400px;
margin: 0 auto;
}
</style>
`
```

Copyright © 2001 -2024 Syncfusion Inc.

Enabling legend

The legend can be added to the tile Maps by setting the visible property of legendSettings to **true**.

`

```
<template>
<div id="app">
<div class='wrapper'>
<ejs-maps id='container' :legendSettings='legendSettings'>
<e-layers>
<e-layer :urlTemplate='urlTemplate' :shapeSettings='shapeSettings'
:markerSettings='markerSettings'></e-layer>
</e-layers>
</ejs-maps>
</div>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
</div>
</template>
<script>
import Vue from 'vue';
import { MapsPlugin, Marker, Legend } from '@syncfusion/ej2-vue-maps';
import { markerDataSource } from './marker-data.js';
Vue.use(MapsPlugin);
export default {
data () {
return {
urlTemplate:
'http://api.tomtom.com/map/1/tile/basic/main/level/tileX/tileY.png?key=subscription_key',
legendSettings: {
visible: true,
type: 'Markers',
useMarkerShape:true,
toggleLegendSettings: {
enable: true,
applyShapeSettings: false,
border: {
color: 'green',
width: 2
}
}
},
shapeSettings: {
fill: '#E5E5E5'
},
markerSettings: [
{
colorValuePath: 'color',
shapeValuePath:'shape',
legendText: 'country',
```

```
visible: true,
dataSource: markerDataSource
}
]
}
},
provide: {
maps: [Legend, Marker]
}
}
</script>
<style>
.wrapper {
max-width: 400px;
margin: 0 auto;
}
</style>
`
```

Customization in Vue Maps component

Setting the size for Maps

The width and height of the Maps can be set using the width and height properties in the Maps component. Percentage or pixel values can be used for the height and width values.

APP.VUE

```
<template>
    <div id="map">
        <div class='wrapper'>
            <ejs-maps height='300px' width='200px'>
                <e-layers>
                    <e-layer :shapeData='shapeData'></e-layer>
                </e-layers>
            </ejs-maps>
        </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { MapsPlugin } from '@syncfusion/ej2-vue-maps';
import { world_map } from './world-map.js';
```

```
Vue.use(MapsPlugin);
export default {
    data () {
        return {
            shapeData: world_map
        }
    }
}
</script>
<style>
  .wrapper {
    max-width: 400px;
    margin: 0 auto;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/maps/getting-started-cs19" %}

Maps title

The title for the Maps can be set using the titleSettings. It can be customized using the following properties.

- alignment - To customize the alignment for the text in the title for the Maps. The possible values are **Center**, **Near** and **Far**.
- description - To set the description of the title in Maps.
- text - To set the text for the title in Maps.
- textStyle - To customize the text of the title in Maps.
- subtitleSettings - To customize the subtitle for the Maps.

APP.VUE

```
<template>
    <div id="map">
        <div class='wrapper'>
            <ejs-maps :titleSettings='titleSettings'>
                <e-layers>
                    <e-layer :shapeData='shapeData'
:shapeSettings='shapeSettings'></e-layer>
                </e-layers>
            </ejs-maps>
        </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { MapsPlugin } from '@syncfusion/ej2-vue-maps';
import { world_map } from './world-map.js';
Vue.use(MapsPlugin);
export default {
    data () {
        return {
            titleSettings: {
                text: 'Maps Component',
                textStyle: {
```

Copyright © 2001 -2024 Syncfusion Inc.

```
                    color: 'red',
                    fontStyle: 'italic',
                    fontWeight: 'regular',
                    fontFamily: 'arial',
                    size: '14px'
                },
                alignment: 'Center'
            },
            shapeData: world_map,
            shapeSettings: {
                autofill: true
            }
        }
    }
}
</script>
<style>
  .wrapper {
    max-width: 400px;
    margin: 0 auto;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/maps/getting-started-cs20" %}

Setting theme

The Maps component supports following themes.

- Material
- Fabric
- Bootstrap
- Highcontrast
- MaterialDark
- FabricDark
- BootstrapDark
- Bootstrap4
- HighContrastLight
- Tailwind

By default, the Maps are rendered by the **Material** theme. The theme of the Maps component is changed using the theme property.

APP.VUE

```
<template>
    <div id="map">
        <div class='wrapper'>
            <ejs-maps theme="MaterialDark">
                <e-layers>
                    <e-layer :shapeData='shapeData'></e-layer>
                </e-layers>
            </ejs-maps>
        </div>
    </div>
```

```
</template>
<script>
import Vue from 'vue';
import { MapsPlugin } from '@syncfusion/ej2-vue-maps';
import { world_map } from './world-map.js';
Vue.use(MapsPlugin);
export default {
    data () {
        return {
            shapeData: world_map
        }
    }
}
</script>
<style>
  .wrapper {
    max-width: 400px;
    margin: 0 auto;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/maps/getting-started-cs21" %}

Customizing Maps container

The following properties are available to customize the container in the Maps.

- background - To apply the background color to the container in the Maps.
- border - To customize the color, width and opacity of the border of the Maps.
- margin - To customize the margins of the Maps.

APP.VUE

```
<template>
    <div id="map">
        <div class='wrapper'>
            <ejs-maps :background='background' :border='border'
:margin='margin'>
                <e-layers>
                    <e-layer :shapeData='shapeData'
:shapeSettings='shapeSettings'></e-layer>
                </e-layers>
            </ejs-maps>
        </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { MapsPlugin } from '@syncfusion/ej2-vue-maps';
import { world_map } from './world-map.js';
Vue.use(MapsPlugin);
export default {
    data () {
        return {
            shapeData: world_map,
            background: '#CCD1D1',
```

Copyright © 2001 -2024 Syncfusion Inc.

```
            border: {
                color: 'green',
                width: 2
            },
            margin: {
                bottom: 10,
                left: 20,
                right: 20,
                top: 10
            },
            shapeSettings: {
                autofill: true
            }
        }
    }
}
</script>
<style>
  .wrapper {
    max-width: 400px;
    margin: 0 auto;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/maps/getting-started-cs22" %}

Customizing Maps area

By default, the background color of the shape maps is set as **white**. To modify the background color of the Maps area, the background property in the mapsArea is used. The border of the Maps area can be customized using the border property in the mapsArea.

APP.VUE

```
<template>
    <div id="map">
        <div class='wrapper'>
            <ejs-maps :mapsArea='mapsArea'>
                <e-layers>
                    <e-layer :shapeData='shapeData'
:shapeSettings='shapeSettings'></e-layer>
                </e-layers>
            </ejs-maps>
        </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { MapsPlugin } from '@syncfusion/ej2-vue-maps';
import { world_map } from './world-map.js';
Vue.use(MapsPlugin);
export default {
    data () {
        return {
            shapeData: world_map,
            mapsArea: {
                background: '#CCD1D1',
```

```
                border: {
                    width: 2,
                    color: 'green'
                }
            },
            shapeSettings: {
                autofill: true,
            }
        }
    }
}
</script>
<style>
  .wrapper {
    max-width: 400px;
    margin: 0 auto;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/maps/getting-started-cs23" %}

Customizing the shapes

The following properties are available in shapeSettings to customize the shapes of the Maps.

- fill - To apply the fill color to the all the shapes.
- autofill - To apply the palette colors to the shapes if it is set as true.
- palette - To set the custom palette for the shapes.
- border - To customize the color, width and opacity of the border of the shapes.
- dashArray - To define the pattern of dashes and gaps that is applied to the outline of the shapes.
- opacity - To customize the transparency for the shapes.

APP.VUE

```
<template>
    <div id="map">
        <div class='wrapper'>
            <ejs-maps >
                <e-layers>
                    <e-layer :shapeData='shapeData'
:shapeSettings='shapeSettings'></e-layer>
                </e-layers>
            </ejs-maps>
        </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { MapsPlugin } from '@syncfusion/ej2-vue-maps';
import { world_map } from './world-map.js';
Vue.use(MapsPlugin);
export default {
data () {
    return {
        shapeData: world_map,
```

Copyright © 2001 -2024 Syncfusion Inc.

```
        shapeSettings: {
            autofill: true,
            palette: ['#C7DE6C', '#59A076', '#88D0BC', '#FEA78C',
'#FFC557'],
            border: {
                color: '#FEE1DD',
                width: 3
            },
            dashArray: '1',
            opacity: 0.9
        }
    }
}
}
</script>
<style>
  .wrapper {
    max-width: 400px;
    margin: 0 auto;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/maps/getting-started-cs24" %}

Setting color to the shapes from the data source

The color for each shape in the Maps can be set using the colorValuePath property of shapeSettings. The value for the colorValuePath property is the field name from the data source of the shapeSettings which contains the color values.

APP.VUE

```
<template>
    <div id="map">
        <div class='wrapper'>
            <ejs-maps>
                <e-layers>
                    <e-layer :shapeData='shapeData'
:shapePropertyPath='shapePropertyPath'
                                :shapeDataPath='shapeDataPath'
:dataSource='dataSource' :shapeSettings='shapeSettings'></e-layer>
                </e-layers>
            </ejs-maps>
        </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { MapsPlugin } from '@syncfusion/ej2-vue-maps';
import { world_map } from './world-map.js';
Vue.use(MapsPlugin);
export default {
    data () {
        return {
            shapeData: world_map,
            shapePropertyPath: 'continent',
            shapeDataPath: 'continent',
```

```
            dataSource: [
                { continent: "North America", color: '#71B081' },
                { continent: "South America", color: '#5A9A77' },
                { continent: "Africa", color: '#498770' },
                { continent: "Europe", color: '#39776C' },
                { continent: "Asia", color: '#266665' },
                { continent: "Oceania", color: '#124F5E' }
            ],
            shapeSettings: {
                colorValuePath: 'color',
            }
        }
    }
}
</script>
<style>
  .wrapper {
    max-width: 400px;
    margin: 0 auto;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/maps/getting-started-cs25" %}

Applying border to individual shapes

The border of each shape in the Maps can be customized using the borderColorValuePath and borderWidthValuePath properties to modify the color and the width of the border respectively. The field name in the data source of the layer which contains the color and the width values must be set in the borderColorValuePath and borderWidthValuePath properties respectively. If the values of borderColorValuePath and borderWidthValuePath do not match with the field name from the data source, then the color and width of the border will be applied to the shapes using the border property in the shapeSettings.

APP.VUE

```
<template>
    <div id="map">
        <div class='wrapper'>
            <ejs-maps>
                <e-layers>
                    <e-layer :shapeData='shapeData'
:shapePropertyPath='shapePropertyPath'
                             :shapeDataPath='shapeDataPath'
:dataSource='dataSource' :shapeSettings='shapeSettings'></e-layer>
                </e-layers>
            </ejs-maps>
        </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { MapsPlugin } from '@syncfusion/ej2-vue-maps';

Projection type

The Maps component supports the following projection types:

- Mercator
- Equirectangular
- Miller
- Eckert3
- Eckert5
- Eckert6
- Winkel3
- AitOff

By default, the Maps are rendered by the **Mercator** projection type in which the Maps are rendered based on the coordinates. So, the Maps is not stretched. To change the type of projection in the Maps, the projectionType property is used.

Color mapping in Vue Maps component

Color mapping is used to customize the shape colors based on the given values. It has three types.

1. Range color mapping
2. Equal color mapping
3. Desaturation color mapping.

To add color mapping to the shapes of the Maps, bind the data source to the dataSource property of layerSettings and set the field name which contains the color value in the data source to the colorValuePath property.

Copyright © 2001 -2024 Syncfusion Inc.

Types of color mapping

Range color mapping

Range color mapping applies the color to the shapes of the Maps which matches the numeric values in the data source within the given color mapping ranges. The from and to properties in the colorMapping are used to specify the color mapping ranges in the Maps.

```ts
export let population_density = [
https://ej2.syncfusion.com/vue/documentation.
{
'code': 'AE',
'value': 90,
'name': 'United Arab Emirates',
'population': 8264070,
'density': 99
},
{
'code': 'GB',
'value': 257,
'name': 'United Kingdom',
'population': 62041708,
'density': 255
},
{
'code': 'US',
'value': 34,
'name': 'United States',
'population': 325020000,
'density': 33
}
...
];
```

Bind the **population_density** data to the dataSource property of layerSettings and set the colorValuePath property of shapeSettings as **density**. The range values can be set using the from and to properties of colorMapping.

        shapeData: world_map,
        shapeDataPath: 'name',
        shapePropertyPath: 'name',
        dataSource: population_density,
        shapeSettings: {
            colorValuePath: 'density',
            fill: '#E5E5E5',
            colorMapping: [
                {
                    from: 0.00001, to: 100, color: 'rgb(153,174,214)'
                },
                {
                    from: 100, to: 200, color: 'rgb(115,143,199)'
                },
                {
                    from: 200, to: 300, color: 'rgb(77,112,184)'
                },
                {
                    from: 300, to: 500, color: 'rgb(38,82,168)'
                },
                {
                    from: 500, to: 19000, color: 'rgb(0,51,153)'
                }
            ]
        }
    }
},
}
</script>
<style>
  .wrapper {

```
    }
</style>
```

{% previewsample "page.domainurl/code-snippet/maps/getting-started-cs13" %}

Equal color mapping

Equal color mapping applies the color to the shapes of the Maps when the value property of colorMapping matches with the values provided in the data source. The following example shows how to apply equal color mapping to the shapes with the data source **unCountries** which illustrates the permanent and non-permanent countries in the UN security council.

`ts

export let unCountries: object[] = [

{ Country: 'China', Membership: 'Permanent' },

{ Country: 'France', Membership: 'Permanent' },

{ Country: 'Russia', Membership: 'Permanent' },

{ Country: 'United Kingdom', Membership: 'Permanent' },

{ Country: 'United States', Membership: 'Permanent' },

{ Country: 'Bolivia', Membership: 'Non-Permanent' },

{ Country: 'Eq. Guinea', Membership: 'Non-Permanent' },

{ Country: 'Ethiopia', Membership: 'Non-Permanent' },

{ Country: "Côte d'Ivoire", Membership: 'Permanent' },

{ Country: 'Kazakhstan', Membership: 'Non-Permanent' },

{ Country: 'Kuwait', Membership: 'Non-Permanent' },

{ Country: 'Netherlands', Membership: 'Non-Permanent' },

{ Country: 'Peru', Membership: 'Non-Permanent' },

{ Country: 'Poland', Membership: 'Non-Permanent' },

{ Country: 'Sweden', Membership: 'Non-Permanent' },

];

`

Bind the **unCountries** data to the dataSource property of layerSettings and set the colorValuePath property of shapeSettings as **Membership**. Set the value property in the colorMapping to **Permanent** and **Non-Permanent** in the different set of color mapping properties. If the corresponding value of the colorValuePath property matches with the corresponding field name in the data source, then the given color will be applied.

{% previewsample "page.domainurl/code-snippet/maps/getting-started-cs14" %}

Desaturation color mapping

Desaturation color mapping applies the color to the shapes of the Maps, similar to the range color mapping. The opacity will be applied in this color mapping based on the minOpacity and maxOpacity properties in the colorMapping.

Copyright © 2001 -2024 Syncfusion Inc.

The following example shows how to apply desaturation color mapping to the shapes with the data source **population_density** that is available in the Range color mapping section.

Bind the **population_density** data to the dataSource property of layerSettings and set the colorValuePath property of shapeSettings as **density**. The range values can be set using the from and to properties of colorMapping.

{% previewsample "page.domainurl/code-snippet/maps/getting-started-cs15" %}

Multiple colors for a single shape

Multiple colors can be added to the color mapping which can be used as gradient effect to a specific shape based on the ranges in the data source. By using the color property of colorMapping, any number of colors can be set to the shapes as a gradient.

The following example demonstrates how to use multiple colors in color mapping with the data source **population_density** that is available in the Range color mapping section.

Bind the **population_density** data to the dataSource property of layerSettings and set the colorValuePath property of shapeSettings as **density**. The range values can be set using the from and to properties of colorMapping.

{% previewsample "page.domainurl/code-snippet/maps/getting-started-cs16" %}

Color for items excluded from color mapping

Color mapping can be applied to the shapes in the Maps which does not match color mapping criteria such as range or equal values using the color property of colorMapping.

The following example shows how to set the color for items excluded from the color mapping with the data source **population_density** that is available in the Range color mapping section.

In the following example, color mapping is added for the ranges from 0 to 200. If there are any records in the data source that are outside of this range, the color mapping will not be applied. To apply the color for these excluded items, set the color property alone in the colorMapping.

APP.VUE

```
<template>

Data labels in Vue Maps component

Data labels provide information to users about the shapes of the Maps component. It can be enabled by setting the visible property of the dataLabelSettings to **true**.

To use the data label feature, the **DataLabel** module must be injected.

Adding data labels

To display the data labels in the Maps, set the field name containing the text to be displayed from the data source or shape data in the labelPath property of the dataLabelSettings property.

In the following example, the value of labelPath property is set from the field name in the shape data of the Maps layer.

APP.VUE

```
<template>

Customization

The following properties are available in the dataLabelSettings to customize the data label of the Maps component.

- border - To customize the color, width and opacity for the border of the data labels in Maps.
- fill - To apply the color of the data labels in Maps.
- opacity - To customize the transparency of the data labels in Maps.
- textStyle - To customize the text style of the data labels in Maps.

{% previewsample "page.domainurl/code-snippet/maps/getting-started-cs30" %}

Label animation

The data labels can be animated during the initial rendering of the Maps. This can be enabled by setting the animationDuration property in the dataLabelSettings of the Maps. The duration of the animation is specified in milliseconds.

{% previewsample "page.domainurl/code-snippet/maps/getting-started-cs106" %}

Smart labels

The Maps component provides an option to handle the labels when they intersect with the corresponding shape borders using the smartLabelMode property. The following options are available in the smartLabelMode property.

- **None** - It specifies that no action is taken, when a label exceeds the shape's region.
- **Hide** - It specifies to hide the labels, when it exceeds the shape's region.
- **Trim** - It specifies to trim the labels, when it exceeds the shape's region.

</style>
```

{% previewsample "page.domainurl/code-snippet/maps/getting-started-cs31" %}

Intersect action

The Maps component provides an option to handle the labels when a label intersects with another label using the intersectionAction property. The following options are available in the intersectionAction property.

- **None** - It specifies that no action is taken, when the labels intersect.
- **Hide** - It specifies to hide the labels when they intersect.
- **Trim** - It specifies to trim the labels when they intersect.

APP.VUE

```
<template>
    <div id="app">
          <div class='wrapper'>

{% previewsample "page.domainurl/code-snippet/maps/getting-started-cs32" %}

Adding data label as a template

The custom elements can be added as a template in the data labels by using the template property of dataLabelSettings in the Maps component.

The properties of data label such as, smartLabelMode , intersectionAction, animationDuration, border, fill, opacity and textStyle properties are not applicable to template property. The styles can be applied to the label template using the CSS styles of the HTML element.

Polygon shape in Vue Maps component

The Maps component allows you to add polygon shape to a geometry map or an online map by using the properties in the polygons. This section describes how to add polygon shape to the map and customize them.

Copyright © 2001 -2024 Syncfusion Inc.

To render polygon shapes in Maps, **Polygon** module must be injected into the Maps using provide:{ maps:[Polygon] } method. The polygon shape can be rendered over the map layer by defining the points property in the polygons of the Maps component. The points property uses a collection of latitude and longitude values to define the polygon shape.

The polygons provides the following properties for customizing the polygon shape of the Maps component.

- fill - It is used to change the color of the polygon shape.
- opacity - It is used to change the opacity of the polygon shape.
- borderColor - It is used to change the color of the border in the polygon shape.
- borderWidth - It is used to change the width of the border in the polygon shape.
- borderOpacity - It is used to change the opacity of the border in the polygon shape.

You can also include “n” polygon shapes using the polygons property.

The following example shows how to customize the polygon shape over the geometry map.

Markers in Vue Maps component

Markers are notes that are used to leave a message on the Maps. It indicates or marks a specific location with desired symbols on the Maps. It can be enabled by setting the visible property of the markerSettings to **true**.

Copyright © 2001 -2024 Syncfusion Inc.

Adding marker

To add the markers, the dataSource property of the markerSettings has a list of objects that contains the data for markers. Using this property, any number of markers can be added to the layers of the Maps. By default, it displays the markers based on the specified latitude and longitude in the given data source. Each data source object contains the following list of properties.

- latitude - The latitude point which determines the X location of the marker.
- longitude - The longitude point which determines the Y location of the marker.

Customization

The following properties are available in markerSettings to customize the Markers of the Maps component.

- border - To customize the color, width and opacity of the border for the markers in Maps.
- fill - To apply the color for markers in Maps.
- dashArray - To define the pattern of dashes and gaps that is applied to the outline of the markers in Maps.
- height - To customize the height of the markers in Maps.
- width - To customize the width of the markers in Maps.
- offset - To customize the position of the markers in Maps.

Copyright © 2001 -2024 Syncfusion Inc.

- opacity - To customize the transparency of the markers in Maps.
- animationDelay - To change the time delay in the transition for markers.
- animationDuration - To change the time duration of animation for markers.

Marker shapes

The Maps component supports the following marker shapes. To set the shape of the marker, the shape property in markerSettings is used.

- Balloon
- Circle
- Cross
- Diamond
- Image
- Rectangle
- Start
- Triangle
- VerticalLine
- HorizontalLine

Rendering marker shape as image

To render a marker as an image in Maps, set the shape property of markerSettings as **Image** and specify the path of the image to imageUrl property. There is another way to render a marker as an image using the imageUrlValuePath property of the markerSettings. Bind the field name that contains the path of the image in the data source to the imageUrlValuePath property.

  }
</style>
```

{% previewsample "page.domainurl/code-snippet/maps/getting-started-cs66" %}

Setting value path from the data source

The latitude and longitude values are used to determine the location of each marker in the Maps. The latitudeValuePath and longitudeValuePath properties are used to specify the value path that presents in the data source of the marker. In the following example, the field name from the data source is set to the latitudeValuePath and longitudeValuePath properties.

Repositioning the marker using drag and drop

The markers on the map can be dragged and dropped to change their position. To enable marker drag and drop, set the enableDrag property to **true** in the markerSettings property.

The data of the drag and dropped marker in the marker data source can be customized using the markerDragStart and markerDragEnd events. When you change the appropriate marker data, the tooltip and legend item text of that marker are automatically updated. The following properties are available in the event argument of the marker drag events.

Argument Name	Description
dataIndex	It represents the index of the data of the dragged marker in the marker data source.
latitude	It represents the latitude coordinate point of the dragged marker.
longitude	It represents the longitude coordinate point for the dragged marker.
markerIndex	It represents the index of the marker setting.
layerIndex	It represents the index of the layer in which the marker belongs.
name	It represents the name of the event.
x	It represents the horizontal location of the mouse pointer on the map when the drag action is performed.
y	It represents the vertical location of the mouse pointer on the map when the drag action is performed.

The following example shows how to use marker drag events to customize the data of the drag and dropped marker in the marker data source.

{% previewsample "page.domainurl/code-snippet/maps/getting-started-cs68" %}

Marker Clustering

Maps provide support to cluster the markers when they overlap each other. The number on a cluster indicates how many overlapped markers it contains. If zooming is performed on any of the cluster locations in Maps, the number on the cluster will decrease, and the individual markers will be seen on the map. When zooming out, the overlapping marker will increase. So that it can cluster again and increase the count over the cluster.

To enable clustering in markers, set the allowClustering property of markerClusterSettings as **true** and customization of clustering can be done with the markerClusterSettings.

APP.VUE

```

Customization of marker cluster

The following properties are available to customize the marker clustering in the Maps component.

- border - To customize the color, width and opacity of the border of cluster in Maps.
- connectorLineSettings - To customize the connector line in cluster separating the markers.
- dashArray - To customize the dash array for the marker cluster in Maps.
- fill - Applies the color of the cluster in Maps.
- height - To customize the height of the marker cluster in Maps.
- imageUrl - To customize the URL path for the marker cluster when the cluster shape is set as image in Maps.
- labelStyle - To customize the text in marker cluster.

Copyright © 2001 -2024 Syncfusion Inc.

- offset - To customize the offset position for the marker cluster in Maps.
- opacity - To customize the opacity of the marker cluster.
- shape - To customize the shape for the cluster of markers.
- width - To customize the width of the marker cluster in Maps.

Expanding the marker cluster

The cluster is formed by grouping an identical and non-identical marker from the surrounding area. By clicking on the cluster and setting the allowClusterExpand property in markerClusterSettings as **true** to expand the identical markers. If zooming is performed in any of the locations of the cluster, the number on the cluster will decrease and the overlapping marker will be split into an individual marker on the map. When performing zoom out, it will increase the marker count and then cluster it again.

Tooltip for marker

Tooltip is used to display more information about a marker on mouse over or touch end event. This can be enabled separately for marker by setting the visible property of tooltipSettings to **true**. The valuePath property in the tooltipSettings takes the field name that presents in dataSource and displays that value as tooltip text.

Bubble in Vue Maps component

Bubbles in the Maps component represent the underlying data values of the Maps. It can be scattered throughout the Maps shapes that contain values in the data source. Bubbles are enabled by setting the visible property of bubbleSettings to **true**. To add bubbles to the Maps, bind the data source to the dataSource property of bubbleSettings and set the field name, that contains the numerical data, in the data source to the valuePath property.

`ts

export let world_map = // paste the world map from worldMap.json GeoJSON file.

`

Bubble shapes

The following types of shapes are available to render the bubbles in Maps.

- Circle
- Square

By default, bubbles are rendered in the **Circle** type. To change the type of the bubble, set the bubbleType property of bubbleSettings as **Square** to render the square shape bubbles.

Customization

The following properties are available in bubbleSettings to customize the bubbles of the Maps component.

- border - To customize the color, width and opacity of the border of the bubbles in Maps.
- fill - To apply the color for bubbles in Maps.
- opacity - To apply opacity to the bubbles in Maps.
- animationDelay - To change the time delay in the transition for bubbles.
- animationDuration - To change the time duration of animation for bubbles.

Legend in Vue Maps component

A Legend is a visual representation of the symbols used on the Maps. It can be represented in various colors, shapes or other identifiers based on the data and provides valuable information for interpreting what the Maps are displaying. It explains what each symbol in the Maps represents. Legends are enabled by setting the visible property of legendSettings to **true**.

Copyright © 2001 -2024 Syncfusion Inc.

Modes of legend

Legend had two types of mode.

1. **Default** mode
2. **Interactive** mode

Default mode

Default mode legends having symbols with legend labels, used to identify the shape or bubble or marker color. To enable this option by setting the mode property of legendSettings as **Default**.

Interactive mode

The legends can be made interactive with an arrow mark indicating the exact range color in the legend when the mouse hovers over the corresponding shapes. To enable this type of mode by setting the mode property of legendSettings as **Interactive**. The invertedPointer property is used to enable or disable the visibility of the inverted pointer in interactive legend in Maps.

Positioning of the legend

The legend can be positioned in the following two ways:

- Absolute position
- Dock position

Absolute position

The legend of the Maps can be positioned using the location property in the legendSettings. For positioning the legend based on co-ordinates corresponding to a Maps, the position property is set as **Float**.

Dock position

Legends are positioned in the following locations within the container. The position property in legendSettings is used to set these options in Maps.

- Top
- Left
- Bottom
- Right

The above four positions can be aligned with combination of **Near**, **Center** and **Far** using alignment property in legendSettings. So, the legend can be aligned to 12 positions.

Legend for shapes

Legend for shapes can be generated from color mapping types such as equal color mapping, range color mapping and desaturation color mapping.

The below code snippet demonstrate the equal color mapping legends for the shapes. To bind the given data source to the dataSource property of layerSettings. Set the value of shapePropertyPath to **name** and shapeDataPath to **Country**. To enable equal color mapping, set the colorMapping as an array in shapeSettings. Finally, set the visible property of legendSettings as **true**. The label property in colorMapping is used to set the text name for legend in Maps.

Legend shape

Maps supports the following types of legend shapes. The shape property in the legendSettings can be used to change the type of legend shapes.

- Circle
- Rectangle
- Triangle
- Diamond
- Cross
- Star
- HorizontalLine
- VerticalLine
- Pentagon
- InvertedTriangle

The shape of legends can be customized by using the shapeWidth, shapeHeight, shapeBorder and shapePadding properties.

Customization

The following properties are available in legend to customize the legend shape and legend text in Maps.

- background - To customize the background color of the Legend.
- border - To customize the color, width and opacity of the border for the Legend.
- fill - To apply the color for the Legend.
- labelDisplayMode - To customize the display mode for the Legend text.
- labelPosition - To customize the position of the Legend text.
- orientation - To customize the orientation of the Legend.
- textStyle - To customize the text style for Legend.
- title - To apply the title for the Legend.

Copyright © 2001 -2024 Syncfusion Inc.

- titleStyle - To customize the style of the title for the Legend.
- height - To customize the height of the Legend.
- width - To customize the width of the Legend.
- opacity - To apply the opacity to the Legend.

{% previewsample "page.domainurl/code-snippet/maps/getting-started-cs54" %}

Legend for items excluded from color mapping

The legend can be enabled for items excluded from the color mapping using the color property in colorMapping. Refer to the **population_density** data which demonstrates the population density of some countries.

`ts

export let population_density = [

https://ej2.syncfusion.com/vue/documentation.

{

'code': 'AE',

'value': 90,

'name': 'United Arab Emirates',

'population': 8264070,

'density': 99

},

Copyright © 2001 -2024 Syncfusion Inc.

{

'code': 'GB',

'value': 257,

'name': 'United Kingdom',

'population': 62041708,

'density': 255

},

{

'code': 'US',

'value': 34,

'name': 'United States',

'population': 325020000,

'density': 33

}

...

];

`

In the following example, color mapping is added for the ranges from **0** to **200**. If there are any records in the data source that are outside of this range, the color mapping will not be applied. To apply the color for these excluded items, set the color property alone in the colorMapping. To enable legend for these items, set the visible property of legendSettings to **true**.

Toggle option in legend

The toggle option has been provided for legend. If the legend can be toggled, the given color will be changed to the corresponding Maps shape item. To enable the toggle options in Legend, set the enable property of the toggleLegendSettings to **true**.

The following properties are available to customize the toggle option in legend.

Copyright © 2001 -2024 Syncfusion Inc.

- applyShapeSettings – To apply the fill property value to the shape of the Maps when toggling the legend items.
- fill - To apply the color to the shape of the Maps for which legend item is toggled.
- opacity – To customize the transparency for the shapes for which legend item is toggled.
- border – To customize the color, width and opacity of the border of the shapes in Maps.

Annotations in Vue Maps component

Annotations are used to mark the specific area of interest in the Maps with texts, shapes, or images. Any number of annotations can be added to the Maps component.

Annotation

By using the content property of e-maps-annotation, text content or id of an element or an HTML string can be specified to render a new HTML element in Maps.

Annotation customization

Changing the z-index

The stack order of an annotation element can be changed using the zIndex property in the e-maps-annotation.

APP.VUE

```
<template>
    <div id="app">
          <div class='wrapper'>
            <ejs-maps >
                <e-maps-annotations>
                  <e-maps-annotation :content='contentTemplate' :x='x1'
:y='y1' :zIndex='zindex'>
                  </e-maps-annotation>
                </e-maps-annotations>
                <e-layers>
                    <e-layer :shapeData='shapeData' >
                    </e-layer>
                </e-layers>
            </ejs-maps>
        </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { MapsPlugin, MapsComponent, Annotations } from '@syncfusion/ej2-vue-
maps';
import { world_map } from './world-map.js';
Vue.use(MapsPlugin);
export default {
data () {
    return{
       shapeData: world_map,
       zindex:1,
       x1:'0%',
       y1:'50%',
       contentTemplate: function () {
          return {
          template: Vue.component('MapsComponent', {
            template: '<div id="first"><h1>Maps</h1></div>',
            data() { return {  }; }
          })
        }
      },
    }
},
provide: {
    maps: [ Annotations ]
}
}
</script>
<style>
  .wrapper {
    max-width: 400px;
    margin: 0 auto;
```

```
   }
</style>
```

{% previewsample "page.domainurl/code-snippet/maps/getting-started-cs2" %}

Positioning an annotation

Annotations can be placed anywhere in the Maps by specifying pixel or percentage values to the x and y properties in the e-maps-annotation.

APP.VUE

```
<template>
    <div id="app">
          <div class='wrapper'>
            <ejs-maps >
                <e-maps-annotations>
                  <e-maps-annotation :content='contentTemplate' :x='x1'
:y='y1' :zIndex='zindex'>
                  </e-maps-annotation>
                </e-maps-annotations>
                <e-layers>
                    <e-layer :shapeData='shapeData' >
                    </e-layer>
                </e-layers>
            </ejs-maps>
        </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { MapsPlugin, MapsComponent, Annotations } from '@syncfusion/ej2-vue-
maps';
import { world_map } from './world-map.js';
Vue.use(MapsPlugin);
export default {
data () {
    return{
       shapeData: world_map,
       zindex:1,
       x1:'20%',
       y1:'50%',
       contentTemplate: function () {
          return {
          template: Vue.component('MapsComponent', {
            template: '<div id="first"><h1>Maps</h1></div>',
            data() { return {  }; }
          })
        }
      },
    }
},
provide: {
    maps: [ Annotations ]
}
}
</script>
```

```
<style>
  .wrapper {
    max-width: 400px;
    margin: 0 auto;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/maps/getting-started-cs3" %}

Alignment of an annotation

Annotations can be aligned using the horizontalAlignment and verticalAlignment properties in the e-maps-annotation. The possible values can be **Center**, **Far**, **Near** and **None**.

APP.VUE

```
<template>
    <div id="app">
          <div class='wrapper'>
            <ejs-maps >
                <e-maps-annotations>
                  <e-maps-annotation :content='contentTemplate' :x='x1'
:y='y1' :zIndex='zindex'
                  horizontalAlignment='Center' verticalAlignment='Center'>
                  </e-maps-annotation>
                </e-maps-annotations>
                <e-layers>
                    <e-layer :shapeData='shapeData' >
                    </e-layer>
                </e-layers>
            </ejs-maps>
        </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { MapsPlugin, MapsComponent, Annotations } from '@syncfusion/ej2-vue-
maps';
import { world_map } from './world-map.js';
Vue.use(MapsPlugin);
export default {
data () {
    return{
       shapeData: world_map,
       zindex:1,
       x1:'20%',
       y1:'50%',
       contentTemplate: function () {
          return {
          template: Vue.component('MapsComponent', {
            template: '<div id="first"><h1>Maps</h1></div>',
            data() { return {  }; }
          })
        }
      },
    }
},
```

```
provide: {
    maps: [ Annotations ]
}
}
</script>

{% previewsample "page.domainurl/code-snippet/maps/getting-started-cs5" %}

Navigation line in Vue Maps component

The navigation lines are used to denote the path between two locations. This feature can be used to draw flight or sea routes. Navigation lines are enabled by setting the visible property of the navigationLineSettings to **true**.

Customization

The following properties are available in navigationLineSettings to customize the navigation line of the Maps component.

- color - To apply the color for navigation lines in Maps.
- dashArray - To define the pattern of dashes and gaps that is applied to the outline of the navigation lines.
- width - To customize the width of the navigation lines.
- angle - To customize the angle of the navigation lines.
- highlightSettings - To customize the highlight settings of the navigation line.
- selectionSettings - To customize the selection settings of the navigation line.

To navigate the line between two cities on the world map, latitude and longitude values are used to indicate the start and end points of navigation lines drawn on Maps.

Enabling the arrows

To enable the arrow in the navigation line, set the showArrow property of arrowSettings to **true**. The following properties are available in arrowSettings to customize the arrow of the navigation lines.

- color - To apply the color for arrow of the navigation line.
- offset - To customize the offset position of the arrow of the navigation line.

Copyright © 2001 -2024 Syncfusion Inc.

- position - To customize the position of the arrow in navigation line. The possible values can be **Start** and **End**.
- size - To customize the size of the arrow in pixels.

User interactions in Vue Maps component

Zooming

The zooming feature is used to zoom in and out of Maps to show in-depth information. It is controlled by the zoomFactor property of the zoomSettings. The zoomFactor is increased or decrease dynamically based on zoom in and out interaction.

Enable zooming

Zooming of Maps is enabled by setting the enable property of zoomSettings to **true**.

Enable panning

To enable the panning feature, set the enablePanning property of zoomSettings to **true**.

`

<template>

<ejs-maps :zoomSettings='zoomSettings' >

<e-layers>

<e-layer :shapeData='shapeData' ></e-layer>

</e-layers>

</ejs-maps>

</template>

<script>

import Vue from 'vue';

import { MapsPlugin, Zoom } from '@syncfusion/ej2-vue-maps';

import { world_map } from './world-map.js';

Vue.use(MapsPlugin);

export default {

data () {

return{

zoomSettings: {

enable: true,

Copyright © 2001 -2024 Syncfusion Inc.

```
enablePanning: true
},
shapeData: world_map,
}
},
provide: {
maps: [Zoom]
}
}
</script>
<style>
.wrapper {
max-width: 400px;
margin: 0 auto;
}
</style>
`
```

Various type of zooming

Zooming can be performed in following types:

Zooming toolbar

By default, the toolbar is rendered with **zoom-in**, **zoom-out**, and **reset** options when it is set to **true** in the enable property of zoomSettings.

The following options are available in toolbar.

1. Zoom - Provides rectangular zoom support.
2. ZoomIn - Zoom in the Maps.
3. ZoomOut - Zoom out the Maps.
4. Pan - Switches to panning if rectangular zoom is activated.
5. Reset - Restores the Maps to the default view.

```
`
<template>
<div id="app">
<div class='wrapper'>
<ejs-maps :zoomSettings='zoomSettings' >
<e-layers>
```

```
<e-layer :shapeData='shapeData' ></e-layer>
</e-layers>
</ejs-maps>
</div>
</div>
</template>
<script>
import Vue from 'vue';
import { MapsPlugin, Zoom } from '@syncfusion/ej2-vue-maps';
import { world_map } from './world-map.js';
Vue.use(MapsPlugin);
export default {
data () {
return{
zoomSettings: {
enable: true,
buttonSettings: {
toolbarItems: ['Zoom', 'ZoomIn', 'ZoomOut', 'Pan', 'Reset']
}
},
shapeData: world_map,
}
},
provide: {
maps: [Zoom]
}
}
</script>
<style>
.wrapper {
max-width: 400px;
margin: 0 auto;
}
```

```
</style>
`
```

Pinch zooming

To enable or disable the pinch zooming, use the pinchZooming property in zoomSettings.

```
`
<template>
<div id="app">
<div class='wrapper'>
<ejs-maps :zoomSettings='zoomSettings' >
<e-layers>
<e-layer :shapeData='shapeData' ></e-layer>
</e-layers>
</ejs-maps>
</div>
</div>
</template>
<script>
import Vue from 'vue';
import { MapsPlugin, Zoom } from '@syncfusion/ej2-vue-maps';
import { world_map } from './world-map.js';
Vue.use(MapsPlugin);
export default {
data () {
return{
zoomSettings: {
enable: true,
pinchZooming: true
},
shapeData: world_map,
}
},
provide: {
maps: [Zoom]
```

```
}
}
</script>
<style>
.wrapper {
max-width: 400px;
margin: 0 auto;
}
</style>
`
```

Single-click zooming

To enable or disable the single-click zooming, use the zoomOnClick property in zoomSettings.

```
`
<template>
<div id="app">
<div class='wrapper'>
<ejs-maps :zoomSettings='zoomSettings' >
<e-layers>
<e-layer :shapeData='shapeData' ></e-layer>
</e-layers>
</ejs-maps>
</div>
</div>
</template>
<script>
import Vue from 'vue';
import { MapsPlugin, Zoom } from '@syncfusion/ej2-vue-maps';
import { world_map } from './world-map.js';
Vue.use(MapsPlugin);
export default {
data () {
return{
zoomSettings: {
```

```
enable: true,
zoomOnClick: true
},
shapeData: world_map,
}
},
provide: {
maps: [Zoom]
}
}
</script>
<style>
.wrapper {
max-width: 400px;
margin: 0 auto;
}
</style>
`
```

Double-click zooming

To enable or disable the double-click zooming, use the doubleClickZoom property in zoomSettings.

```
`
<template>
<div id="app">
<div class='wrapper'>
<ejs-maps :zoomSettings='zoomSettings' >
<e-layers>
<e-layer :shapeData='shapeData' ></e-layer>
</e-layers>
</ejs-maps>
</div>
</div>
</template>
<script>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
import Vue from 'vue';
import { MapsPlugin, Zoom } from '@syncfusion/ej2-vue-maps';
import { world_map } from './world-map.js';
Vue.use(MapsPlugin);
export default {
data () {
return{
zoomSettings: {
enable: true,
doubleClickZoom: true
},
shapeData: world_map,
}
},
provide: {
maps: [Zoom]
}
}
</script>
<style>
.wrapper {
max-width: 400px;
margin: 0 auto;
}
</style>
`
```

Mouse wheel zooming

To enable or disable mouse wheel zooming, use the mouseWheelZoom property in zoomSettings.

```
`
<template>
<div id="app">
<div class='wrapper'>
<ejs-maps :zoomSettings='zoomSettings' >
```

```
<e-layers>
<e-layer :shapeData='shapeData' ></e-layer>
</e-layers>
</ejs-maps>
</div>
</div>
</template>
<script>
import Vue from 'vue';
import { MapsPlugin, Zoom } from '@syncfusion/ej2-vue-maps';
import { world_map } from './world-map.js';
Vue.use(MapsPlugin);
export default {
data () {
return{
zoomSettings: {
enable: true,
mouseWheelZoom: true
},
shapeData: world_map,
}
},
provide: {
maps: [Zoom]
}
}
</script>
<style>
.wrapper {
max-width: 400px;
margin: 0 auto;
}
</style>
```

Copyright © 2001 -2024 Syncfusion Inc.

`

Selection zooming

To enable or disable selection zooming, use the enableSelectionZooming property in zoomSettings. The enablePanning property must be set to **false** to enable the selection zooming in Maps.

`

```
<template>
<div id="app">
<div class='wrapper'>
<ejs-maps :zoomSettings='zoomSettings' >
<e-layers>
<e-layer :shapeData='shapeData' ></e-layer>
</e-layers>
</ejs-maps>
</div>
</div>
</template>
<script>
import Vue from 'vue';
import { MapsPlugin, Zoom } from '@syncfusion/ej2-vue-maps';
import { world_map } from './world-map.js';
Vue.use(MapsPlugin);
export default {
data () {
return{
zoomSettings: {
enable: true,
enableSelectionZooming: true,
enablePanning: false
},
shapeData: world_map,
}
},
provide: {
maps: [Zoom]
```

```
}
}
</script>
<style>
.wrapper {
max-width: 400px;
margin: 0 auto;
}
</style>
`
```

Setting minimum and maximum values for zoom factor

The zooming range can be adjusted using the minZoom and maxZoom properties in zoomSettings. The minZoom value is set to 1 by default, and the maxZoom value is set to 10.

```
`
<template>
<div id="app">
<div class='wrapper'>
<ejs-maps :zoomSettings='zoomSettings' >
<e-layers>
<e-layer :shapeData='shapeData' ></e-layer>
</e-layers>
</ejs-maps>
</div>
</div>
</template>
<script>
import Vue from 'vue';
import { MapsPlugin, Zoom } from '@syncfusion/ej2-vue-maps';
import { world_map } from './world-map.js';
Vue.use(MapsPlugin);
export default {
data () {
return{
zoomSettings: {
```

```
enable: true,
minZoom: 2,
maxZoom: 12
},
shapeData: world_map,
}
},
provide: {
maps: [Zoom]
}
}
</script>
<style>
.wrapper {
max-width: 400px;
margin: 0 auto;
}
</style>
`
```

Zooming with animation

To zoom in or zoom out the Maps with animation, use the animationDuration property in layers.

```
`
<template>
<div id="app">
<div class='wrapper'>
<ejs-maps :zoomSettings='zoomSettings' >
<e-layers>
<e-layer :shapeData='shapeData' :animationDuration='animationDuration' ></e-layer>
</e-layers>
</ejs-maps>
</div>
</div>
</template>
```

```
<script>
import Vue from 'vue';
import { MapsPlugin, Zoom } from '@syncfusion/ej2-vue-maps';
import { world_map } from './world-map.js';
Vue.use(MapsPlugin);
export default {
data () {
return{
zoomSettings: {
enable: true,
mouseWheelZoom: true
},
shapeData: world_map,
animationDuration: 500
}
},
provide: {
maps: [Zoom]
}
}
</script>
<style>
.wrapper {
max-width: 400px;
margin: 0 auto;
}
</style>
`
```

APP.VUE

```

Customizing the zoom toolbar

The zoom toolbar can be customized by using the toolbarSettings option in the zoomSettings. The following properties can be used to customize the zoom toolbar.

- backgroundColor - It is used to customize the background color of the zoom toolbar.
- borderOpacity - It is used to customize the opacity of the border of the zoom toolbar.
- borderWidth - It is used to customize the thickness of the border of the zoom toolbar.
- borderColor - It is used to customize the color of the border of the zoom toolbar.
- horizontalAlignment - It is used to position the zoom toolbar in near, far, and center positions to customize its horizontal placement.
- verticalAlignment - It is used to position the zoom toolbar in near, far, and center positions to customize its vertical placement.
- orientation - It is used to change the orientation (horizontal/vertical) of the zoom toolbar.

Customizing the buttons in the zoom toolbar

The appearance of the buttons in the zoom toolbar can be customized by using the buttonSettings option in the toolbarSettings of the zoomSettings property. The following properties can be used to customize the zoom toolbar buttons.

- fill - It is used to set the background color of the buttons.
- color - It is used to customize the color of the icons inside the button.
- borderOpacity - It is used to set the opacity of the border of the zoom toolbar buttons.
- borderWidth - It is used to set the thickness of the border of the zoom toolbar buttons.

Copyright © 2001 -2024 Syncfusion Inc.

- borderColor - It is used to set the color of the border of the zoom toolbar buttons.
- radius - It is used to set the size of the button.
- selectionColor - It is used to set the color of the icons inside the button when selection is performed.
- highlightColor - It is used to change the color of the button when the mouse is hovered over it.
- padding - It is used to change the padding space between each button.
- opacity - It is used to change the opacity of the button.
- toolbarItems - It is used to change the items that should be displayed in the zoom toolbar. By default, zoom-in, zoom-out, and reset buttons will be available. Other options include selection zoom and panning.

Selection

Each shape in the Maps can be selected and deselected during interaction with the shapes. Selection is enabled by setting the enable property of selectionSettings to **true**.

The following properties are available to customize the selection of Maps elements such as shapes, bubbles, markers and legends.

- border - To customize the color, width and opacity of the border of which element is selected in Maps.
- fill - Applies the color for the element that is selected.
- opacity - To customize the transparency for the element that is selected.
- enableMultiSelect - To enable or disable the selection for multiple shapes or markers or bubbles in the Maps.

By tapping on the specific legend, the shapes which are bounded to the selected legend is also selected and vice versa.

Enable selection for polygons

When the enable property of selectionSettings is set to **true**, the polygon shapes can be selected via user interaction. The following properties are available in selectionSettings to customize the polygon shape when it is selected.

- enableMultiSelect - It is used to enable multiple selection of polygon shapes.
- fill - It is used to change the color of the selected polygon shape.
- opacity - It is used to change the opacity of the selected polygon shape.
- border - This property is used to change the color, width, and opacity of the border of the selected polygon shape.

To use the polygon feature, the **Polygon** module must be injected, as described in this link.

The following example shows how to select the polygon shape in the geometry map.

Public method for the shape selection

The shapeSelection method can be used to select each shape in the Maps.

LayerIndex, propertyName, country name, and selected value as a boolean state(true / false) are the input parameters for this method.

Initial marker selection

Using the initialMarkerSelection, the marker shape can be selected initially. Markers render based on the latitude and longitude values.

Note: initialMarkerSelection is an Array property.

APP.VUE

```

{% previewsample "page.domainurl/code-snippet/maps/getting-started-cs96" %}

Enable highlight for polygons

The polygon shapes can be highlighted via user interaction if the enable property of highlightSettings is set to **true**. The following properties are available in highlightSettings to customize the polygon shape when it is highlighted.

- fill - It is used to change the color of the highlighted polygon shape.
- opacity - It is used to change the opacity of the highlighted polygon shape.
- border - This property is used to change the color, width, and opacity of the border of the highlighted polygon shape.

To use the polygon feature, the **Polygon** module must be injected, as described in this link.

The following example shows how to highlight a polygon shape on a geometry map.

APP.VUE

```
<template>
    <div id="app">
        <div class='wrapper'>
```

```
            <ejs-maps>
                <e-layers>
                    <e-layer :shapeData='shapeData'
:polygonSettings='polygonSettings'></e-layer>
                </e-layers>
            </ejs-maps>
        </div>
    </div>

Tooltip

On mouse over or touch end event, the tooltip is used to get more information about the layer, bubble, or marker. It can be enabled separately for layer or bubble or marker by using the visible property of tooltipSettings as **true**. The valuePath property in the tooltip takes the field name that presents in dataSource and displays that value as tooltip text. The tooltipDisplayMode property is used to change the display mode of the tooltip in Maps. Following display modes of tooltip are available in the Maps component. By default, tooltipDisplayMode is set to **MouseMove**.

- MouseMove
- Click
- DoubleClick

Customization

The following properties are available in the tooltipSettings to customize the tooltip of the Maps component.

- border - To customize the color, width and opacity of the border of the tooltip in layers, markers, and bubbles of Maps.
- fill - Applies the color of the tooltip in layers, markers, and bubbles of Maps.
- format - To customize the format of the tooltip in layers, markers, and bubbles of Maps
- textStyle - To customize the style of the text in the tooltip for layers, markers, and bubbles of Maps.

Tooltip template

The HTML element can be rendered in the tooltip of the Maps using the template property of the tooltipSettings. In the following example, ${value1} and ${value2} are the place holders in the HTML element to display the value1 and value2 values of the corresponding shape.

APP.VUE

```
<template>
    <div id="app">
          <div class='wrapper'>
            <ejs-maps>
                <e-layers>
                    <e-layer :shapeData='shapeData'
:shapePropertyPath='shapePropertyPath' :shapeDataPath='shapeDataPath'
:dataSource='dataSource' :tooltipSettings='tooltipSettings' ></e-layer>
                </e-layers>
            </ejs-maps>
        </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { MapsPlugin, MapsTooltip } from '@syncfusion/ej2-vue-maps';
import { world_map } from './world-map.js';
import { default_data } from './default-data.js';
Vue.use(MapsPlugin);
export default {
data () {
    return{
        shapeData: world_map,
        shapePropertyPath: 'continent',
        shapeDataPath: 'continent',
        dataSource: default_data,
        tooltipSettings: {
            visible: true,
```

Copyright © 2001 -2024 Syncfusion Inc.

```
            valuePath: 'continent',
            template: '<div style="width:60px; text-align:center;

{% previewsample "page.domainurl/code-snippet/maps/getting-started-cs99" %}

Print in Vue Maps component

Print

The rendered Maps can be printed directly from the browser by calling the print method. To use the print functionality, **Print** module must be injected into the Maps using **provide** section and set the allowPrint property to **true**. The following code snippet demonstrates injecting the Print module into the Maps component.

`

<template>

<ejs-maps id='maps'></ejs-maps>

</template>

<script>

export default ({

data() {

return{ };

},

provide: {

maps: [Print]

}

</script>

});

`

APP.VUE

```
<template>
    <div id="app">
        <button id="print" @click="clickPrint">Print</button>
        <ejs-maps id='container' :allowPrint='allowPrint' ref="maps"
height='450px' width='500px'>
            <e-layers>
                <e-layer :shapeData='shapeData'
:dataLabelSettings='dataLabelSettings' :shapeSettings='shapeSettings'
:tooltipSettings='tooltipSettings' ></e-layer>
            </e-layers>
        </ejs-maps>
    </div>
</template>
<script>
import Vue from 'vue';
import { MapsPlugin, MapsTooltip, DataLabel, Print } from '@syncfusion/ej2-
vue-maps';
import { usMap } from './usa.js';
import { ButtonPlugin } from '@syncfusion/ej2-vue-buttons';
Vue.use(MapsPlugin,ButtonPlugin);
export default {
data () {
    return {
        dataLabelSettings: {
            visible: true,
            labelPath: 'name',
            smartLabelMode: 'Trim'
        },
        shapeData: usMap,
        shapeSettings: {
            autofill: true
        },
        tooltipSettings: {
            visible: true,
            valuePath: 'name'
        },
        allowPrint: true
    }
},
provide: {
    maps: [MapsTooltip, DataLabel, Print]
},
methods: {
    clickPrint: function(args) {
        let map=document.getElementById('container');
        map.ej2_instances[0].print();
    }
}
}
</script>
```

Export

Image Export

To use the image export functionality in Maps, **ImageExport** module must be injected into the Maps using **provide** section and set the allowImageExport property to **true**.

`

<template>

<ejs-maps id='maps'></ejs-maps>

</template>

<script>

export default ({

data() {

return{ };

},

provide: {

maps: [ImageExport]

}

</script>

});

`

The rendered Maps can be exported as an image using the export method. The method requires two parameters: image type and file name. The Maps can be exported as an image in the following formats.

- JPEG
- PNG
- SVG

APP.VUE

```
<template>
    <div id="app">
        <button id="export" @click="clickExport">Export</button>
        <ejs-maps  id='container' :allowImageExport='allowImageExport'
ref='maps' height='450px' width='500px'>
            <e-layers>
                <e-layer :shapeData='shapeData'
:markerSettings='markerSettings' :shapeSettings='shapeSettings'></e-layer>
            </e-layers>
        </ejs-maps>
    </div>
</template>
<script>
import Vue from 'vue';
```

```
import { MapsPlugin, MapsTooltip, Marker, ImageExport} from
'@syncfusion/ej2-vue-maps';
import { world_map } from './world-map.js';
Vue.use( MapsPlugin );
export default {
data () {
    return {
        shapeData: world_map,
        shapeSettings: { fill: 'lightgrey', border: { color: 'black', width:
0.1 } },
        allowImageExport: true,
        markerSettings: [
            {
                animationDuration: 0,
                visible: true,
                dataSource: [
                    { longitude: 116.5703749, latitude: 40.4319077, name:

                    { longitude: 12.4922309, latitude: 41.8902102, name:
'The Roman Colosseum, Rome, Italy' },
                    { longitude: -88.5677826, latitude: 20.6842849, name:
'The Chichen Itza, Mexico' },
                    { longitude: -72.5449629, latitude: -13.1631412, name:
'Machu Picchu, Peru' },
                    { longitude: -43.2104872, latitude: -22.951916, name:
'Christ Redeemer, Rio de janeiro, Brazil'}
                ],
                shape: 'Balloon',
                fill: '#E13E40',
                height: 20,
                width: 15,
                tooltipSettings: {
                    visible: true,
                    valuePath: 'name'
                }
            }
        ]
    }
},
provide: {
    maps: [Marker, MapsTooltip, ImageExport]
},
methods: {
     clickExport: function(args) {
        let map = document.getElementById('container');
        map.ej2_instances[0].export("PNG", "Maps");
    }
}
};
</script>
```

{% previewsample "page.domainurl/code-snippet/maps/getting-started-cs78" %}

Exporting Maps as base 64 string of the file

The image can be exported as base64 string for the JPEG and PNG formats. The rendered Maps can be exported to image as a base64 string using the export method. There are four parameters required: image type, file name, orientation of the exported PDF document which must be set as **null** for image export and finally **allowDownload** which should be set as **false** to return base64 string.

APP.VUE

```
<template>
    <div id="app">
        <button id="export" @click="clickExport">Export</button>
        <ejs-maps  id='container' :allowImageExport='allowImageExport'
ref='maps' height='450px' width='500px'>
            <e-layers>
                <e-layer :shapeData='shapeData'
:markerSettings='markerSettings' :shapeSettings='shapeSettings'></e-layer>
            </e-layers>
        </ejs-maps>
        <div id="data"></data>
    </div>
</template>
<script>
import Vue from 'vue';
import { MapsPlugin, MapsTooltip, Marker, ImageExport} from
'@syncfusion/ej2-vue-maps';
import { world_map } from './world-map.js';
Vue.use( MapsPlugin );
export default {
data () {
    return {
        shapeData: world_map,
        shapeSettings: { fill: 'lightgrey', border: { color: 'black', width:
0.1 } },
        allowImageExport: true,
        markerSettings: [
            {
                animationDuration: 0,
                visible: true,
                dataSource: [
                    { longitude: 116.5703749, latitude: 40.4319077, name:
'The Great Wall of China, China ' },
                    { longitude: 35.4443622, latitude: 30.3284544, name:
'Petra, Jorden' },
                    { longitude: 78.0421552, latitude: 27.1750151, name:
'Taj Mahal, Agra, India' },
                    { longitude: 12.4922309, latitude: 41.8902102, name:
'The Roman Colosseum, Rome, Italy' },
                    { longitude: -88.5677826, latitude: 20.6842849, name:
'The Chichen Itza, Mexico' },
                    { longitude: -72.5449629, latitude: -13.1631412, name:
'Machu Picchu, Peru' },
                    { longitude: -43.2104872, latitude: -22.951916, name:
'Christ Redeemer, Rio de janeiro, Brazil'}
                ],
                shape: 'Balloon',
                fill: '#E13E40',
```

```
                height: 20,
                width: 15,
                tooltipSettings: {
                    visible: true,
                    valuePath: 'name'
                }
            }
        ]
    }
},
provide: {
    maps: [Marker, MapsTooltip, ImageExport]
},
methods: {
     clickExport: function(args) {
        let map=document.getElementById('container');
        map.ej2_instances[0].export("PNG","Maps",null,false).then((data) =>
{
            document.getElementById('data').innerHTML = data;
        });
    }
}
}
</script>
```

{% previewsample "page.domainurl/code-snippet/maps/getting-started-cs79" %}

PDF Export

To use the PDF export functionality in Maps, **PdfExport** module must be injected into the Maps using **provide** section and set the allowPdfExport property to **true**.

`

<template>

<ejs-maps id='maps'></ejs-maps>

</template>

<script>

export default ({

data() {

return{ };

},

provide: {

maps: [PdfExport]

}

</script>

});

`

The rendered Maps can be exported as PDF using the export method. The export method requires three parameters: file type, file name and orientation of the PDF document. The orientation setting is optional and **0** indicates portrait and **1** indicates landscape.

APP.VUE

```
<template>
    <div id="app">
        <button id="export" @click="clickExport">export</button>
        <ejs-maps  id='container' :allowPdfExport='allowPdfExport'
ref='maps' height='450px' width='500px'>
            <e-layers>
                <e-layer :shapeData='shapeData'
:markerSettings='markerSettings' :shapeSettings='shapeSettings'></e-layer>
            </e-layers>
        </ejs-maps>
    </div>
</template>
<script>
import Vue from 'vue';
import { MapsPlugin, MapsTooltip, Marker, PdfExport} from '@syncfusion/ej2-
vue-maps';
import { world_map } from './world-map.js';
Vue.use( MapsPlugin );
export default {
data () {
    return {
        shapeData: world_map,
        shapeSettings: { fill: 'lightgrey', border: { color: 'black', width:
0.1 } },
        allowPdfExport: true,
        markerSettings: [
            {
                animationDuration: 0,
                visible: true,
                dataSource: [
                    { longitude: 116.5703749, latitude: 40.4319077, name:
'The Great Wall of China, China ' },
                    { longitude: 35.4443622, latitude: 30.3284544, name:
'Petra, Jorden' },
                    { longitude: 78.0421552, latitude: 27.1750151, name:
'Taj Mahal, Agra, India' },
                    { longitude: 12.4922309, latitude: 41.8902102, name:
'The Roman Colosseum, Rome, Italy' },
                    { longitude: -88.5677826, latitude: 20.6842849, name:
'The Chichen Itza, Mexico' },
                    { longitude: -72.5449629, latitude: -13.1631412, name:
'Machu Picchu, Peru' },
                    { longitude: -43.2104872, latitude: -22.951916, name:
'Christ Redeemer, Rio de janeiro, Brazil'}
                ],
                shape: 'Balloon',
                fill: '#E13E40',
                height: 20,
                width: 15,
                tooltipSettings: {
                    visible: true,
```

```
                    valuePath: 'name'
                }
            }
        ]
    }
},
provide: {
    maps: [Marker, MapsTooltip, PdfExport]
},
methods: {
     clickExport: function(args) {
        let map=document.getElementById('container');
        map.ej2_instances[0].export("PDF", "Maps", 0);
    }
}
}
</script>
```

{% previewsample "page.domainurl/code-snippet/maps/getting-started-cs80" %}

The exporting of the Maps as base64 string is not supported for the PDF export.

Export the tile Maps

The rendered Maps with providers such as OSM, Bing and Google static Maps can be exported using the export method. It supports the following export formats.

- JPEG
- PNG
- PDF

APP.VUE

```
<template>
    <div id="app">

State persistence in Vue Maps component

State Persistence

State persistence allows the Maps to retain the current model value in the browser cookies for state maintenance. This action is handled through the enablePersistence property which is set to **false** by default. When this property is set to **true**, some of the Maps component model values are preserved even after the page is refreshed.

`

<template>

<ejs-maps :zoomSettings='zoomSettings' enablePersistence='enablePersistence' >

Accessibility in Vue Maps component

Maps has built-in accessibility features like screen reading, keyboard navigation, and WAI-ARIA attributes.

WAI-ARIA attributes

To meet accessibility standards, the Maps component follows to the WAI-ARIA patterns. In the Maps component, the following ARIA attributes are used:

Copyright © 2001 -2024 Syncfusion Inc.

| Attributes | Purpose |

| --- | --- |

| role=region | It specifies the Maps areas that do not support interactive functions like selection and highlight. |

| role=button | It specifies the Maps areas where interactive functions such as selection and highlight are available. |

| aria-label | Provides an accessible name for Maps elements such as geometric map shapes, legend title, data labels, and so on. To learn more, see the next topic. |

Screen reading in Maps

Accessibility in the Maps component ensures that all users, regardless of ability or disability, can use screen reading. The following Map elements will be read aloud using screen reading software, such as Narrator for Windows.

| Elements | Description |

| --- | --- |

| Shapes in the layer | Reads the names of the geographical shapes (such as countries, states, and regions) that appear on the Maps. |

| Legend title | Reads the contents of the legend's title as specified in Maps. |

| Legend item label | Reads the label of a legend item in Maps. |

| Data label | Reads the label specified for the shapes in the Maps layer. |

| Annotation | Reads the content specified in the annotation. |

| Marker template | Reads the content provided in the marker template. |

| Tooltip template | Reads the content provided in the tooltip template. |

| Data label template | Reads the content provided in the data label template. |

Keyboard Navigation

All the Maps actions can be controlled via keyboard keys. The applicable key combinations and their relative functionalities are listed below for the appropriate UI features available in the component.

Interaction Keys |Description

Tab |Moves to the next focusable element on the map, such as the legend or shape.

Shift + Tab |Moves to the previous focusable element on the map, such as the legend or shape.

+ |When zooming is enabled, zoom in operation can be performed.

- |When zooming is enabled, zoom out operation can be performed.

Left arrow |When zoomed in, the map can be scrolled to the left.

Right arrow |When zoomed in, the map can be scrolled to the right.

Up arrow |When zoomed in, the map can be scrolled upward.

Down arrow |When zoomed in, the map can be scrolled downward.

Copyright © 2001 -2024 Syncfusion Inc.

R |When zooming is enabled, reset operation can be performed.

Enter |The page can be navigated to the next and previous states in legend. Similarly, the selection can be made while navigating over the shape.

Ensuring accessibility

The Maps component's accessibility levels are ensured using an accessibility-checker and axe-core software tools during automated testing.

The accessibility compliance of the Maps component is shown in the following sample. Open the sample in a new window to evaluate the accessibility of the Maps component with accessibility tools.

{% previewsample "https://ej2.syncfusion.com/accessibility/maps.html" %}

Internationalization in Vue Maps component

Maps provide support for internationalization for the below elements.

- Data label
- Tooltip

For more information about number and date formatter, refer to the internationalization section.

<!-- markdownlint-disable MD036 -->

Globalization

Globalization is the process of designing and developing a component that works in different

cultures/locales. Internationalization library is used to globalize number, date, time values in

Maps component using format property in the Maps.

Numeric Format

The numeric formats such as currency, percentage and so on can be displayed in the tooltip and data labels of the Maps using the format property in the Maps. In the below example, the tooltip is globalized to **German** culture. When setting the useGroupingSeparator property as **true**, the numeric text in the Maps separates with the comma separator.

APP.VUE

```
<template>
    <div id="app">
        <div class='wrapper'>
            <ejs-maps  :format='format'

Localization in Vue Maps component

The localization library allows localizing the default text content of the Maps component. The Maps component has the static text of some features such as tooltip of zoom toolbar, and that can be changed to any other culture(Arabic, Deutsch, French, etc) by defining the locale value and translation object.

<!-- markdownlint-disable MD033 -->

Locale key words	Text to display
Zoom	Zoom
ZoomIn	Zoom In
ZoomOut	Zoom Out
Reset	Reset
Pan	Pan

To load translation object in the application, use load function of **L10n** class. For more information about localization, refer here.

Methods in Vue Maps component

Methods

This section explains the methods used in the Maps component.

getMinMaxLatitudeLongitude

The `getMinMaxLatitudeLongitude` method returns the minimum and maximum latitude and longitude values of the Maps visible area. This method returns a IMinMaxLatitudeLongitude object that contains the Maps minimum and maximum latitude and longitude coordinates.

How To

Annotation in Vue Maps component

Annotations are used to mark the specific area of interest in the Maps with texts, shapes, or images. Any number of annotations can be added to the Maps component.

Initialize the Maps component with annotation option, text content or ID of an HTML element or an HTML string can be specified to render a new element that needs to be displayed in the Maps by using the content property. To specify the content position with x and y properties as mentioned in the following example.

Marker type in Vue Maps component

Add different types of markers

Different marker objects can be added to the Maps component using the marker settings. To update different marker settings in Maps, please follow the given steps:

Step 1:

Initialize the Maps component with marker settings. Here, a marker has been added with specified latitude and longitude of California by using the dataSource property. To customize the shape of the marker using the shape property and change the border color and width of the marker using the border property as mentioned in the following example.

APP.VUE

```
<template>
    <div id="app">
          <div class='wrapper'>
            <ejs-maps >
                <e-layers>
                    <e-layer :shapeData='shapeData'
:markerSettings='markerSettings'></e-layer>
                </e-layers>
            </ejs-maps>
        </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { MapsPlugin, Marker, } from '@syncfusion/ej2-vue-maps';
import { world_map } from './world-map.js';
Vue.use(MapsPlugin);
export default {
data () {
    return {
        shapeData: world_map,
        markerSettings: [{
        dataSource: [
            { latitude: 40.7424509, longitude: -74.0081468, city: 'New York'
}],
        visible:true,
        shape: 'Circle',
        fill: 'white',
        width: 3,
        animationDuration:0,
            border: { width: 2, color: '#333' }
        }]
    }
},
provide: {
    maps: [Marker]
}
}
```

```
</script>
<style>
  .wrapper {
    max-width: 400px;
    margin: 0 auto;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/maps/getting-started-cs44" %}

Step 2:

Customize the above option for n number of markers as mentioned in the following example.

APP.VUE

```
<template>
    <div id="app">
          <div class='wrapper'>
            <ejs-maps >
                <e-layers>
                    <e-layer :shapeData='shapeData'
:markerSettings='markerSettings'></e-layer>
                </e-layers>
            </ejs-maps>
        </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { MapsPlugin, Marker, } from '@syncfusion/ej2-vue-maps';
import { world_map } from './world-map.js';
Vue.use(MapsPlugin);
export default {
data () {
    return {
        shapeData: world_map,
        markerSettings: [{
            dataSource: [
                { latitude: 37.6276571, longitude: -122.4276688, city: 'San
Bruno' },
            ],
            visible:true,
            shape:'Circle',
            fill:'white',
            width:3,
            animationDuration:0,
            border:{ width: 2, color: '#333'}
        },
        {
            dataSource: [
                { latitude: 33.5302186, longitude: -117.7418381, city:
'Laguna Niguel' },
            ],
            visible:true,
            shape:'Rectangle',
            fill:'yellow',
```

```
            width:15,
            height:4,
            animationDuration:0,
            border: { width: 2, color: '#333' }
        },
        {
            dataSource: [
                { latitude: 40.7424509, longitude: -74.0081468, city: 'New
York' }
            ],
            visible:true,
            shape:'Diamond',
            fill:'white',
            width:10,
            height:10,
            animationDuration:0,
            border: { width: 2, color: 'blue' }
        }]
    }
},
provide: {
    maps: [Marker]
}
}
</script>
<style>
  .wrapper {
    max-width: 400px;
    margin: 0 auto;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/maps/getting-started-cs45" %}

Multiple layer in Vue Maps component

The multilayer support allows loading multiple shape files in a single container and enables Maps to display more information. The shape layer is the main layer of the Maps. Multiple layers can be added in a shape layer as **SubLayer** using the type property.

APP.VUE

```
<template>
    <div id="app">
          <div class='wrapper'>
            <ejs-maps :layers='layers'>
            </ejs-maps>
        </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { MapsPlugin } from '@syncfusion/ej2-vue-maps';
import { usMap } from './usa.js';
import { texas } from './texas.js';
import { california } from './california.js';
Vue.use(MapsPlugin);
```

Copyright © 2001 -2024 Syncfusion Inc.

```
export default {
data () {
    return {
       layers: [{
            shapeData: usMap,
            shapeSettings: {
                fill: '#E5E5E5',
                border: {
                    color: 'black',
                    width: 0.1
                }
            }
        },
        {
            shapeData: texas,
            type: 'SubLayer',
            shapeSettings: {
                fill: 'rgba(141, 206, 255, 0.6)',
                border: {
                    color: '#1a9cff',
                    width: 0.25
                }
            }
        },
        {
            shapeData: california,
            type: 'SubLayer',
            shapeSettings: {
                fill: 'rgba(141, 206, 255, 0.6)',
                border: {
                    color: '#1a9cff',
                    width: 0.25
                }
            }
        }
    ]}
}
}
</script>
<style>
    .wrapper {
        max-width: 400px;
        margin: 0 auto;
    }
</style>
```

{% previewsample "page.domainurl/code-snippet/maps/getting-started-cs46" %}

Zooming in Vue Maps component

The center position zooming can be achieved by using the centerPosition and zoomFactor properties as mentioned in the following example. The center position is used to configure the zoom level of Maps, and the zoom factor is used to specify the center position where the Maps should be displayed.

APP.VUE

```
<template>
```

```
    <div id="app">
          <div class='wrapper'>
            <ejs-maps :zoomSettings='zoomSettings'
:centerPosition='centerPosition'>
                <e-layers>
                    <e-layer :shapeData='shapeData'></e-layer>
                </e-layers>
            </ejs-maps>
        </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { MapsPlugin, Zoom } from '@syncfusion/ej2-vue-maps';
import { world_map } from './world-map.js';
Vue.use(MapsPlugin);
export default {
data () {
    return {
        zoomSettings: {
            enable: true,
            zoomFactor: 13
        },
        centerPosition: {
            latitude: 25.54244147012483,
            longitude: -89.62646484375
        },
        shapeData: world_map,
    }
},
provide: {
    maps: [Zoom]
}
}
</script>
<style>
  .wrapper {
    max-width: 400px;
    margin: 0 auto;
  }
</style>
```

MaskedTextBox

Getting Started with the Vue Maskedtextbox Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using Vue-CLI and integrating the Syncfusion Vue Maskedtextbox component using the Composition API / Options API.

Prerequisites

System requirements for Syncfusion Vue UI components

Copyright © 2001 -2024 Syncfusion Inc.

Setting up the Vue 2 project

To generate a Vue 2 project using Vue-CLI, use the vue create command. Follow these steps to install Vue CLI and create a new project:

`bash

npm install -g @vue/cli

vue create quickstart

cd quickstart

npm run serve

`

or

`bash

yarn global add @vue/cli

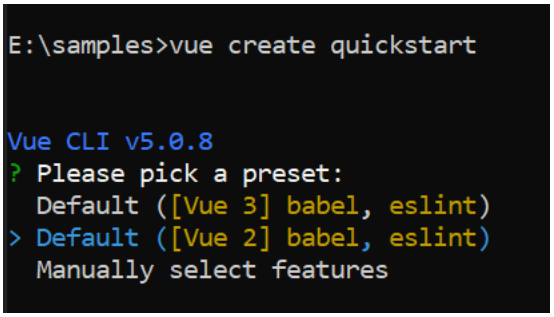
vue create quickstart

cd quickstart

yarn run serve

`

When creating a new project, choose the option Default ([Vue 2] babel, eslint) from the menu.



Once the quickstart project is set up with default settings, proceed to add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion packages are available at npmjs.com. To use Vue components, install the required npm package.

This article uses the Vue Maskedtextbox component as an example. Install the @syncfusion/ej2-vue-inputs package by running the following command:

`bash

npm install @syncfusion/ej2-vue-inputs --save

`

or

`bash

yarn add @syncfusion/ej2-vue-inputs

`

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, the Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the Maskedtextbox component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
</style>
```

If you want to refer the combined component styles, please make use of our CRG (Custom Resource Generator) in your application.

Add Syncfusion Vue component

Follow the below steps to add the Vue Maskedtextbox component using Composition API or Options API:

1\. First, import and register the Maskedtextbox component in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { MaskedTextBoxComponent as EjsMaskedtextbox } from "@syncfusion/ej2-vue-inputs";
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { MaskedTextBoxComponent } from "@syncfusion/ej2-vue-inputs";
export default {
components: {
'ejs-maskedtextbox': MaskedTextBoxComponent
}
}
</script>
```

Copyright © 2001 -2024 Syncfusion Inc.

Adding MaskedTextBox component

Add the EJ2 Vue MaskedTextBox using <ejs-maskedtextbox> to the <template> section of the App.vue file in src directory, the content attribute of the MaskedTextBox component is provided as name in data option in the <script> section.

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<div class="control_wrapper">
<div class="control-label">MaskedTextbox
</div>
<ejs-maskedtextbox></ejs-maskedtextbox>
</div>
</template>
<script setup>
import { MaskedTextBoxComponent as EjsMaskedtextbox } from "@syncfusion/ej2-vue-inputs";
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<div class="control_wrapper">
<div class="control-label">MaskedTextbox
</div>
<ejs-maskedtextbox></ejs-maskedtextbox>
</div>
</template>
<script>
import { MaskedTextBoxComponent } from "@syncfusion/ej2-vue-inputs";
export default {
components: {
'ejs-maskedtextbox': MaskedTextBoxComponent
},
data () {
return {}
}
}
</script>
```

Set the mask

You can set the mask to the MaskedTextBox to validate the user input by using the mask property. To know more about the usage of mask and configuration, refer to this link.

The following example demonstrates the usage of mask element 0 that allows any single digit from 0 to 9.

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<div class="control_wrapper">
<div class="control-label">MaskedTextBox
</div>
<ejs-maskedtextbox mask="000-000-0000"></ejs-maskedtextbox>
</div>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
</template>
<script setup>
import { MaskedTextBoxComponent as EjsMaskedtextbox } from "@syncfusion/ej2-vue-inputs";
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<div class="control_wrapper">
<div class="control-label">MaskedTextBox
</div>
<ejs-maskedtextbox mask="000-000-0000"></ejs-maskedtextbox>
</div>
</template>
<script>
import { MaskedTextBoxComponent } from "@syncfusion/ej2-vue-inputs";
export default {
components: {
'ejs-maskedtextbox': MaskedTextBoxComponent
}
}
</script>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
  <div id="app">
    <div class='wrap'>
        <ejs-maskedtextbox mask='000-000-0000' placeholder='MaskedTextBox' floatLabelType='Always'></ejs-maskedtextbox>
    </div>
  </div>
</template>
<script setup>
import { MaskedTextBoxComponent as EjsMaskedtextbox } from "@syncfusion/ej2-vue-inputs";
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
 .wrap {
    margin: 0 auto;
    width: 240px;
}
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
  <div id="app">
    <div class='wrap'>
```

```
        <ejs-maskedtextbox mask='000-000-0000' placeholder='MaskedTextBox'
floatLabelType='Always'></ejs-maskedtextbox>
    </div>
  </div>
</template>
<script>
import { MaskedTextBoxComponent } from "@syncfusion/ej2-vue-inputs";
export default {
  components: {
    'ejs-maskedtextbox': MaskedTextBoxComponent
  },
  data () {
    return {}
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
 .wrap {
    margin: 0 auto;
    width: 240px;
}
</style>
```

Run the project

To run the project, use the following command:

`bash

npm run serve

`

or

`bash

yarn run serve

`

{% previewsample "page.domainurl/code-snippet/masked-textbox/getting-started-cs1" %}

Model binding

In MaskedTextBox, the value property supports model binding functionality.

The following example demonstrates model binding functionality with the MaskedTextBox and HTML input element.

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
  <div id="app">
  <div class='wrap'>
        <div class='e-input-group' style='margin-bottom:30px'>
        <input class='e-input' type='text' v-model='value'
placeholder='Mobile Number'  />
```

Copyright © 2001 -2024 Syncfusion Inc.

```
        </div>
        <div>
           <ejs-maskedtextbox v-model="value" :value="value" mask='000-000-
0000'></ejs-maskedtextbox>
        </div>
    </div>
  </div>
</template>
<script setup>
import { MaskedTextBoxComponent as EjsMaskedtextbox } from "@syncfusion/ej2-
vue-inputs";
const value = '';

</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
 .wrap {
  margin: 35px auto;
  width: 240px;
}
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
  <div id="app">
  <div class='wrap'>
        <div class='e-input-group' style='margin-bottom:30px'>
        <input class='e-input' type='text' v-model='value'
placeholder='Mobile Number'  />
        </div>
        <div>
           <ejs-maskedtextbox v-model="value" :value="value" mask='000-000-
0000'></ejs-maskedtextbox>
        </div>
    </div>
  </div>
</template>
<script>
import { MaskedTextBoxComponent } from "@syncfusion/ej2-vue-inputs";
export default {
  components: {
    'ejs-maskedtextbox': MaskedTextBoxComponent
  },
  data () {
    return {
      value : ''
    }
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
 .wrap {
```

Copyright © 2001 -2024 Syncfusion Inc.

```
  margin: 35px auto;
  width: 240px;
}
</style>
```

Getting Started with the Vue MaskedTextBox Component in Vue 3

This article provides a step-by-step guide for setting up a Vite project with a JavaScript environment and integrating the Syncfusion Vue MaskedTextBox component using the Composition API / Options API.

The Composition API is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

The Options API is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

Prerequisites

System requirements for Syncfusion Vue UI components

Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using Vite. To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

`bash

npm create vite@latest

`

or

`bash

yarn create vite

`

Using one of the above commands will lead you to set up additional configurations for the project as below:

1.Define the project name: We can specify the name of the project directly. Let's specify the name of the project as my-project for this article.

`bash

? Project name: » my-project

Copyright © 2001 -2024 Syncfusion Inc.

`

2.Select Vue as the framework. It will create a Vue 3 project.

`bash

? Select a framework: » - Use arrow-keys. Return to submit.

Vanilla

Vue

React

Preact

Lit

Svelte

Others

`

3.Choose JavaScript as the framework variant to build this Vite project using JavaScript and Vue.

`bash

? Select a variant: » - Use arrow-keys. Return to submit.

JavaScript

TypeScript

Customize with create-vue ↗

Nuxt ↗

`

4.Upon completing the aforementioned steps to create the my-project, run the following command to install its dependencies:

`bash

cd my-project

npm install

`

or

`bash

cd my-project

yarn install

`

Now that my-project is ready to run with default settings, let's add Syncfusion components to the project.

Copyright © 2001 -2024 Syncfusion Inc.

Add Syncfusion Vue packages

Syncfusion Vue component packages are available at npmjs.com. To use Syncfusion Vue components in the project, install the corresponding npm package.

This article uses the Vue MaskedTextBox component as an example. To use the Vue MaskedTextBox component in the project, the @syncfusion/ej2-vue-inputs package needs to be installed using the following command:

`bash

npm install @syncfusion/ej2-vue-inputs --save

`

or

`bash

yarn add @syncfusion/ej2-vue-inputs

`

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the MaskedTextBox component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
</style>
```

The order of importing CSS styles should be in line with its dependency graph.

Add Syncfusion Vue component

Follow the below steps to add the Vue MaskedTextBox component using Composition API or Options API:

1.First, import and register the MaskedTextBox component in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { MaskedTextBoxComponent as EjsMaskedtextbox } from "@syncfusion/ej2-vue-inputs";
</script>
```

OPTIONS API (~/SRC/APP.VUE)

Copyright © 2001 -2024 Syncfusion Inc.

```
<script>
import { MaskedTextBoxComponent } from "@syncfusion/ej2-vue-inputs";
//Component registeration
export default {
name: "App",
components: {
'ejs-maskedtextbox': MaskedTextBoxComponent,
}
}
</script>
```

2.In the template section, define the MaskedTextBox component with the dataSource property and column definitions.

~/SRC/APP.VUE

```
<template>
<div class="control_wrapper">
<ejs-maskedtextbox></ejs-maskedtextbox>
</div>
</template>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<div class="control_wrapper">
<ejs-maskedtextbox></ejs-maskedtextbox>
</div>
</template>
<script setup>
import { MaskedTextBoxComponent as EjsMaskedtextbox } from "@syncfusion/ej2-vue-inputs";
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
.control_wrapper {
margin: 0 auto;
width: 240px;
}
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<div class="control_wrapper">
<ejs-maskedtextbox></ejs-maskedtextbox>
</div>
</template>
<script>
import { MaskedTextBoxComponent } from "@syncfusion/ej2-vue-inputs";
//Component registeration
export default {
```

Copyright © 2001 -2024 Syncfusion Inc.

```
name: 'App',
components: {
"ejs-maskedtextbox": MaskedTextBoxComponent
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
.control_wrapper {
margin: 0 auto;
width: 240px;
}
</style>
```

Run the project

To run the project, use the following command:

`bash

npm run dev

`

or

`bash

yarn run dev

`

Set the mask

You can set the mask to the MaskedTextBox to validate the user input by using the

mask property. To know more about

the usage of mask and configuration, refer to this link.

The following example demonstrates the usage of mask element 0 that allows any single digit from 0 to 9.

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<div id="app">
<div class='wrap'>
<ejs-maskedtextbox mask='000-000-0000' placeholder='MaskedTextBox'
floatLabelType='Always'></ejs-maskedtextbox>
</div>
</div>
</template>
<script setup>
import { MaskedTextBoxComponent as EjsMaskedtextbox } from "@syncfusion/ej2-
vue-inputs";
const data = [];
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
```

Copyright © 2001 -2024 Syncfusion Inc.

```
@import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
.wrap {
margin: 0 auto;
width: 240px;
}
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<div id="app">
<div class='wrap'>
<ejs-maskedtextbox mask='000-000-0000' placeholder='MaskedTextBox'
floatLabelType='Always'></ejs-maskedtextbox>
</div>
</div>
</template>
<script>
import { MaskedTextBoxComponent } from "@syncfusion/ej2-vue-inputs";
//Component registeration
export default {
name: 'App',
components: {
"ejs-maskedtextbox": MaskedTextBoxComponent
},
data () {
return {}
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
.wrap {
margin: 0 auto;
width: 240px;
}
</style>
```

The output will appear as follows:

Model binding

In MaskedTextBox, the value property supports model binding functionality.

The following example demonstrates model binding functionality with the MaskedTextBox and HTML input element.

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<div id="app">
<div class='wrap'>
```

```
<div class='e-input-group' style='margin-bottom:30px'>
<input class='e-input' type='text' v-model='value' placeholder='Mobile
Number' />
</div>
<ejs-maskedtextbox v-model="value" :value="value" mask='000-000-0000'></ejs-
maskedtextbox>
</div>
</div>
</template>
<script setup>
import { ref } from 'vue';
import { MaskedTextBoxComponent as EjsMaskedtextbox } from "@syncfusion/ej2-
vue-inputs";
const value = ref('');
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
.wrap {
margin: 35px auto;
width: 240px;
}
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<div id="app">
<div class='wrap'>
<div class='e-input-group' style='margin-bottom:30px'>
<input class='e-input' type='text' v-model='value' placeholder='Mobile
Number' />
</div>
<ejs-maskedtextbox v-model="value" :value="value" mask='000-000-0000'></ejs-
maskedtextbox>
</div>
</div>
</template>
<script>
import { MaskedTextBoxComponent } from "@syncfusion/ej2-vue-inputs";
//Component registeration
export default {
name: 'App',
components: {
"ejs-maskedtextbox": MaskedTextBoxComponent
},
data () {
return {
value : ''
}
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
```

Copyright © 2001 -2024 Syncfusion Inc.

```
.wrap {
margin: 35px auto;
width: 240px;
}
</style>
```

The output will appear as follows:

Mask configuration in Vue Maskedtextbox component

The mask is a combination of standard and custom mask elements, that validates the user input based on its behavior.

When the mask value is empty, the MaskedTextBox behaves as an input element with text type.

Standard mask elements

The following table shows the list of mask elements and its behavior based on

MSDN standard.

The mask can be formed by combining any one or more of these mask elements.

| Mask Element | Description |

| ---------- | ---------- |

| 0 | Digit required. This element will accept any single digit from **0** to **9**. |

| 9 | Digit or space, optional. |

| # | Digit or space, optional, Plus(**+**) and minus(**-**) signs are allowed. |

| L | Letter required. It will accept letters **a-z** and **A-Z**. |

| ? | Letter or space, optional. |

| & | Requires a character. |

| C | Character or space, optional. |

| A | Alphanumeric **(A-Za-z0-9)** required.|

| a | Alphanumeric **(A-Za-z0-9)** or space, optional. |

| < | Shift down. Converts all characters to lower case. |

Copyright © 2001 -2024 Syncfusion Inc.

| > | Shift up. Converts all characters to upper case. |

| | | Disable a previous shift up or shift down. |

| \\\\ | Escapes a mask character, turning it into a literal. |

| All other characters | Literals. All non-mask elements (literals) will appear as themselves within MaskedTextBox. |

The following example demonstrates the usage of standard mask elements.

APP.VUE

```
<template>
  <div id="app">
        <div class='wrap'>
           <ejs-maskedtextbox mask='#####' placeholder='Mask ##### (ex:
012+-)' floatLabelType='Always'></ejs-maskedtextbox>
        </div>
        <div class='wrap'>
            <ejs-maskedtextbox mask='LLLLLL' placeholder='Mask LLLLLL (ex:
Sample)' floatLabelType='Always'></ejs-maskedtextbox>
        </div>
        <div class='wrap'>
            <ejs-maskedtextbox mask='&&&&&' placeholder='Mask &&&&& (ex:
A12@#)' floatLabelType='Always'></ejs-maskedtextbox>
        </div>
        <div class='wrap'>
            <ejs-maskedtextbox mask='>LLL<LLL' placeholder='Mask >LLL<LL
(ex: SAMple)' floatLabelType='Always'></ejs-maskedtextbox>
        </div>
        <div class='wrap'>
            <ejs-maskedtextbox mask='\\A999' placeholder='Mask \\A999 (ex:
A321)' floatLabelType='Always'></ejs-maskedtextbox>
        </div>
  </div>
</template>
<script>
import Vue from "vue";
import { MaskedTextBoxPlugin } from "@syncfusion/ej2-vue-inputs";
Vue.use(MaskedTextBoxPlugin);
export default {
  data () {
    return {}
  }
}
</script>
<style>
  @import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../../node_modules/@syncfusion/ej2-vue-
inputs/styles/material.css";
 .wrap {
  margin: 20px auto;
  width: 240px;
}
</style>
```

Copyright © 2001 -2024 Syncfusion Inc.

{% previewsample "page.domainurl/code-snippet/masked-textbox/mask-configuration/standard-cs1" %}

Custom mask elements

Other than the above standard mask elements, the mask can be configured with the custom characters or regular expression to define a custom behavior.

Custom characters

You can define any of the non-mask element as the mask element and its behavior through the customCharacters property.

In the following example, non-mask element P accepts the values P, A, p, a and M accepts the values M, m as mentioned in the custom characters collection.

APP.VUE

```
<template>
  <div id="app">
    <div class='wrap'>
        <ejs-maskedtextbox :customCharacters='customCharacters' mask='00:00
>PM' placeholder='Time (ex: 10:00 PM, 10:00 AM)'
floatLabelType='Always'></ejs-maskedtextbox>
    </div>
  </div>
</template>
<script>
import Vue from "vue";
import { MaskedTextBoxPlugin } from "@syncfusion/ej2-vue-inputs";
Vue.use(MaskedTextBoxPlugin);
export default {
  data () {
    return {
        customCharacters: {
            P: 'P,A,a,p',
            M: 'M,m'
        }
    }
  }
}
</script>
<style>
  @import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../../node_modules/@syncfusion/ej2-vue-
inputs/styles/material.css";
 .wrap {
    margin: 0 auto;
    width: 240px;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/masked-textbox/mask-configuration/custom-cs1" %}

Copyright © 2001 -2024 Syncfusion Inc.

Regular expression

Instead of the mask element, you can define your own regular expression to validate the input of a particular input place. The regular expressions should be wrapped by the square brackets (e.g.,: [Regex]).

In the following example, regular expression has been set for each input places.

APP.VUE

```
<template>
  <div id="app">
    <div class='wrap'>
        <ejs-maskedtextbox mask='[0-2][0-9][0-9].[0-2][0-9][0-9].[0-2][0-
9][0-9].[0-2][0-9][0-9]' placeholder='IP Address (ex: 212.212.111.222)'
id='mask1' name='mask_value' floatLabelType='Always'></ejs-maskedtextbox>
    </div>
  </div>
  </template>
<script>
import Vue from "vue";
import { MaskedTextBoxPlugin } from "@syncfusion/ej2-vue-inputs";
Vue.use(MaskedTextBoxPlugin);
export default {
  data () {
    return {}
  }
}
</script>
<style>
  @import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../../node_modules/@syncfusion/ej2-vue-
inputs/styles/material.css";
 .wrap {
    margin: 0 auto;
    width: 240px;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/masked-textbox/mask-configuration/regular-cs1" %}

Prompt character

The Prompt character is a prompting symbol in the MaskedTextBox for the mask elements. The symbol is used to show the input positions in the MaskedTextBox. You can customize the prompt character of MaskedTextBox by using the promptChar property.

The following example demonstrates the MaskedTextBox with customized prompt character as *.

APP.VUE

```
<template>
  <div id="app">
    <div class='wrap'>
        <ejs-maskedtextbox mask='999-999-9999' promptChar="#"></ejs-
maskedtextbox>
    </div>
  </div>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
</template>
<script>
import Vue from "vue";
import { MaskedTextBoxPlugin } from "@syncfusion/ej2-vue-inputs";
Vue.use(MaskedTextBoxPlugin);
export default {
  data () {
    return {}
  }
}
</script>
<style>
  @import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../../node_modules/@syncfusion/ej2-vue-
inputs/styles/material.css";
 .wrap {
    margin: 0 auto;
    width: 240px;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/masked-textbox/mask-configuration/prompt-cs1" %}

Accessibility in Vue Maskedtextbox component

The Maskedtextbox component followed the accessibility guidelines and standards, including ADA, Section 508, WCAG 2.2 standards, and WCAG roles that are commonly used to evaluate accessibility.

The accessibility compliance for the Maskedtextbox component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| WCAG 2.2 Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Section 508 Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Screen Reader Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Right-To-Left Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Color Contrast | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Mobile Device Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Keyboard Navigation Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Accessibility Checker Validation | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

Copyright © 2001 -2024 Syncfusion Inc.

| Axe-core Accessibility Validation | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> - All features of the component meet the requirement.

<img src="https://cdn.syncfusion.com/content/images/landing-page/intermediate.png" alt="Intermediate"> - Some features of the component do not meet the requirement.

<img src="https://cdn.syncfusion.com/content/images/landing-page/no.png" alt="No"> - The component does not meet the requirement.

WAI-ARIA attributes

The MaskedTextBox is characterized with complete ARIA Accessibility support that helps to access through the on-screen readers and other assistive technology devices. This component is designed with the reference of the guidelines document given in WAI ARAI Accessibility practices.

The MaskedTextBox uses the `textbox` role and following ARIA properties for its element based on its state.

| **Property** | **Functionality** |

| --- | --- |

| aria-live | The `aria-live` attribute indicates the priority of updates to a live region. |

| aria-disabled | The `aria-disabled` property indicates the disabled state of the MaskedTextBox. |

| aria-valuenow | The `aria-valuenow` property specifies the current value of the MaskedTextBox. |

| aria-invalid | The `aria-invalid` property indicates that the user input is incorrect or not within the acceptable ranges. |

| aria-placeholder | The `aria-placeholder` is a short hint to help the users with data entry when the MaskedTextBox has no value. |

| aria-labelledby | The `aria-labelledby` property indicates the floating label element of the MaskedTextBox. |

Ensuring accessibility

The MaskedTextBox component's accessibility levels are ensured through an accessibility-checker and axe-core software tools during automated testing.

The accessibility compliance of the MaskedTextBox component is shown in the following sample. Open the sample in a new window to evaluate the accessibility of the MaskedTextBox component with accessibility tools.

Two way binding in Vue Maskedtextbox component

Two-way binding can be achieved by using the v-model directive in Vue. In the following sample, when you change the value in one MaskedTextBox component, v-model will automatically update the value in the other MaskedTextBox.

The following example demonstrates how to set the two-way-binding in the MaskedTextBox.

APP.VUE

```
<template>
<div id="app">
    <div id="wrapper1">
        <ejs-maskedtextbox floatLabelType="Auto" placeholder="Enter a value"
mask="999-999-9999" v-model="value"></ejs-textbox>
    </div>
    <div id="wrapper2">
        <ejs-maskedtextbox floatLabelType="Auto" placeholder="Enter a value"
mask="999-999-9999" v-model="value"></ejs-textbox>
    </div>
</div>
</template>
<script>
import Vue from 'vue';
import { MaskedTextBoxPlugin } from '@syncfusion/ej2-vue-inputs';
Vue.use(MaskedTextBoxPlugin);
export default {
 data: function(){
        return {
            value: null
        }
    }
}
</script>
<style>
@import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
#wrapper1{
    min-width: 250px;
    float: left;
    margin-left: 100px;
}
#wrapper2{
    min-width: 250px;
    float: right;
    margin-right: 100px;
}
</style>
```

Style appearance in Vue Maskedtextbox component

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

Customizing the appearance of MaskedTextBox wrapper element

Use the following CSS to customize the appearance of wrapper element.

```
/* To specify height, font size, and border */

.e-input-group input.e-input, .e-input-group.e-control-wrapper input.e-input, .e-input-group textarea.e-input, .e-input-group.e-control-wrapper textarea.e-input {

font-size: 20px;

border-color: red;

height: 40px;

border: 2px solid;

}
```

Customizing the MaskedTextBox element on hovering

Use the following CSS to customize the Input Mask element on hovering

```
/* To specify border */

.e-input-group input.e-input, .e-input-group input.e-input:hover:not(.e-success):not(.e-warning):not(.e-error):not([disabled]):not(:focus), .e-input-group.e-control-wrapper input.e-input,.e-input-group.e-control-wrapper input.e-input:hover:not(.e-success):not(.e-warning):not(.e-error):not([disabled]):no(:focus){

border: 3px solid red;

}
```

How To

Perform custom validation using form validator in Vue Maskedtextbox component

To perform custom validation on the MaskedTextBox use the FormValidator along with custom validation rules.

In the following example, the MaskedTextBox is validated for invalid mobile number by adding custom validation in the rules collection of the FormValidator.

APP.VUE

```
<template>
  <div id="app">
    <div class='wrap'>
      <form id="form-element" class="form-horizontal">
        <div class="form-group">
```

Copyright © 2001 -2024 Syncfusion Inc.

```
          <ejs-maskedtextbox id="mask" type="text" name="mask" class="form-
control" mask='000-000-0000' placeholder='Mobile Number'
floatLabelType='Always'></ejs-maskedtextbox>
          <button type="button" id="submit_btn" style="margin-top: 10px" v-
on:click="onClick">Submit</button>
        </div>
      </form>
    </div>
  </div>
</template>
<script>
import Vue from "vue";
import { MaskedTextBoxPlugin } from "@syncfusion/ej2-vue-inputs";
import { FormValidator, FormValidatorModel } from '@syncfusion/ej2-inputs';
Vue.use(MaskedTextBoxPlugin);
export default {
  data () {
    return {}
  },
  mounted: function() {
    var customFn = function (args) {
        if (args.element.ej2_instances[0].value.length !== 0) {
          return args.element.ej2_instances[0].value.length >= 10; }
          else {
            return true;
        }
      };
      var custom = function (args) {
        if (args.element.ej2_instances[0].value.length === 0) {
          return 0;
        }
        else {
          return args.element.ej2_instances[0].value.length;
        }
          //return args.element.ej2_instances[0].value.length === 0;
      };
      // sets required property in the FormValidator rules collection
      var options = {
          rules: {
              'mask': { numberValue: [customFn, 'Enter valid mobile number']
},
          },
      };
      // defines FormValidator to validate the MaskedTextBox
       this.formObject = new FormValidator('#form-element', options);
      this.formObject.addRules('mask', { maxLength: [custom, 'Enter mobile
number'] });
      // places error label outside the MaskedTextBox using the
customPlacement event of FormValidator
      this.formObject.customPlacement = function (element, errorElement) {
document.querySelector(".form-group").appendChild(errorElement);
};
  },
  methods: {
    onClick: function (event) {
      this.formObject.validate("mask");
      var ele = document.getElementById('mask');
```

```
      // checks for incomplete value and alerts the format submit
      if (ele.value !== "" &&
ele.value.indexOf(mask.ej2_instances[0].promptChar) === -1) {
            alert("Submitted");
      }
    }
  }
}
</script>
<style>
  @import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../../node_modules/@syncfusion/ej2-vue-
inputs/styles/material.css";
 .wrap {
    margin: 0 auto;
    width: 240px;
}
.e-mask.e-control-wrapper {
  margin-bottom: 20px;
}
label.e-error {
  margin-top: -42px;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/masked-textbox/how-to/validation-cs1" %}

Set cursor position while focus on the input textbox in Vue Maskedtextbox component

By default, on focusing the MaskedTextBox the entire mask gets selected. You can customize by using any one of the following methods:

- Setting cursor position at the start of the MaskedTextBox.
- Setting cursor position at the end of the MaskedTextBox.
- Setting cursor at the specified position in the MaskedTextBox.

The **selectionStart** and **selectionEnd** set to **0** instead of the input element value's length, when we focus on a MaskedTextBox control filled with all mask characters. This is the default behavior of the HTML 5 input element.

Following is an example that demonstrates the above cases to set cursor position in the MaskedTextBox using focus event.

APP.VUE

```
<template>
  <div id="app">
        <div class='wrap'>
           <ejs-maskedtextbox mask='00000-00000' value='93828-32132'
placeholder='Default cursor position' floatLabelType='Always'></ejs-
maskedtextbox>
        </div>
        <div class='wrap'>
            <ejs-maskedtextbox mask='00000-00000' value='83929-4342'
placeholder='Cursor positioned at start' floatLabelType='Always'
:focus='focus'></ejs-maskedtextbox>
```

```
        </div>
        <div class='wrap'>
            <ejs-maskedtextbox mask='00000-00000' value='83929-3213'
placeholder='Cursor positioned at end' floatLabelType='Always'
:focus='endfocus'></ejs-maskedtextbox>
        </div>
        <div class='wrap'>
            <ejs-maskedtextbox mask='+1 000-000-0000' value='234-432-432'
placeholder='Cursor at specified position' floatLabelType='Always'
:focus='specifiedfocus'></ejs-maskedtextbox>
        </div>
  </div>
</template>
<script>
import Vue from "vue";
import { MaskedTextBoxPlugin } from "@syncfusion/ej2-vue-inputs";
Vue.use(MaskedTextBoxPlugin);
export default {
  data () {
    return {}
  },
  methods: {
      focus: function(args) {
           args.selectionEnd= args.selectionStart = 0;
      } ,
      endfocus: function(args){
          args.selectionStart=args.selectionEnd = args.maskedValue.length;
      },
      specifiedfocus: function(args){
          args.selectionStart = 3;
          args.selectionEnd = 3;
      }
    }
}
</script>
<style>
  @import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../../node_modules/@syncfusion/ej2-vue-
inputs/styles/material.css";
 .wrap {
  margin: 20px auto;
  width: 240px;
}
.e-widget {
  padding-bottom: 12px;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/masked-textbox/how-to/cursor-cs1" %}

Display numeric keypad when focus on mobile devices in Vue Maskedtextbox component

By default, on focusing the MaskedTextBox, alphanumeric keypad will be displayed on mobile devices. Sometimes only numeric keypad for number

values is needed, and this can be achieved by setting "type" property to tel. Refer to the following example to enable numeric keypad in MaskedTextBox.

Copyright © 2001 -2024 Syncfusion Inc.

APP.VUE

```
<template>
  <div id="app">
    <div class='wrap'>
        <ejs-maskedtextbox type='tel' class='form-control' mask='999-99999'
value='342-45432'></ejs-maskedtextbox>
    </div>
  </div>
</template>
<script>
import Vue from "vue";
import { MaskedTextBoxPlugin } from "@syncfusion/ej2-vue-inputs";
Vue.use(MaskedTextBoxPlugin);
export default {
  data () {
    return {}
  },
}
</script>
<style>
  @import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../../node_modules/@syncfusion/ej2-vue-
inputs/styles/material.css";
 .wrap {
    margin: 0 auto;
    width: 240px;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/masked-textbox/how-to/numeric-cs1" %}

Customize the ui appearance of the control in Vue Maskedtextbox component

The appearance of the MaskedTextBox can be changed by adding custom cssClass to the component and enabling styles. Refer to the following example to change the appearance of the MaskedTextBox.

APP.VUE

```
<template>
  <div id="app">
    <div class='wrap'>
        <ejs-maskedtextbox mask='00000' value='42648' placeholder='Enter
User ID' cssClass='e-style' floatLabelType='Always' :focus='focus'></ejs-
maskedtextbox>
    </div>
  </div>
</template>
<script>
import Vue from "vue";
import { MaskedTextBoxPlugin } from "@syncfusion/ej2-vue-inputs";
Vue.use(MaskedTextBoxPlugin);
export default {
  data () {
    return {}
  },
  methods: {
```

Copyright © 2001 -2024 Syncfusion Inc.

```
      focus: function(args) {
           args.selectionEnd = args.selectionStart;
           }
    }
}
</script>
<style>
@import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
.wrap {
    margin: 0 auto;
    width: 240px;
}
.e-widget.e-mask.e-style .e-control.e-maskedtextbox {
  color: #00fff ;
  letter-spacing: 10px ;
  font-size: xx-large ;
  border: 1px ;
  border-color: #ffffff ;
}
.e-widget.e-control-wrapper.e-mask.e-float-input.e-style .e-float-
line::before {
  background: #ffffff ;
}
.e-widget.e-control-wrapper.e-mask.e-float-input.e-style .e-float-
line::after {
  background: #ffffff ;
}
.e-widget.e-control-wrapper.e-mask.e-float-input.e-style .e-float-text.e-
label-top {
  color: #00fff ;
  font-size: medium ;
}
</style>
```

Mention

Getting Started with the Vue Mention Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using Vue-CLI and integrating the Syncfusion Vue Mention component using the Composition API / Options API.

Prerequisites

System requirements for Syncfusion Vue UI components

Dependencies

The following list of dependencies are required to use the Mention component in your application.

`js

|-- @syncfusion/ej2-vue-dropdowns

|-- @syncfusion/ej2-vue-base

|-- @syncfusion/ej2-dropdowns

Copyright © 2001 -2024 Syncfusion Inc.

|-- @syncfusion/ej2-base

|-- @syncfusion/ej2-data

|-- @syncfusion/ej2-lists

|-- @syncfusion/ej2-popups

|-- @syncfusion/ej2-buttons

`

Setting up the Vue 2 project

To generate a Vue 2 project using Vue-CLI, use the vue create command. Follow these steps to install Vue CLI and create a new project:

`bash

npm install -g @vue/cli

vue create quickstart

cd quickstart

npm run serve

`

or

`bash

yarn global add @vue/cli

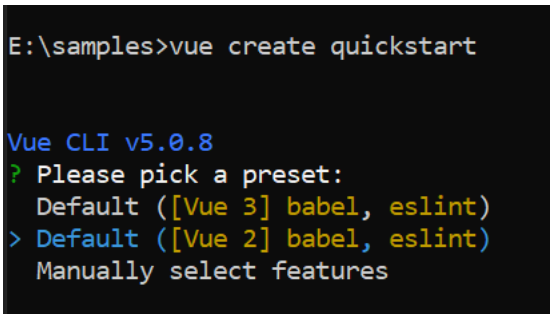
vue create quickstart

cd quickstart

yarn run serve

`

When creating a new project, choose the option Default ([Vue 2] babel, eslint) from the menu.



Once the quickstart project is set up with default settings, proceed to add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion packages are available at npmjs.com. To use Vue components, install the required npm package.

This article uses the Vue Mention component as an example. Install the @syncfusion/ej2-vue-dropdowns package by running the following command:

`bash

npm install @syncfusion/ej2-vue-dropdowns --save

`

or

`bash

yarn add @syncfusion/ej2-vue-dropdowns

`

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, the Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the Mention component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/bootstrap5.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/bootstrap5.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/bootstrap5.css";
@import "../node_modules/@syncfusion/ej2-lists/styles/bootstrap5.css";
@import "../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/bootstrap5.css";
</style>
```

Add Syncfusion Vue component

Follow the below steps to add the Vue Mention component using Composition API or Options API:

1\. First, import and register the Mention component in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { MentionComponent as EjsMention } from "@syncfusion/ej2-vue-
dropdowns";
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { MentionComponent } from "@syncfusion/ej2-vue-dropdowns";
export default {
```

Copyright © 2001 -2024 Syncfusion Inc.

```
components: {
'ejs-mention': MentionComponent
}
}
</script>
```

Adding Mention component

Add the EJ2 Vue Mention using <ejs-mention> to the <template> section of the App.vue file in src directory. To use the Mention component properly, the target property should be configured so that it renders the Mention component in the configured element.

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<div id="app">
<label id="comment" >Comments</label>
<div id="mentionElement" placeholder = "Type @ and tag user"></div>
<ejs-mention id='defaultMention' :target='mentionTarget'></ejs-mention>
</div>
</template>
<script setup>
import { MentionComponent as EjsMention } from "@syncfusion/ej2-vue-
dropdowns";
const mentionTarget = "#mentionElement";
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/bootstrap5.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/bootstrap5.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/bootstrap5.css";
@import "../node_modules/@syncfusion/ej2-lists/styles/bootstrap5.css";
@import "../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/bootstrap5.css";
#app {
color: #008cff;
height: 40px;
left: 15%;
position: absolute;
top: 10%;
width: 30%;
}
#comment {
font-size: 15px;
font-weight: 600;
}
#mentionElement {
min-height: 100px;
border: 1px solid #D7D7D7;
border-radius: 4px;
padding: 8px;
font-size: 14px;
width: 600px;
}
div#mentionElement[placeholder]:empty:before {
content: attr(placeholder);
color: #555;
}
```

Copyright © 2001 -2024 Syncfusion Inc.

```
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<div id="app">
<label id="comment" >Comments</label>
<div id="mentionElement" placeholder = "Type @ and tag user"></div>
<ejs-mention id='defaultMention' :target='mentionTarget'></ejs-mention>
</div>
</template>
<script>
import { MentionComponent } from "@syncfusion/ej2-vue-dropdowns";
export default {
components: {
'ejs-mention': MentionComponent
},
name: 'app',
data: function() {
return {
mentionTarget: "#mentionElement",
};
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/bootstrap5.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/bootstrap5.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/bootstrap5.css";
@import "../node_modules/@syncfusion/ej2-lists/styles/bootstrap5.css";
@import "../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/bootstrap5.css";
#app {
color: #008cff;
height: 40px;
left: 15%;
position: absolute;
top: 10%;
width: 30%;
}
#comment {
font-size: 15px;
font-weight: 600;
}
#mentionElement {
min-height: 100px;
border: 1px solid #D7D7D7;
border-radius: 4px;
padding: 8px;
font-size: 14px;
width: 600px;
}
div#mentionElement[placeholder]:empty:before {
content: attr(placeholder);
color: #555;
}
```

Copyright © 2001 -2024 Syncfusion Inc.

```
</style>
```

Binding data source

After initialization, populate the Mention with data using the dataSource property. Here, an array of string values is passed to the Mention component.

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<div id="app">
<label id="comment" >Comments</label>
<div id="mentionElement" placeholder = "Type @ and tag user"></div>
<ejs-mention id='defaultMention' :target='mentionTarget'
:dataSource='userData'></ejs-mention>
</div>
</template>
<script setup>
import { MentionComponent as EjsMention } from "@syncfusion/ej2-vue-
dropdowns";
const mentionTarget = "#mentionElement";
const userData = ['Selma Rose', 'Garth', 'Robert', 'William', 'Joseph'];
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/bootstrap5.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/bootstrap5.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/bootstrap5.css";
@import "../node_modules/@syncfusion/ej2-lists/styles/bootstrap5.css";
@import "../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/bootstrap5.css";
#app {
color: #008cff;
height: 40px;
left: 15%;
position: absolute;
top: 10%;
width: 30%;
}
#comment {
font-size: 15px;
font-weight: 600;
}
#mentionElement {
min-height: 100px;
border: 1px solid #D7D7D7;
border-radius: 4px;
padding: 8px;
font-size: 14px;
width: 600px;
}
div#mentionElement[placeholder]:empty:before {
content: attr(placeholder);
color: #555;
}
</style>
```

Copyright © 2001 -2024 Syncfusion Inc.

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<div id="app">
<label id="comment" >Comments</label>
<div id="mentionElement" placeholder = "Type @ and tag user"></div>
<ejs-mention id='defaultMention' :target='mentionTarget'
:dataSource='userData'></ejs-mention>
</div>
</template>
<script>
import { MentionComponent } from "@syncfusion/ej2-vue-dropdowns";
export default {
components: {
'ejs-mention': MentionComponent
},
name: 'app',
data: function() {
return {
mentionTarget: "#mentionElement",
userData: ['Selma Rose', 'Garth', 'Robert', 'William', 'Joseph']
};
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/bootstrap5.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/bootstrap5.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/bootstrap5.css";
@import "../node_modules/@syncfusion/ej2-lists/styles/bootstrap5.css";
@import "../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/bootstrap5.css";
#app {
color: #008cff;
height: 40px;
left: 15%;
position: absolute;
top: 10%;
width: 30%;
}
#comment {
font-size: 15px;
font-weight: 600;
}
#mentionElement {
min-height: 100px;
border: 1px solid #D7D7D7;
border-radius: 4px;
padding: 8px;
font-size: 14px;
width: 600px;
}
div#mentionElement[placeholder]:empty:before {
content: attr(placeholder);
color: #555;
}
</style>
```

Copyright © 2001 -2024 Syncfusion Inc.

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
  <div id="app">
    <label id="comment" >Comments</label>
    <div id="mentionElement" placeholder = "Type @ and tag user"></div>
    <ejs-mention id='defaultMention' :target='mentionTarget'
:dataSource='userData'></ejs-mention>
  </div>
</template>
<script setup>
import { MentionComponent as EjsMention } from "@syncfusion/ej2-vue-
dropdowns";
const mentionTarget = "#mentionElement";
const userData = ['Selma Rose', 'Garth', 'Robert', 'William', 'Joseph'];
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/bootstrap5.css";
  @import "../node_modules/@syncfusion/ej2-buttons/styles/bootstrap5.css";
  @import "../node_modules/@syncfusion/ej2-popups/styles/bootstrap5.css";
  @import "../node_modules/@syncfusion/ej2-lists/styles/bootstrap5.css";
  @import "../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/bootstrap5.css";
  #app {
      color: #008cff;
      height: 40px;
      left: 15%;
      position: absolute;
      top: 10%;
      width: 30%;
  }
  #comment {
      font-size: 15px;
      font-weight: 600;
  }
  #mentionElement {
      min-height: 100px;
      border: 1px solid #D7D7D7;
      border-radius: 4px;
      padding: 8px;
      font-size: 14px;
      width: 600px;
  }
  div#mentionElement[placeholder]:empty:before {
      content: attr(placeholder);
      color: #555;
  }
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
  <div id="app">
```

Copyright © 2001 -2024 Syncfusion Inc.

```
    <label id="comment" >Comments</label>
    <div id="mentionElement" placeholder = "Type @ and tag user"></div>
    <ejs-mention id='defaultMention' :target='mentionTarget'
:dataSource='userData'></ejs-mention>
  </div>
</template>
<script>
import { MentionComponent } from "@syncfusion/ej2-vue-dropdowns";
export default {
  components: {
    'ejs-mention': MentionComponent
  },
  name: 'app',
  data: function() {
    return {
      mentionTarget: "#mentionElement",
      userData: ['Selma Rose', 'Garth', 'Robert', 'William', 'Joseph']
    };
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/bootstrap5.css";
  @import "../node_modules/@syncfusion/ej2-buttons/styles/bootstrap5.css";
  @import "../node_modules/@syncfusion/ej2-popups/styles/bootstrap5.css";
  @import "../node_modules/@syncfusion/ej2-lists/styles/bootstrap5.css";
  @import "../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/bootstrap5.css";
  #app {
      color: #008cff;
      height: 40px;
      left: 15%;
      position: absolute;
      top: 10%;
      width: 30%;
  }
  #comment {
      font-size: 15px;
      font-weight: 600;
  }
  #mentionElement {
      min-height: 100px;
      border: 1px solid #D7D7D7;
      border-radius: 4px;
      padding: 8px;
      font-size: 14px;
      width: 600px;
  }
  div#mentionElement[placeholder]:empty:before {
      content: attr(placeholder);
      color: #555;
  }
</style>
```

Copyright © 2001 -2024 Syncfusion Inc.

Run the project

To run the project, use the following command:

`bash

npm run serve

`

or

`bash

yarn run serve

`

{% previewsample "page.domainurl/code-snippet/mention/getting-started-cs1" %}

Display Mention character

By using the showMentionChar property, the text content can be displayed along with the mention character. You can customize the mention character by using the mentionChar property in the Mention component.

By default, the mentionChar is @ and the showMentionChar property is disabled.

The following example displays the text content along with the mention character configured as #.

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
  <div id="app">
    <label id="comment" >Comments</label>
    <div id="mentionElement" placeholder = "Type # and tag user"></div>
    <ejs-mention id='defaultMention' showMentionChar='true' mentionChar='#'
:target='mentionTarget' :dataSource='userData'></ejs-mention>
  </div>
</template>
<script setup>
import { MentionComponent as EjsMention } from "@syncfusion/ej2-vue-
dropdowns";
const mentionTarget = "#mentionElement";
const userData = ['Selma Rose', 'Garth', 'Robert', 'William', 'Joseph'];

Getting Started with the Vue Mention Component in Vue 3

This article provides a step-by-step guide for setting up a Vite project with a JavaScript environment and integrating the Syncfusion Vue Mention component using the Composition API / Options API.

The Composition API is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

The Options API is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

Prerequisites

System requirements for Syncfusion Vue UI components

Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using Vite. To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

`bash

npm create vite@latest

`

or

`bash

yarn create vite

`

Using one of the above commands will lead you to set up additional configurations for the project as below:

Copyright © 2001 -2024 Syncfusion Inc.

1.Define the project name: We can specify the name of the project directly. Let's specify the name of the project as my-project for this article.

`bash

? Project name: » my-project

`

2.Select Vue as the framework. It will create a Vue 3 project.

`bash

? Select a framework: » - Use arrow-keys. Return to submit.

Vanilla

Vue

React

Preact

Lit

Svelte

Others

`

3.Choose JavaScript as the framework variant to build this Vite project using JavaScript and Vue.

`bash

? Select a variant: » - Use arrow-keys. Return to submit.

JavaScript

TypeScript

Customize with create-vue ↗

Nuxt ↗

`

4.Upon completing the aforementioned steps to create the my-project, run the following command to install its dependencies:

`bash

cd my-project

npm install

`

or

`bash

cd my-project

yarn install

`

Now that my-project is ready to run with default settings, let's add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion Vue component packages are available at npmjs.com. To use Syncfusion Vue components in the project, install the corresponding npm package.

This article uses the Vue Mention component as an example. To use the Vue Mention component in the project, the @syncfusion/ej2-vue-dropdowns package needs to be installed using the following command:

`bash

npm install @syncfusion/ej2-vue-dropdowns --save

`

or

`bash

yarn add @syncfusion/ej2-vue-dropdowns

`

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the Mention component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/bootstrap5.css";
@import "../node_modules/@syncfusion/ej2-vue-buttons/styles/bootstrap5.css";
@import "../node_modules/@syncfusion/ej2-vue-popups/styles/bootstrap5.css";
@import "../node_modules/@syncfusion/ej2-vue-list/styles/bootstrap5.css";
@import "../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/bootstrap5.css";
</style>
```

The order of importing CSS styles should be in line with its dependency graph.

Add Syncfusion Vue component

Follow the below steps to add the Vue Mention component using Composition API or Options API:

1.First, import and register the Mention component in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

Copyright © 2001 -2024 Syncfusion Inc.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { MentionComponent as EjsMention } from "@syncfusion/ej2-vue-
dropdowns";
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { MentionComponent } from "@syncfusion/ej2-vue-dropdowns";
//Component registeration
export default {
name: "App",
components: {
'ejs-mention' : MentionComponent,
}
}
</script>
```

2.In the template section, define the Mention component with the dataSource property and column definitions.

~/SRC/APP.VUE

```
<template>
<div class="control_wrapper">
<label style="font-size: 15px; font-weight: 600;">Comments</label>
<div id="mentionElement" style="min-height: 100px; border: 1px solid
#D7D7D7; border-radius: 4px; padding: 8px; font-size: 14px; width:
600px;"></div>
<ejs-mention id='defaultMention' :target='mentionTarget'
:dataSource='userData'></ejs-mention>
</div>
</template>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<div class="control_wrapper">
<label id="comment" >Comments</label>
<div id="mentionElement" placeholder = "Type # and tag user"></div>
<ejs-mention id='defaultMention' :target='data[0].mentionTarget'
:dataSource='data[0].userData'></ejs-mention>
</div>
</template>
<script setup>
import { MentionComponent as EjsMention } from "@syncfusion/ej2-vue-
dropdowns";
const data = [{ target: "#mentionElement",
userData: ['Selma Rose', 'Garth', 'Robert', 'William', 'Joseph'] }]
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/bootstrap5.css";
```

Copyright © 2001 -2024 Syncfusion Inc.

```
@import "../node_modules/@syncfusion/ej2-buttons/styles/bootstrap5.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/bootstrap5.css";
@import "../node_modules/@syncfusion/ej2-lists/styles/bootstrap5.css";
@import "../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/bootstrap5.css";
#app {
color: #008cff;
height: 40px;
left: 15%;
position: absolute;
top: 10%;
width: 30%;
}
#comment {
font-size: 15px;
font-weight: 600;
}
#mentionElement {
min-height: 100px;
border: 1px solid #D7D7D7;
border-radius: 4px;
padding: 8px;
font-size: 14px;
width: 600px;
}
div#mentionElement[placeholder]:empty:before {
content: attr(placeholder);
color: #555;
}
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<div class="control_wrapper">
<label id="comment" >Comments</label>
<div id="mentionElement" placeholder = "Type # and tag user"></div>
<ejs-mention id='defaultMention' :target='mentionTarget'
:dataSource='userData'></ejs-mention>
</div>
</template>
<script>
import { MentionComponent } from "@syncfusion/ej2-vue-dropdowns";
//Component registration
export default {
name: 'App',
components: {
"ejs-mention": MentionComponent
},
data () {
return {
target: "#mentionElement",
userData: ['Selma Rose', 'Garth', 'Robert', 'William', 'Joseph']
}
}
}
```

Copyright © 2001 -2024 Syncfusion Inc.

```
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/bootstrap5.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/bootstrap5.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/bootstrap5.css";
@import "../node_modules/@syncfusion/ej2-lists/styles/bootstrap5.css";
@import "../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/bootstrap5.css";
#app {
color: #008cff;
height: 40px;
left: 15%;
position: absolute;
top: 10%;
width: 30%;
}
#comment {
font-size: 15px;
font-weight: 600;
}
#mentionElement {
min-height: 100px;
border: 1px solid #D7D7D7;
border-radius: 4px;
padding: 8px;
font-size: 14px;
width: 600px;
}
div#mentionElement[placeholder]:empty:before {
content: attr(placeholder);
color: #555;
}
</style>
```

Run the project

To run the project, use the following command:

`bash

npm run dev

`

or

`bash

yarn run dev

`

Display Mention character

By using the showMentionChar property, the text content can be displayed along with the mention character. You can customize the mention character by using the mentionChar property in the Mention component.

By default, the mentionChar is @ and the showMentionChar property is disabled.

The following example code displays the text content along with the mention character configured as #.

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<div id="app">
<label id="comment" >Comments</label>
<div id="mentionElement" placeholder = "Type # and tag user"></div>
<ejs-mention id='defaultMention' showMentionChar='true' mentionChar='#'
:target='data[0].mentionTarget' :dataSource='data[0].userData'></ejs-
mention>
</div>
</template>
<script setup>
import { MentionComponent as EjsMention } from "@syncfusion/ej2-vue-
dropdowns";
const data = [{ mentionTarget: "#mentionElement",
userData: ['Selma Rose', 'Garth', 'Robert', 'William', 'Joseph']}]
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/bootstrap5.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/bootstrap5.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/bootstrap5.css";
@import "../node_modules/@syncfusion/ej2-lists/styles/bootstrap5.css";
@import "../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/bootstrap5.css";
#app {
color: #008cff;
height: 40px;
left: 15%;
position: absolute;
top: 10%;
width: 30%;
}
#comment {
font-size: 15px;
font-weight: 600;
}
#mentionElement {
min-height: 100px;
border: 1px solid #D7D7D7;
border-radius: 4px;
padding: 8px;
font-size: 14px;
width: 600px;
}
div#mentionElement[placeholder]:empty:before {
content: attr(placeholder);
}
</style>
```

OPTIONS API (~/SRC/APP.VUE)

font-size: 14px;
width: 600px;
}
div#mentionElement[placeholder]:empty:before {
content: attr(placeholder);
}
</style>
```

Working with data in Vue Mention component

The Mention loads the data either from local data sources or remote data services using the dataSource property. It supports the data type of either `array` or `DataManager`.

Copyright © 2001 -2024 Syncfusion Inc.

The Mention also supports different kinds of data services such as OData V4 and Web API, and data formats such as XML, JSON, and JSONP with the help of DataManager adaptors.

| Fields | Type | Description |

|------|------|-------------|

| text | string | Specifies the display text of each list item. |

| value | number or string | Specifies the hidden data value mapped to each list item that should contain a unique value. |

| groupBy | string | Specifies the category under which the list item has to be grouped. |

| iconCss | string | Specifies the icon class of each list item. |

When binding complex data to the Mention, fields should be mapped correctly. Otherwise, the selected item remains undefined.

Binding local data

Local data can be represented in three ways as described in the following.

Array of simple data

The Mention has provided support to load an array of primitive data such as strings and numbers. Here, both the value and text fields act the same.

APP.VUE

```
<template>
    <div id="app">
        <label id="comment" >Comments</label>
        <div id="mentionElement" placeholder = "Type @ and tag user"></div>
        <ejs-mention id='defaultMention' :target='target'
:dataSource='userData'></ejs-mention>
    </div>
</template>
<script>
import Vue from "vue";
import { MentionPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(MentionPlugin);
export default {
    data: function() {
        return {
            target: "#mentionElement",
            userData: ['Selma Rose', 'Garth', 'Robert', 'William', 'Joseph']
        };
    }
}
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-base/styles/bootstrap5.css";
    @import "../node_modules/@syncfusion/ej2-buttons/styles/bootstrap5.css";
    @import "../node_modules/@syncfusion/ej2-popups/styles/bootstrap5.css";
    @import "../node_modules/@syncfusion/ej2-list/styles/bootstrap5.css";
    @import "../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/bootstrap5.css";
    #app {
        color: #008cff;
```

Copyright © 2001 -2024 Syncfusion Inc.

```
        height: 40px;
        left: 15%;
        position: absolute;
        top: 10%;
        width: 30%;
    }
    #comment {
        font-size: 15px;
        font-weight: 600;
    }
    #mentionElement {
        min-height: 100px;
        border: 1px solid #D7D7D7;
        border-radius: 4px;
        padding: 8px;
        font-size: 14px;
        width: 600px;
    }
    div#mentionElement[placeholder]:empty:before {
        content: attr(placeholder);
    }
</style>
```

{% previewsample "page.domainurl/code-snippet/mention/working-with-data-cs1" %}

Array of JSON data

The Mention can generate its list items through an array of complex data. Therefore, the appropriate columns should be mapped to the fields property.

In the following example, ID column and Game column from complex data have been mapped to the value field and text field, respectively.

APP.VUE

```
<template>
    <div id="app">
        <label id="comment" >Comments</label>
        <div id="mentionElement" placeholder = "Type @ and tag sport"></div>
        <ejs-mention id='defaultMention' :target='target'
:dataSource='userData' :fields='fields' ></ejs-mention>
    </div>
</template>
<script>
import Vue from "vue";
import { MentionPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(MentionPlugin);
export default {
    data: function() {
        return {
            userData:  [
                { ID: 'game1', Game: 'Badminton' },
                { ID: 'game2', Game: 'Football' },
                { ID: 'game3', Game: 'Tennis' },
                { ID: 'game4', Game: 'Hockey' },
                { ID: 'game5', Game: 'Basketball' }
            ],
```

Copyright © 2001 -2024 Syncfusion Inc.

```
            fields: { text: 'Game', value: 'ID' },
            target: "#mentionElement"
        };
    }
}
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-base/styles/bootstrap5.css";
    @import "../node_modules/@syncfusion/ej2-buttons/styles/bootstrap5.css";
    @import "../node_modules/@syncfusion/ej2-popups/styles/bootstrap5.css";
    @import "../node_modules/@syncfusion/ej2-list/styles/bootstrap5.css";
    @import "../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/bootstrap5.css";
    #app {
        color: #008cff;
        height: 40px;
        left: 15%;
        position: absolute;
        top: 10%;
        width: 30%;
    }
    #comment {
        font-size: 15px;
        font-weight: 600;
    }
    #mentionElement {
        min-height: 100px;
        border: 1px solid #D7D7D7;
        border-radius: 4px;
        padding: 8px;
        font-size: 14px;
        width: 600px;
    }
    div#mentionElement[placeholder]:empty:before {
        content: attr(placeholder);
    }
</style>
```

{% previewsample "page.domainurl/code-snippet/mention/working-with-data-cs2" %}

Array of Complex data

The Mention can generate its list items through an array of complex data. For this, the appropriate columns should be mapped to the fields property.

In the following example, Code.ID column and Country.Name column from complex data have been mapped to the value field and text field, respectively.

APP.VUE

```
<template>
    <div id="app">
        <label id="comment" >Comments</label>
        <div id="mentionElement" placeholder = "Type @ and tag
country"></div>
        <ejs-mention id='defaultMention' :target='target'
:dataSource='userData' :fields='fields' ></ejs-mention>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
    </div>
</template>
<script>
import Vue from "vue";
import { MentionPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(MentionPlugin);
export default {
    data: function() {
        return {
            userData: [
                { Country: { Name: 'Australia' }, Code: { ID: 'AU' }},
                { Country: { Name: 'Bermuda' }, Code: { ID: 'BM' }},
                { Country: { Name: 'Canada'}, Code:{ ID: 'CA'} },
                { Country: { Name: 'Cameroon'}, Code:{ ID: 'CM'} },
                { Country: { Name: 'Denmark'}, Code:{ ID: 'DK' }},
                { Country: { Name: 'France'}, Code: { ID:'FR'} }
            ],
            fields: { text: 'Country.Name', value: 'Code.ID' },
            target: "#mentionElement"
        };
    }
}
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-base/styles/bootstrap5.css";
    @import "../node_modules/@syncfusion/ej2-buttons/styles/bootstrap5.css";
    @import "../node_modules/@syncfusion/ej2-popups/styles/bootstrap5.css";
    @import "../node_modules/@syncfusion/ej2-list/styles/bootstrap5.css";
    @import "../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/bootstrap5.css";
    #app {
        color: #008cff;
        height: 40px;
        left: 15%;
        position: absolute;
        top: 10%;
        width: 30%;
    }
    #comment {
        font-size: 15px;
        font-weight: 600;
    }
    #mentionElement {
        min-height: 100px;
        border: 1px solid #D7D7D7;
        border-radius: 4px;
        padding: 8px;
        font-size: 14px;
        width: 600px;
    }
    div#mentionElement[placeholder]:empty:before {
        content: attr(placeholder);
        color: #555;

{% previewsample "page.domainurl/code-snippet/mention/working-with-data-cs3" %}

Binding remote data

The Mention supports retrieval of data from remote data services with the help of DataManager component. The query property is used to fetch the data from the database and bind it to the Mention component.

OData v4 adaptor - Binding OData v4 service

The ODataV4 is an improved version of OData protocols, and the DataManager can also retrieve and consume OData v4 services. For more details on OData v4 services, refer to the odata documentation. To bind OData v4 service, use the ODataV4Adaptor.

The following sample displays the first 6 contacts from Customers table of the Northwind Data Service.

APP.VUE

```
<template>
    <div id="app">
        <label id="comment" >Comments</label>
        <div id="mentionElement" placeholder = "Type @ and tag user"></div>
        <ejs-mention id='defaultMention' :target='target'
:dataSource='dataSource' :query='query' :fields='fields'
popupWidth='250px'></ejs-mention>
    </div>
</template>
<script>
import Vue from "vue";
import { MentionPlugin } from "@syncfusion/ej2-vue-dropdowns";
import { Query, DataManager, ODataV4Adaptor } from '@syncfusion/ej2-data';
Vue.use(MentionPlugin);
export default {
    data: function() {
        return {
            dataSource: new DataManager({
                url:
'https://services.odata.org/V4/Northwind/Northwind.svc/',
                adaptor: new ODataV4Adaptor,
                crossDomain: true
            }),
            query: new Query().from('Customers').select(['ContactName',
'CustomerID']).take(6),
            fields: { text: 'ContactName', value: 'CustomerID' },
            target:'#mentionElement'
        };
    }
}
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-base/styles/bootstrap5.css";
    @import "../node_modules/@syncfusion/ej2-buttons/styles/bootstrap5.css";
    @import "../node_modules/@syncfusion/ej2-popups/styles/bootstrap5.css";
    @import "../node_modules/@syncfusion/ej2-list/styles/bootstrap5.css";
    @import "../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/bootstrap5.css";
    #app {
        color: #008cff;
```

Copyright © 2001 -2024 Syncfusion Inc.

```
        height: 40px;
        left: 15%;
        position: absolute;
        top: 10%;
        width: 30%;
    }
    #comment {
        font-size: 15px;
        font-weight: 600;
    }
    #mentionElement {
        min-height: 100px;
        border: 1px solid #D7D7D7;
        border-radius: 4px;
        padding: 8px;
        font-size: 14px;
        width: 600px;
    }
    div#mentionElement[placeholder]:empty:before {
        content: attr(placeholder);
    }
</style>
```

{% previewsample "page.domainurl/code-snippet/mention/working-with-data-cs4" %}

Web API adaptor

You can use WebApiAdaptor to bind mention with Web API created using OData endpoint.

APP.VUE

```
<template>
    <div id="app">
        <label id="comment" >Comments</label>
        <div id="mentionElement" placeholder = "Type @ and tag user"></div>
        <ejs-mention id='defaultMention' :target='target'
:dataSource='dataSource' :fields='fields' :query='query'
popupWidth='250px'></ejs-mention>
    </div>
</template>
<script>
import Vue from "vue";
import { MentionPlugin } from "@syncfusion/ej2-vue-dropdowns";
import { Query, DataManager, WebApiAdaptor } from '@syncfusion/ej2-data';
Vue.use(MentionPlugin);
export default {
    data: function() {
        return {
            dataSource: new DataManager({

Filtering data in Vue Mention component

The Mention component has built-in support to filter data items. The filter operation starts as soon as you start typing characters in the mention element.

Limit the minimum filter character

You can control the minimum length of user input to initiate the search action using minLength property. This can be useful if you have a very large list of data. The default value is 0, where suggestion the list opened as soon as the user inputs the mention character.

The remote request does not fetch the search data until the search key contains three characters as shown in the following example.

APP.VUE

```
 <template>
    <div id="app">
        <label id="comment" >Comments</label>
```

```
        <div id="mentionElement" placeholder = "Type @ and tag user"></div>
        <ejs-mention id='defaultMention' :target='target'
:dataSource='DataManager' :query='query' :fields='fields'
minLength='3'></ejs-mention>
    </div>
</template>
<script>
import Vue from "vue";
import { MentionPlugin } from "@syncfusion/ej2-vue-dropdowns";
import { Query, DataManager, ODataV4Adaptor } from '@syncfusion/ej2-data';
Vue.use(MentionPlugin);
export default {
        data: function() {
        return {
            DataManager : new DataManager({
                url:
'https://services.odata.org/V4/Northwind/Northwind.svc/Customers',
                adaptor: new ODataV4Adaptor,
                crossDomain: true
            }),
            query: new Query().select(['ContactName',
'CustomerID']).take(7),
            // map the appropriate column
            fields: { text: 'ContactName', value: 'CustomerID' },
            minLength: 3,
            target: "#mentionElement"
        }
    }
}

```

{% previewsample "page.domainurl/code-snippet/mention/filtering-data-cs1" %}

Change the filter type

While filtering, you can change the filter type to Contains, StartsWith, or EndsWith in the filterType property. The default filter operator is Contains.

- StartsWith - Filter the items that begin with the specified text value.
- Contains - Filter the items that contain the specified text value.
- EndsWith - Filter the items that end with the specified text value.

APP.VUE

```
<template>
    <div id="app">
        <label id="comment" >Comments</label>
        <div id="mentionElement" placeholder = "Type @ and tag user"></div>

        content: attr(placeholder);
    }
</style>
```

{% previewsample "page.domainurl/code-snippet/mention/filtering-data-cs2" %}

Allow spacing between search

While filtering, you can allow the space in the middle of the mention the data in the data source by using the allowSpaces property. If the data source does not match with the mentioned element data, the popup will be hidden on the space key press. The default value of allowSpaces is false.

By default, the allowSpaces property is disabled, and the space ends the mention component search.

Sorting in Vue Mention component

You can display the suggestions list items in a specific order. It has possible types as Ascending, Descending, and None in the sortOrder property.

- None - The data source is not sorted.
- Ascending - The data source is sorted in ascending order.
- Descending - The data source is sorted in descending order.

In the following sample, the popup list data is rendered in Descending order.

No records template

You can show the custom design of the popup list content when no data is found and no matches are found on search with the help of noRecordsTemplate property.

In the following sample, popup list content displays the notification of no data available.

APP.VUE

```
<template>
        <div id="app">
            <label id="comment" >Comments</label>
            <div id="mentionElement" placeholder = "Type @ and tag
user"></div>
            <ejs-mention id='defaultMention' :target='target' :dataSource=[]
:noRecordsTemplate='noRecordsTemplate' ></ejs-mention>
        </div>
</template>
<script>
import Vue from "vue";
import { MentionPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(MentionPlugin);
export default {
    data: function() {
        return {
            noRecordsTemplate:"<span class='norecord'> NO DATA
AVAILABLE</span>",
```

```
            target: "#mentionElement"
        };
    }
}
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-base/styles/bootstrap5.css";
    @import "../node_modules/@syncfusion/ej2-buttons/styles/bootstrap5.css";
    @import "../node_modules/@syncfusion/ej2-popups/styles/bootstrap5.css";
    @import "../node_modules/@syncfusion/ej2-list/styles/bootstrap5.css";
    @import "../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/bootstrap5.css";
    #app {
        color: #008cff;
        height: 40px;
        left: 15%;
        position: absolute;
        top: 10%;
        width: 30%;
    }
    #comment {
        font-size: 15px;
        font-weight: 600;
    }
    #mentionElement {
        min-height: 100px;
        border: 1px solid #D7D7D7;
        border-radius: 4px;
        padding: 8px;
        font-size: 14px;
        width: 600px;
    }
    div#mentionElement[placeholder]:empty:before {

Localization in Vue Mention component

The Localization library allows you to localize static text content of the noRecordsTemplate properties according to the culture currently assigned to the Mention.

| Locale key | en-US (default) |

|------|------|

| noRecordsTemplate | No records found |

Loading translations

To load the translation object to your application, use the load function of the **L10n** class.

In the following sample, French culture is set to the mention component and no data is loaded. Hence, the noRecordsTemplate property displays its text in French culture initially.

APP.VUE

```
<template>
    <div id="app">
        <label id="comment" >Comments</label>
        <div id="mentionElement" placeholder = "Type @ and tag user"></div>
        <ejs-mention id='defaultMention' :target='target'
:dataSource='customerData' :fields='fields' :query='query' locale='fr-
BE'></ejs-mention>
    </div>
</template>
<script>
import Vue from "vue";
import { MentionPlugin } from "@syncfusion/ej2-vue-dropdowns";
import { L10n, setCulture} from '@syncfusion/ej2-base';
import { DataManager, ODataV4Adaptor, Query } from '@syncfusion/ej2-data';
Vue.use(MentionPlugin);
export default {
    data: function() {
        L10n.load({
            'fr-BE': {
                'dropdowns': {
                    'noRecordsTemplate': "Aucun enregistrement trouvé"
                }
            }
```

Customization in Vue Mention component

Show or hide mention character

You can show mention character as prefix of selected item in mention component using showMentionChar property. The default value of showMentionChar is false.

Copyright © 2001 -2024 Syncfusion Inc.

APP.VUE

```
<template>
    <div id="app">
        <label id="comment" >Comments</label>
        <div id="mentionElement" placeholder = "Type @ and tag user"></div>

Adding the suffix character after selection

The Mention has provided support to specify the custom suffix to append alongside the mentioned selected item while inserting. You can append space or new line character as suffixText.

The following example displays the white space next to the text selected since the suffixText is configured as .

APP.VUE

```
<template>
    <div id="app">
        <label id="comment" >Comments</label>
        <div id="mentionElement" placeholder = "Type @ and tag
country"></div>
        <ejs-mention id='defaultMention' :target='target'
:dataSource='userData' :fields='fields' showMentionChar='true'
:suffixText='suffixText'></ejs-mention>
    </div>
</template>
<script>
import Vue from "vue";
import { MentionPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(MentionPlugin);
export default {
        data: function() {
        return {
            target: "#mentionElement",
            suffixText: ' ',
            userData: [
                { Country : "Australia", Code : "AU" },
                { Country : "Bermuda" , Code : "BM" },
                { Country : "Canada" , Code :  "CA" },
                { Country : "Cameroon" , Code : "CM" },
                { Country : "Denmark" , Code : "DK" }
            ],
            fields: {text:'Country'}
        };
    }
}
</script>
<style>

Trigger character

You can customize the trigger character by using the mentionChar property in the Mention component. The trigger character triggers the suggestion list to display in the target area.

By default, the mentionChar is @.

Accessibility in Vue Mention component

Web accessibility makes web content and web applications more accessible for people with disabilities. Mention component provides built-in compliance with WAI-ARIA specifications. The WAI-ARIA support is achieved using the attributes such as aria-selected and aria-activedescendent.

Copyright © 2001 -2024 Syncfusion Inc.

The Mention component followed the accessibility guidelines and standards, including ADA, Section 508, WCAG 2.2 standards, and WCAG roles that are commonly used to evaluate accessibility.

The accessibility compliance for the Mention component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| WCAG 2.2 Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

<img src="https://cdn.syncfusion.com/content/images/landing-page/no.png" alt="No"> - The component does not meet the requirement.

WAI-ARIA attributes

The Mention component uses the `Listbox` role where each list item has an `option` role. The following `ARIA attributes` denote the Mention state.

Copyright © 2001 -2024 Syncfusion Inc.

| **Properties** | **Functionalities** |

| --- | --- |

| aria-selected | Indicates the selected option.|

| aria-activedescendent | This attribute holds the ID of the active list item to focus its descendant child element. |

| aria-owns | This attribute contains the ID of the popup list to indicate popup as a child element. |

Keyboard interaction

You can use the following key shortcuts to access the Mention without interruptions.

| **Keyboard shortcuts** | **Actions** |

| --- | --- |

| Arrow Down | Selects the first item in the Mention list. Otherwise, selects the item next to the currently selected item. |

| Arrow Up | Selects the item previous to the currently selected one. |

| Esc(Escape) | Closes the popup list when it is in an open state. |

| Enter | Selects the focused item, and when it is in an open state the popup list closes. |

| Tab | Focuses on the next TabIndex element on the page when the popup is closed. Otherwise, inserts the selected popup list item and closes the popup list. |

APP.VUE

```
<template>
    <div id="app">
        <label id="comment" >Comments</label>
        <div id="mentionElement" placeholder = "Type @ and tag user"></div>
        <ejs-mention id='defaultMention' :target='target'
:dataSource='userData' :fields='fields'></ejs-mention>
    </div>
</template>
<script>
import Vue from "vue";
import { MentionPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(MentionPlugin);
export default {
    data: function() {
        return {
            target: "#mentionElement",
            userData: [
                { Name : "Andrew Fuller", ID : "1" },
                { Name : "Anne Dodsworth" , ID : "2" },
                { Name : "Janet Leverling" , ID :  "3" },
                { Name : "Laura Callahan" , ID : "4" },
                { Name : "Margaret Peacock" , ID : "5" }
            ],
          fields: {text:'Name'}
        };
    }
}
```

Ensuring accessibility

The Mention component's accessibility levels are ensured through an accessibility-checker and axe-core software tools during automated testing.

The accessibility compliance of the Mention component is shown in the following sample. Open the sample in a new window to evaluate the accessibility of the Mention component with accessibility tools.

{% previewsample "https://ej2.syncfusion.com/accessibility/mention.html" %}

Menu

Getting Started with the Vue Menu Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using Vue-CLI and integrating the Syncfusion Vue Menu component using the Composition API / Options API.

Prerequisites

System requirements for Syncfusion Vue UI components

Dependencies

The following list of dependencies are required to use the Menu component in your application.

```
|-- @syncfusion/ej2-vue-navigations
|-- @syncfusion/ej2-vue-base
|-- @syncfusion/ej2-navigations
|-- @syncfusion/ej2-base
|-- @syncfusion/ej2-data
|-- @syncfusion/ej2-lists
|-- @syncfusion/ej2-inputs
|-- @syncfusion/ej2-popups
|-- @syncfusion/ej2-buttons
```

Setting up the Vue 2 project

To generate a Vue 2 project using Vue-CLI, use the vue create command. Follow these steps to install Vue CLI and create a new project:

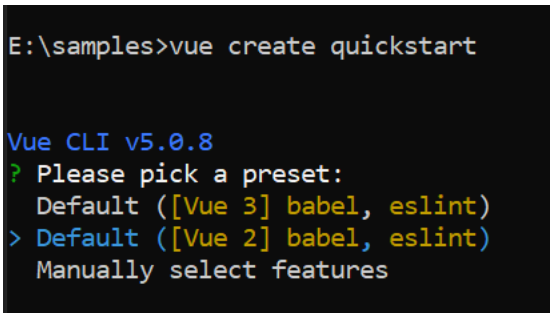
```bash
npm install -g @vue/cli
vue create quickstart
cd quickstart
npm run serve
```

or

```bash
yarn global add @vue/cli
vue create quickstart
cd quickstart
yarn run serve
```

When creating a new project, choose the option `Default ([Vue 2] babel, eslint)` from the menu.

Copyright © 2001 -2024 Syncfusion Inc.



Once the quickstart project is set up with default settings, proceed to add Syncfusion components to the project.

Install Syncfusion Menu packages using below command.

`bash

npm install @syncfusion/ej2-vue-navigations --save

`

Add Syncfusion Vue packages

Syncfusion packages are available at npmjs.com. To use Vue components, install the required npm package.

This article uses the Vue Menu component as an example. Install the @syncfusion/ej2-vue-navigations package by running the following command:

`bash

npm install @syncfusion/ej2-vue-navigations --save

`

or

`bash

yarn add @syncfusion/ej2-vue-navigations

`

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, the Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the Menu component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
</style>
```

Copyright © 2001 -2024 Syncfusion Inc.

Add Syncfusion Vue component

Follow the below steps to add the Vue Menu component using Composition API or Options API:

1\. First, import and register the Menu component in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { MenuComponent as EjsMenu } from "@syncfusion/ej2-vue-navigations";
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { MenuComponent } from "@syncfusion/ej2-vue-navigations";
export default {
components: {
'ejs-menu': MenuComponent
}
}
</script>
```

Initialize Menu

Add the EJ2 Vue Menu using <ejs-menu> to the <template> section of the App.vue file in src directory.

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<div>
<ejs-menu :items='menuItems'></ejs-menu>
</div>
</template>
<script setup>
import { MenuComponent as EjsMenu } from "@syncfusion/ej2-vue-navigations";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
//Menu items definition
const menuItems =  [
{
text: 'File',
items: [
{ text: 'Open' },
{ text: 'Save' },
{ text: 'Exit' }
]
},
{
text: 'Edit',
items: [
{ text: 'Cut' },
```

Copyright © 2001 -2024 Syncfusion Inc.

```
{ text: 'Copy' },
{ text: 'Paste' }
]
},
{
text: 'View',
items: [
{ text: 'Toolbar' },
{ text: 'Sidebar' }
]
},
{
text: 'Tools',
items: [
{ text: 'Spelling & Grammar' },
{ text: 'Customize' },
{ text: 'Options' }
]
},
{ text: 'Go' },
{ text: 'Help' }
];
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<div>
<ejs-menu :items='menuItems'></ejs-menu>
</div>
</template>
<script>
import { MenuComponent } from "@syncfusion/ej2-vue-navigations";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
export default {
components: {
'ejs-menu': MenuComponent
},
data: function() {
return {
//Menu items definition
menuItems:  [
{
text: 'File',
items: [
{ text: 'Open' },
{ text: 'Save' },
{ text: 'Exit' }
]
},
{
text: 'Edit',
items: [
{ text: 'Cut' },
{ text: 'Copy' },
```

Copyright © 2001 -2024 Syncfusion Inc.

```
{ text: 'Paste' }
]
},
{
text: 'View',
items: [
{ text: 'Toolbar' },
{ text: 'Sidebar' }
]
},
{
text: 'Tools',
items: [
{ text: 'Spelling & Grammar' },
{ text: 'Customize' },
{ text: 'Options' }
]
},
{ text: 'Go' },
{ text: 'Help' }
]
};
}
}
</script>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<div>
<ejs-menu :items='menuItems'></ejs-menu>
</div>
</template>
<script setup>
import { MenuComponent as EjsMenu } from "@syncfusion/ej2-vue-navigations";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
//Menu items definition
const menuItems = [
        {
        text: 'File',
        items: [
            { text: 'Open' },
            { text: 'Save' },
            { text: 'Exit' }
        ]
    },
    {
        text: 'Edit',
        items: [
            { text: 'Cut' },
            { text: 'Copy' },
            { text: 'Paste' }
        ]
```

```
    },
    {
        text: 'View',
        items: [
            { text: 'Toolbar' },
            { text: 'Sidebar' }
        ]
    },
    {
        text: 'Tools',
        items: [
            { text: 'Spelling & Grammar' },
            { text: 'Customize' },
            { text: 'Options' }
        ]
    },
    { text: 'Go' },
    { text: 'Help' }
    ];

</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
body {
    margin-top: 100px;
    text-align: center;
}
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<div>
<ejs-menu :items='menuItems'></ejs-menu>
</div>
</template>
<script>
import { MenuComponent } from "@syncfusion/ej2-vue-navigations";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
export default {
   components: {
    'ejs-menu': MenuComponent
   },
   data: function() {
        return {
            //Menu items definition
           menuItems:  [
        {
        text: 'File',
        items: [
            { text: 'Open' },
            { text: 'Save' },
            { text: 'Exit' }
```

```
            ]
        },
        {
            text: 'Edit',
            items: [
                { text: 'Cut' },
                { text: 'Copy' },
                { text: 'Paste' }
            ]
        },
        {
            text: 'View',
            items: [
                { text: 'Toolbar' },
                { text: 'Sidebar' }
            ]
        },
        {
            text: 'Tools',
            items: [
                { text: 'Spelling & Grammar' },
                { text: 'Customize' },
                { text: 'Options' }
            ]
        },
        { text: 'Go' },
        { text: 'Help' }
        ]
        };
        }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
body {
    margin-top: 100px;
    text-align: center;
}
</style>
```

Run the project

To run the project, use the following command:

`bash

npm run serve

`

or

`bash

yarn run serve

`

{% previewsample "page.domainurl/code-snippet/menu/getting-started-cs6" %}

Group menu items with separator

The separators are both horizontal and vertical lines used to separate the menu items. You cannot select the separators, but you can enable separators to group the menu items using the separator property. The Open and Save sub menu items are grouped using the separator property in the following sample.

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<div>
<ejs-menu :items='menuItems'></ejs-menu>
</div>
</template>
<script setup>
import { MenuComponent as EjsMenu } from "@syncfusion/ej2-vue-navigations";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
const menuItems =  [
        {
        text: 'File',
        items: [
            { text: 'Open' },
            { text: 'Save' },
            { separator: true },
            { text: 'Exit' }
        ]
    },
    {
        text: 'Edit',
        items: [
            { text: 'Cut' },
            { text: 'Copy' },
            { text: 'Paste' }
        ]
    },
    {
        text: 'View',
        items: [
            { text: 'Toolbar' },
            { text: 'Sidebar' },
            { text: 'Full Screen' }
        ]
    },
    {
        text: 'Tools',
         items: [
            { text: 'Spelling & Grammar' },
            { text: 'Customize' },
            { text: 'Options' }
        ]
    },
    { text: 'Go' },
    { text: 'Help' }
];
```

```
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
body {
    margin-top: 100px;
    text-align: center;
}
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<div>
<ejs-menu :items='menuItems'></ejs-menu>
</div>
</template>
<script>
import { MenuComponent } from "@syncfusion/ej2-vue-navigations";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
export default {
   components: {
    'ejs-menu': MenuComponent
   },
   data: function() {
        return {
           menuItems:  [
        {
        text: 'File',
        items: [
            { text: 'Open' },
            { text: 'Save' },
            { separator: true },
            { text: 'Exit' }
        ]
    },
    {
        text: 'Edit',
        items: [
            { text: 'Cut' },
            { text: 'Copy' },
            { text: 'Paste' }
        ]
    },
    {
        text: 'View',
        items: [
            { text: 'Toolbar' },
            { text: 'Sidebar' },
            { text: 'Full Screen' }
        ]
    },
    {
        text: 'Tools',
```

```
          items: [
              { text: 'Spelling & Grammar' },
              { text: 'Customize' },
              { text: 'Options' }
          ]
      },
      { text: 'Go' },
      { text: 'Help' }
      ]
      };
      }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
body {
    margin-top: 100px;
    text-align: center;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/menu/getting-started-cs7" %}

The separator property should not be given along with

the other fields in the MenuItem. You can also enable the separator to group **horizontal** menu items.

Getting Started with the Vue Menu Component in Vue 3

This article provides a step-by-step guide for setting up a Vite project with a JavaScript environment and integrating the Syncfusion Vue Menu component using the Composition API / Options API.

The Composition API is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

The Options API is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

Prerequisites

System requirements for Syncfusion Vue UI components

Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using Vite. To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

Copyright © 2001 -2024 Syncfusion Inc.

`bash
npm create vite@latest
`

or

`bash
yarn create vite
`

Using one of the above commands will lead you to set up additional configurations for the project as below:

1.Define the project name: We can specify the name of the project directly. Let's specify the name of the project as `my-project` for this article.

`bash
? Project name: » my-project
`

2.Select `Vue` as the framework. It will create a Vue 3 project.

`bash
? Select a framework: » - Use arrow-keys. Return to submit.
Vanilla
Vue
React
Preact
Lit
Svelte
Others
`

3.Choose `JavaScript` as the framework variant to build this Vite project using JavaScript and Vue.

`bash
? Select a variant: » - Use arrow-keys. Return to submit.
JavaScript
TypeScript
Customize with create-vue ↗
Nuxt ↗
`

Copyright © 2001 -2024 Syncfusion Inc.

4.Upon completing the aforementioned steps to create the my-project, run the following command to install its dependencies:

`bash

cd my-project

npm install

`

or

`bash

cd my-project

yarn install

`

Now that my-project is ready to run with default settings, let's add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion Vue component packages are available at npmjs.com. To use Syncfusion Vue components in the project, install the corresponding npm package.

This article uses the Vue Menu component as an example. To use the Vue Menu component in the project, the @syncfusion/ej2-vue-navigations package needs to be installed using the following command:

`bash

npm install @syncfusion/ej2-vue-navigations --save

`

or

`bash

yarn add @syncfusion/ej2-vue-navigations

`

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the Menu component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
```

Copyright © 2001 -2024 Syncfusion Inc.

```
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
</style>
```

The order of importing CSS styles should be in line with its dependency graph.

Add Syncfusion Vue component

Follow the below steps to add the Vue Menu component using Composition API or Options API:

1.First, import and register the Menu component and its child directives in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { MenuComponent as EjsMenu } from "@syncfusion/ej2-vue-navigations";
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { MenuComponent } from "@syncfusion/ej2-vue-navigations";
//Component registration
export default {
name: "App",
components: {
"ejs-menu": MenuComponent
}
}
</script>
```

2.In the template section, define the Menu component with the items property.

~/SRC/APP.VUE

```
<template>
<ejs-menu :items='menuItems'></ejs-menu>
</template>
```

3.Declare the values for the items property in the script section.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
const menuItems =  [
{
text: 'File',
items: [
{ text: 'Open' },
{ text: 'Save' },
{ text: 'Exit' }
]
},
{
text: 'Edit',
```

Copyright © 2001 -2024 Syncfusion Inc.

```
items: [
{ text: 'Cut' },
{ text: 'Copy' },
{ text: 'Paste' }
]
},
{
text: 'View',
items: [
{ text: 'Toolbar' },
{ text: 'Sidebar' }
]
},
{
text: 'Tools',
items: [
{ text: 'Spelling & Grammar' },
{ text: 'Customize' },
{ text: 'Options' }
]
},
{ text: 'Go' },
{ text: 'Help' }
];
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
data() {
return {
menuItems:  [
{
text: 'File',
items: [
{ text: 'Open' },
{ text: 'Save' },
{ text: 'Exit' }
]
},
{
text: 'Edit',
items: [
{ text: 'Cut' },
{ text: 'Copy' },
{ text: 'Paste' }
]
},
{
text: 'View',
items: [
{ text: 'Toolbar' },
{ text: 'Sidebar' }
]
},
{
```

```
text: 'Tools',
items: [
{ text: 'Spelling & Grammar' },
{ text: 'Customize' },
{ text: 'Options' }
]
},
{ text: 'Go' },
{ text: 'Help' }
],
};
}
</script>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<ejs-menu :items='menuItems'></ejs-menu>
</template>
<script setup>
import { MenuComponent as EjsMenu } from "@syncfusion/ej2-vue-navigations";
const menuItems =  [
{
text: 'File',
items: [
{ text: 'Open' },
{ text: 'Save' },
{ text: 'Exit' }
]
},
{
text: 'Edit',
items: [
{ text: 'Cut' },
{ text: 'Copy' },
{ text: 'Paste' }
]
},
{
text: 'View',
items: [
{ text: 'Toolbar' },
{ text: 'Sidebar' }
]
},
{
text: 'Tools',
items: [
{ text: 'Spelling & Grammar' },
{ text: 'Customize' },
{ text: 'Options' }
]
},
{ text: 'Go' },
```

```
{ text: 'Help' }
];
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<ejs-menu :items='menuItems'></ejs-menu>
</template>
<script>
import { MenuComponent } from "@syncfusion/ej2-vue-navigations";
// Component registration
export default {
name: "App",
// Declaring component and its directives
components: {
"ejs-menu": MenuComponent
},
// Bound properties declarations
data() {
return {
menuItems:  [
{
text: 'File',
items: [
{ text: 'Open' },
{ text: 'Save' },
{ text: 'Exit' }
]
},
{
text: 'Edit',
items: [
{ text: 'Cut' },
{ text: 'Copy' },
{ text: 'Paste' }
]
},
{
text: 'View',
items: [
{ text: 'Toolbar' },
{ text: 'Sidebar' }
]
},
{
text: 'Tools',
items: [
{ text: 'Spelling & Grammar' },
{ text: 'Customize' },
{ text: 'Options' }
```

Copyright © 2001 -2024 Syncfusion Inc.

```
]
},
{ text: 'Go' },
{ text: 'Help' }
],
};
}
};
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
</style>
```

Run the project

To run the project, use the following command:

`bash

npm run dev

`

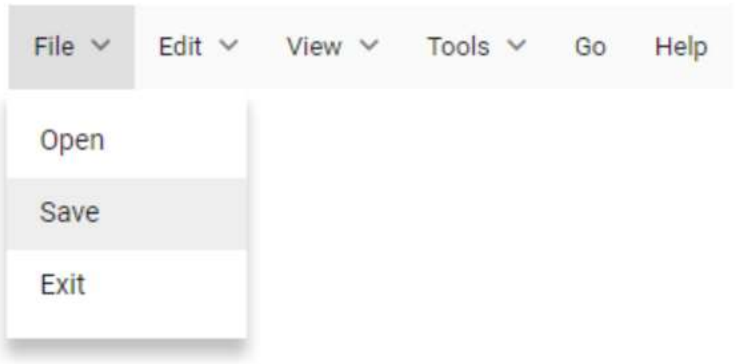
or

`bash

yarn run dev

`

The output will appear as follows:



For migrating from Vue 2 to Vue 3, refer to the migration documentation.

Icons and sub menu items in Vue Menu component

Icons

The menu item contains an icon/image in it to provide a visual representation of an action. To place the icon on a menu item, set the iconCss property with the required icon CSS. By default, the icon is positioned at the left of the menu item. In the following sample, the icons of File and Edit menu items and Open, Save, Cut, Copy,and Paste sub menu items are added using the iconCss property.

APP.VUE

```
<template>
<div>
<ejs-menu :items='menuItems'></ejs-menu>
</div>
</template>
<script>
import Vue from 'vue';
import { MenuPlugin } from "@syncfusion/ej2-vue-navigations";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(MenuPlugin);
export default {
  data: function() {
    return {
        //Menu items definition
        menuItems:  [
            {
                text: 'File',
                iconCss: 'em-icons e-file',
                items: [
                    { text: 'Open', iconCss: 'em-icons e-open' },
                    { text: 'Save', iconCss: 'e-icons e-save' },
                    { separator: true },
                    { text: 'Exit' }
                ]
            },
            {
                text: 'Edit',
                iconCss: 'em-icons e-edit',
                items: [
                    { text: 'Cut', iconCss: 'em-icons e-cut' },
                    { text: 'Copy', iconCss: 'em-icons e-copy' },
                    { text: 'Paste', iconCss: 'em-icons e-paste' }
                ]
            },
            {
                text: 'View',
                items: [
                    { text: 'Toolbar' },
                    { text: 'Sidebar' },

Navigation

Navigation in Menu is used to navigate to the other web page when a menu item is clicked. It can be achieved by providing a link to the menu item using the `url` property. In the following sample, the Navigation URL is added to sub menu items using the `url` property.

APP.VUE

    text-align: center;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/menu/getting-started-cs19" %}

Multilevel nesting

The Menu supports multiple level nesting, and it can be achieved by mapping the items property inside the parent menuItems. In the following sample, three-level nesting of menu has been provided.

APP.VUE

```
<template>
<div>
<ejs-menu :items='menuItems'></ejs-menu>
</div>
</template>
<script>
import Vue from 'vue';
import { MenuPlugin } from "@syncfusion/ej2-vue-navigations";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(MenuPlugin);
export default {
  data: function() {
    return {
        //Menu items definition
        menuItems:   [
            {
                text: 'Fashion',
                items: [
                    {
                        text: 'Men Fashion',
                        items: [
                            {
                                text: 'Personal Care',
                                items: [
                                    { text: 'Trimmers' },
                                    { text:  'Shavers' }
                                ]
                            },
                            {
```

```
                                text: 'Clothing',
                                items: [
                                    { text: 'Shirts' },
                                    { text: 'Jackets' },
                                    { text: 'Track Suits' }
                                ]
                            },
                            { text: 'Footwear' }
                        ]
                    },
                    {
                        text: 'Women Fashion',
                        items: [
                            {
                                text: 'Clothing',
                                items: [
                                    { text: 'Kurtas' },
                                    { text: 'Salwars' },
                                    { text: 'Sarees' }
                                ]
                            },
                            {
                                text: 'Jewellery',
                                items: [
                                    { text: 'Nosepins' },
                                    { text:  'Anklets' }
                                ]

{% previewsample "page.domainurl/code-snippet/menu/getting-started-cs20" %}

The below table represents the MenuItem properties and it's description.

Property Name | Type | Description

|iconCss|string|Defines class/multiple classes separated by a space for the menu Item that is used to include an icon. Menu Item can include font icon and sprite image.

|id|string|Specifies the id for menu item.

|separator|boolean|Specifies separator between the menu items. Separator are either horizontal or vertical lines used to group menu items.

|items|MenuItemModel[]|Specifies the sub menu items that is the array of MenuItem model/

|text|string|Specifies text for menu item.

|url|string|Specifies url for menu item that creates the anchor link to navigate to the url provided.

Data source binding and custom menu items in Vue Menu component

Data binding

The Menu supports data source bindings such as array of JavaScript objects that can be structured as either hierarchical or self-referential data.

Hierarchical data

The Menu can be populated with hierarchical data source by assigning it to the items property, and the fields with corresponding keys can be mapped to the fields property.

JSON data

The Menu can generate its menu items through an array of complex data source by mapping fields from the fields property.

APP.VUE

```
<template>
<div>
<ejs-menu :items='datasource' :fields='menuFields'></ejs-menu>
</div>
</template>
<script>
import Vue from 'vue';
import { MenuPlugin } from "@syncfusion/ej2-vue-navigations";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
```

{% previewsample "page.domainurl/code-snippet/menu/getting-started-cs2" %}

Data Service

In application level, remote data binding can be achieved using DataManager.

To create Menu, assign items property with resultant data from callback function.

APP.VUE

```
<template>
    <div class="template-menu-control">
        <ejs-menu v-if="items" :items="items" :fields="menuFields"></ejs-
menu>
    </div>
</template>
<script>
import Vue from 'vue';
import { MenuPlugin } from "@syncfusion/ej2-vue-navigations";
import { ODataV4Adaptor, DataManager, Query } from "@syncfusion/ej2-data";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(MenuPlugin);
var SERVICE_URI = 'https://services.odata.org/V4/Northwind/Northwind.svc/';
var result;
export default {
   data: function() {
    return {
        items: this.menuItems(),
        menuFields: {
            text: ['FirstName','ShipName'],
            children: ['Orders']
        }
      }
   },
   methods: {
```

Copyright © 2001 -2024 Syncfusion Inc.

```
    menuItems() {
        new DataManager({ url: SERVICE_URI, adaptor: new ODataV4Adaptor(),
crossDomain: true })
        .executeQuery(
        new Query().from('Employees').take(5).hierarchy(
            new Query()
            .foreignKey('EmployeeID')
            .from('Orders').take(13),
            function() {
                return [1,2,3,4,5]
            }
        ))
        .then((e) => {
            this.items =  e.result
        });
        return this.items;
     }
   }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
.template-menu-control {
    margin-top: 100px;
    text-align: center;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/menu/getting-started-cs3" %}

Self-referential data

Menu can be populated from self-referential data structure that contains array of JSON objects with `parentId` mapping.

In the following example, the **id**, **pId**, and **text** columns from self-referential data have been mapped to the **itemId**, **parentId**, and **text** fields, respectively.

APP.VUE

```
<template>
<div>
<ejs-menu :items='datasource' :fields='menuFields'></ejs-menu>
</div>
</template>
<script>
import Vue from 'vue';
import { MenuPlugin } from "@syncfusion/ej2-vue-navigations";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(MenuPlugin);
export default {
   data: function() {
        return {
            //Menu datasource
```

Copyright © 2001 -2024 Syncfusion Inc.

```
            datasource:  [
        { id: 'parent1', text: 'Events' },
    { id: 'parent2', text: 'Movies' },
    { id: 'parent3', text: 'Directory' },
    { id: 'parent4', text: 'Queries', pId: null },
    { id: 'parent5', text: 'Services', pId: null },
    { id: 'parent6', text: 'Conferences', pId: 'parent1' },
    { id: 'parent7', text: 'Music', pId: 'parent1' },
    { id: 'parent8', text: 'Workshops', pId: 'parent1' },
    { id: 'parent9', text: 'Now Showing', pId: 'parent2' },
    { id: 'parent10', text: 'Coming Soon', pId: 'parent2' },
    { id: 'parent10', text: 'Media Gallery', pId: 'parent3' },
    { id: 'parent11', text: 'Newsletters', pId: 'parent3' },
    { id: 'parent12', text: 'Our Policy', pId: 'parent4' },
    { id: 'parent13', text: 'Site Map', pId: 'parent4' },
    { id: 'parent14', text: 'Pop', pId: 'parent7' },
    { id: 'parent15', text: 'Folk', pId: 'parent7' },
    { id: 'parent16', text: 'Classical', pId: 'parent7' }
    ],
    //Menu fields definition
    menuFields: {
    itemId:'id',
    text: 'text',
    parentId: 'pId'
}
    };
    }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
body {
    margin-top: 100px;
    text-align: center;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/menu/getting-started-cs4" %}

Custom menu items

The Menu can be customized using Essential JS2 Template engine to render the elements.

To customize menu items in your application, set your customized template string to the template property. In the following example, the menu has been rendered with customized menu items.

Install Syncfusion Layouts and Navigations packages using below command.

`bash

npm install @syncfusion/ej2-vue-layouts --save

npm install @syncfusion/ej2-vue-navigations --save

`

- Render menu with items

Use case scenarios in Vue Menu component

Scrollable menu

The menu component supports horizontal and vertical scrolling to render large menus and submenus in an adaptive way. This can be achieved by enabling the enableScrolling property and by restricting the corresponding menu/submenu size.

APP.VUE

```
<template>
    <div>
        <ejs-menu :items='menuItems' :beforeOpen='onBeforeOpen' cssClass='e-
scrollable-menu' :enableScrolling='true'></ejs-menu>
    </div>
</template>
<script>
```

```
import Vue from 'vue';
import { MenuPlugin } from "@syncfusion/ej2-vue-navigations";
import { enableRipple, closest } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(MenuPlugin);
export default {
  data: function() {
    return {
        // Menu items definition
        menuItems: [
        {
            text: 'Appliances',
            items: [
                {
                    text: 'Kitchen',
                    items: [
                        { text: 'Electric Cookers' },
                        { text: 'Coffee Makers' },
                        { text: 'Blenders' },
                        { text: 'Microwave Ovens' }
                    ]
                },
                {
                    text: 'Television',
                    items: [
                        { text: 'Our Exclusive TVs' },
                        { text: 'Smart TVs' },
                        { text: 'Big Screen TVs' }
                    ]
                },

Menu in toolbar

The following example demonstrates how to integrate Menu with Toolbar component.

APP.VUE

```
<template>
<div class="toolbar-menu-control">
<ejs-toolbar ref="toolbar" :created="onCreated">
    <e-items>
        <e-item :template='menuTemplate'></e-item>
        <e-item prefixIcon='em-icons e-shopping-cart' align='Right' ></e-
item>
    </e-items>
</ejs-toolbar>
</div>
</template>
<script>
import Vue from 'vue';
import { MenuPlugin, ToolbarPlugin } from "@syncfusion/ej2-vue-navigations";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(MenuPlugin);
Vue.use(ToolbarPlugin);
var menutemplateVue = Vue.component("demo1", {
  template: '<ejs-menu :items="menuItems"
:animationSettings="animation"></ejs-menu>',
  data() {
    return {
      data: {},
      menuItems: [
            {
                text: 'Appliances',
                items: [
                    {
                        text: 'Kitchen',
                        items: [
                            { text: 'Electric Cookers' },
                            { text: 'Coffee Makers' },
                            { text: 'Blenders' }
                        ]
                    },
                    {
                        text: 'Washing Machine',
                        items: [
                            { text: 'Fully Automatic' },
                            { text: 'Semi Automatic' }

Hamburger menu

The following example demonstrates the use case of menu with Accordion component integrated in SideBar.

APP.VUE

```
<template>
<div>
    <div class="header">
        <span id="hamburger" class="e-icons menu default"
@click='hamburgerClick'></span>
        <div class="content">Header content</div>
    </div>
    <ejs-sidebar ref="sidebar" id='default-sidebar' width='220px'
type='Over'>
        <div class="title-header">
            <div style="display:inline-block"> Menu </div>
            <span  id="close" class="e-icons" @click='close'></span>
        </div>
        <div class="content-area">
            <ejs-accordion ref="accordion" :items='items'
:expanding='expand' :clicked='clicked'></ejs-accordion>
        </div>
```

```
    </ejs-sidebar>
</div>
</template>
<script>

Accessibility in Vue Menu component

The Menu component followed the accessibility guidelines and standards, including ADA, Section 508, WCAG 2.2 standards, and WCAG roles that are commonly used to evaluate accessibility.

The accessibility compliance for the Menu component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| WCAG 2.2 Support | |

| Section 508 Support | |

| Screen Reader Support | |

| Right-To-Left Support | |

| Color Contrast | |

| Mobile Device Support | |

| Keyboard Navigation Support | |

| Accessibility Checker Validation | |

| Axe-core Accessibility Validation | |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

 - All features of the component meet the requirement.

 - Some features of the component do not meet the requirement.

 - The component does not meet the requirement.

Copyright © 2001 -2024 Syncfusion Inc.

WAI-ARIA attributes

The Menu component followed the WAI-ARIA patterns to meet the accessibility. The following ARIA attributes are used in the Menu component:

| Attributes | Purpose |

| --- | --- |

| role | Indicates Menu component's root menu as menubar, popup as menu, and the popup items as menuitem. |

| aria-haspopup | Indicates the availability and type of interactive popup element. |

| aria-expanded | Indicates whether the subtree can be expanded or collapsed, and indicates whether its current state can be expanded or collapsed. |

| aria-orientation | Indicates whether the orientation is horizontal or vertical. The default orientation is horizontal. |

| aria-label | Indicates the menu item text. |

| aria-disabled | Indicates the state of menu item whether it is disabled. |

Keyboard interaction

The Menu component followed the keyboard interaction guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Menu component.

| **Press** | **To do this** |

| --- | --- |

| Esc | Closes the sub menu that contains focus and returns focus to the parent element. |

| Enter | Opens the sub menu if focused menu item has sub menu, and places focus on its first item or activates the item and closes the sub menu. |

| Up | Navigates up or to the previous menu item. |

| Down | Navigates down or to the next menu item. |

| Left | Closes the current sub menu and navigates to the parent menu. |

| Right | Navigates and open the next sub menu. |

| Home | Focuses the first item. |

| End | Focuses the last item.

Ensuring accessibility

The Menu component's accessibility levels are ensured through an accessibility-checker and axe-core software tools during automated testing.

The accessibility compliance of the Menu component is shown in the following sample. Open the sample in a new window to evaluate the accessibility of the Menu component with accessibility tools.

Style and appearance in Vue Menu component

To modify the Menu appearance, you need to override the default CSS of Menu component. Please find the list of CSS classes and its corresponding section in Menu component. Also, you have an option to create your own custom theme for the controls using our Theme Studio.

CSS Class | Purpose of Class

|.e-menu-wrapper|To customize the menu wrapper

|.e-menu-wrapper.e-menu-popup|To customize the menu popup wrapper

|.e-menu-wrapper ul .e-menu-item|To customize the menu items

|.e-menu-wrapper.e-menu-popup .e-menu-item|To customize the menu popup items

|.e-menu-wrapper ul .e-menu-item .e-caret|To customize the menu items caret icon

How To

Change orientation in Vue Menu component

Orientation in menu items can be changed horizontally or vertically using the orientation property. By default, it is horizontally aligned.

APP.VUE

```
<template>
<div>
<ejs-menu :items='menuItems' orientation='Vertical'></ejs-menu>
</div>
</template>
<script>
import Vue from 'vue';
import { MenuPlugin } from "@syncfusion/ej2-vue-navigations";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(MenuPlugin);
export default {
   data: function() {
        return {
           menuItems:  [
        {
        text: 'File',
        items: [
            { text: 'Open' },
            { text: 'Save' },
            { text: 'Exit' }
        ]
    },
    {
        text: 'Edit',
        items: [
            { text: 'Cut' },
            { text: 'Copy' },
```

```
            { text: 'Paste' }
        ]
    },
    {
        text: 'View',
        items: [
            { text: 'Toolbar' },
            { text: 'Sidebar' },
            { text: 'Full Screen' }
        ]
    },
    {
        text: 'Tools',
        items: [
            { text: 'Spelling & Grammar' },
            { text: 'Customize' },
            { text: 'Options' }
        ]
    },
    { text: 'Help' }
    ]
    };
    }
}
</script>

Customize menu using events in Vue Menu component

The Menu provides a set of events to enable users to customize it.

APP.VUE

```
<template>
 <div id='container'>
        <div class="control-section">
            <div class="menu-section">
                <ejs-menu :items='menuItems' :beforeOpen='beforeOpen'
:beforeClose='beforeClose' :onClose='onClose' :onOpen='onOpen'
:select='select'></ejs-menu>
            </div>
            <div class="property-section">
                <table id="propertyTable" title="Event trace">
                    <tbody>
                        <th>Event trace:-</th>
                        <tr>
                            <td></td>
```

```
                        </tr>
                    </tbody>
                </table>
            </div>
            <button id='clear' @click=onClick>Clear</button>
        </div>
    </div>
</template>
<script>
import Vue from 'vue';

Customize menu items in Vue Menu component

Add or remove menu items

Menu items can be added or removed using the insertAfter, insertBefore and removeItems methods.

In the following example, the **Europe** menu items are added before the **Oceania** item, the **Africa** menu items are added after the **Asia**, and the **South America** and **Mexico** items are removed from menu.

APP.VUE

```
<template>
<div>
<ejs-menu ref="menu" id="menu" :items='menuItems' :fields='menuFields'
:created='onCreated'></ejs-menu>
</div>
</template>
<script>
import Vue from 'vue';
import { MenuPlugin } from "@syncfusion/ej2-vue-navigations";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(MenuPlugin);
export default {
   data: function() {
        return {
           menuItems:  [
            {
                continent: 'Asia',
                countries: [
                    { country: 'China' },
                    { country: 'India' },
                    { country: 'Japan' }
                ]
            },
            {
                continent: 'North America',
                countries: [
                    { country: 'Canada' },
                    { country: 'Mexico' },
                    { country: 'USA' }
                ]
            },
            {
                continent: 'South America',
                countries: [
                    { country: 'Brazil' },
                    { country: 'Colombia' },
                    { country: 'Argentina' }
                ]
            },
            {
                continent: 'Oceania',
                countries: [
                    { country: 'Australia' },
                    { country: 'New Zealand' },
                    { country: 'Samoa' },
                ]
            },
```

```
            { continent: 'Antarctica' }
        ],
        menuFields: {
            text: ['continent', 'country'],
            children: ['countries']
        }
    };
  },
  methods: {
      onCreated: function(args) {
          var insertItem = [
              {
                  continent: 'Europe',
                  countries: [
                      { country: 'Finland' },
                      { country: 'Austria' }
                  ]
              }
          ];
          this.$refs.menu.insertBefore(insertItem, 'Oceania', false);
          insertItem = [
              {
                  continent: 'Africa',
                  countries: [
                      { country: 'Nigeria' }
                  ]
              }
          ];
          this.$refs.menu.insertAfter(insertItem, 'Oceania', false);
          this.$refs.menu.removeItems(['South America', 'Mexico'], false);
      }
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";

    margin-top: 100px;
    text-align: center;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/menu/getting-started-cs11" %}

To process items with ID values, set isUnique to true.

Enable or disable menu items

You can enable and disable the menu items using the enableItems method in Menu. To enable menuItems, set the enable property in argument to true and vice-versa.

Install Syncfusion Buttons packages using below command.

`bash

npm install @syncfusion/ej2-vue-buttons --save

`

In the following example, the **Directory** header item, **Conferences**, and **Music** sub menu items are disabled.

APP.VUE

```
<template>
    <div>
        <ejs-button ref='enableAll'  v-on:click.native="btnClick">Enable all items</ejs-button>
        <div class="menu-section">
            <ejs-menu ref="menu" id="menu" :items='menuItems' :created='onCreated' :beforeOpen='beforeOpen'></ejs-menu>
        </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { MenuPlugin } from "@syncfusion/ej2-vue-navigations";
import { ButtonPlugin } from "@syncfusion/ej2-vue-buttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(MenuPlugin);
Vue.use(ButtonPlugin);
var disableItems = ['Conferences', 'Music', 'Directory'];
export default {
   data: function() {
        return {
           menuItems:  [
    {
        text: 'Events',
        items: [
            { text: 'Conferences' },
            { text: 'Music' },
            { text: 'Workshops' }
        ]
    },
    {
        text: 'Movies',
        items: [
            { text: 'Now Showing' },
            { text: 'Coming Soon' }
        ]
    },
    {
        text: 'Directory',
        items: [
            { text: 'Media Gallery' },
            { text: 'Newsletters' }
        ]
    },
    {
        text: 'Queries',
        items: [
            { text: 'Our Policy' },
```

```
            { text: 'Site Map' }
        ]
    },
    { text: 'Services' }
]
     };
   },
   methods: {
       beforeOpen: function(args) {
        for (var i = 0; i  < args.items.length; i++) {

{% previewsample "page.domainurl/code-snippet/menu/getting-started-cs13" %}

Using the beforeOpen event, you can hide the sub menu items as in the above example since the menu supports to hide items only for headers initially.

Create mnemonic ui in menuitem in Vue Menu component

A particular character in a text can be underlined in the beforeItemRender event by adding `<u>` tag in between the text and assign the innerHTML to the `li` element.

In the following example, the first character in `File`, `Open`, and `Save` menu items are underlined.

APP.VUE

```
<template>
    <div>
        <ejs-menu ref="menu" id="menu" :items='menuItems'
:beforeItemRender='beforeItemRender'></ejs-menu>
    </div>
</template>
<script>
import Vue from 'vue';
import { MenuPlugin } from "@syncfusion/ej2-vue-navigations";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(MenuPlugin);
export default {
   data: function() {
        return {
           menuItems:   [
        {
            text: 'File',
            iconCss: 'em-icons e-file',
            items: [
                { text: 'Open', iconCss: 'em-icons e-open' },
                { text: 'Save', iconCss: 'e-icons e-save' },
                { separator: true },
                { text: 'Exit' }
            ]
        },
        {
```

```
            text: 'Edit',
            iconCss: 'em-icons e-edit',
            items: [
                { text: 'Cut', iconCss: 'em-icons e-cut' },
                { text: 'Copy', iconCss: 'em-icons e-copy' },
                { text: 'Paste', iconCss: 'em-icons e-paste' }
            ]
        },
        { text: 'Format' },
        { text: 'View' },
        { text: 'Bookmarks' },
        { text: 'Tools' },
        { separator: true },
        { text: 'Help' }
    ]
     };
   },

Change sub menu position in Vue Menu component

The submenu position can be changed by using the beforeOpen event. Assign the top and left position where you want to open the submenu to the beforeOpen event arguments args.top and args.left respectively.

In the below sample, the sub menu opens above the parent menu item.

APP.VUE

```
<template>
    <div>
        <ejs-menu :items='menuItems' :beforeOpen='onBeforeOpen'></ejs-menu>
    </div>
</template>
<script>
import Vue from 'vue';
import { MenuPlugin } from "@syncfusion/ej2-vue-navigations";
import { enableRipple, closest } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(MenuPlugin);
export default {
  data: function() {
    return {
        // Menu items definition
        menuItems: [
        {
            text: 'File',
            items: [
                { text: 'Open' },
                { text: 'Save' },
                { text: 'Exit' }]
        },
        {
            text: 'Edit',
            items: [
                { text: 'Cut' },
                { text: 'Copy' },
                { text: 'Paste' }]
        },
        {
            text: 'View',
            items: [
```

```
                { text: 'Toolbar' },
                { text: 'Sidebar' }]
        },
        {
            text: 'Tools',
            items: [
                { text: 'Spelling & Grammar' },
                { text: 'Customize' },
                { text: 'Options' }]
        },
        { text: 'Go' },
        { text: 'Help' }
    ]
    };
  },
   methods: {
        onBeforeOpen(args) {
            // Getting parent menu item element offset
            let relativeOffset = closest(args.event.target, '.e-menu-
item').getBoundingClientRect();
            // Getting sub menu wrapper element using closest method
            let subMenuEle = closest(args.element, '.e-menu-wrapper');
            subMenuEle.style.display = 'block';
            args.top = (relativeOffset.top -
subMenuEle.getBoundingClientRect().height) + pageYOffset;
            args.left = relativeOffset.left + pageXOffset;
            subMenuEle.style.display = '';
        }
   }
}

> For custom positioning, set both `top` and `left` position in the beforeOpen event.

Set title in Vue Menu component

In this sample , the title for menu item can be achievable by using 'beforeItemRender' client-side event in Menu component.

APP.VUE

```
<template>
    <div class="control-section">
        <div class="menu-section">
            <ejs-menu :items='menuItems'
:beforeItemRender='beforeItemRender' ></ejs-menu>
```

```
        </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { MenuPlugin } from "@syncfusion/ej2-vue-navigations";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(MenuPlugin);
export default {
   data: function() {
        return {
           menuItems:  [
        {
            id: 'settingIcon',
            iconCss: 'em-icons e-file',
            items: [
                { text: 'Open',
                  items: [
                      { text: 'Sub Option1' },
                      { text: 'Sub Option2' },
                  ]
                },
                { text: 'Save' },
                { separator: true },
                { text: 'Exit' }
            ]
        }
    ]
    };
    },
    methods: {
beforeItemRender: function(args) {
    if (args.item.id == 'settingIcon') {
        args.element.setAttribute('title', 'Settings');
      }
},
    }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
body {
    margin-top: 100px;
    text-align: center;
}

Rounded corner in Vue Menu component

The rounded corner can be achieved by using the cssClass property. Add a custom class to the menu component and customize it using the border-radius CSS property. For more information, refer to the styles specified in the below sample.

APP.VUE

```
<template>
    <div>
        <ejs-menu :items='menuItems' cssClass='e-rounded-menu'></ejs-menu>
    </div>
</template>
<script>
import Vue from 'vue';
import { MenuPlugin } from "@syncfusion/ej2-vue-navigations";
Vue.use(MenuPlugin);
export default {
  data: function() {
    return {
        // Menu items definition
        menuItems: [
        {
            text: 'File',
            items: [
                { text: 'Open' },
                { text: 'Save' },
                { text: 'Exit' }]
        },
        {
            text: 'Edit',
            items: [
                { text: 'Cut' },
                { text: 'Copy' },
                { text: 'Paste' }]
        },
        {
            text: 'View',
            items: [
                { text: 'Toolbar' },
                { text: 'Sidebar' }]
        },
        {
```

```
            text: 'Tools',
            items: [
                { text: 'Spelling & Grammar' },
                { text: 'Customize' },
                { text: 'Options' }]
        },
        { text: 'Go' },
        { text: 'Help' }
    ]
    };
  }
}
</script>
<style>

Menu item click in Vue Menu component

You can open menu items and sub menu on menu item click by setting showItemOnClick property of the Menu. To open sub menu items only on item click, should be set as true.

APP.VUE

```
<template>
    <div>
        <ejs-menu :items='menuItems' showItemOnClick = "true"></ejs-menu>
    </div>
</template>
<script>
import Vue from 'vue';
import { MenuPlugin } from "@syncfusion/ej2-vue-navigations";
Vue.use(MenuPlugin);
export default {
  data: function() {
    return {
        // Menu items definition
        menuItems: [
        {
```

```
            text: 'File',
            items: [
                { text: 'Open' },
                { text: 'Save' },
                { text: 'Exit' }]
        },
        {
            text: 'Edit',
            items: [
                { text: 'Cut' },
                { text: 'Copy' },
                { text: 'Paste' }]
        },
        {
             text: 'View',
             items: [
                 {
                 text: 'Toolbars',
                 items: [
                     { text: 'Menu Bar' },
                     { text: 'Bookmarks Toolbar' },
                     { text: 'Customize' },
                   ]
                 },
                {
                 text: 'Zoom',
                 items: [
                     { text: 'Zoom In' },
                     { text: 'Zoom Out' },
                     { text: 'Reset' },
                    ]
                },
                { text: 'Full Screen' }
            ]
        },
        {
            text: 'Tools',
            items: [
                { text: 'Spelling & Grammar' },
                { text: 'Customize' },
                { text: 'Options' }]
        },
        { text: 'Go' },
        { text: 'Help' }
    ]
    };
  }
}

Message

Getting Started with the Vue Message Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using Vue-CLI and integrating the Syncfusion Vue Message component using the Composition API / Options API.

Prerequisites

System requirements for Syncfusion Vue UI components

Setting up the Vue 2 project

To generate a Vue 2 project using Vue-CLI, use the vue create command. Follow these steps to install Vue CLI and create a new project:

`bash

npm install -g @vue/cli

vue create quickstart

cd quickstart

npm run serve

`

or

`bash

yarn global add @vue/cli

vue create quickstart

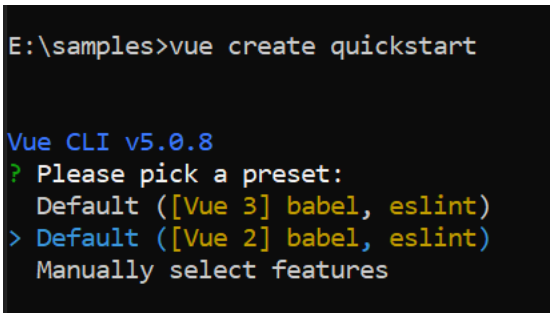
cd quickstart

yarn run serve

`

When creating a new project, choose the option Default ([Vue 2] babel, eslint) from the menu.

Copyright © 2001 -2024 Syncfusion Inc.



Once the quickstart project is set up with default settings, proceed to add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion packages are available at npmjs.com. To use Vue components, install the required npm package.

This article uses the Vue Message component as an example. Install the @syncfusion/ej2-vue-notifications package by running the following command:

`bash

npm install @syncfusion/ej2-vue-notifications --save

`

or

`bash

yarn add @syncfusion/ej2-vue-notifications

`

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, [CRG] and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, the Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the Message component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
notifications/styles/material.css";
</style>
```

Add Syncfusion Vue component

Follow the below steps to add the Vue Message component using Composition API or Options API:

1\. First, import and register the Message component in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { MessageComponent as EjsMessage } from "@syncfusion/ej2-vue-
notifications";
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { MessageComponent } from "@syncfusion/ej2-vue-notifications";
//Component registration
export default {
name: 'app',
components: {
'ejs-message': MessageComponent
}
}
</script>
```

2\. In the template section, define the Message component with the content property.

~/SRC/APP.VUE

```
<template>
<ejs-message id="msg" :content="content"></ejs-message>
</template>
```

3\. Declare the value for the content property in the script section.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
const content = "Please read the comments carefully";
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
data() {
return {
content: "Please read the comments carefully"
};
}
</script>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
  <ejs-message id="msg" :content="content"></ejs-message>
</template>
<style>
  .e-message {
    margin: 100px;
  }
</style>
<script setup>
import { MessageComponent as EjsMessage } from "@syncfusion/ej2-vue-
notifications";
const content = 'Please read the comments carefully';
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-
notifications/styles/message/material.css";
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
  <ejs-message id="msg" :content="content"></ejs-message>
</template>
<style>
  .e-message {
    margin: 100px;
  }
</style>
<script>
import { MessageComponent } from "@syncfusion/ej2-vue-notifications";
export default {
  name: "app",
  components: {
    'ejs-message': MessageComponent
  },
  data() {
    return {
      content: "Please read the comments carefully"
    };
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-
notifications/styles/message/material.css";
</style>
```

Run the project

To run the project, use the following command:

`bash

npm run serve

`

or

`bash

yarn run serve

`

{% previewsample "page.domainurl/code-snippet/message/getting-started-cs4" %}

Getting Started with the Vue Message Component in Vue 3

This article provides a step-by-step guide for setting up a Vite project with a JavaScript environment and integrating the Syncfusion Vue Message component using the Composition API / Options API.

The Composition API is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

The Options API is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

Prerequisites

System requirements for Syncfusion Vue UI components

Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using Vite. To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

`bash

npm create vite@latest

`

or

`bash

yarn create vite

`

Using one of the above commands will lead you to set up additional configurations for the project as below:

1.Define the project name: We can specify the name of the project directly. Let's specify the name of the project as my-project for this article.

`bash

? Project name: » my-project

`

2.Select Vue as the framework. It will create a Vue 3 project.

`bash

? Select a framework: » - Use arrow-keys. Return to submit.

Copyright © 2001 -2024 Syncfusion Inc.

Vanilla

Vue

React

Preact

Lit

Svelte

Others

`

3.Choose JavaScript as the framework variant to build this Vite project using JavaScript and Vue.

`bash

? Select a variant: » - Use arrow-keys. Return to submit.

JavaScript

TypeScript

Customize with create-vue ↗

Nuxt ↗

`

4.Upon completing the aforementioned steps to create the my-project, run the following command to install its dependencies:

`bash

cd my-project

npm install

`

or

`bash

cd my-project

yarn install

`

Now that my-project is ready to run with default settings, let's add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion Vue component packages are available at npmjs.com. To use Syncfusion Vue components in the project, install the corresponding npm package.

This article uses the Vue Message component as an example. To use the Vue Message component in the project, the @syncfusion/ej2-vue-notifications package needs to be installed using the following command:

`bash

npm install @syncfusion/ej2-vue-notifications --save

`

or

`bash

yarn add @syncfusion/ej2-vue-notifications

`

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the Message component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
notifications/styles/message/material.css";
</style>
```

The order of importing CSS styles should be in line with its dependency graph.

Add Syncfusion Vue component

Follow the below steps to add the Vue Message component using Composition API or Options API:

1.First, import and register the Message component in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { MessageComponent as EjsMessage } from "@syncfusion/ej2-vue-
notifications";
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { MessageComponent } from '@syncfusion/ej2-vue-notifications';
//Component registration
export default {
name: "App",
components: {
'ejs-message': MessageComponent
}
```

Copyright © 2001 -2024 Syncfusion Inc.

```
}
</script>
```

2.In the template section, define the Message component with the content property.

~/SRC/APP.VUE

```
<template>
<ejs-message id="msg" :content="content"></ejs-message>
</template>
```

3.Declare the value for the content property in the script section.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
const content = "Please read the comments carefully";
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
data() {
return {
content: "Please read the comments carefully"
};
}
</script>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<ejs-message id="msg" :content="content"></ejs-message>
</template>
<script setup>
import { MessageComponent as EjsMessage } from "@syncfusion/ej2-vue-
notifications";
const content = "Please read the comments carefully";
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
notifications/styles/message/material.css";
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<ejs-message id="msg" :content="content"></ejs-message>
</template>
<script>
import { MessageComponent } from '@syncfusion/ej2-vue-notifications';
//Component registration
```

Copyright © 2001 -2024 Syncfusion Inc.

```
export default {
name: "App",
components: {
'ejs-message': MessageComponent
},
data() {
return {
content: "Please read the comments carefully"
};
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
notifications/styles/message/material.css";
</style>
```

Run the project

To run the project, use the following command:

`bash

npm run dev

`

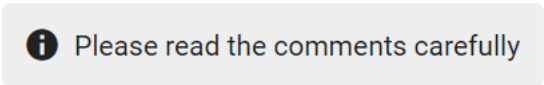
or

`bash

yarn run dev

`

The output will appear as follows:



For migrating from Vue 2 to Vue 3, refer to the migration documentation.

Severities in Vue Message component

The severity denotes the importance and context of the message to the user. The message contains different severity types. Use the severity property to display the messages with different severity levels.

The available severity types are **Normal**, **Success**, **Info**, **Warning** and **Error**. The default severity type for messages is **Normal**.

The following example demonstrates the severity of the messages.

APP.VUE

```
<template>
  <div class="msg-default-section">
    <div class="content-section">
      <ejs-message id="msg_default" content="Editing is restricted"></ejs-
message>
      <ejs-message id="msg_info" content="Please read the comments
carefully" severity="Info"></ejs-message>
      <ejs-message id="msg_success" content="Your message has been sent
successfully" severity="Success"></ejs-message>
      <ejs-message id="msg_warning" content="There was a problem with your
network connection" severity="Warning"></ejs-message>
      <ejs-message id="msg_error" content="A problem occurred while
submitting your data" severity="Error"></ejs-message>
    </div>
  </div>
</template>
<script setup>
import { MessageComponent as EjsMessage } from "@syncfusion/ej2-vue-
notifications";
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-
notifications/styles/message/material.css";
  .msg-default-section .content-section {
    margin: 0 auto;
    max-width: 450px;
    padding-top: 10px;
  }
  .msg-default-section .e-message {
    margin: 10px 0;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/message/getting-started-cs8" %}

Variants in Vue Message component

The Message has predefined appearance variants for different visual representations. The variants of the message can be changed based on the variant property.

The available variants are **Text**, **Outlined** and **Filled**. The default variant type for messages is **Text**.

- **Text** - The severity is differentiated using a text color and a light background color.
- **Outlined** - The severity is differentiated using a text color and a border without a background.
- **Filled** - The severity is differentiated using a text color and a dark background color.

The following example demonstrates the default message with different variant types.

Copyright © 2001 -2024 Syncfusion Inc.

APP.VUE

```
<template>
  <div class="msg-variant-section">
    <div class="content-section">
      <h4>Filled</h4>
      <ejs-message id="msg_default_filled" variant="Filled">Editing is
restricted</ejs-message>
      <ejs-message id="msg_info_filled" severity="Info"
variant="Filled">Please read the comments carefully</ejs-message>
      <ejs-message id="msg_success_filled" severity="Success"
variant="Filled">Your message has been sent successfully</ejs-message>
      <ejs-message id="msg_warning_filled" severity="Warning"
variant="Filled">There was a problem with your network connection</ejs-
message>
      <ejs-message id="msg_error_filled" severity="Error" variant="Filled">A
problem occurred while submitting your data</ejs-message>
    </div>
    <div class="content-section">
      <h4>Outlined</h4>
      <ejs-message id="msg_default_outlined" variant="Outlined">Editing is
restricted</ejs-message>
      <ejs-message id="msg_info_outlined" severity="Info"
variant="Outlined">Please read the comments carefully</ejs-message>
      <ejs-message id="msg_success_outlined" severity="Success"
variant="Outlined">Your message has been sent successfully</ejs-message>
      <ejs-message id="msg_warning_outlined" severity="Warning"
variant="Outlined">There was a problem with your network connection</ejs-
message>
      <ejs-message id="msg_error_outlined" severity="Error"
variant="Outlined">A problem occurred while submitting your data</ejs-
message>
    </div>
    <div class="content-section">
      <h4>Text</h4>
      <ejs-message id="msg_default">Editing is restricted</ejs-message>
      <ejs-message id="msg_info" severity="Info">Please read the comments
carefully</ejs-message>
      <ejs-message id="msg_success" severity="Success">Your message has been
sent successfully</ejs-message>
      <ejs-message id="msg_warning" severity="Warning">There was a problem
with your network connection</ejs-message>
      <ejs-message id="msg_error" severity="Error">A problem occurred while
submitting your data</ejs-message>
    </div>
  </div>
</template>
<script setup>
import { MessageComponent as EjsMessage } from "@syncfusion/ej2-vue-
notifications";
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-
notifications/styles/message/material.css";

```
  max-width: 520px;
  padding: 10px;
}
.msg-variant-section .e-message {
  margin: 10px 0;
}
.msg-variant-section {
  display: flex;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/message/getting-started-cs10" %}

Icons in Vue Message component

This section explains the message with no icons, how to show or hide the close icon and add the custom severity icon to the message.

No Icon

By default, severity icons can be displayed according to the severity types to make it more understandable to the user by visual information rather than text. To hide the severity icons, set the `showIcon` property to `false`.

The following example demonstrates the different severity messages without the severity icons.

APP.VUE

```
<template>
  <div class="msg-default-section">
    <div class="content-section">
      <ejs-message id="msg_default" content="Editing is restricted"
:showIcon="showIcon"></ejs-message>
      <ejs-message id="msg_info" content="Please read the comments
carefully" severity="Info" :showIcon="showIcon"></ejs-message>
      <ejs-message id="msg_success" content="Your message has been sent
successfully" severity="Success" :showIcon="showIcon"></ejs-message>
      <ejs-message id="msg_warning" content="There was a problem with your
network connection" severity="Warning" :showIcon="showIcon"></ejs-message>
      <ejs-message id="msg_error" content="A problem occurred while
submitting your data" severity="Error" :showIcon="showIcon"></ejs-message>
    </div>
  </div>
</template>
<script setup>
import { MessageComponent as EjsMessage } from "@syncfusion/ej2-vue-
notifications";
const showIcon = true;
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-
notifications/styles/message/material.css";
  .msg-default-section .content-section {
    margin: 0 auto;
    max-width: 450px;
    padding-top: 10px;
  }
```

```
  .msg-default-section .e-message {
    margin: 10px 0;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/message/getting-started-cs5" %}

Custom Icon

By default, the severity icons can be displayed according to the severity type to make it more understandable to the user by visual information rather than text. If the user wants to customize these icons, it can be achieved through the cssClass property.

The following example demonstrates how the default message is rendered with a custom severity icon.

APP.VUE

```
<template>
  <div class="col-lg-12 control-section msg-custom-section">
    <div class="content-section">
      <ejs-message id="msg_icon" cssClass="custom">Essential JS 2 is a
modern JavaScript UI Controls library that has been built from the ground up
to be lightweight, responsive, modular and touch friendly. It is written in
TypeScript and has no external dependencies. It also includes complete
support for Angular, React, Vue, ASP.NET MVC and ASP.NET Core frameworks.
      </ejs-message>
    </div>
  </div>
</template>
<script setup>
import { MessageComponent as EjsMessage } from "@syncfusion/ej2-vue-
notifications";
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-
notifications/styles/message/material.css";
  .msg-custom-section .content-section {
    margin: 0 auto;
    max-width: 400px;
    padding-top: 10px;
  }
  .msg-custom-section .e-message {
    margin: 10px 0;
  }

{% previewsample "page.domainurl/code-snippet/message/getting-started-cs6" %}

Close Icon

The message can be rendered with or without the close icon. The close icon is used to hide the message, either by manually clicking the close icon or through keyboard interaction.

By default, the close icon is not rendered in the message. To show the close icon, set the `showCloseIcon` property to `true`.

In the following example, the messages are rendered with the close icon.

APP.VUE

```
<template>
  <div class="col-lg-8 control-section msg-icon-section">
    <div class="content-section">
      <ejs-button id="btn1" ref="defaultBtn" content="Show Default Message"
cssClass="e-outline e-primary msg-hidden"
        v-on:click="defaultClick"></ejs-button>
      <ejs-message id="msg_default_icon" ref="msgDefault"
:showCloseIcon="showCloseIcon" :closed="defaultClosed">Editing
        is restricted</ejs-message>
      <ejs-button id="btn2" ref="infoBtn" content="Show Info Message"
cssClass="e-outline e-primary e-info msg-hidden"
        v-on:click="infoClick"></ejs-button>
```

Customization in Vue Message component

The Message component allows the user to customize the content display positions and appearance. This section explains the details about changing the content alignments and border styles for messages.

Content Alignment

Normally, the message content is aligned to the **left**. The Message component allows the user to align the message content in the **center** or **right** through the built-in classes `e-content-center` and `e-content-right`.

The following example demonstrates the message with different content alignments.

APP.VUE

```
<template>
  <div class="msg-custom-section">
    <div class="content-section">
      <h4>Content Alignment</h4>
      <ejs-message id="msg_content_left" content="Your license has been
activated successfully" severity="Success"></ejs-message>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
      <ejs-message id="msg_content_center" content="The license will expire
today" cssClass="e-content-center" severity="Warning"></ejs-message>
      <ejs-message id="msg_content_right" content="The license key is
invalid" cssClass="e-content-right" severity="Error"></ejs-message>
    </div>
  </div>
</template>
<script setup>
import { MessageComponent as EjsMessage } from "@syncfusion/ej2-vue-
notifications";
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-
notifications/styles/message/material.css";
  .msg-custom-section .content-section {
    margin: 0 auto;
    max-width: 400px;
    padding-top: 10px;
  }
  .msg-custom-section .e-message {
    margin: 10px 0;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/message/getting-started-cs1" %}

Rounded and Square

To customize the Message component's appearance, add the custom class to the message through the cssClass property. This custom class will be added to the root element. Based on this custom class, the user can override the message styles at the application level.

The following example shows the rounded and squared appearance of the message, which can be achieved by adding the cssClass property.

APP.VUE

```
<template>
  <div class="msg-custom-section">
    <div class="content-section">
      <h4>Rounded</h4>
      <ejs-message content="The license will expire today"
cssClass="rounded" severity="Warning"></ejs-message>
      <h4>Square</h4>
      <ejs-message content="The license key is invalid" cssClass="square"
severity="Error"></ejs-message>
    </div>
  </div>
</template>
<script setup>
import { MessageComponent as EjsMessage } from "@syncfusion/ej2-vue-
notifications";
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
```

Copyright © 2001 -2024 Syncfusion Inc.

```
  @import "../node_modules/@syncfusion/ej2-vue-
notifications/styles/message/material.css";
  .msg-custom-section .content-section {
    margin: 0 auto;
    max-width: 400px;
    padding-top: 10px;
  }
  .msg-custom-section .e-message {
    margin: 10px 0;
  }
  .msg-custom-section .e-message.rounded {
    border-radius: 5px;
  }
  .msg-custom-section .e-message.square {
    border-radius: 1px;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/message/getting-started-cs2" %}

CSS Message

The Essential JS 2 Message has predefined CSS classes that can be defined in the HTML elements, which renders the message without any script reference. This can display a simple message with content and make the code lighter.

The following DOM structure is required to display the simple message with the content.

`bash

..content..

`

The following DOM structure is required to display the simple message with the content and severity icon.

`bash

..content..

`

The following is the available list of predefined CSS classes to make the appearance of a message.

| Class | Description |

| -------- | -------- |

| e-message | Represents the message wrapper. |

Copyright © 2001 -2024 Syncfusion Inc.

| e-msg-icon | Represents the severity type icon. |

| e-msg-content | Represents the message content. |

| e-msg-close-icon | Represents the close icon. |

| e-info | Represents the information message. |

| e-success | Represents the success message. |

| e-warning | Represents the warning message. |

| e-error | Represents the error message. |

| e-content-center | Aligns the message content to the center. |

| e-content-right | Aligns the message content to the right. |

The following example shows the message which renders without any script reference.

APP.VUE

```
<template>
  <div class="msg-default">
    <div id="msg" class="e-message" role="alert">
      <span class="e-msg-icon"></span>
      <div class="e-msg-content">Please read the comments carefully</div>
    </div>
  </div>
</template>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-
notifications/styles/message/material.css";
  .msg-default .e-message {
    margin: 100px;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/message/getting-started-cs3" %}

Template in Vue Message component

The message supports templates that allows the user to customize the content with a custom structure. The content can be a string, paragraph, or any other HTML element. The template can be rendered through the `content` property or added directly to the HTML element.

In the following sample, the Message component content is customized with HTML elements and Vue Button components, which are directly added to the `<ejs-message>` element.

APP.VUE

```
<template>
  <div class=" msg-template-section">
    <div class="content-section">
      <ejs-button id="showBtn" ref="showBtn" content="Show pull request"
        cssClass="e-outline e-primary e-success msg-hidden" v-
on:click="showClick"></ejs-button>
      <ejs-message id="msg_template" ref="msgTemplate" severity="Success"
:content="'contentTemplate'" :closed="closed">
```

Copyright © 2001 -2024 Syncfusion Inc.

```
        <template v-slot:contentTemplate>
          <div>
            <h1>Merged pull request</h1>
            <p>Pull request #41 merged after a successful build</p>
            <ejs-button id="commitBtn" cssClass="e-link" content="View
commit"></ejs-button>
            <ejs-button id="closeBtn" cssClass="e-link" content="Dismiss" v-
on:click="dismissClick"></ejs-button>
          </div>
        </template>
      </ejs-message>
    </div>
  </div>
</template>
<script setup>
import { MessageComponent as EjsMessage } from "@syncfusion/ej2-vue-
notifications";
import { ButtonComponent as EjsButton } from "@syncfusion/ej2-vue-buttons";
const showClick = function () {
  this.$refs.msgTemplate.ej2Instances.visible = true;
  this.$refs.showBtn.ej2Instances.element.classList.add("msg-hidden");
};
const dismissClick = function () {
  this.$refs.msgTemplate.ej2Instances.visible = false;
};
const closed = function () {
  this.$refs.showBtn.ej2Instances.element.classList.remove("msg-hidden");
};
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-
notifications/styles/message/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-
buttons/styles/button/material.css";
.msg-template-section .content-section {
  margin: 0 auto;
  max-width: 450px;
  padding-top: 20px;
}
.msg-template-section .e-btn.msg-hidden {
  display: none;
}
.msg-template-section .e-message h1 {
  margin: 0;
  font-size: 16px;
  font-weight: 600;
  line-height: 1.25;
}
.msg-template-section .e-message .e-msg-icon {
  padding: 0 4px;
  margin-top: 3px;
}
.msg-template-section .e-message p {
  margin: 8px 0 4px;
}
.msg-template-section .e-message .e-btn {
```

```
  padding: 0;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/message/getting-started-cs9" %}

Accessibility in Vue Message component

The Message component followed the accessibility guidelines and standards, including ADA, Section 508, WCAG 2.2 standards, and WCAG roles that are commonly used to evaluate accessibility.

The accessibility compliance for the Message component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| WCAG 2.2 Support | <img src="https://cdn.syncfusion.com/content/images/documentation/full.png" alt="Yes"> |

| Section 508 Support | <img src="https://cdn.syncfusion.com/content/images/documentation/full.png" alt="Yes"> |

| Screen Reader Support | <img src="https://cdn.syncfusion.com/content/images/documentation/full.png" alt="Yes"> |

| Right-To-Left Support | <img src="https://cdn.syncfusion.com/content/images/documentation/full.png" alt="Yes"> |

| Color Contrast | <img src="https://cdn.syncfusion.com/content/images/documentation/full.png" alt="Yes"> |

| Mobile Device Support | <img src="https://cdn.syncfusion.com/content/images/documentation/full.png" alt="Yes"> |

| Keyboard Navigation Support | <img src="https://cdn.syncfusion.com/content/images/documentation/full.png" alt="Yes"> |

| Accessibility Checker Validation | <img src="https://cdn.syncfusion.com/content/images/documentation/full.png" alt="Yes"> |

| Axe-core Accessibility Validation | <img src="https://cdn.syncfusion.com/content/images/documentation/full.png" alt="Yes"> |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<img src="https://cdn.syncfusion.com/content/images/documentation/full.png" alt="Yes"> - All features of the component meet the requirement.

<img src="https://cdn.syncfusion.com/content/images/documentation/partial.png" alt="Intermediate"> - Some features of the component do not meet the requirement.

<img src="https://cdn.syncfusion.com/content/images/documentation/not-supported.png" alt="No"> - The component does not meet the requirement.

WAI-ARIA attributes

The Message component followed the WAI-ARIA patterns to meet the accessibility. The following ARIA attributes are used in the Message component:

| Attributes | Purpose |

| --- | --- |

| role=alert | Used to convey a significant and contextual message to the user. |

| aria-label | Provides an accessible name for the close icon. |

Keyboard interaction

The Message component followed the keyboard interaction guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Message component.

| **Press** | **To do this** |

| --- | --- |

| Tab / Shift + Tab | To focus the close icon in the message. |

| Enter / Space | Closes the focused close icon's message. |

Ensuring accessibility

The Message component's accessibility levels are ensured through an accessibility-checker and axe-core software tools during automated testing.

The accessibility compliance of the Message component is shown in the following sample. Open the sample in a new window to evaluate the accessibility of the Message component with accessibility tools.

{% previewsample "https://ej2.syncfusion.com/accessibility/message.html" %}

MultiSelect

Getting Started with the Vue Multi select Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using Vue-CLI and integrating the Syncfusion Vue Multi select component using the Composition API / Options APILink to the Video.

To get start quickly with MultiSelect Dropdown using Vue CLI , you can check on this video:

Prerequisites

System requirements for Syncfusion Vue UI components

Copyright © 2001 -2024 Syncfusion Inc.

Setting up the Vue 2 project

To generate a Vue 2 project using Vue-CLI, use the vue create command. Follow these steps to install Vue CLI and create a new project:

`bash

npm install -g @vue/cli

vue create quickstart

cd quickstart

npm run serve

`

or

`bash

yarn global add @vue/cli

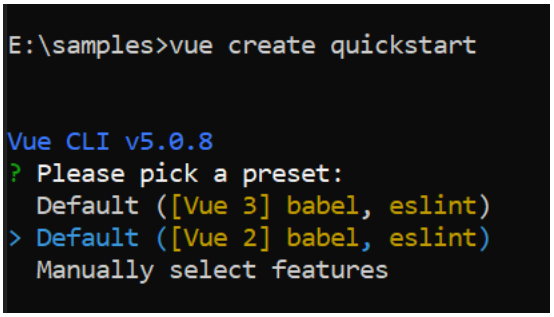
vue create quickstart

cd quickstart

yarn run serve

`

When creating a new project, choose the option Default ([Vue 2] babel, eslint) from the menu.



Once the quickstart project is set up with default settings, proceed to add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion packages are available at npmjs.com. To use Vue components, install the required npm package.

This article uses the Vue Multi select component as an example. Install the @syncfusion/ej2-vue-dropdowns package by running the following command:

`bash

npm install @syncfusion/ej2-vue-dropdowns --save

`

or

`bash

yarn add @syncfusion/ej2-vue-dropdowns

`

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, the Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the Multi select component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-dropdowns/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
</style>
```

Add Syncfusion Vue component

Follow the below steps to add the Vue Multiselect component using Composition API or Options API:

1\. First, import and register the Multiselect component in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { MultiSelectComponent as EjsMultiselect } from "@syncfusion/ej2-vue-dropdowns";
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { MultiSelectComponent } from "@syncfusion/ej2-vue-dropdowns";
export default {
components: {
'ejs-multiselect': MultiSelectComponent
}
}
</script>
```

2\. In the template section, define the Multiselect component with dataSource and placeholder property

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
```

```
<div id="app">
<div id='container' style="margin:50px auto 0; width:250px;">
<br>
<ejs-multiselect id='multiselect' :dataSource='sportsData' placeholder="Find a game"></ejs-multiselect>
</div>
</div>
</template>
```

Binding data source

After initialization, populate the data using dataSource property. Here, an array of string values is passed to the MultiSelect component.

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<div class="control_wrapper">
<ejs-multiselect id='multiselect' :dataSource='sportsData'></ejs-multiselect>
</div>
</template>
<script setup>
import { MultiSelectComponent as EjsMultiselect } from "@syncfusion/ej2-vue-dropdowns";
const sportsData = ['Badminton', 'Basketball', 'Cricket', 'Football', 'Golf', 'Gymnastics', 'Hockey', 'Rugby', 'Snooker', 'Tennis'];
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<div class="control_wrapper">
<ejs-multiselect id='multiselect' :dataSource='sportsData'></ejs-multiselect>
</div>
</template>
<script>
import { MultiSelectComponent } from "@syncfusion/ej2-vue-dropdowns";
export default {
components: {
'ejs-multiselect': MultiSelectComponent
},
data: function() {
return {
sportsData: ['Badminton', 'Basketball', 'Cricket', 'Football', 'Golf', 'Gymnastics', 'Hockey', 'Rugby', 'Snooker', 'Tennis']
};
}
}
</script>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSITION API (~/SRC/APP.VUE)

Copyright © 2001 -2024 Syncfusion Inc.

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
        <br>
        <ejs-multiselect id='multiselect' :dataSource='sportsData'
placeholder="Find a game"></ejs-multiselect>
    </div>
  </div>
</template>
<script setup>
import { MultiSelectComponent as EjsMultiselect } from "@syncfusion/ej2-vue-
dropdowns";
const sportsData = ['Badminton', 'Cricket', 'Football', 'Golf', 'Tennis'];
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-dropdowns/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
        <br>
        <ejs-multiselect id='multiselect' :dataSource='sportsData'
placeholder="Find a game"></ejs-multiselect>
    </div>
  </div>
</template>
<script>
import { MultiSelectComponent } from "@syncfusion/ej2-vue-dropdowns";
export default {
  components: {
    'ejs-multiselect': MultiSelectComponent
  },
  data (){
    return {
      sportsData: ['Badminton', 'Cricket', 'Football', 'Golf', 'Tennis']
    }
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-dropdowns/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
</style>
```

Run the project

To run the project, use the following command:

Copyright © 2001 -2024 Syncfusion Inc.

`bash

npm run serve

`

or

`bash

yarn run serve

`

{% previewsample "page.domainurl/code-snippet/multi-select/getting-started/getting-started-cs1" %}

Configure the Popup List

By default, the width of the popup list automatically adjusts according to the MultiSelect input element's width and the height of the popup list has '300px'.

You can also customize the suggestion list height and width using popupHeight and popupWidth properties respectively.

In the following sample, popup list's width and height are configured.

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
        <br>
        <ejs-multiselect id='multiselect' :dataSource='sportsData'
popupHeight="250px" popupWidth="250px" placeholder="Find a game"></ejs-
multiselect>
    </div>
  </div>
</template>
<script setup>
import { MultiSelectComponent as EjsMultiselect } from "@syncfusion/ej2-vue-
dropdowns";
const sportsData = ['Badminton', 'Basketball', 'Cricket', 'Football',
'Golf', 'Gymnastics', 'Hockey', 'Rugby','Snooker', 'Tennis'];
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-dropdowns/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
        <br>
        <ejs-multiselect id='multiselect' :dataSource='sportsData'
popupHeight="250px" popupWidth="250px" placeholder="Find a game"></ejs-
multiselect>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
    </div>
  </div>
</template>
<script>
import { MultiSelectComponent } from "@syncfusion/ej2-vue-dropdowns";
export default {
  components: {
    'ejs-multiselect': MultiSelectComponent
  },
  data (){
    return {
      sportsData: ['Badminton', 'Basketball', 'Cricket', 'Football', 'Golf',
'Gymnastics', 'Hockey', 'Rugby','Snooker', 'Tennis']
    }
  }
}
</script>

- How to bind the data

Getting Started with the Vue MultiSelect Component in Vue 3

This article provides a step-by-step guide for setting up a Vite project with a JavaScript environment and integrating the Syncfusion Vue MultiSelect component using the Composition API / Options API.

The Composition API is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

The Options API is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

Prerequisites

System requirements for Syncfusion Vue UI components

Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using Vite. To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

`bash

npm create vite@latest

`

Copyright © 2001 -2024 Syncfusion Inc.

or

`bash

yarn create vite

`

Using one of the above commands will lead you to set up additional configurations for the project as below:

1.Define the project name: We can specify the name of the project directly. Let's specify the name of the project as my-project for this article.

`bash

? Project name: » my-project

`

2.Select Vue as the framework. It will create a Vue 3 project.

`bash

? Select a framework: » - Use arrow-keys. Return to submit.

Vanilla

Vue

React

Preact

Lit

Svelte

Others

`

3.Choose JavaScript as the framework variant to build this Vite project using JavaScript and Vue.

`bash

? Select a variant: » - Use arrow-keys. Return to submit.

JavaScript

TypeScript

Customize with create-vue ↗

Nuxt ↗

`

4.Upon completing the aforementioned steps to create the my-project, run the following command to install its dependencies:

`bash

cd my-project

Copyright © 2001 -2024 Syncfusion Inc.

npm install

`

or

`bash

cd my-project

yarn install

`

Now that my-project is ready to run with default settings, let's add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion Vue component packages are available at npmjs.com. To use Syncfusion Vue components in the project, install the corresponding npm package.

This article uses the Vue MultiSelect component as an example. To use the Vue MultiSelect component in the project, the @syncfusion/ej2-vue-dropdowns package needs to be installed using the following command:

`bash

npm install @syncfusion/ej2-vue-dropdowns --save

`

or

`bash

yarn add @syncfusion/ej2-vue-dropdowns

`

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the MultiSelect component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-dropdowns/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
</style>
```

The order of importing CSS styles should be in line with its dependency graph.

Copyright © 2001 -2024 Syncfusion Inc.

Add Syncfusion Vue component

Follow the below steps to add the Vue MultiSelect component using Composition API or Options API:

1.First, import and register the MultiSelect component in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { MultiSelectComponent as EjsMultiselect } from "@syncfusion/ej2-vue-dropdowns";
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { MultiSelectComponent } from "@syncfusion/ej2-vue-dropdowns";
//Component registeration
export default {
name: "App",
components: {
'ejs-multiselect' : MultiSelectComponent,
}
}
</script>
```

2.In the template section, define the MultiSelect component with the dataSource property and column definitions.

~/SRC/APP.VUE

```
<template>
<div class="control_wrapper">
<ejs-multiselect id='multiselect' :dataSource='sportsData'></ejs-combobox>
</div>
</template>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<div class="control_wrapper">
<ejs-multiselect id='multiselect' :dataSource='data[0].sportsData'></ejs-multiselect>
</div>
</template>
<script setup>
import { MultiSelectComponent as EjsMultiselect } from "@syncfusion/ej2-vue-dropdowns";
const data = [{ sportsData: ['Badminton', 'Basketball', 'Cricket', 'Football', 'Golf', 'Gymnastics', 'Hockey', 'Rugby', 'Snooker', 'Tennis']}]
</script>
<style>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-dropdowns/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<div class="control_wrapper">
<ejs-multiselect id='multiselect' :dataSource='sportsData'></ejs-
multiselect>
</div>
</template>
<script>
import { MultiSelectComponent } from "@syncfusion/ej2-vue-dropdowns";
//Component registeration
export default {
name: 'App',
components: {
"ejs-multiselect": MultiSelectComponent
},
data () {
return {
sportsData: ['Badminton', 'Basketball', 'Cricket', 'Football', 'Golf',
'Gymnastics', 'Hockey', 'Rugby', 'Snooker', 'Tennis']
}
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-dropdowns/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
</style>
```

Run the project

To run the project, use the following command:

`bash

npm run dev

`

or

`bash

yarn run dev

`

Configure the Popup List

By default, the width of the popup list automatically adjusts according to the MultiSelect input element's width and the height of the popup list has '300px'.

Copyright © 2001 -2024 Syncfusion Inc.

You can also customize the suggestion list height and width using popupHeight and popupWidth properties respectively.

In the following sample, popup list's width and height are configured.

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<div id="app">
<div id='container' style="margin:50px auto 0; width:250px;">
<br>
<ejs-multiselect id='multiselect' :dataSource='data[0].sportsData'
popupHeight="250px" popupWidth="250px" placeholder="Find a game"></ejs-
multiselect>
</div>
</div>
</template>
<script setup>
import { MultiSelectComponent as EjsMultiselect } from "@syncfusion/ej2-vue-
dropdowns";
const data = [{ sportsData: ['Badminton', 'Basketball', 'Cricket',
'Football', 'Golf', 'Gymnastics', 'Hockey', 'Rugby', 'Snooker', 'Tennis'] }]
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-dropdowns/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<div id="app">
<div id='container' style="margin:50px auto 0; width:250px;">
<br>
<ejs-multiselect id='multiselect' :dataSource='sportsData'
popupHeight="250px" popupWidth="250px" placeholder="Find a game"></ejs-
multiselect>
</div>
</div>
</template>
<script>
import { MultiSelectComponent } from "@syncfusion/ej2-vue-dropdowns";
//Component registeration
export default {
name: 'App',
components: {
"ejs-multiselect": MultiSelectComponent
},
data (){
return {
sportsData: ['Badminton', 'Basketball', 'Cricket', 'Football', 'Golf',
'Gymnastics', 'Hockey', 'Rugby', 'Snooker', 'Tennis']
}
}
}
```

Copyright © 2001 -2024 Syncfusion Inc.

```
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-dropdowns/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
</style>
```

The output will appear as follows:

- How to bind the data

Data binding in Vue Multi select component

The MultiSelect loads the data either from local data sources or remote data services using the dataSource property. It supports the data type of `array` or `DataManager`.

The MultiSelect also supports different kinds of data services such as OData, OData V4, and Web API, and data formats such as XML, JSON, and JSONP with the help of `DataManager` adaptors.

| Fields | Type | Description |

|------|------|-------------|

| text | `string` | Specifies the display text of each list item. |

| value | `number or string` | Specifies the hidden data value mapped to each list item that should contain a unique value. |

| groupBy | `string` | Specifies the category under which the list item has to be grouped. |

| iconCss | `string` | Specifies the icon class of each list item. |

When binding complex data to the MultiSelect, fields should be mapped correctly. Otherwise, the selected item remains undefined.

Binding local data

Local data can be represented in two ways as described below.

1. Array of string

The MultiSelect has support to load array of primitive data such as strings and numbers. Here, both value and text field act the same.

Copyright © 2001 -2024 Syncfusion Inc.

APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
        <br>
        <ejs-multiselect id='multiselect' :dataSource='sportsData'
placeholder="Select a game"></ejs-multiselect>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { MultiSelectPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(MultiSelectPlugin);
export default {
  data (){
    return {
      sportsData: ['Badminton', 'Cricket', 'Football', 'Golf', 'Tennis']
    }
  }
}
</script>
<style>
@import
"https://ej2.syncfusion.com/vue/documentation/../node_modules/@syncfusion/ej
2-base/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-buttons/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/multi-select/data-binding/simple-cs1" %}

2. Array of object

The MultiSelect can generate its list items through an array of complex data. For this, the appropriate columns should be mapped to the fields property.

In the following example, id column and sports column from complex data have been mapped to the value field and text field, respectively.

APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
        <br>
        <ejs-multiselect id='multiselect' :dataSource='sportsData'
:fields='fields' placeholder="Select a game"></ejs-multiselect>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { MultiSelectPlugin } from "@syncfusion/ej2-vue-dropdowns";
```

Copyright © 2001 -2024 Syncfusion Inc.

```
Vue.use(MultiSelectPlugin);
export default {
  data (){
    return {
      sportsData: [
        { Id: 'game1', Game: 'Badminton' },
        { Id: 'game2', Game: 'Football' },
        { Id: 'game3', Game: 'Tennis' }
      ],
      fields : { text: 'Game', value: 'Id' }
    }
  }
}
</script>
<style>
@import
"https://ej2.syncfusion.com/vue/documentation/../node_modules/@syncfusion/ej
2-base/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-buttons/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/multi-select/data-binding/json-cs1" %}

3. Array of complex object

The MultiSelect can generate its list items through an array of complex data. For this, the appropriate columns should be mapped to the fields property.

In the following example, Code.Id column and Country.Name column from complex data have been mapped to the value field and text field, respectively.

APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
        <br>
        <ejs-multiselect id='multiselect' :dataSource='countriesData'
:fields='fields' placeholder="Select a country"></ejs-multiselect>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { MultiSelectPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(MultiSelectPlugin);
export default {
  data (){
    return {
      countriesData : [
        { Country: { Name: 'Australia' }, Code: { Id: 'AU' }},
        { Country: { Name: 'Bermuda' },Code: { Id: 'BM' }},
        { Country:{ Name: 'Canada'}, Code:{ Id: 'CA'} },
        { Country:{Name: 'Cameroon'}, Code:{ Id: 'CM'} },
```

```
        { Country:{Name: 'Denmark'}, Code:{ Id: 'DK' }},
        { Country:{Name: 'France'}, Code: { Id:'FR'} }
      ],
      fields : { text: 'Country.Name', value: 'Code.Id' }
    }
  }
}
</script>
<style>
@import
"https://ej2.syncfusion.com/vue/documentation/../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-vue-dropdowns/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-buttons/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/multi-select/data-binding/complex-cs1" %}

Binding remote data

The MultiSelect supports retrieval of data from remote data services with the help of DataManager component. The Query property is used to fetch data from the database and bind it to the MultiSelect.

The following sample displays the first 6 contacts from “Customers” table of the Northwind Data Service.

APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
        <br>
        <ejs-multiselect id='multiselect' sortOrder='Ascending'
:dataSource='customerData' :query='query' :fields='fields'
placeholder="Select a customer"></ejs-multiselect>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { MultiSelectPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(MultiSelectPlugin);
import { Query, DataManager, ODataV4Adaptor } from '@syncfusion/ej2-data';
export default {
  data (){
    return {
      customerData : new DataManager({
        url: 'https://services.odata.org/V4/Northwind/Northwind.svc/',
        adaptor: new ODataV4Adaptor,
        crossDomain: true
      }),
      query : new Query().from('Customers').select(['ContactName',
'CustomerID']).take(6),
      fields : { text: 'ContactName', value: 'CustomerID' }
    }
```

Copyright © 2001 -2024 Syncfusion Inc.

```
  }
}
</script>
<style>
@import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-buttons/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/multi-select/data-binding/remote-cs1" %}

Templates in Vue Multi select component

The MultiSelect has been provided with several options to customize each list item, group title, selected value, header, and footer elements.

To customize MultiSelect dropdown items Using templates, you can check on this video:

Item template

The content of each list item within the MultiSelect can be customized with the help of itemTemplate property.

In the following sample, each list item is split into two columns to display relevant data's.

APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
        <br>
        <ejs-multiselect id='multiselect' sortOrder='Ascending'
:itemTemplate='itemTemplate' :dataSource='employeeData' :query='query'
:fields='fields' placeholder="Select an employee"></ejs-multiselect>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { MultiSelectPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(MultiSelectPlugin);
import { Query, DataManager, ODataV4Adaptor } from '@syncfusion/ej2-data';
var itemVue = Vue.component("itemTemplate", {
  template: `<span><span class='name'>{{data.FirstName}}</span><span class
='city'>{{data.City}}</span></span>`,
  data() {
    return {
      data: {}
    };
```

```
  }
});
export default {
  data (){
    return {
      employeeData : new DataManager({
            url: 'https://services.odata.org/V4/Northwind/Northwind.svc/',
            adaptor: new ODataV4Adaptor,
            crossDomain: true
      }),
      query : new Query().from('Employees').select(['FirstName', 'City',
'EmployeeID']).take(6),
      fields : { text: 'FirstName', value: 'EmployeeID' },
      itemTemplate : function(e) {
        return {
          template: itemVue
        }
      }
    }
  }
}
</script>
<style>
@import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-buttons/styles/material.css";
.city {
    right: 15px;
    position: absolute;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/multi-select/template/item-cs1" %}

Value template

The currently selected value that is displayed by default on the MultiSelect input element can be customized using the valueTemplate property.

In the following sample, the selected value is displayed as a combined text of both FirstName and City in the MultiSelect input, which is separated by a hyphen.

APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
        <br>
        <ejs-multiselect id='multiselect' placeholder='Select an employee'
sortOrder='Ascending' :valueTemplate="valueTemplate"
:itemTemplate="itemTemplate" :dataSource='dataSource' :query='query'
:fields='fields'></ejs-multiselect>
    </div>
  </div>
</template>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
<script>
import Vue from 'vue';
import { MultiSelectPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(MultiSelectPlugin);
import { DataManager,Query,ODataV4Adaptor } from "@syncfusion/ej2-data";
var itemVue = Vue.component("itemTemplate", {
  template: `<span><span class='name'>{{data.FirstName}}</span><span class
='city'>{{data.City}}</span></span>`,
  data() {
    return {
      data: {}
    };
  }
});
var valueVue = Vue.component("valueTemplate", {
  template: `<span>{{data.FirstName}} - {{data.City}}</span>`,
  data() {
    return {
      data: {}
    };
  }
});
export default {
  data (){
      return {
        valueTemplate : function(e) {
          return {
            template: valueVue
          }
        },
        itemTemplate : function(e) {
          return {
            template: itemVue
          }
        },
        query :  new Query().from('Employees').select(['FirstName', 'City',
'EmployeeID']).take(6),
        dataSource : new DataManager({
            url: 'https://services.odata.org/V4/Northwind/Northwind.svc/',
            adaptor: new ODataV4Adaptor,
            crossDomain: true
        }),
        fields: { text: 'FirstName', value: 'EmployeeID' }
    }
  }
}
</script>
<style>

```
</style>
```

{% previewsample "page.domainurl/code-snippet/multi-select/template/value-cs1" %}

Group template

The group header title under which appropriate sub-items are categorized can also be customize with the help of groupTemplate property. This template is common for both inline and floating group header template.

In the following sample, employees are grouped according to their city.

APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
        <br>
        <ejs-multiselect id='multiselect' sortOrder='Ascending'
:groupTemplate='groupTemplate' :dataSource='employeeData' :query='query'
:fields='fields' placeholder="Select an employee"></ejs-multiselect>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { MultiSelectPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(MultiSelectPlugin);
import { Query, DataManager, ODataV4Adaptor, Predicate } from
'@syncfusion/ej2-data';
var itemVue = Vue.component("groupTemplate", {
  template: `<strong>{{data.City}}</strong>`,
  data() {
    return {
      data: {}
    };
  }
});
export default {
  data (){
    return {
      employeeData : new DataManager({
            url: 'https://services.odata.org/V4/Northwind/Northwind.svc/',
            adaptor: new ODataV4Adaptor,
            crossDomain: true
      }),
      query : new Query().from('Employees').select(['FirstName', 'City',
'EmployeeID']).take(6).where(new Predicate('City', 'equal',
'london').or('City', 'equal', 'seattle')),
      fields : { text: 'FirstName', value: 'EmployeeID', groupBy: 'City' },
      groupTemplate : function(e) {
        return {
          template: itemVue
        }
      }
    }
  }
```

```
}
</script>
<style>
@import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-buttons/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/multi-select/template/group-cs1" %}

Header template

The header element is shown statically at the top of the popup list items within the MultiSelect, and any custom element can be placed as a header element using the headerTemplate property.

In the following sample, the list items and its headers are designed and displayed as two columns similar to multiple columns of the grid.

APP.VUE

```
<template>

{% previewsample "page.domainurl/code-snippet/multi-select/template/header-cs1" %}

Footer template

The MultiSelect has options to show a footer element at the bottom of the list items in the popup list. Here, you can place any custom element as a footer element using the footerTemplate property.

In the following sample, footer element displays the total number of list items present in the MultiSelect.

APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
        <br>
        <ejs-multiselect id='multiselect' :dataSource='sportsData'
:footerTemplate='footerTemplate' :open='onPopupOpen'
:select='updateDataCount' placeholder="Select a game"></ejs-multiselect>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { MultiSelectPlugin } from "@syncfusion/ej2-vue-dropdowns";
import { isNullOrUndefined } from "@syncfusion/ej2-base";
Vue.use(MultiSelectPlugin);
var footerVue = Vue.component("footerTemplate", {
  template: `<span class='foot'></span>`,
  data() {
    return {
      data: {}
    };
  }
});
export default {
  data (){
    var data = ['Badminton', 'Cricket', 'Football', 'Golf', 'Tennis'];
    return {
      sportsData: data,
      footerTemplate : function(e) {
        return {
          template: footerVue
        }
      }
    }
  },
  methods: {
    updateDataCount: function() {
      var remainingDatasCount = document.querySelectorAll('.e-list-
item').length - document.querySelectorAll('.e-hide-listitem').length;
      if (remainingDatasCount !== 0) {
        document.querySelector('.foot').innerText = "Total list item: " +
(remainingDatasCount -1);
      }
    },
    onPopupOpen: function(e) {
```

```
        e.popup.element.querySelector('.foot').innerText  = "Total list
item: " + (5- document.querySelectorAll('.e-chips-collection .e-
chips').length);
    }
  }
}
</script>
<style>
@import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-buttons/styles/material.css";
.foot {
    text-indent: 1.2em;
    display: block;
    font-size: 15px;
    line-height: 40px;
    border-top: 1px solid #e0e0e0;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/multi-select/template/footer-cs1" %}

No records template

The MultiSelect is provided with support to custom design the popup list content when no data is found and no matches found on search with the help of noRecordsTemplate property.

In the following sample, popup list content displays the notification of no data available.

APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
        <br>
        <ejs-multiselect id='multiselect' :dataSource='data'
:noRecordsTemplate='noRecordsTemplate' placeholder="Select an item"></ejs-
multiselect>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { MultiSelectPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(MultiSelectPlugin);
var footerVue = Vue.component("footerTemplate", {
  template: `<span class='norecord'> NO DATA AVAILABLE</span>`,
  data() {
    return {
      data: {}
    };
  }
});
export default {
  data (){
```

```
    return {
      data: [],
      noRecordsTemplate : function(e) {
        return {
          template: footerVue
        }
      }
    }
  }
}
</script>
<style>
@import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-buttons/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/multi-select/template/no-records-cs1" %}

Action failure template

There is also an option to custom design the popup list content when the data fetch request fails at the remote server. This can be achieved using the actionFailureTemplate property.

In the following sample, when the data fetch request fails, the MultiSelect displays the notification.

APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
        <br>
        <ejs-multiselect id='multiselect'
:actionFailureTemplate='actionFailureTemplate' :dataSource='customerData'
:query='query' :fields='fields' placeholder="Select a customer"></ejs-
multiselect>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { MultiSelectPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(MultiSelectPlugin);
import { Query, DataManager, ODataV4Adaptor } from '@syncfusion/ej2-data';
var footerVue = Vue.component("footerTemplate", {
  template: `<span class='action-failure'> Data fetch get fails</span>`,
  data() {
    return {
      data: {}
    };
  }
});
export default {
  data (){
    return {
```

```
      customerData : new DataManager({
            url: 'https://services.odata.org/V4/Northwind/Northwind.svcs/',
            adaptor: new ODataV4Adaptor,
            crossDomain: true
      }),
      query : new Query().from('Customers').select(['ContactName',
'CustomerID']).take(6),
      fields : { text: 'ContactName', value: 'CustomerID' },
      actionFailureTemplate : function (e) {
        return {
          template: footerVue
        }
      }
      }
  }
}
</script>
<style>
@import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-buttons/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/multi-select/template/action-cs1" %}

Grouping in Vue Multi select component

The MultiSelect supports wrapping nested elements into a group based on different categories. The category of each list item can be mapped through the groupByLink to the Video field in the data table. The group header is displayed both as inline and fixed headers. The fixed group header contentis updated dynamically on scrolling the popup list with its category value.

To group the Vue MultiSelect dropdown items, you can check on this video:

In the following sample, vegetables are grouped according on its category using groupBy field.

APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
        <br>
        <ejs-multiselect id='multiselect' :dataSource='vegetableData'
:fields='fields' popupHeight="200px" placeholder="Select a vegetable"></ejs-
multiselect>
    </div>
  </div>
</template>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
<script>
import Vue from 'vue';
import { MultiSelectPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(MultiSelectPlugin);
export default {
  data (){
    return {
      vegetableData: [
        { vegetable: 'Cabbage', category: 'Leafy and Salad', id: 'item1' },
        { vegetable: 'Spinach', category: 'Leafy and Salad', id: 'item2' },
        { vegetable: 'Wheat grass', category: 'Leafy and Salad', id: 'item3'
},
        { vegetable: 'Yarrow', category: 'Leafy and Salad', id: 'item4' },
        { vegetable: 'Pumpkins', category: 'Leafy and Salad', id: 'item5' },
        { vegetable: 'Chickpea', category: 'Beans', id: 'item6' },
        { vegetable: 'Green bean', category: 'Beans', id: 'item7' },
        { vegetable: 'Horse gram', category: 'Beans', id: 'item8' },
        { vegetable: 'Garlic', category: 'Bulb and Stem', id: 'item9' },
        { vegetable: 'Nopal', category: 'Bulb and Stem', id: 'item10' },
        { vegetable: 'Onion', category: 'Bulb and Stem', id: 'item11' }
    ],
    fields : { groupBy: 'category', text: 'vegetable', value: 'id' }
    }
  }
}
</script>

{% previewsample "page.domainurl/code-snippet/multi-select/grouping-cs1" %}

Customization

The grouping header is also provided with customization option. This allows custom designing using the groupTemplate property for both inline and fixed headers.

Grouping with CheckBox

Previously, there is no checkbox for group headers. Now, this feature allow to render checkbox in group header to select the group items in single selection. You can enable this feature by setting enableGroupCheckBox property value as **true** and **mode** property as **CheckBox**.

Inject the CheckBoxSelection module in the MultiSelect to use the checkbox.

APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">

- Group Template support to MultiSelect.

Filtering in Vue Multi select component

The MultiSelect has built-in support to filter data items when allowFiltering is enabled. The filter operation starts as soon as you start typing characters in the MultiSelect input.

Copyright © 2001 -2024 Syncfusion Inc.

To display filtered items in the popup, filter the required data and return it to the MultiSelect via Link to the Video method by using the filtering event.

To filter the Vue MultiSelect dropdown items, you can check on this video:

The following sample illustrates how to query the data source and pass the data to the MultiSelect through the updateData method in filtering event.

APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
        <br>
        <ejs-multiselect id='multiselect' popupHeight="250px"
:allowFiltering='allowFiltering' :filtering='filtering'
:dataSource='searchData' :fields='fields' placeholder="Select a
country"></ejs-multiselect>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { MultiSelectPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(MultiSelectPlugin);
import { Query } from '@syncfusion/ej2-data';
export default {
  data (){
    return {
        searchData : [
            { Index: "s1", Country: "California" }, { Index: "s2", Country:
"Florida" },
            { Index: "s3", Country: "Alaska" }, { Index: "s4", Country:
"Georgia" }
        ],
        fields : { text: "Country", value: "Index" },
        allowFiltering : true
        }
  },
   methods: {
        filtering: function(args) {
           var searchData = [
                { Index: "s1", Country: "California" }, { Index: "s2",
Country: "Florida" },
                { Index: "s3", Country: "Alaska" }, { Index: "s4", Country:
"Georgia" }
            ];
           var query = new Query();
            //frame the query based on search string with filter type.
           query = (args.text != "") ? query.where("Country", "startswith",
args.text, true) : query;
            //pass the filter data source, filter query to updateData
method.
            args.updateData(searchData, query);
        }
    }
}
```

```

{% previewsample "page.domainurl/code-snippet/multi-select/filtering/default-cs1" %}

Limit the minimum filter character

When filtering the list items, you can set the limit for character count to raise remote request and fetch filtered data on the MultiSelect. This can be done by manual validation within the filter event handler.

In the following example, the remote request does not fetch the search data until the search key contains three characters.

APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
        <br>
        <ejs-multiselect id='multiselect' sortOrder='Ascending'
popupHeight="250px" :allowFiltering='allowFiltering' :filtering='filtering'
:dataSource='searchData' :fields='fields' placeholder="Select a
customer"></ejs-multiselect>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { MultiSelectPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(MultiSelectPlugin);
import { Query, DataManager, ODataV4Adaptor } from '@syncfusion/ej2-data';
export default {
  data (){
    return {
        searchData : new DataManager({
            url:
'https://services.odata.org/V4/Northwind/Northwind.svc/Customers',
            adaptor: new ODataV4Adaptor,
            crossDomain: true
        }),
        fields : { text: 'ContactName', value: 'CustomerID' },
        query : new Query().select(['ContactName', 'CustomerID']).take(6),
        allowFiltering : true
        }
  },
   methods: {
        filtering: function(e) {
           var searchData = new DataManager({
                url:
'https://services.odata.org/V4/Northwind/Northwind.svc/Customers',
                adaptor: new ODataV4Adaptor,
```

```
                crossDomain: true
            });
           // load overall data when search key empty.
            if (e.text == '') e.updateData(searchData);
            else {
                // restrict the remote request until search key contains 3
characters.
                if (e.text.length < 3) { return; }
                var query = new Query().select(['ContactName',
'CustomerID']);
                query = (e.text !== '') ? query.where('ContactName',
'startswith', e.text, true) : query;
                e.updateData(searchData, query);
            }
        }
    }
}
</script>
<style>
@import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-buttons/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/multi-select/filtering/min-char-cs1" %}

Change the filter type

While filtering, you can change the filter type to `contains`, `startsWith`, or `endsWith` for string type within the filter event handler.

In the following examples, data filtering is done with `endsWith` type.

APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
        <br>
        <ejs-multiselect id='multiselect' sortOrder='Ascending'
popupHeight="250px" :allowFiltering='allowFiltering' :filtering='filtering'
:dataSource='searchData' :query='query' :fields='fields' placeholder="Select
a customer"></ejs-multiselect>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { MultiSelectPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(MultiSelectPlugin);
import { Query, DataManager, ODataV4Adaptor } from '@syncfusion/ej2-data';
export default {
  data (){
    return {
             searchData : new DataManager({
```

```
                url:
'https://js.syncfusion.com/demos/ejServices/Wcf/Northwind.svc/Suppliers',
                crossDomain: true
            }),
            fields : { text: "ContactName", key: "SupplierID" },
            query : new Query().select(["SupplierID",
"ContactName"]).take(6),
            allowFiltering : true
        }
  },
   methods: {
        filtering: function(e) {
           var searchData = new DataManager({
                url:
'https://js.syncfusion.com/demos/ejServices/Wcf/Northwind.svc/Suppliers',
                crossDomain: true
            });
             if (e.text == '') e.updateData(searchData);
            else {
                var query = new Query().select(["SupplierID",
"ContactName"]);
                query = (e.text !== '') ? query.where('ContactName',
'endswith', e.text, true) : query;
                e.updateData(searchData, query);
            }
        }
    }
}
</script>
<style>
@import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-buttons/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/multi-select/filtering/type-cs1" %}

Case sensitive filtering

Data items can be filtered either with or without case sensitivity using the DataManager. This can be done by passing the fourth optional parameter of the where clause.

The following example shows how to perform case-sensitive filter.

APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">

Diacritics Filtering

MultiSelect supports diacritics filtering which will ignore the diacritics and makes it easier to filter the results in international characters lists when the ignoreAccent is enabled.

In the following sample,data with diacritics are bound as dataSource for MultiSelect.

APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:15px auto 0; width:250px;">
        <br>
        <ejs-multiselect id='multiselect' :dataSource='diacriticsData'
:ignoreAccent="ignoreAccent" :allowFiltering='allowFiltering'
placeholder="e.g: aero"></ejs-multiselect>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { MultiSelectPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(MultiSelectPlugin);
export default {
  data (){
    return {
      diacriticsData : [
            'Aeróbics',
            'Aeróbics en Agua',
            'Aerografía',
            'Aeromodelaje',
            'Águilas',
            'Ajedrez',
            'Ala Delta',
            'Álbumes de Música',
            'Alusivos',
            'Análisis de Escritura a Mano'
        ],

Custom value in Vue Multi select component

The MultiSelect allows user to add a new non-present option to the component value when allowCustomValue is enabled. while selecting the new custom value customValueSelection event will be triggered.

The following sample demonstrates configuration of custom value support with the MultiSelect component.

APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
        <br>
        <ejs-multiselect id='multiselect' :dataSource='sportsData'
:fields='fields' :allowCustomValue='allowCustomValue' placeholder="Select a
game"></ejs-multiselect>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { MultiSelectPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(MultiSelectPlugin);
export default {
  data (){
    return {
      sportsData: [
        { Id: 'game1', Game: 'Badminton' },
        { Id: 'game2', Game: 'Football' },
        { Id: 'game3', Game: 'Tennis' }
      ],
      fields : { text: 'Game', value: 'Id' },
      allowCustomValue : true
    }
  }
}

{% previewsample "page.domainurl/code-snippet/multi-select/checkbox/default-cs1" %}

Select All

The MultiSelect component has in-built support to select the all list items using Select All options in the header.

When the showSelectAll property is set to true, by default Select All text will show. You can customize the name attribute of the Select All option by using selectAllText.

For the unSelect All option, by default unSelect All text will show. You can customize the name attribute of the unSelect All option by using

unSelectAllText.

APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:15px auto 0; width:250px;">

Chip customization in Vue Multi select component

The MultiSelect allows the user to customize the selected chip element through the tagging event. In that event, you can set the custom classes to chip element via that event argument of setClass method.

Copyright © 2001 -2024 Syncfusion Inc.

The following sample demonstrates chip-customization with the MultiSelect component.

APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">

Localization in Vue Multi select component

The Localization library allows you to localize static text content of the noRecordsTemplate and actionFailureTemplate properties according to the culture currently assigned to the MultiSelect.

| Locale key | en-US (default) |

|-----------|-----------------|

| noRecordsTemplate | No records found |

| actionFailureTemplate | The request failed |

Loading translations

To load translation object to your application, use load function of the **L10n** class.

In the following sample, French culture is set to the MultiSelect and no data is loaded. Hence, the noRecordsTemplate property displays its text in French culture initially, and if the sample is run offline, the actionFailureTemplate property displays its text appropriately.

APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
        <br>
        <ejs-multiselect id='multiselect' :dataSource='customerData'
:query='query' :fields='fields' locale="fr-BE" placeholder="Sélectionnez un
client"></ejs-multiselect>
    </div>
  </div>
</template>
<script>

Style in Vue Multi select component

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

Customizing the background color of wrapper element

Use the following CSS to customize the background color of wrapper element.

`

.e-multiselect.e-input-group .e-multi-select-wrapper {

background-color: red;

}

`

Customizing the appearance of the delimiter wrapper element

Use the following CSS to customize the appearance of delimiter wrapper element.

`

.e-multiselect .e-delim-values {

-webkit-text-fill-color: blue;

font-size: 16px;

font-family: cursive;

}

`

Customizing the appearance of chips

Use the following CSS to customize the appearance of selected chips.

`

.e-multiselect .e-multi-select-wrapper .e-chips .e-chipcontent {

font-family: cursive;

font-size: 20px;

-webkit-text-fill-color: blue;

Copyright © 2001 -2024 Syncfusion Inc.

```
}
.e-multi-select-wrapper .e-chips {
background-color: aqua;
height: 26px;
}
```

Customizing the dropdown icon’s color

Use the following CSS to customize the dropdown icon’s color.

```
.e-multiselect.e-input-group .e-input-group-icon, .e-multiselect.e-input-group.e-control-wrapper .e-input-group-icon:hover {
color: red;
font-size: 14px;
}
```

Customizing the focus color

Use the following CSS to customize the focusing color of input element.

```
.e-multiselect.e-input-group.e-control-wrapper.e-input-focus::before, .e-multiselect.e-input-group.e-control-wrapper.e-input-focus::after {
background: #c000ff;
}
```

Customizing the disabled component’s text color

Use the following CSS to customize the text color when the component is disabled.

```
.e-multiselect.e-disabled .e-multi-select-wrapper .e-delim-values {
-webkit-text-fill-color: red;
}
```

Customizing the color of the placeholder text

Use the following CSS to customize the text color of placeholder.

```
.e-multiselect input.e-dropdownbase::placeholder {
color: red;
```

Copyright © 2001 -2024 Syncfusion Inc.

```
}
```

Customizing the placeholder to add mandatory indicator(*)

Use the following CSS to add the mandatory indicator * to the float label element.

```
.e-input-group.e-control-wrapper.e-float-input .e-float-text::after {
content: "*";
color: red;
}
```

Customizing the float label element's focusing color

Use the following CSS to customize the focusing color of float label element.

```
.e-float-input.e-input-group:not(.e-float-icon-left) .e-float-line::before,.e-float-input.e-control-wrapper.e-input-group:not(.e-float-icon-left) .e-float-line::before,.e-float-input.e-input-group:not(.e-float-icon-left) .e-float-line::after,.e-float-input.e-control-wrapper.e-input-group:not(.e-float-icon-left) .e-float-line::after {
background-color: #2319b8;
}
.e-multiselect.e-input-group.e-control-wrapper.e-float-input.e-input-focus .e-float-text.e-label-top, .e-float-input.e-control-wrapper:not(.e-error).e-input-focus input ~ label.e-float-text {
color: #2319b8;
}
```

Customizing the outline theme's focus color

Use the following CSS to customize the focusing color of outline theme.

```
.e-outline.e-input-group.e-input-focus:hover:not(.e-success):not(.e-warning):not(.e-error):not(.e-disabled):not(.e-float-icon-left),.e-outline.e-input-group.e-input-focus.e-control-wrapper:hover:not(.e-success):not(.e-warning):not(.e-error):not(.e-disabled):not(.e-float-icon-left),.e-outline.e-input-group.e-input-focus:not(.e-success):not(.e-warning):not(.e-error):not(.e-disabled),.e-outline.e-input-group.e-control-wrapper.e-input-focus:not(.e-success):not(.e-warning):not(.e-error):not(.e-disabled) {
border-color: #b1bd15;
box-shadow: inset 1px 1px #b1bd15, inset -1px 0 #b1bd15, inset 0 -1px #b1bd15;
}
```

Copyright © 2001 -2024 Syncfusion Inc.

Customizing the background color of focus, hover, and active item's

Use the following CSS to customize the background color of focus, hover and active item's.

```
.e-dropdownbase .e-list-item.e-item-focus, .e-dropdownbase .e-list-item.e-active, .e-dropdownbase .e-list-item.e-active.e-hover, .e-dropdownbase .e-list-item.e-hover {
background-color: #1f9c99;
color: #2319b8;
}
```

Customizing the appearance of pop-up element

Use the following CSS to customize the appearance of popup element.

```
.e-dropdownbase .e-list-item, .e-dropdownbase .e-list-item.e-item-focus {
background-color: #29c2b8;
color: #207cd9;
font-family: emoji;
min-height: 29px
}
```

Customizing the color of the checkbox

Use the following CSS to customize the color of checkbox.

```
.e-popup .e-checkbox-wrapper .e-frame.e-check, .e-popup .e-checkbox-wrapper:hover .e-frame.e-check {
background-color: green;
color: white;
}
```

Accessibility in Vue Multi select component

The MultiSelect component has been designed, keeping in mind the WAI-ARIA specifications, and applies the WAI-ARIA roles, states, and properties along with keyboard support. This component is characterized by complete keyboard interaction support and ARIA accessibility support that makes it easy for people who use assistive technologies (AT) or those who completely rely on keyboard navigation.

The MultiSelect component followed the accessibility guidelines and standards, including ADA, Section 508, WCAG 2.2 standards, and WCAG roles that are commonly used to evaluate accessibility.

Copyright © 2001 -2024 Syncfusion Inc.

The accessibility compliance for the MultiSelect component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| WCAG 2.2 Support | |

| Section 508 Support | |

| Screen Reader Support | |

| Right-To-Left Support | |

| Color Contrast | |

| Mobile Device Support | |

| Keyboard Navigation Support | |

| Accessibility Checker Validation | |

| Axe-core Accessibility Validation | |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

 - All features of the component meet the requirement.

 - Some features of the component do not meet the requirement.

 - The component does not meet the requirement.

WAI-ARIA attributes

The MultiSelect component uses the `Listbox` role, and each list item has an `option` role. The following `ARIA attributes` denote the MultiSelect state.

| **Properties** | **Functionalities** |

Copyright © 2001 -2024 Syncfusion Inc.

| --- | --- |

| aria-haspopup | Indicates whether the MultiSelect input element has a popup list or not. |

| aria-expanded | Indicates whether the popup list has expanded or not. |

| aria-selected | Indicates the selected option. |

| aria-readonly | Indicates the readonly state of the MultiSelect element. |

| aria-disabled | Indicates whether the MultiSelect component is in a disabled state or not. |

| aria-activedescendent | This attribute holds the ID of the active list item to focus its descendant child element. |

| aria-owns | This attribute contains the ID of the popup list to indicate popup as a child element. |

Keyboard interaction

You can use the following key shortcuts to access the MultiSelect without interruptions.

| **Keyboard shortcuts** | **Actions** |

| --- | --- |

| Arrow Down | Set focus at the first item in the MultiSelect when no item selected. Otherwise, moves focus next to the currently selected item. |

| Arrow Up | Moves focus previous to the currently selected one. |

| Page Down | Scrolls down to the next page and set focus to the first item when popup list opens. |

| Page Up | Scrolls up to the previous page and set focus to the first item when popup list opens. |

| Enter | Selects the focused item, and popup list closes when it is in open state. |

| Tab | Focuses on the next TabIndex element on the page when the popup is closed. Otherwise, closes the popup list and remains the focus of the component. |

| Shift + tab | Focuses on the previous TabIndex element on the page when the popup is closed. Otherwise, closes the popup list and remains the focus of the component. |

| Alt + Down | Opens the popup list. |

| Alt + Up | Closes the popup list. |

| Esc(Escape) | Closes the popup list when it is in an open state and the currently selected item remains the same. |

| Home | set focus to the first item. |

| End | set focus to the last item. |

In the below sample, focus the MultiSelect component using alt+t keys.

APP.VUE

```
<template>
  <div id="app">
```

```
    <div id='container' style="margin:50px auto 0; width:250px;">
        <br>
        <ejs-multiselect id='multiselect' ref='multiselectInstance'
:dataSource='sportsData' :fields='fields' popupHeight="200px"
placeholder="Find a game"></ejs-multiselect>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { MultiSelectPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(MultiSelectPlugin);
export default {
  mounted () {
    let multiselectObj = this.$refs.multiselectInstance;
      document.onkeyup = function (e) {
          if (e.altKey && e.keyCode === 84) {
            // press alt+t to focus the control.
            multiselectObj.ej2Instances.focusIn();
          }
      }
      document.onclick = function (e) {
        document.getElementsByClassName('e-
multiselect')[0].classList.remove('e-input-focus');
      }
  },
  data (){
    return {
      sportsData: [
        { id: 'Game1', game: 'Badminton' },
        { id: 'Game2', game: 'Basketball' },
        { id: 'Game3', game: 'Cricket' },
        { id: 'Game4', game: 'Football' },
        { id: 'Game5', game: 'Golf' },
        { id: 'Game6', game: 'Hockey' },
        { id: 'Game7', game: 'Rugby' },
        { id: 'Game8', game: 'Snooker' },
        { id: 'Game9', game: 'Tennis' }
      ],
      fields : { text: 'game', value: 'id' }
    }
  }
}
</script>
<style>
@import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-inputs/styles/material.css";

Ensuring accessibility

The MultiSelect component's accessibility levels are ensured through an accessibility-checker and axe-core software tools during automated testing.

The accessibility compliance of the MultiSelect component is shown in the following sample. Open the sample in a new window to evaluate the accessibility of the MultiSelect component with accessibility tools.

{% previewsample "https://ej2.syncfusion.com/accessibility/multi-select.html" %}

Two way binding in Vue Multi select component

Two-way binding can be achieved by using the v-model directive in Vue. In the following sample, when you change the value in one MultiSelect component, v-model will automatically update the value in the other MultiSelect.

The following example demonstrates how to set the two-way-binding in the MultiSelect.

APP.VUE

```
<template>
<div id="app">
    <div id="wrapper1">
          <ejs-multiselect id='first':dataSource='sportsData'
:fields='fields' :placeholder="waterMark" v-model="value" ></ejs-
multiselect>
    </div>
    <div id="wrapper2">
          <ejs-multiselect id='second' :dataSource='sportsData'
:fields='fields' :placeholder="waterMark" v-model="value" ></ejs-
multiselect>
    </div>
</div>
</template>
<script>
import Vue from 'vue';
import { MultiSelectPlugin } from '@syncfusion/ej2-vue-dropdowns';
Vue.use(MultiSelectPlugin);
export default {
  name: 'app',
   data () {
    return {
      waterMark : 'Select a game',
       value: null,
      sportsData: [
     { Id: 'Game1', Game: 'Badminton' },
    { Id: 'Game2', Game: 'Basketball' },
    { Id: 'Game3', Game: 'Cricket' },
    { Id: 'Game4', Game: 'Football' },
    { Id: 'Game5', Game: 'Golf' },
    { Id: 'Game6', Game: 'Hockey' },
    { Id: 'Game7', Game: 'Rugby' },
    { Id: 'Game8', Game: 'Snooker' }
```

```
    ],
    fields: { value: 'Game' }
    }
  }
}
</script>

How To

Icons support in Vue Multi select component

You can render **icons** to the list items by mapping the iconCss field. This iconCss field create a span in the list item with mapped class name to allow styling as per your need.

In the following sample, icon classes are mapped with iconCss field.

APP.VUE

```
<template>
  <div id="app">
    <div id='container' style="margin:50px auto 0; width:250px;">
        <br>
        <ejs-multiselect id='multiselect' :dataSource='sortFormatData'
:fields='fields' placeholder="Select a format"></ejs-multiselect>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { MultiSelectPlugin } from "@syncfusion/ej2-vue-dropdowns";
Vue.use(MultiSelectPlugin);
export default {
  data (){
    return {
      sortFormatData: [
        { Class: 'sort', Type: 'Sort A to Z', Id: '1' },
        { Class: 'filter', Type: 'Filter', Id: '2' },
        { Class: 'clear', Type: 'Clear', Id: '3' }
      ],
      fields : { text: 'Type', iconCss: 'Class', value: 'Id' }
```

NumericTextbox

Getting Started with the Vue Numerictextbox Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using Vue-CLI and integrating the Syncfusion Vue Numerictextbox component using the Composition API / Options API.

Prerequisites

System requirements for Syncfusion Vue UI components

Setting up the Vue 2 project

To generate a Vue 2 project using Vue-CLI, use the vue create command. Follow these steps to install Vue CLI and create a new project:

`bash

npm install -g @vue/cli

vue create quickstart

cd quickstart

Copyright © 2001 -2024 Syncfusion Inc.

npm run serve

`

or

`bash

yarn global add @vue/cli

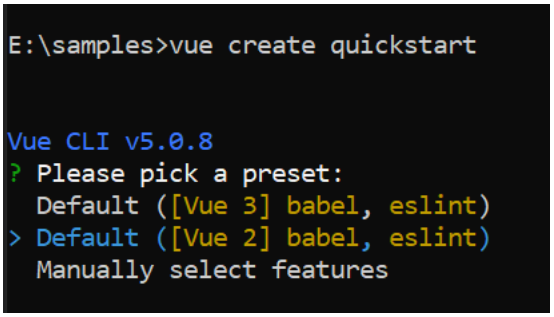
vue create quickstart

cd quickstart

yarn run serve

`

When creating a new project, choose the option Default ([Vue 2] babel, eslint) from the menu.



Once the quickstart project is set up with default settings, proceed to add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion packages are available at npmjs.com. To use Vue components, install the required npm package.

This article uses the Vue Numerictextbox component as an example. Install the @syncfusion/ej2-vue-inputs package by running the following command:

`bash

npm install @syncfusion/ej2-vue-inputs --save

`

or

`bash

yarn add @syncfusion/ej2-vue-inputs

`

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

Copyright © 2001 -2024 Syncfusion Inc.

In this article, the Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the Numerictextbox component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
</style>
```

If you want to refer the combined component styles, please make use of our CRG (Custom Resource Generator) in your application.

Add Syncfusion Vue component

Follow the below steps to add the Vue Numerictextbox component using Composition API or Options API:

1\. First, import and register the Numerictextbox component in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { NumericTextBoxComponent as EjsNumerictextbox } from
"@syncfusion/ej2-vue-inputs";
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { NumericTextBoxComponent } from "@syncfusion/ej2-vue-inputs";
export default {
components: {
'ejs-numerictextbox': NumericTextBoxComponent
}
}
</script>
```

2\. In the template section, define the Numerictextbox component with the value property.

~/SRC/APP.VUE

```
<template>
<div id="app">
<div class='wrap'>
<ejs-numerictextbox value="10"></ejs-numerictextbox>
</div>
</div>
</template>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

Copyright © 2001 -2024 Syncfusion Inc.

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
  <div id="app">
    <div class='wrap'>
        <ejs-numerictextbox value="10"></ejs-numerictextbox>
    </div>
  </div>
</template>
<script setup>
import { NumericTextBoxComponent as EjsNumerictextbox } from
"@syncfusion/ej2-vue-inputs";
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
 .wrap {
    margin: 0 auto;
    width: 240px;
}
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
  <div id="app">
    <div class='wrap'>
        <ejs-numerictextbox value="10"></ejs-numerictextbox>
    </div>
  </div>
</template>
<script>
import { NumericTextBoxComponent } from "@syncfusion/ej2-vue-inputs";
export default {
  components: {
    'ejs-numerictextbox': NumericTextBoxComponent
  },
  data () {
    return {
    }
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
 .wrap {
    margin: 0 auto;
    width: 240px;
}
</style>
```

Run the project

To run the project, use the following command:

Copyright © 2001 -2024 Syncfusion Inc.

`bash

npm run serve

`

or

`bash

yarn run serve

`

{% previewsample "page.domainurl/code-snippet/numeric-textbox/getting-started/getting-started-cs2" %}

Range validation

You can set the minimum and maximum range of values in the NumericTextBox using the min and max properties, so the numeric value should be in the min and max range.

The validation behavior depends on the strictMode property.

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
  <div id="app">
    <div class='wrap'>
        <ejs-numerictextbox id="numeric" ref="numeric_instance"
:value="value" :step="step" :min="min" :max="max"></ejs-numerictextbox>
    </div>
  </div>
</template>
<script setup>
import { NumericTextBoxComponent as EjsNumerictextbox } from
"@syncfusion/ej2-vue-inputs";
const min = 1;
const max = 100;
const value = 30;
const step = 2;
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
 .wrap {
    margin: 0 auto;
    width: 240px;
}
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
  <div id="app">
    <div class='wrap'>
        <ejs-numerictextbox id="numeric" ref="numeric_instance"
:value="value" :step="step" :min="min" :max="max"></ejs-numerictextbox>
    </div>
  </div>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
</template>
<script>
import { NumericTextBoxComponent } from "@syncfusion/ej2-vue-inputs";
export default {
  components: {
    'ejs-numerictextbox': NumericTextBoxComponent
  },
  data () {
    return {
        min: 1,
        max: 100,
        value: 30,
        step: 2
    }
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
 .wrap {
    margin: 0 auto;
    width: 240px;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/numeric-textbox/getting-started/range-validation-cs1" %}

Formatting the value

User can set the format of the NumericTextBox component using format

property. The value will be displayed in the specified format, when the component is in focused out state. For more information about formatting the value, refer to this link.

The below example demonstrates format the value by using currency format value c2.

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
  <div id="app">
    <div class='wrap'>
        <ejs-numerictextbox id="numeric" ref="numeric_instance"
:format="format" :value="value"></ejs-numerictextbox>
    </div>
  </div>
</template>
<script setup>
import { NumericTextBoxComponent as EjsNumerictextbox } from
"@syncfusion/ej2-vue-inputs";
const format = 'c2';
// sets value to the NumericTextBox
const value = 10;
</script>
\<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
```

Copyright © 2001 -2024 Syncfusion Inc.

```
  @import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
 .wrap {
    margin: 0 auto;
    width: 240px;
}
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
  <div id="app">
    <div class='wrap'>
        <ejs-numerictextbox id="numeric" ref="numeric_instance"
:format="format" :value="value"></ejs-numerictextbox>
    </div>
  </div>
</template>
<script>
import { NumericTextBoxComponent } from "@syncfusion/ej2-vue-inputs";
export default {
  components: {
    'ejs-numerictextbox': NumericTextBoxComponent
  },
  data () {
    return {
       format: 'c2',
        // sets value to the NumericTextBox
        value: 10
    }
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
 .wrap {
    margin: 0 auto;
    width: 240px;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/numeric-textbox/getting-started/formating-value-cs1" %}

Precision of numbers

You can restrict the number of decimals to be entered in the NumericTextBox by using the decimals and validateDecimalOnType properties.

So, you can't enter the number whose precision is greater than the mentioned decimals.

- If validateDecimalOnType is false, number of decimals will not be restricted.

Else, number of decimals will be restricted while typing in the NumericTextBox.

Copyright © 2001 -2024 Syncfusion Inc.

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
  <div id="app">
        <div class='wrap'>
           <ejs-numerictextbox id="strict" :validateDecimalOnType='true'

    width: 240px;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/numeric-textbox/getting-started/precision-numbers-cs1" %}

Model binding

In NumericTextBox, the value property supports model binding functionality.

The below example demonstrates model binding functionality with the NumericTextBox and HTML input element.

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
  <div id="app">
  <div class='wrap'>
        <div class='e-input-group' style='margin-bottom:30px'>
        <input class='e-input' type='text' v-model='value'
placeholder='Enter a number'  />
        </div>
        <div>
           <ejs-numerictextbox v-model="value" :value="value"></ejs-
numerictextbox>
        </div>
  </div>
  </div>
</template>
<script setup>
import { NumericTextBoxComponent as EjsNumerictextbox } from
"@syncfusion/ej2-vue-inputs";
const value = 10;
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
 .wrap {
  margin: 35px auto;
  width: 240px;
}
</style>
```

Copyright © 2001 -2024 Syncfusion Inc.

OPTIONS API (~/SRC/APP.VUE)

```
<template>
  <div id="app">
  <div class='wrap'>
        <div class='e-input-group' style='margin-bottom:30px'>
        <input class='e-input' type='text' v-model='value'
placeholder='Enter a number'  />
        </div>
        <div>
           <ejs-numerictextbox v-model="value" :value="value"></ejs-
numerictextbox>
        </div>
  </div>
  </div>
</template>
<script>
import { NumericTextBoxComponent } from "@syncfusion/ej2-vue-inputs";
export default {
  components: {
    'ejs-numerictextbox': NumericTextBoxComponent
  },
  data () {
    return {
      value : 10
    }
  }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
 .wrap {
  margin: 35px auto;
  width: 240px;
}
</style>
```

Getting Started with the Vue NumericTextBox Component in Vue 3

This article provides a step-by-step guide for setting up a Vite project with a JavaScript environment and integrating the Syncfusion Vue NumericTextBox component using the Composition API / Options API.

Copyright © 2001 -2024 Syncfusion Inc.

The Composition API is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

The Options API is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

Prerequisites

System requirements for Syncfusion Vue UI components

Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using Vite. To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

`bash

npm create vite@latest

`

or

`bash

yarn create vite

`

Using one of the above commands will lead you to set up additional configurations for the project as below:

1.Define the project name: We can specify the name of the project directly. Let's specify the name of the project as my-project for this article.

`bash

? Project name: » my-project

`

2.Select Vue as the framework. It will create a Vue 3 project.

`bash

? Select a framework: » - Use arrow-keys. Return to submit.

Vanilla

Vue

React

Preact

Lit

Svelte

Others

`

3.Choose JavaScript as the framework variant to build this Vite project using JavaScript and Vue.

`bash

? Select a variant: » - Use arrow-keys. Return to submit.

JavaScript

TypeScript

Customize with create-vue ↗

Nuxt ↗

`

4.Upon completing the aforementioned steps to create the my-project, run the following command to install its dependencies:

`bash

cd my-project

npm install

`

or

`bash

cd my-project

yarn install

`

Now that my-project is ready to run with default settings, let's add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion Vue component packages are available at npmjs.com. To use Syncfusion Vue components in the project, install the corresponding npm package.

This article uses the Vue NumericTextBox component as an example. To use the Vue NumericTextBox component in the project, the @syncfusion/ej2-vue-inputs package needs to be installed using the following command:

`bash

npm install @syncfusion/ej2-vue-inputs --save

`

or

`bash

yarn add @syncfusion/ej2-vue-inputs

`

Copyright © 2001 -2024 Syncfusion Inc.

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the NumericTextBox component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
</style>
```

The order of importing CSS styles should be in line with its dependency graph.

Add Syncfusion Vue component

Follow the below steps to add the Vue NumericTextBox component using Composition API or Options API:

1.First, import and register the NumericTextBox component in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { NumericTextBoxComponent as EjsNumerictextbox } from
"@syncfusion/ej2-vue-inputs";
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { NumericTextBoxComponent } from "@syncfusion/ej2-vue-inputs";
//Component registeration
export default {
name: "App",
components: {
'ejs-numerictextbox' : NumericTextBoxComponent,
}
}
</script>
```

2.In the template section, define the NumericTextBox component with the dataSource property and column definitions.

~/SRC/APP.VUE

```
<template>
<div class="control_wrapper">
<ejs-numerictextbox value="10"></ejs-numerictextbox>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
</div>
</template>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<div class="control_wrapper">
<ejs-numerictextbox value="10"></ejs-numerictextbox>
</div>
</template>
<script setup>
import { NumericTextBoxComponent as EjsNumerictextbox } from
"@syncfusion/ej2-vue-inputs";
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
.control_wrapper {
margin: 35px auto;
width: 240px;
}
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<div class="control_wrapper">
<ejs-numerictextbox value="10"></ejs-numerictextbox>
</div>
</template>
<script>
import { NumericTextBoxComponent } from "@syncfusion/ej2-vue-inputs";
//Component registeration
export default {
name: 'App',
components: {
"ejs-numerictextbox": NumericTextBoxComponent
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
.control_wrapper {
margin: 35px auto;
width: 240px;
}
</style>
```

Run the project

To run the project, use the following command:

`bash

npm run dev

`

or

`bash

yarn run dev

`

The output will appear as follows:

Range validation

You can set the minimum and maximum range of values in the NumericTextBox using the min and max properties, so the numeric value should be in the min and max range.

The validation behavior depends on the strictMode property.

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<div id="app">
<div class='wrap'>
<ejs-numerictextbox id="numeric" ref="numeric_instance"
:value="data[0].value" :step="data[0].step" :min="data[0].min"
:max="data[0].max"></ejs-numerictextbox>
</div>
</div>
</template>
<script setup>
import { NumericTextBoxComponent as EjsNumerictextbox } from
"@syncfusion/ej2-vue-inputs";
const data = [{ min: 1,
max: 100,
value:30,
step: 2}]
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
.wrap {
margin: 0 auto;
width: 240px;
}
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<div id="app">
<div class='wrap'>
<ejs-numerictextbox id="numeric" ref="numeric_instance" :value="value"
:step="step" :min="min" :max="max"></ejs-numerictextbox>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
</div>
</div>
</template>
<script>
import { NumericTextBoxComponent } from "@syncfusion/ej2-vue-inputs";
//Component registeration
export default {
name: 'App',
components: {
"ejs-numerictextbox": NumericTextBoxComponent
},
data () {
return {
min: 1,
max: 100,
value: 30,
step: 2
}
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
.wrap {
margin: 0 auto;
width: 240px;
}
</style>
```

The output will appear as follows:

Formatting the value

User can set the format of the NumericTextBox component using format

property. The value will be displayed in the specified format, when the component is in focused out state. For more information about formatting the value, refer to this link.

The below example demonstrates format the value by using currency format value c2.

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<div id="app">
<div class='wrap'>
<ejs-numerictextbox id="numeric" ref="numeric_instance"
:format="data[0].format" :value="data[0].value"></ejs-numerictextbox>
</div>
</div>
</template>
<script setup>
import { NumericTextBoxComponent as EjsNumerictextbox } from
"@syncfusion/ej2-vue-inputs";
```

```
const data = [{ format: 'c2',
// sets value to the NumericTextBox
value: 10}]
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
.wrap {
margin: 0 auto;
width: 240px;
}
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<div id="app">
<div class='wrap'>
<ejs-numerictextbox id="numeric" ref="numeric_instance" :format="format"
:value="value"></ejs-numerictextbox>
</div>
</div>
</template>
<script>
import { NumericTextBoxComponent } from "@syncfusion/ej2-vue-inputs";
//Component registeration
export default {
name: 'App',
components: {
"ejs-numerictextbox": NumericTextBoxComponent
},
data () {
return {
format: 'c2',
// sets value to the NumericTextBox
value: 10
}
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
.wrap {
margin: 0 auto;
width: 240px;
}
</style>
```

The output will appear as follows:

Copyright © 2001 -2024 Syncfusion Inc.

Precision of numbers

You can restrict the number of decimals to be entered in the NumericTextBox by using the decimals and validateDecimalOnType properties.

So, you can't enter the number whose precision is greater than the mentioned decimals.

*If validateDecimalOnType is false, number of decimals will not be restricted. Else, number of decimals will be restricted while typing in the NumericTextBox.

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<div id="app">
<div class='wrap'>
<ejs-numerictextbox id="strict" :validateDecimalOnType='true'
placeholder="ValidateDecimalOnType enabled" floatLabelType="Auto"
format='n3' :value="data[0].value" :decimals="data[0].decimals"></ejs-
numerictextbox>
</div>
<div class='wrap'>
<ejs-numerictextbox id="allow" placeholder="ValidateDecimalOnType disabled"
floatLabelType="Auto" format='n3' :value="data[0].value"
:decimals="data[0].decimals"></ejs-numerictextbox>
</div>
</div>
</template>
<script setup>
import { NumericTextBoxComponent as EjsNumerictextbox } from
"@syncfusion/ej2-vue-inputs";
const data = [{ decimals: 3,
value: 10 }]
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
.wrap {
margin: 35px auto;
width: 240px;
}
</style>
```

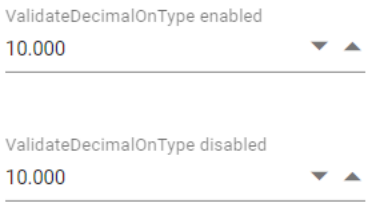
OPTIONS API (~/SRC/APP.VUE)

```
<template>
<div id="app">
<div class='wrap'>
<ejs-numerictextbox id="strict" :validateDecimalOnType='true'
placeholder="ValidateDecimalOnType enabled" floatLabelType="Auto"
format='n3' :value="value" :decimals="decimals"></ejs-numerictextbox>
</div>
<div class='wrap'>
<ejs-numerictextbox id="allow" placeholder="ValidateDecimalOnType disabled"
floatLabelType="Auto" format='n3' :value="value" :decimals="decimals"></ejs-
numerictextbox>
</div>
</div>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
</template>
<script>
import { NumericTextBoxComponent } from "@syncfusion/ej2-vue-inputs";
//Component registeration
export default {
name: 'App',
components: {
"ejs-numerictextbox": NumericTextBoxComponent
},
data () {
return {
// sets number of decimal places to be allowed by the NumericTextBox
decimals: 3,
value: 10,
}
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
.wrap {
margin: 35px auto;
width: 240px;
}
</style>
```

The output will appear as follows:



Model binding

In NumericTextBox, the value property supports model binding functionality. The below example demonstrates model binding functionality with the NumericTextBox and HTML input element.

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<div id="app">
<div class='wrap'>
<div class='e-input-group' style='margin-bottom:30px'>
<input class='e-input' type='text' v-model='value' placeholder='Enter a
number'  />
</div>
<ejs-numerictextbox v-model="value" :value="value"></ejs-numerictextbox>
</div>
</div>
</template>
<script setup>
```

```
import { ref } from 'vue'
import { NumericTextBoxComponent as EjsNumerictextbox } from
"@syncfusion/ej2-vue-inputs";
const value = ref(10);
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
.wrap {
margin: 35px auto;
width: 240px;
}
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<div id="app">
<div class='wrap'>
<div class='e-input-group' style='margin-bottom:30px'>
<input class='e-input' type='text' v-model='value' placeholder='Enter a
number'  />
</div>
<ejs-numerictextbox v-model="value" :value="value"></ejs-numerictextbox>
</div>
</div>
</template>
<script>
import { NumericTextBoxComponent } from "@syncfusion/ej2-vue-inputs";
//Component registeration
export default {
name: 'App',
components: {
"ejs-numerictextbox": NumericTextBoxComponent
},
data () {
return {
value : 10
}
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
.wrap {
margin: 35px auto;
width: 240px;
}
</style>
```

The output will appear as follows:

Copyright © 2001 -2024 Syncfusion Inc.

Formats in Vue Numerictextbox component

You can format the value of NumericTextBox using format property. The value will be displayed in the specified format when the component is in focused out state. The format string supports both the standard numeric format and custom numeric format.

Standard formats

From the standard numeric formats, you can use the numeric related format specifiers such as n,p and c in the NumericTextBox component. By using these format specifiers, you can achieve the percentage and currency textbox behavior also.

The below example demonstrates percentage and currency formats.

APP.VUE

```
<template>
  <div id="app">
        <div class='wrap'>
           <ejs-numerictextbox id="percent" format='p2'
placeholder="Percentage format" floatLabelType="Auto" :value="value"
:step="step" :min="min" :max="max"></ejs-numerictextbox>
        </div>
        <div class='wrap'>
           <ejs-numerictextbox id="currency" placeholder="Currency format"
floatLabelType="Auto" format='c2' :value="currencyvalue"></ejs-
numerictextbox>
        </div>
  </div>
</template>
<script>
import Vue from "vue";
import { NumericTextBoxPlugin } from "@syncfusion/ej2-vue-inputs";
Vue.use(NumericTextBoxPlugin);
export default {
  data () {
    return {
        value: 0.5,
        min: 0,
```

```
        max: 1,
        step: 0.01,
        // sets currency with 2 numbers of decimal places format
        format: 'c2'
        currencyvalue: 10,
    }
  }
}
</script>
<style>
  @import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../../node_modules/@syncfusion/ej2-vue-
inputs/styles/material.css";
 .wrap {
    margin: 35px auto;
    width: 240px;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/numeric-textbox/number-formats/standard-cs1" %}

Custom formats

From the custom numeric format, you can provide any custom format by combining one or more custom specifiers.

The below examples demonstrate format the value by using currency format string # and 0.

APP.VUE

```
<template>
  <div id="app">
        <div class='wrap'>
           <ejs-numerictextbox id="numeric" format='###.##'
placeholder="Custom format string #" floatLabelType="Auto"
:value="value"></ejs-numerictextbox>
        </div>
        <div class='wrap'>
           <ejs-numerictextbox id="numeric1" placeholder="Custom format
string 0" floatLabelType="Auto" format='000.00' :value="numvalue"></ejs-
numerictextbox>
        </div>
  </div>
</template>
<script>
import Vue from "vue";
import { NumericTextBoxPlugin } from "@syncfusion/ej2-vue-inputs";
Vue.use(NumericTextBoxPlugin);
export default {
  data () {
    return {
        // sets the format using custom format string `#`
        value: 10,
        // sets the format using custom format string `0`
        numvalue: 10,
    }
  }
```

Copyright © 2001 -2024 Syncfusion Inc.

```
}
</script>
<style>
  @import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../../node_modules/@syncfusion/ej2-vue-
inputs/styles/material.css";
 .wrap {
    margin: 35px auto;
    width: 240px;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/numeric-textbox/number-formats/custom-cs1" %}

Globalization in Vue Numerictextbox component

Localization

Localization library allows users to localize the default text contents of the NumericTextBox to different cultures using the locale property. In NumericTextBox, spin buttons title for the tooltip will be localized based on the culture.

| Locale key | en-US (default) |

|------|------|

| incrementTitle | Increment value |

| decrementTitle | Decrement value |

Loading translations

To load translation object in your application use `load` function of `L10n` class.

The below example demonstrates the NumericTextBox in `German` culture with the spin buttons tooltip.

APP.VUE

```
<template>
  <div id="app">
        <div class='wrap'>
           <ejs-numerictextbox id="numeric" locale='de'
:value="value"></ejs-numerictextbox>
        </div>
  </div>
</template>
<script>
import Vue from "vue";
import { L10n } from '@syncfusion/ej2-base';
import { NumericTextBoxPlugin } from "@syncfusion/ej2-vue-inputs";
Vue.use(NumericTextBoxPlugin);
// Load `German` culture to override spin buttons tooltip text
L10n.load({
    'de': {
        'numerictextbox': {
            incrementTitle: 'Wert erhöhen', decrementTitle: 'Dekrementwert'
        }
    },
});
export default {
```

```
  data () {
    return {
        value: 10,
    }
  }
}
</script>
<style>
  @import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../../node_modules/@syncfusion/ej2-vue-
inputs/styles/material.css";
 .wrap {
    margin: 0px auto;
    width: 240px;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/numeric-textbox/locale-cs1" %}

Internationalization

Internationalization library provides support for formatting and parsing the number by using the official Unicode CLDR JSON data and also provides the loadCldr method to load the culture specific CLDR JSON data. The NumericTextBox comes with built-in

internationalization support to adapt based on culture. For more information about internationalization, refer to this link.

By default, all the Essential JS 2 component are specific to English culture ('en-US'). If you want to go with the different culture other than English, follow the below steps.

- Install the CLDR-Data package by using the below command (it installs the CLDR JSON data). For more information about CLDR-Data, refer to this link.

`

npm install cldr-data --save

`

Once the package installed, you can find the culture specific JSON data under the location /node_modules/cldr-data.

- Now import the installed CLDR JSON data into the app.vue file.

To import JSON data we need to install the JSON plugin loader. Here we have used the SystemJS JSON plugin loader.

`

npm install systemjs-plugin-json --save-dev

`

Copyright © 2001 -2024 Syncfusion Inc.

- Once installed, configure the system.config.js configuration settings as like below to map the systemjs-plugin-json loader.
- Now import the required culture from the installed location to app.vue file as like the below code snippets.
- Set the culture by using the locale property.

The below example demonstrates the NumericTextBox in German culture with the EUR currency format.

APP.VUE

```
<template>
  <div id="app">
        <div class='wrap'>
           <ejs-numerictextbox id="numeric" locale='de' currency='EUR'
format='c2' :value='value'></ejs-numerictextbox>
        </div>
  </div>
</template>
<script>
import Vue from "vue";
import { loadCldr,L10n,Ajax } from '@syncfusion/ej2-base';
import { NumericTextBoxPlugin } from "@syncfusion/ej2-vue-inputs";
import * as numberingSystems from './numberingSystems.json';
import * as currencyData from './currencyData.json';
import * as numbers from './numbers.json';
import * as currencies from './currencies.json';
Vue.use(NumericTextBoxPlugin);
loadCldr(numberingSystems, currencyData, numbers, currencies);
L10n.load({
    'de': {
      'numerictextbox': { incrementTitle: 'Wert erhöhen', decrementTitle:
'Dekrementwert'}
    }
});
export default {
  data (){
      return {

Right to Left(RTL)

Localization library allows users to localize the default text contents of the NumericTextBox to different cultures using the locale property. In NumericTextBox, spin buttons title for the tooltip will be localized based on the culture.

RTL provides an option to switch the text direction and layout of the NumericTextBox component from right to left. It improves the user experiences and accessibility for users who use right-to-left languages (Arabic, Farsi, Urdu, etc.). To enable RTL NumericTextBox, set the enableRtl to true.

APP.VUE

```
<template>
  <div id="app">
        <div class='wrap'>
           <ejs-numerictextbox id="numeric" locale='ar-AE'
floatLabelType='Auto' placeholder='أدخل القيمة' :enableRtl='true'
:value='value'></ejs-numerictextbox>
        </div>
  </div>
</template>
<script>
import Vue from "vue";
import { loadCldr,L10n,Ajax } from '@syncfusion/ej2-base';
import { NumericTextBoxPlugin } from "@syncfusion/ej2-vue-inputs";
Vue.use(NumericTextBoxPlugin);
L10n.load({
    'ar-AE': {
      'numerictextbox': { incrementTitle: 'قيمة الزيادة', decrementTitle:
'قيمة تناقص'}
    }
});
export default {
  data (){
      return {
        value : 100
      }
    }
  }
}
</script>
<style>
  @import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../../node_modules/@syncfusion/ej2-vue-

Accessibility in Vue Numerictextbox component

The Numerictextbox component followed the accessibility guidelines and standards, including ADA, Section 508, WCAG 2.2 standards, and WCAG roles that are commonly used to evaluate accessibility.

Copyright © 2001 -2024 Syncfusion Inc.

The accessibility compliance for the Numerictextbox component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| WCAG 2.2 Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Section 508 Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Screen Reader Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Right-To-Left Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Color Contrast | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

}

</style>

<img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> - All features of the component meet the requirement.

<img src="https://cdn.syncfusion.com/content/images/landing-page/intermediate.png" alt="Intermediate"> - Some features of the component do not meet the requirement.

<img src="https://cdn.syncfusion.com/content/images/landing-page/no.png" alt="No"> - The component does not meet the requirement.

WAI-ARIA attributes

The NumericTextBox characterized with complete ARIA Accessibility support which helps to accessible

by on-screen readers and other assistive technology devices. This component designed with the reference of the guidelines document given in WAI ARAI Accessibility practices.

Copyright © 2001 -2024 Syncfusion Inc.

The NumericTextBox uses the spinbutton role and following ARIA properties to its element based on its state.

| **Property** | **Functionality** |

| --- | --- |

| aria-live | The aria-live attribute indicates the priority of updates to a live region |

| aria-valuemin | The aria-valuemin property specifies the minimum allowable range of the NumericTextBox.|

| aria-valuemax | The aria-valuemax property specifies the maximum allowable range of the NumericTextBox. |

| aria-disabled | The aria-disabled property indicates disabled state of the NumericTextBox. |

| aria-readonly | The aria-readonly property indicates the read-only state of the NumericTextBox. |

| aria-valuenow | The aria-valuenow property specifies the current value of the NumericTextBox. |

| aria-invalid | The aria-invalid property indicates that the user input is incorrect or not within acceptable ranges. |

| aria-label | The aria-label property indicates a string value that labels the NumericTextBox. |

Keyboard interaction

Keyboard interaction of the NumericTextBox component has been designed based on WAI-ARIA Practices described for the NumericTextBox and it is an alternative to mouse actions to interact with the NumericTextBox.

The below table shows shortcut keys and its corresponding usage.

| **Keyboard shortcuts** | **Actions** |

| --- | --- |

| Arrow Down | Increments the value. |

| Arrow Up | Decrements the value |

Two way binding in Vue Numerictextbox component

Two-way binding can be achieved by using the v-model directive in Vue. In the following sample, when you change the value in one NumericTextBox component, v-model will automatically update the value in the other NumericTextBox.

The following example demonstrates how to set the two-way-binding in the NumericTextBox.

APP.VUE

```
<template>
<div id="app">
    <div id="wrapper1">
        <ejs-numerictextbox floatLabelType="Auto" placeholder="Enter a
value" v-model="value"></ejs-numerictextbox>
    </div>
    <div id="wrapper2">
        <ejs-numerictextbox floatLabelType="Auto" placeholder="Enter a
value" v-model="value"></ejs-numerictextbox>
    </div>
</div>
</template>
<script>
import Vue from 'vue';
import { NumericTextBoxPlugin } from '@syncfusion/ej2-vue-inputs';
Vue.use(NumericTextBoxPlugin);
export default {
```

Copyright © 2001 -2024 Syncfusion Inc.

```
 data: function(){
        return {
            value: null
        }
    }
}
</script>
<style>
@import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
#wrapper1{
    min-width: 250px;
    float: left;
    margin-left: 100px;
}
#wrapper2{
    min-width: 250px;
    float: right;
    margin-right: 100px;
}
</style>
```

Style appearance in Vue Numerictextbox component

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

Customizing the appearance of NumericTextBox wrapper element

Use the following CSS to customize the appearance of wrapper element.

`

/ To specify height and font size /

.e-input-group input.e-input, .e-input-group.e-control-wrapper input.e-input, .e-input-group textarea.e-input, .e-input-group.e-control-wrapper textarea.e-input {

height: 40px;

font-size: 20px;

}

`

Customizing the NumericTextBox icons

Use the following CSS to customize the Numeric TextBox icons

`

/ To specify font size and background color /

.e-numeric.e-control-wrapper.e-input-group .e-input-group-icon {

font-size: 20px;

background-color: beige;

}
`

How To

Customize the ui appearance of the control in Vue Numerictextbox component

You can change the appearance of the NumericTextBox by adding custom cssClass to the component and enabling styles. Refer to the following example to change the appearance of the NumericTextBox.

APP.VUE

```
<template>
  <div id="app">
        <div class='wrap'>
           <ejs-numerictextbox id="numeric" :value="value"
placeholder='Enter value' floatLabelType='Always' cssClass='e-style'></ejs-
numerictextbox>
        </div>
  </div>
</template>
<script>
import Vue from "vue";
import { NumericTextBoxPlugin } from "@syncfusion/ej2-vue-inputs";
Vue.use(NumericTextBoxPlugin);
export default {
  data () {
    return {
      value: 10
    }
  }
}
</script>
<style>
  @import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../../node_modules/@syncfusion/ej2-vue-
inputs/styles/material.css";
 .wrap {
  margin: 0 auto;
  width: 240px;
  padding-top: 100px;
}
  .e-numeric.e-style .e-control.e-numerictextbox  {
    color: royalblue ;
    font-size: xx-large ;
    border: 0px ;
  }
  .e-input-group.e-control-wrapper:not(.e-success):not(.e-warning):not(.e-
error):not(.e-float-icon-left), .e-float-input.e-control-
wrapper:hover:not(.e-success):not(.e-warning):not(.e-error):not(.e-
disabled):not(.e-float-icon-left) {
    border-color: royalblue;
  }
  .e-control-wrapper.e-numeric.e-float-input.e-style .e-spin-down  {
    color:royalblue;
  }
  .e-control-wrapper.e-numeric.e-float-input.e-style .e-float-line::before {
    background: royalblue ;
```

Copyright © 2001 -2024 Syncfusion Inc.

```
  }
  .e-control-wrapper.e-numeric.e-float-input.e-style .e-float-line::after {
    background: royalblue ;
   }
  .e-control-wrapper.e-numeric.e-float-input.e-style .e-spin-up {
    color:royalblue ;
  }
  .e-control-wrapper.e-numeric.e-float-input.e-style .e-float-text.e-label-
top {

Customize the spin buttons up and down arrow in Vue Numerictextbox component

This section explains about how to change/customize spin up and down icons. You can customize spin button icons using e-spin-up and e-spin-down

classes of those buttons.

You can override the default icons of e-spin-up and e-spin-down classes using the following CSS code snippets.

`

.e-numeric .e-input-group-icon.e-spin-up:before {

content: "\e823";

color: rgba(0, 0, 0, 0.54);

}

.e-numeric .e-input-group-icon.e-spin-down:before {

content: "\e934";

color: rgba(0, 0, 0, 0.54);

}

`

APP.VUE

Maintain trailing zeros in numerictextbox in Vue Numerictextbox component

By default, trailing zeros disappear when the NumericTextBox gets focus. However, you can use the following sample to maintain the trailing zeros while focusing the NumericTextBox.

APP.VUE

```
<template>
  <div id="app">
        <div class='wrap'>
           <ejs-numerictextbox id="numeric" :value='value' format='n2'
:decimals='decimals' placeholder='NumericTextBox' :change='onChange'
:created='onCreate'></ejs-numerictextbox>
        </div>
  </div>
</template>
<script>
import Vue from "vue";
import { NumericTextBoxPlugin } from "@syncfusion/ej2-vue-inputs";
Vue.use(NumericTextBoxPlugin);
export default {
  data () {
    return {
      value : 10,
      decimals : 2
    }
  },
  methods: {
    onChange: function (event) {
      var numericObj = document.getElementById("numeric").ej2_instances[0];
      numericObj.element.value =
numericObj.formattedValue(numericObj.decimals, +numericObj.element.value);
    },
     onCreate: function (event) {

document.getElementById("numeric").addEventListener('focus',function(){
        var numericObj =
document.getElementById("numeric").ej2_instances[0];
        numericObj.element.value =
numericObj.formattedValue(numericObj.decimals, +numericObj.element.value);
```

```
      });
    }
}
}
</script>
<style>
  @import "../../node_modules/@syncfusion/ej2-base/styles/material.css";

Perform custom validation using form validator in Vue Numerictextbox component

This section explains how to perform custom validation on the NumericTextBox using FormValidator. The NumericTextBox will be validated when the value changes or the user clicks the submit button.

Validation can be performed by adding custom validation in the rules collection of the FormValidator.

APP.VUE

```
<template>
  <div id="app">
    <div class='wrap'>
      <form id="form-element" class="form-horizontal">
        <div class="form-group">
          <ejs-numerictextbox id="numericRange" name="numericRange"
class="form-control" floatLabelType='Always' :min='min' :max='max'
:strictMode='strictMode'  :created='onCreate' :change='onChange'></ejs-
numerictextbox>
          <button type="button" id="submit_btn" style="margin-top: 40px" v-
on:click="onClick">Submit</button>
        </div>
      </form>
    </div>
  </div>
</template>
<script>
import Vue from "vue";
import { NumericTextBoxPlugin } from "@syncfusion/ej2-vue-inputs";
import { FormValidator, FormValidatorModel } from '@syncfusion/ej2-inputs';
Vue.use(NumericTextBoxPlugin);
export default {
  data () {
     // checks the value of NumericTextbox and returns the corresponding
boolean value
      var customFn = function(args) {
         var numeric =
document.getElementById('numericRange').ej2_instances[0];
          if(numeric.value>=10 && numeric.value<=100) {
              return true;
```

```
            }
            else {
                return false;
            }
        };
        // sets required property in the FormValidator rules collection
        var options = {
            rules: {
                    'numeric': { required: [true, "Number is required"] },
            },
        }
        // defines FormValidator to validate the NumericTextBox
        var formObject = new FormValidator('#form-element', options);
        // places error label outside the NumericTextBox using the
customPlacement event of FormValidator
        formObject.customPlacement = function (element, errorElement) {

element.parentNode.parentNode.parentNode.appendChild(errorElement);
        };

Prevent nullable input in numerictextbox in Vue Numerictextbox component

By default, the value of the NumericTextBox sets to null. In some applications, the value of the NumericTextBox should not be null at any instance. In such cases, following sample can be used to prevent nullable input in NumericTextBox.

APP.VUE

```
<template>
  <div id="app">
        <div class='wrap'>
           <ejs-numerictextbox id="numeric" :value='value'
placeholder='NumericTextBox' :created='onCreate' :blur='onBlur'
floatLabelType='Always'></ejs-numerictextbox>
        </div>
  </div>
</template>
<script>
import Vue from "vue";
import { NumericTextBoxPlugin } from "@syncfusion/ej2-vue-inputs";
Vue.use(NumericTextBoxPlugin);
export default {
  data () {
    return {
      value : null
    }
  },
  methods: {
    onCreate: function (event) {
      var numericObj=document.getElementById("numeric").ej2_instances[0];
      //  prevents nullable value during initialization
      if (numericObj.value==null) {
        numericObj.value=0;
      }
   }
   onBlur: function(args) {
     if(args.value == null) {
       numeric.value = 0;
     }
   }
}
}
</script>
<style>
  @import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../../node_modules/@syncfusion/ej2-vue-
inputs/styles/material.css";
```

Copyright © 2001 -2024 Syncfusion Inc.

```
  .wrap {
   margin: 0 auto;
   width: 240px;
   padding-top: 100px;
}
</style>
```

Pager

Getting started

This section explains you the steps required to create a simple pager

and demonstrate the basic usage of the pager component in Vue environment.

Prerequisites

System requirements for Syncfusion Vue UI components

Setup Vue Environment

You can use Vue CLI to setup your vue applications.

To install Vue CLI use the following commands.

`bash

npm install -g @vue/cli

npm install -g @vue/cli-init

`

Create a Vue Application

Start a new Vue application using below Vue CLI command.

`bash

vue init webpack-simple quickstart

cd quickstart

npm install

`

Adding Syncfusion Pager package

All the available Essential JS 2 packages are published in npmjs.com registry.

To install pager component, use the following command

`bash

npm install @syncfusion/ej2-vue-grids --save

`

The **--save** will instruct NPM to include the grid package inside of the dependencies section of the package.json.

Copyright © 2001 -2024 Syncfusion Inc.

Registering Pager Component

You can register the pager component in your application by using the Vue.use().

Refer to the code example given below.

`ts

import { PagerPlugin } from '@syncfuion/ej2-vue-grids';

Vue.use(PagerPlugin);

`

Adding CSS Reference

The pager has different themes. They are:

- Material
- Office 365
- Fabric
- Bootstrap
- High Contrast

Import pager component CSS as given below in <style> section of the App.vue file.

`

<style>

<!-- Material theme used for this sample -->

@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";

</style>

`

Adding Pager component

Add the Vue pager by using <ejs-pager> selector in <template> section of the App.vue file.

Import pager plugin into Vue application[src/App.vue] from the package @syncfusion/ej2-vue-grids.

Now place the below pager code in the App.vue.

Here the pager is rendered with totalRecordsCount which is used to render numeric container.

`

<template>

<ejs-pager> </ejs-pager>

</template>

<script>

import Vue from 'vue';

Copyright © 2001 -2024 Syncfusion Inc.

```
import { PagerPlugin } from '@syncfusion/ej2-vue-grids';
Vue.use(PagerPlugin);
export default {
data () {
return {
}
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>
`
```

Modify the template in [src/app.vue] file to render the pager component.

```
`
<template>
<div id="app">
<ejs-pager :totalRecordsCount='20'> </ejs-pager>
</div>
</template>
<script>
import Vue from 'vue';
import { PagerPlugin } from '@syncfusion/ej2-vue-grids';
Vue.use(PagerPlugin);
export default {
data () {
return {
}
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
```

Copyright © 2001 -2024 Syncfusion Inc.

</style>
`

Page Size

pageSize value defines the number of records to be displayed per page. The default value for the pageSize is 12.

APP.VUE

```
<template>
  <div id="app">
      <ejs-pager :pageSize='1' :totalRecordsCount='20'> </ejs-pager>
  </div>
</template>
<script>
import Vue from 'vue';
import { PagerPlugin } from '@syncfusion/ej2-vue-grids';
Vue.use(PagerPlugin);
export default {
  data () {
    return {
    }
  }
}
</script>
<style>
 @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pager/pager-cs1" %}

Page Count

pageCount value defines the number of pages to be displayed in the pager component for navigation.

The default value for pageCount is 10 and value will be updated based on totalRecordsCount

and pageSize values.

APP.VUE

```
<template>
  <div id="app">
      <ejs-pager :pageSize='1' :pageCount='3' :totalRecordsCount='20'>
</ejs-pager>
  </div>
</template>
<script>
import Vue from 'vue';
import { PagerPlugin } from '@syncfusion/ej2-vue-grids';
Vue.use(PagerPlugin);
export default {
  data () {
    return {
    }
  }
}
```

Copyright © 2001 -2024 Syncfusion Inc.

```
</script>
<style>
 @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pager/pager-cs2" %}

Run the application

Use the following command to run the application in browser.

`javascript

npm run dev

`

Output will be appears as follows.

APP.VUE

```
<template>
  <div id="app">
      <ejs-pager :pageSize='1' :pageCount='3' :totalRecordsCount='20'>
</ejs-pager>
  </div>
</template>
<script>
import Vue from 'vue';
import { PagerPlugin } from '@syncfusion/ej2-vue-grids';
Vue.use(PagerPlugin);
export default {
  data () {
    return {
    }
  }
}
</script>
<style>
 @import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pager/pager-cs3" %}

Style and appearance in Vue Pager component

To modify the Pager appearance, you need to override the default CSS of Pager. Please find the CSS structure that can be used to modify the Pager appearance. Also, you have an option to create your own custom theme for all the JavaScript controls using our Theme Studio.

Customizing the Pager

Use the below CSS to customize the Pager root element.

`

.e-pager {

background-color: #deecf9;

Copyright © 2001 -2024 Syncfusion Inc.

```
}
```

Customizing the Pager container element

Use the below CSS to customize the pager container element.

```
.e-pager .e-pagercontainer {
background-color: #deecf9;
}
```

Customizing the Pager navigation elements

Customize the pager navigation elements, using the below selector.

```
.e-pager .e-prevpagedisabled,
.e-pager .e-prevpage,
.e-pager .e-nextpage,
.e-pager .e-nextpagedisabled,
.e-pager .e-lastpagedisabled,
.e-pager .e-lastpage,
.e-pager .e-firstpage,
.e-pager .e-firstpagedisabled {
background-color: #deecf9;
}
```

Customizing the Pager page numeric link elements

Use the below CSS to customize the pager current page numeric link elements.

```
.e-pager .e-numericitem {
border-radius: initial;
}
```

Customizing the Pager current page numeric element

Using this CSS, you can customize the pager current page numeric item.

```
.e-pager .e-currentitem {
```

Copyright © 2001 -2024 Syncfusion Inc.

background-color: #0078d7;

}

`

Accessibility in Vue Pager component

Accessibility is achieved in the Pager component through WAI-ARIA standard and keyboard navigations. The Pager features can be effectively accessed through assistive technologies such as screen readers.

WAI-ARIA

WAI-ARIA (Accessibility Initiative – Accessible Rich Internet Applications) defines a way to increase the accessibility of web pages, dynamic content, and user interface components developed with Ajax, HTML, JavaScript, and related technologies. ARIA provides additional semantics to describe the role, state, and functionality of web components.

The following ARIA attributes are used in the Pager:

- pager (data-role)
- aria-selected (attribute)
- aria-owns (attribute)
- aria-label (attribute)

Keyboard navigation

Pager functionalities can be interactive with keyboard shortcuts.

The following keyboard shortcuts are supported by the Pager.

Interaction Keys | Description

Pager||

Alt + J | Focus on the first pager item.

Tab / Shift + Tab | Focus on the next/previous pager item.

Enter / Space | Select the currently focused page.

Right Arrow / PageDown | Navigate to next page.

Left Arrow / PageUp | Navigate to previous page.

Home / End | Navigate to first and last page.

PDF Viewer

Getting Started

Getting Started with Standalone PDF Viewer component

This section explains the steps to create a simple Standalone Vue PDF Viewer and demonstrate its basic usage.

Prerequisites

System requirements for Syncfusion Vue UI components

Setup Vue environment

You can use Vue CLI to setup your Vue applications.

To install Vue CLI, use the following commands.

`bash

npm install -g @vue/cli

npm install -g @vue/cli-init

`

Create a Vue application

Start a new Vue application using the following Vue CLI command.

`bash

vue init webpack-simple quickstart

cd quickstart

npm install

`

Adding Syncfusion PDF Viewer package

All the available Essential JS 2 packages are published in npmjs.com registry.

- To install PDF Viewer component, use the following command.

`bash

npm install @syncfusion/ej2-vue-pdfviewer --save

`

The **--save** will instruct NPM to include the PDF Viewer package inside the dependencies section of the package.json.

- Create a new directory named 'js' within the 'public' directory using the following command:

`bash

mkdir -p public/js

`

- Duplicate the content of the 'ej2-pdfviewer-lib' folder located in './node_modules/@syncfusion/ej2-pdfviewer/dist' to the public directory using the command:

`bash

cp -R ./node_modules/@syncfusion/ej2-pdfviewer/dist/ej2-pdfviewer-lib public/js/ej2-pdfviewer-lib

`

- Ensure that within your 'public' directory, there exists a directory named 'ej2-pdfviewer-lib' containing the assets of the PDF Viewer library.

Copyright © 2001 -2024 Syncfusion Inc.

- Validate that your server has been configured to utilize the Content-Type: application/wasm MIME type. Additional information can be found in the Troubleshooting section.

Registering PDF Viewer component

You can register the Vue PDF Viewer component in your application by using the Vue.use() as in the below.

```ts
import { PdfViewerPlugin } from '@syncfusion/ej2-vue-pdfviewer';

Vue.use(PdfViewerPlugin);
```

Registering PdfViewerPlugin in Vue, will register the PDF Viewer component along with its required child directives globally.

Adding CSS reference

Add the Vue PDF Viewer component's styles as given below in <style> section of the App.vue file.

```
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-dropdowns/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-navigations/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-pdfviewer/styles/material.css";
</style>
```

Adding PDF Viewer component

Add the Vue PDF Viewer by using the <ejs-pdfviewer> selector in <template> section of the App.vue file.

```
<template>
<div id="app">
<ejs-pdfviewer
id="pdfViewer"
:documentPath="documentPath"
:resourceUrl="resourceUrl">
```

Copyright © 2001 -2024 Syncfusion Inc.

</ejs-pdfviewer>

</template>

<script>

import Vue from 'vue';

import { PdfViewerPlugin, Toolbar, Magnification, Navigation, LinkAnnotation,

BookmarkView,ThumbnailView, Print,TextSelection, TextSearch,

Annotation, FormDesigner, FormFields } from '@syncfusion/ej2-vue-pdfviewer';

Vue.use(PdfViewerPlugin);

export default {

name: 'app',

data () {

return {

documentPath:'https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf',

resourceUrl:"https://cdn.syncfusion.com/ej2/23.1.43/dist/ej2-pdfviewer-lib"

};

},

provide: {

PdfViewer: [Toolbar, Magnification, Navigation, LinkAnnotation, BookmarkView, ThumbnailView,

Print, TextSelection, TextSearch, Annotation, FormFields, FormDesigner]

}

}

</script>

`

Run the application

The Vue PDF Viewer application is configured to compile and run the application in a browser. Use the following command to run the application.

`bash

npm run dev

`

Output will be displayed as follows.

APP.VUE

```
<template>
<div id="app">
<ejs-pdfviewer
```

```
id="pdfViewer"
:documentPath="documentPath"
:resourceUrl="resourceUrl">
</ejs-pdfviewer>
</div>
</template>
<script>
import Vue from 'vue';
import { PdfViewerPlugin, Toolbar, Magnification, Navigation,
LinkAnnotation,
BookmarkView, ThumbnailView, Print, TextSelection, TextSearch,
Annotation, FormDesigner, FormFields } from '@syncfusion/ej2-vue-pdfviewer';
Vue.use(PdfViewerPlugin);
export default {
name: 'app',
data () {
return {
documentPath:"https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf",
resourceUrl:"https://cdn.syncfusion.com/ej2/23.1.43/dist/ej2-pdfviewer-lib",
};
},
provide: {
PdfViewer: [ Toolbar, Magnification, Navigation, LinkAnnotation,
BookmarkView, ThumbnailView,
Print, TextSelection, TextSearch, Annotation, FormFields, FormDesigner ]
}
}
</script>
```

{% previewsample "page.domainurl/code-snippet/pdfviewer/getting-started-cs2" %}

View sample in GitHub

You can refer to our Vue PDF Viewer feature tour page for its groundbreaking feature representations. You can also explore our Vue PDF Viewer example to understand how to explains core features of PDF Viewer.

Limitation over Server-Backed PDF Viewer to Standalone PDF Viewer control

When comparing a Standalone PDF Viewer to a Server-Backed PDF Viewer control, it's crucial to understand the limitations that the Standalone PDF Viewer may have in comparison. These limitations are important to consider

PNG Image Support

The Standalone PDF Viewer does not have the capability to utilize PNG format for adding images to handwritten annotations ,custom stamp ,signature and initial form fields. It's important to be aware that only certain image formats, such as JPEG, are compatible for these purposes.

Local File Access

- The Standalone PDF Viewer control does not have the capability to directly access and load local physical files from a user's device. As a result, it is not possible to use a documentPath to load a PDF file directly from a local server within the viewer.
- The Standalone PDF Viewer allows users to export annotations and form fields from the viewer, it's important to be aware that the viewer does not support the direct import of annotations

Copyright © 2001 -2024 Syncfusion Inc.

and form fields from a locally specified file path. In other words, you can extract annotations and form fields from the viewer, but you cannot reintroduce them into the viewer from external sources by specifying a file path located on your local device.

Note: These limitations are temporary and are expected to be addressed in the near future.

Getting Started with the Vue Pdfviewer Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using Vue-CLI and integrating the Syncfusion Vue Pdfviewer component

Prerequisites

System requirements for Syncfusion Vue UI components

Setting up the Vue 2 project

To generate a Vue 2 project using Vue-CLI, use the vue create command. Follow these steps to install Vue CLI and create a new project:

`bash

npm install -g @vue/cli

vue create quickstart

cd quickstart

`

or

`bash

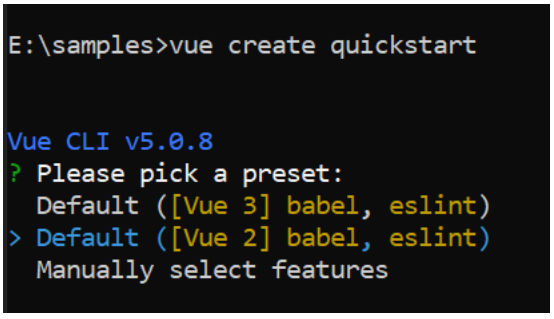
yarn global add @vue/cli

vue create quickstart

cd quickstart

`

When creating a new project, choose the option Default ([Vue 2] babel, eslint) from the menu.



Once the quickstart project is set up with default settings, proceed to add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion packages are available at npmjs.com. To use Vue components, install the required npm package.

This article uses the Vue Pdfviewer component as an example. Install the @syncfusion/ej2-vue-pdfviewer package by running the following command:

`bash

npm install @syncfusion/ej2-vue-pdfviewer --save

`

or

`bash

yarn add @syncfusion/ej2-vue-pdfviewer

`

The **--save** will instruct NPM to include the PDF Viewer package inside the dependencies section of the package.json.

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, the Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the Pdfviewer component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-dropdowns/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-navigations/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-pdfviewer/styles/material.css";
</style>
```

Add Syncfusion Vue component

Follow the below steps to add the Vue Pdfviewer component:

1\. First, import and register the Pdfviewer component in the script section of the **src/App.vue** file

~/SRC/APP.VUE

```
<script>
import { PdfViewerComponent, Toolbar, Magnification, Navigation,
LinkAnnotation,
BookmarkView, ThumbnailView, Print, TextSelection, TextSearch,
Annotation, FormDesigner, FormFields } from '@syncfusion/ej2-vue-pdfviewer';
export default {
components: {
'ejs-pdfviewer': PdfViewerComponent
}
```

Copyright © 2001 -2024 Syncfusion Inc.

```
}
</script>
```

2\. In the template section, define the Pdfviewer component with documentPath and serviceUrl property.

~/SRC/APP.VUE

```
<template>
<div id="app">
<ejs-pdfviewer
id="pdfViewer"
:serviceUrl="serviceUrl"
:documentPath="documentPath">
</ejs-pdfviewer>
</div>
</template>
```

3\. Declare the value for the documentPath and serviceUrl properties in the script section.

~/SRC/APP.VUE

```
<script>
data () {
return {
serviceUrl:"https://services.syncfusion.com/vue/production/api/pdfviewer",
documentPath:"https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf"
};
}
</script>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

~/SRC/APP.VUE

```
<template>
  <div id="app">
    <ejs-pdfviewer
      id="pdfViewer"
      :serviceUrl="serviceUrl"
      :documentPath="documentPath">
    </ejs-pdfviewer>
  </div>
</template>
<script>
import { PdfViewerComponent, Toolbar, Magnification, Navigation,
LinkAnnotation,
         BookmarkView, ThumbnailView, Print, TextSelection, TextSearch,
         Annotation, FormDesigner, FormFields } from '@syncfusion/ej2-vue-
pdfviewer';
export default {
  components: {
    'ejs-pdfviewer': PdfViewerComponent
  },
  name: 'app',
  data () {
```

Copyright © 2001 -2024 Syncfusion Inc.

```
    return {

serviceUrl:"https://services.syncfusion.com/vue/production/api/pdfviewer",
      documentPath:"https://cdn.syncfusion.com/content/pdf/pdf-
succinctly.pdf",
    };
  },
  provide: {
    PdfViewer: [ Toolbar, Magnification, Navigation, LinkAnnotation,
BookmarkView, ThumbnailView,
                 Print, TextSelection, TextSearch, Annotation, FormFields,
FormDesigner ]
  }
}
</script>
<style>
  @import '../node_modules/@syncfusion/ej2-base/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-dropdowns/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-navigations/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-
splitbuttons/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-vue-
pdfviewer/styles/material.css';
  #pdfViewer {
    height: 640px;
  }
</style>
```

Run the project

To run the project, use the following command:

`bash

npm run serve

`

or

`bash

yarn run serve

`

{% previewsample "page.domainurl/code-snippet/pdfviewer/getting-started-cs1" %}

For PDF Viewer serviceUrl creation, follow the steps provided in the link

How to run the PDF Viewer web service

1.Download the sample from the Web service sample in GitHub link. 2.Navigate to the ASP.NET Core folder and open it in the command prompt. 3.Use the below command to restore the required packages.

Copyright © 2001 -2024 Syncfusion Inc.

`

dotnet restore

`

4.Use the below command to run the web service.

`

dotnet run

`

5.You can see that the PDF Viewer server instance runs in the local host with the port number localhost:5001 and navigate to the PDF Viewer Web control localhost:5001/pdfviewer which returns the default get response method. We can bind the link to the serviceUrl property of PDF Viewer as below.

`js

export default {

name: 'app',

data () {

return {

serviceUrl:"https://localhost:5001/pdfviewer",

documentPath:"PDF_Succinctly.pdf"

};

}}

`

Note: When configuring the server-backed PDF viewer, it's essential to understand that there is no need to include the pdfium.js and pdfium.wasm files. Unlike the standalone PDF viewer, which relies on these files for local rendering, the server-backed PDF viewer fetches and renders PDFs directly from the server. Consequently, you can exclude the copy command for deployment process, as they are not required to load and display PDFs in this context.

View sample in GitHub.

You can refer to our Vue PDF Viewer feature tour page for its groundbreaking feature representations. You can also explore our Vue PDF Viewer example to understand how to explains core features of PDF Viewer.

Getting Started with Syncfusion PDF Viewer Component in Vue 3

This article provides a step-by-step guide for setting up a Vite project with a JavaScript environment and integrating the Syncfusion Vue PDF Viewer component using the Composition API / Options API.

The Composition API is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

Copyright © 2001 -2024 Syncfusion Inc.

The Options API is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

Prerequisites

System requirements for Syncfusion Vue UI components

Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using Vite. To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

`bash

npm create vite@latest

`

or

`bash

yarn create vite

`

Using one of the above commands will lead you to set up additional configurations for the project as below:

1.Define the project name: We can specify the name of the project directly. Let's specify the name of the project as my-project for this article.

`bash

? Project name: » my-project

`

2.Select Vue as the framework. It will create a Vue 3 project.

`bash

? Select a framework: » - Use arrow-keys. Return to submit.

Vanilla

Vue

React

Preact

Lit

Svelte

Others

`

3.Choose JavaScript as the framework variant to build this Vite project using JavaScript and Vue.

`bash

? Select a variant: » - Use arrow-keys. Return to submit.

JavaScript

TypeScript

Customize with create-vue ↗

Nuxt ↗

`

4.Upon completing the aforementioned steps to create the my-project, run the following command to install its dependencies:

`bash

cd my-project

npm install

`

or

`bash

cd my-project

yarn install

`

Now that my-project is ready to run with default settings, let's add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion Vue component packages are available at npmjs.com. To use Syncfusion Vue components in the project, install the corresponding npm package.

This article uses the Vue PDF Viewer component as an example. To use the Vue PDF Viewer component in the project, the @syncfusion/ej2-vue-pdfviewer package needs to be installed using the following command:

`bash

npm install @syncfusion/ej2-vue-pdfviewer --save

`

or

`bash

yarn add @syncfusion/ej2-vue-pdfviewer

`

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

Copyright © 2001 -2024 Syncfusion Inc.

In this article, Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the PDF Viewer component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-dropdowns/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-navigations/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import '../node_modules/@syncfusion/ej2-vue-pdfviewer/styles/material.css';
</style>
```

Add Syncfusion Vue component

Follow the below steps to add the Vue PDF Viewer component using Composition API or Options API:

1.First, import and register the PDF Viewer component and its child directives in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { PdfViewerComponent as EjsPdfviewer, Toolbar, Magnification,
Navigation, LinkAnnotation,
BookmarkView, ThumbnailView, Print, TextSelection, TextSearch,
Annotation, FormDesigner, FormFields } from '@syncfusion/ej2-vue-pdfviewer';
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { PdfViewerComponent, Toolbar, Magnification, Navigation,
LinkAnnotation,
BookmarkView,ThumbnailView, Print,TextSelection, TextSearch,
Annotation, FormDesigner, FormFields } from '@syncfusion/ej2-vue-pdfviewer';
}
</script>
```

2. Add the component definition in template section.

~/SRC/APP.VUE

```
<template>
<div id="app">
<ejs-pdfviewer
id="pdfViewer"
:serviceUrl="serviceUrl"
```

Copyright © 2001 -2024 Syncfusion Inc.

```
:documentPath="documentPath"
:style="{ height: '800px', width: '1200px' }">
</ejs-pdfviewer>
</div>
</template>
```

3. Declare the bound properties serviceUrl and documentPath in the script section.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { provide } from 'vue';
import { PdfViewerComponent as EjsPdfviewer, Toolbar, Magnification,
Navigation, LinkAnnotation, BookmarkView,
ThumbnailView, Print, TextSelection, TextSearch, Annotation, FormDesigner,
FormFields } from '@syncfusion/ej2-vue-pdfviewer';
const serviceUrl =
'https://services.syncfusion.com/vue/production/api/pdfviewer';
const documentPath = 'https://cdn.syncfusion.com/content/pdf/pdf-
succinctly.pdf';
const pdfViewer = null;
provide('PdfViewer', [ Toolbar, Magnification, Navigation, LinkAnnotation,
BookmarkView, ThumbnailView,
Print, TextSelection, TextSearch, Annotation, FormDesigner, FormFields]);
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { PdfViewerComponent, Toolbar, Magnification, Navigation,
LinkAnnotation,
BookmarkView,ThumbnailView, Print,TextSelection, TextSearch,
Annotation, FormDesigner, FormFields } from '@syncfusion/ej2-vue-pdfviewer';
export default {
name: 'App',
components: {
"ejs-pdfviewer": PdfViewerComponent
},
data () {
return {
serviceUrl:"https://services.syncfusion.com/vue/production/api/pdfviewer",
documentPath:"https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf"
};
},
provide: {
PdfViewer: [ Toolbar, Magnification, Navigation, LinkAnnotation,
BookmarkView, ThumbnailView,
Print, TextSelection, TextSearch, Annotation, FormDesigner, FormFields ]}
}
</script>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSITION API (~/SRC/APP.VUE)

Copyright © 2001 -2024 Syncfusion Inc.

```
<template>
<ejs-pdfviewer
ref="pdfViewer"
:serviceUrl="serviceUrl"
:documentPath="documentPath"

@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import '../node_modules/@syncfusion/ej2-vue-pdfviewer/styles/material.css';
</style>
```

Run the project

To run the project, use the following command:

`bash

npm run dev

`

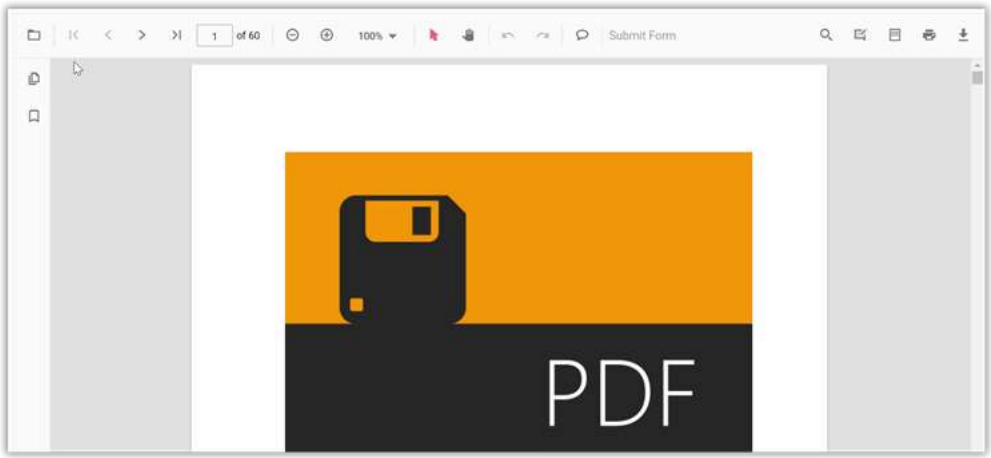
or

`bash

yarn run dev

`

The output will appear as follows:



View sample in GitHub.

For migrating from Vue 2 to Vue 3, refer to the migration documentation.

Feature module in Vue Pdfviewer component

The PDF Viewer features are segregated into individual feature-wise modules to enable selectively referencing in the application. The required modules should be injected to extend its functionality. The following are the selective modules of PDF Viewer that can be included as required:

The available PdfViewer modules are:

- **Toolbar**:- Built-in toolbar for better user interaction.
- **Magnification**:- Perform zooming operation for better viewing experience.
- **Navigation**:- Easy navigation across the PDF pages.
- **LinkAnnotation**:- Easy navigation within and outside of the PDF document.
- **ThumbnailView**:- Easy navigation with in the PDF document.
- **BookmarkView**:- Easy navigation based on the bookmark content of the PDF document.
- **TextSelection**:- Select and copy text from a PDF file.
- **TextSearch**:- Search a text easily across the PDF document.
- **Print**:- Print the entire document or a specific page directly from the browser.
- **Annotation**:- Annotations can be added or edited in the PDF document.
- **FormFields**:- Preserve the form fields in the PDF document.
- **FormDesigner**:- Form fields can be added or edited in the PDF document.

In addition to injecting the required modules in your application, enable corresponding properties to extend the functionality for a PDF Viewer instance.

Refer to the following table.

| Module | Property to enable the functionality for a PDF Viewer instance |

|---|---|

|Toolbar|<ejs-pdfviewer :enableToolbar="true" ></ejs-pdfviewer>|

|Magnification|<ejs-pdfviewer :enableMagnification="true" ></ejs-pdfviewer>|

|Navigation|<ejs-pdfviewer :enableNavigation="true" ></ejs-pdfviewer>|

|LinkAnnotation|<ejs-pdfviewer :enableHyperlink="true" ></ejs-pdfviewer>|

|ThumbnailView|<ejs-pdfviewer :enableThumbnail="true" ></ejs-pdfviewer>|

|BookmarkView|<ejs-pdfviewer :enableBookmark="true" ></ejs-pdfviewer>|

|TextSelection|<ejs-pdfviewer :enableTextSelection="true" ></ejs-pdfviewer>|

|TextSearch|<ejs-pdfviewer :enableTextSearch="true" ></ejs-pdfviewer>|

|Print|<ejs-pdfviewer :enablePrint="true" ></ejs-pdfviewer>|

|Annotation|<ejs-pdfviewer :enableAnnotation="true" ></ejs-pdfviewer>|

|FormFields|<ejs-pdfviewer :enableFormFields="true" ></ejs-pdfviewer>|

|FormDesigner|<ejs-pdfviewer :enableFormDesigner="true" ></ejs-pdfviewer>|

Open PDF files

You might need to open and view the PDF files from various location. In this section, you can find the information about how to open PDF files from URL, database and as base64 string.

Opening a PDF from URL

If you have your PDF files in the web, you can open it in the viewer using URL.

Step 1: Create a Simple PDF Viewer Sample in Vue

Start by following the steps provided in this link to create a simple PDF viewer sample in Vue. This will give you a basic setup of the PDF viewer component.

Step 2: Modify the `PdfViewerController.cs` File in the Web Service Project

1. Create a web service project in .NET Core 3.0 or above. You can refer to this link for instructions on how to create a web service project.
2. Open the `PdfViewerController.cs` file in your web service project.
3. Modify the `Load()` method to open it in the viewer using URL

```csharp
public IActionResult Load([FromBody] Dictionary<string, string> jsonData)
{
// Initialize the PDF viewer object with memory cache object
PdfRenderer pdfviewer = new PdfRenderer(_cache);
MemoryStream stream = new MemoryStream();
object jsonResult = new object();
if (jsonObject != null && jsonObject.ContainsKey("document"))
{
if (bool.Parse(jsonObject["isFileName"]))
{
string documentPath = GetDocumentPath(jsonData["document"]);
if (!string.IsNullOrEmpty(documentPath))
{
byte[] bytes = System.IO.File.ReadAllBytes(documentPath);
stream = new MemoryStream(bytes);
}
```

```
else
{
string fileName = jsonData["document"].Split(new string[] { "://" }, StringSplitOptions.None)[0];
if (fileName == "http" || fileName == "https")
{
WebClient WebClient = new WebClient();
byte[] pdfDoc = WebClient.DownloadData(jsonData["document"]);
stream = new MemoryStream(pdfDoc);
}
else
{
return this.Content(jsonData["document"] + " is not found");
}
}
}
else
{
byte[] bytes = Convert.FromBase64String(jsonObject["document"]);
stream = new MemoryStream(bytes);
}
}
jsonResult = pdfviewer.Load(stream, jsonObject);
return Content(JsonConvert.SerializeObject(jsonResult));
}
```

Step 3: Set the PDF Viewer Properties in React PDF viewer component

Modify the `serviceUrl` property of the PDF viewer component with the accurate URL of your web service project, replacing `https://localhost:44396/pdfviewer` with the actual URL of your server.Modify the documentPath with the correct PDF Document URL want to load.

```
<template>
<div id="app">
<ejs-pdfviewer
id="pdfViewer"
```

```
:serviceUrl="serviceUrl"
:documentPath="documentPath">
</ejs-pdfviewer>
</div>
</template>
<script>
import Vue from 'vue';
import { PdfViewerPlugin, Toolbar, Magnification, Navigation, LinkAnnotation, BookmarkView,
ThumbnailView, Print, TextSelection, TextSearch, Annotation, FormFields, FormDesigner } from
'@syncfusion/ej2-vue-pdfviewer';
Vue.use(PdfViewerPlugin);
export default {
name: 'app',
data() {
return {
// Replace the "localhost:44396" with the actual URL of your server
serviceUrl: "https://localhost:44396/pdfviewer",
// Replace  correct PDF Document URL want to load
documentPath: "https://cdn.syncfusion.com/content/PDFViewer/flutter-succinctly.pdf"
};
},
provide: {
PdfViewer: [ Toolbar, Magnification, Navigation, LinkAnnotation, BookmarkView, ThumbnailView,
Print, TextSelection, TextSearch, Annotation, FormFields, FormDesigner]
}
}
</script>
`
```

View sample in GitHub

Opening a PDF from base64 data

The following code steps how the PDF file can be loaded in PDF Viewer as base64 string.

Step 1: Create a Simple PDF Viewer Sample in Angular

Start by following the steps provided in this link to create a simple PDF viewer sample in Angular. This will give you a basic setup of the PDF viewer component.

Copyright © 2001 -2024 Syncfusion Inc.

Step 2: Use the following code snippet to load the PDF document using a base64 string.

```
<template>
<div id="app">
<button v-on:click="load">LoadDocumentFromBase64</button>
<ejs-pdfviewer
id="pdfViewer"
:serviceUrl="serviceUrl"
:documentPath="documentPath"

</ejs-pdfviewer>
</div>
</template>
<script>
import Vue from 'vue';
import { PdfViewerPlugin, Toolbar, Magnification, Navigation, LinkAnnotation, BookmarkView,
ThumbnailView, Print, TextSelection, TextSearch, Annotation, FormFields, FormDesigner } from
'@syncfusion/ej2-vue-pdfviewer';
Vue.use(PdfViewerPlugin);
export default {
name: 'app',
data() {
return {
// Replace the "localhost:44396" with the actual URL of your server
serviceUrl: "https://localhost:44396/pdfviewer"
};
},
provide: {
PdfViewer: [ Toolbar, Magnification, Navigation, LinkAnnotation, BookmarkView, ThumbnailView,
Print, TextSelection, TextSearch, Annotation, FormFields, FormDesigner ]
},
methods: {
// Event triggers on the Export FDF button click.
```

Copyright © 2001 -2024 Syncfusion Inc.

load: function (event) {

var viewer = document.getElementById('pdfViewer').ej2_instances[0];

viewer.load('data:application/pdfbase64,'+ AddBase64String, null);

}

}

}

</script>

`

View sample in GitHub

Opening a PDF from database

To load a PDF file from SQL Server database in a PDF Viewer, you can follow the steps below

Step 1: Create a Simple PDF Viewer Sample in Vue

Start by following the steps provided in this link to create a simple PDF viewer sample in Vue. This will give you a basic setup of the PDF viewer component.

Step 2: Modify the PdfViewerController.cs File in the Web Service Project

1. Create a web service project in .NET Core 3.0 or above. You can refer to this link for instructions on how to create a web service project.
2. Open the PdfViewerController.cs file in your web service project.
3. Import the required namespaces at the top of the file:

`csharp

using System.IO;

using System.Data.SqlClient;

`

4. Add the following private fields and constructor parameters to the PdfViewerController class, In the constructor, assign the values from the configuration to the corresponding fields

`csharp

private IConfiguration _configuration;

public readonly string _connectionString;

public PdfViewerController(IWebHostEnvironment hostingEnvironment, IMemoryCache cache, IConfiguration configuration)

{

_hostingEnvironment = hostingEnvironment;

_cache = cache;

Copyright © 2001 -2024 Syncfusion Inc.

```
_configuration = configuration;
connectionString = configuration.GetValue<string>("ConnectionString");
}
`
```

5. Modify the Load() method to open it in the viewer using URL

```
`csharp
public IActionResult Load([FromBody] Dictionary<string, string> jsonData)
{
// Initialize the PDF viewer object with memory cache object
PdfRenderer pdfviewer = new PdfRenderer(_cache);
MemoryStream stream = new MemoryStream();
object jsonResult = new object();
if (jsonObject != null && jsonObject.ContainsKey("document"))
{
if (bool.Parse(jsonObject["isFileName"]))
{
string documentPath = GetDocumentPath(jsonData["document"]);
if (!string.IsNullOrEmpty(documentPath))
{
byte[] bytes = System.IO.File.ReadAllBytes(documentPath);
stream = new MemoryStream(bytes);
}
string documentName = jsonObject["document"];
string connectionString = _connectionString;
System.Data.SqlClient.SqlConnection connection = new
System.Data.SqlClient.SqlConnection(connectionString);
//Searches for the PDF document from the database
string query = "SELECT FileData FROM Table WHERE FileName = '" + documentName + "'";
System.Data.SqlClient.SqlCommand command = new System.Data.SqlClient.SqlCommand(query,
connection);
connection.Open();
using (SqlDataReader reader = command.ExecuteReader())
{
```

```
if (reader.Read())
{
byte[] byteArray = (byte[])reader["FileData"];
stream = new MemoryStream(byteArray);
}
}
}
else
{
byte[] bytes = Convert.FromBase64String(jsonObject["document"]);
stream = new MemoryStream(bytes);
}
}
jsonResult = pdfviewer.Load(stream, jsonObject);
return Content(JsonConvert.SerializeObject(jsonResult));
}
```

6. Open the appsettings.json file in your web service project, Add the following lines below the existing “AllowedHosts” configuration

```json
{
"Logging": {
"LogLevel": {
"Default": "Information",
"Microsoft.AspNetCore": "Warning"
}
},
"AllowedHosts": "*",
"ConnectionString": "Your connection string for SQL server"
}
```

Note: Replace **Your Connection string from SQL server** with the actual connection string for your SQL Server database

Copyright © 2001 -2024 Syncfusion Inc.

Note: The **System.Data.SqlClient** package must be installed in your application to use the previous code example. You need to modify the connectionString variable in the previous code example as per the connection string of your database.

View sample in GitHub

Saving PDF file

After editing the PDF file with various annotation tools, you will need to save the updated PDF to the server, database, or local file system.

Save PDF file to Server

Need to save the modified PDF back to a server. To achieve this, proceed with the following steps

Step 1: Create a Simple PDF Viewer Sample in Vue

Start by following the steps provided in this link to create a simple PDF viewer sample in Vue. This will give you a basic setup of the PDF viewer component.

Step 2: Modify the PdfViewerController.cs File in the Web Service Project

1. Create a web service project in .NET Core 3.0 or above. You can refer to this link for instructions on how to create a web service project.
2. Open the PdfViewerController.cs file in your web service project.
3. Modify the Download() method to open it in the viewer using URL

```csharp
public IActionResult Download([FromBody] Dictionary<string, string> jsonObject)
{
//Initialize the PDF Viewer object with memory cache object
PdfRenderer pdfviewer = new PdfRenderer(_cache);
string documentBase = pdfviewer.GetDocumentAsBase64(jsonObject);
MemoryStream stream = new MemoryStream();
string documentName = jsonObject["document"];
string result = Path.GetFileNameWithoutExtension(documentName);
string fileName = result + "_downloaded.pdf";
// Save the file on the server
string serverFilePath = @"Path to where you need to save your file in the server";
string filePath = Path.Combine(serverFilePath, fileName);
using (FileStream fileStream = new FileStream(filePath, FileMode.Create))
{
//Saving the new file in root path of application
stream.CopyTo(fileStream);
fileStream.Close();
```

Copyright © 2001 -2024 Syncfusion Inc.

```
}
return Content(documentBase);
}
```

Step 3: Set the PDF Viewer Properties in React PDF viewer component

Modify the `serviceUrl` property of the PDF viewer component with the accurate URL of your web service project, replacing `https://localhost:44396/pdfviewer` with the actual URL of your server.Modify the documentPath with the correct PDF Document URL want to load.

```
<template>
<div id="app">
<ejs-pdfviewer
id="pdfViewer"
:serviceUrl="serviceUrl"
:documentPath="documentPath">
</ejs-pdfviewer>
</div>
</template>
<script>
import Vue from 'vue';
import { PdfViewerPlugin, Toolbar, Magnification, Navigation, LinkAnnotation, BookmarkView,
ThumbnailView, Print, TextSelection, TextSearch, Annotation, FormFields, FormDesigner } from
'@syncfusion/ej2-vue-pdfviewer';
Vue.use(PdfViewerPlugin);
export default {
name: 'app',
data() {
return {
// Replace the "localhost:44396" with the actual URL of your server
serviceUrl: "https://localhost:44396/pdfviewer",
documentPath: "https://cdn.syncfusion.com/content/PDFViewer/flutter-succinctly.pdf"
};
},
provide: {
```

```
PdfViewer: [ Toolbar, Magnification, Navigation, LinkAnnotation, BookmarkView, ThumbnailView,
Print, TextSelection, TextSearch, Annotation, FormFields, FormDesigner]
}
}
</script>
```

[View sample in GitHub]

Download PDF file as a copy

In the built-in toolbar, you have an option to download the updated PDF to the local file system, you can use it to download the PDF file.

```
<template>
<div id="app">
<button v-on:click="downloadClicked">Download</button>
<ejs-pdfviewer
id="pdfViewer"
:serviceUrl="serviceUrl"
:documentPath="documentPath">
</ejs-pdfviewer>
</div>
</template>
<script>
import Vue from 'vue';
import { PdfViewerPlugin, Toolbar, Magnification, Navigation, LinkAnnotation, BookmarkView,
ThumbnailView, Print, TextSelection, TextSearch, Annotation, FormFields, FormDesigner } from
'@syncfusion/ej2-vue-pdfviewer';
Vue.use(PdfViewerPlugin);
export default {
name: 'app',
data() {
return {
// Replace the "localhost:44396" with the actual URL of your server
serviceUrl: "https://localhost:44396/pdfviewer",
// Replace PDF_Succinctly.pdf with the actual document name that you want to load
```

```
documentPath:"PDF_Succinctly.pdf"
};
},
provide: {
PdfViewer: [ Toolbar, Magnification, Navigation, LinkAnnotation, BookmarkView, ThumbnailView,
Print, TextSelection, TextSearch, Annotation, FormFields, FormDesigner ]
},
methods: {
downloadClicked: function (args) {
var viewer = document.getElementById('pdfViewer').ej2_instances[0];
viewer.download();
},
}
}
</script>
`
```

Save PDF file to Database

If you have plenty of PDF files stored in database and you want to save the updated PDF file back to the database, use the following code example.

Step 1: Create a Simple PDF Viewer Sample in Vue

Start by following the steps provided in this link to create a simple PDF viewer sample in Vue. This will give you a basic setup of the PDF viewer component.

Step 2: Modify the `PdfViewerController.cs` File in the Web Service Project

1. Create a web service project in .NET Core 3.0 or above. You can refer to this link for instructions on how to create a web service project.
2. Open the `PdfViewerController.cs` file in your web service project.
3. Import the required namespaces at the top of the file:

```
`csharp
using System.IO;
using System.Data.SqlClient;
`
```

4. Add the following private fields and constructor parameters to the `PdfViewerController` class, In the constructor, assign the values from the configuration to the corresponding fields

Copyright © 2001 -2024 Syncfusion Inc.

`csharp

private IConfiguration _configuration;

public readonly string _connectionString;

public PdfViewerController(IWebHostEnvironment hostingEnvironment, IMemoryCache cache, IConfiguration configuration)

{

_hostingEnvironment = hostingEnvironment;

_cache = cache;

_configuration = configuration;

connectionString = configuration.GetValue<string>("ConnectionString");

}

`

5. Modify the Download() method to open it in the viewer using URL

`csharp

[HttpPost("Download")]

[Microsoft.AspNetCore.Cors.EnableCors("MyPolicy")]

[Route("[controller]/Download")]

//Post action for downloading the PDF documents

public async Task<IActionResult> Download([FromBody] Dictionary<string, string> jsonObject)

{

//Initialize the PDF Viewer object with memory cache object

PdfRenderer pdfviewer = new PdfRenderer(_cache);

string documentBase = pdfviewer.GetDocumentAsBase64(jsonObject);

byte[] documentBytes = Convert.FromBase64String(documentBase.Split(",")[1]);

string documentId = jsonObject["documentId"];

string result = Path.GetFileNameWithoutExtension(documentId);

string fileName = result + "_downloaded.pdf";

string connectionString = _connectionString;

using (SqlConnection connection = new SqlConnection(connectionString))

{

connection.Open();

using (SqlCommand cmd = new SqlCommand("INSERT INTO Table (FileName, fileData) VALUES (@FileName, @fileData)", connection))

```
{
cmd.Parameters.AddWithValue("@FileName", fileName);
cmd.Parameters.AddWithValue("@fileData", documentBytes);
cmd.ExecuteNonQuery();
}
connection.Close();
}
return Content(documentBase);
}
```

6. Open the appsettings.json file in your web service project, Add the following lines below the existing “AllowedHosts” configuration

```json
{
"Logging": {
"LogLevel": {
"Default": "Information",
"Microsoft.AspNetCore": "Warning"
}
},
"AllowedHosts": "*",
"ConnectionString": "Your connection string for SQL server"
}
```

Note: Replace **Your Connection string from SQL server** with the actual connection string for your SQL Server database

Note: The **System.Data.SqlClient** package must be installed in your application to use the previous code example. You need to modify the connectionString variable in the previous code example as per the connection string of your database.

View sample in GitHub

Accessibility in Syncfusion Vue PDF Viewer components

The PDF Viewer component followed the accessibility guidelines and standards, including ADA, Section 508, WCAG 2.2 standards, and WCAG roles that are commonly used to evaluate accessibility.

The accessibility compliance for the PDF Viewer component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| WCAG 2.2 Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Section 508 Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Screen Reader Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Right-To-Left Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Color Contrast | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Mobile Device Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/intermediate.png" alt="Intermediate"> |

| Keyboard Navigation Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Accessibility Checker Validation | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Axe-core Accessibility Validation | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> - All features of the component meet the requirement.

<img src="https://cdn.syncfusion.com/content/images/landing-page/intermediate.png" alt="Intermediate"> - Some features of the component do not meet the requirement.

<img src="https://cdn.syncfusion.com/content/images/landing-page/no.png" alt="No"> - The component does not meet the requirement.

WAI-ARIA attributes

WAI-ARIA (Accessibility Initiative – Accessible Rich Internet Applications) defines a way to increase the accessibility of web pages, dynamic content, and user interface components developed with Ajax, HTML, JavaScript,and related technologies. ARIA provides additional semantics to describe the role, state, and functionality of web components. The following ARIA attributes are used in the PDF Viewer component:

| Attributes | Purpose |

| --- | --- |

| aria-disabled| Indicates whether the PDF Viewer component is in a disabled state or not.|

| aria-expanded| Indicates whether the suggestion list has expanded or not. |

| aria-readonly | Indicates the readonly state of the PDF Viewer element. |

| aria-haspopup | Indicates whether the PDF Viewer input element has a suggestion list or not. |

| aria-label | Indicates the breadcrumb item text. |

| aria-labelledby | Provides a label for the PDF Viewer. Typically, the "aria-labelledby" attribute will contain the id of the element used as the PDF Viewer's title. |

| aria-describedby | This attribute points to the PDF Viewer element describing the one it's set on. |

| aria-orientation | Indicates whether the PDF Viewer element is oriented horizontally or vertically. |

| aria-valuetext | Returns the current text of the PDF Viewer. |

| aria-valuemax | Indicates the Maximum value of the PDF Viewer. |

| aria-valuemin | Indicates the Minimum value of the PDF Viewer. |

| aria-valuenow | Indicates the current value of the PDF Viewer. |

| aria-controls | Attribute is set to the button and it points to the corresponding content. |

Keyboard interaction

The PDF Viewer component followed the keyboard interaction guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Message component.

| **Press (Windows)** |**Press (Macintosh)** | **To do this** |

| --- | --- | --- |

|||**Shortcuts for page navigation**|

| Home | Function + Left arrow |Navigate to the first page |

| End |Function + Right arrow |Navigate to the last page |

|Up Arrow |Up Arrow |Navigate to the previous page|

| Down Arrow | Down Arrow | Navigate to the next page |

|||**Shortcuts for Zooming**|

|CONTROL + = |COMMAND + = | Perform zoom-in operation |

| CONTROL + - | COMMAND + - | Perform zoom-out operation |

|CONTROL + 0 |COMMAND + 0 | Retain the zoom level to 1 |

|||**Shortcut for Text Search**|

Ensuring accessibility

The PDF Viewer component's accessibility levels are ensured through an accessibility-checker and axe-core software tools during automated testing.

The accessibility compliance of the PDF Viewer component is shown in the following sample. Open the sample in a new window to evaluate the accessibility of the PDF Viewer component with accessibility tools.

{% previewsample "https://ej2.syncfusion.com/accessibility/pdf-viewer.html" %}

- Accessibility in Syncfusion Vue components

Toolbar in Vue Pdfviewer component

The PDF Viewer comes with a powerful built-in toolbar to execute important actions such as page navigation, text search,view mode,download,print,bookmark, and thumbnails.

The following table shows built-in toolbar items and its actions:-

| Option | Description |

|---|---|

| OpenOption | This option provides an action to load the PDF documents to the PDF Viewer.|

| PageNavigationTool | This option provides an action to navigate the pages in the PDF Viewer. It contains GoToFirstPage,GoToLastPage,GotoPage,GoToNext, and GoToLast tools.|

| MagnificationTool |This option provides an action to magnify the pages either with predefined or user defined zoom factors in the PDF Viewer. Contains ZoomIn, ZoomOut, Zoom, FitPage and FitWidth tools|

| PanTool | This option provides an action for panning the pages in the PDF Viewer.|

Copyright © 2001 -2024 Syncfusion Inc.

| SelectionTool | This option provides an action to enable/disable the text selection in the PDF Viewer.|

| SearchOption | This option provides an action to search a word in the PDF documents.|

| PrintOption | This option provides an action to print the PDF document being loaded in the PDF Viewer.|

| DownloadOption |This Download option provides an action to download the PDF document that has been loaded in the PDF Viewer.|

| UndoRedoTool | This tool provides options to undo and redo the annotation actions performed in the PDF Viewer.|

| AnnotationEditTool | This tool provides options to enable or disable the edit mode of annotation in the PDF Viewer.|

| FormDesignerEditTool | This tool provides options to enable or disable the edit mode of form fields in the PDF Viewer.|

Show/Hide the default toolbar

The PDF Viewer has an option to show or hide the complete default toolbar. You can achieve this by using following two ways.,

- **Show/Hide toolbar using enableToolbar API as in the following code snippet**

APP.VUE

```
<template>
<div id="app">
<ejs-pdfviewer
id="pdfViewer"
:documentPath="documentPath"
:enableToolbar="false"
:resourceUrl="resourceUrl">
</ejs-pdfviewer>
</div>
</template>
<script>
import Vue from 'vue';
import { PdfViewerPlugin, Toolbar, Magnification, Navigation,
LinkAnnotation,
BookmarkView, ThumbnailView, Print, TextSelection, TextSearch,
Annotation, FormDesigner, FormFields } from '@syncfusion/ej2-vue-pdfviewer';
Vue.use(PdfViewerPlugin);
export default {
name: 'app',
data () {
return {
documentPath:"https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf",
resourceUrl:"https://cdn.syncfusion.com/ej2/23.1.43/dist/ej2-pdfviewer-lib",
};
},
provide: {
PdfViewer: [ Toolbar, Magnification, Navigation, LinkAnnotation,
BookmarkView, Annotation,
ThumbnailView, Print, TextSelection, TextSearch, FormFields, FormDesigner ]}
}
```

Copyright © 2001 -2024 Syncfusion Inc.

```
</script>
```

Note: To set up the **server-backed PDF Viewer** in the app.vue file, include the following serviceUrl:

serviceUrl: “https://services.syncfusion.com/vue/production/api/pdfviewer”

Within the template, configure the PDF Viewer by adding the :serviceUrl=“serviceUrl” attribute inside the element.

{% previewsample "page.domainurl/code-snippet/pdfviewer/toolbar/toolbar-hide-cs1" %}

- **Show/Hide toolbar using showToolbar as in the following code snippet**

APP.VUE

```
<template>
<div id="app">
<button v-on:click="showToolbarClicked">showToolbarClicked</button>
<ejs-pdfviewer
id="pdfViewer"
ref="pdfviewer"
:documentPath="documentPath"
:documentLoad="documentLoad"
:resourceUrl="resourceUrl">
</ejs-pdfviewer>
</div>
</template>
<script>
import Vue from 'vue';
import { PdfViewerPlugin, Toolbar, Magnification, Navigation,
LinkAnnotation,
BookmarkView, ThumbnailView, Print, TextSelection, TextSearch,
Annotation, FormDesigner, FormFields } from '@syncfusion/ej2-vue-pdfviewer';
Vue.use(PdfViewerPlugin);
var viewer;
export default {
name: 'app',
data () {
return {
documentPath:"https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf",
resourceUrl:"https://cdn.syncfusion.com/ej2/23.1.43/dist/ej2-pdfviewer-lib"
};
},
provide: {
PdfViewer: [ Toolbar, Magnification, Navigation, LinkAnnotation, Annotation,
BookmarkView,
ThumbnailView, Print, TextSelection, TextSearch, FormFields, FormDesigner
]},
methods: {
showToolbarClicked: function (args) {
viewer.toolbar.showToolbar(false);
},
documentLoad: function (args) {
viewer = this.$refs.pdfviewer.ej2Instances;
},
}
```

Copyright © 2001 -2024 Syncfusion Inc.

```
}
</script>
```

Note: To set up the **server-backed PDF Viewer** in the app.vue file, include the following serviceUrl:

serviceUrl: “https://services.syncfusion.com/vue/production/api/pdfviewer”

Within the template, configure the PDF Viewer by adding the :serviceUrl=“serviceUrl” attribute inside the element.

{% previewsample "page.domainurl/code-snippet/pdfviewer/toolbar/toolbar-method-cs1" %}

Show/Hide the default toolbaritem

The PDF Viewer has an option to show or hide these grouped items in the default toolbar.

- **Show/Hide toolbaritem using toolbarSettings as in the following code snippet.**

APP.VUE

```
<template>
<div id="app">
<ejs-pdfviewer
id="pdfViewer"
ref="pdfviewer"
:documentPath="documentPath"
:enableTextSelection="false"
:toolbarSettings="toolbarSettings"
:resourceUrl="resourceUrl">
</ejs-pdfviewer>
</div>
</template>
<script>
import Vue from 'vue';
import { PdfViewerPlugin, Toolbar, Magnification, Navigation,
LinkAnnotation,
BookmarkView, ThumbnailView, Print, TextSelection, TextSearch,
Annotation, FormDesigner, FormFields } from '@syncfusion/ej2-vue-pdfviewer';
Vue.use(PdfViewerPlugin);
export default {
name: 'app',
data () {
return {
documentPath:"https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf",
resourceUrl:"https://cdn.syncfusion.com/ej2/23.1.43/dist/ej2-pdfviewer-lib",
toolbarSettings:{ showTooltip : true, toolbarItems: ['OpenOption',
'UndoRedoTool', 'PageNavigationTool', 'MagnificationTool', 'PanTool',

};
},
provide: {
PdfViewer: [ Toolbar, Magnification, Navigation, LinkAnnotation, Annotation,
BookmarkView,
ThumbnailView, Print, TextSelection, TextSearch, FormFields, FormDesigner ]}
}
</script>
```

Note: To set up the **server-backed PDF Viewer** in the app.vue file, include the following serviceUrl:

serviceUrl: “https://services.syncfusion.com/vue/production/api/pdfviewer”

Within the template, configure the PDF Viewer by adding the :serviceUrl=“serviceUrl” attribute inside the element.

{% previewsample "page.domainurl/code-snippet/pdfviewer/toolbar/toolbar-items-cs1" %}

- **Show/Hide toolbaritem using showToolbaritem as in the following code snippet**

APP.VUE

```
<template>
<div id="app">
<button v-on:click="showToolbarClicked">ShowToolbar</button>
<ejs-pdfviewer
id="pdfViewer"
ref="pdfviewer"
:documentPath="documentPath"
:documentLoad="documentLoad"
:resourceUrl="resourceUrl">
</ejs-pdfviewer>
</div>
</template>
<script>
import Vue from 'vue';
import { PdfViewerPlugin, Toolbar, Magnification, Navigation,
LinkAnnotation,
BookmarkView, ThumbnailView, Print, TextSelection, TextSearch,
Annotation, FormDesigner, FormFields } from '@syncfusion/ej2-vue-pdfviewer';
Vue.use(PdfViewerPlugin);
var viewer;
export default {
name: 'app',
data () {
return {
documentPath:"https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf",
resourceUrl:"https://cdn.syncfusion.com/ej2/23.1.43/dist/ej2-pdfviewer-lib"
};
},
provide: {
```

```
PdfViewer: [ Toolbar, Magnification, Navigation, LinkAnnotation, Annotation,
BookmarkView,
ThumbnailView, Print, TextSelection, TextSearch, FormFields, FormDesigner ]
},
methods: {
showToolbarClicked: function (args) {
viewer.toolbar.showToolbarItem(["OpenOption"],false);
},
documentLoad: function (args) {
viewer = this.$refs.pdfviewer.ej2Instances;
},
}
}
</script>
```

Note: To set up the **server-backed PDF Viewer** in the app.vue file, include the following serviceUrl:

serviceUrl: “https://services.syncfusion.com/vue/production/api/pdfviewer”

Within the template, configure the PDF Viewer by adding the :serviceUrl=“serviceUrl” attribute inside the element.

Navigation in Vue Pdfviewer component

The PDF Viewer supports different internal and external navigations.

Toolbar page navigation option

The default toolbar of PDF Viewer contains the following navigation options

- **Go to page**:- Navigates to the specific page of a PDF document.
- **Show next page**:- Navigates to the next page of PDF a document.
- **Show previous page**:- Navigates to the previous page of a PDF document.
- **Show first page**:- Navigates to the first page of a PDF document.
- **Show last page**:- Navigates to the last page of a PDF document.

You can enable/disable page navigation option in PDF Viewer using the EnableNavigation property and use the following code snippet,

STANDALONE

```
<template>
<div id="app">
<ejs-pdfviewer
id="pdfViewer"
:documentPath="documentPath"
:enableNavigation="true">
</ejs-pdfviewer>
</div>
```

Magnification in Vue Pdfviewer component

The magnification tools of the PDF Viewer contains ZoomIn, ZoomOut, Zoom, FitPage, and FitWidth tools in the

default toolbar. The PDF Viewer also has an option to show or hide the magnification tools in the default toolbar.

The following code snippet describes how to enable the magnification in PDF Viewer.

STANDALONE

```
<template>
<div id="app">
<ejs-pdfviewer
id="pdfViewer"
:documentPath="documentPath"
:enableMagnification="true">
</ejs-pdfviewer>
</div>
</template>
<script>
import Vue from 'vue';
import { PdfViewerPlugin, Toolbar, Magnification, Navigation,
LinkAnnotation, BookmarkView, Annotation, ThumbnailView,
Print, TextSelection, TextSearch } from '@syncfusion/ej2-vue-pdfviewer';
Vue.use(PdfViewerPlugin);
export default {
```

Copyright © 2001 -2024 Syncfusion Inc.

```
name: 'app',
data () {
return {
documentPath:"https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf"
};
},
provide: {
PdfViewer: [ Toolbar, Magnification, Navigation, LinkAnnotation,
BookmarkView,
Annotation, ThumbnailView, Print, TextSelection, TextSearch ]},
}
</script>
```

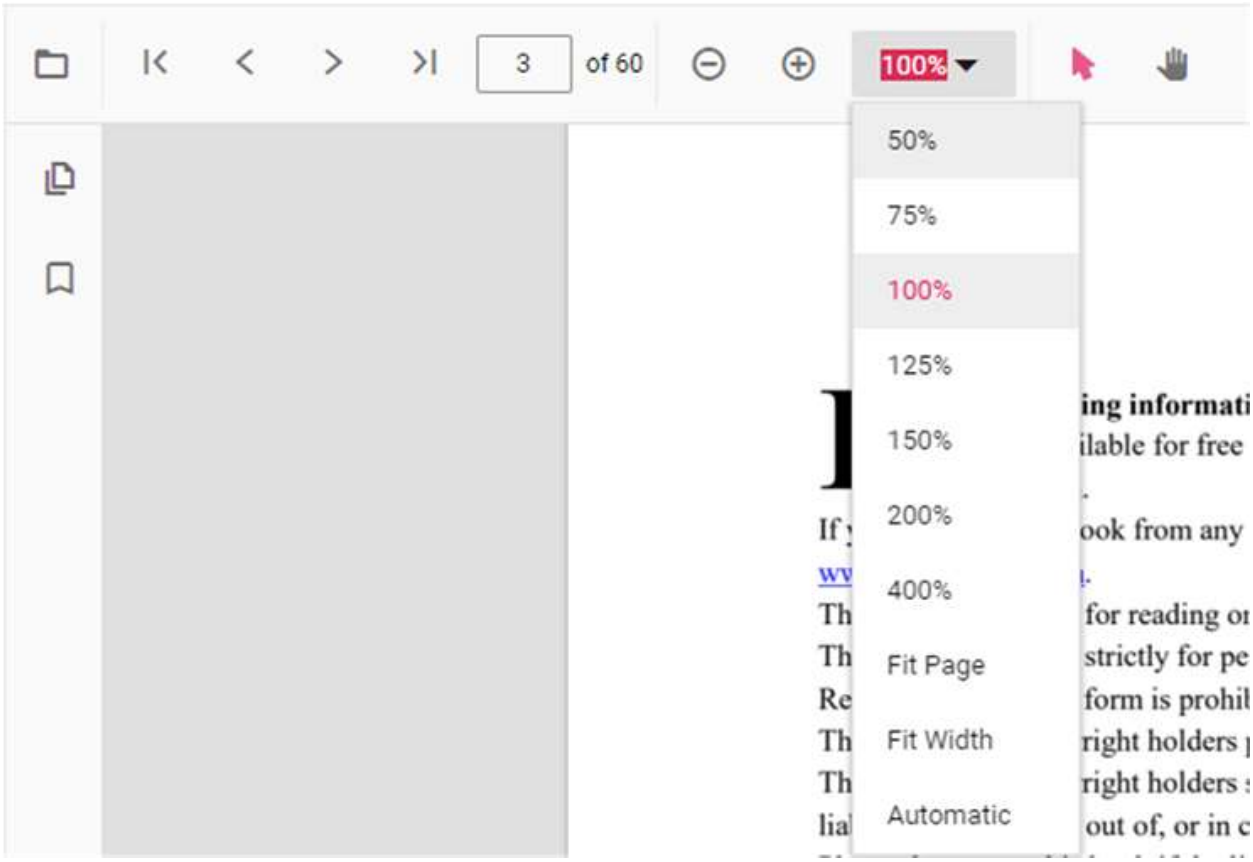
SERVER-BACKED

```
<template>
<div id="app">
<ejs-pdfviewer
id="pdfViewer"
:documentPath="documentPath"
:serviceUrl="serviceUrl"
:enableMagnification="true">
</ejs-pdfviewer>
</div>
</template>
<script>
import Vue from 'vue';
import { PdfViewerPlugin, Toolbar, Magnification, Navigation,
LinkAnnotation, BookmarkView, Annotation, ThumbnailView,
Print, TextSelection, TextSearch } from '@syncfusion/ej2-vue-pdfviewer';
Vue.use(PdfViewerPlugin);
export default {
name: 'app',
data () {
return {
serviceUrl:"https://services.syncfusion.com/vue/production/api/pdfviewer",
documentPath:"https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf"
};
},
provide: {
PdfViewer: [ Toolbar, Magnification, Navigation, LinkAnnotation,
BookmarkView,
Annotation, ThumbnailView, Print, TextSelection, TextSearch ]},
}
</script>
```

The following magnification options are available in the default toolbar of PDF Viewer,

- **ZoomIn**:- Zoom in from the current zoom value of PDF pages.
- **ZoomOut**:- Zoom out from the current zoom value of PDF pages.
- **Zoom**:- Zoom to specific zoom value of PDF pages.
- **FitPage**:- Fits the page width with in the available view port size.
- **FitWidth**:- Fits the view port width based on the page content size.

Copyright © 2001 -2024 Syncfusion Inc.



PDF Viewer can support the zoom value ranges from 50 to 400.

Text search in Vue Pdfviewer component

The Text Search option in PDF Viewer is used to find and highlight the text content from the document. You can enable/disable the text search using the following code snippet.

STANDALONE

```
<template>
<div id="app">
<ejs-pdfviewer
id="pdfViewer"
:documentPath="documentPath"
:enableTextSearch="true">
</ejs-pdfviewer>
</div>
</template>
<script>
import Vue from 'vue';
import { PdfViewerPlugin, Toolbar, Magnification, Navigation,
LinkAnnotation, BookmarkView, Annotation, ThumbnailView,
Print, TextSelection, TextSearch } from '@syncfusion/ej2-vue-pdfviewer';
```

```
Vue.use(PdfViewerPlugin);
export default {
name: 'app',
data () {
return {
documentPath:"https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf"
};
},
provide: {
PdfViewer: [ Toolbar, Magnification, Navigation, LinkAnnotation,
BookmarkView,
Annotation, ThumbnailView, Print, TextSelection, TextSearch ]},
}
</script>
```

SERVER-BACKED

```
<template>
<div id="app">
<ejs-pdfviewer
id="pdfViewer"
:serviceUrl="serviceUrl"
:documentPath="documentPath"
:enableTextSearch="true">

</div>
</template>
<script>
import Vue from 'vue';
import { PdfViewerPlugin, Toolbar, Magnification, Navigation,
LinkAnnotation, BookmarkView, Annotation, ThumbnailView,
Print, TextSelection, TextSearch } from '@syncfusion/ej2-vue-pdfviewer';
Vue.use(PdfViewerPlugin);
export default {
name: 'app',
data () {
return {
serviceUrl:"https://services.syncfusion.com/vue/production/api/pdfviewer",
documentPath:"https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf"
};
},
provide: {
PdfViewer: [ Toolbar, Magnification, Navigation, LinkAnnotation,
BookmarkView,
Annotation, ThumbnailView, Print, TextSelection, TextSearch ]},
}
</script>
```

The following text search methods are available in the PDF Viewer,

- Search text:- Searches the target text in the PDF document and highlights the occurrences in the pages.
- Search next:- Searches the next occurrence of the searched text from the current occurrence of the PdfViewer.

Copyright © 2001 -2024 Syncfusion Inc.

- **Search previous**:- Searches the previous occurrence of the searched text from the current occurrence of the PdfViewer.
- **Cancel text search**:- The text search can be cancelled and the highlighted occurrences from the PDF Viewer can be removed .

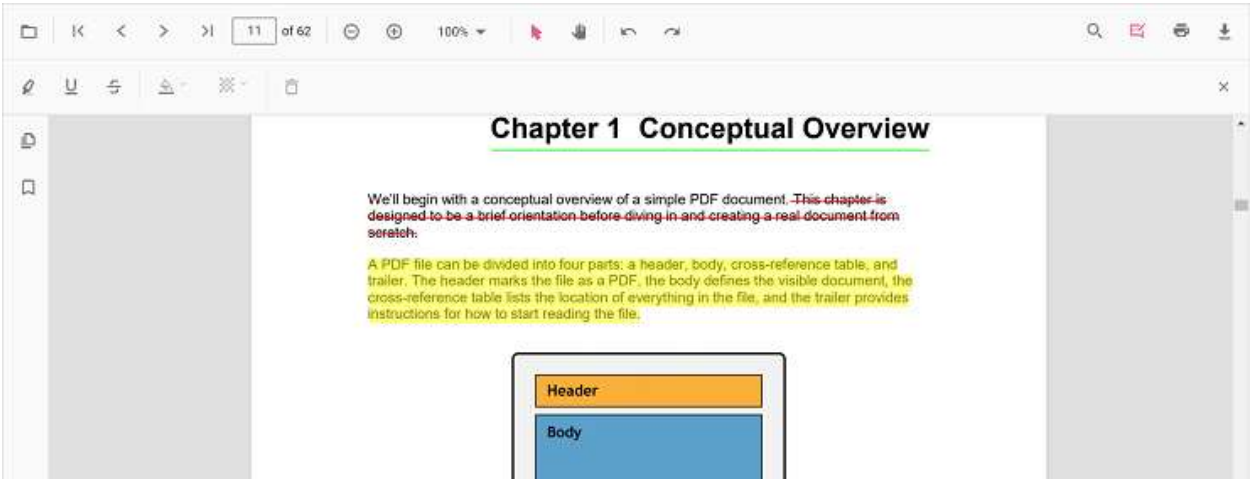
Annotation

Text markup annotation in Vue Pdfviewer component

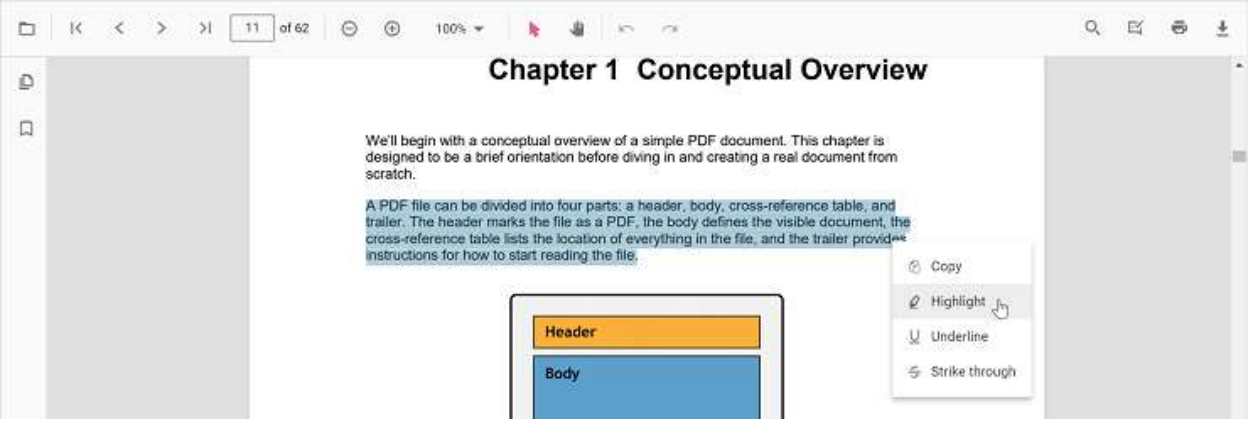
The PDF Viewer control provides the options to add, edit, and delete text markup annotations such as highlight, underline, and strikethrough annotations in the PDF document.



Highlight a text

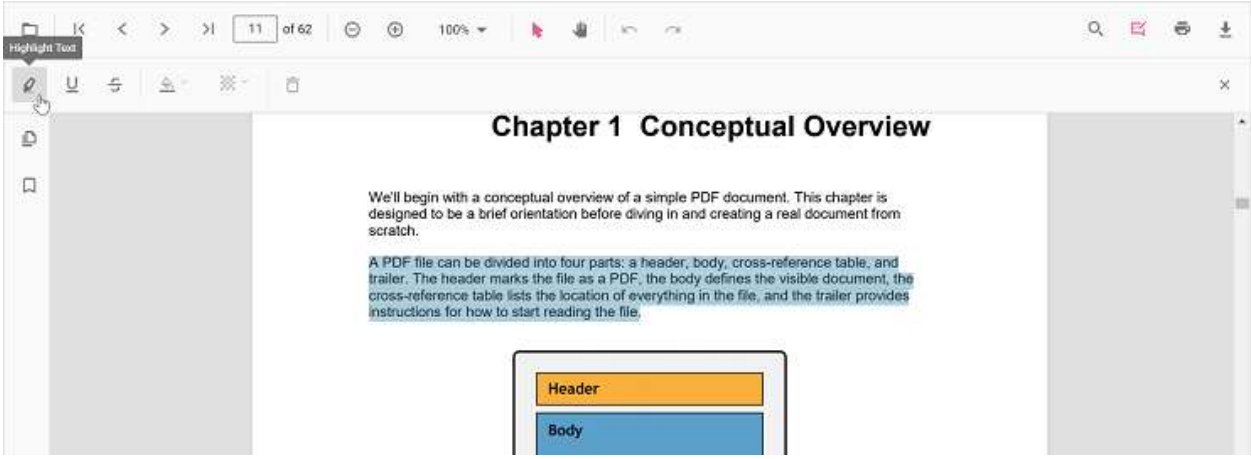
There are two ways to highlight a text in the PDF document:

1.Using the context menu *Select a text in the PDF document and right-click it.* Select **Highlight** option in the context menu that appears.



<!-- markdownlint-disable MD029 -->

2.Using the annotation toolbar *Click the Edit Annotation button in the PDF Viewer toolbar. A toolbar appears below it.* Select the **Highlight** button in the annotation toolbar. It enables the highlight mode. *Select the text and the highlight annotation will be added.* You can also select the text and apply the highlight annotation using the **Highlight** button.



In the pan mode, if the highlight mode is entered, the PDF Viewer control will switch to text select mode to enable the text selection for highlighting the text.

Refer to the following code snippet to switch to highlight mode.

STANDALONE

```
<template>
<div id="app">
<button id="set">Highlight</button>
<ejs-pdfviewer
id="pdfViewer"
ref="pdfviewer"
:documentPath="documentPath"
:documentLoad="documentLoad">
```

```
</ejs-pdfviewer>
</div>
</template>
<script>
import Vue from 'vue';
import { PdfViewerPlugin, Toolbar, Magnification, Navigation,
LinkAnnotation, BookmarkView, ThumbnailView, Print,
TextSelection, TextSearch, Annotation, FormFields, FormDesigner } from
'@syncfusion/ej2-vue-pdfviewer';
Vue.use(PdfViewerPlugin);
var viewer;
export default {
name: 'app',
data () {
return {
documentPath:"https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf",
};
},
provide: {
PdfViewer: [ Toolbar, Magnification, Navigation, LinkAnnotation,
BookmarkView, ThumbnailView,
Print, TextSelection, TextSearch, Annotation, FormFields, FormDesigner ]},
methods: {
documentLoad() {
viewer = this.$refs.pdfviewer.ej2Instances;
document.getElementById('set').addEventListener('click', ()=> {
viewer.annotation.setAnnotationMode('Highlight');
});
}
}
}
</script>
```

SERVER-BACKED

```
<template>
<div id="app">

</script>
```

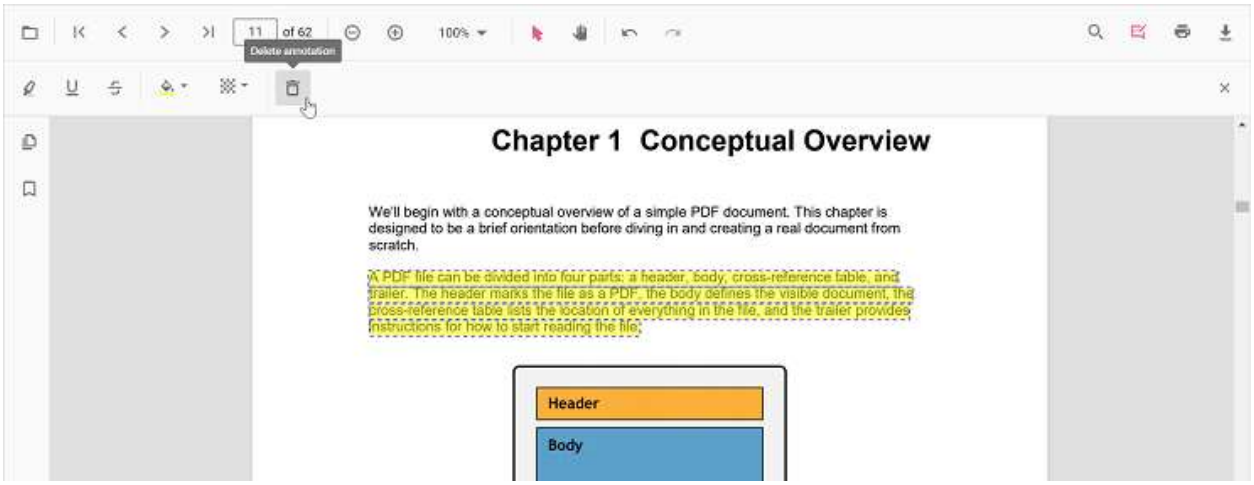
Deleting a text markup annotation

The selected annotation can be deleted by the following ways:

1.Using Delete key *Select the annotation to be deleted.* Click the Delete key in the keyboard. The selected annotation will be deleted. 2.Using the annotation toolbar *Select the annotation to be deleted.* Click the **Delete Annotation** button in the annotation toolbar. The selected annotation will be deleted.

Copyright © 2001 -2024 Syncfusion Inc.

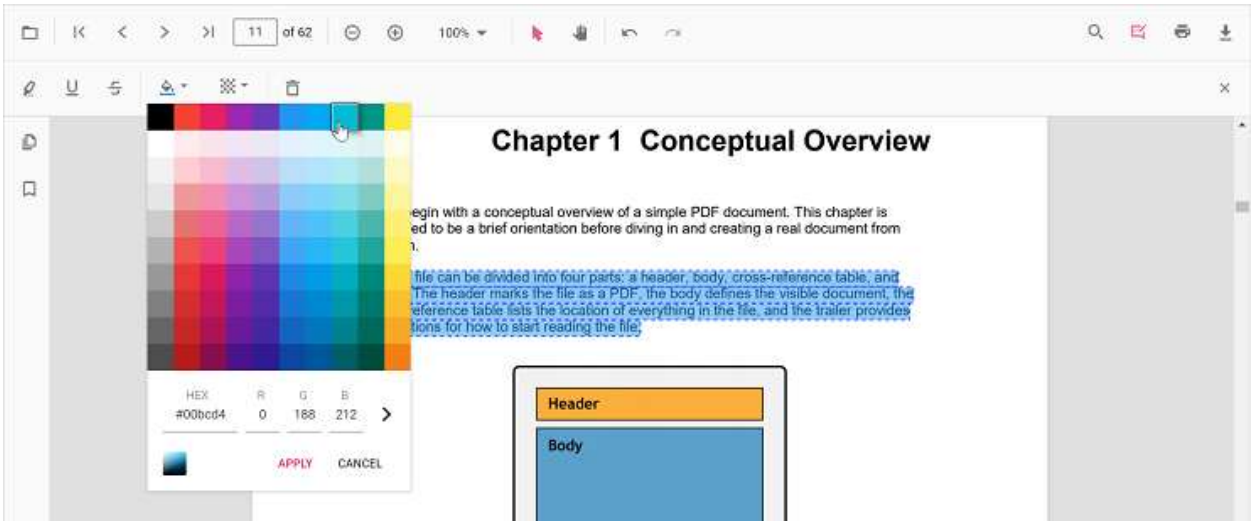


Editing the properties of the text markup annotation

The color and the opacity of the text markup annotation can be edited using the Edit Color tool and the Edit Opacity tool in the annotation toolbar.

Editing color

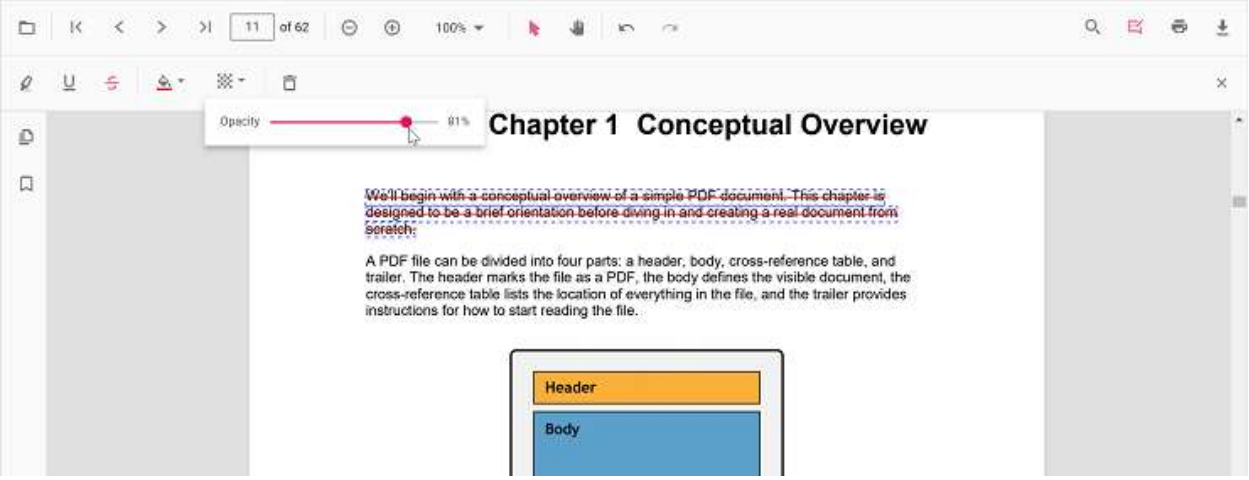
The color of the annotation can be edited using the color palette provided in the Edit Color tool.



Editing opacity

The opacity of the annotation can be edited using the range slider provided in the Edit Opacity tool.

Copyright © 2001 -2024 Syncfusion Inc.



Setting default properties during control initialization

The properties of the text markup annotation can be set before creating the control using highlightSettings, underlineSettings, and strikethroughSettings.

After editing the default color and opacity using the Edit Color tool and Edit Opacity tool, they will be changed to the selected values.

Refer to the following code snippet to set the default annotation settings.

STANDALONE

Performing undo and redo

The PDF Viewer performs undo and redo for the changes made in the PDF document. In text markup annotation, undo and redo actions are provided for:

Copyright © 2001 -2024 Syncfusion Inc.

- Inclusion of the text markup annotations.
- Deletion of the text markup annotations.
- Change of either color or opacity of the text markup annotations.

Undo and redo actions can be done by the following ways:

1.Using keyboard shortcuts:

After performing a text markup annotation action, you can undo it by using Ctrl + Z shortcut and redo by using Ctrl + Y shortcut.

2.Using toolbar:

Undo and redo can be done using the **Undo** tool and **Redo** tool provided in the toolbar.

Refer to the following code snippet for calling undo and redo actions from the client-side.

STANDALONE

```
<template>
<div id="app">
<button id="undo">Undo</button>
<button id="redo">Redo</button>

Saving the text markup annotation

When you click the download tool in the toolbar, the text markup annotations will be saved in the PDF document. This action will not affect the original document.

Printing the text markup annotation

When the print tool is selected in the toolbar, the PDF document will be printed along with the text markup annotations added to the pages. This action will not affect the original document.

Disabling text markup annotation

The PDF Viewer control provides an option to disable the text markup annotation feature. The code snippet for disabling the feature is as follows.

STANDALONE

```
<template>
<div id="app">
<ejs-pdfviewer
id="pdfViewer"
ref="pdfviewer"
:documentPath="documentPath"
:enableTextMarkupAnnotation="false">

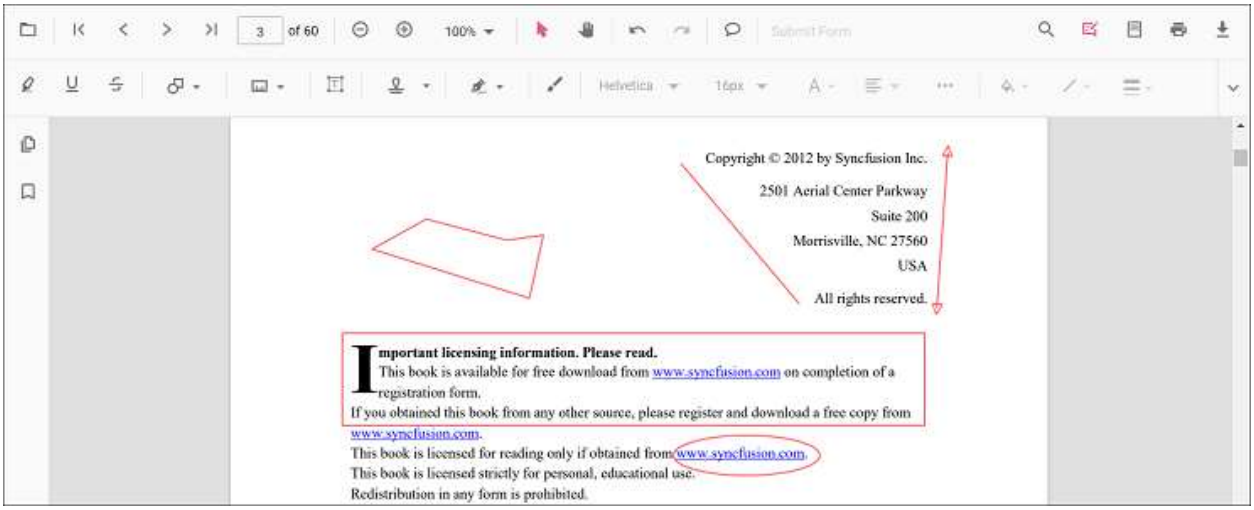
Shape annotation in Vue Pdfviewer component

The PDF Viewer control provides the options to add, edit, and delete the shape annotations. The shape annotation types supported in the PDF Viewer control are:

- Line
- Arrow
- Rectangle
- Circle
- Polygon

Copyright © 2001 -2024 Syncfusion Inc.

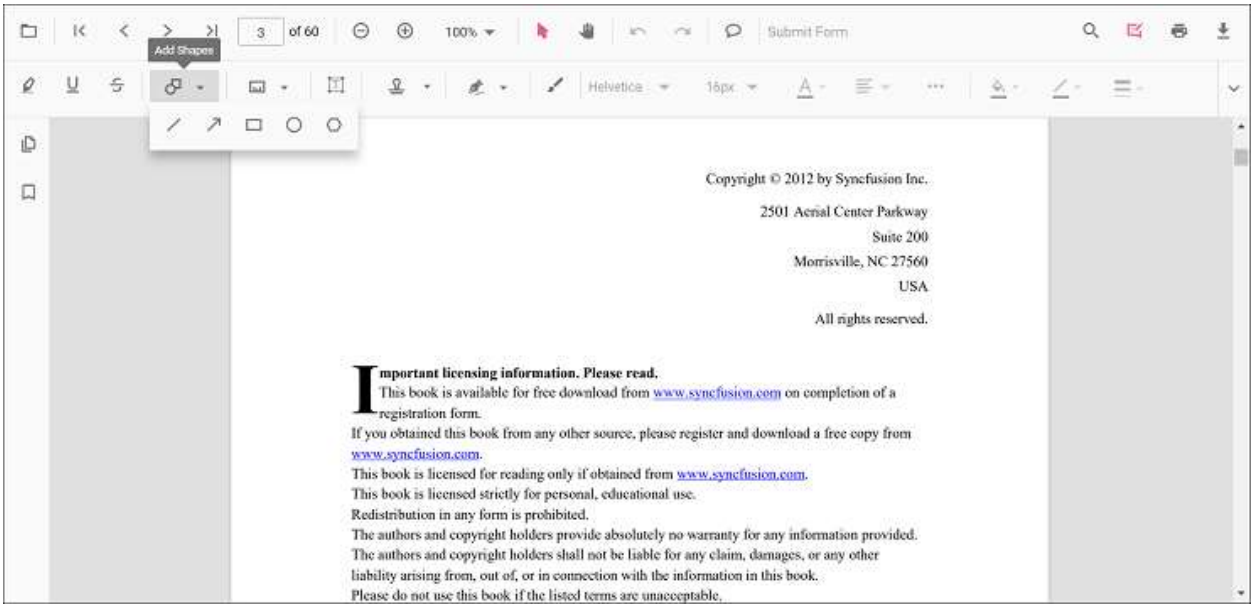


Adding a shape annotation to the PDF document

Shape annotations can be added to the PDF document using the annotation toolbar.

- Click the **Edit Annotation** button in the PDF Viewer toolbar. A toolbar appears below it.
- Click the **Shape Annotation** drop-down button. A drop-down pop-up will appear and shows the shape annotations to be added.
- Select the shape types to be added to the page in the drop-down pop-up. It enables the selected shape annotation mode.
- You can add the shapes over the pages of the PDF document.

In the pan mode, if the shape annotation mode is entered, the PDF Viewer control will switch to text select mode.



Refer to the following code sample to switch to the circle annotation mode.

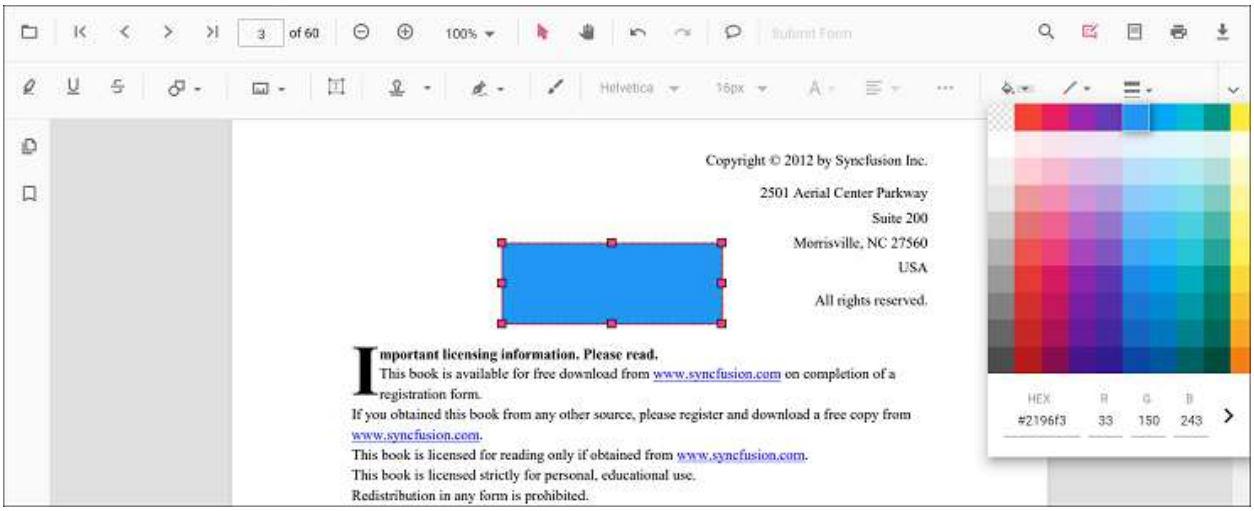
Editing the properties of the shape annotation

The fill color, stroke color, thickness, and opacity of the shape annotation can be edited using the Edit color tool, Edit stroke color tool, Edit thickness tool, and Edit opacity tool in the annotation toolbar.

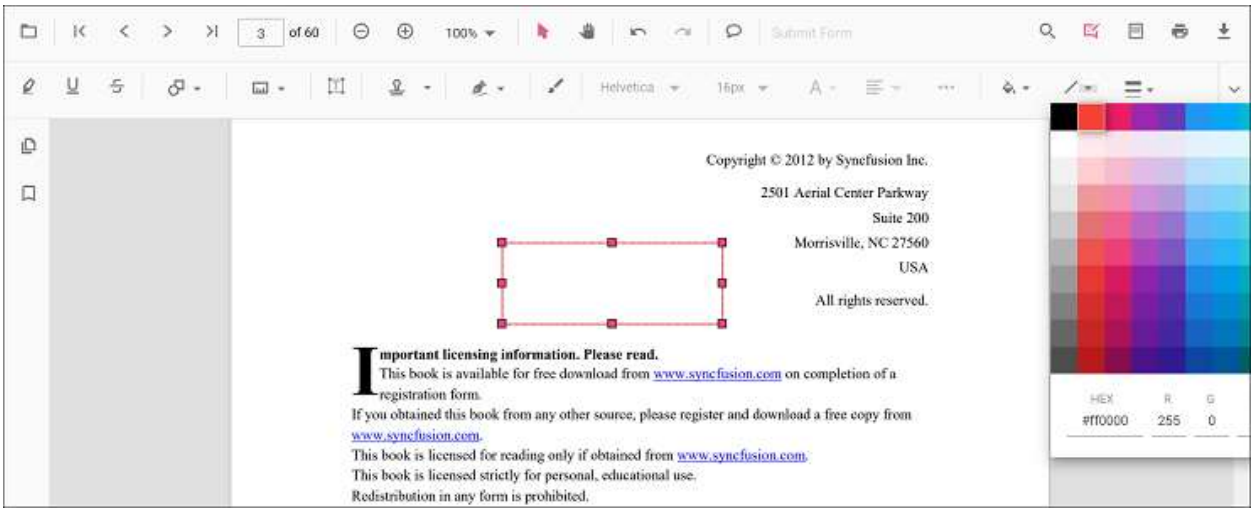
Editing fill color

The fill color of the annotation can be edited using the color palette provided in the Edit Color tool.



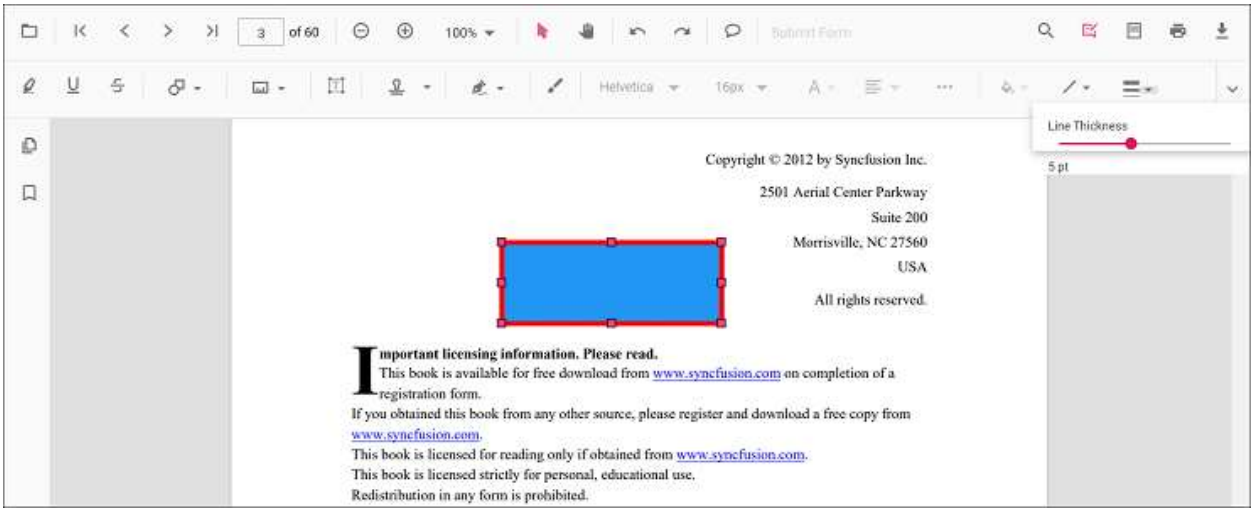
Editing stroke color

The stroke color of the annotation can be edited using the color palette provided in the Edit Stroke Color tool.



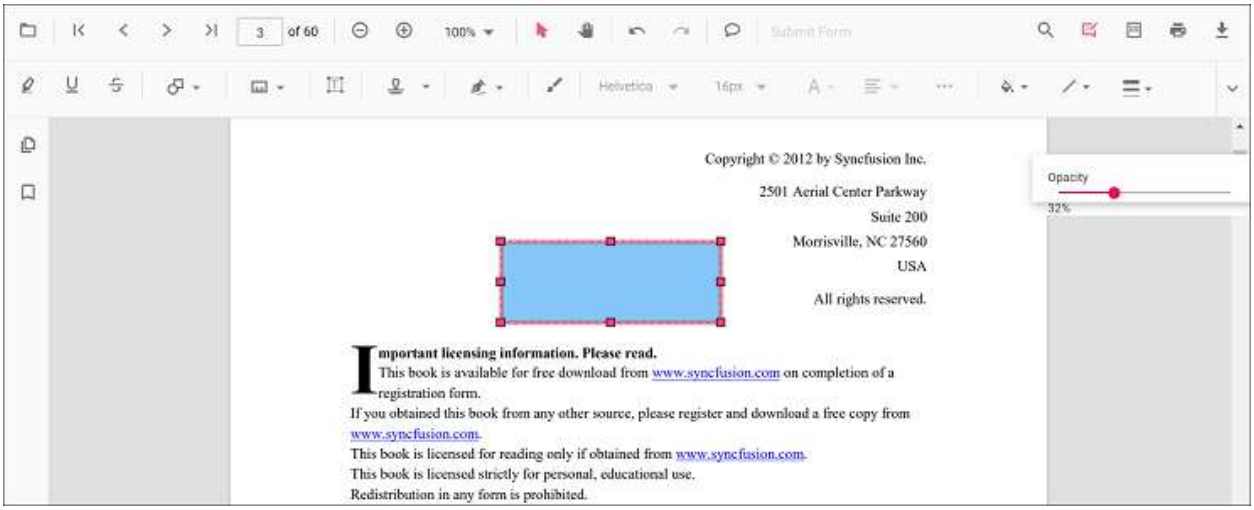
Editing thickness

The thickness of the border of the annotation can be edited using the range slider provided in the Edit Thickness tool.



Editing opacity

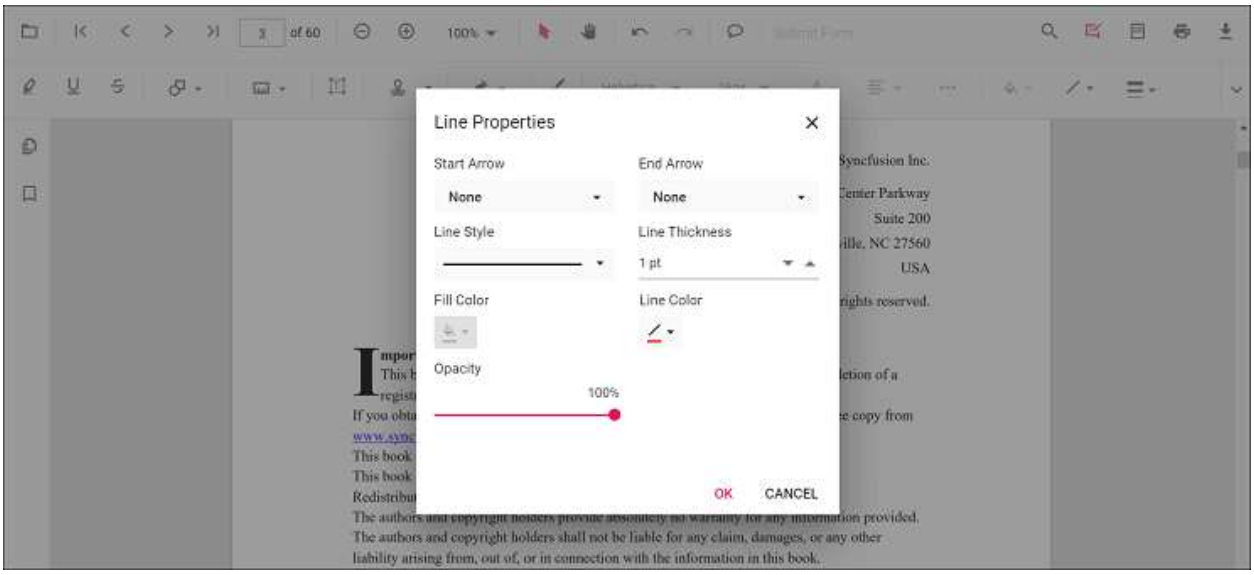
The opacity of the annotation can be edited using the range slider provided in the Edit Opacity tool.



Editing the line properties

The properties of the line shapes such as line and arrow annotations can be edited using the Line Properties window. It can be opened by selecting the Properties option in the context menu that appears on right-clicking the line and arrow annotations.

Refer to the following code sample to set the default annotation settings.



Setting default properties during the control initialization

The properties of the shape annotations can be set before creating the control using LineSettings, ArrowSettings, RectangleSettings, CircleSettings, and PolygonSettings.

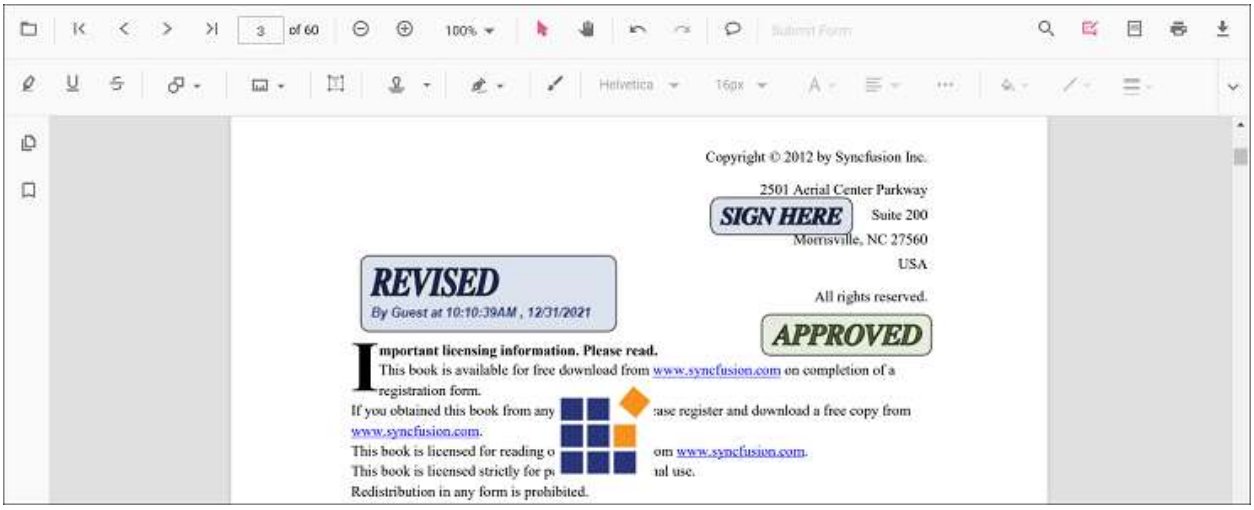
Stamp annotation in Vue Pdfviewer component

The PDF Viewer control provides options to add, edit, delete, and rotate the following stamp annotation in the PDF documents:

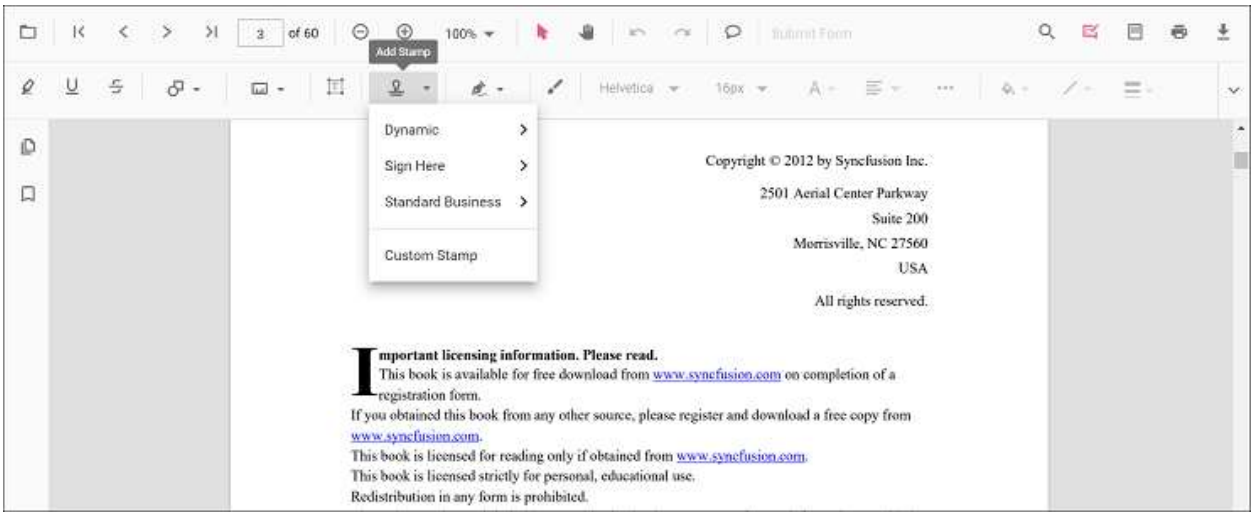
- Dynamic
- Sign Here
- Standard Business
- Custom Stamp



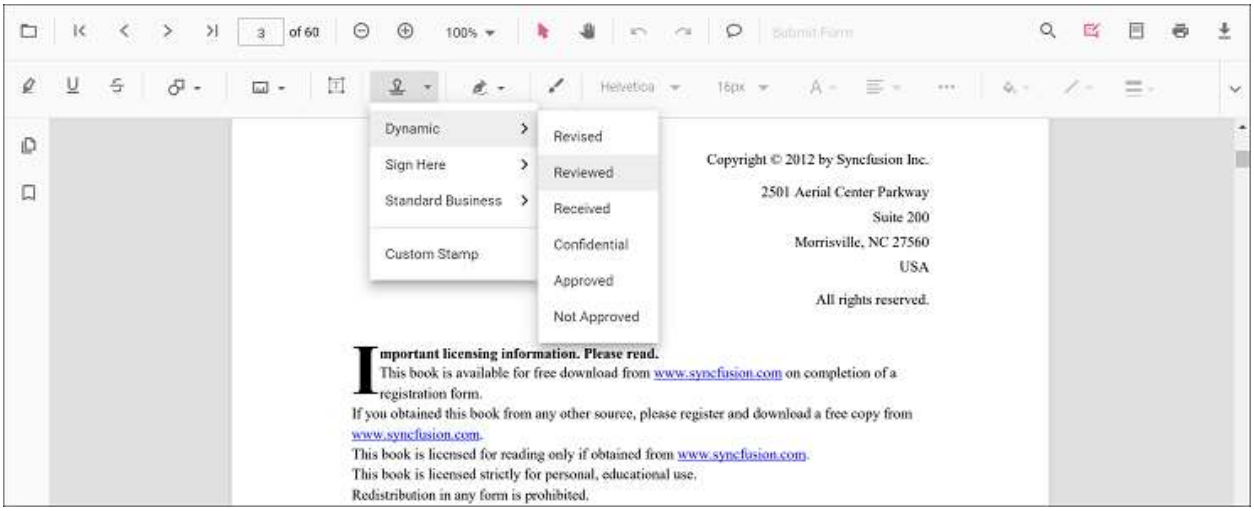
Adding stamp annotations to the PDF document

The stamp annotations can be added to the PDF document using the annotation toolbar.

- Click the **Edit Annotation** button in the PDF Viewer toolbar. A toolbar appears below it.
- Click the **Stamp Annotation** drop-down button. A drop-down pop-up will appear and shows the stamp annotations to be added.



- Select the annotation type to be added to the page in the pop-up.



- You can add the annotation over the pages of the PDF document.

In the pan mode, if the stamp annotation mode is entered, the PDF Viewer control will switch to text select mode.

Refer to the following code sample to switch to the stamp annotation mode.

STANDALONE

```
<template>
<div id="app">
<button id="set">Stamp</button>
<ejs-pdfviewer

document.getElementById('set').addEventListener('click', ()=> {
viewer.annotation.setAnnotationMode('Stamp', null, SignStampItem.Witness);
});
}
}
}
</script>
```

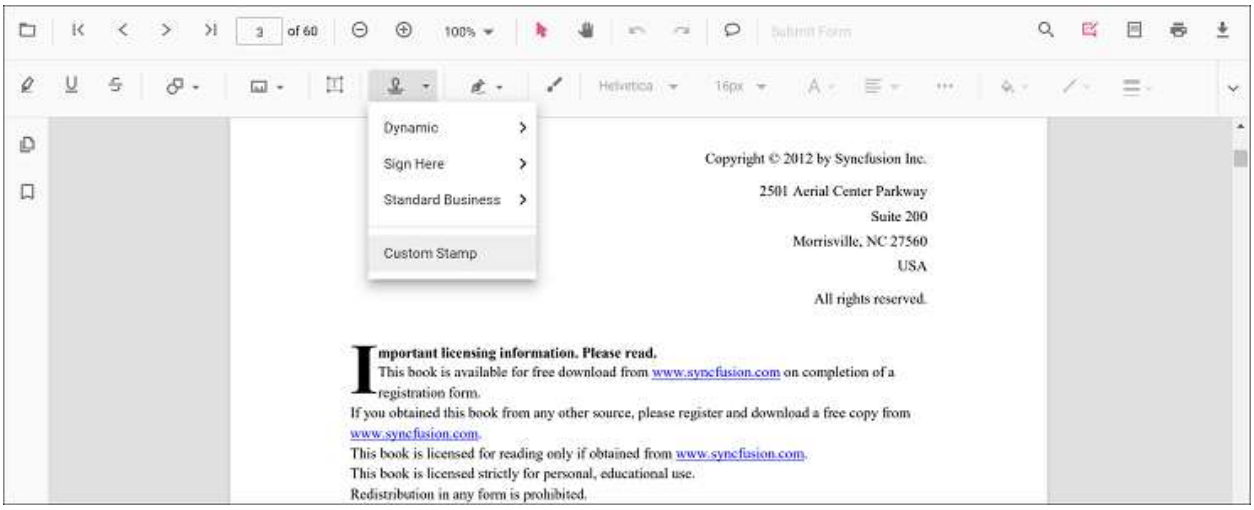
Adding custom stamp to the PDF document

- Click the **Edit Annotation** button in the PDF Viewer toolbar. A toolbar appears below it.
- Click the **Stamp Annotation** drop-down button. A drop-down pop-up will appear and shows the stamp annotations to be added.
- Click the Custom Stamp button.



- The file explorer dialog will appear, choose the image and then add the image to the PDF page.

The JPG and JPEG image format is only supported in the custom stamp annotations.

Setting default properties during control initialization

The properties of the stamp annotation can be set before creating the control using the StampSettings.

After editing the default opacity using the Edit Opacity tool, they will be changed to the selected values.

Refer to the following code sample to set the default sticky note annotation settings.

STANDALONE

```
<template>

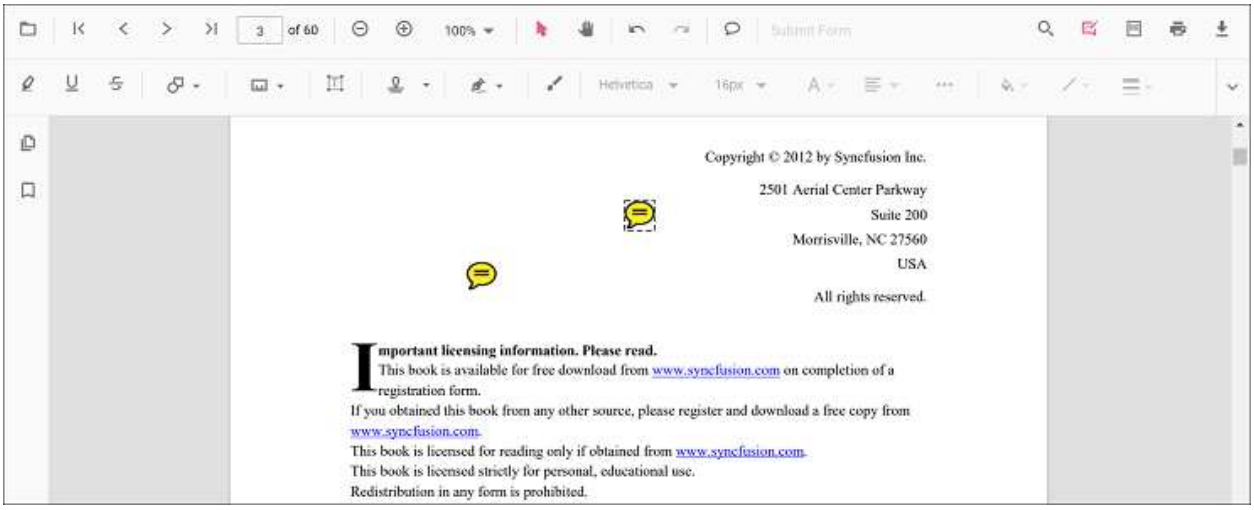
Sticky notes annotation in Vue Pdfviewer component

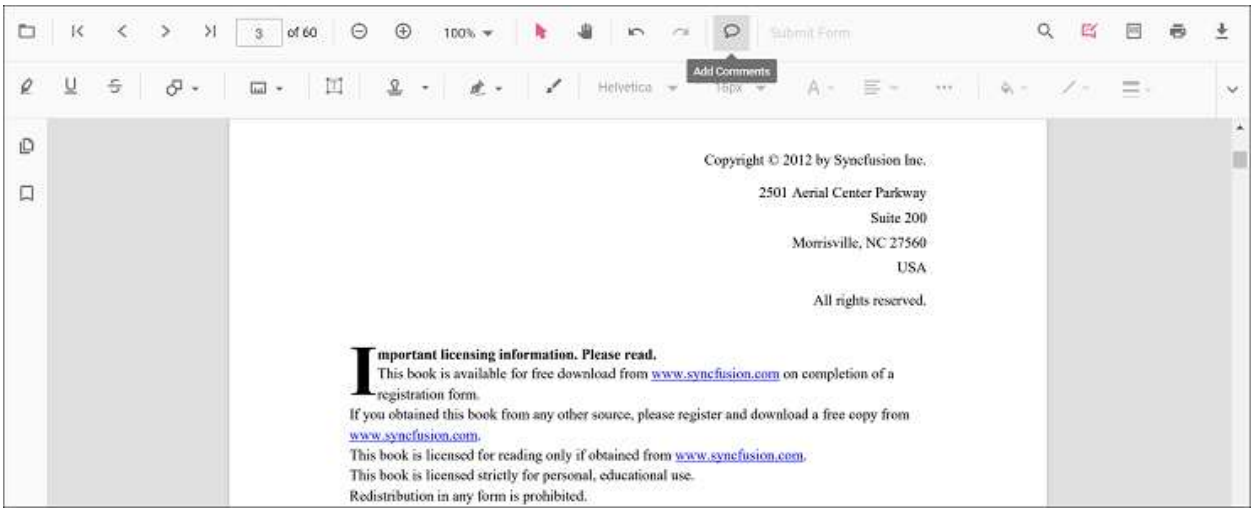
The PDF Viewer control provides the options to add, edit, and delete the sticky note annotations in the PDF document.



Adding a sticky note annotation to the PDF document

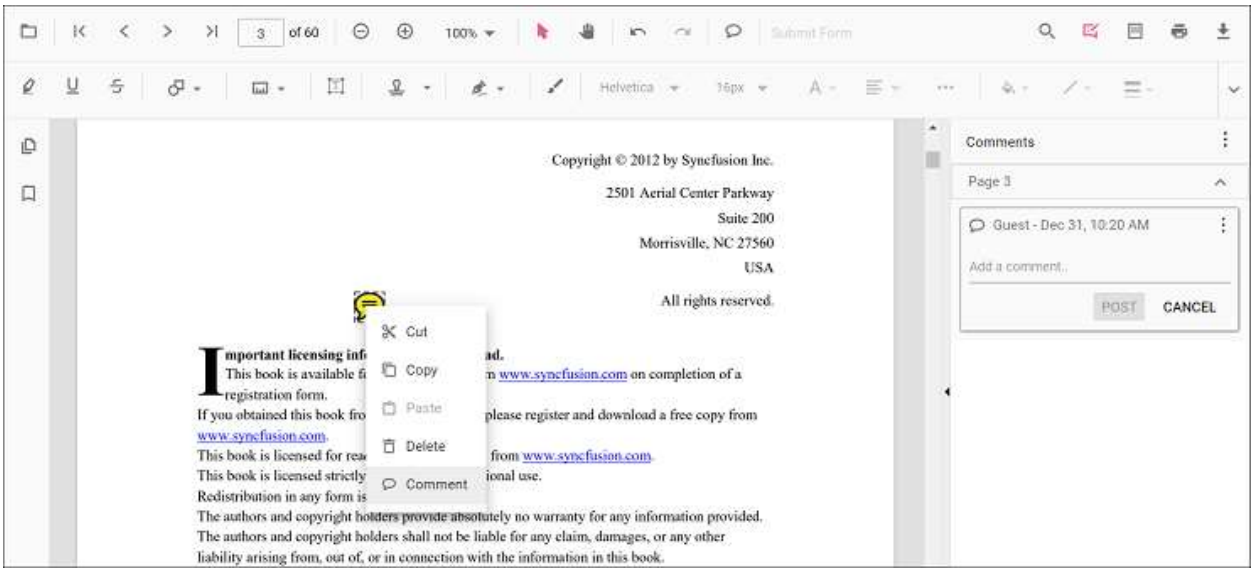
Sticky note annotations can be added to the PDF document using the annotation toolbar.

- Click the **Comments** button in the PDF Viewer toolbar. A toolbar appears below it.
- Click the position where you want to add sticky note annotation in the PDF document.
- Sticky note annotation will be added in the clicked positions.



Annotation comments can be added to the PDF document using the comment panel.

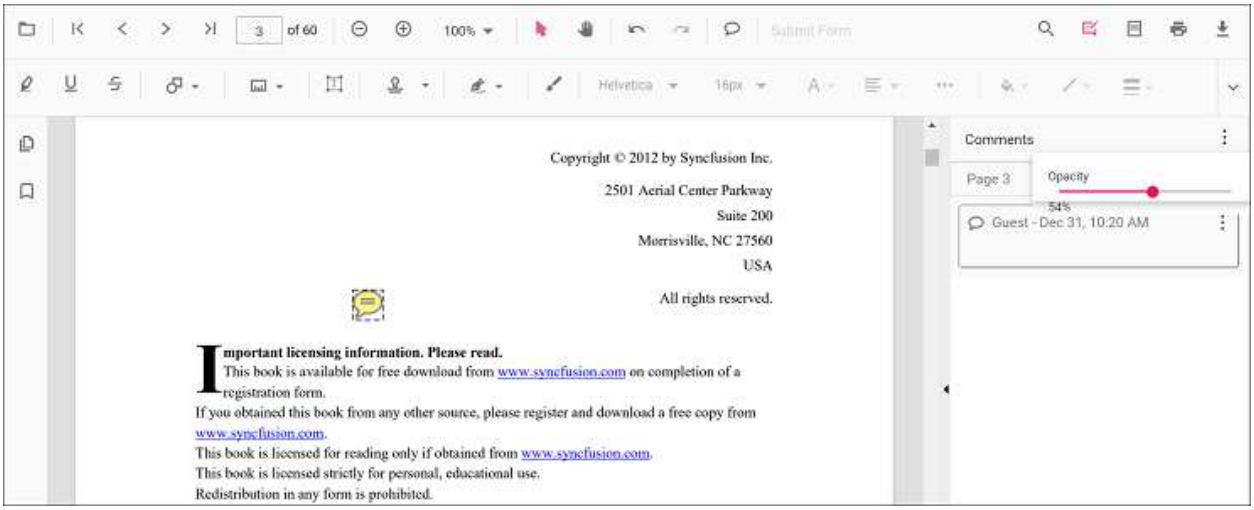
- Select a Sticky note annotation in the PDF document and right-click it.
- Select the Comment option in the context menu that appears.
- Now, you can add Comments, Reply, and Status using the Comment Panel.
- Now, you can add Comments, Reply, and Status using the Comment Panel.



Editing the properties of the sticky note annotation

Editing opacity

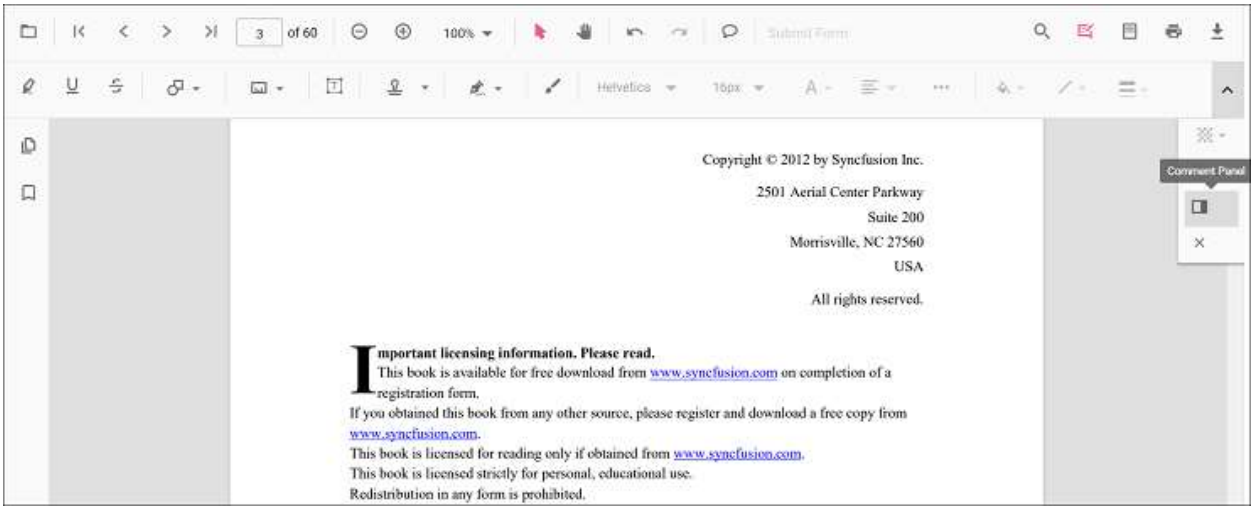
The opacity of the annotation can be edited using the range slider provided in the Edit Opacity tool.



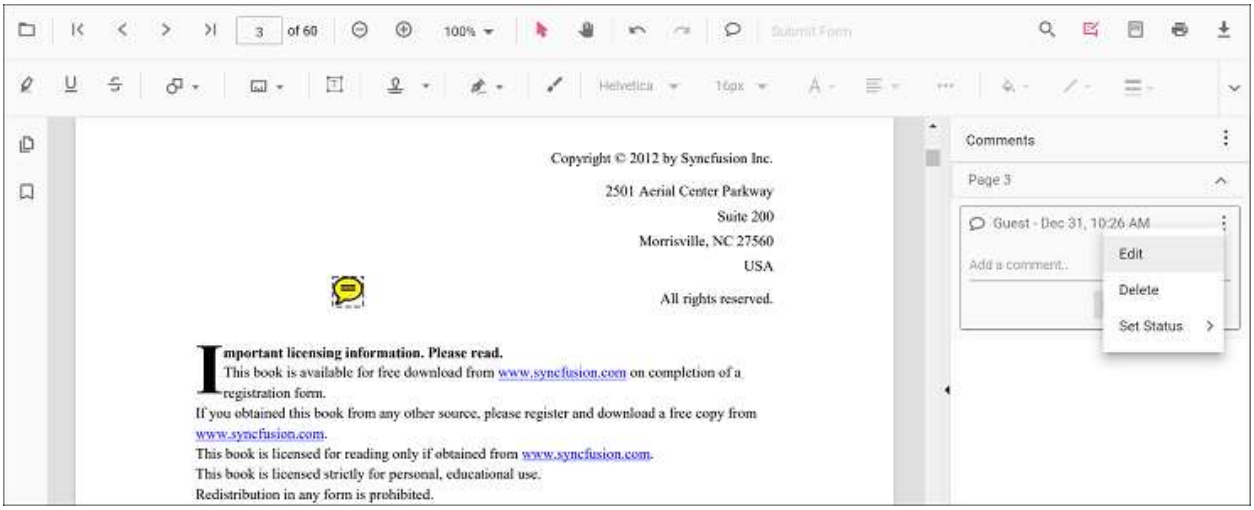
Editing comments

The comment, comment reply, and comment status of the annotation can be edited using the Comment Panel.

- Open the comment panel using the Comment Panel button showing in the annotation toolbar.



You can modify or delete the comments or comments replay and it’s status using the menu option provided in the comment panel.



Setting default properties during the control initialization

The properties of the sticky note annotation can be set before creating the control using the StickyNoteSettings.

After editing the default opacity using the Edit Opacity tool, they will be changed to the selected values. Refer to the following code sample to set the default sticky note annotation settings.

STANDALONE

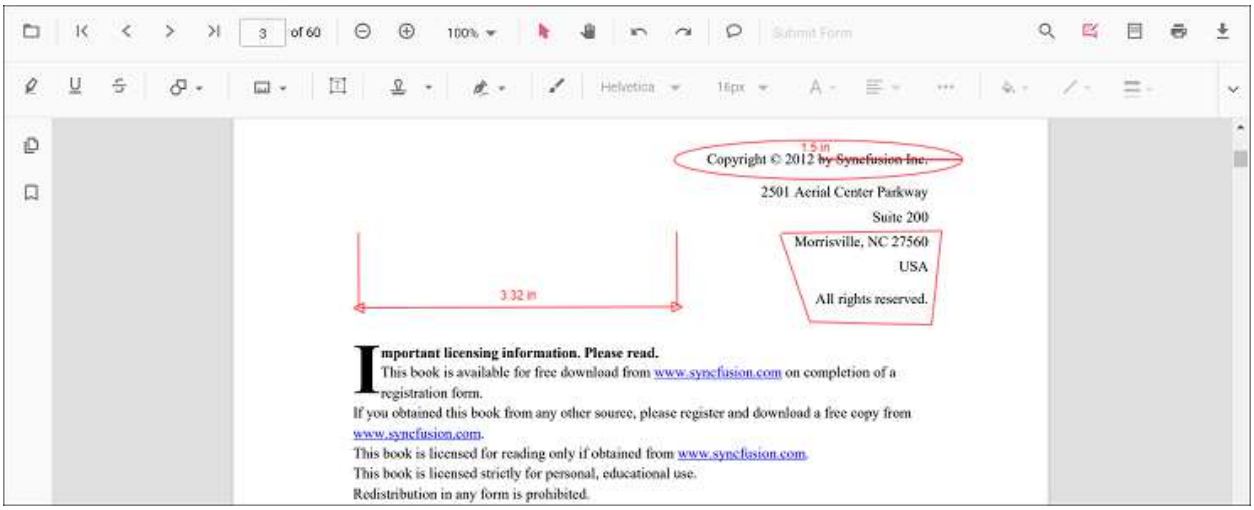
Measurement annotation in Vue Pdfviewer component

The PDF Viewer provides the options to add measurement annotations. You can measure the page annotations with the help of measurement annotation. The supported measurement annotations in the PDF Viewer control are:

- Distance
- Perimeter
- Area
- Radius
- Volume



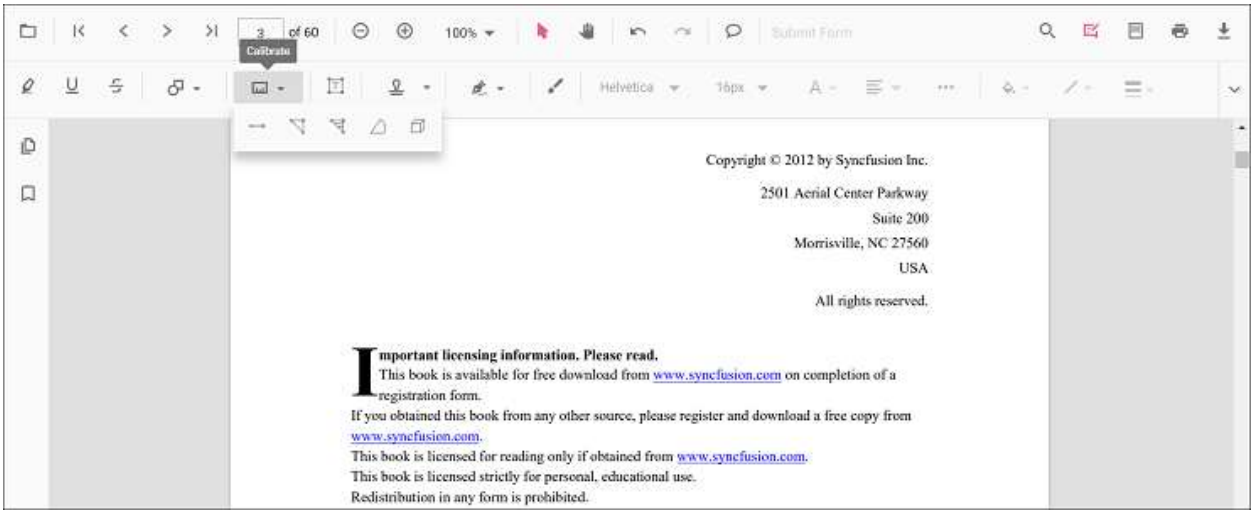
Adding measurement annotations to the PDF document

The measurement annotations can be added to the PDF document using the annotation toolbar.

- Click the **Edit Annotation** button in the PDF Viewer toolbar. A toolbar appears below it.
- Click the **Measurement Annotation** dropdown button. A dropdown pop-up will appear and shows the measurement annotations to be added.
- Select the measurement type to be added to the page in the dropdown pop-up. It enables the selected measurement annotation mode.
- You can measure and add the annotation over the pages of the PDF document.

In the pan mode, if the measurement annotation mode is entered, the PDF Viewer control will switch to text select mode.

Copyright © 2001 -2024 Syncfusion Inc.



Refer to the following code snippet to switch to distance annotation mode.

STANDALONE

```
<template>

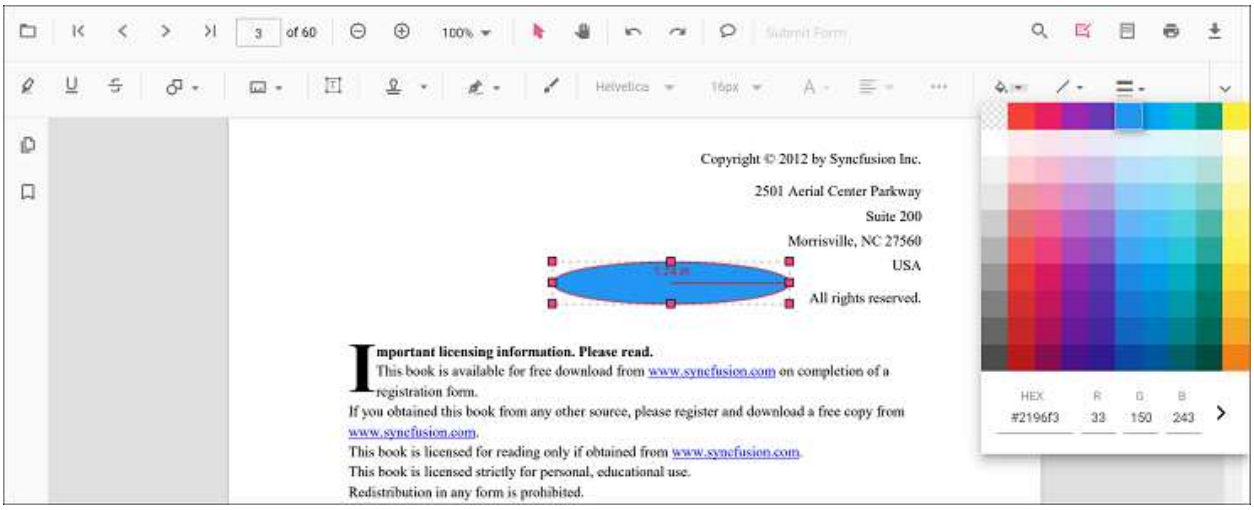
Editing the properties of measurement annotation

The fill color, stroke color, thickness, and opacity of the measurement annotation can be edited using the Edit Color tool, Edit Stroke Color tool, Edit Thickness tool, and Edit Opacity tool in the annotation toolbar.

Copyright © 2001 -2024 Syncfusion Inc.

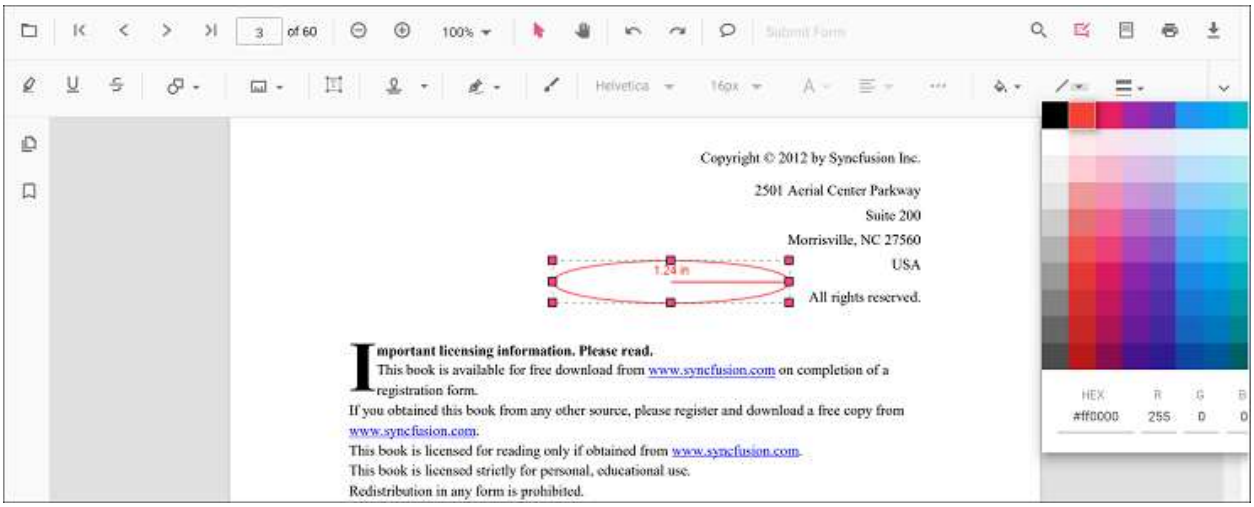
Editing fill color

The fill color of the annotation can be edited using the color palette provided in the Edit Color tool.



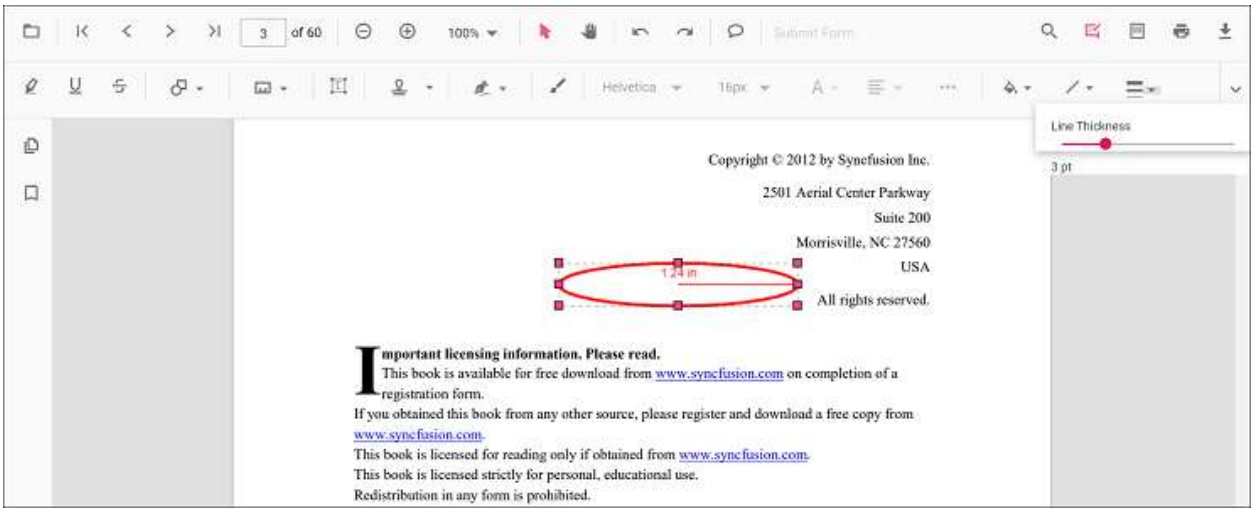
Editing stroke color

The stroke color of the annotation can be edited using the color palette provided in the Edit Stroke Color tool.



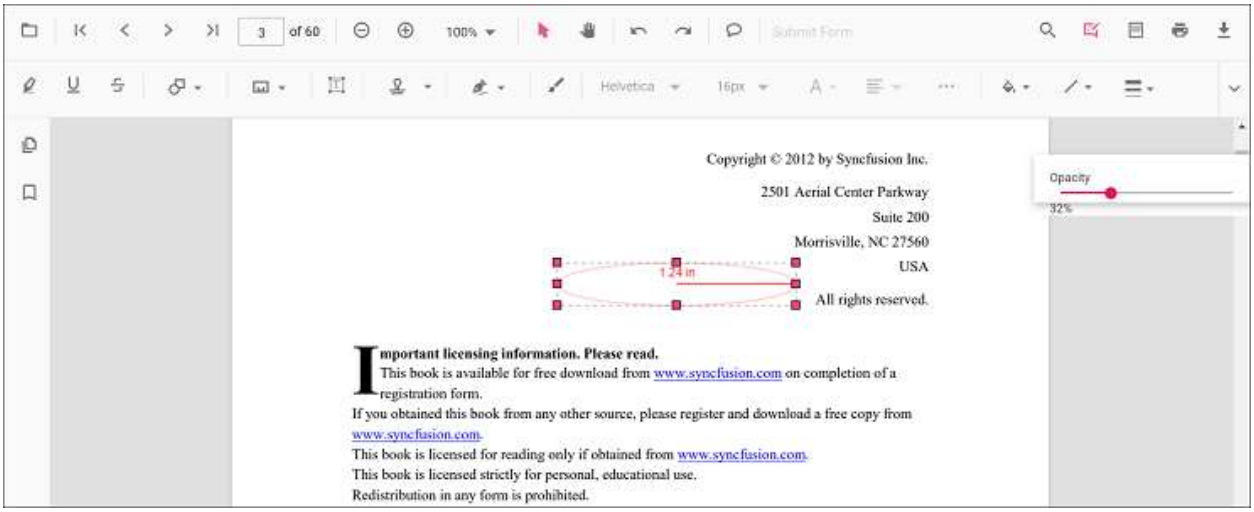
Editing thickness

The thickness of the border of the annotation can be edited using the range slider provided in the Edit thickness tool.



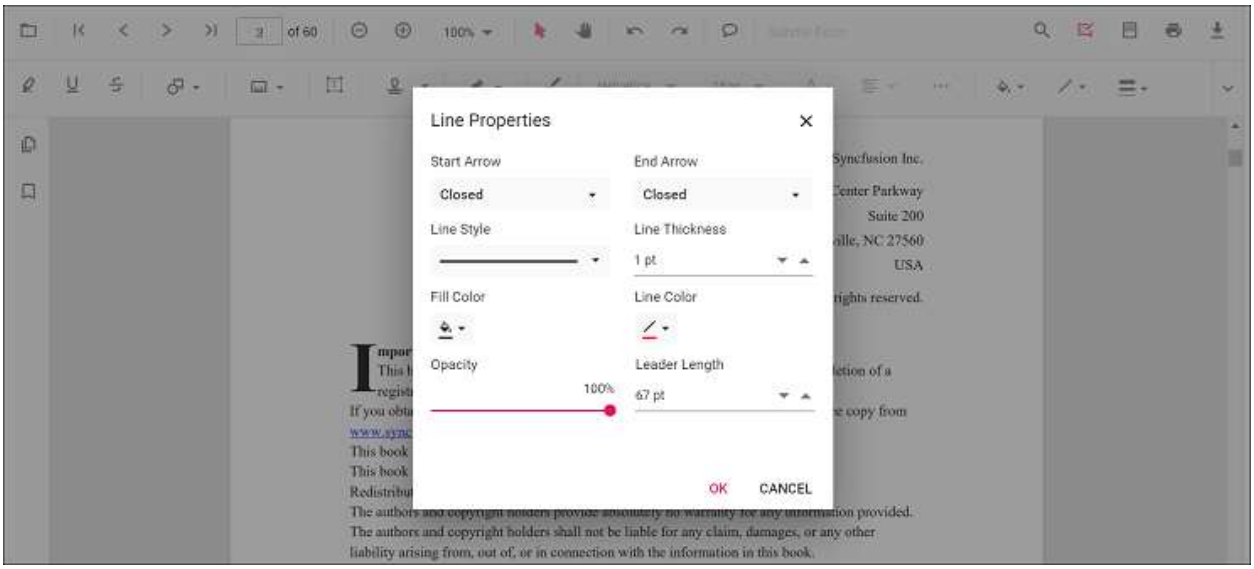
Editing opacity

The opacity of the annotation can be edited using the range slider provided in the Edit Opacity tool.



Editing the line properties

The properties of the line shapes such as distance and perimeter annotations can be edited using the Line properties window. It can be opened by selecting the Properties option in the context menu that appears on right-clicking the distance and perimeter annotations.



Setting default properties during control initialization

The properties of the shape annotations can be set before creating the control using distanceSettings, perimeterSettings, areaSettings, radiusSettings and volumeSettings. Refer to the following code snippet to set the default annotation settings.

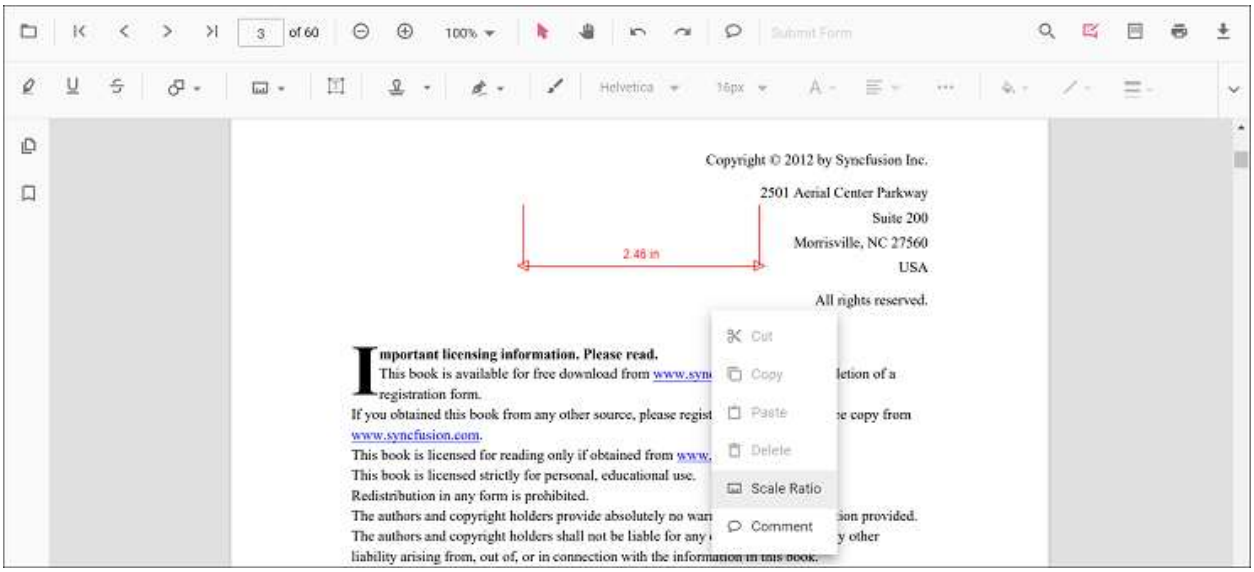
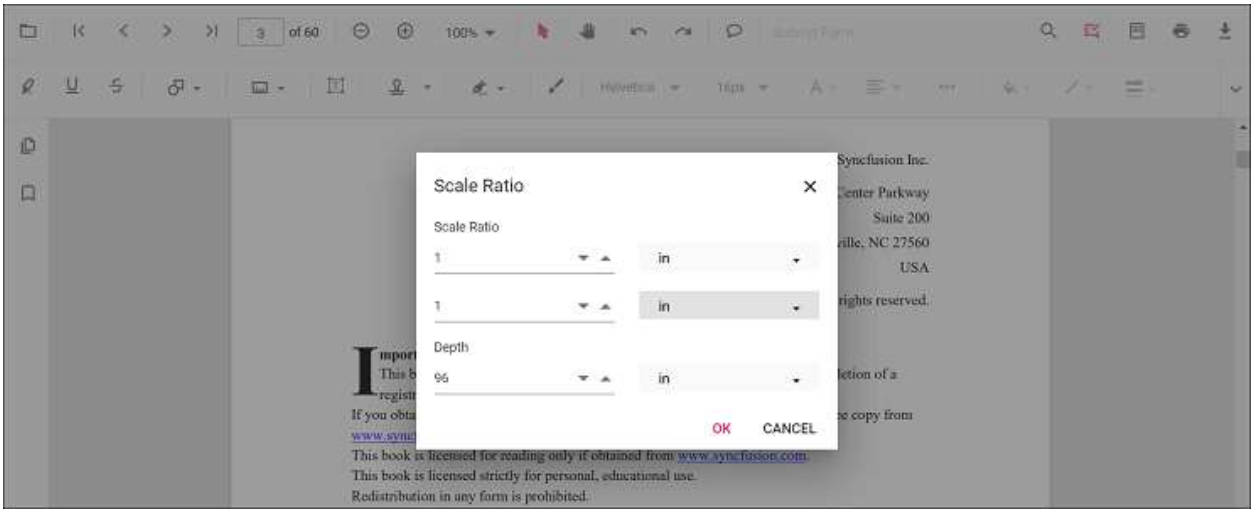
Editing scale ratio and unit of the measurement annotation

The scale ratio and unit of measurement can be modified using the scale ratio option provided in the context menu of the PDF Viewer control.



The Units of measurements support for the measurement annotations in the PDF Viewer are

- Inch
- Millimeter
- Centimeter
- Point
- Pica
- Feet



Setting default scale ratio settings during control initialization

The properties of scale ratio for measurement annotation can be set before creating the control using ScaleRatioSettings as shown in the following code snippet,

STANDALONE

Editing the properties of free text annotation

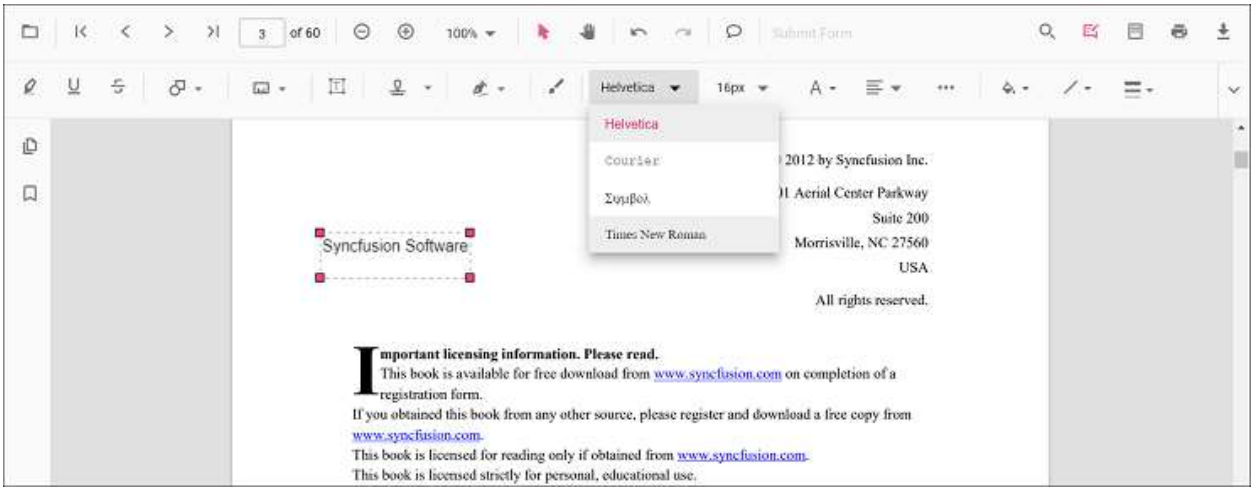
The font family, font size, font styles, font color, text alignment, fill color, the border stroke color, border thickness, and opacity of the free text annotation can be edited using the Font Family tool, Font Size

Copyright © 2001 -2024 Syncfusion Inc.

tool, Font Color tool, Text Align tool, Font Style tool Edit Color tool, Edit Stroke Color tool, Edit Thickness tool, and Edit Opacity tool in the annotation toolbar.

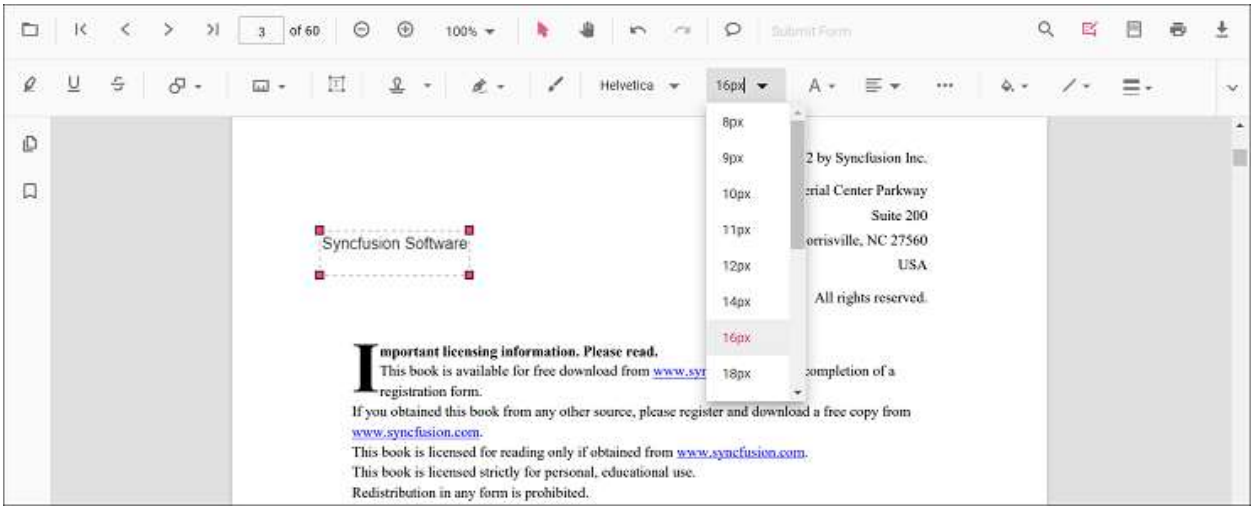
Editing font family

The font family of the annotation can be edited by selecting the desired font in the Font Family tool.



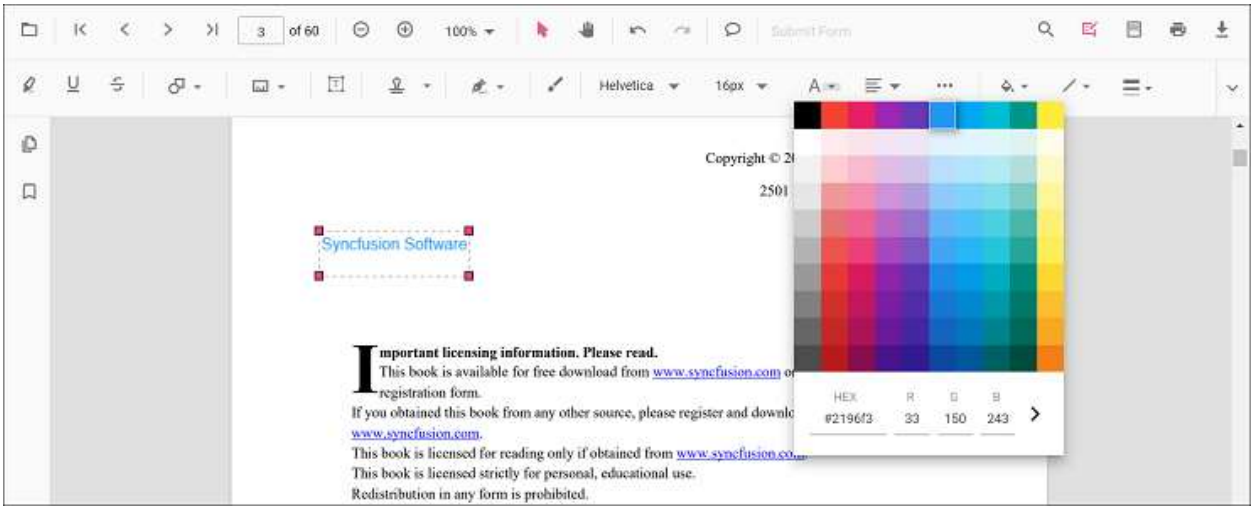
Editing font size

The font size of the annotation can be edited by selecting the desired size in the Font Size tool.



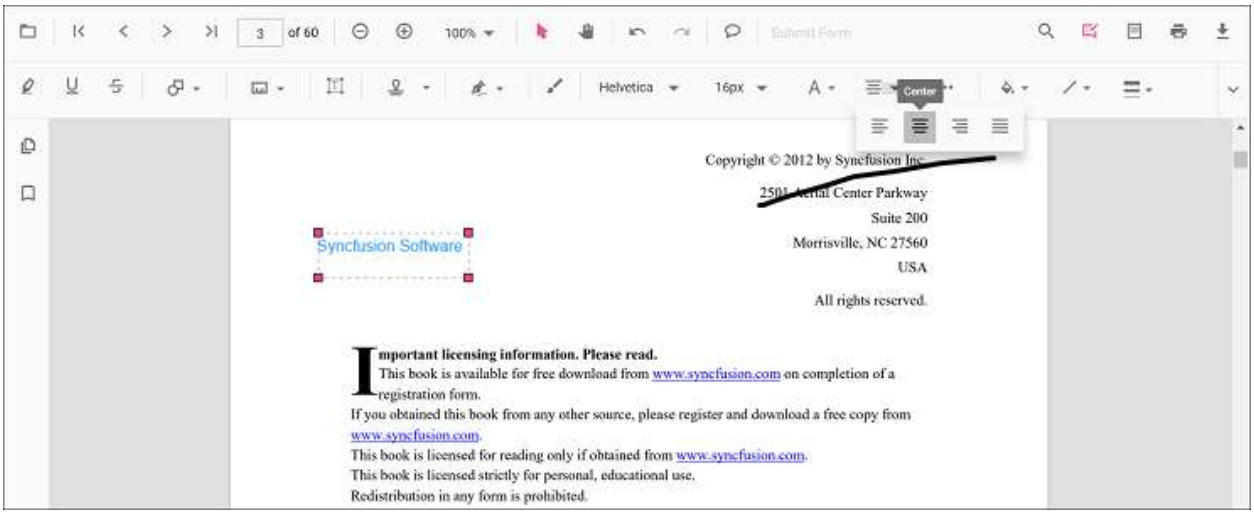
Editing font color

The font color of the annotation can be edited using the color palette provided in the Font Color tool.



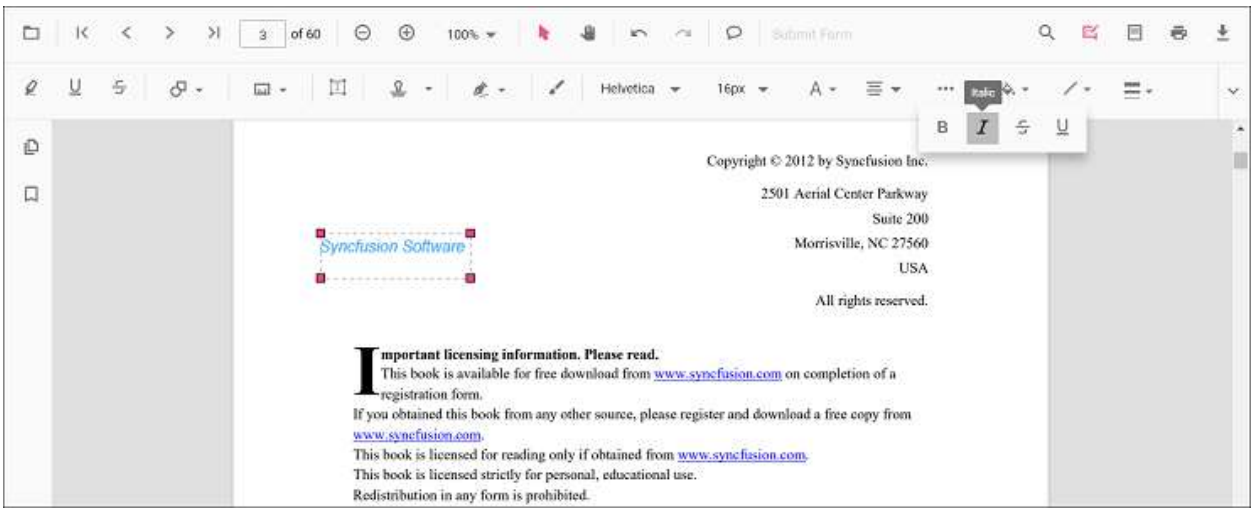
Editing the text alignment

The text in the annotation can be aligned by selecting the desired styles in the drop-down pop-up in the Text Align tool.



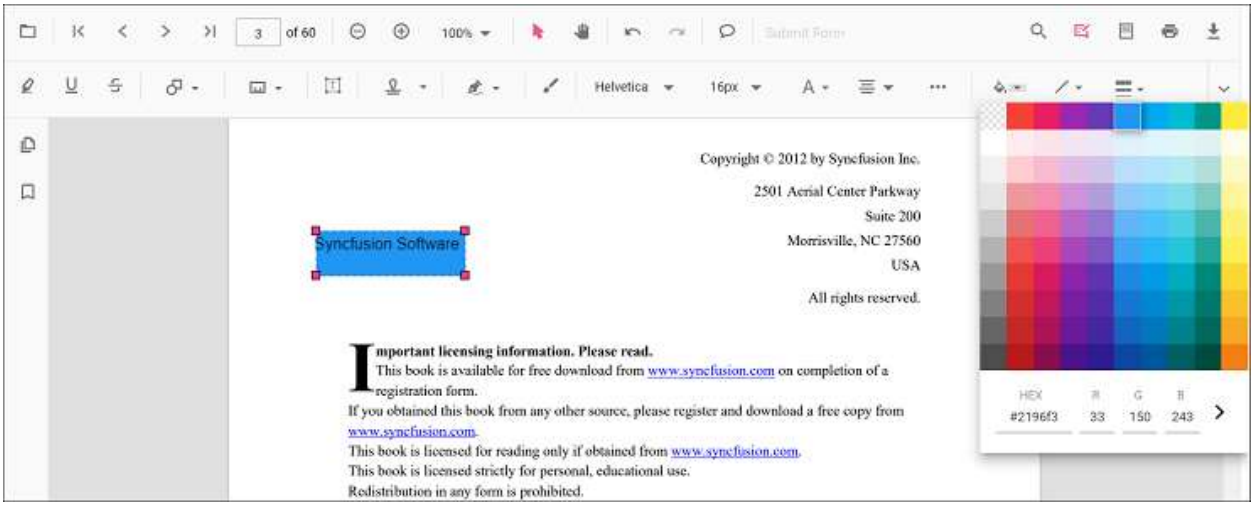
Editing text styles

The style of the text in the annotation can be edited by selecting the desired styles in the drop-down pop-up in the Font Style tool.



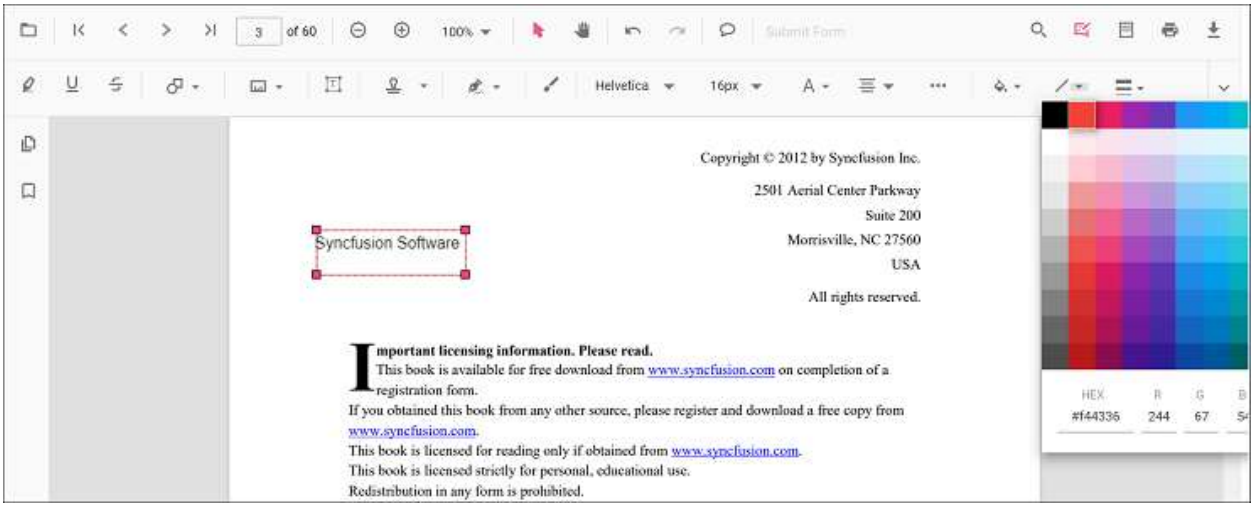
Editing fill color

The fill color of the annotation can be edited using the color palette provided in the Edit Color tool.



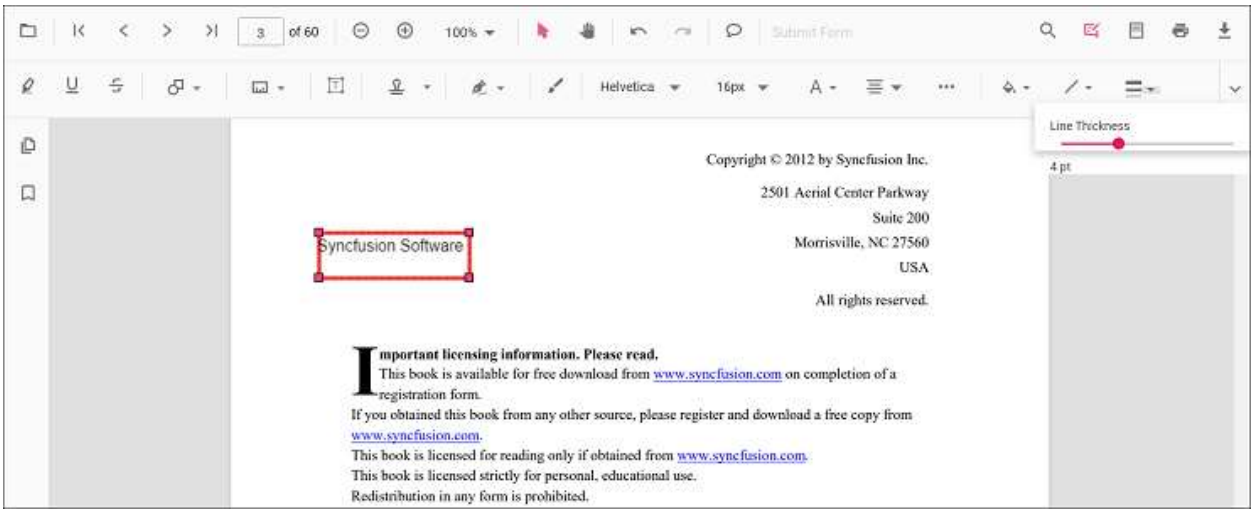
Editing stroke color

The stroke color of the annotation can be edited using the color palette provided in the Edit Stroke Color tool.



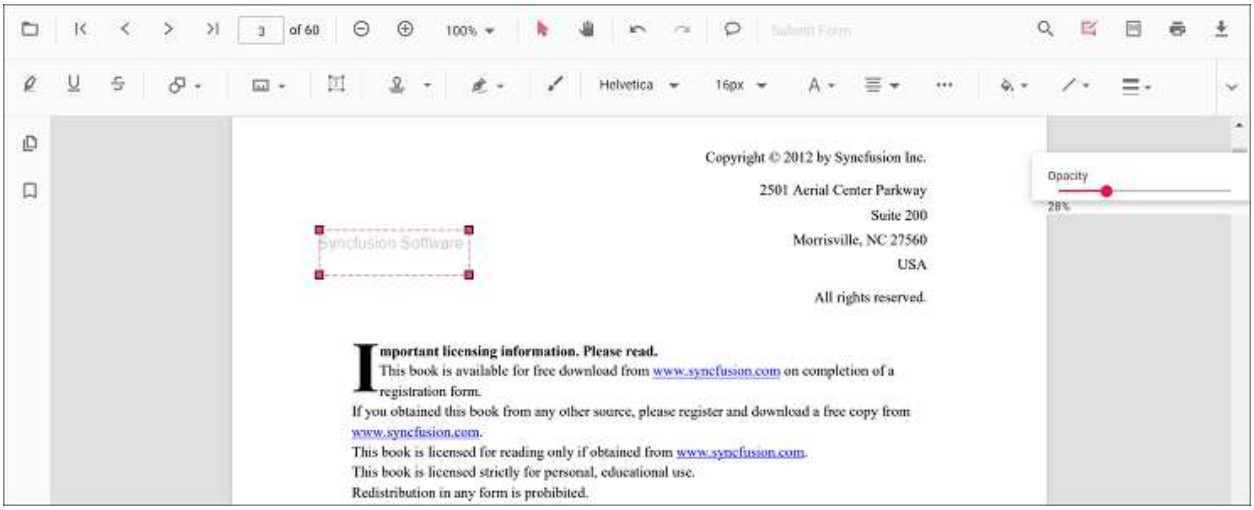
Editing thickness

The border thickness of the annotation can be edited using the range slider provided in the Edit Thickness tool.



Editing opacity

The opacity of the annotation can be edited using the range slider provided in the Edit Opacity tool.



Setting default properties during control initialization

The properties of the free text annotation can be set before creating the control using the FreeTextSettings.

After editing the default values, they will be changed to the selected values. Refer to the following code sample to set the default free text annotation settings.

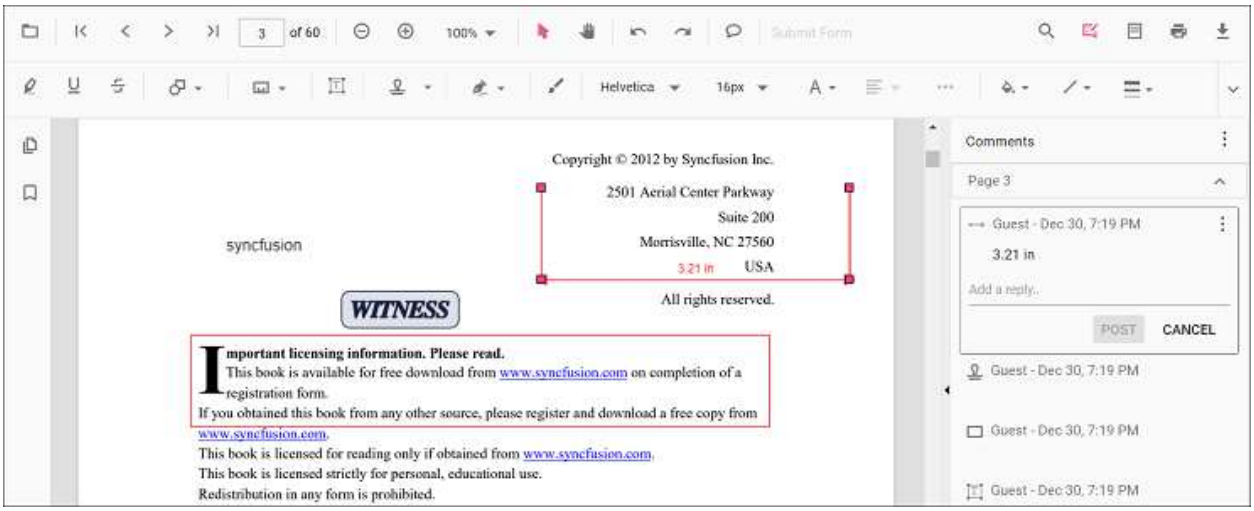
Comments in Vue Pdfviewer component

The PDF Viewer control provides options to add, edit, and delete the comments to the following annotation in the PDF documents:

- Shape annotation
- Stamp annotation
- Sticky note annotation
- Measurement annotation
- Text markup annotation
- Free text annotation
- Ink annotation



Adding a comment to the annotation

Annotation comment, comment replies, and status can be added to the PDF document using the comment panel.

Comment panel

Annotation comments can be added to the PDF using the comment panel. The comment panel can be opened in the following ways:

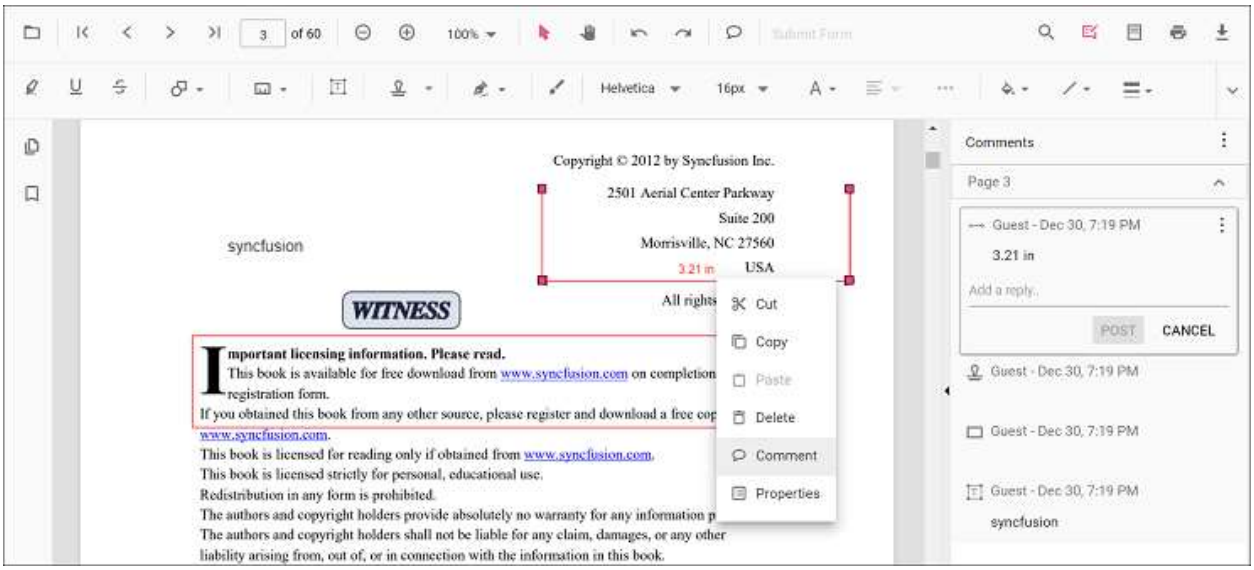
1. Using the annotation menu
    - Click the Edit Annotation button in the PDF Viewer toolbar. A toolbar appears below it.
    - Click the Comment Panel button. A comment panel will appear.
2. Using Context menu
    - Select annotation in the PDF document and right-click it.
    - Select the comment option in the context menu that appears.
3. Using the Mouse click
    - Select annotation in the PDF document and double click it, a comment panel will appear.

Copyright © 2001 -2024 Syncfusion Inc.

If the comment panel is already in the open state, you can select the annotations and add annotation comments using the comment panel.

Adding comments

- Select annotation in the PDF document and click it.
- The selected annotation comment container is highlighted in the comment panel.
- Now, you can add comment and comment replies using the comment panel.

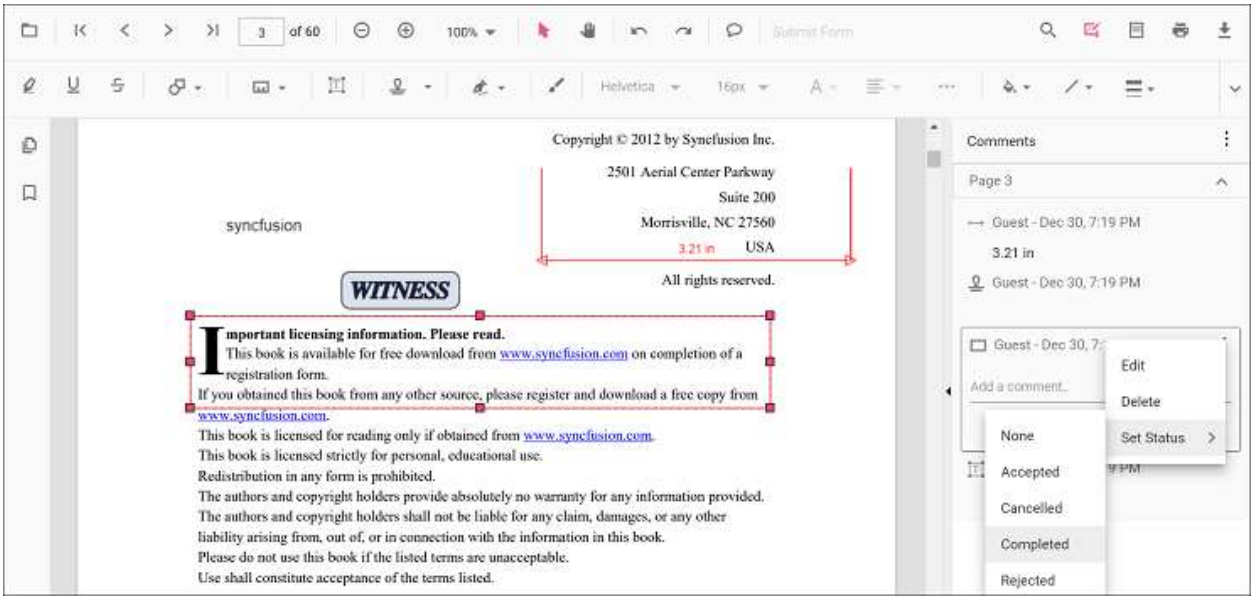


Adding Comment Replies

- The PDF Viewer control provides an option to add multiple replies to the comment.
- After adding the annotation comment, you can add a reply to the comment.

Adding Comment or Reply Status

- Select the Annotation Comments in the comment panel.
- Click the more options button showing in the Comments or reply container.
- Select the Set Status option in the context menu that appears.
- Select the status of the annotation comment in the context menu that appears.



Editing the comments and comments replies of the annotations

The comment, comment replies, and status of the annotation can be edited using the comment panel.

Editing the Comment or Comment Replies

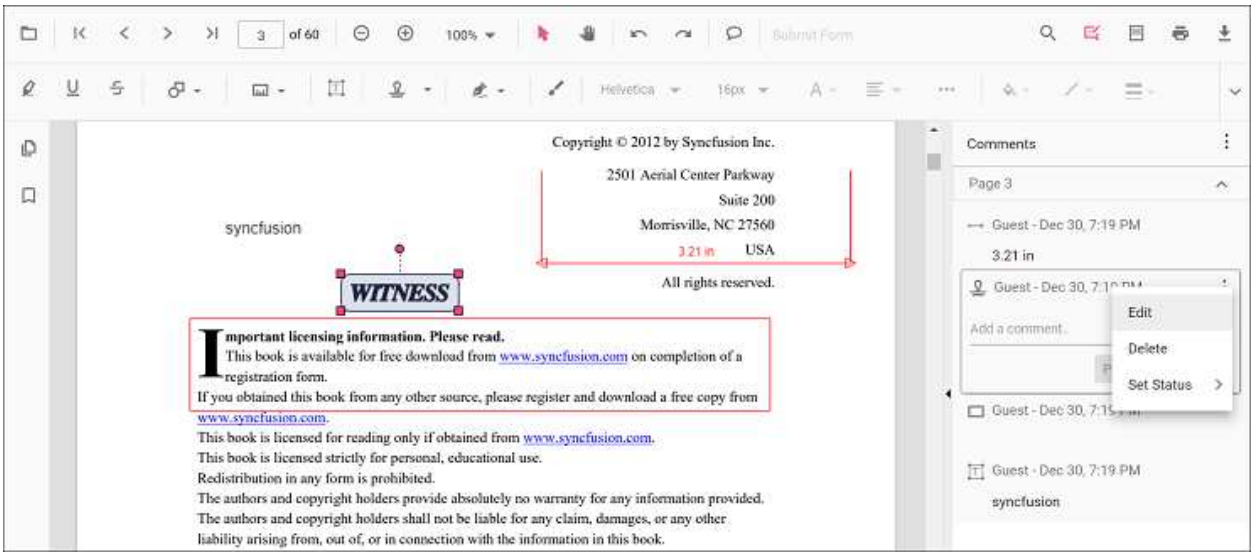
The annotation comment and comment replies can be edited in the following ways:

1. Using the Context menu
    - Select the Annotation Comments in the comment panel.
    - Click the More options button showing in the Comments or reply container.
    - Select the Edit option in the context menu that appears.
    - Now, an editable text box appears. You can change the content of the annotation comment or comment reply.
2. Using the Mouse Click
    - Select the annotation comments in the comment panel.
    - Double click the comment or comment reply content.
    - Now, an editable text box appears. You can change the content of the annotation comment or comment reply.

Editing Comment or Reply Status

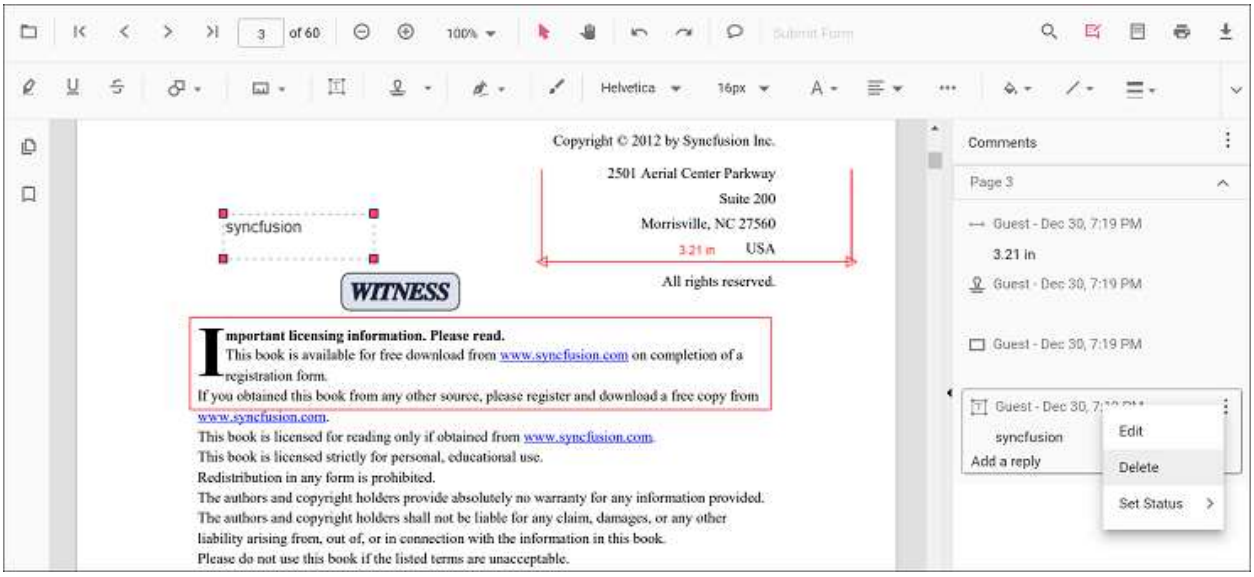
- Select the Annotation Comments in the comment panel.
- Click the more options button showing in the Comments or reply container.
- Select the Set Status option in the context menu that appears.
- Select the status of the annotation comment in the context menu that appears.
- Status ‘None’ is the default state. If the status is set to ‘None,’ the comments or reply does not appear.

Copyright © 2001 -2024 Syncfusion Inc.



Delete Comment or Comment Replies

- Select the Annotation Comments in the comment panel.
- Click the more options button shown in the Comments or reply container.
- Select the Delete option in the context menu that appears.



The annotation will be deleted on deleting the comment using comment panel.

Interaction mode in Vue Pdfviewer component

The PDF Viewer provides interaction mode for easy interaction with the loaded PDF document. Selection mode and panning mode are the two interactions modes.

Selection mode

In this mode, the text selection can be performed in the PDF document loaded in PDF Viewer. The panning and scrolling of the pages by touch cannot be performed in this mode. It allows users to select

and copy text from the PDF files. This is helpful for copying and sharing text content. You can enable/disable the text selection using the following code snippet.

STANDALONE

};
},
provide: {
PdfViewer: [ Toolbar, Magnification, Navigation, LinkAnnotation,
BookmarkView,
Annotation, ThumbnailView, Print, TextSelection, TextSearch ]},
}
</script>
```

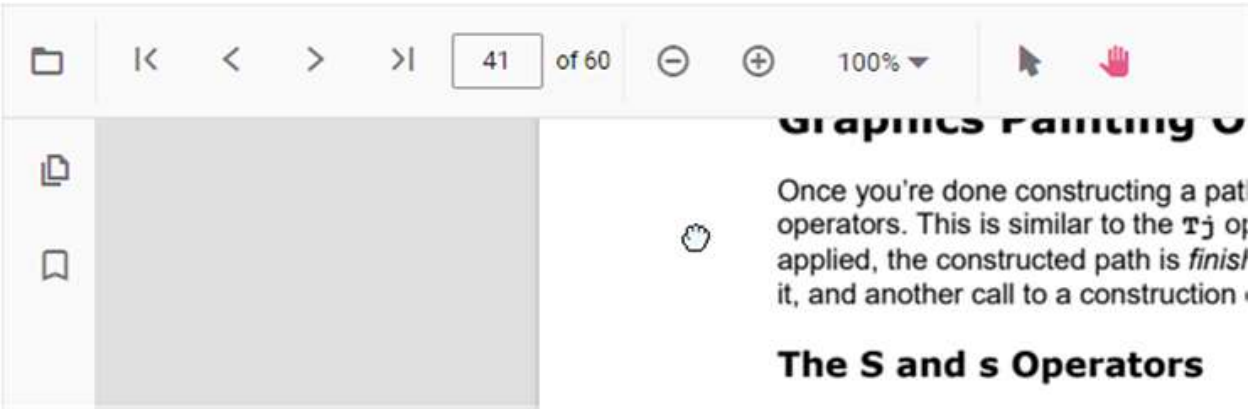
Panning Mode

In this mode, the panning and scrolling of the pages by touch can be performed in the PDF document loaded in the PDF Viewer, but the text selection cannot be performed.



You can switch the interaction mode of PDF Viewer by using the following code snippet.,

STANDALONE

```
<template>
<div id="app">
<ejs-pdfviewer
id="pdfViewer"
:documentPath="documentPath"
:enableTextSelection="false"
:interactionMode="interactionMode">
</ejs-pdfviewer>
</div>
</template>
<script>
import Vue from 'vue';
import { PdfViewerPlugin, Toolbar, Magnification, Navigation,
```

```
LinkAnnotation, BookmarkView, Annotation, ThumbnailView,
Print, TextSelection, TextSearch } from '@syncfusion/ej2-vue-pdfviewer';
Vue.use(PdfViewerPlugin);
export default {
name: 'app',
data () {
return {
documentPath:"https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf",
interactionMode:"InteractionMode.Pan"
};
},
provide: {
PdfViewer: [ Toolbar, Magnification, Navigation, LinkAnnotation,
BookmarkView,
Annotation, ThumbnailView, Print, TextSelection, TextSearch ]},
}
</script>
```

SERVER-BACKED

```
<template>
<div id="app">
<ejs-pdfviewer
id="pdfViewer"
:serviceUrl="serviceUrl"
:documentPath="documentPath"
:enableTextSelection="false"
:interactionMode="interactionMode">
</ejs-pdfviewer>
</div>
</template>
<script>
import Vue from 'vue';
import { PdfViewerPlugin, Toolbar, Magnification, Navigation,
LinkAnnotation, BookmarkView, Annotation, ThumbnailView,
Print, TextSelection, TextSearch } from '@syncfusion/ej2-vue-pdfviewer';
Vue.use(PdfViewerPlugin);
export default {
name: 'app',
data () {
return {
serviceUrl:"https://services.syncfusion.com/vue/production/api/pdfviewer",
documentPath:"https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf",
interactionMode:"InteractionMode.Pan"
};
},
provide: {
PdfViewer: [ Toolbar, Magnification, Navigation, LinkAnnotation,

Form Designer

Create form fields programmatically in Vue Pdfviewer component

The PDF Viewer control provides the option to add, edit and delete the Form Fields. The Form Fields type supported by the PDF Viewer Control are:

- Textbox
- Password
- CheckBox
- RadioButton
- ListBox
- DropDown
- SignatureField
- InitialField

Add a form field to PDF document programmatically

Using addFormField method, the form fields can be added to the PDF document programmatically. We need to pass two parameters in this method. They are Form Field Type and Properties of Form Field Type. To add form field programmatically, Use the following code.

APP.VUE

```
<template>
<div id="app">
<ejs-pdfviewer
id="pdfViewer"
ref="pdfviewer"
:documentPath="documentPath"
:documentLoad="documentLoad"
:resourceUrl="resourceUrl">
</ejs-pdfviewer>
</div>
</template>
<script>
import Vue from 'vue';
import { PdfViewerPlugin, Toolbar, Magnification, Navigation,
LinkAnnotation,
BookmarkView, ThumbnailView, Print, TextSelection, TextSearch,
Annotation, FormDesigner, FormFields } from '@syncfusion/ej2-vue-pdfviewer';
Vue.use(PdfViewerPlugin);
var viewer;
export default {
name: 'app',
data () {
return {
documentPath:"https://cdn.syncfusion.com/content/pdf/form-designer.pdf",
resourceUrl:"https://cdn.syncfusion.com/ej2/23.1.43/dist/ej2-pdfviewer-lib"
};
```

```
</script>
```

Note: To set up the **server-backed PDF Viewer** in the app.vue file, include the following serviceUrl:

serviceUrl: “https://services.syncfusion.com/vue/production/api/pdfviewer”

Within the template, configure the PDF Viewer by adding the :serviceUrl=“serviceUrl” attribute inside the element.

{% previewsample "page.domainurl/code-snippet/pdfviewer/addformfield-cs1" %}

Edit or update form field programmatically

Using updateFormField method, Form Field can be updated programmatically. We should get the Form Field object/Id from FormFieldCollections property that you would like to edit and pass it as a parameter to updateFormField method. The second parameter should be the properties that you would like to update for Form Field programmatically. We have updated the value and background Color properties of Textbox Form Field.

APP.VUE

```
<template>
<div id="app">
<ejs-pdfviewer
id="pdfViewer"
ref="pdfviewer"
:documentPath="documentPath"
:documentLoad="documentLoad"
:resourceUrl="resourceUrl">
</ejs-pdfviewer>
</div>
</template>
<script>

Reminder',bounds: { X: 56, Y: 740, Width: 20, Height: 20 },isChecked:
false,});
viewer.formDesignerModule.addFormField('CheckBox', {name: 'Request for
Customerservice',bounds: { X: 56, Y: 778, Width: 20, Height: 20 },isChecked:
false,});
viewer.formDesignerModule.addFormField('CheckBox', {name: 'Information
Billing',bounds: { X: 290, Y: 740, Width: 20, Height: 20 },isChecked:
false,});
viewer.formDesignerModule.addFormField('Textbox', {name: 'My Email',bounds:
{ X: 146, Y: 850, Width: 200, Height: 24 },});
viewer.formDesignerModule.addFormField('Textbox', {name: 'My Phone',bounds:
{ X: 482, Y: 850, Width: 200, Height: 24 },});
viewer.formDesignerModule.addFormField('SignatureField', {name:
'Sign',bounds: { X: 57, Y: 923, Width: 200, Height: 43 },});
viewer.formDesignerModule.addFormField('Textbox', {name: 'DOS Month',bounds:
{ X: 386, Y: 923, Width: 35, Height: 24 },});
viewer.formDesignerModule.addFormField('Textbox', {name: 'DOS Date',bounds:
{ X: 434, Y: 923, Width: 35, Height: 24 },});
viewer.formDesignerModule.addFormField('Textbox', {name: 'DOS Year',bounds:
{ X: 482, Y: 923, Width: 35, Height: 24 },});
viewer.formDesignerModule.updateFormField(viewer.formFieldCollections[0], {
backgroundColor: 'red' });
}
}
}
</script>
```

Note: To set up the **server-backed PDF Viewer** in the app.vue file, include the following serviceUrl:

serviceUrl: “https://services.syncfusion.com/vue/production/api/pdfviewer”

Copyright © 2001 -2024 Syncfusion Inc.

Within the template, configure the PDF Viewer by adding the :serviceUrl="serviceUrl" attribute inside the element.

{% previewsample "page.domainurl/code-snippet/pdfviewer/updateformfield-cs1" %}

Delete form field programmatically

Using deleteFormField method, the form field can be deleted programmatically. We should retrieve the Form Field object/Id from FormFieldCollections property that you would like to delete and pass it as a parameter to deleteFormField method. To delete a Form Field programmatically, use the following code.

APP.VUE

```
<template>
<div id="app">
<ejs-pdfviewer

},
}
}
</script>
```

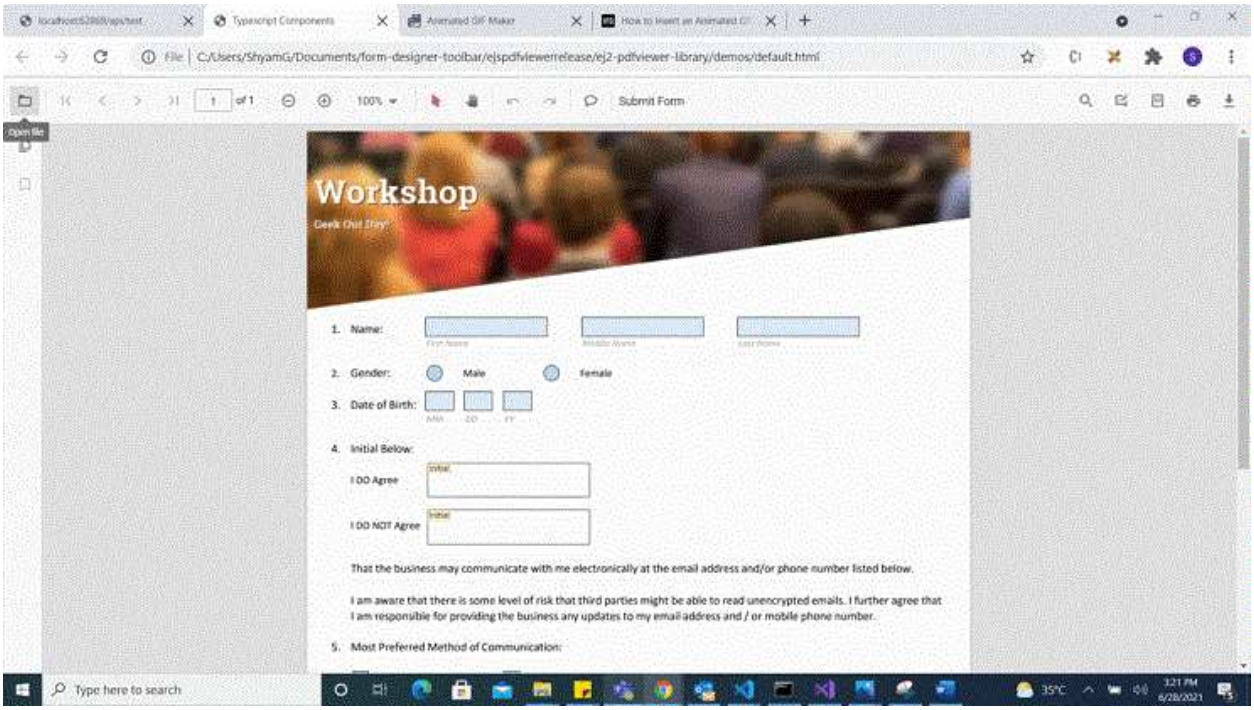
Open the existing PDF document

We can open the already saved PDF document contains Form Fields in it by clicking the open icon in the toolbar. Refer the below GIF for further reference.



Validate form fields

The form fields in the PDF Document will be validated when the enableFormFieldsValidation is set to true and hook the validateFormFields. The validateFormFields will be triggered when the PDF document is downloaded or printed with the non-filled form fields. The non-filled fields will be obtained in the nonFillableFields property of the event arguments of validateFormFields.

Add the following code snippet to validate the form fields,

STANDALONE

```
<template>
<div id="app">
<ejs-pdfviewer
id="pdfViewer"
ref="pdfviewer"
:documentPath="documentPath"
:documentLoad="documentLoad"
:enableFormFieldsValidation="true"
:validateFormFields="validateFormFields">
</ejs-pdfviewer>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
</div>
</template>
<script>
import Vue from 'vue';

Export and import form fields

The PDF Viewer control provides the support to export and import the form field data in the following formats using the methods importFormFields, exportFormFields, exportFormFieldsAsObject.

- FDF
- XFDF
- JSON
- XML

Export and import as FDF

Using the exportFormFields method, the form field data can be exported in the specified data format. This method accepts two parameters:

- The first one must be the destination path for the exported data. If path is not specified, it will ask for the location while exporting.
- The second parameter should be the format type of the form data.

The following code explains how to export and import the form field data as FDF.

```ts
<template>
<div id="app">
<button v-on:click="exportFdf">Export FDF</button>
<button v-on:click="imporFdf">Import FDF</button>
<ejs-pdfviewer
id="pdfViewer"
ref="pdfviewer"
:serviceUrl="serviceUrl"
:documentPath="documentPath">
</ejs-pdfviewer>
</div>
</template>
<script>
import Vue from 'vue';
import { PdfViewerPlugin, Toolbar, Magnification, Navigation, LinkAnnotation,
BookmarkView,ThumbnailView, Print,TextSelection, TextSearch,
Annotation, FormDesigner, FormFields, FormFieldDataFormat } from '@syncfusion/ej2-vue-pdfviewer';
Vue.use(PdfViewerPlugin);
export default {
```

```
name: 'app',
data () {
return {
serviceUrl:"https://services.syncfusion.com/vue/production/api/pdfviewer",
documentPath:"https://cdn.syncfusion.com/content/pdf/form-designer.pdf"
};
},
provide: {
PdfViewer: [ Toolbar, Magnification, Navigation, LinkAnnotation, Annotation, BookmarkView,
ThumbnailView, Print, TextSelection, TextSearch, FormFields, FormDesigner ]},
methods: {
// Event triggers on the Export FDF button click.
exportFdf: function () {
// Data must be the desired path for the exported document.
var viewer = document.getElementById('pdfViewer').ej2_instances[0];
viewer.exportFormFields('Data', FormFieldDataFormat.Fdf);
},
// Event triggers on the Import FDF button click.
importFdf: function () {
var viewer = document.getElementById('pdfViewer').ej2_instances[0];
// The file for importing the form fields should be placed in the desired location and the path should be provided correctly
viewer.importFormFields('File',FormFieldDataFormat.Fdf);
},
}
}
</script>
`
```

Export and import as XFDF

The following code explains how to export and import the form field data as XFDF.

```
`ts
<template>
<div id="app">
<button v-on:click="exportXfdf">Export XFDF</button>
```

```
<button v-on:click="importXfdf">Import XFDF</button>
<ejs-pdfviewer
id="pdfViewer"
ref="pdfviewer"
:serviceUrl="serviceUrl"
:documentPath="documentPath">
</ejs-pdfviewer>
</div>
</template>
<script>
import Vue from 'vue';
import { PdfViewerPlugin, Toolbar, Magnification, Navigation, LinkAnnotation,
BookmarkView,ThumbnailView, Print,TextSelection, TextSearch,
Annotation, FormDesigner, FormFields, FormFieldDataFormat } from '@syncfusion/ej2-vue-pdfviewer';
Vue.use(PdfViewerPlugin);
export default {
name: 'app',
data () {
return {
serviceUrl:"https://services.syncfusion.com/vue/production/api/pdfviewer",
documentPath:"https://cdn.syncfusion.com/content/pdf/form-designer.pdf"
};
},
provide: {
PdfViewer: [ Toolbar, Magnification, Navigation, LinkAnnotation, Annotation, BookmarkView,
ThumbnailView, Print, TextSelection, TextSearch, FormFields, FormDesigner ]},
methods: {
// Event triggers on the Export XFDF button click.
exportXfdf: function () {
// Data must be the desired path for the exported document.
var viewer = document.getElementById('pdfViewer').ej2_instances[0];
viewer.exportFormFields('Data', FormFieldDataFormat.Xfdf);
},
```

Copyright © 2001 -2024 Syncfusion Inc.

```
// Event triggers on the Import XFDF button click.
importXfdf: function () {
var viewer = document.getElementById('pdfViewer').ej2_instances[0];
// The file for importing the form fields should be placed in the desired location and the path should be provided correctly
viewer.importFormFields('File',FormFieldDataFormat.Xfdf);
},
}
}
</script>
`
```

Export and import as JSON

The following code explains how to export and import the form field data as JSON.

```
`ts
<template>
<div id="app">
<button v-on:click="exportJson">Export JSON</button>
<button v-on:click="importJson">Import JSON</button>
<ejs-pdfviewer
id="pdfViewer"
ref="pdfviewer"
:serviceUrl="serviceUrl"
:documentPath="documentPath">
</ejs-pdfviewer>
</div>
</template>
<script>
import Vue from 'vue';
import { PdfViewerPlugin, Toolbar, Magnification, Navigation, LinkAnnotation,
BookmarkView,ThumbnailView, Print,TextSelection, TextSearch,
Annotation, FormDesigner, FormFields, FormFieldDataFormat } from '@syncfusion/ej2-vue-pdfviewer';
Vue.use(PdfViewerPlugin);
export default {
name: 'app',
```

```
data () {
return {
serviceUrl:"https://services.syncfusion.com/vue/production/api/pdfviewer",
documentPath:"https://cdn.syncfusion.com/content/pdf/form-designer.pdf"
};
},
provide: {
PdfViewer: [ Toolbar, Magnification, Navigation, LinkAnnotation, Annotation, BookmarkView,
ThumbnailView, Print, TextSelection, TextSearch, FormFields, FormDesigner ]},
methods: {
// Event triggers on the Export JSON button click.
exportJson: function () {
// Data must be the desired path for the exported document.
var viewer = document.getElementById('pdfViewer').ej2_instances[0];
viewer.exportFormFields('Data', FormFieldDataFormat.Json);
},
// Event triggers on the Import JSON button click.
importJson: function () {
var viewer = document.getElementById('pdfViewer').ej2_instances[0];
// The file for importing the form fields should be placed in the desired location and the path should be provided correctly
viewer.importFormFields('File',FormFieldDataFormat.Json);
},
}
}
`
```

Export and import as Object

The PDF Viewer control supports exporting the form field data as an object, and the exported data will be imported into the current PDF document from the object.

The following code shows how to export the form field data as an object and import the form field data from that object into the current PDF document via a button click.

```ts
<template>
<div id="app">
```

```
<button v-on:click="exportDataAsObject">Export Object</button>
<button v-on:click="importData">Import Data</button>
<ejs-pdfviewer
id="pdfViewer"
ref="pdfviewer"
:serviceUrl="serviceUrl"
:documentPath="documentPath">
</ejs-pdfviewer>
</div>
</template>
<script>
import Vue from 'vue';
import { PdfViewerPlugin, Toolbar, Magnification, Navigation, LinkAnnotation,
BookmarkView,ThumbnailView, Print,TextSelection, TextSearch,
Annotation, FormDesigner, FormFields, FormFieldDataFormat } from '@syncfusion/ej2-vue-pdfviewer';
Vue.use(PdfViewerPlugin);
var exportedData;
export default {
name: 'app',
data () {
return {
serviceUrl:"https://services.syncfusion.com/vue/production/api/pdfviewer"
documentPath:"https://cdn.syncfusion.com/content/pdf/form-designer.pdf"
};
},
provide: {
PdfViewer: [ Toolbar, Magnification, Navigation, LinkAnnotation, Annotation, BookmarkView,
ThumbnailView, Print, TextSelection, TextSearch, FormFields, FormDesigner ]},
methods: {
// Event triggers on the Export Object button click.
exportDataAsObject: function (args) {
// Export the form fields data to an FDF object.
exportedData = viewer.exportFormFieldsAsObject(FormFieldDataFormat.Fdf);
```

Copyright © 2001 -2024 Syncfusion Inc.

```
//// Export the form fields data to an XFDF object.
//exportedData = viewer.exportFormFieldsAsObject(FormFieldDataFormat.Xfdf);
//// Export the form fields data to an JSON object.
//exportedData = viewer.exportFormFieldsAsObject(FormFieldDataFormat.Json);
},
// Event triggers on the Import Data button click.
importData: function (args) {
// Import the form fields data from the FDF object into the current PDF document.
viewer.importFormFields(exportedData, FormFieldDataFormat.Fdf);
//// Import the form fields data from the XFDF object into the current PDF document.
//viewer.importFormFields(exportedData, FormFieldDataFormat.Xfdf);
//// Import the form fields data from the JSON object into the current PDF document.
//viewer.importFormFields(exportedData, FormFieldDataFormat.Json);
},
}
}
`
```

Export and import as XML

The following code explains how to export and import the form field data as XML.

```ts
<template>
<div id="app">
<button v-on:click="exportXml">Export XML</button>
<button v-on:click="importXml">Import XML</button>
<ejs-pdfviewer
id="pdfViewer"
ref="pdfviewer"
:serviceUrl="serviceUrl"
:documentPath="documentPath">
</ejs-pdfviewer>
</div>
</template>
<script>
```

```
import Vue from 'vue';
import { PdfViewerPlugin, Toolbar, Magnification, Navigation, LinkAnnotation,
BookmarkView,ThumbnailView, Print,TextSelection, TextSearch,
Annotation, FormDesigner, FormFields, FormFieldDataFormat } from '@syncfusion/ej2-vue-pdfviewer';
Vue.use(PdfViewerPlugin);
export default {
name: 'app',
data () {
return {
serviceUrl:"https://services.syncfusion.com/vue/production/api/pdfviewer",
documentPath:"https://cdn.syncfusion.com/content/pdf/form-designer.pdf"
};
},
provide: {
PdfViewer: [ Toolbar, Magnification, Navigation, LinkAnnotation, Annotation, BookmarkView,
ThumbnailView, Print, TextSelection, TextSearch, FormFields, FormDesigner ]},
methods: {
// Event triggers on the Export XML button click.
exportXml: function () {
// Data must be the desired path for the exported document.
var viewer = document.getElementById('pdfViewer').ej2_instances[0];
viewer.exportFormFields('Data', FormFieldDataFormat.Xml);
},
// Event triggers on the Import XML button click.
importXml: function () {
var viewer = document.getElementById('pdfViewer').ej2_instances[0];
// The file for importing the form fields should be placed in the desired location and the path should be
provided correctly
viewer.importFormFields('File',FormFieldDataFormat.Xml);
},
}
}
`
```

Form field properties

Form field properties in Syncfusion PDF Viewer allow you to customize and interact with form fields embedded within PDF documents. This documentation provides an overview of the form field properties supported by the Syncfusion PDF Viewer and explains how to use them effectively.

- Textbox
- Password
- CheckBox
- RadioButton
- ListBox
- DropDown
- SignatureField
- InitialField

Signature and initial fields settings

Using the updateFormField method, the form fields can be updated programmatically.

The following code example explains how to update the signature field properties on a button click.

STANDALONE

```
<template>
<div id="app">
<button v-on:click="updateProperties">Update Properties</button>
<ejs-pdfviewer
id="pdfViewer"
ref="pdfviewer"
:documentPath="documentPath">
</ejs-pdfviewer>
</div>
</template>
<script>
import Vue from 'vue';
import { PdfViewerPlugin, Toolbar, Magnification, Navigation,
LinkAnnotation, BookmarkView, Annotation, ThumbnailView,
Print, TextSelection, TextSearch, FormFields, FormDesigner } from
'@syncfusion/ej2-vue-pdfviewer';
Vue.use(PdfViewerPlugin);
var viewer;
export default {
name: 'app',
data () {
return {
documentPath:"https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf"
};
},
provide: {
PdfViewer: [ Toolbar, Magnification, Navigation, LinkAnnotation,
BookmarkView, Annotation,
ThumbnailView, Print, TextSelection, TextSearch, FormFields, FormDesigner
]},
methods: {
// Event triggers on the Update Properties button click.
updateProperties: function (args) {
```

```
viewer = this.$refs.pdfviewer.ej2Instances;
var formField = viewer.retrieveFormFields();
viewer.formDesignerModule.updateFormField(formField[0], {
name: 'Signature',
isReadOnly: true,
visibility: 'visible',
isRequired: false,
isPrint: true,
tooltip: 'Signature',
thickness: 4
});
},
}
}
</script>
```

SERVER-BACKED

```
<template>
<div id="app">
<button v-on:click="updateProperties">Update Properties</button>
<ejs-pdfviewer
id="pdfViewer"
ref="pdfviewer"
:serviceUrl="serviceUrl"
:documentPath="documentPath">
</ejs-pdfviewer>
</div>
</template>
<script>
import Vue from 'vue';
import { PdfViewerPlugin, Toolbar, Magnification, Navigation,
LinkAnnotation, BookmarkView, Annotation, ThumbnailView,
Print, TextSelection, TextSearch, FormFields, FormDesigner } from
'@syncfusion/ej2-vue-pdfviewer';
Vue.use(PdfViewerPlugin);
var viewer;
export default {
name: 'app',
data () {
return {
serviceUrl:"https://services.syncfusion.com/vue/production/api/pdfviewer",
documentPath:"https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf"
};
},
provide: {
PdfViewer: [ Toolbar, Magnification, Navigation, LinkAnnotation,
BookmarkView, Annotation,
ThumbnailView, Print, TextSelection, TextSearch, FormFields, FormDesigner
]},
methods: {
// Event triggers on the Update Properties button click.
updateProperties: function (args) {
viewer = this.$refs.pdfviewer.ej2Instances;
var formField = viewer.retrieveFormFields();
viewer.formDesignerModule.updateFormField(formField[0], {
```

Copyright © 2001 -2024 Syncfusion Inc.

```
name: 'Signature',
isReadOnly: true,
visibility: 'visible',
isRequired: false,
isPrint: true,
tooltip: 'Signature',
thickness: 4
});
},
}
}
</script>
```

The following code example explains how to update the properties of the signature field added to the document from the form designer toolbar.

`ts

// Properties to customize the signature field settings

viewer.signatureFieldSettings = {

// Set the name of the form field element.

name: 'Signatute',

// Specify whether the signature field is in read-only or read-write mode.

isReadOnly: false,

// Set the visibility of the form field.

visibility: 'visible',

// Specify whether the field is mandatory or not.

isRequired: false,

// Specify whether to print the signature field.

isPrint: true,

// Set the text to be displayed as a tooltip.

tooltip: 'Signatute',

// Set the thickness of the signature field. To hide the borders, set the value to 0 (zero).

thickness: 4,

// Specify the properties of the signature Dialog Settings in the signature field.

signatureDialogSettings: {

isplayMode: DisplayMode.Draw | DisplayMode.Upload | DisplayMode.Text,

hideSaveSignature: false,

},

// Specify the properties of the signature indicator in the signature field.

Copyright © 2001 -2024 Syncfusion Inc.

signatureIndicatorSettings: {

opacity: 1,

backgroundColor: '#237ba2',

height: 50,

fontSize: 15,

text: 'Signature Field',

color: 'white'

},

};

`

The following code example explains how to update the properties of the initial field added to the document from the form designer toolbar.

`ts

// Properties to customize the initial field settings

viewer.initialFieldSettings = {

// Set the name of the form field element.

name: 'Initial',

// Specify whether the initial field is in read-only or read-write mode.

isReadOnly: false,

// Set the visibility of the form field.

visibility: 'visible',

// Specify whether the field is mandatory or not.

isRequired: false,

// Specify whether to print the initial field.

isPrint: true,

// Set the text to be displayed as tooltip.

tooltip: 'Initial',

// Set the thickness of the initial field. To hide the borders, set the value to 0 (zero).

thickness: 4,

// Specify the properties of the initial indicator in the initial field.

Copyright © 2001 -2024 Syncfusion Inc.

initialIndicatorSettings: {

opacity: 1,

backgroundColor: '#237ba2',

height: 50,

fontSize: 15,

text: 'Initial Field',

color: 'white'

},

// Specify the properties of the initial Dialog Settings in the intial field.

initialDialogSettings: {

displayMode: DisplayMode.Draw | DisplayMode.Upload | DisplayMode.Text,

hideSaveSignature: false

}

};

`

Textbox field settings

Using the updateFormField method, the form fields can be updated programmatically.

The following code example explains how to update the Textbox field properties on a button click.

STANDALONE

Create form fields with UI interaction in Vue Pdfviewer component

The PDF viewer control provides the option for interaction with Form Fields such as Drag and resize. you can draw a Form Field dynamically by clicking the Form Field icon on the toolbar and draw it in the PDF document. The Form Fields type supported by the PDF Viewer Control are:

- Textbox
- Password
- CheckBox
- RadioButton
- ListBox
- DropDown
- SignatureField
- InitialField

Enable or Disable form designer toolbar

We should inject FormDesigner module and set enableFormDesignerToolbar as true to enable the Form designer icon on the toolbar. By default, enableFormDesignerToolbar is set as true. Use the following code to inject FormDesigner module and to enable the enableFormDesignerToolbar property.

STANDALONE

```
<template>
<div id="app">
<ejs-pdfviewer
id="pdfViewer"
ref="pdfviewer"
:documentPath="documentPath"
:enableFormDesignerToolbar= "false">
</ejs-pdfviewer>
</div>
</template>
<script>
import Vue from 'vue';
import { PdfViewerPlugin, Toolbar, Magnification, Navigation,
LinkAnnotation,
BookmarkView, ThumbnailView, Print, TextSelection, TextSearch,
Annotation, FormDesigner, FormFields } from '@syncfusion/ej2-vue-pdfviewer';
Vue.use(PdfViewerPlugin);
export default {
name: 'app',
```

```
data () {
return {
documentPath:"https://cdn.syncfusion.com/content/pdf/form-designer.pdf",
};
},
provide: {
PdfViewer: [ Toolbar, Magnification, Navigation, LinkAnnotation,
BookmarkView, ThumbnailView,
Print, TextSelection, TextSearch, Annotation, FormDesigner, FormFields ]}
}
</script>
```

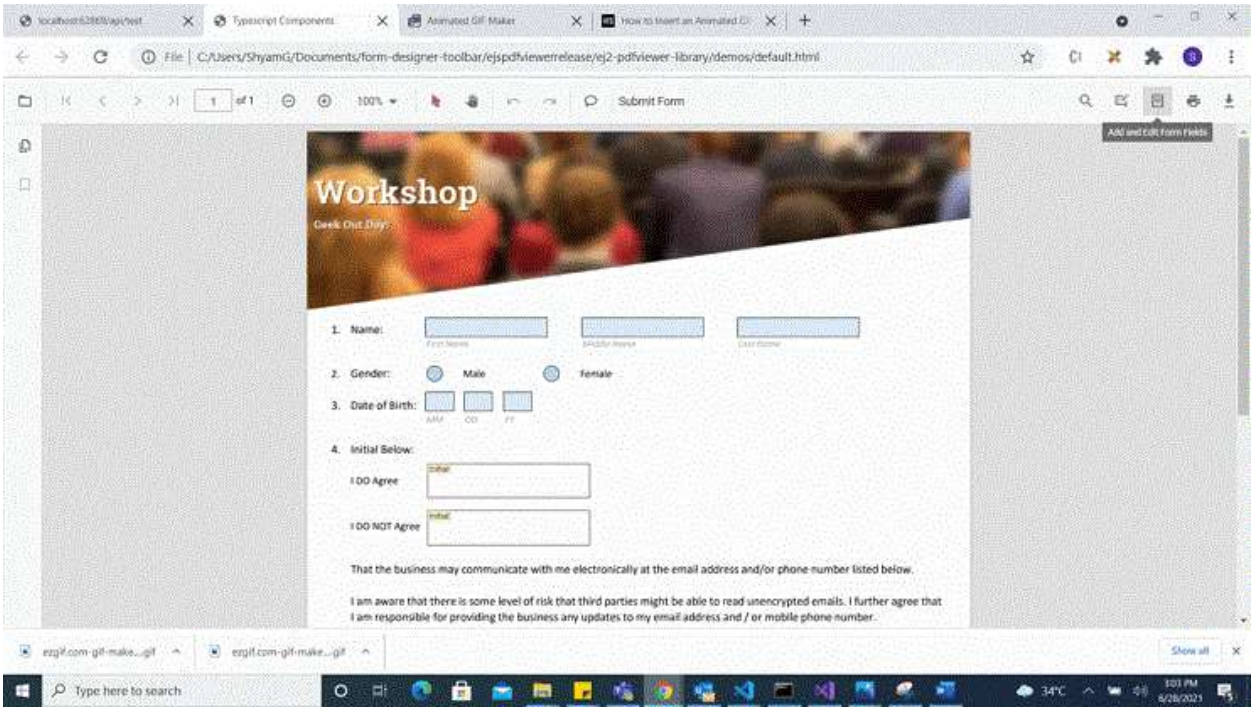
SERVER-BACKED

```
<template>
<div id="app">
<ejs-pdfviewer
id="pdfViewer"
ref="pdfviewer"
:documentPath="documentPath"
:serviceUrl="serviceUrl"
:enableFormDesignerToolbar= "false">
</ejs-pdfviewer>
</div>
</template>
<script>
import Vue from 'vue';
import { PdfViewerPlugin, Toolbar, Magnification, Navigation,
LinkAnnotation,
BookmarkView, ThumbnailView, Print, TextSelection, TextSearch,
Annotation, FormDesigner, FormFields } from '@syncfusion/ej2-vue-pdfviewer';
Vue.use(PdfViewerPlugin);
export default {
name: 'app',
data () {
return {
serviceUrl:"https://services.syncfusion.com/vue/production/api/pdfviewer",
documentPath:"https://cdn.syncfusion.com/content/pdf/form-designer.pdf"
};
},
provide: {
PdfViewer: [ Toolbar, Magnification, Navigation, LinkAnnotation,
BookmarkView, ThumbnailView,
Print, TextSelection, TextSearch, Annotation, FormDesigner, FormFields ]}
}
</script>
```

Add the form field dynamically

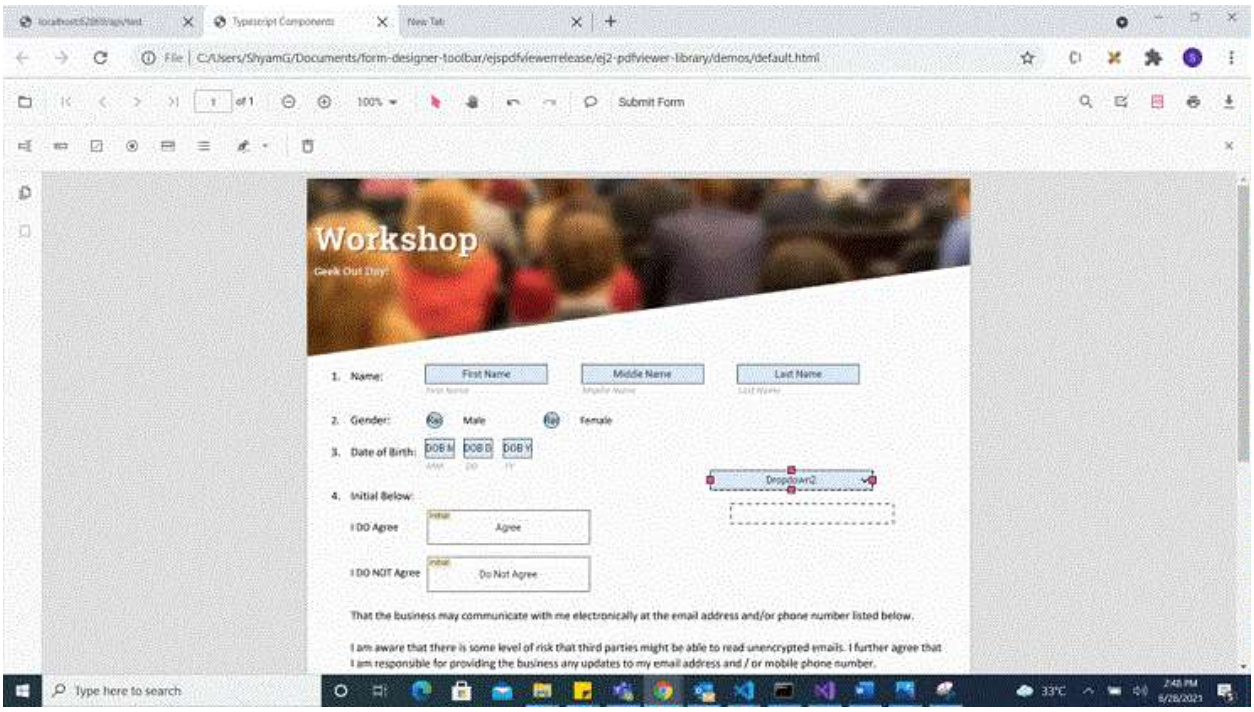
Click the Form Field icon on the toolbar and then click on to the PDF document to draw a Form Field. Refer the below GIF for further reference.

Copyright © 2001 -2024 Syncfusion Inc.



Drag the form field

We provide options to drag the Form Field which is currently selected in the PDF document. Refer the below GIF for further reference.



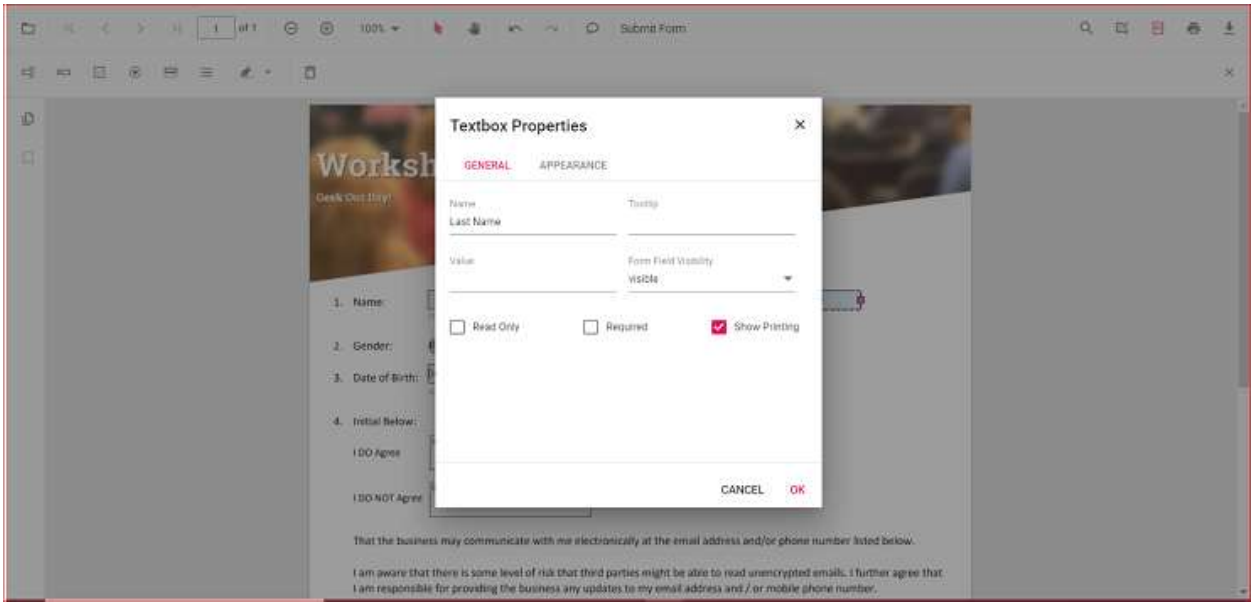
Resize the form field

We provide options to resize the Form Field which is currently selected in the PDF document. Refer the below GIF for further reference.

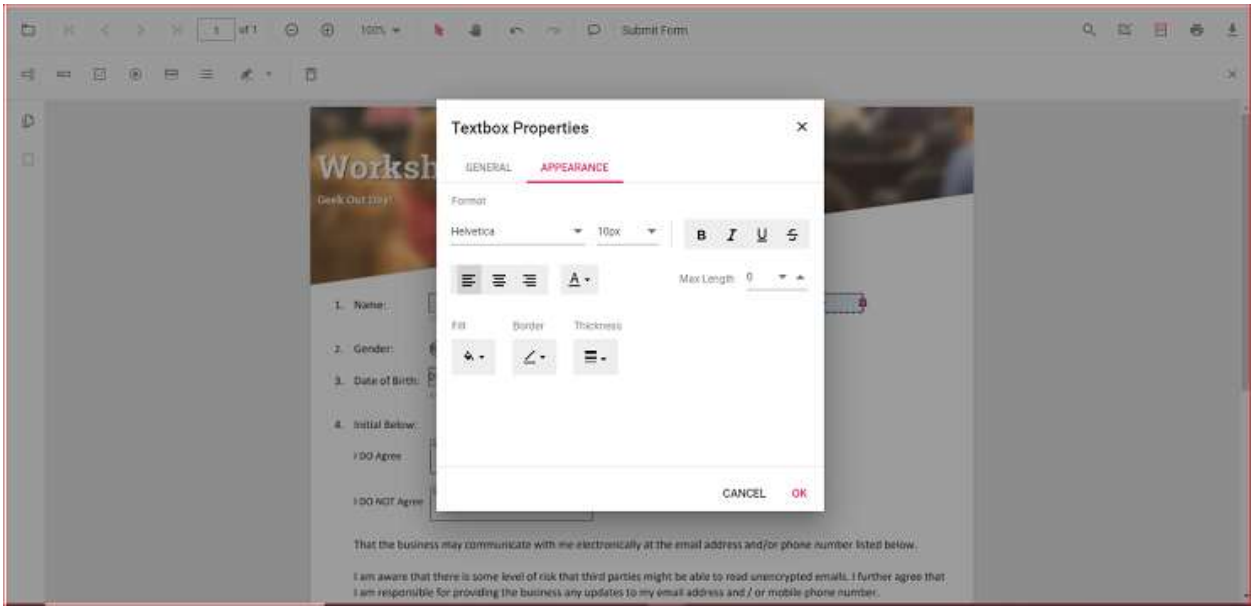
Copyright © 2001 -2024 Syncfusion Inc.

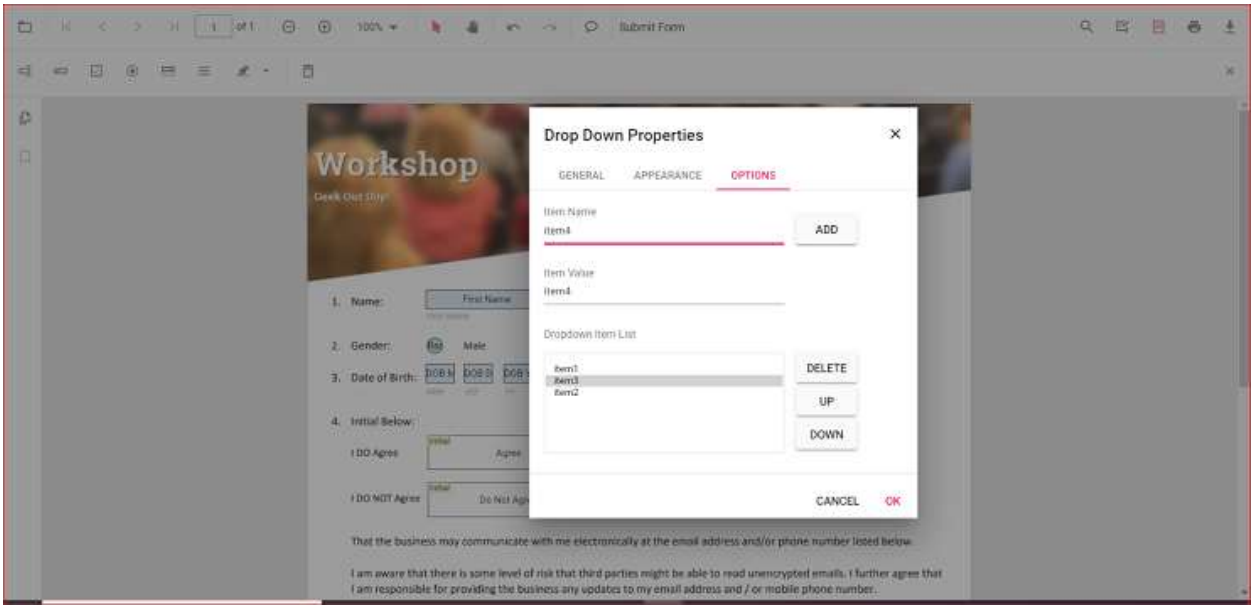
Edit or Update the form field dynamically

The properties of the Form Fields can be edited using the Form Field Properties window. It can be opened by selecting the Properties option in the context menu that appears on the right by clicking the Form Field object. Refer the below image for the properties available to customize the appearance of the Form Field.



Copyright © 2001 -2024 Syncfusion Inc.

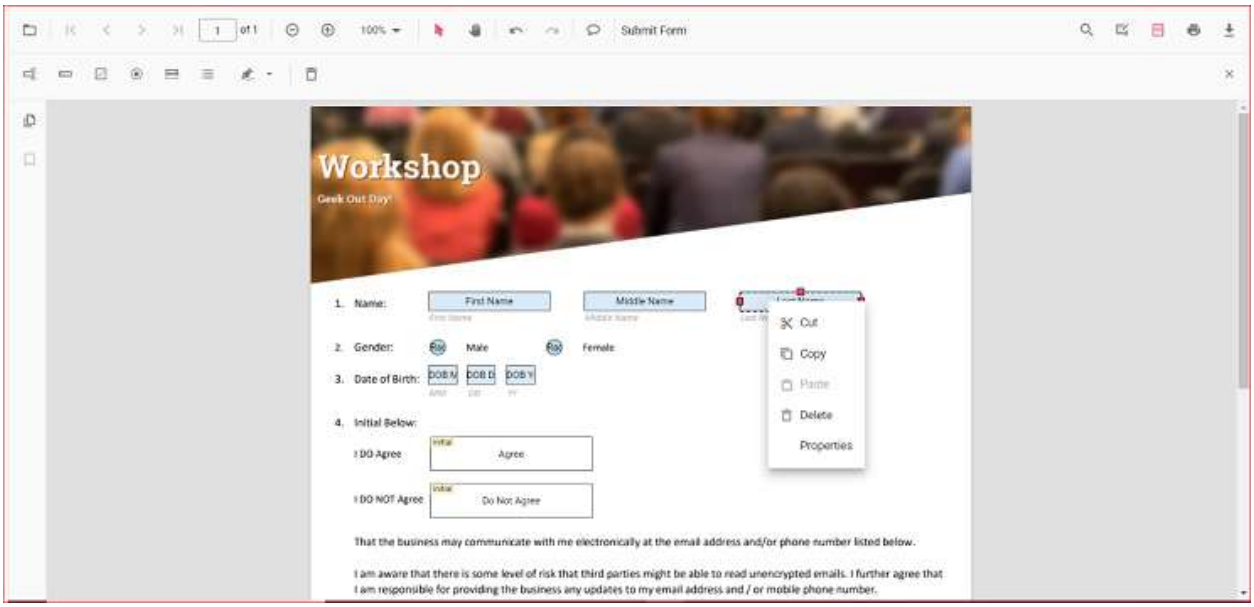




Clipboard operation with form field

The PDF Viewer control supports the clipboard operations such as cut, copy and paste for Form Fields. You can right click on the Form Field object to view the context menu and select to the clipboard options that you would like to perform. Refer the below image for the options in the context menu.

Copyright © 2001 -2024 Syncfusion Inc.



Undo and Redo

We provided support to undo/redo the Form Field actions that are performed at runtime. Use the following code example to perform undo/redo actions.

STANDALONE

```
<template>
<div id="app">
<button v-on:click="undoClicked">Undo</button>
<button v-on:click="redoClicked">Redo</button>
<ejs-pdfviewer
id="pdfViewer"
ref="pdfviewer"
:documentPath="documentPath">
</ejs-pdfviewer>
</div>
</template>
<script>
import Vue from 'vue';

Globalization in Vue Pdfviewer component

The text contents provided in the PDF Viewer can be localized using the collection of localized strings for different cultures. By default, the PDF Viewer is localized in "**en-US**".

The following table shows the default text values used in PDF Viewer in 'en-US' culture:

|Keywords|Values|

|---|---|

|PdfViewer|PDF Viewer|

|Cancel|Cancel|

|Download file|Download file|

|Download|Download|

|Enter Password|This document is password protected. Please enter a password.|

|File Corrupted|File corrupted|

|File Corrupted Content|The file is corrupted and cannot be opened.|

|Fit Page|Fit page|

|Fit Width|Fit width|

|Automatic|Automatic|

|Go To First Page|Show first page|

|Invalid Password|Incorrect password. Please try again.|

|Next Page|Show next page|

|OK|OK|

How To

Toolbar customization in Vue Pdfviewer component

The PDF Viewer provides API for user interactions options provided in it's built-in toolbar. Using this we can create our own User Interface for toolbar actions in application level by hiding the default toolbar. The following steps are used to create the custom toolbar for PDF Viewer,

Step 1: Follow the steps provided in the link to create simple PDF Viewer sample.

Step 2: Now, add an HTML div element in template to act as the custom toolbar PDF Viewer using the following code.

STANDALONE

```
<template>
<div>
<ejs-toolbar id="customToolbar" ref="toolbar">
<e-items>
<e-item prefixIcon='e-pv-open-document-icon' tooltipText='Open'
:click="openClicked"></e-item>
<e-item prefixIcon='e-pv-previous-page-navigation-icon' id="previousPage"
tooltipText='Previous Page' align='Center' :click="previousClicked"></e-
item>
<e-item prefixIcon='e-pv-next-page-navigation-icon' id="nextPage"
tooltipText='Next Page' align='Center' :click="nextClicked"></e-item>
<e-item :template='pageNoTemplate' tooltipText='Page Number'
align='Center'></e-item>
<e-item :template='pageTextTemplate' tooltipText='Page Number'
align='Center'></e-item>
<e-item prefixIcon='e-pv-print-document-icon' tooltipText='Print'
align='Right' :click="printClicked"></e-item>
<e-item prefixIcon='e-pv-download-document-icon' tooltipText='Download'
align='Right' :click="downloadClicked"></e-item>
</e-items>
</ejs-toolbar>
<ejs-toolbar id="magnificationToolbar">
<e-items>
<e-item prefixIcon='e-pv-fit-page-icon' id="fitPage" tooltipText='Fit to
page' :click="pageFitClicked"></e-item>
<e-item prefixIcon='e-pv-zoom-in-icon' id="zoomIn" tooltipText='Zoom in'
:click="zoomInClicked"></e-item>
<e-item prefixIcon='e-pv-zoom-out-icon' id="zoomOut" tooltipText='Zoom out'
:click="zoomOutClicked"></e-item>
</e-items>
</ejs-toolbar>
<input type ="file" id="fileUpload" accept=".pdf"
style="display:block;visibility:hidden;width:0;height:0;"></input>
<div class="control-section">
<ejs-pdfviewer
id="pdfviewer"
ref="pdfviewer"
:pageChange="pageChange"
:documentLoad="documentLoad"
:serviceUrl="serviceUrl"
:documentPath="documentPath"
:enableToolbar="enableToolbar">
</ejs-pdfviewer>
```

```
</div>
</div>
</template>
```

SERVER-BACKED

```
<template>
<div>
<ejs-toolbar id="customToolbar" ref="toolbar">
<e-items>
<e-item prefixIcon='e-pv-open-document-icon' tooltipText='Open'
:click="openClicked"></e-item>
<e-item prefixIcon='e-pv-previous-page-navigation-icon' id="previousPage"
tooltipText='Previous Page' align='Center' :click="previousClicked"></e-
item>
<e-item prefixIcon='e-pv-next-page-navigation-icon' id="nextPage"
tooltipText='Next Page' align='Center' :click="nextClicked"></e-item>
<e-item :template='pageNoTemplate' tooltipText='Page Number'
align='Center'></e-item>
<e-item :template='pageTextTemplate' tooltipText='Page Number'
align='Center'></e-item>
<e-item prefixIcon='e-pv-print-document-icon' tooltipText='Print'
align='Right' :click="printClicked"></e-item>
<e-item prefixIcon='e-pv-download-document-icon' tooltipText='Download'
align='Right' :click="downloadClicked"></e-item>
</e-items>
</ejs-toolbar>
<ejs-toolbar id="magnificationToolbar">
<e-items>
<e-item prefixIcon='e-pv-fit-page-icon' id="fitPage" tooltipText='Fit to
page' :click="pageFitClicked"></e-item>
<e-item prefixIcon='e-pv-zoom-in-icon' id="zoomIn" tooltipText='Zoom in'
:click="zoomInClicked"></e-item>
<e-item prefixIcon='e-pv-zoom-out-icon' id="zoomOut" tooltipText='Zoom out'
:click="zoomOutClicked"></e-item>
</e-items>
</ejs-toolbar>
<input type ="file" id="fileUpload" accept=".pdf"
style="display:block;visibility:hidden;width:0;height:0;"></input>
<div class="control-section">
<ejs-pdfviewer
id="pdfviewer"
ref="pdfviewer"
:pageChange="pageChange"
:documentLoad="documentLoad"
:documentPath="documentPath"
:enableToolbar="enableToolbar">
</ejs-pdfviewer>
</div>
</div>
</template>
```

Step 3: Import and inject the modules used for the custom toolbar,

`ts

import Vue from "vue";

import { PdfViewerPlugin, Toolbar, Magnification, Navigation,

LinkAnnotation, BookmarkView, Annotation, ThumbnailView,

Print, TextSelection, TextSearch, FormFields, FormDesigner } from "@syncfusion/ej2-vue-pdfviewer";

import { ToolbarPlugin } from "@syncfusion/ej2-vue-navigations";

import { CalendarPlugin } from '@syncfusion/ej2-vue-calendars';

Vue.use(CalendarPlugin);

Vue.use(PdfViewerPlugin);

Vue.use(ToolbarPlugin);

`

Step 4: Hide the default toolbar of PDF Viewer using below code snippet,

STANDALONE

```
export default Vue.extend({
data: function () {
return {
documentPath: "https://cdn.syncfusion.com/content/pdf/hive-succinctly.pdf",
enableToolbar: false,
pageNoTemplate: '<div class=""><input type="text" class="e-input-group e-pv-current-page-number" id="currentPage" /></div>',
pageTextTemplate: '<div class=""><span class="e-pv-total-page-number" id="totalPage">of 0</span></div>'
}
})
};
```

SERVER-BACKED

```
export default Vue.extend({
data: function () {
return {
serviceUrl: "https://services.syncfusion.com/vue/production/api/pdfviewer",
documentPath: "https://cdn.syncfusion.com/content/pdf/hive-succinctly.pdf",
enableToolbar: false,
pageNoTemplate: '<div class=""><input type="text" class="e-input-group e-pv-current-page-number" id="currentPage" /></div>',
pageTextTemplate: '<div class=""><span class="e-pv-total-page-number" id="totalPage">of 0</span></div>'
}
})
};
```

Step 7: Add the following style to achieve the custom toolbar styling,

`

<style>

Copyright © 2001 -2024 Syncfusion Inc.

```
pdfviewer {
height: 640px;
}
.control-section {
padding-top: 0px !important;
}
magnificationToolbar {
background: transparent;
height: auto;
min-height: 56px;
width: auto;
border: none;
position: absolute;
z-index: 900;
top: calc(100% - 110px);
left: calc(100% - 120px);
transform: rotate(90deg);
}
div#magnificationToolbar.e-toolbar .e-toolbar-items {
background: transparent;
padding: 2px 3px 2px 2px;
}
magnificationToolbar.e-toolbar .e-tbar-btn {
border-radius: 50%;
min-height: 30px;
min-width: 30px;
border: 1px solid #c8c8c8;
}
customToolbar {
top: 0px;
z-index: 900;
}
.e-bookmark-popup {

Load documents in Vue Pdfviewer component

The PDF Viewer library allows you to switch or load PDF documents dynamically after the initial load operation. To achieve this, load the PDF document as a base64 string or file name into the PDF Viewer control using the **Load()** method dynamically.

The following steps are used to load the PDF document dynamically.

Step 1: Follow the steps provided in the link to create a simple PDF Viewer sample.

Step 2: Use the following code snippet to load the PDF document using a base64 string.

STANDALONE

```
<template>
<div id="app">
<button v-on:click="load">LoadDocument</button>
<ejs-pdfviewer
id="pdfViewer"
ref="pdfviewer"
:documentPath="documentPath">
</ejs-pdfviewer>
</div>
</template>
<script>
import Vue from 'vue';
import { PdfViewerPlugin, Toolbar, Magnification, Navigation,
LinkAnnotation, BookmarkView, Annotation, ThumbnailView,
Print, TextSelection, TextSearch, FormFields, FormDesigner } from
'@syncfusion/ej2-vue-pdfviewer';
Vue.use(PdfViewerPlugin);
export default {
name: 'app',
data () {
return {
documentPath:"https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf",
};
},
provide: {
PdfViewer: [ Toolbar, Magnification, Navigation, LinkAnnotation,
BookmarkView, Annotation,
ThumbnailView, Print, TextSelection, TextSearch, FormFields, FormDesigner
]},
methods: {
// Load the PDF document from a Base64 string
load: function (event) {
var viewer = document.getElementById('pdfViewer').ej2_instances[0];
viewer.load('data:application/pdf;base64',+AddBase64String, null);
}
}
}
</script>
```

SERVER-BACKED

Unload document in Vue Pdfviewer component

The PDF Viewer library allows you to unload the PDF document being displayed in the PDF Viewer control programmatically using the **unload()** method.

The following steps are used to unload the PDF document programmatically.

Step 1: Follow the steps provided in the link to create a simple PDF Viewer sample.

Step 2: Add the following code snippet to perform the unload operation.

STANDALONE

```
<template>
<div id="app">
<button v-on:click="unload">Unload Document</button>
<ejs-pdfviewer
id="pdfViewer"
ref="pdfviewer"
:documentPath="documentPath">
</ejs-pdfviewer>
</div>
</template>
<script>
import Vue from 'vue';
import { PdfViewerPlugin, Toolbar, Magnification, Navigation,
LinkAnnotation, BookmarkView, Annotation, ThumbnailView,
Print, TextSelection, TextSearch, FormFields, FormDesigner } from
'@syncfusion/ej2-vue-pdfviewer';
Vue.use(PdfViewerPlugin);
export default {
name: 'app',
data () {
return {
documentPath:"https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf"
};
},
provide: {

Open thumbnail in Vue Pdfviewer component

The PDF Viewer library allows you to open the thumbnail of the PDF document using the **openThumbnailPanel()** method.

The following steps are used to open the thumbnail of the PDF Document.

Step 1: Follow the steps provided in the link to create simple PDF Viewer sample in Vue.

Step 2: Add the following code snippet to open the thumbnail in the resizing event of splitter.

STANDALONE

```
<template>
<div id="app">
<button v-on:click="onSplitterResize">Open ThumbnailPanel</button>
<ejs-pdfviewer
id="pdfViewer"
ref="pdfviewer"
:documentPath="documentPath" >
</ejs-pdfviewer>
</div>
</template>
<script>
import Vue from 'vue';
import { PdfViewerPlugin, Toolbar, Magnification, Navigation,
LinkAnnotation, BookmarkView, Annotation, ThumbnailView,
Print, TextSelection, TextSearch, FormFields, FormDesigner } from
'@syncfusion/ej2-vue-pdfviewer';
Vue.use(PdfViewerPlugin);
export default {
name: 'app',
data () {
return {
documentPath:"https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf",
};
},
provide: {
PdfViewer: [ Toolbar, Magnification, Navigation, LinkAnnotation,
BookmarkView, Annotation,
ThumbnailView, Print, TextSelection, TextSearch, FormFields, FormDesigner
]},
methods: {
onSplitterResize: function () {
var viewer = document.getElementById('pdfViewer').ej2_instances[0];
viewer.updateViewerContainer();
viewer.thumbnailViewModule.openThumbnailPane();
debugger;
},
}
}
</script>
```

SERVER-BACKED

```
<template>
```

```
<div id="app">

Extract text in Vue Pdfviewer component

The PDF Viewer library allows you to extract the text from a page along with the bounds. Text extraction can be done using the **isExtractText** property and **extractTextCompleted** event.

The following steps are used to extract the text from the page.

Step 1: Follow the steps provided in the link to create a simple PDF Viewer sample.

Step 2: The following code snippet explains how to extract the text from a page .

`

<template>

```
<ejs-pdfviewer
id="pdfViewer"
:serviceUrl="serviceUrl"
:documentPath="documentPath"
:isExtractText="true"
:extractTextCompleted="extractTextCompleted">
</ejs-pdfviewer>
</template>
<script>
import Vue from 'vue';
import { PdfViewerPlugin, Toolbar, Magnification, Navigation, LinkAnnotation,
BookmarkView,ThumbnailView, Print,TextSelection, TextSearch,
Annotation, FormDesigner, FormFields } from '@syncfusion/ej2-vue-pdfviewer';
Vue.use(PdfViewerPlugin);
export default {
data () {
return {
serviceUrl:"https://services.syncfusion.com/vue/production/api/pdfviewer",
documentPath:"PDF_Succinctly.pdf",
extractTextCompleted: function (args) {
// Extract the Complete text of load document
console.log(args);
console.log(args.documentTextCollection[1]);
// Extract the Text data.
console.log(args.documentTextCollection[1][1].TextData);
// Extract Text in the Page.
console.log(args.documentTextCollection[1][1].PageText);
// Extracts the first text of the PDF document along with its bounds
console.log(args.documentTextCollection[1][1].TextData[0].Bounds);
}
};
},
provide: {
```

PdfViewer: [Toolbar, Magnification, Navigation, LinkAnnotation, BookmarkView, ThumbnailView,

Print, TextSelection, TextSearch,Annotation, FormDesigner, FormFields]}

}

</script>

`

Find the Sample, how to Extract Text

Import export annotation object in Vue Pdfviewer component

The PDF Viewer library allows you to import annotations from objects or streams instead of loading it as a file. To import such annotation objects, the PDF Viewer control must export the PDF annotations as objects using the **ExportAnnotationsAsObject()** method. Only the annotations objects that are exported from the PDF Viewer can be imported.

The following steps are used to import and export annotation as object.

Step 1: Follow the steps provided in the link to create a simple PDF Viewer sample.

Step 2: Use the following code snippet to perform import and export annotation.

STANDALONE

```
<template>
<div id="app">
<button v-on:click="exportAnnotation">Export Annotation</button>
<button v-on:click="importAnnotation">Import Annotation</button>
<ejs-pdfviewer
id="pdfViewer"
ref="pdfviewer"
:documentPath="documentPath">
</ejs-pdfviewer>
</div>
</template>
<script>
import Vue from 'vue';

Authorization token in Vue Pdfviewer component

The PDF Viewer library allows you to include the authorization token in the PDF viewer AJAX request using the properties of the ajaxRequest header available in AjaxRequestSettings, and it will be included in every AJAX request send from PDF Viewer.

The following steps are used to include the authorization token to the PDF viewer control.

Step 1: Follow the steps provided in the link to create simple PDF Viewer sample in React.

Step 2: Add the following code snippet to include the authorization token.

`

<template>

<ejs-pdfviewer

id="pdfViewer"

:serviceUrl="serviceUrl"

:documentPath="documentPath"

:ajaxRequestSettings="ajaxRequestSettings">

</ejs-pdfviewer>

</template>

<script>

import Vue from 'vue';

import { PdfViewerPlugin, Toolbar, Magnification, Navigation, LinkAnnotation,

BookmarkView,ThumbnailView, Print,TextSelection, TextSearch,

Annotation, FormDesigner, FormFields } from '@syncfusion/ej2-vue-pdfviewer';

Vue.use(PdfViewerPlugin);

export default {

data () {

```
return {
serviceUrl:"https://services.syncfusion.com/vue/production/api/pdfviewer",
documentPath:"PDF_Succinctly.pdf",
// Include Authorization Token.
ajaxRequestSettings:{
ajaxHeaders: [
{
headerName: 'Authorization',
headerValue: 'Bearer 64565dfgfdsjweiuvbiuyhiueygf'
}
],
withCredentials: false
},
};
},
provide: {
PdfViewer: [ Toolbar, Magnification, Navigation, LinkAnnotation, BookmarkView, ThumbnailView,
Print, TextSelection, TextSearch, Annotation, FormDesigner, FormFields ]}
}
</script>
`
```

Find the Sample, how to include authorization token

Delete annotation in Vue Pdfviewer component

The PDF Viewer library allows you to delete a specific annotation from a PDF document. Deleting a specific annotation can be done using the **deleteAnnotationById()** method. This method is used to delete a specific annotation using its id.

The following steps are used to delete a specific annotation from PDF Document.

Step 1: Follow the steps provided in the link to create a simple PDF Viewer sample.

Step 2: Use the following code snippet to delete a specific annotation using deleteAnnotationById() method.

STANDALONE

```
<template>
<div id="app">
<button v-on:click="deleteAnnotationById">Delete Annotation By Id</button>
<ejs-pdfviewer
id="pdfViewer"
```

```
ref="pdfviewer"
:documentPath="documentPath">
</ejs-pdfviewer>
</div>
</template>
<script>
import Vue from 'vue';
import { PdfViewerPlugin, Toolbar, Magnification, Navigation,
LinkAnnotation, BookmarkView, Annotation, ThumbnailView,
Print, TextSelection, TextSearch, FormFields, FormDesigner } from
'@syncfusion/ej2-vue-pdfviewer';
Vue.use(PdfViewerPlugin);
export default {
name: 'app',
data () {
return {
documentPath:"https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf",
};
},
provide: {
PdfViewer: [ Toolbar, Magnification, Navigation, LinkAnnotation,
BookmarkView, Annotation,
ThumbnailView, Print, TextSelection, TextSearch, FormFields, FormDesigner
]},
methods: {
// Delete annotation by ID.
deleteAnnotationById: function() {
var viewer = document.getElementById('pdfViewer').ej2_instances[0];
viewer.annotationModule.deleteAnnotationById(viewer.annotationCollection[0].
annotationId);
}
}
}
</script>
```

SERVER-BACKED

```
<template>
<div id="app">
<button v-on:click="deleteAnnotationById">Delete Annotation By Id</button>
<ejs-pdfviewer
id="pdfViewer"
ref="pdfviewer"
:serviceUrl="serviceUrl"
:documentPath="documentPath">
</ejs-pdfviewer>
</div>
</template>
<script>
import Vue from 'vue';
import { PdfViewerPlugin, Toolbar, Magnification, Navigation,
LinkAnnotation, BookmarkView, Annotation, ThumbnailView,
Print, TextSelection, TextSearch, FormFields, FormDesigner } from
'@syncfusion/ej2-vue-pdfviewer';
Vue.use(PdfViewerPlugin);
export default {
```

Copyright © 2001 -2024 Syncfusion Inc.

```
name: 'app',
data () {
return {
serviceUrl:"https://services.syncfusion.com/vue/production/api/pdfviewer",
documentPath:"https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf"
};
},
provide: {
PdfViewer: [ Toolbar, Magnification, Navigation, LinkAnnotation,
BookmarkView, Annotation,
ThumbnailView, Print, TextSelection, TextSearch, FormFields, FormDesigner
]},
methods: {
// Delete annotation by ID.
deleteAnnotationById: function() {
var viewer = document.getElementById('pdfViewer').ej2_instances[0];
viewer.annotationModule.deleteAnnotationById(viewer.annotationCollection[0].
annotationId);
}
}
}
</script>
```

Note :

If you use the **deleteAnnotation** API to delete an annotation, select an annotation first using the **selectAnnotation** API. You can't delete an annotation without selecting that annotation.

Convert pixel to point in server side in Vue Pdfviewer component

Syncfusion PDF viewer will get the bounds of the annotations as the pixel in the Client-side. But while using it in the back end, we need to convert the pixel into point by using the below calculation. And the 0.75 is constant for all the calculations in the back end.

`ts

X = x * 72 / 96

Y = y * 72 / 96

Width = width * 72 / 96

Height = height * 72 / 96

`

Select annotation in Vue Pdfviewer component

The PDF Viewer library allows you to select an annotation from a PDF document. Selecting an annotation can be done using the selectAnnotation() method. This method is used to select an annotation using its id.

The following steps are used to select an annotation from a PDF Document.

Step 1: Follow the steps provided in this link to create a simple PDF Viewer sample.

Copyright © 2001 -2024 Syncfusion Inc.

Step 2: The following code sample represents how to select an annotation in a button click.

STANDALONE

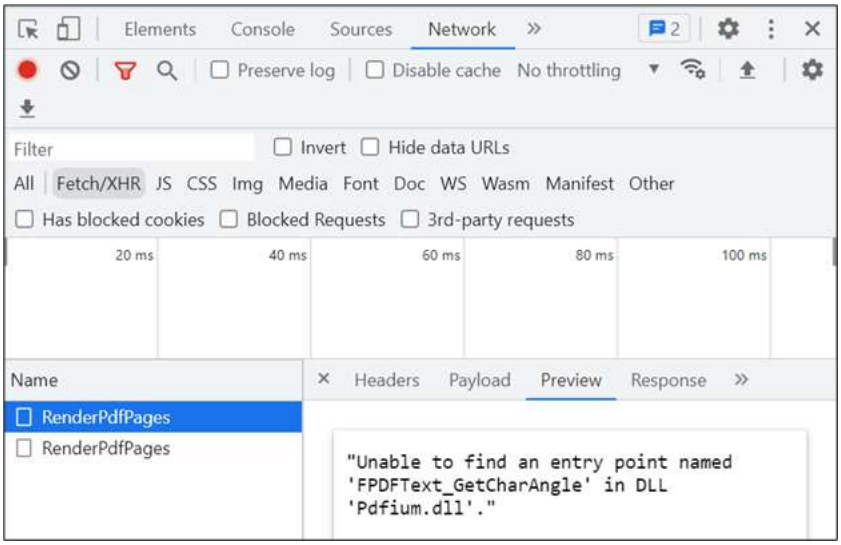
Resolve "Unable to find an entry point named FPDFText_GetCharAngle" error

From the release of version **21.1.0.35 (2023 Volume 1)** of Essential Studio, the Pdfium package has been upgraded to improve various functionalities like text search, text selection, rendering, and even

performance. If you are updating your project to this version of the Syncfusion PDF Viewer, you may encounter the **“Web-Service is not listening”** error. The Network tab can help you identify the root cause of the issue, which is typically caused by an old version of pdfium assembly being referenced in the local web service project. Below are the assemblies to be referred to in the respective operating systems.

- Windows – pdfium.dll
- Linux – libpdfium.so
- OSX – libpdfium.dylib

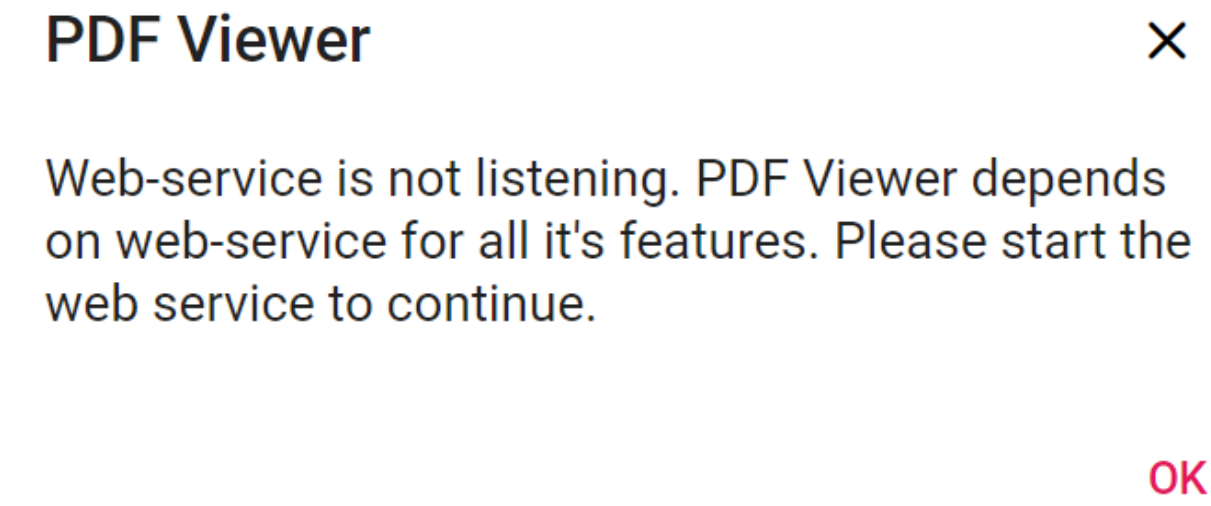


To solve this issue, you should follow the below steps:

1. Clear the bin and object files of the web-service project.
2. Re-publish the web-service project.

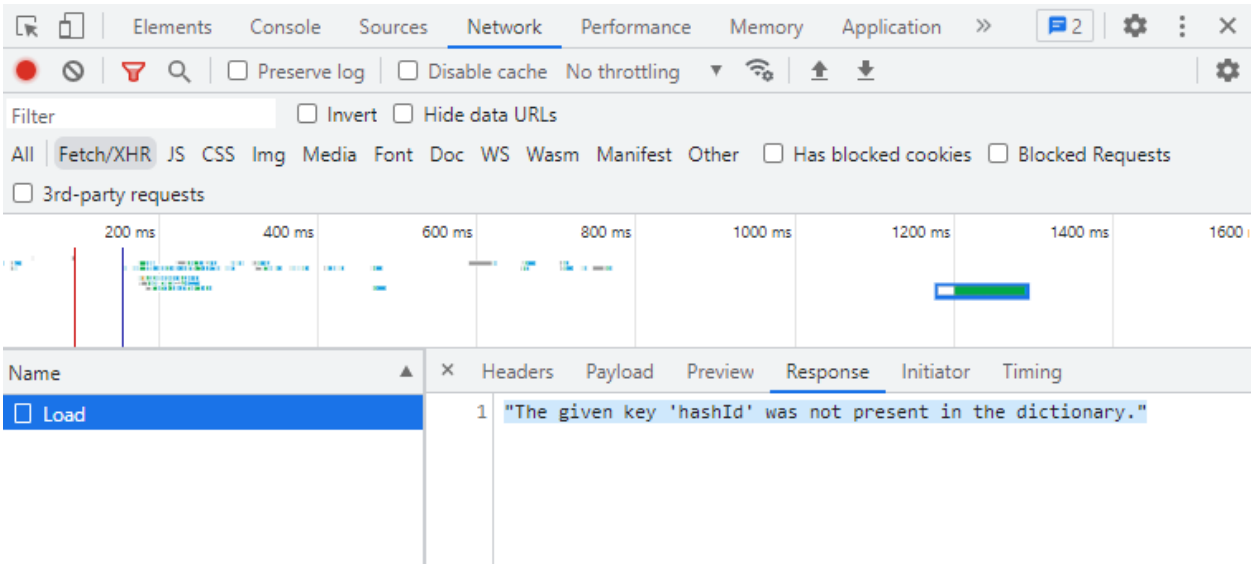
Note: Note: If you are hosting your application in Azure, AWS, or in Linux environments, delete the older published files and republish the application.

How to clear the "Web-service is not listening" to error



If you are facing a **Web-service is not listening** to error in the Syncfusion PDF Viewer, there could be several reasons for this. To troubleshoot the issue, you can use the Network tab in your browser's developer tools to gather more information. Here are the steps you can follow:

Step 1: Open the browser's developer tools by right-clicking on the page and selecting `Inspect` from the dropdown menu. Then Navigate to the `Network` tab. This will show you all of the requests that are being made by the page.



Step 2: Try to request the web service. If the service is not listening, the request will fail, and you should see an error message in the Network tab. Click on the failing request to see the details of the error, such as the error message or stack trace. This can help you identify the root cause of the issue. Check the server logs for any errors or warnings that may indicate the cause of the issue and help you to troubleshoot the problem.

Step 3: Check the request URL and parameters to see if they are correct. If there is a type or an incorrect parameter, the web service may be unable to process the request.

Copyright © 2001 -2024 Syncfusion Inc.

By following these steps and using the Network tab in your browser's developer tools, you can gather more information about the issue and troubleshoot the problem more effectively.

Note: Make sure you are connected to the internet and that your connection is stable. You can try accessing other websites or services to see if they are working, and make sure the URL you are using to access the web service is correct and properly formatted.

Here are some common exceptions

- File not found.
- Document cache not found.
- Document pointer does not exist in the cache.

File not found

If you are encountering an error message stating that the web service is not listening due to a file not being found in the Syncfusion PDF viewer, you can try the following steps to resolve the issue:

Check the file path

Ensure that the file path you use to access the PDF file is correct and that the file exists in that location. You will need to update the file path if the file does not exist.

Document cache not found

The Document cache not found exception in Syncfusion PDF Viewer typically occurs when the cache used to store the rendered pages of a PDF document is not found or has been deleted. This can happen if the cache directory is changed or deleted or if the application is running in a different environment than it was previously.

Check for multiple instances

It's possible that you have multiple instances of the Syncfusion PDF Viewer running simultaneously, which can cause issues with the document cache. To check for this, open the Task Manager on your computer and look for any instances of the Syncfusion PDF Viewer running. If you find multiple instances, try closing them all and reopening the viewer.

We can use Redis cache and distributive cache for this issue.

Check your network connection

Ensure that your network connection is stable and strong enough to support the web service you are trying to use. Sometimes, simply restarting the web service can resolve the issue. Try stopping and starting the service again to see if it resolves the problem.

The document pointer does not exist in the cache.

The Document pointer does not exist in the cache exception in the Syncfusion PDF Viewer usually occurs when there is an issue with loading or caching the PDF document. This error can be caused by a variety of reasons, including:

To clear this error in the Syncfusion PDF Viewer, you can try the following steps:

Step 1: Clearing the cache may help resolve the issue. To clear the cache, navigate to the cache location, which can be found in the Syncfusion PDF Viewer's settings or configuration files. Once you locate the cache folder, delete its contents.

Step 2: Try reloading the document to ensure it is loaded correctly. You can do this by calling the controller's Load() method. Ensure the document is not already loaded before attempting to load it again.

Copyright © 2001 -2024 Syncfusion Inc.

Step 3: Restart the application. If clearing the cache does not work, you can try restarting the PDF Viewer application. This will reload all the necessary components and may resolve the error.

Internal server error

Server-side exceptions happen for various use cases. We can't just define them if they are document-specific, provide the document, or you may need to contact Syncfusion support for further assistance.

Retry Timeout

The **Retry Timeout** feature allows you to specify a duration for the PDF Viewer to retry failed AJAX requests before considering them permanent failures. It helps in handling temporary failures due to network issues or server unavailability.

The retryTimeout allows developers to specify a duration after which the AJAX request should retry failed requests automatically. Developers can ensure a more resilient and fault-tolerant PDF viewing experience by configuring an appropriate retry timeout value.

By default, when an AJAX request fails, the Retry Timeout property is set to `0`, indicating that no timeout is set. In this case, the PDF Viewer will wait indefinitely for a response, potentially leading to a hanging request. However, you can set the Retry Timeout property to a positive number, specifying the maximum number of seconds the PDF Viewer should wait for a response. If the response is not received within the specified time, the request will be aborted, triggering an appropriate error or timeout property.

To set the retry timeout, use the `retryTimeout` property in the PDF Viewer configuration. This property takes a value in seconds.

`

```
<template>
<div id="app">
<ejs-pdfviewer
id="pdfViewer"
:serviceUrl="serviceUrl"
:documentPath="documentPath"
:retryTimeout="retryTimeout"
:retryCount="retryCount" >
</ejs-pdfviewer>
</div>
</template>
<script>
import Vue from 'vue';
import { PdfViewerPlugin, Toolbar, Magnification, Navigation,
Annotation, LinkAnnotation, BookmarkView, ThumbnailView,
Print, TextSelection, TextSearch, FormFields, FormDesigner } from '@syncfusion/ej2-vue-pdfviewer';;
```

Copyright © 2001 -2024 Syncfusion Inc.

```
Vue.use(PdfViewerPlugin);
export default {
name: 'app',
data() {
return {
serviceUrl: "https://services.syncfusion.com/vue/production/api/pdfviewer",
documentPath: "PDF_Succinctly.pdf",
retryTimeout : 10,
retryCount : 10
};
},
provide: {
PdfViewer: [ Toolbar, Magnification, Navigation, LinkAnnotation, BookmarkView, ThumbnailView,
Print, TextSelection, TextSearch, Annotation, FormDesigner, FormFields ]},
}
</script>
`
```

In the given example, the `retryTimeout` is set to 10 seconds, and the `retryCount` is set to 5. This means that if a request made by the PDF Viewer takes longer than 10 seconds to receive a response, it will be considered a timeout. In such cases, The PDF Viewer will resend the same request based on the retryCount. Here, this process will repeat up to maximum of 5 retries.

When an exception occurs during the AJAX request in the context of the PDF Viewer, the request will wait for the specified `retryTimeout` duration. If the timeout duration is exceeded, the PDF Viewer will decrement the retryCount and attempt to load the document again. This retry process continues until the document is successfully loaded or the retryCount limit is reached.

The `retryCount` property of the PDF Viewer allows you to set the number of retries for a specific request. This feature is particularly useful for handling temporary errors such as network timeouts or server issues. By initiating new requests according to the retry count, ensure a smoother user experience and efficiently handle network or server problems.

If the timeout duration specified by `retryTimeout` is exceeded during the AJAX request, the PDF Viewer will decrement the `retryCount` and initiate a new request. This process will continue until the document is successfully loaded or the retry count limit is reached. This functionality helps improve the handling of temporary errors and ensures a more efficient and user-friendly experience.

View sample in GitHub

Load N number of pages on initial loading

The initial rendering in a PDF viewer allows users to control the number of pages displayed when opening a PDF document. This improves the user experience by providing flexibility in loading a specific

number of pages initially, while additional pages are dynamically rendered as the user scrolls through the document. This approach enhances the responsiveness of the PDF viewer and minimizes delays as users can access specific pages without waiting for the entire document to load.

To utilize this capability in Syncfusion PDF Viewer, use the initialRenderPages property. You can achieve the desired outcome by setting this property to the desired number of pages you want to load initially. However, it's important to exercise caution when setting a high value for the initialRenderPages in large documents with numerous pages. Rendering a large number of pages simultaneously can increase memory usage and slow down loading times, impacting the performance of the PDF viewer.

Using the initialRenderPages property judiciously is advisable, especially when dealing with larger documents. It is more suitable for scenarios where a smaller range of pages, such as 10-20, can be loaded to provide a quick initial view of the document.

Customize toolbar in PDF Viewer component

How to customize existing toolbar in PDF Viewer component

PDF Viewer allows you to customize(add, show, hide, enable, and disable) existing items in a toolbar.

- Add - New items can defined by **CustomToolbarItemModel** and with existing items in **ToolbarSettings** property. Newly added item click action can be defined in toolbarclick.
- Show, Hide - Existing items can be shown or hidden using the ToolbarSettings property. Pre-defined toolbar items are available with ToolbarItem.
- Enable, Disable - Toolbar items can be enabled or disable using enabletoolbaritem

Note : Default value of toolbar items is ['OpenOption', 'PageNavigationTool','MagnificationTool', 'PanTool', 'SelectionTool', 'SearchOption', 'PrintOption', 'DownloadOption','UndoRedoTool', 'AnnotationEditTool', 'FormDesignerEditTool', 'CommentTool', 'SubmitForm']

Align Property

The align property is used to specify the alignment of a toolbar item within the toolbar.

Left: Aligns the item to the left side of the toolbar.

Right: Aligns the item to the right side of the toolbar.

Tooltip Property

The tooltip property is used to set the tooltip text for a toolbar item. Tooltip provides additional information when a user hovers over the item.

CssClass Property

The cssClass property is used to apply custom CSS classes to a toolbar item. It allows custom styling of the toolbar item.

Prefix Property

The prefix property is used to set the CSS class or icon that should be added as a prefix to the existing content of the toolbar item.

ID Property

The id property within a CustomToolbarItemModel is a compulsory attribute that plays a vital role in toolbar customization. It serves as a unique identifier for each toolbar item, facilitating distinct references and interactions.

When defining or customizing toolbar items, it is mandatory to assign a specific and descriptive id to each item.

These properties are commonly used when defining custom toolbar items with the CustomToolbarItemModel in the context of Syncfusion PDF Viewer. When configuring the toolbar using the ToolbarSettings property, you can include these properties to customize the appearance and behavior of each toolbar item.

Note: When customizing toolbar items, you have the flexibility to include either icons or text based on your design preference.

View sample in GitHub

Troubleshooting

Why Do I Have to Manually Copy Files from node_modules into My App?

PDF Viewer offers flexibility across different build systems, remaining both framework-agnostic and independent of bundlers. Even without a bundler, you can seamlessly integrate the PDF Viewer by directly linking its assets through standard HTML tags.

Moreover, our codebase is meticulously divided into distinct files, enabling selective loading of components when required. This strategic approach to lazy loading prevents unwieldy file sizes that a single bundle might impose, which is often impractical.

Copyright © 2001 -2024 Syncfusion Inc.

While 'pdfium.js,' the primary entry point, is commonly bundled automatically, the supplementary assets from 'ej2-pdfviewer-lib' need to be manually incorporated due to their on-demand loading. This necessity arises because the host application lacks inherent awareness of these assets' lazy loading behavior.

Troubleshoot error 'cp' is not recognized as a command

The error message you're seeing, "'cp' is not recognized as an internal or external command," is because the `cp` command you're trying to use is not recognized on Windows command prompt.

On Windows, you should use the `copy` command to copy files and directories instead of `cp`. The equivalent command in Windows to copy a directory and its contents recursively is:

```batch
xcopy /s /e /i .\node_modules\@syncfusion\ej2-pdfviewer\dist\ej2-pdfviewer-lib public\js\ej2-pdfviewer-lib
```

Here, `/s` indicates that you want to copy directories and subdirectories recursively. Also, note that Windows uses backslashes `\` as path separators, not forward slashes `/`.

Make sure to run this command in the appropriate directory where you want to perform the copy operation.

Note: If you encounter other issues or error messages while working with the Windows Command Prompt, make sure to double-check your command syntax and file paths for accuracy. Additionally, ensure that you have the necessary permissions to perform the copy operation in the specified directories.

Document Loading Issues in Version 23.1 or Newer

If you're experiencing problems with your document not rendering in the viewer, especially when using version 23.1 or a newer version, follow these troubleshooting steps to resolve the issue:

1. **Check for viewer.dataBind() Requirement**: Ensure that you have called `viewer.dataBind()` as required in version 23.1 or newer. This explicit call is essential for initializing data binding and document rendering correctly. It is must to call the dataBind() method before load.

```typescript
<button v-on:click="documentLoad">Load</button>
<ejs-pdfviewer id="pdfViewer" ref="pdfviewer">
</ejs-pdfviewer>
documentLoad: function (args) {
pdfViewer.serviceUrl = "https://ej2services.syncfusion.com/angular/development/api/pdfviewer";
pdfViewer.dataBind();
pdfViewer.load("https://cdn.syncfusion.com/content/pdf/annotations.pdf");
}
```

Copyright © 2001 -2024 Syncfusion Inc.

2. **Verify Document Source**: Confirm that the document source or URL you're trying to display is valid and accessible. Incorrect URLs or document paths can lead to loading issues.
3. **Network Connectivity**: Ensure that your application has a stable network connection. Document rendering may fail if the viewer can't fetch the document due to network issues.
4. **Console Errors**: Use your browser's developer tools to check for any error messages or warnings in the console. These messages can provide insights into what's causing the document not to load.
5. **Loading Sequence**: Make sure that you're calling `viewer.dataBind()` and initiating document loading in the correct sequence. The viewer should be properly initialized before attempting to load a document.
6. **Update Viewer**: Ensure that you're using the latest version of the viewer library or framework. Sometimes, issues related to document loading are resolved in newer releases.
7. **Cross-Origin Resource Sharing (CORS)**: If you're loading documents from a different domain, ensure that CORS headers are correctly configured to allow cross-origin requests.
8. **Content Security Policies (CSP)**: Check if your application's Content Security Policy allows the loading of external resources, as this can affect document loading. Refer here to troubleshoot.

By following these troubleshooting steps, you should be able to address issues related to document loading in version 23.1 or newer, ensuring that your documents render correctly in the viewer.

Pivot Table

Getting Started with the Vue Pivotview Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using Vue-CLI and integrating the Syncfusion Vue Pivotview component

Prerequisites

System requirements for Syncfusion Vue UI components

Dependencies

The following list of dependencies are required to use the pivot table component in your application.

`javascript

|-- @syncfusion/ej2-vue-pivotview

|-- @syncfusion/ej2-base

|-- @syncfusion/ej2-data

|-- @syncfusion/ej2-excel-export

|-- @syncfusion/ej2-file-utils

|-- @syncfusion/ej2-compression

|-- @syncfusion/ej2-pdf-export

|-- @syncfusion/ej2-file-utils

|-- @syncfusion/ej2-compression

|-- @syncfusion/ej2-grids

|-- @syncfusion/ej2-inputs

Copyright © 2001 -2024 Syncfusion Inc.

|-- @syncfusion/ej2-buttons

|-- @syncfusion/ej2-dropdowns

|-- @syncfusion/ej2-lists

|-- @syncfusion/ej2-popups

|-- @syncfusion/ej2-navigations

`

Setting up the Vue 2 project

To generate a Vue 2 project using Vue-CLI, use the vue create command. Follow these steps to install Vue CLI and create a new project:

`bash

npm install -g @vue/cli

vue create quickstart

cd quickstart

npm run serve

`

or

`bash

yarn global add @vue/cli

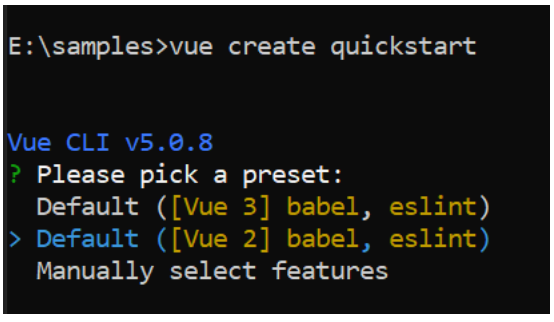
vue create quickstart

cd quickstart

yarn run serve

`

When creating a new project, choose the option Default ([Vue 2] babel, eslint) from the menu.



Once the quickstart project is set up with default settings, proceed to add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion packages are available at npmjs.com. To use Vue components, install the required npm package.

This article uses the Vue Pivotview component as an example. Install the @syncfusion/ej2-vue-pivotview package by running the following command:

`bash

npm install @syncfusion/ej2-vue-pivotview --save

`

or

`bash

yarn add @syncfusion/ej2-vue-pivotview

`

The **--save** will instruct NPM to include the pivot table package inside the dependencies section of the package.json.

Import Syncfusion CSS styles

The pivot table has different themes. They are:

- Material
- Fabric
- Bootstrap
- High Contrast

import pivot table component CSS as given below in <style> section of the App.vue file.

~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-dropdowns/styles/material.css";
@import "../node_modules/@syncfusion/ej2-lists/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-grids/styles/material.css";
@import "../node_modules/@syncfusion/ej2-pivotview/styles/material.css";
</style>
```

Add Syncfusion Vue component

Follow the below steps to add the Vue Pivotview component:

1\. First, import and register the Pivotview component in the script section of the **src/App.vue** file.

~/SRC/APP.VUE

```
<script>
import { PivotViewComponent } from "@syncfusion/ej2-vue-pivotview";
export default {
components: {
'ejs-pivotview': PivotViewComponent
```

Copyright © 2001 -2024 Syncfusion Inc.

```
}
}
</script>
```

2\. In the template section, define the Pivotview component.

~/SRC/APP.VUE

```
<template>
<div id="app">
<ejs-pivotview> </ejs-pivotview>
</div>
</template>
```

Browser compatibility

Polyfills are required to use the Pivot Table in Internet Explorer 11 browser. Refer the documentation for more details.

Assigning sample data to the pivot table

The Pivot Table component further needs to be populated with an appropriate data source. For illustration purpose, a collection of objects mentioning the sales details of certain products over a period and region has been prepared. This sample data is assigned to the pivot table component through dataSource property under dataSourceSettings.

~/SRC/APP.VUE

```
<template>
<div id="app">
<ejs-pivotview :dataSourceSettings="dataSourceSettings"> </ejs-pivotview>
</div>
</template>
<script>
import { PivotViewComponent } from "@syncfusion/ej2-vue-pivotview";
export default {
components: {
'ejs-pivotview': PivotViewComponent
},
data () {
return {
dataSourceSettings: {
dataSource: [
{
"balance": 2430.87,
"quantity": 11,
"name": "Skinner Ward",
"gender": "male",
"company": "GROK",
"state": "New Jercy"
},
{
"balance": 3192.7,
"quantity": 15,
"name": "Gwen Dixon",
"gender": "female",
"company": "ICOLOGY",
```

Copyright © 2001 -2024 Syncfusion Inc.

```
"state": "Vetaikan"
},
{
"balance": 1663.84,
"quantity": 14,
"name": "Deena Gillespie",
"gender": "female",
"company": "OVERPLEX",
"state": "New Jercy"
}
]
}
}
}
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

Adding fields to row, column, value and filter axes

Now that pivot table is initialized and assigned with sample data, will further move to showcase the component by organizing appropriate fields in row, column, value and filter axes.

In dataSourceSettings, four major axes - rows, columns, values and filters plays a vital role in defining and organizing fields from the bound data source, to render the entire pivot table component in a desired format.

rows – Collection of fields that needs to be displayed in row axis of the pivot table.

columns – Collection of fields that needs to be displayed in column axis of the pivot table.

values – Collection of fields that needs to be displayed as aggregated numeric values in the pivot table.

filters - Collection of fields that would act as master filter over the data bound in row, column and value axes of the pivot table.

In-order to define each field in the respective axis, the following basic properties should be set.

- name: It allows to set the field name from the bound data source. It's casing should match exactly like in the data source and if not set properly, the pivot table will not be rendered.
- caption: It allows to set the field caption, which is the alias name of the field that needs to be displayed in the pivot table.
- type: It allows to set the summary type of the field. By default, **Sum** is applied.

In this illustration, "Year" and "Quarter" are added in column, "Country" and "Products" in row, and "Sold" and "Amount" in value section respectively.

~/SRC/APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings" :height=
"height" > </ejs-pivotview>
    </div>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
</template>
<script>
import { PivotViewComponent } from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
export default {
  components: {
    'ejs-pivotview': PivotViewComponent
  },
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        filters: []
      },
      height: 350
    }
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-dropdowns/styles/material.css";
@import "../node_modules/@syncfusion/ej2-lists/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-grids/styles/material.css";
@import "../node_modules/@syncfusion/ej2-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs88" %}

Applying formatting to a value field

Formatting defines a way in which values should be displayed. For example, format **“C”** denotes the values should be displayed in currency pattern. To do so, define the formatSetting with its name and format properties and add it to formatSettings. In this illustration, the name property is set as **Amount**, a field from value section and its format is set as currency. Likewise, we can set format for other value fields as well and add it to formatSettings.

Only fields from value section, which is in the form of numeric data values are applicable for formatting.

~/SRC/APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings" :height=
"height" > </ejs-pivotview>
    </div>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
</template>
<script>
import { PivotViewComponent } from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
export default {
  components: {
    'ejs-pivotview': PivotViewComponent
  },
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 350
    }
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";

@import "../node_modules/@syncfusion/ej2-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs89" %}

Module injection

To create pivot table with additional features, inject the required modules. The modules that are available with basic functionality are as follows.

- `GroupingBar` - Inject this module to access grouping bar feature.
- `FieldList` - Inject this module to access pivot field list feature.
- `CalculatedField` - Inject this module to access calculated field feature.

Register the required array of modules under the key `pivotview` in the `provide` section within the `App.vue` file as shown below. On doing so, only the injected views will be loaded and displayed along with pivot table.

`

Copyright © 2001 -2024 Syncfusion Inc.

<script>

provide: {

pivotview: [GroupingBar, FieldList, CalculatedField]

}

</script>

`

Enable Pivot Field List

The field list allows to add or remove fields and also rearrange the fields between different axes, including column, row, value, and filter along with filter and sort options dynamically at runtime. It can be enabled by setting the showFieldList property to **true**. To know more about field list, refer here.

If the FieldList module is not injected, the Field List will not be rendered with the pivot table component.

~/SRC/APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings" :height=
"height" :showFieldList="showFieldList"> </ejs-pivotview>
    </div>
</template>
<script>
import { PivotViewComponent, FieldList } from "@syncfusion/ej2-vue-
pivotview";
import { pivotData } from './pivotData.js';
export default {
  components: {
    'ejs-pivotview': PivotViewComponent
  },
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 350,
      showFieldList: true
    }
  },
  provide: {
        pivotview: [FieldList]
    }
}
```

Copyright © 2001 -2024 Syncfusion Inc.

```
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-dropdowns/styles/material.css";
@import "../node_modules/@syncfusion/ej2-lists/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-grids/styles/material.css";
@import "../node_modules/@syncfusion/ej2-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs90" %}

Enable Grouping Bar

The grouping bar feature automatically populates fields from the bound data source and allows end users to drag fields between different axes such as columns, rows, values, and filters, and alter pivot table at runtime. It also provides option to sort, filter and remove fields. It can be enabled by setting the showGroupingBar property to **true**. To know more about grouping bar, refer here.

If the GroupingBar module is not injected, the grouping bar will not be rendered with the pivot table component.

~/SRC/APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings" :height=
"height" :showGroupingBar="showGroupingBar"> </ejs-pivotview>
    </div>
</template>
<script>
import { PivotViewComponent, GroupingBar } from "@syncfusion/ej2-vue-
pivotview";
import { pivotData } from './pivotData.js';
export default {
  components: {
    'ejs-pivotview': PivotViewComponent
  },
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 350,
      showGroupingBar: true
```

Copyright © 2001 -2024 Syncfusion Inc.

```
    }
  },
  provide: {
        pivotview: [GroupingBar]
    }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-dropdowns/styles/material.css";
@import "../node_modules/@syncfusion/ej2-lists/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-grids/styles/material.css";
@import "../node_modules/@syncfusion/ej2-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs91" %}

Exploring Filter Axis

The filter axis contains collection of fields that would act as master filter over the data bound in row, column and value axes of the pivot table. The fields along with filter members could be set to filter axis either through report via code behind or by dragging and dropping fields from other axes to filter axis via grouping bar or field list at runtime.

~/SRC/APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings" :height=
"height" :showGroupingBar="showGroupingBar"> </ejs-pivotview>
    </div>
</template>
<script>
import { PivotViewComponent, GroupingBar } from "@syncfusion/ej2-vue-
pivotview";
import { pivotData } from './pivotData.js';
export default {
  components: {
    'ejs-pivotview': PivotViewComponent
  },
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: [{ name: 'Country' }]
```

Copyright © 2001 -2024 Syncfusion Inc.

```
      },
      height: 350,
      showGroupingBar: true
    }
  },
  provide: {
        pivotview: [GroupingBar]
    }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-dropdowns/styles/material.css";
@import "../node_modules/@syncfusion/ej2-lists/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-grids/styles/material.css";
@import "../node_modules/@syncfusion/ej2-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs92" %}

Calculated field

The calculated field feature allows user to insert or add a new calculated field based on the available fields from the bound data source using basic arithmetic operators. The calculated field can be included in pivot table using the calculatedFieldSettings from code behind. Or else, calculated fields can be added at run time through the built-in dialog by just setting the allowCalculatedField property to **true** in pivot table. You will see a button enabled in the Field List UI automatically to invoke the calculated field dialog and perform necessary operation. To know more about calculated field, refer here.

If the CalculatedField module is not injected, the calculated field popup will not be rendered with the pivot table component. Moreover calculated field is applicable only for value fields.

~/SRC/APP.VUE

```
<template>
    <div id="app">
        <ejs-button id="calculated-field-btn" :isPrimary="isPrimary" v-
on:click.native="btnClick">Calculated Field</ejs-button>
        <ejs-pivotview id="pivotview" :height= "height"
:dataSourceSettings="dataSourceSettings"
:allowCalculatedField="allowCalculatedField"> </ejs-pivotview>
    </div>
</template>
<script>
import { PivotViewComponent, CalculatedField } from "@syncfusion/ej2-vue-
pivotview";
import { ButtonComponent } from "@syncfusion/ej2-vue-buttons";
import { pivotData } from './pivotData.js';
export default {
  components: {
    'ejs-pivotview': PivotViewComponent,
```

You can also explore our Vue Pivot Table example that shows how to rendering of the pivot table with drill-up and drill-down functionality bound to a relational report.

Getting Started with the Vue Pivot Table component in Vue 3

This article provides a step-by-step guide for setting up a Vite project with a JavaScript environment and integrating the Syncfusion Vue Pivotview component using the Composition API / Options API.

The Composition API is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

The Options API is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

Prerequisites

System requirements for Syncfusion Vue UI components

Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using Vite. To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

`bash

npm create vite@latest

`

or

`bash

yarn create vite

`

Using one of the above commands will lead you to set up additional configurations for the project as below:

1. Define the project name: We can specify the name of the project directly. Let's specify the name of the project as my-project for this article.

`bash

? Project name: » my-project

`

2. Select Vue as the framework. It will create a Vue 3 project.

`bash

? Select a framework: » - Use arrow-keys. Return to submit.

Vanilla

Vue

React

Preact

Lit

Svelte

Others

`

3. Choose JavaScript as the framework variant to build this Vite project using JavaScript and Vue.

`bash

? Select a variant: » - Use arrow-keys. Return to submit.

JavaScript

TypeScript

Customize with create-vue ↗

Nuxt ↗

`

4. Upon completing the aforementioned steps to create the my-project, run the following command to install its dependencies:

`bash

cd my-project

npm install

`

or

`bash

cd my-project

yarn install

`

Now that my-project is ready to run with default settings, let's add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion Vue component packages are available at npmjs.com. To use Syncfusion Vue components in the project, install the corresponding npm package.

This article uses the Vue Pivotview component as an example. To use the Vue Pivotview component in the project, the @syncfusion/ej2-vue-pivotview package needs to be installed using the following command:

Copyright © 2001 -2024 Syncfusion Inc.

`bash

npm install @syncfusion/ej2-vue-pivotview --save

`

or

`bash

yarn add @syncfusion/ej2-vue-pivotview

`

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the Pivotview component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-dropdowns/styles/material.css";
@import "../node_modules/@syncfusion/ej2-lists/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-grids/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

The order of importing CSS styles should be in line with its dependency graph.

Add Syncfusion Vue component

Follow the below steps to add the Vue Pivotview component using Composition API or Options API:

1. First, import and register the Pivotview component and its child directives in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { PivotViewComponent, FieldList, GroupingBar, CalculatedField } from
"@syncfusion/ej2-vue-pivotview";
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
```

```
import { PivotViewComponent, FieldList, GroupingBar, CalculatedField } from
"@syncfusion/ej2-vue-pivotview";
//Component registeration.
export default {
name: "App",
components: {
"ejs-pivotview": PivotViewComponent
}
}
</script>
```

2. In the template section, define the Pivotview component with the dataSource property and column definitions.

~/SRC/APP.VUE

```
<template>
<ejs-pivotview :height="height" :width="width"
:dataSourceSettings="dataSourceSettings" :showFieldList="showFieldList"
:showGroupingBar="showGroupingBar"
:allowCalculatedField="allowCalculatedField"></ejs-pivotview>
</template>
```

3. Declare the values for the dataSource property in the script section.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
const dataSource = [
{ Amount: 5100, Country: "Canada", Date: "FY 2006", Product: "Car",
Quantity: 21, State: "Alberta" },
{ Amount: 1900, Country: "France", Date: "FY 2007", Product: "Car",
Quantity: 23, State: "Alberta" },
{ Amount: 1000, Country: "Germany", Date: "FY 2008", Product: "Car",
Quantity: 29, State: "Alberta" },
{ Amount: 2060, Country: "Canada", Date: "FY 2006", Product: "Car",
Quantity: 93, State: "British Columbia" },
{ Amount: 6200, Country: "France", Date: "FY 2007", Product: "Car",
Quantity: 36, State: "British Columbia" },
{ Amount: 2000, Country: "Germany", Date: "FY 2008", Product: "Car",
Quantity: 31, State: "British Columbia" },
{ Amount: 1300, Country: "Canada", Date: "FY 2005", Product: "Car",
Quantity: 45, State: "Brunswick" },
{ Amount: 3400, Country: "France", Date: "FY 2006", Product: "Car",
Quantity: 47, State: "Brunswick" },
{ Amount: 2300, Country: "Germany", Date: "FY 2007", Product: "Car",
Quantity: 43, State: "Brunswick" },
]
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
data() {
return {
```

```
dataSourceSettings: {
dataSource: [
{ Amount: 5100, Country: "Canada", Date: "FY 2006", Product: "Car",
Quantity: 21, State: "Alberta" },
{ Amount: 1900, Country: "France", Date: "FY 2007", Product: "Car",
Quantity: 23, State: "Alberta" },
{ Amount: 1000, Country: "Germany", Date: "FY 2008", Product: "Car",
Quantity: 29, State: "Alberta" },
{ Amount: 2060, Country: "Canada", Date: "FY 2006", Product: "Car",
Quantity: 93, State: "British Columbia" },
{ Amount: 6200, Country: "France", Date: "FY 2007", Product: "Car",
Quantity: 36, State: "British Columbia" },
{ Amount: 2000, Country: "Germany", Date: "FY 2008", Product: "Car",
Quantity: 31, State: "British Columbia" },
{ Amount: 1300, Country: "Canada", Date: "FY 2005", Product: "Car",
Quantity: 45, State: "Brunswick" },
{ Amount: 3400, Country: "France", Date: "FY 2006", Product: "Car",
Quantity: 47, State: "Brunswick" },
{ Amount: 2300, Country: "Germany", Date: "FY 2007", Product: "Car",
Quantity: 43, State: "Brunswick" },
],
rows: [{ name: 'Country' }],
columns: [{ name: 'Date' }],
values: [{ name: 'Amount' }, { name: 'Total', type: 'CalculatedField' }],
formatSettings: [{ name: 'Amount', format: 'C1' }],
calculatedFieldSettings: [{ name: 'Total', formula:
'"Sum(Amount)"+"Sum(Quantity)"' }]
},
showFieldList: true,
showGroupingBar: true,
allowCalculatedField: true,
height: '350px',
width: '100%'
};
}
</script>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<ejs-pivotview :height="height" :width="width"
:dataSourceSettings="dataSourceSettings" :showFieldList="showFieldList"
:showGroupingBar="showGroupingBar"
:allowCalculatedField="allowCalculatedField"></ejs-pivotview>
</template>
<script setup>
export default {
data() {
return {
dataSourceSettings: {
dataSource: [
{ Amount: 5100, Country: "Canada", Date: "FY 2006", Product: "Car",
Quantity: 21, State: "Alberta" },
```

Copyright © 2001 -2024 Syncfusion Inc.

```
{ Amount: 1900, Country: "France", Date: "FY 2007", Product: "Car",

Run the project

To run the project, use the following command:

`bash

npm run dev

`

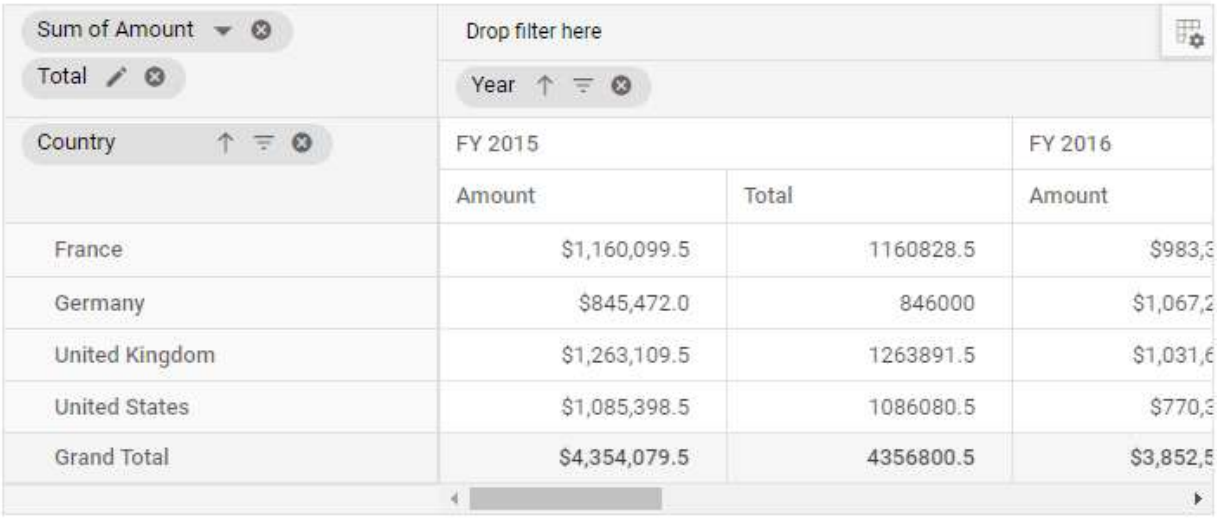
or

`bash

yarn run dev

`

The output will appear as follows:



Using template properties in the component

The following sample uses the HTML elements to showcase each cell with custom format using the Pivot Table's cellTemplate property.

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<ejs-pivotview id="pivotview" ref="pivotview"
:dataSourceSettings="dataSourceSettings" :height="height" :dataBound="trend"
:cellTemplate="cellTemplate">
</ejs-pivotview>
</template>
<script setup>
import { PivotViewComponent as EjsPivotview } from "@syncfusion/ej2-vue-
pivotview";
import { createApp } from 'vue';
```

```
const app = createApp();
var dataSourceSettings = {

Data binding in Vue Pivotview component

JSON

For JSON data binding, the type property under dataSourceSettings needs to be set as JSON. By default, the default value is assumed as JSON.

Binding JSON data via local

In-order to bind local JSON data to the pivot table user can assign the local variable holding the JSON data to the dataSource property under dataSourceSettings.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:height="height"> </ejs-pivotview>
    </div>
</template>
<script>
```

```
import Vue from "vue";
import { PivotViewPlugin } from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 350
    }
  }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs19" %}

Using local variable, the JSON data can also be bound to the pivot table using DataManager option with the help of JsonAdaptor. Here the instance of DataManager holding JSON data is assigned to dataSource property under dataSourceSettings. The use of DataManager is optional here.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:height="height"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin } from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
import { DataManager, JsonAdaptor, Query, ReturnOption } from
'@syncfusion/ej2-data';
Vue.use(PivotViewPlugin);
let remoteData = new DataManager({
  json: pivotData,
  adaptor: new JsonAdaptor()
});
export default {
  data () {
    return {
```

```
      dataSourceSettings: {
        dataSource: remoteData,
        expandAll: false,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 350
    }
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-grids/styles/material.css";
@import "../node_modules/@syncfusion/ej2-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs20" %}

In the meantime, the JSON data from the local *.json file type can also be connected to the pivot table via the file uploader option. Here, the resulting string after uploading the file needs to be converted to JSON data that can be assigned to the dataSource property under dataSourceSettings. The following code example illustrates the same.

`javascript

import Vue from "vue";

import { PivotViewPlugin } from "@syncfusion/ej2-vue-pivotview";

import { Uploader } from '@syncfusion/ej2-inputs';

Vue.use(PivotViewPlugin);

export default {

data() {

return {

// Step 1: Initiate the file uploader

let uploadObj: Uploader = new Uploader({

});

uploadObj.appendTo('#fileupload');

let input = document.querySelector('input[type="file"]');

// Step 2: Add the event listener which fires when the *.JSON file is uploaded.

input.addEventListener('change', function (e: Event) {

Copyright © 2001 -2024 Syncfusion Inc.

// Step 3: Initiate the file reader

let reader: FileReader = new FileReader();

reader.onload = function () {

// Step 4: Getting the string output which is to be parsed as JSON.

let result: string[][] = JSON.parse(reader.result as string);

dataSourceSettings: {

// Step 5: The JSON result to be bound as data source.

dataSource: this.result

// Step 6: The appropriate report needs to be provided here.

},

}

reader.readAsText((input as any).files[0]);

});

}

}

}

</script>

< style >

@import "@syncfusion/ej2-vue-pivotview/styles/material.css";

</style>

`

Binding JSON data via remote

In-order to bind remote JSON data, mention the endpoint URL under dataSourceSettings property. The URL property supports both direct downloadable file (*.json) and web service URL.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:height="height"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin } from "@syncfusion/ej2-vue-pivotview";
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        url: 'https://cdn.syncfusion.com/data/sales-analysis.json',
```

Copyright © 2001 -2024 Syncfusion Inc.

```
        expandAll: false,
        rows: [
          { name: 'EnerType', caption: 'Energy Type' },
        ],
        columns: [
          { name: 'EneSource', caption: 'Energy Source' }
        ],
        values: [
          { name: 'PowUnits', caption: 'Units (GWh)' },
          { name: 'ProCost', caption: 'Cost (MM)' }
        ],
        filters: []
      },
      height: 350
    }
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-grids/styles/material.css";
@import "../node_modules/@syncfusion/ej2-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/common-cs1" %}

CSV

For CSV data binding, the type property under dataSourceSettings needs to be set as CSV mandatorily.

The CSV format is considered to be the most compact format compared to JSON since it is half the size of JSON. This helps to reduce the bandwidth while transferring to the browser.

Binding CSV data via local

In-order to bind local CSV data to the pivot table, user needs to convert it as string array and then directly assign it to the dataSource property under dataSourceSettings.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:height="height"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin } from "@syncfusion/ej2-vue-pivotview";
import { csvdata } from './csvdata.js';
import { isNullOrUndefined } from "@syncfusion/ej2-base";
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: this.getCSVData(),
        type: 'CSV',
```

```
        expandAll: false,
        formatSettings: [{ name: 'Total Cost', format: 'C0' }, { name:
'Total Revenue', format: 'C0' }, { name: 'Total Profit', format: 'C0' }],
        drilledMembers: [{ name: 'Item Type', items: ['Baby Food'] }],
        rows: [
            { name: 'Country' },
            { name: 'Region' }
        ],
        columns: [
            { name: 'Sales Channel' },
            { name: 'Item Type' }
        ],
        values: [
            { name: 'Total Cost' },
            { name: 'Total Revenue' },
            { name: 'Total Profit' }
        ],
        filters: []
      },
      height: 350
    }
  }
  methods: {
    getCSVData: function() {
      let dataSource = [];
      let jsonObject = csvdata.split(/\r?\n|\r/);
      for (let i = 0; i < jsonObject.length; i++) {
        if (!isNullOrUndefined(jsonObject[i]) && jsonObject[i] !== "") {
          dataSource.push(jsonObject[i].split(","));
        }
      }
      return dataSource;
    }
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-grids/styles/material.css";

Remote Data Binding

To interact with remote data source, provide the endpoint url within DataManager along with appropriate adaptor. By default, DataManager uses ODataAdaptor for remote data-binding.

Binding with OData services

OData is a standardized protocol for creating and consuming data. User can retrieve data from OData service using the DataManager. Refer to the following code example for remote data binding using OData service.

APP.VUE

```
<template>
  <div id="app">
    <ejs-pivotview id="pivotview" :dataSourceSettings="dataSourceSettings"
:height="height"></ejs-pivotview>
  </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, IDataSet } from "@syncfusion/ej2-vue-pivotview";
import { DataManager, WebApiAdaptor, ODataAdaptor, Query, ReturnOption }
from '@syncfusion/ej2-data';
Vue.use(PivotViewPlugin);
let remoteData: DataManager = new DataManager({
  url: "https://bi.syncfusion.com/northwindservice/api/orders",
  adaptor: new WebApiAdaptor(),
  crossDomain: true
});
export default {
  data() {
    return {
      dataSourceSettings: {
        dataSource: remoteData as DataManager,
        expandAll: true,
        filters: [],
        columns: [{ name: 'ProductName', caption: 'Product Name' }],
        rows: [{ name: 'ShipCountry', caption: 'Ship Country' }, { name:
'ShipCity', caption: 'Ship City' }],
        formatSettings: [{ name: 'UnitPrice', format: 'C0' }],
        values: [{ name: 'Quantity' }, { name: 'UnitPrice', caption: 'Unit
Price' }]
      },
      height: 350
    }
  }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/common-cs3" %}

Binding with OData V4 services

The OData V4 is an improved version of OData protocols, and the DataManager can be used to retrieve and consume OData V4 services. For more details on OData V4 services, refer to the OData documentation. To bind OData V4 service, use the ODataV4Adaptor.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview id="pivotview"
:dataSourceSettings="dataSourceSettings" :height="height"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, IDataSet, FieldList } from "@syncfusion/ej2-vue-
pivotview";
import { DataManager, WebApiAdaptor, ODataV4Adaptor, Query, ReturnOption }
from '@syncfusion/ej2-data';
Vue.use(PivotViewPlugin);
let remoteData: DataManager = new DataManager({
  adaptor: new ODataV4Adaptor,
  url:
'https://services.odata.org/V4/Northwind/Northwind.svc/Orders/?$top=7',
  crossDomain: true
});
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: remoteData as DataManager,
        expandAll: true,
        filters: [],
        columns: [{ name: 'OrderDate'}, { name: 'ShipCity' }],
        rows: [{ name: 'OrderID' }, { name: 'CustomerID' }],
        values: [{ name: 'Freight' }]
      },
      height: 350,
      showFieldList: true
    }
  }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/common-cs4" %}

Web API

User can use WebApiAdaptor to bind pivot table with Web API created using OData endpoint.

APP.VUE

```
<template>
    <div id="app">
```

```
        <ejs-pivotview id="pivotview"
:dataSourceSettings="dataSourceSettings" :height="height"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, IDataSet } from "@syncfusion/ej2-vue-pivotview";
import { DataManager, WebApiAdaptor, ODataAdaptor, Query, ReturnOption }
from '@syncfusion/ej2-data';
Vue.use(PivotViewPlugin);
let remoteData: DataManager = new DataManager({
  url: "https://bi.syncfusion.com/northwindservice/api/orders",
  adaptor: new WebApiAdaptor(),
  crossDomain: true
});
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: remoteData as DataManager,
        expandAll: true,
        filters: [],
        columns: [{ name: 'ProductName', caption: 'Product Name' }],
        rows: [{ name: 'ShipCountry', caption: 'Ship Country' }, { name:
'ShipCity', caption: 'Ship City' }],
        formatSettings: [{ name: 'UnitPrice', format: 'C0' }],
        values: [{ name: 'Quantity' }, { name: 'UnitPrice', caption: 'Unit
Price' }]
      },
      height: 350
    }
  }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/common-cs5" %}

Querying in Data Manager

By default, the data manager retrieves all the data from the provider which is mapped in it. The data from the provider can be filtered, sorted, paged, etc. by setting the own query in defaultQuery property in the data manager instance.

APP.VUE

```
<template>
  <div id="app">
    <ejs-pivotview id="pivotview" :dataSourceSettings="dataSourceSettings"
:height="height"></ejs-pivotview>
  </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, IDataSet } from "@syncfusion/ej2-vue-pivotview";
```

```
import { DataManager, WebApiAdaptor, ODataAdaptor, Query, ReturnOption }
from '@syncfusion/ej2-data';
Vue.use(PivotViewPlugin);
let remoteData: DataManager = new DataManager({
  url: "https://bi.syncfusion.com/northwindservice/api/orders",
  adaptor: new WebApiAdaptor(),
  crossDomain: true
});
remoteData.defaultQuery = new Query().take(2);
export default {
  data() {
    return {
      dataSourceSettings: {
        dataSource: remoteData as DataManager,
        expandAll: true,
        filters: [],
        columns: [{ name: 'ProductName', caption: 'Product Name' }],
        rows: [{ name: 'ShipCountry', caption: 'Ship Country' }, { name:
'ShipCity', caption: 'Ship City' }],
        formatSettings: [{ name: 'UnitPrice', format: 'C0' }],
        values: [{ name: 'Quantity' }, { name: 'UnitPrice', caption: 'Unit
Price' }]
      },
      height: 350
    }
  }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/common-cs6" %}

Mapping

One can define field information like alias name (caption), data type, aggregation type, show and hide subtotals etc. using the fieldMapping property under dataSourceSettings. The available options are,

- name - It is to specify the appropriate field name.
- caption - It is to set the alias name (caption) to the specific field. Instead of actual field name, the alias name (caption) will be set in the UI of the pivot table.
- type - It is to display values in the pivot table with appropriate aggregation such as sum, product, count, average, minimum, maximum, etc. Its default value is **sum**. This option is applicable only for relational data source.
- axis - It will help to display the field in specified axis such as row/column/value/filter axis of the pivot table.
- showNoDataItems - It is to show all the members of a specific field to the pivot table, even if there are no data in the intersection of the row and column. The default value is **false**. This option is applicable only for relational data source.
- baseField - For the aggregate types like "DifferenceFrom" or "PercentageOfDifferenceFrom" or "PercentageOfParentTotal", selective field is assigned for comparison via this property.

Copyright © 2001 -2024 Syncfusion Inc.

- baseItem For the aggregate types like "DifferenceFrom" or "PercentageOfDifferenceFrom" or "PercentageOfParentTotal", selective member in a field is assigned for comparison via this property.
- expandAll - It is to expand or collapse all headers of a specific field in row and column axes of the pivot table. The default value is **false**.
- showSubTotals - It is to show or hide sub-totals of a specific field in row and column axis of the pivot table. The default value is **true**.
- isNamedSet - It is to set whether the specified field is named set or not. In general, the named set is a set of dimension members or a set expression (MDX query) to be created as a dimension in the SSAS OLAP cube itself. The default value is **false** and this option is applicable only for OLAP data source.
- isCalculatedField - It is to set whether the specified field is a calculated field or not. In general, a calculated field is created from the bound data source or using simple formula with basic arithmetic operators in the pivot table. The default value is **false** and this option is applicable only for OLAP data source.
- showFilterIcon - It is to show or hide the filter icon of a specific field which will be displayed on the button of the grouping bar and field list UI. This filter icon is used to filter the members of a specified field at runtime in the pivot table. The default value is **true**.
- showSortIcon - It is to show or hide the sort icon of a specific field which will be displayed on the button of the grouping bar and field list UI. This sort icon is used to order members of a specified field either in ascending or descending at runtime. The default value is **true**.
- showRemoveIcon - It is to show or hide the remove icon of a specific field which will be displayed on the button of the grouping bar and field list UI. This remove icon is used to remove the specified field during runtime. The default value is **true**.
- showValueTypeIcon - It is to show or hide the value type icon of a specific field which will be displayed on the button of the grouping bar and field list UI. This value type icon helps to select the appropriate aggregation type to specified value field at runtime. The default value is **true**.
- showEditIcon - It is to show or hide the edit icon of a specific field which will be displayed on the button of the grouping bar and field list UI. This edit icon is used to modify caption, formula, and format of a specified calculated field at runtime. The default value is **true**.
- allowDragAndDrop - It is to restrict specific field's button from being dragged on runtime in the grouping bar and field list UI. This will prevent from altering the current report. The default value is **true**.
- dataType - It is to specify the type of the field like 'string', 'number', 'datetime', 'date', and 'boolean'.
- groupName - It is to display fields in the field list UI by grouping them under the desired folder name.

The main purpose of these mapping options is to configure each field that is not part of the initial pivot report. Even if any field that is part of this mapping is defined here, the value set in the initial report will have the highest preceding.

This option is applicable only for relational data source.

In the below code sample, visibility of the field button icons are configured.

APP.VUE

```
<template>
    <div id="app">
```

```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs21" %}

Values in row axis

By default, the value fields are plotted in column axis. To plot those fields in row axis, use the valueAxis property by setting its value as **row**. By default, it holds the value **column**.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:height="height"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin } from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: [],
        valueAxis: 'row'
      },
      height: 350
    }
  }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs22" %}

Values at different positions

By default, the value fields are placed at the end of the row or column axis. To place those value fields in different positions, use the valueIndex property and set the value to an appropriate index position. Its default value is **-1**, which denotes the last position. The valueIndex property is dependent on the valueAxis property.

This support is only available for relational data sources. Also, enable the showValuesButton property in the grouping bar and field list UI to **true** to re-arrange the values fields at different positions via user interaction.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:height="height"> </ejs-pivotview>
    </div>
</template>
<script>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
import Vue from "vue";
import { PivotViewPlugin } from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: true,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: [],
        valueIndex: 1
      },
      height: 350
    }
  }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs23" %}

Show 'no data' items

By default, the pivot table only shows the field item if it has data in its row or column combination. To show all items that do not have data in row and column combination in the pivot table, use the showNoDataItems property by settings its value to **true** for the desired fields. In the following code sample, rows of the "County" and "State" fields do not have data in all combination with "Date" column field.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:height="height"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin } from "@syncfusion/ej2-vue-pivotview";
import { noData } from './noData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: noData,
        expandAll: true,
```

```
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        columns: [{ name: 'Date', showNoDataItems: true}],
        values: [{ name: 'Quantity', caption: 'Units Sold' }, { name:
'Amount', caption: 'Sold Amount' }],
        rows: [{ name: 'Country', showNoDataItems: true }, { name: 'State',
showNoDataItems: true }],
        filters: []
      },
      height: 350
    }
  }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/noData-cs1" %}

Show value headers always

To show value header always in pivot table, even if it holds a single value, use the alwaysShowValueHeader property by settings its value as **true**.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:height="height"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin } from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: [],
        alwaysShowValueHeader: true
      },
      height: 350
    }
  }
}
</script>
```

```
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs24" %}

Customize empty value cells

User can show custom string in empty value cells using the emptyCellsTextContent property in dataSourceSettings of the pivot table. Since the property is of string data type, user can fill empty value cells with any value like "0", "-", "*", "(blank)", etc. Its common for all value fields and can be configured through code behind.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:height="height"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin } from "@syncfusion/ej2-vue-pivotview";
import { noData } from './noData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: noData,
        expandAll: true,
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        columns: [{ name: 'Date', showNoDataItems: true}],
        values: [{ name: 'Quantity', caption: 'Units Sold' }, { name:
'Amount', caption: 'Sold Amount' }],
        rows: [{ name: 'Country', showNoDataItems: true }, { name: 'State',
showNoDataItems: true }],
        filters: [],
        emptyCellsTextContent:'**'
      },
      height: 350
    }
  }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/noData-cs2" %}

Event

Load

The event load fires before initiate rendering of pivot table. It holds following parameters likedataSourceSettings, fieldsType and pivotView. In this event user can customize data source settings before initiating pivot table render module.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:height="height" :load="load"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, LoadEventArgs } from "@syncfusion/ej2-vue-
pivotview";
import { noData } from './noData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: noData,
        expandAll: true,
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        columns: [{ name: 'Date'}],
        values: [{ name: 'Quantity', caption: 'Units Sold' }, { name:
'Amount', caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'State' }],
        filters: [],
        emptyCellsTextContent: '**'
      },
      height: 350
    }
  }
  methods: {
    load:function(args: LoadEventArgs) {
        args.dataSourceSettings.emptyCellsTextContent = "###";
        args.dataSourceSettings.columns[0].caption = "Full Year";
        args.dataSourceSettings.expandAll = false;
    }
  }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/noData-cs3" %}

EnginePopulated

The event enginePopulated is triggered after engine is populated. It has following parameters - dataSourceSettings, pivotFieldList and pivotValues.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:height="height" :enginePopulated="enginePopulated"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, EnginePopulatedEventArgs } from "@syncfusion/ej2-
vue-pivotview";
import { noData } from './noData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: noData,
        expandAll: true,
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        columns: [{ name: 'Date'}],
        values: [{ name: 'Quantity', caption: 'Units Sold' }, { name:
'Amount', caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'State' }],
        filters: [],
        emptyCellsTextContent: '**'
      },
      height: 350
    }
  }
  methods: {
    enginePopulated:function(args: EnginePopulatedEventArgs) {
      //triggers after engine populated
      }
    }
  }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/noData-cs4" %}

EnginePopulating

The event enginePopulating triggers before the pivot engine starts to populate and allows to customize the pivot datasource settings. It has following parameter dataSourceSettings.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:height="height" :enginePopulating="enginePopulating"> </ejs-pivotview>
    </div>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, EnginePopulatingEventArgs  } from
"@syncfusion/ej2-vue-pivotview";
import { noData } from './noData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: noData,
        expandAll: true,
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        columns: [{ name: 'Date'}],
        values: [{ name: 'Quantity', caption: 'Units Sold' }, { name:
'Amount', caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'State' }],
        filters: [],
        emptyCellsTextContent: '**'
      },
      height: 350
    }
  }
  methods: {
    enginePopulating:function(args: EnginePopulatingEventArgs ) {
       args.dataSourceSettings.columns[0].caption = 'Full Year';
       args.dataSourceSettings.emptyCellsTextContent = '##';
    }
  }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

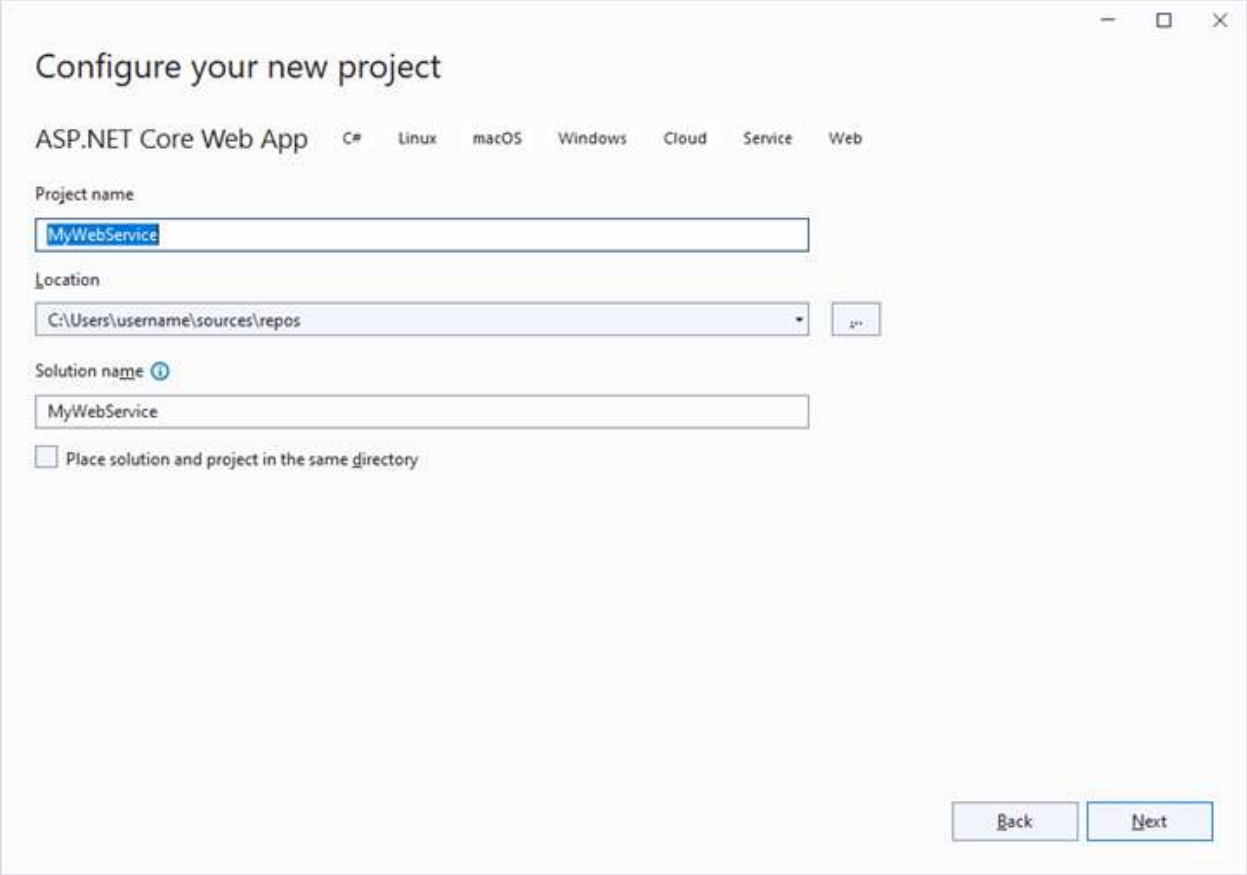
Connecting To Data Source

MySQL in EJ2 Vue Pivotview Component

This section describes how to retrieve data from a MySQL database using MySqlClient and bind it to the Pivot Table via a Web API controller.

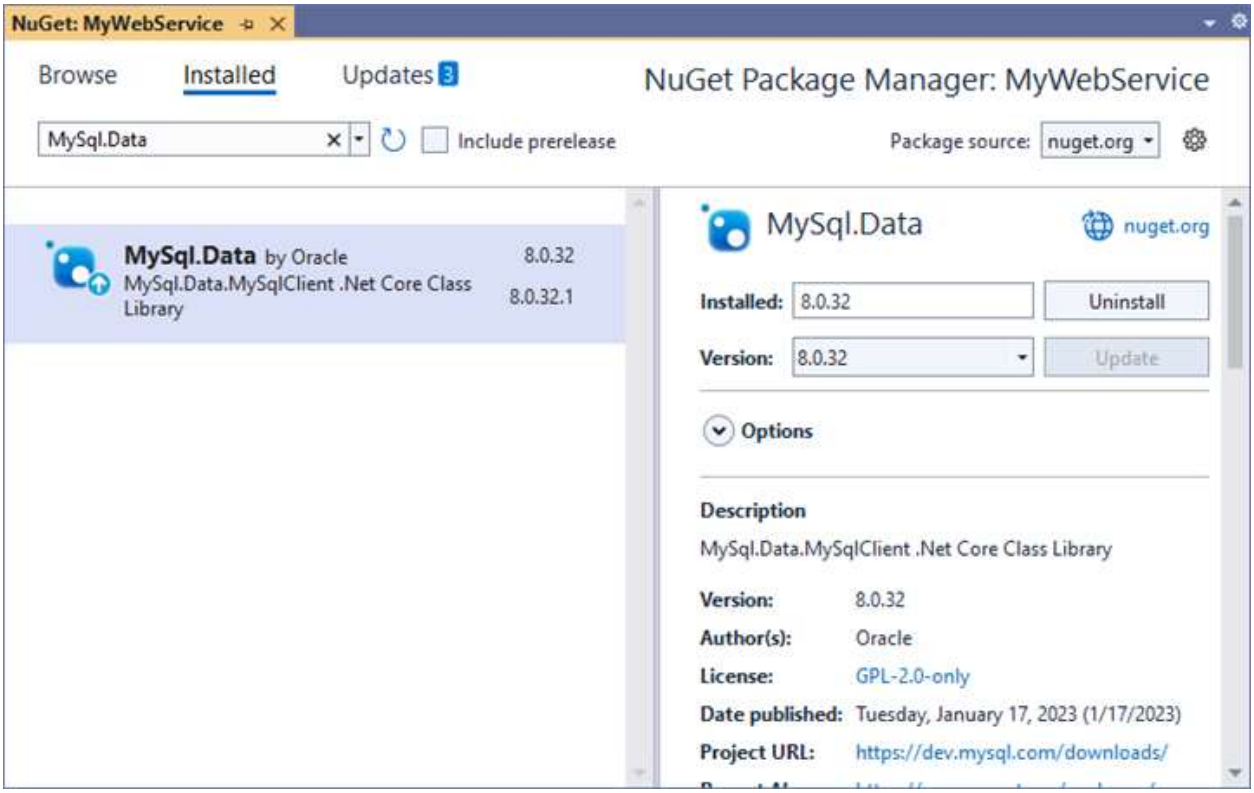
Create a Web API service to fetch MySQL data

1. Open Visual Studio and create an ASP.NET Core Web App project type, naming it **MyWebService**. To create an ASP.NET Core Web application, follow the document link.



2. To connect a MySQL Server using the **MySqlClient** in our application, we need to install the MySql.Data NuGet package. To do so, open the NuGet package manager of the project solution, search for the package **MySql.Data** and install it.

Copyright © 2001 -2024 Syncfusion Inc.



3. Create a Web API controller (aka, PivotController.cs) file under **Controllers** folder that helps to establish data communication with the Pivot Table.

4. In the Web API controller (aka, PivotController), **MySqlConnection** helps to connect the MySQL database. Next, using **MySqlCommand** and **MySqlDataAdapter** you can process the desired query string and retrieve data from the MySQL database. The **Fill** method of the **MySqlDataAdapter** is used to populate the retrieved data into a **DataTable** as shown in the following code snippet.

```csharp
using Microsoft.AspNetCore.Mvc;
using MySql.Data.MySqlClient;
using Newtonsoft.Json;
using System.Data;
namespace MyWebService.Controllers
{
[ApiController]
[Route("[controller]")]
public class PivotController : ControllerBase
{
public dynamic GetMySQLResult()
{
```

```
// Replace with your own connection string.
MySqlConnection connection = new MySqlConnection("<Enter your valid connection string here>");
connection.Open();
MySqlCommand command = new MySqlCommand("SELECT * FROM orders", connection);
MySqlDataAdapter dataAdapter = new MySqlDataAdapter(command);
DataTable dataTable = new DataTable();
dataAdapter.Fill(dataTable);
connection.Close();
return dataTable;
}
}
}
```

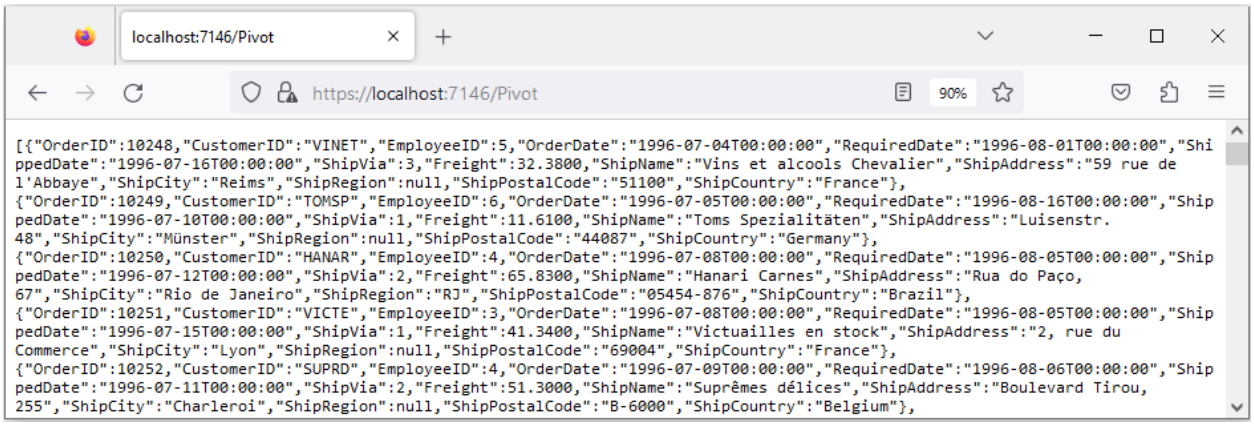
5. In the **Get()** method of the **PivotController.cs** file, the **GetMySQLResult** method is used to retrieve the MySQL data as a **DataTable**, which is then serialized into JSON string using **JsonConvert.SerializeObject()**.

```csharp
using Microsoft.AspNetCore.Mvc;
using MySql.Data.MySqlClient;
using Newtonsoft.Json;
using System.Data;
namespace MyWebService.Controllers
{
[ApiController]
[Route("[controller]")]
public class PivotController : ControllerBase
{
[HttpGet(Name = "GetMySQLResult")]
public object Get()
{
return JsonConvert.SerializeObject(GetMySQLResult());
}
public dynamic GetMySQLResult()
{
```

```
// Replace with your own connection string.
MySqlConnection connection = new MySqlConnection("<Enter your valid connection string here>");
connection.Open();
MySqlCommand command = new MySqlCommand("SELECT * FROM orders", connection);
MySqlDataAdapter dataAdapter = new MySqlDataAdapter(command);
DataTable dataTable = new DataTable();
dataAdapter.Fill(dataTable);
connection.Close();
return dataTable;
}
}
}
`
```

6. Run the application and it will be hosted within the URL https://localhost:7146.

7. Finally, the retrieved data from MySQL database which is in the form of JSON can be found in the Web API controller available in the URL link https://localhost:7146/Pivot, as shown in the browser page below.



Connecting the Pivot Table to a MySQL database using the Web API service

1. Create a simple Vue Pivot Table by following the **"Getting Started"** documentation link.

2. Map the hosted Web API's URL link https://localhost:7146/Pivot to the Pivot Table in **App.vue** by using the url property under dataSourceSettings.

```
`ts
<script>
import Vue from "vue";
import {
FieldList,
```

```
PivotViewPlugin,
} from "@syncfusion/ej2-vue-pivotview";
Vue.use(PivotViewPlugin);
export default {
data() {
return {
dataSourceSettings: {
url: 'https://localhost:7146/pivot'
//Other codes here...
}
};
}
};
</script>
<style>
//Syncfusion Angular controls styles
</style>
`
```

3. Frame and set the report based on the data retrieved from the MySQL database.

```
`ts
<template>
<div>
<div class="control-section" style="overflow: auto">
<div class="content-wrapper">
<ejs-pivotview
id="pivotview"
ref="pivotview"
:dataSourceSettings="dataSourceSettings"
:showFieldList="showFieldList"
</ejs-pivotview>
</div>
</div>
</div>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
</template>
<script>
import Vue from "vue";
import {
FieldList,
PivotViewPlugin,
} from "@syncfusion/ej2-vue-pivotview";
Vue.use(PivotViewPlugin);
export default {
data() {
return {
dataSourceSettings: {
url: 'https://localhost:7146/Pivot',
columns: [{ name: 'ShipName' }],
values: [{ name: 'Freight', caption: 'Sum of Freight' }],
rows: [{ name: 'ShipCity' }],
filters: []
},
showFieldList: true
};
},
methods: {
},
provide: {
pivotview: [FieldList]
}
};
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
```

Copyright © 2001 -2024 Syncfusion Inc.

```
@import "../node_modules/@syncfusion/ej2-dropdowns/styles/material.css";
@import "../node_modules/@syncfusion/ej2-lists/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-grids/styles/material.css";
@import "../node_modules/@syncfusion/ej2-pivotview/styles/material.css";
</style>
`
```

When you run the sample, the resulting pivot table will look like this:

Explore our Vue Pivot Table sample and ASP.NET Core Web Application to extract data from a MySQL database and bind to the Pivot Table in this GitHub repository.

Microsoft SQL server in EJ2 Vue Pivotview Component

This section describes how to retrieve data from SQL Server database using Microsoft SqlClient and bind it to the Pivot Table via a Web API controller.

Steps to connect the SQL Server database via Web API application

1. Download the ASP.NET Core Web Application from this GitHub repository.

2. The application named as **PivotController** (server-side) that is downloaded from the above GitHub repository includes the following files.

- **PivotController.cs** file under **Controllers** folder – This helps to do data communication with Pivot Table.
- **Database1.mdf** file under **App_Data** folder – This MDF (Master Database File) file contains example data.

3. In the Web API controller (aka, PivotController), **SqlConnection** helps to connect the SQL database (that is, Database1.mdf). Next, using **SqlCommand** and **SqlDataAdapter** you can process the desired SQL

Copyright © 2001 -2024 Syncfusion Inc.

query string and retrieve data from the database. The **Fill** method of the DataAdapter is used to populate the SQL data into a **DataTable** as shown in the following code snippet.

```
using Microsoft.AspNetCore.Mvc;
using System.Data;
using System.Data.SqlClient;
namespace PivotController.Controllers
{
[ApiController]
[Route("[controller]")]
public class PivotController : ControllerBase
{
private static DataTable FetchSQLResult()
{
string conSTR = @"<Enter your valid connection string here>";
string xquery = "SELECT * FROM table1";
SqlConnection sqlConnection = new(conSTR);
sqlConnection.Open();
SqlCommand cmd = new(xquery, sqlConnection);
SqlDataAdapter dataAdapter = new(cmd);
DataTable dataTable = new();
dataAdapter.Fill(dataTable);
return dataTable;
}
}
}
```

4. In the **Get()** method of the **PivotController.cs** file, the **FetchSQLResult** method is used to retrieve the SQL data as a **DataTable**, which is then serialized into JSON using **JsonConvert.SerializeObject()**.

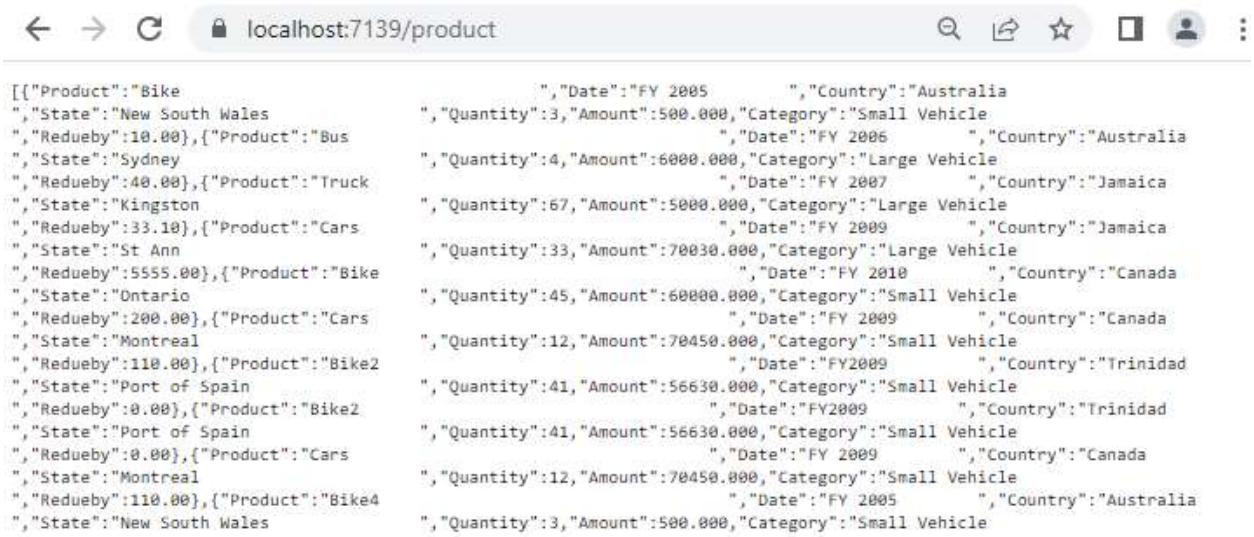
```
using Microsoft.AspNetCore.Mvc;
using Newtonsoft.Json;
using System.Data;
using System.Data.SqlClient;
```

```
namespace PivotController.Controllers
{
[ApiController]
[Route("[controller]")]
public class PivotController : ControllerBase
{
[HttpGet(Name = "GetSQLResult")]
public object Get()
{
return JsonConvert.SerializeObject(FetchSQLResult());
}
private static DataTable FetchSQLResult()
{
string conSTR = @"<Enter your valid connection string here>";
string xquery = "SELECT * FROM table1";
SqlConnection sqlConnection = new(conSTR);
sqlConnection.Open();
SqlCommand cmd = new(xquery, sqlConnection);
SqlDataAdapter dataAdapter = new(cmd);
DataTable dataTable = new();
dataAdapter.Fill(dataTable);
return dataTable;
}
}
}
`
```

5. Run the web application (aka, PivotController) and it will be hosted within the URL https://localhost:7139.

6. Finally, the retrieved data from SQL Server which is in the form of JSON can be found in the Web API controller available in the URL link https://localhost:7139/pivot, as shown in the browser page below.

Copyright © 2001 -2024 Syncfusion Inc.



Connecting the Pivot Table to the hosted Web API URL

1. Download the vue Pivot Table sample from this GitHub repository.

2. Next, map the hosted Web API's URL link https://localhost:7139/pivot to the Pivot Table component in **app.ts** by using the url property under dataSourceSettings.

```ts
<script>
import Vue from "vue";
import {
FieldList,
PivotViewPlugin,
} from "@syncfusion/ej2-vue-pivotview";
Vue.use(PivotViewPlugin);
export default {
data() {
return {
dataSourceSettings: {
url: 'https://localhost:7139/pivot'
//Other codes here...
}
};
}
};
</script>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
<style>
//Syncfusion Angular controls styles
</style>
`
```

3. Frame and set the report based on the data retrieved from the SQL database.

```ts
<template>
<div>
<div class="control-section" style="overflow: auto">
<div class="content-wrapper">
<ejs-pivotview
id="pivotview"
ref="pivotview"
:dataSourceSettings="dataSourceSettings"
:showFieldList="showFieldList"
</ejs-pivotview>
</div>
</div>
</div>
</template>
<script>
import Vue from "vue";
import {
FieldList,
PivotViewPlugin,
} from "@syncfusion/ej2-vue-pivotview";
Vue.use(PivotViewPlugin);
export default {
data() {
return {
dataSourceSettings: {
url: 'https://localhost:7139/pivot',
enableSorting: true,
```

Copyright © 2001 -2024 Syncfusion Inc.

```
expandAll: false,
columns: [{ name: 'Product' }],
values: [{ name: 'Quantity' }, { name: 'Amount', caption: 'Sold Amount' }],
rows: [{ name: 'Country' }, { name: 'State' }],
formatSettings: [{ name: 'Amount', format: 'C0' }],
filters: []
},
showFieldList: true
};
},
methods: {
},
provide: {
pivotview: [FieldList]
}
};
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-dropdowns/styles/material.css";
@import "../node_modules/@syncfusion/ej2-lists/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-grids/styles/material.css";
@import "../node_modules/@syncfusion/ej2-pivotview/styles/material.css";
</style>
`
```

4. Run the sample to get the following result.

Copyright © 2001 -2024 Syncfusion Inc.

	Large Vehicle		Small Vehicle		Grand Total	
	Quantity	Amount	Quantity	Amount	Quantity	Am
Australia	16	24000	12	2000	28	
Canada			420	1649000	420	
Jamaica	400	300120			400	
Trinidad			328	453040	328	
Grand Total	416	324120	760	2104040	1176	

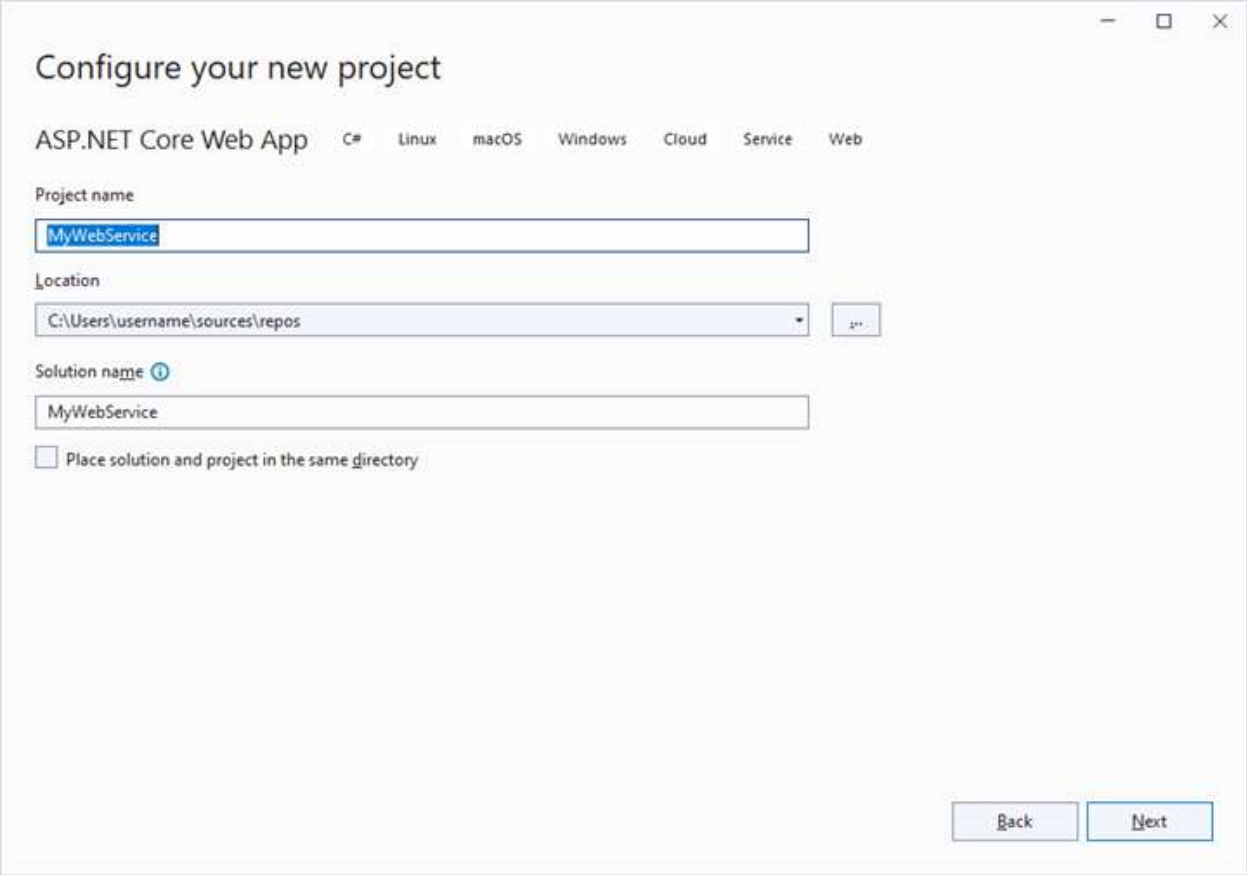
The sample for connecting the Pivot Table to a SQL Server database via an ASP.NET Web application can be found in this GitHub repository.

PostgreSQL in EJ2 Vue Pivotview Component

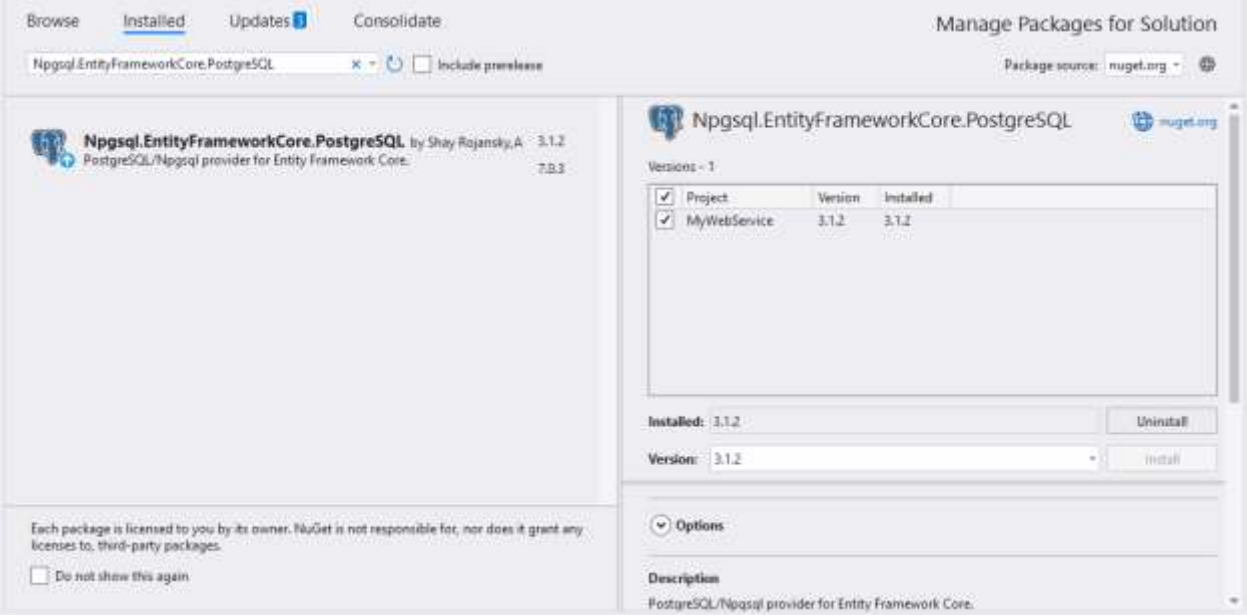
This section describes how to consume data from PostgreSQL database using Microsoft Npgsql and bind it to the Pivot Table via a Web API controller.

Create a Web API service to fetch PostgreSQL data

1. Open Visual Studio and create an ASP.NET Core Web App project type, naming it **MyWebService**. To create an ASP.NET Core Web application, follow the document link.



2. To connect a PostgreSQL Server using the **Npgsql** in our application, we need to install the Npgsql.EntityFrameworkCore.PostgreSQL NuGet package. To do so, open the NuGet package manager of the project solution, search for the package **Npgsql.EntityFrameworkCore.PostgreSQL** and install it.



3. Create a Web API controller (aka, PivotController.cs) file under **Controllers** folder that helps to establish data communication with the Pivot Table.

4. In the Web API controller (aka, PivotController), **NpgsqlConnection** helps to connect the PostgreSQL database. Next, using **NpgsqlCommand** and **NpgsqlDataAdapter** you can process the desired PostgreSQL query string and retrieve data from the database. The **Fill** method of the **NpgsqlDataAdapter** is used to populate the retrieved data into a **DataTable** as shown in the following code snippet.

```csharp
using Microsoft.AspNetCore.Mvc;
using Newtonsoft.Json;
using System.Data;
using Npgsql;
namespace MyWebService.Controllers
{
[ApiController]
[Route("[controller]")]
public class PivotController : ControllerBase
{
public dynamic GetPostgreSQLResult()
{
```

```
// Replace with your own connection string.
NpgsqlConnection connection = new NpgsqlConnection("<Enter your valid connection string here>");
connection.Open();
NpgsqlCommand cmd = new NpgsqlCommand("SELECT * FROM tablename", connection);
NpgsqlDataAdapter da = new NpgsqlDataAdapter(cmd);
DataTable dt = new DataTable();
da.Fill(dt);
connection.Close();
return dt;
}
}
}
`
```

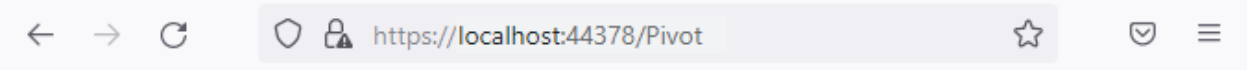
5. In the **Get()** method of the **PivotController.cs** file, the **GetPostgreSQLResult** method is used to retrieve the PostgreSQL data as a **DataTable**, which is then serialized into JSON using **JsonConvert.SerializeObject()**.

```csharp
using Microsoft.AspNetCore.Mvc;
using Newtonsoft.Json;
using System.Data;
using Npgsql;
namespace MyWebService.Controllers
{
[ApiController]
[Route("[controller]")]
public class PivotController : ControllerBase
{
[HttpGet(Name = "GetPostgreSQLResult")]
public object Get()
{
return JsonConvert.SerializeObject(GetPostgreSQLResult());
}
public dynamic GetPostgreSQLResult()
{
```

```
// Replace with your own connection string.
NpgsqlConnection connection = new NpgsqlConnection("<Enter your valid connection string here>");
connection.Open();
NpgsqlCommand cmd = new NpgsqlCommand("SELECT * FROM tablename", connection);
NpgsqlDataAdapter da = new NpgsqlDataAdapter(cmd);
DataTable dt = new DataTable();
da.Fill(dt);
connection.Close();
return dt;
}
}
}
`
```

6. Run the application and it will be hosted within the URL https://localhost:44378/.

7. Finally, the retrieved data from PostgreSQL database which is in the form of JSON can be found in the Web API controller available in the URL link https://localhost:44378/Pivot, as shown in the browser page below.



```
[{"revenue":56300,"servicetype":"Retail","servicecategory":"Department","openinghours_practice"
:"08:21:03","closinghours_practice":"05:42:15"},
{"revenue":75400,"servicetype":"Surgical","servicecategory":"Hospital","openinghours_practice":
"10:13:04","closinghours_practice":"03:22:14"},{"revenue":67300,"servicetype":"Non-
Surgical","servicecategory":"Hospital","openinghours_practice":"11:14:06","closinghours_practic
e":"05:26:12"}]
```

Connecting the Pivot Table to a PostgreSQL database using the Web API service

1. Create a simple Vue Pivot Table by following the **"Getting Started"** documentation link.

2. Map the hosted Web API's URL link https://localhost:44378/Pivot to the Pivot Table component in **App.vue** by using the url property under dataSourceSettings.

```
`ts
<script>
import Vue from "vue";
import {
FieldList,
PivotViewPlugin,
} from "@syncfusion/ej2-vue-pivotview";
Vue.use(PivotViewPlugin);
```

```
export default {
data() {
return {
dataSourceSettings: {
url: https://localhost:44378/Pivot
//Other codes here...
}
};
}
};
</script>
<style>
//Syncfusion Angular controls styles
</style>
`
```

3. Frame and set the report based on the data retrieved from the PostgreSQL database.

```
`ts
<template>
<div>
<div class="control-section" style="overflow: auto">
<div class="content-wrapper">
<ejs-pivotview
id="pivotview"
ref="pivotview"
:dataSourceSettings="dataSourceSettings"
:showFieldList="showFieldList"
</ejs-pivotview>
</div>
</div>
</div>
</template>
<script>
import Vue from "vue";
```

```
import {
FieldList,
PivotViewPlugin,
} from "@syncfusion/ej2-vue-pivotview";
Vue.use(PivotViewPlugin);
export default {
data() {
return {
dataSourceSettings: {
url: 'https://localhost:44378/Pivot',
enableSorting: true,
columns: [{ name: 'openinghours practice' }, { name: 'closinghours practice' }],
values: [{ name: 'revenue' }],
rows: [{ name: 'servicetype' }, { name: 'servicecategory' }]
},
showFieldList: true
};
},
methods: {
},
provide: {
pivotview: [FieldList]
}
};
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-dropdowns/styles/material.css";
@import "../node_modules/@syncfusion/ej2-lists/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
```

Copyright © 2001 -2024 Syncfusion Inc.

@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";

@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";

@import "../node_modules/@syncfusion/ej2-grids/styles/material.css";

@import "../node_modules/@syncfusion/ej2-pivotview/styles/material.css";

</style>

`

When you run the sample, the resulting pivot table will look like this:

	08:21:03	10:13:04	11:14:06	Grand Total
Non-Surgical			67300	67300
Retail	56300			56300
Surgical		75400		75400
Grand Total	56300	75400	67300	199000

Explore our Vue Pivot Table sample and ASP.NET Core Web Application to extract data from a PostgreSQL database and bind to the Pivot Table in this GitHub repository.

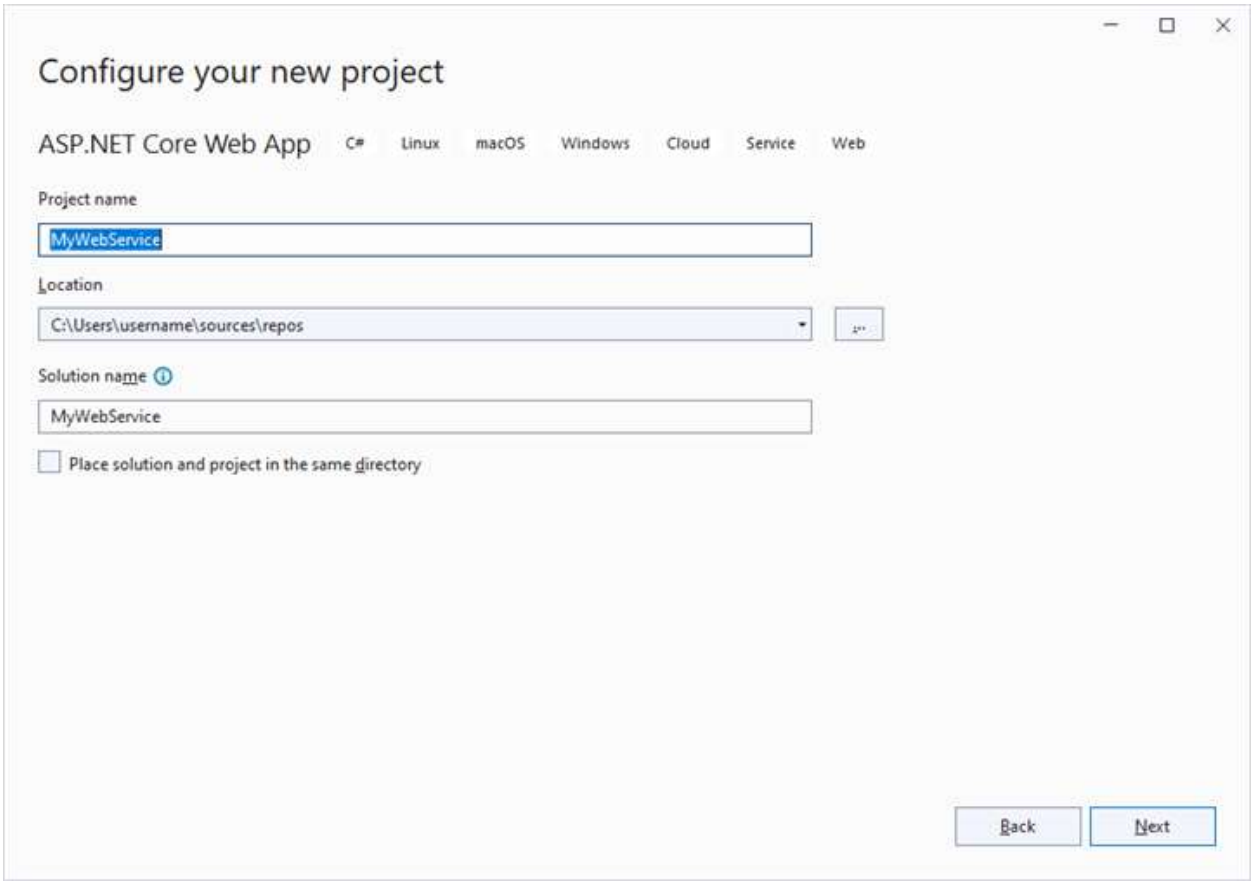
Oracle in EJ2 Vue Pivotview Component

This section describes how to retrieve data from Oracle database using Oracle Managed Data Access and bind it to the Pivot Table via a Web API controller.

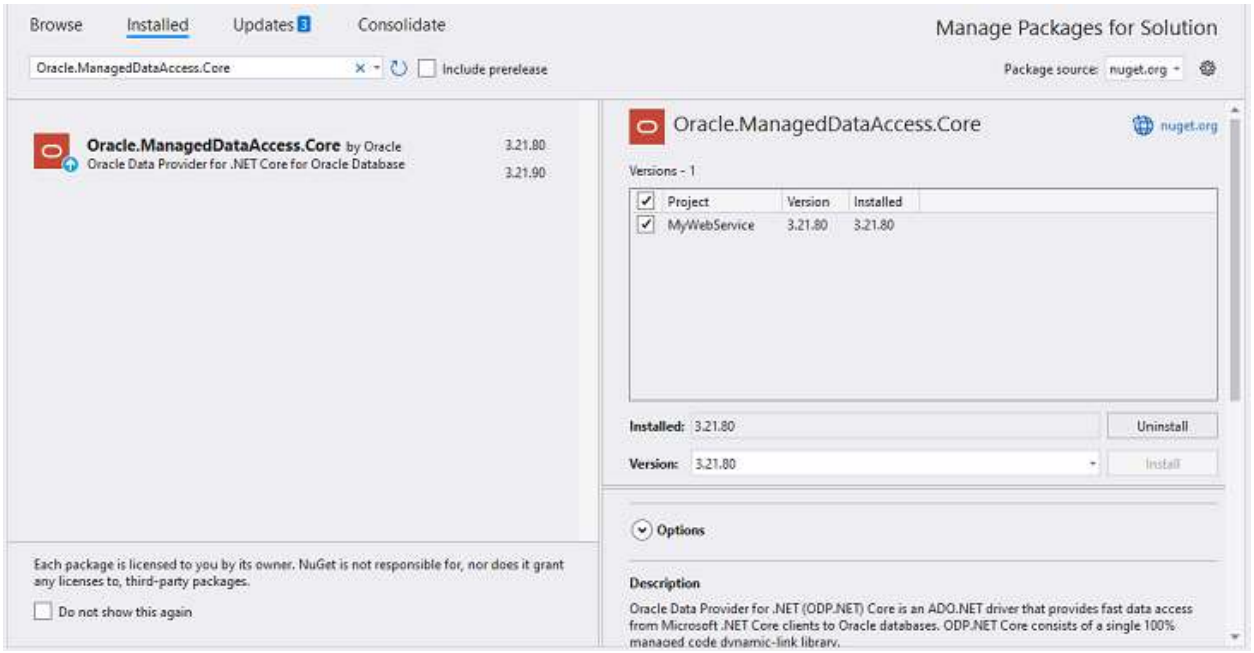
Create a Web API service to fetch Oracle data

1. Open Visual Studio and create an ASP.NET Core Web App project type, naming it **MyWebService**. To create an ASP.NET Core Web application, follow the document link.

Copyright © 2001 -2024 Syncfusion Inc.



2. To connect a Oracle Server using the **Oracle.ManagedDataAccess.Client** in our application, we need to install the Oracle.ManagedDataAccess.Core NuGet package. To do so, open the NuGet package manager of the project solution, search for the package **Oracle.ManagedDataAccess.Core** and install it.



Copyright © 2001 -2024 Syncfusion Inc.

3. Create a Web API controller (aka, PivotController.cs) file under **Controllers** folder that helps to establish data communication with the Pivot Table.

4. In the Web API controller (aka, PivotController), **OracleConnection** helps to connect the Oracle database. Next, using **OracleCommand** and **OracleDataAdapter** you can process the desired Oracle query string and retrieve data from the database. The **Fill** method of the **OracleDataAdapter** is used to populate the retrieved data into a **DataTable** as shown in the following code snippet.

```csharp
using Microsoft.AspNetCore.Mvc;
using Newtonsoft.Json;
using Oracle.ManagedDataAccess.Client;
using System.Data;
namespace MyWebService.Controllers
{
[ApiController]
[Route("[controller]")]
public class PivotController : ControllerBase
{
private static DataTable FetchOracleResult()
{
// Replace with your own connection string.
string connectionString = "<Enter your valid connection string here>";
OracleConnection oracleConnection = new OracleConnection(connectionString);
oracleConnection.Open();
OracleCommand command = new OracleCommand("SELECT * FROM EMPLOYEES", oracleConnection);
OracleDataAdapter dataAdapter = new OracleDataAdapter(command);
DataTable dataTable = new DataTable();
dataAdapter.Fill(dataTable);
oracleConnection.Close();
return dataTable;
}
}
}
```

5. In the **Get()** method of the **PivotController.cs** file, the **FetchOracleResult()** method is used to retrieve the Oracle data, which is then serialized into JSON using **JsonConvert.SerializeObject()**.

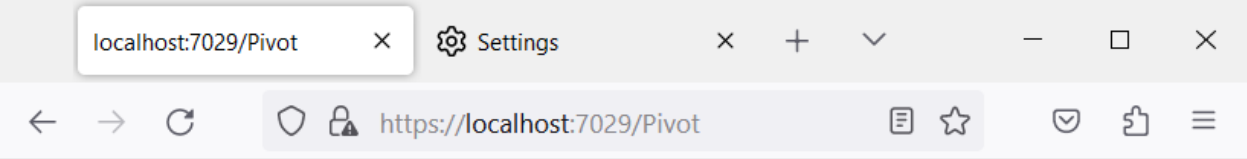
Copyright © 2001 -2024 Syncfusion Inc.

```csharp
using Microsoft.AspNetCore.Mvc;
using Newtonsoft.Json;
using Oracle.ManagedDataAccess.Client;
using System.Data;
namespace MyWebService.Controllers
{
[ApiController]
[Route("[controller]")]
public class PivotController : ControllerBase
{
[HttpGet(Name = "GetOracleResult")]
public object Get()
{
return JsonConvert.SerializeObject(FetchOracleResult());
}
private static DataTable FetchOracleResult()
{
// Replace with your own connection string.
string connectionString = "<Enter your valid connection string here>";
OracleConnection oracleConnection = new OracleConnection(connectionString);
oracleConnection.Open();
OracleCommand command = new OracleCommand("SELECT * FROM EMPLOYEES", oracleConnection);
OracleDataAdapter dataAdapter = new OracleDataAdapter(command);
DataTable dataTable = new DataTable();
dataAdapter.Fill(dataTable);
oracleConnection.Close();
return dataTable;
}
}
}
```

6. Run the application and it will be hosted within the URL https://localhost:44346.

Copyright © 2001 -2024 Syncfusion Inc.

7. Finally, the retrieved data from Oracle database which is in the form of JSON can be found in the Web API controller available in the URL link https://localhost:44346/Pivot, as shown in the browser page below.



```

```

Connecting the Pivot Table to a Oracle database using the Web API service

1. Create a simple Vue Pivot Table by following the **"Getting Started"** documentation link.

2. Map the hosted Web API's URL link https://localhost:44346/Pivot to the Pivot Table component in **App.vue** by using the url property under dataSourceSettings.

`typescript

<script>

import Vue from "vue";

import {

FieldList,

PivotViewPlugin,

} from "@syncfusion/ej2-vue-pivotview";

Copyright © 2001 -2024 Syncfusion Inc.

```
Vue.use(PivotViewPlugin);
export default {
data() {
return {
dataSourceSettings: {
url: 'https://localhost:44346/Pivot'
//Other codes here...
}
};
}
};
</script>
<style>
//Syncfusion Angular controls styles
</style>
`
```

3. Frame and set the report based on the data retrieved from the Oracle database.

```
`typescript
<template>
<div>
<div class="control-section" style="overflow: auto">
<div class="content-wrapper">
<ejs-pivotview
id="pivotview"
ref="pivotview"
:dataSourceSettings="dataSourceSettings"
:showFieldList="showFieldList"
</ejs-pivotview>
</div>
</div>
</div>
</template>
<script>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
import Vue from "vue";
import {
FieldList,
PivotViewPlugin,
} from "@syncfusion/ej2-vue-pivotview";
Vue.use(PivotViewPlugin);
export default {
data() {
return {
dataSourceSettings: {
url: 'https://localhost:44346/Pivot',
enableSorting: true,
expandAll: false,
columns: [
{ name: 'DEPARTMENT_ID', caption: 'Department ID' },
{ name: 'EMPLOYEE_NAME', caption: 'Employee Name' },
],
rows: [
{ name: 'JOB', caption: 'Job' },
{ name: 'SALARY', caption: 'Salary' }
],
values: [
{ name: 'EMPLOYEE_ID', caption: 'Employee ID' },
{ name: 'CC_EMPLOYEES', caption: 'Employees' },
{ name: 'CCTAXPERCENTAGE', caption: 'Percentage' },
],
filters: []
},
showFieldList: true
};
},
methods: {
},
```

```
provide: {
pivotview: [FieldList]
}
};
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-dropdowns/styles/material.css";
@import "../node_modules/@syncfusion/ej2-lists/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-grids/styles/material.css";
@import "../node_modules/@syncfusion/ej2-pivotview/styles/material.css";
</style>
`
```

When you run the sample, the resulting pivot table will look like this:

	10	20	30	Grand Total
ANALYST		15690		15690
CLERK	7934	15245	7900	31079
MANAGER	7782	7566	7698	23046
PRESIDENT	7839			7839
SALESMAN			30518	30518
Grand Total	23555	38501	46116	108172

Explore our Vue Pivot Table sample and ASP.NET Core Web Application to extract data from a Oracle database and bind to the Pivot Table in this GitHub repository.

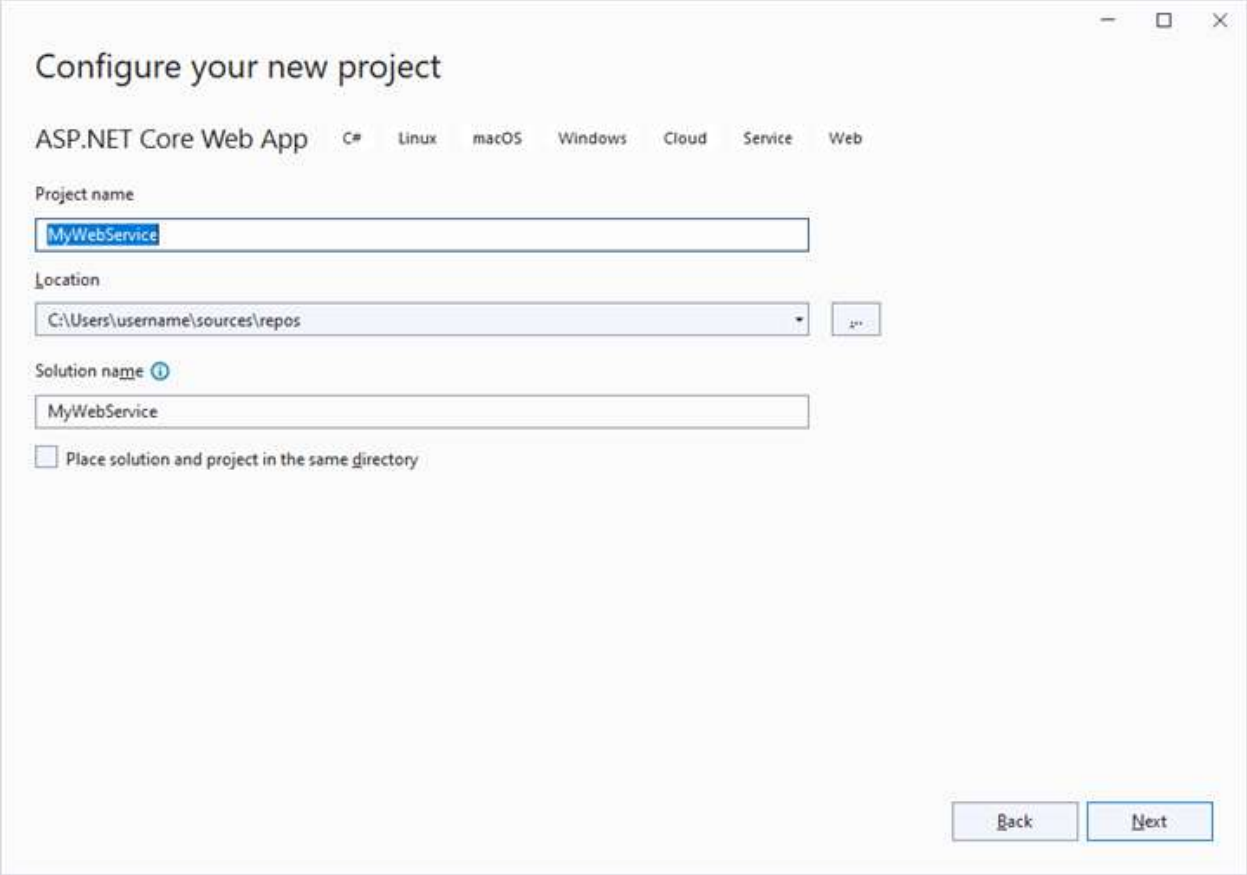
MongoDB in EJ2 Vue Pivotview Component

This section describes how to consume data from MongoDB database using MongoDB Driver and MongoDB Bson libraries and bind it to the Pivot Table via a Web API controller.

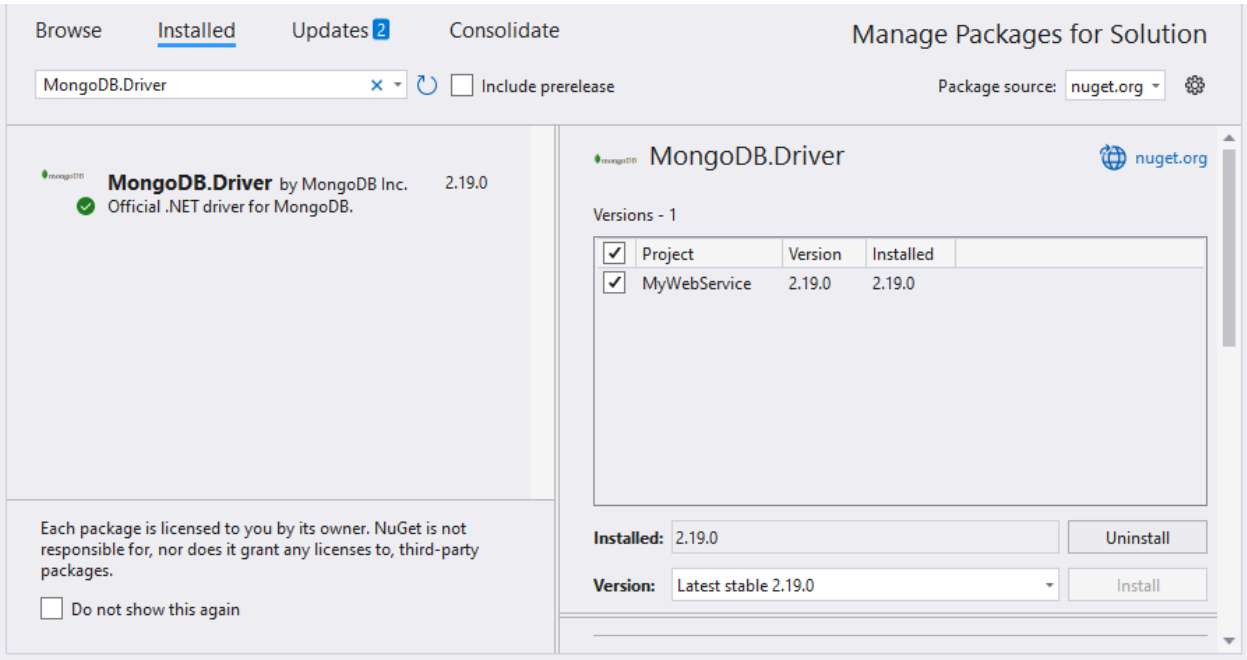
Create a Web API service to fetch MongoDB data

1. Open Visual Studio and create an ASP.NET Core Web App project type, naming it **MyWebService**. To create an ASP.NET Core Web application, follow the document link.

Copyright © 2001 -2024 Syncfusion Inc.



2. To connect a MongoDB Server using the **MongoDB.Driver** and **MongoDB.Bson** in our application, we need to install the MongoDB.Driver NuGet package. To do so, open the NuGet package manager of the project solution, search for the package **MongoDB.Driver** and install it.



3. Create a Web API controller (aka, PivotController.cs) file under **Controllers** folder that helps to establish data communication with the Pivot Table.

4. In the Web API controller (aka, PivotController), **MongoClient** helps to connect the MongoDB database. Next, using the **GetDatabase** and **GetCollection** methods, you can retrieve data from the database. The **Find** method of the **IMongoDatabase** is used to populate the retrieved data into a **List**, as shown in the following code snippet.

```csharp
using Microsoft.AspNetCore.Mvc;
using Newtonsoft.Json;
using MongoDB.Driver;
using MongoDB.Bson;
namespace MyWebService.Controllers
{
[ApiController]
[Route("[controller]")]
public class PivotController : ControllerBase
{
private static List<ProductDetails> FetchMongoDbResult()
{
// Replace with your own connection string.
string connectionString = "<Enter your valid connection string here>";
MongoClient client = new MongoClient(connectionString);
IMongoDatabase database = client.GetDatabase("sample_training");
var collection = database.GetCollection<ProductDetails>("ProductDetails");
return collection.Find(new BsonDocument()).ToList();
}
public class ProductDetails
{
public ObjectId Id { get; set; }
public int Sold { get; set; }
public double Amount { get; set; }
public string? Country { get; set; }
public string? Products { get; set; }
public string? Year { get; set; }
```

```
public string? Quarter { get; set; }
}
}
}
```

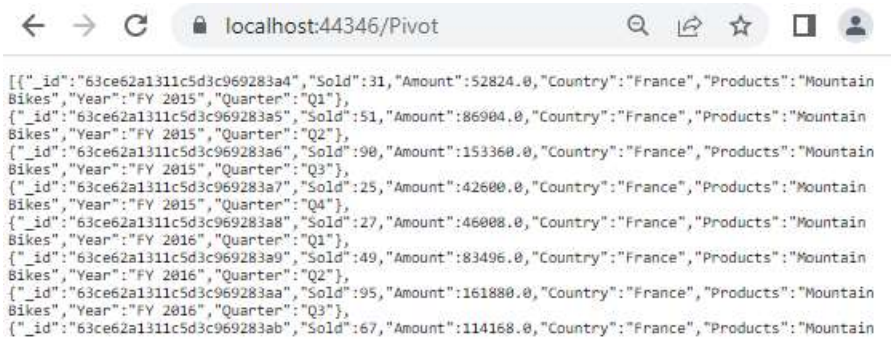
5. In the **Get()** method of the **PivotController.cs** file, the **FetchMongoDbResult()** method is used to retrieve the MongoDB data as a **List**, which is then serialized into JSON using **JsonConvert.SerializeObject()**.

```csharp
using Microsoft.AspNetCore.Mvc;
using Newtonsoft.Json;
using MongoDB.Bson;
using MongoDB.Driver;
namespace MyWebService.Controllers
{
[ApiController]
[Route("[controller]")]
public class PivotController : ControllerBase
{
[HttpGet(Name = "GetMongoDbResult")]
public object Get()
{
return JsonConvert.SerializeObject(FetchMongoDbResult());
}
private static List<ProductDetails> FetchMongoDbResult()
{
// Replace with your own connection string.
string connectionString = "<Enter your valid connection string here>";
MongoClient client = new MongoClient(connectionString);
IMongoDatabase database = client.GetDatabase("sample_training");
var collection = database.GetCollection<ProductDetails>("ProductDetails");
return collection.Find(new BsonDocument()).ToList();
}
public class ProductDetails
```

```
{
public ObjectId Id { get; set; }
public int Sold { get; set; }
public double Amount { get; set; }
public string? Country { get; set; }
public string? Products { get; set; }
public string? Year { get; set; }
public string? Quarter { get; set; }
}
}
}
`
```

6. Run the web application and it will be hosted within the URL https://localhost:44346/.

7. Finally, the retrieved data from MongoDB database which is in the form of JSON can be found in the Web API controller available in the URL link https://localhost:44346/Pivot, as shown in the browser page below.



Connecting the Pivot Table to a MongoDB database using the Web API service

1. Create a simple Vue Pivot Table by following the **"Getting Started"** documentation link.

2. Map the hosted Web API's URL link https://localhost:44346/Pivot to the Pivot Table component in **App.vue** by using the url property under dataSourceSettings.

```
`ts
<script>
import Vue from "vue";
import {
FieldList,
PivotViewPlugin,
} from "@syncfusion/ej2-vue-pivotview";
```

```
Vue.use(PivotViewPlugin);
export default {
data() {
return {
dataSourceSettings: {
url: 'https://localhost:44346/Pivot',
//Other codes here...
}
};
}
};
</script>
<style>
//Syncfusion Angular controls styles
</style>
`
```

3. Frame and set the report based on the data retrieved from the MongoDB database.

```
`ts
<template>
<div>
<div class="control-section" style="overflow: auto">
<div class="content-wrapper">
<ejs-pivotview
id="pivotview"
ref="pivotview"
:dataSourceSettings="dataSourceSettings"
:showFieldList="showFieldList"
</ejs-pivotview>
</div>
</div>
</div>
</template>
<script>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
import Vue from "vue";
import {
FieldList,
PivotViewPlugin,
} from "@syncfusion/ej2-vue-pivotview";
Vue.use(PivotViewPlugin);
export default {
data() {
return {
dataSourceSettings: {
url: 'https://localhost:44346/Pivot',
enableSorting: true,
columns: [
{ name: 'Year' }
],
values: [
{ name: 'Sold', caption: "Units Sold"},
{ name: 'Amount', caption: "Sold Amount"}
],
rows: [
{ name: 'Country' },
{ name: 'Products' }
]
},
showFieldList: true
};
},
methods: {
},
provide: {
pivotview: [FieldList]
}
};
```

Copyright © 2001 -2024 Syncfusion Inc.

```
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-dropdowns/styles/material.css";
@import "../node_modules/@syncfusion/ej2-lists/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-grids/styles/material.css";
@import "../node_modules/@syncfusion/ej2-pivotview/styles/material.css";
</style>
`
```

When you run the sample, the resulting pivot table will look like this:

	FY 2015		FY 2016		F
	Units Sold	Sold Amount	Units Sold	Sold Amount	U
France	729	1160099.5	609	983317	
Germany	528	845472	667	1067220	
United Kingdom	782	1263109.5	640	1031630.5	
United States	682	1085398.5	480	770362	
Grand Total	2721	4354079.5	2396	3852529.5	

Explore our Vue Pivot Table sample and ASP.NET Core Web Application to extract data from a MongoDB database and bind to the Pivot Table in this GitHub repository.

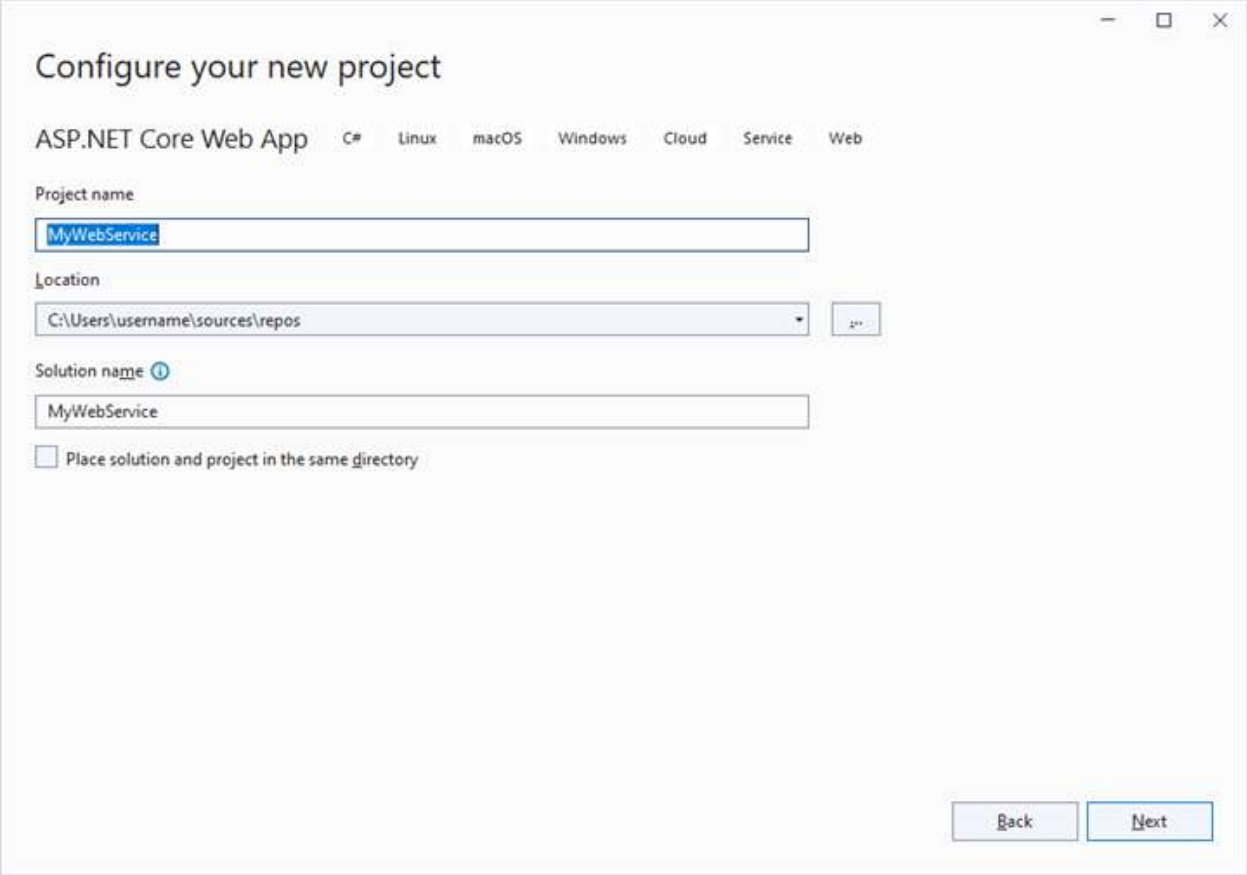
Elasticsearch in EJ2 Vue Pivotview Component

This section describes how to retrieve data from Elasticsearch database using Nest library and bind it to the Pivot Table via a Web API controller.

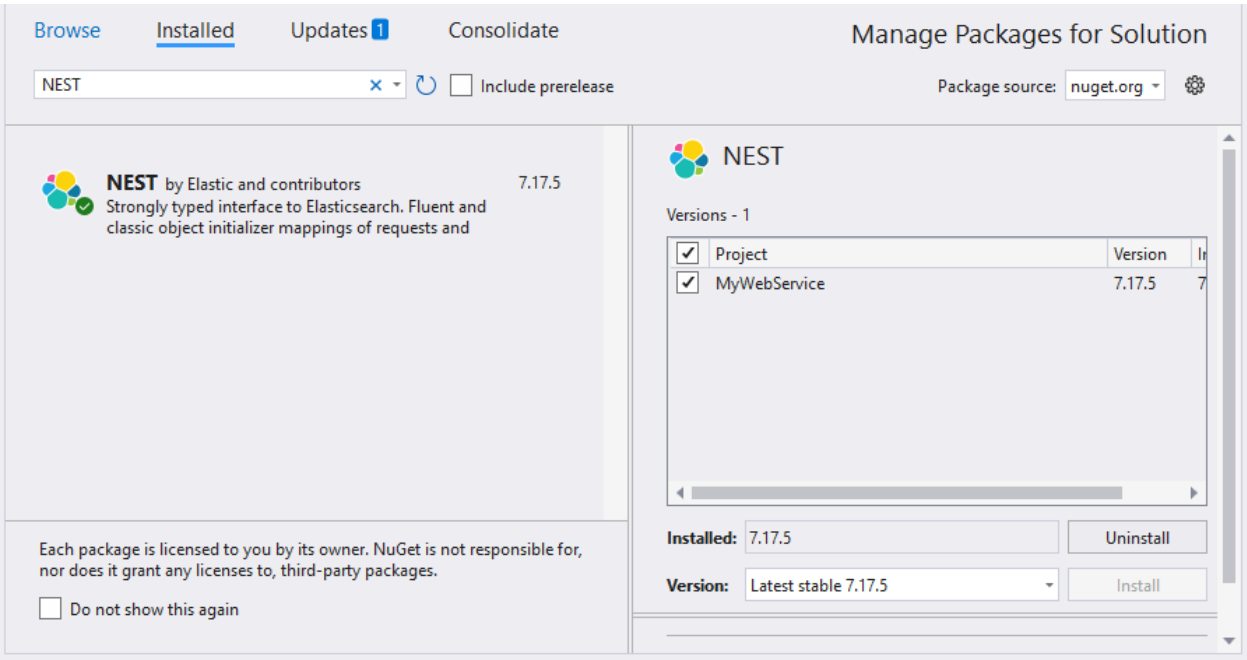
Create a Web API service to fetch Elasticsearch data

1. Open Visual Studio and create an ASP.NET Core Web App project type, naming it **MyWebService**. To create an ASP.NET Core Web application, follow the document link.

Copyright © 2001 -2024 Syncfusion Inc.



2. To connect a Elasticsearch Server using the **NEST** in our application, we need to install the NEST NuGet package. To do so, open the NuGet package manager of the project solution, search for the package **NEST** and install it.



3. Create a Web API controller (aka, PivotController.cs) file under **Controllers** folder that helps to establish data communication with the Pivot Table.

4. In the Web API controller (aka, PivotController), **ElasticClient** helps to connect the Elasticsearch database. Next, using **Search** method you can query your Elasticsearch index and retrieve results from the database.

5. In the **Get()** method of the **PivotController.cs** file, the **FetchElasticsearchData** method is used to retrieve the Elasticsearch data, which is then serialized into JSON using **JsonConvert.SerializeObject()**.

```csharp
using Microsoft.AspNetCore.Mvc;
using Nest;
using Newtonsoft.Json;
namespace MyWebService.Controllers
{
[ApiController]
[Route("[controller]")]
public class PivotController : ControllerBase
{
[HttpGet(Name = "GetElasticSearchData")]
public object Get()
{
return JsonConvert.SerializeObject(FetchElasticsearchData());
}
private static object FetchElasticsearchData()
{
// Replace with your own connection string.
var connectionString = "<Enter your valid connection string here>";
var uri = new Uri(connectionString);
var connectionSettings = new ConnectionSettings(uri);
var client = new ElasticClient(connectionSettings);
var searchResponse = client.Search<object>(s => s
.Index("product")
.Size(1000)
);
return searchResponse.Documents;
```

Copyright © 2001 -2024 Syncfusion Inc.

}

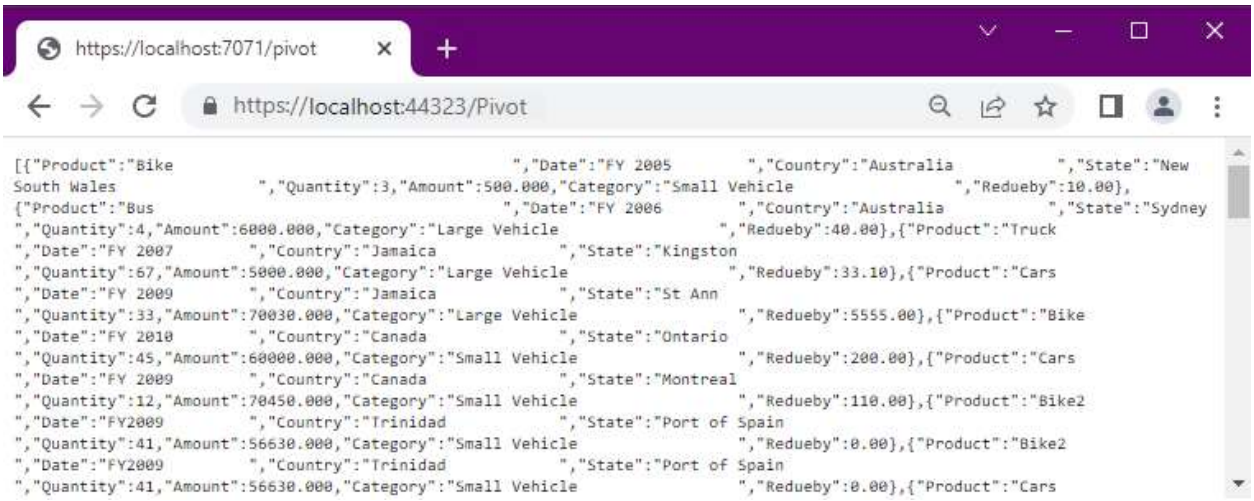
}

}

`

6. Run the web application and it will be hosted within the URL https://localhost:44323.

7. Finally, the retrieved data from Elasticsearch database which is in the form of JSON can be found in the Web API controller available in the URL link https://localhost:44323/Pivot, as shown in the browser page below.



Connecting the Pivot Table to a Elasticsearch database using the Web API service

1. Create a simple Vue Pivot Table by following the **"Getting Started"** documentation link.

2. Map the hosted Web API's URL link https://localhost:44323/Pivot to the Pivot Table component in **App.vue** by using the url property under dataSourceSettings.

`typescript

<script>

import Vue from "vue";

import {

FieldList,

PivotViewPlugin,

} from "@syncfusion/ej2-vue-pivotview";

Vue.use(PivotViewPlugin);

export default {

data() {

return {

dataSourceSettings: {

```
url: 'https://localhost:44323/Pivot'
//Other codes here...
}
};
}
};
</script>
<style>
//Syncfusion Angular controls styles
</style>
`
```

3. Frame and set the report based on the data retrieved from the Elasticsearch database.

```
`typescript
<template>
<div>
<div class="control-section" style="overflow: auto">
<div class="content-wrapper">
<ejs-pivotview
id="pivotview"
ref="pivotview"
:dataSourceSettings="dataSourceSettings"
:showFieldList="showFieldList"
</ejs-pivotview>
</div>
</div>
</div>
</template>
<script>
import Vue from "vue";
import {
FieldList,
PivotViewPlugin,
} from "@syncfusion/ej2-vue-pivotview";
```

Copyright © 2001 -2024 Syncfusion Inc.

```
Vue.use(PivotViewPlugin);
export default {
data() {
return {
dataSourceSettings: {
url: 'https://localhost:44323/Pivot',
expandAll: false,
enableSorting: true,
columns: [{ name: 'Product' }],
values: [{ name: 'Quantity' }, { name: 'Amount', caption: 'Sold Amount' }],
rows: [{ name: 'Country' }, { name: 'State' }],
formatSettings: [{ name: 'Amount', format: 'C0' }],
filters: []
},
showFieldList: true
};
},
methods: {
},
provide: {
pivotview: [FieldList]
}
};
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-dropdowns/styles/material.css";
@import "../node_modules/@syncfusion/ej2-lists/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
```

Copyright © 2001 -2024 Syncfusion Inc.

@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";

@import "../node_modules/@syncfusion/ej2-grids/styles/material.css";

@import "../node_modules/@syncfusion/ej2-pivotview/styles/material.css";

</style>

`

When you run the sample, the resulting pivot table will look like this:

	Large Vehicle		Small Vehicle		Grand Total	
	Quantity	Amount	Quantity	Amount	Quantity	Am
Australia	16	24000	12	2000	28	
Canada			420	1649000	420	
Jamaica	400	300120			400	
Trinidad			328	453040	328	
Grand Total	416	324120	760	2104040	1176	

Explore our Vue Pivot Table sample and ASP.NET Core Web Application to extract data from a Elasticsearch database and bind to the Pivot Table in this GitHub repository.

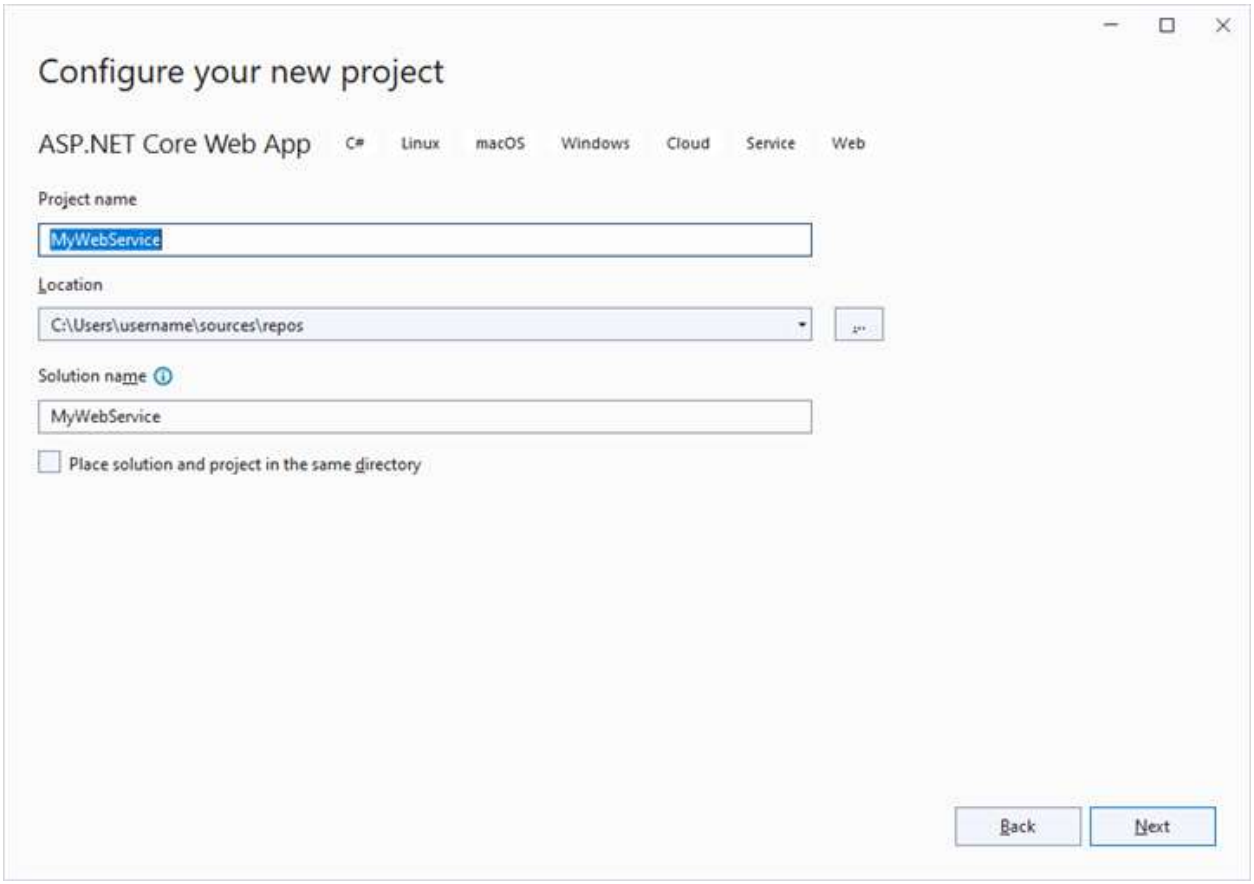
Snowflake in EJ2 Vue Pivotview Component

This section describes how to retrieve data from a Snowflake database using Snowflake Data and bind it to the Pivot Table via a Web API controller.

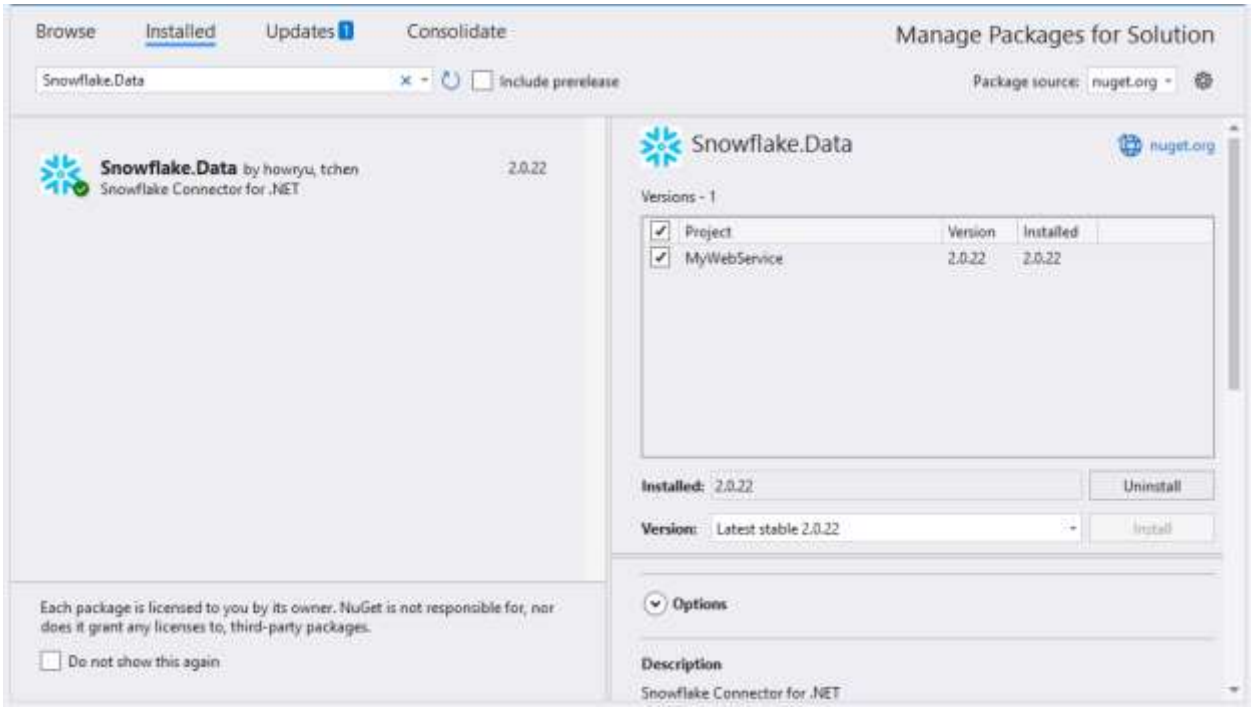
Create a Web API service to fetch Snowflake data

1. Open Visual Studio and create an ASP.NET Core Web App project type, naming it **MyWebService**. To create an ASP.NET Core Web application, follow the document link.

Copyright © 2001 -2024 Syncfusion Inc.



2. To connect a Snowflake Server using the **Snowflake.Data.Client** in our application, we need to install the Snowflake.Data NuGet package. To do so, open the NuGet package manager of the project solution, search for the package **Snowflake.Data** and install it.



Copyright © 2001 -2024 Syncfusion Inc.

3. Create a Web API controller (aka, PivotController.cs) file under **Controllers** folder that helps to establish data communication with the Pivot Table.

4. In the Web API controller (aka, PivotController), **SnowflakeDbConnection** helps to connect the Snowflake database. Next, using **SnowflakeDbDataAdapter** you can process the desired Snowflake query string and retrieve data from the database. The **Fill** method of the **SnowflakeDbDataAdapter** is used to populate the retrieved data into a **DataTable** as shown in the following code snippet.

```csharp
using Microsoft.AspNetCore.Mvc;
using Snowflake.Data.Client;
using Newtonsoft.Json;
using System.Data;
namespace MyWebService.Controllers
{
[ApiController]
[Route("[controller]")]
public class PivotController : ControllerBase
{
[HttpGet(Name = "GetSnowflakeResult")]
public object Get()
{
return JsonConvert.SerializeObject(FetchSnowflakeResult());
}
public static DataTable FetchSnowflakeResult()
{
using (SnowflakeDbConnection snowflakeConnection = new SnowflakeDbConnection())
{
// Replace with your own connection string.
snowflakeConnection.ConnectionString = "<Enter your valid connection string here>";
snowflakeConnection.Open();
SnowflakeDbDataAdapter adapter = new SnowflakeDbDataAdapter("select * from CALL_CENTER", snowflakeConnection);
DataTable dataTable = new DataTable();
adapter.Fill(dataTable);
snowflakeConnection.Close();
return dataTable;
```

Copyright © 2001 -2024 Syncfusion Inc.

```
}
}
}
}
`
```

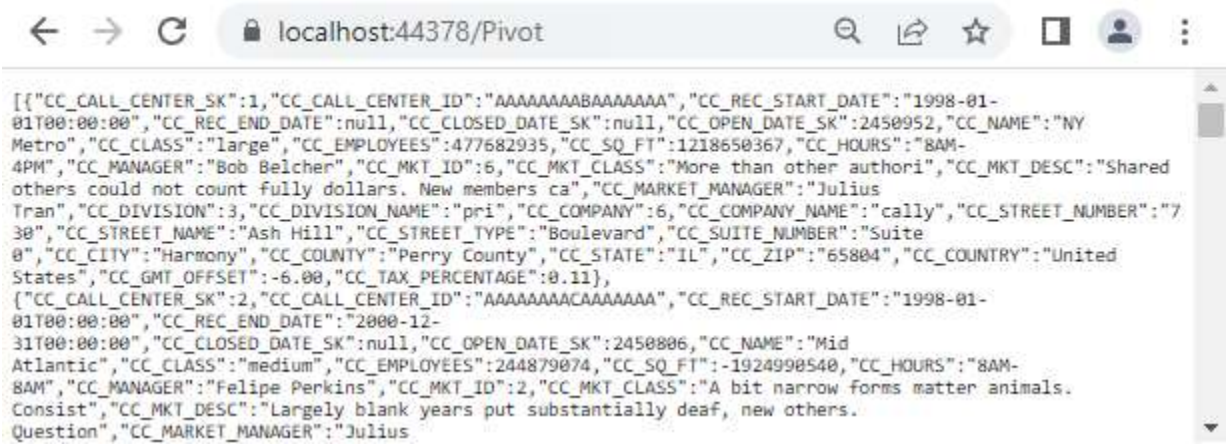
5. In the **Get()** method of the **PivotController.cs** file, the **FetchSnowflakeResult** method is used to retrieve the Snowflake data as a **DataTable**, which is then serialized into JSON string using **JsonConvert.SerializeObject()**.

```csharp
using Microsoft.AspNetCore.Mvc;
using Snowflake.Data.Client;
using Newtonsoft.Json;
using System.Data;
namespace MyWebService.Controllers
{
[ApiController]
[Route("[controller]")]
public class PivotController : ControllerBase
{
[HttpGet(Name = "GetSnowflakeResult")]
public object Get()
{
return JsonConvert.SerializeObject(FetchSnowflakeResult());
}
public static DataTable FetchSnowflakeResult()
{
using (SnowflakeDbConnection snowflakeConnection = new SnowflakeDbConnection())
{
// Replace with your own connection string.
snowflakeConnection.ConnectionString = "<Enter your valid connection string here>";
snowflakeConnection.Open();
SnowflakeDbDataAdapter adapter = new SnowflakeDbDataAdapter("select * from CALL_CENTER", snowflakeConnection);
DataTable dataTable = new DataTable();
```

```
adapter.Fill(dataTable);
snowflakeConnection.Close();
return dataTable;
}
}
}
}
`
```

6. Run the application and it will be hosted within the URL https://localhost:44378/.

7. Finally, the retrieved data from Snowflake database which is in the form of JSON can be found in the Web API controller available in the URL link https://localhost:44378/Pivot, as shown in the browser page below.



Connecting the Pivot Table to a Snowflake database using the Web API service

1. Create a simple Vue Pivot Table by following the **"Getting Started"** documentation link.

2. Map the hosted Web API's URL link https://localhost:44378/Pivot to the Pivot Table component in **App.vue** by using the url property under dataSourceSettings.

```
`ts
<script>
import Vue from "vue";
import {
FieldList,
PivotViewPlugin,
} from "@syncfusion/ej2-vue-pivotview";
Vue.use(PivotViewPlugin);
export default {
```

```
data() {
return {
dataSourceSettings: {
url: 'https://localhost:44378/pivot'
//Other codes here...
}
};
}
};
</script>
<style>
//Syncfusion Angular controls styles
</style>
`
```

3. Frame and set the report based on the data retrieved from the Snowflake database.

```
`ts
<template>
<div>
<div class="control-section" style="overflow: auto">
<div class="content-wrapper">
<ejs-pivotview
id="pivotview"
ref="pivotview"
:dataSourceSettings="dataSourceSettings"
:showFieldList="showFieldList"
</ejs-pivotview>
</div>
</div>
</div>
</template>
<script>
import Vue from "vue";
import {
```

```
FieldList,
PivotViewPlugin,
} from "@syncfusion/ej2-vue-pivotview";
Vue.use(PivotViewPlugin);
export default {
data() {
return {
dataSourceSettings: {
url: 'https://localhost:44378/Pivot',
enableSorting: true,
expandAll: false,
dataSource: [],
columns: [
{ name: 'CC_COUNTRY', caption: 'Country' }
],
rows: [
{ name: 'CC_STATE', caption: 'State' },
{ name: 'CC_CITY', caption: 'City' }
],
values: [
{ name: 'CC_COMPANY', caption: 'Company' },
{ name: 'CC_EMPLOYEES', caption: 'Employees' },
{ name: 'CCTAXPERCENTAGE', caption: 'Percentage' },
],
filters: []
},
showFieldList: true
};
},
methods: {
},
provide: {
pivotview: [FieldList]
```

Copyright © 2001 -2024 Syncfusion Inc.

```
}
};
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-dropdowns/styles/material.css";
@import "../node_modules/@syncfusion/ej2-lists/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-grids/styles/material.css";
@import "../node_modules/@syncfusion/ej2-pivotview/styles/material.css";
</style>
`
```

When you run the sample, the resulting pivot table will look like this:

	United States			Grand Total		
	Company	Employees	Percentage	Company	Employees	Percenta
CA	16	413279139	0.4800000000...	16	413279139	0.48000
CO	5	1160903623	0.18	5	1160903623	
FL	15	1162362540	0.33	15	1162362540	
GA	20	2358562323	0.12	20	2358562323	
IL	8	707852970	0.1699999999...	8	707852970	0.16999
KS	9	1842349179	0.19	9	1842349179	
LA	6	528468075	0.16	6	528468075	

Explore our Vue Pivot Table sample and ASP.NET Core Web Application to extract data from a Snowflake database and bind to the Pivot Table in this GitHub repository.

Olap in Vue Pivotview component

Getting Started

This section explain steps to create a simple **Pivot Table** with OLAP data source in a Vue environment.

Dependencies

The following list of dependencies are required to use the pivot table component in your application.

`javascript

|-- @syncfusion/ej2-vue-pivotview

|-- @syncfusion/ej2-pivotview

|-- @syncfusion/ej2-base

|-- @syncfusion/ej2-data

|-- @syncfusion/ej2-excel-export

|-- @syncfusion/ej2-file-utils

|-- @syncfusion/ej2-compression

|-- @syncfusion/ej2-pdf-export

|-- @syncfusion/ej2-file-utils

|-- @syncfusion/ej2-compression

|-- @syncfusion/ej2-calendars

|-- @syncfusion/ej2-charts

|-- @syncfusion/ej2-svg-base

|-- @syncfusion/ej2-inputs

|-- @syncfusion/ej2-buttons

|-- @syncfusion/ej2-dropdowns

|-- @syncfusion/ej2-lists

|-- @syncfusion/ej2-popups

|-- @syncfusion/ej2-navigations

|-- @syncfusion/ej2-grids

`

Setup Vue Environment

You can use Vue CLI to setup your vue application. To install Vue CLI use the following commands.

`bash

npm install -g @vue/cli

npm install -g @vue/cli-init

`

Create a Vue Application

Create a new Vue application using below Vue CLI command.

`bash

vue init webpack-simple quickstart

`

Now, the application is created in the **quickstart** demo folder. Run the following command one-by-one to navigate to the **quickstart** demo folder, and install the required **npm** dependent packages.

`bash

cd quickstart

npm install

`

Adding Syncfusion pivot table package

All the available Essential JS 2 packages are published in npmjs.com registry. To install pivot table component, use the following command.

`bash

npm install @syncfusion/ej2-vue-pivotview --save

`

The **--save** will instruct NPM to include the pivot table package inside the **dependencies** section of the **package.json**.

Registering pivot table Component

You can register the pivot table component in your application by using the Vue.use() in **App.vue** file as follows.

`ts

import { PivotViewPlugin } from '@syncfusion/ej2-vue-pivotview';

Vue.use(PivotViewPlugin);

`

Registering PivotViewPlugin in vue, will register the pivot table component along with its required child directives globally.

Adding CSS Reference

Import pivot table and its dependent components styles as given below in <style> section of the **App.vue** file.

`

<style>

<!-- Material theme used for this sample -->

@import '../node_modules/@syncfusion/ej2-base/styles/material.css';

@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';

@import '../node_modules/@syncfusion/ej2-dropdowns/styles/material.css';

@import '../node_modules/@syncfusion/ej2-grids/styles/material.css';

@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';

@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';

@import '../node_modules/@syncfusion/ej2-navigations/styles/material.css';

Copyright © 2001 -2024 Syncfusion Inc.

@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';

@import '../node_modules/@syncfusion/ej2-calendars/styles/material.css';

@import "../node_modules/@syncfusion/ej2-pivotview/styles/material.css";

</style>

`

Adding pivot table component

Add the EJ2 Vue pivot table using <ejs-pivotview> to the <template> section of the **App.vue** file in src directory. The properties of pivot table can be assigned in <ejs-pivotview> tag and that can be bounded under **data** section.

`

<template>

<ejs-pivotview></ejs-pivotview>

</template>

<script>

import Vue from "vue";

import { PivotViewPlugin } from "@syncfusion/ej2-vue-pivotview";

Vue.use(PivotViewPlugin);

export default {

data () {

return {

}

}

}

</script>

<style>

@import "@syncfusion/ej2-vue-pivotview/styles/material.css";

</style>

`

Next we need to add the the following code in **App.vue** file to populate pivot table with a sample OLAP data source. Refer here to know the more details about OLAP data binding.

`

<template>

```
<div id="app">
<ejs-pivotview :dataSourceSettings="dataSourceSettings"> </ejs-pivotview>
</div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin } from "@syncfusion/ej2-vue-pivotview";
Vue.use(PivotViewPlugin);
export default {
data () {
return {
dataSourceSettings: {
catalog: 'Adventure Works DW 2008 SE',
cube: 'Adventure Works',
providerType: 'SSAS',
enableSorting: true,
url: 'https://bi.syncfusion.com/olap/msmdpump.dll',
localeIdentifier: 1033
}
}
}
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
`
```

Adding OLAP cube elements to row, column, value and filter axes

Now that pivot table is initialized and assigned with sample OLAP data source, will further move to showcase the component by organizing appropriate OLAP cube elements in rows, columns, values and filters axes.

In dataSourceSettings property, four major axes rows, columns, values and filters plays a vital role in defining and organizing OLAP cube elements from the bound data source, to render the entire pivot table component in a desired format.

Copyright © 2001 -2024 Syncfusion Inc.

rows – Collection of OLAP cube elements (such as Hierarchies, NamedSet, Calculated Members etc.,) that needs to be displayed in row axis of the pivot table.

columns – Collection of OLAP cube elements (such as Hierarchies, NamedSet, Calculated Members etc.,) that needs to be displayed in column axis of the pivot table.

values – Collection of OLAP cube elements (such as Measures, Calculated Measures) that needs to be displayed as aggregated numeric values in the pivot table.

filters - Collection of OLAP cube elements (such as Hierarchies and Calculated Members) that would act as master filter over the data bound in row, column and value axes of the pivot table.

In-order to define each OLAP cube element in the respective axis, the following basic properties should be set.

- name: It allows to set the unique name of the hierarchies, named set, measures, calculated members etc., from the bound OLAP data source. It's casing should match exactly like in the data source and if not set properly, the pivot table will be rendered as empty.
- caption: It allows to set the caption, which is the alias name of the unique name that needs to be displayed in the pivot table. If not provided, unique name will be displayed.

In this sample, "Product Categories" is added in column, "Customer Geography" in row, and "Customer Count" and "Internet Sales Amount" in value axes respectively.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings" :height=
"height"> </ejs-pivotview>
    </div>

Applying formatting to measures

Formatting defines a way in which values should be displayed in pivot table. For example, format **“C0”** denotes the values should be displayed in currency pattern without decimal points. To do so, define the formatSettings with its name and format properties. In this sample, the name property is set as "[Measures].[Internet Sales Amount]", a measure from value axis and its format is set as "C0". Likewise, we can set format for other measures as well.

Only measures from value axis, which is in the form of numeric data values are applicable for formatting.

Enable grouping bar

The Grouping Bar feature automatically populates OLAP cube elements from the bound data source and allows end users to drag OLAP cube elements between different axes such as rows, columns, values and filters, and change pivot view at runtime. Sorting, filtering and removing of elements is also possible. It can be enabled by setting the showGroupingBar property to **true** and by injecting the **GroupingBar** module as follows.

If the **GroupingBar** module is not injected, the grouping bar will not be rendered with the pivot table component.

Enable pivot field list

The component provides a built-in Field List similar to Microsoft Excel. It allows you to add or remove OLAP cube elements and also rearrange the OLAP cube elements between different axes, including rows, columns, values and filters along with filter and sort options dynamically at runtime. It can be enabled by setting the showFieldList property to **true** and by injecting the **FieldList** module as follows.

If the **FieldList** module is not injected, the Field List will not be rendered with the pivot table component.

Exploring filter axis

The filter axis contains collection of OLAP cube elements such as hierarchies and calculated members that would act as master filter over the data bound in rows, columns and values axes of the pivot table. The OLAP cube elements along with filter members could be set to filter axis either through report via code behind or by dragging and dropping OLAP cube elements from other axes to filter axis via grouping bar or field list at runtime.

Calculated field

The calculated field allows user to insert or add a new calculated field based on the available OLAP cube elements from the bound data source. Calculated fields are nothing but customized dimensions or measures that are newly created based on the user-defined expression.

The two types of calculated fields are as follows:

- **Calculated Measure** – Creates a new measure through user-defined expression.
- **Calculated Dimension** – Creates a new dimension through user-defined expression.

It can be customized using the calculatedFieldsSettings property through code behind. The setting required for calculate field feature at code behind are:

- name: It allows to set the unique name for new calculated field.
- formula: It allows to set the user-defined expression.

Copyright © 2001 -2024 Syncfusion Inc.

- hierarchyUniqueName: It allows to specify dimension unique name whose hierarchies alone should be used in the expression. This will be applicable only for calculated dimension.
- formatString: It allows to set the format string for the resultant calculated field.

You need to set isCalculatedField property to true, while adding calculated fields to respective axis through code behind.

Also calculated fields can be added at run time through the built-in dialog. The dialog can be enabled by setting the allowCalculatedField property to **true** and by injecting the **CalculatedField** module as follows. You will see a button enabled in the Field List UI automatically to invoke the calculated field dialog and perform necessary operation.

If the **CalculatedField** module is not injected, the calculated field dialog will not be rendered with the pivot table component. Moreover calculated measure can be added only in value axis.

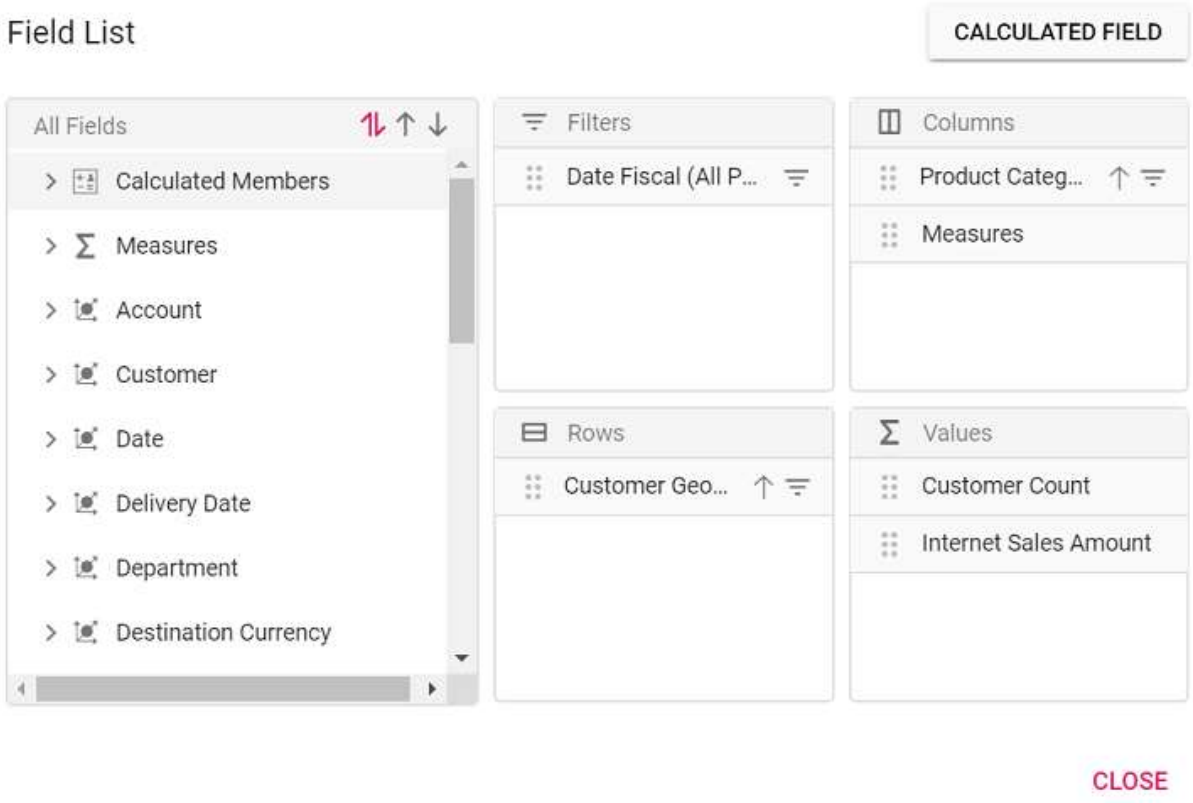
</style>
```

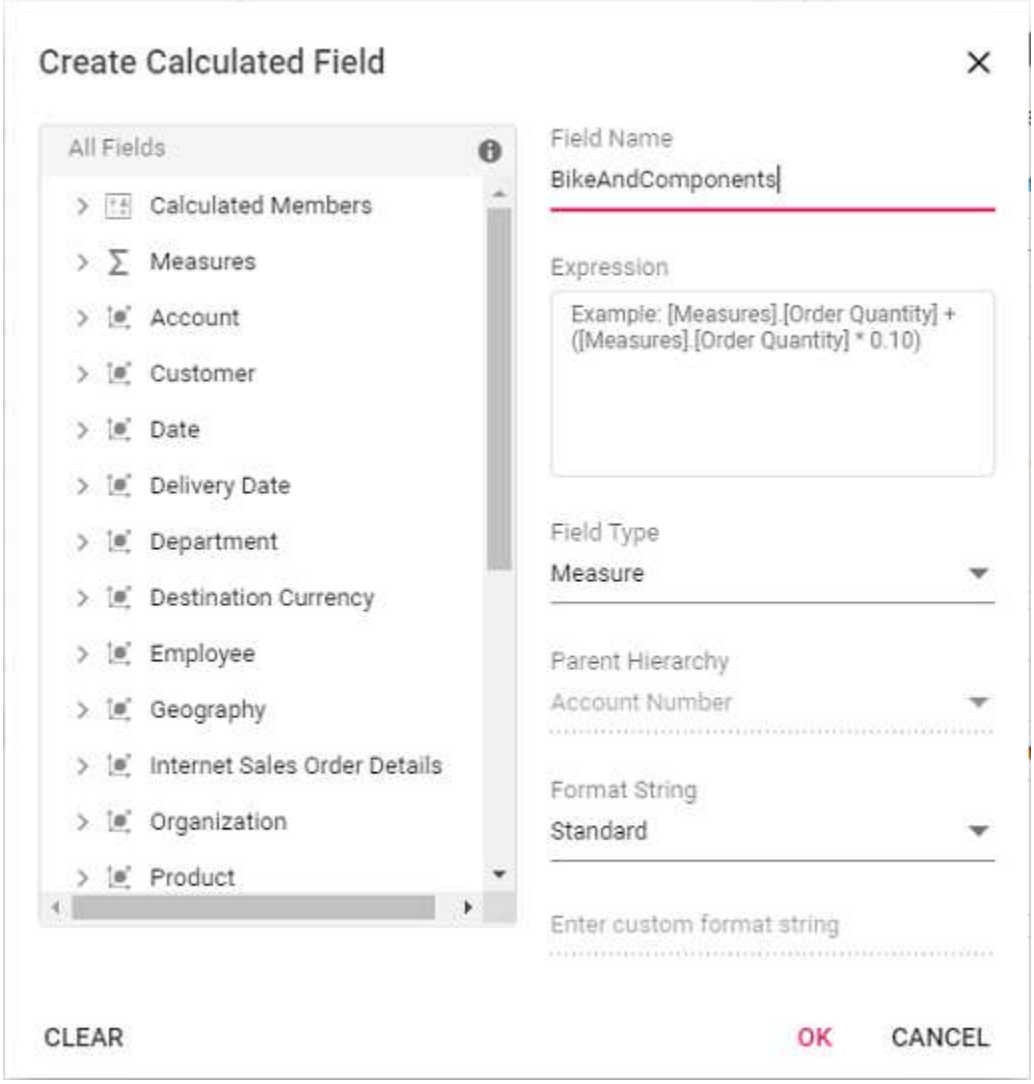
{% previewsample "page.domainurl/code-snippet/pivot-grid/common-cs18" %}

Users can add a calculated field at runtime through the built-in dialog by using the following steps.

Step 1: Click the "CALCULATED FIELD" button in the field list dialog positioned at the top right corner. The calculated field dialog will be opened now. Enter the name of the calculated field to be created.

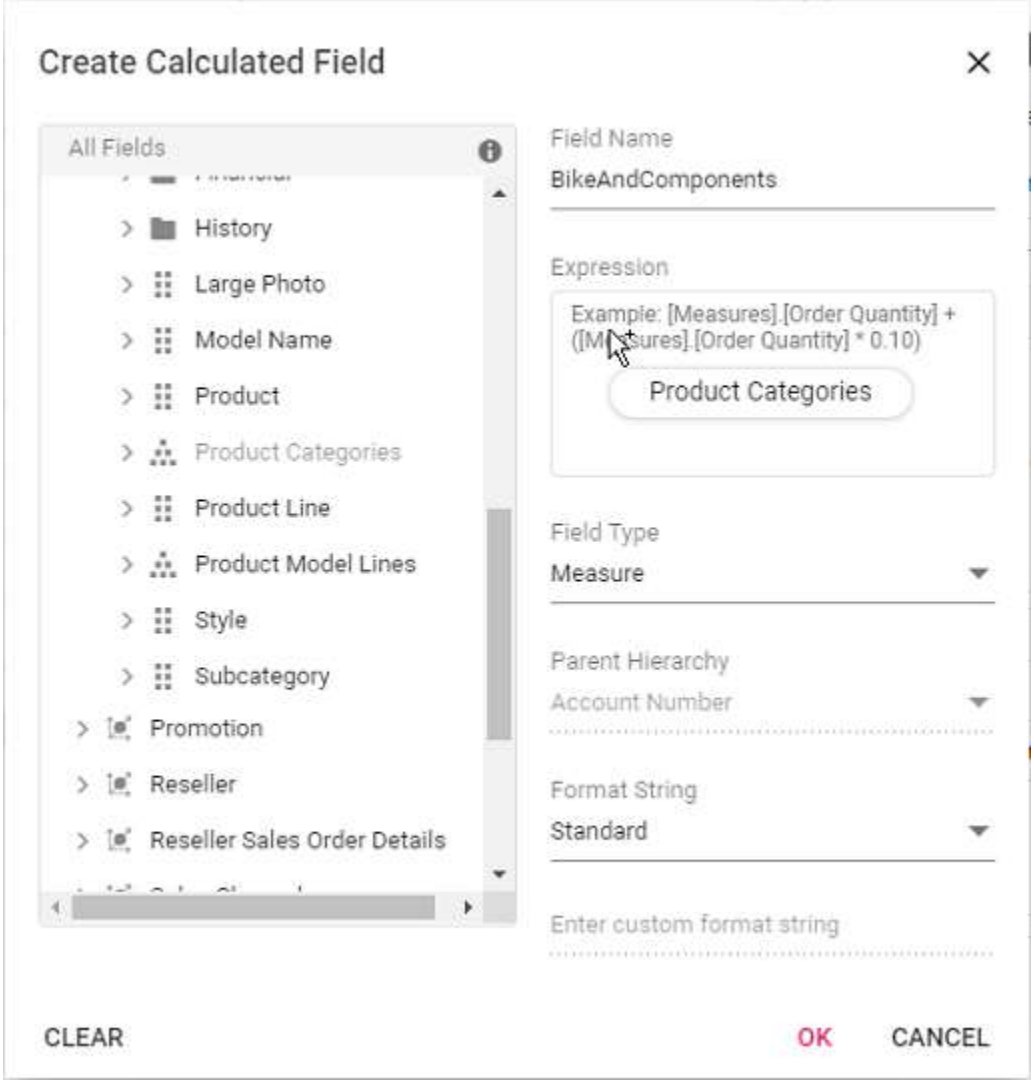


Field List
CALCULATED FIELD
All Fields
Calculated Members
Measures
Account
Customer
Date
Delivery Date
Department
Destination Currency
Filters
Date Fiscal (All P...
Columns
Product Categ...
Measures
Rows
Customer Geo...
Values
Customer Count
Internet Sales Amount
CLOSE

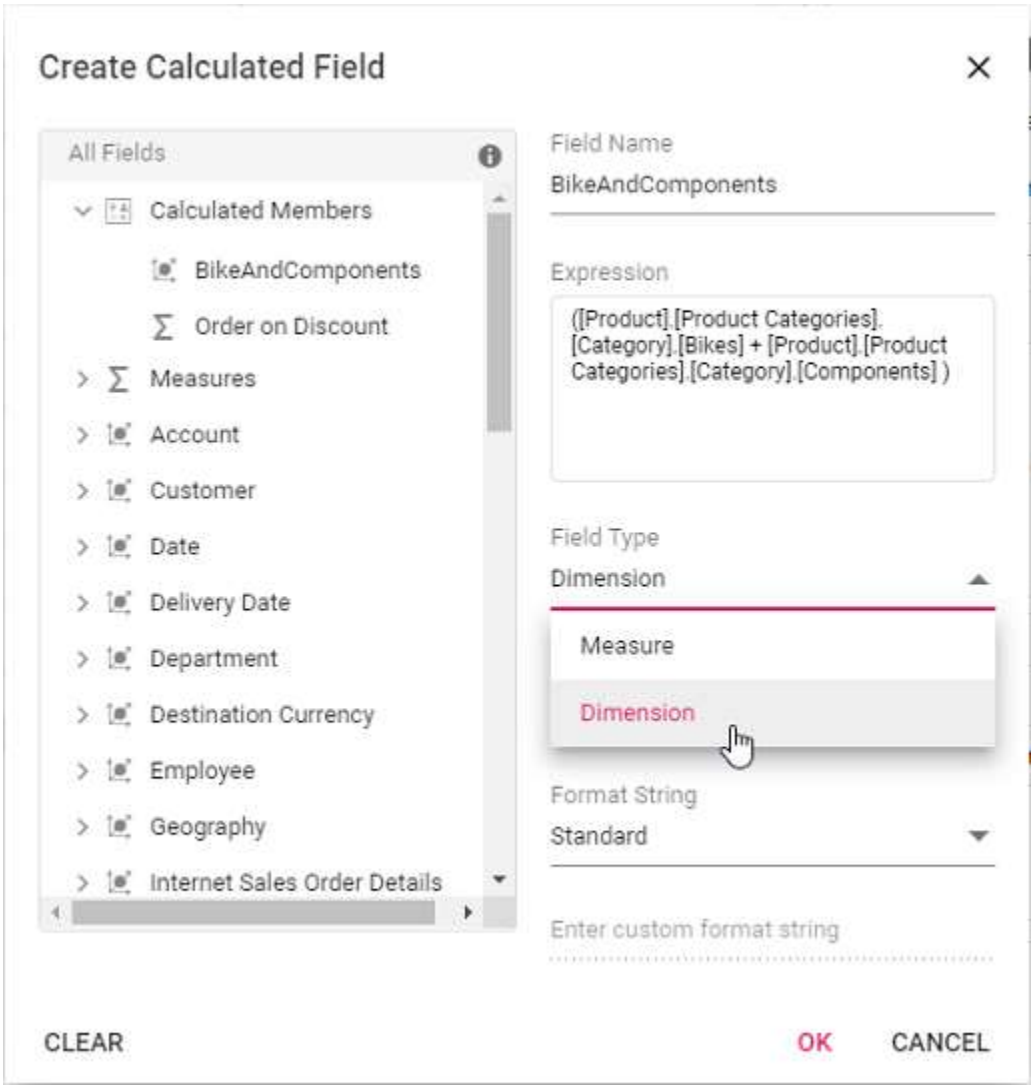


Step 2: Frame the expression by dragging and dropping the fields from the tree view on the left side of the dialog using simple arithmetic operators. **Example:** "IIF([Measures].[Internet Sales Amount]^0.5 > 100, [Measures].[Internet Sales Amount]*100, [Measures].[Internet Sales Amount]/100)". Please refer here to learn more about the supported operators and functions to frame the expression.

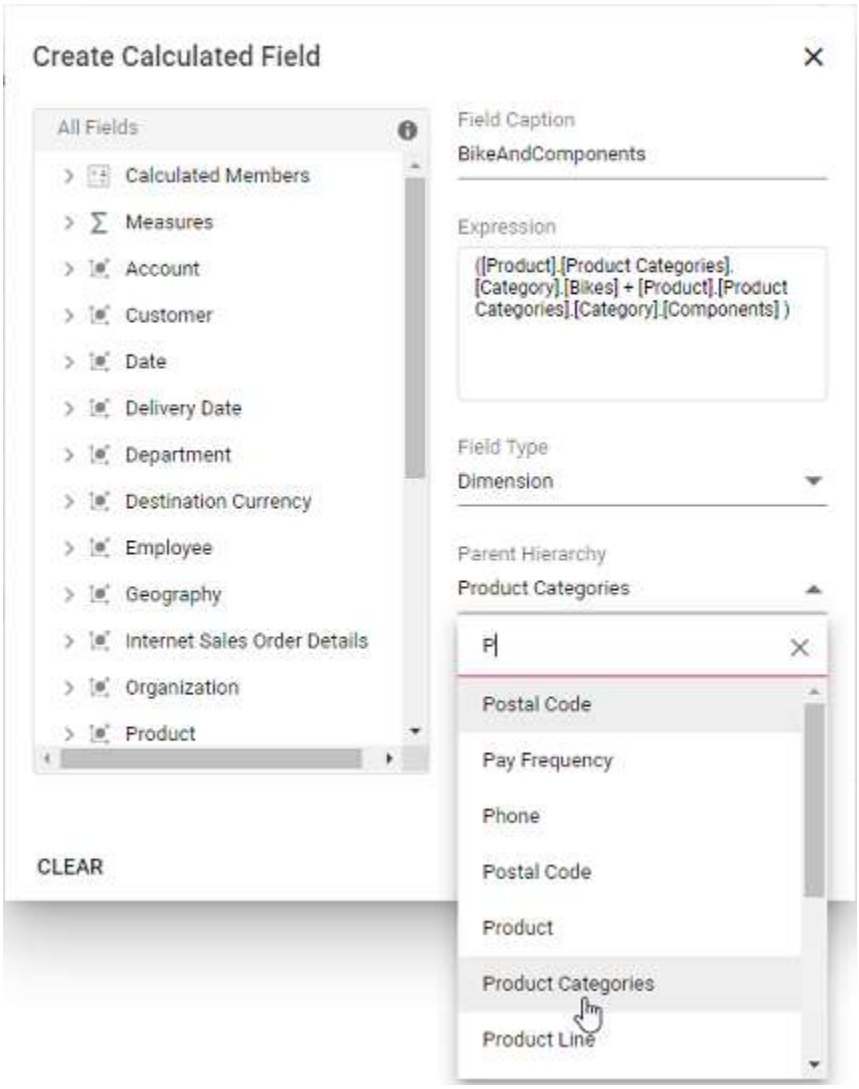
Copyright © 2001 -2024 Syncfusion Inc.



Step 3: Confirm the type of the field to be created - calculated measure or calculated dimension.



Step 4: Choose the parent hierarchy of the calculated field. NOTE: It is only applicable to the calculated dimension.



Step 5: Then select the format string from the drop-down list and finally click "OK".

	Accessories		
	Customer Count	Internet Sales Amount	Order on Discount
Australia	2,905	$138,690.63	$68,124.10
Canada	1,230	$103,377.85	$68,124.10
France	1,505	$63,406.78	$68,124.10
Germany	1,535	$62,232.59	$68,124.10

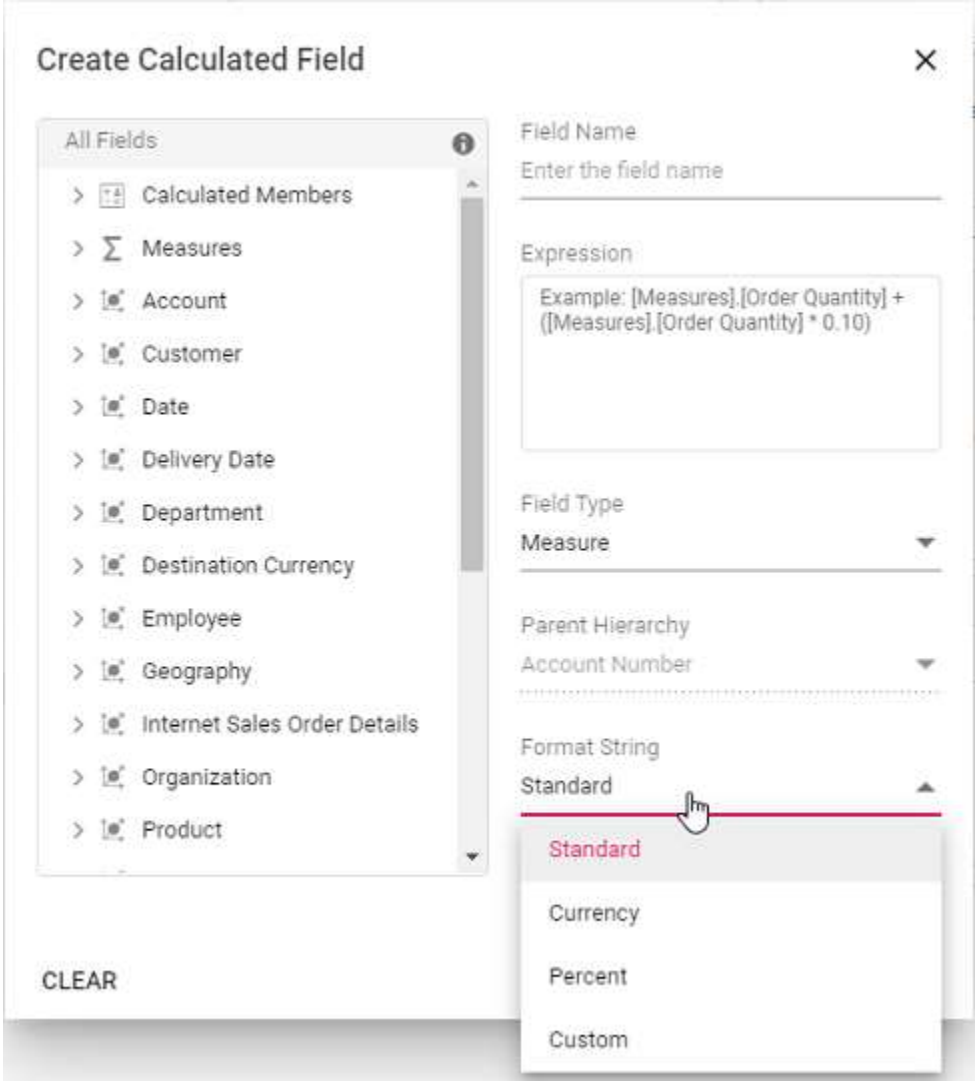
Copyright © 2001 -2024 Syncfusion Inc.

Format String

Allows you to specify the required format string while creating new calculated field. Supported format strings are:

- **Standard** - Denotes the numeric type.
- **Currency** - Denotes the currency type.
- **Percent** - Denotes the percentage type.
- **Custom** - Denotes the custom format. For example: "###0.##0#". This shows the value "9584.3" as "9584.300."

By default, **Standard** will be selected from the drop down list.



Renaming the existing calculated field

Existing calculated field can be renamed only through the UI at runtime. To do so, open the calculated field dialog, click the target field. User can now see the existing name getting displayed in the text box at the top of the dialog. Now, change the name based on user requirement and click "OK".

Modifying the existing format string

Existing calculated field's format string can be modified only through the UI at runtime. To do so, open the calculated field dialog and click the target calculated field. User can now see the format string for the existing calculated field getting displayed in a drop-down list. Change the format string based on the requirement and finally click "OK".

Clearing the changes while editing the calculated field

Previous changes can be cleared by using the "Clear" option while performing operations such as creating and editing the calculated field. To do so, click the "Clear" button in the bottom left corner of the dialog.

Virtual Scrolling

Allows large amounts of data to be loaded without any performance degradation by rendering rows and columns in relation to the current viewport. Rest of the data will be brought into the viewport dynamically based on vertical or horizontal scroll position. This feature can be enabled by setting the enableVirtualization property to **true**.

To use the virtual scrolling feature, inject the VirtualScroll module into the pivot table.

APP.VUE

```
<template>
  <div id="app">
    <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:height="height">
    </ejs-pivotview>
  </div>

{% previewsample "page.domainurl/code-snippet/pivot-grid/common-cs19" %}

Limitations for virtual scrolling

- The columnWidth property in gridSettings should be in pixels. The percentage value is not accepted.
- Resizing columns and setting the width of individual columns will affect scrolling and is therefore not recommended.
- The grand totals option is not supported by virtual scrolling.

Run the application

The quickstart project is configured to compile and run the application in the browser. Use the following command to run the application.

`bash

npm run dev

`

Output will be displayed as follows.

Data Binding

To bind OLAP datasource to the pivot table, you need to specify following properties under dataSourceSettings option.

| Properties|Description |

|-----|-----|

| cube| Points the respective cube name from OLAP database.|

| providerType| Points the provider type for pivot table to identify the type of data source.|

| url| Contains the cube URL for establishing the connection (online).|

| catalog| Contains the database name (catalog name) to fetch the data.|

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings" :height=

{% previewsample "page.domainurl/code-snippet/pivot-grid/common-cs23" %}

Named set

Named set is a multidimensional expression (MDX) that returns a set of dimension members, which can be created by combining the cube data, arithmetic operators, numbers, and functions.

You can bind the named sets in the pivot table by setting it's unique name in the name property either in row or column axis and isNamedSet boolean property to **true**. In this sample, we have added "Core Product Group" named set in the column axis.

APP.VUE

```
<template>

Configuring authentication

Users can configure basic authentication information to access the OLAP cube using the authentication property. The settings required to configure are as follows:

- userName: It allows the user to set a username that recognizes the basic authentication of the IIS.
- password: It allows to set the appropriate password.

If the user does not configure the authentication, a default popup will appear in the browser to get the authentication information.

Roles

SQL Server Analysis Services uses roles to limit data access within a cube. Each role defines a set of permissions that can be granted to a single user or groups of users. It is used to manage security by limiting access to sensitive data and determining who has access to and can change the cube. It can be configured using the roles property in dataSourceSettings.

The roles property can be used to specify one or more roles to the OLAP cube, separated by commas.

OLAP Cube: Elements

Field list

The field list, aka cube dimension browser, is a tree view like structure that organizes the cube elements such as dimensions, hierarchies, measures, etc., from the selected cube into independent logical groups.

Types of node in field list

- **Display folder**: A folder that contains a set of similar elements.
- **Measure**: Quantity available for analysis.
- **Dimension**: A name given to the parts of the cube that categorizes data.
- **Attribute Hierarchy**: Level of attributes down the hierarchy.
- **User-defined Hierarchy**: Members of a dimension in a hierarchical structure.
- **Level**: Denotes a specific level in the category.
- **Named Set**: A collection of tuples and members, that can be defined and saved as a part of cube definition for later use.

Measure

In a cube, a measure is a set of values that are based on a column in the cube's fact table and are usually numeric. The measures are the central values of a cube that are analyzed. That is, measures are the

numeric data of primary interest to users browsing a cube. You can select measures depend on the types of users request. Some common measures are sales, costs, expenditures, and production count.

Dimension

A simple dimension object is composed of basic information such as name, hierarchy, level, and members. You can create a dimension element by specifying its name and providing the hierarchy and level name. The dimension element contains the hierarchical details and information about each included level elements in that hierarchy. A hierarchy can have any number of level elements and the level elements can have any number of members and the member elements can have any number of child members.

Hierarchy

Each element of a dimension can be summarized using a hierarchy. The hierarchy is a series of parent-child relationship, where a parent member represents the consolidation of members which are its children. Parent members can be further aggregated as the children of another parent. For example, May 2005 can be summarized into Second Quarter 2005 which in turn would be summarized in the year 2005.

Level

Level element is the child of hierarchy element which contains a set of members, each of which has the same rank within a hierarchy.

Attribute hierarchy

Attribute hierarchy contains the following levels:

- A leaf level contains distinct attribute member, and each member of the leaf level is known as a leaf member.
- Intermediate levels if the attribute hierarchy is a parent-child hierarchy.
- An optional (all) level contains the aggregated value of the attribute hierarchy's leaf members, with the member of the (all) level also known as the (all) member.

User-defined hierarchy

User-defined hierarchy organizes the members of a dimension into hierarchical structure and provides navigation paths in a cube. For example, take a dimension table that supports three attributes such as year, quarter, and month. The year, quarter, and month attributes are used to construct a user-defined hierarchy, named Calendar, in the time dimension that relates to all levels.

Differentiating user-defined hierarchy and attribute hierarchy

- User-defined hierarchy contains more than one level whereas attribute hierarchy contains only one level.
- User-defined hierarchy provides the navigation path between the levels taken from attribute hierarchies of the same dimension.
- The attribute hierarchy and the user-defined hierarchy are represented in different ways as shown in the following table.

Named set

A named set is a collection of tuples and members, which can be defined and saved as a part of the cube definition. Named set records reside inside the sets folder, which is under a dimension element. These elements can be dragged to rows or columns axis via grouping bar or field list at runtime. To work with a

Copyright © 2001 -2024 Syncfusion Inc.

lengthy, complex, or commonly used expression easier, Multidimensional Expressions (MDX) allows you to define a named set.

Calculated field

The calculated field allows user to insert or add a new calculated field based on the available OLAP cube elements from the bound data source. Calculated fields are nothing but customized dimensions or measures that are newly created based on the user-defined expression.

The two types of calculated fields are as follows:

- **Calculated Measure** – Creates a new measure through user-defined expression.
- **Calculated Dimension** – Creates a new dimension through user-defined expression.

Symbolic representation of the nodes inside field list

| Icon|Name | Node type | Is Draggable |

|-----|-----|-----------|--------------|

| | Display Folder| Display Folder| False|

| |Measure| Measure| False|

| | Dimension| Dimension| False|

| | User Defined Hierarchy| Hierarchy| True|

| | Attribute Hierarchy| Hierarchy| True|

|

  | Levels (in order)| Level Element| True|

| | Named Set| Named Set| True|

In general, the Pivot Table is created using the built-in engine for given data source. This is an optional feature that allows you to create the Pivot Table with a server-side pivot engine and external data binding. And this option is applicable only for relational data source.

Server side pivot engine in Vue Pivotview component

This section briefs the Syncfusion assembly Syncfusion.Pivot.Engine, which is used in a server-side application to perform all Pivot calculations such as aggregation, filtering, sorting, grouping, and so on, and only the information to be displayed in the Pivot Table's viewport is passed to the client-side (browser) via web service (Web API) rather than the entire data source. It reduces network traffic and improves the rendering performance of the Pivot Table, especially when dealing with large amounts of data. It also works best with virtual scrolling enabled and supports all the Pivot Table's existing features.

Quick steps to render the Pivot Table by using the server-side Pivot Engine

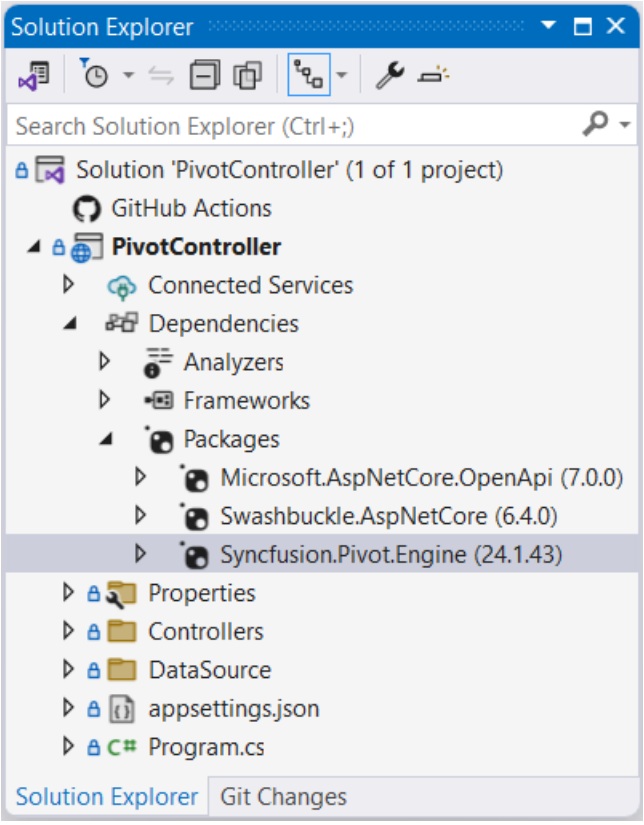
Download and installing Server-side Pivot Engine

1. Download the ASP.NET Core-based stand-alone Pivot Table application from the GitHub repository.

2. The **PivotController** (Server-side) application that is downloaded includes the following files.

- **PivotController.cs** file under **Controllers** folder – This helps to do data communication with Pivot Table.
- **DataSource.cs** file under **DataSource** folder – This file has model classes to define the structure of the data sources.
- The sample data source files **sales.csv** and **sales-analysis.json** under **DataSource** folder.

3. Open the **PivotController** application in Visual Studio where the Syncfusion library Syncfusion.Pivot.Engine will be downloaded automatically from the nuget.org site.



Connecting Pivot Table to Server-side Pivot Engine

1. Run the **PivotController** (Server-side) application which will be hosted in IIS shortly.

2. Then in the Pivot Table sample, set the mode property under dataSourceSettings as **Server** and map the URL of the hosted Server-side application in URL property of dataSourceSettings.

`javascript

<script>

import Vue from "vue";

import { PivotViewPlugin } from "@syncfusion/ej2-vue-pivotview";

Vue.use(PivotViewPlugin);

export default {

data () {

return {

```
dataSourceSettings: {
url: 'https://localhost:44350/api/pivot/post',
mode: 'Server',
},
height: 350
}
}
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
`
```

3. Frame and set the report based on the data source available in the **PivotController** application.

```
`javascript
<script>
import Vue from "vue";
import { PivotViewPlugin } from "@syncfusion/ej2-vue-pivotview";
Vue.use(PivotViewPlugin);
export default {
data () {
return {
dataSourceSettings: {
url: 'https://localhost:44350/api/pivot/post',
mode: 'Server',
rows: [{
name: 'ProductID', caption: 'Product ID'
}],
formatSettings: [{
name: 'Price', format: 'C'
}],
columns: [{
name: 'Year', caption: 'Production Year'
```

```
}],
values: [
{ name: 'Sold', caption: 'Units Sold' },
{ name: 'Price', caption: 'Sold Amount' }
],
},
height: 350
}
}
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
`
```

4. Run the sample to get the following result.

	FY 2015		FY 2016		FY 2017
	Units Sold	Sold Amount	Units Sold	Sold Amount	Units Sold
PRO-10	7901220	$1,841,712.00	7561880	$1,762,804.00	759
PRO-11	7174625	$1,673,533.00	7338175	$1,711,599.80	716
PRO-12	9168140	$2,135,848.80	7689400	$1,792,704.00	737
PRO-13	6674280	$1,560,619.20	8585260	$2,001,738.40	657
PRO-14	7489240	$1,745,841.20	7167840	$1,675,479.20	739
PRO-15	8149185	$1,902,397.00	7450585	$1,734,093.00	724
PRO-16	7070150	$1,652,838.40	8037500	$1,873,597.60	788

Available configurations in Server-side application

Supportive Data Sources

The server-side Pivot Engine supports the following data sources,

- Collection
- JSON
- CSV
- DataTable
- Dynamic

Copyright © 2001 -2024 Syncfusion Inc.

Collection

The collection data sources such as List, IEnumerable, and so on are supported. This can be bound using the **GetData** controller method. Also, in the Pivot Table sample, set the type property under dataSourceSettings to **JSON**, which is also the default enumeration value.

In the server-side application **(PivotController)**, a collection type data source is framed in the **DataSource.cs** file as shown in the following.

```
public class PivotViewData
{
public string ProductID { get; set; }
public string Country { get; set; }
public string Product { get; set; }
public double Sold { get; set; }
public double Price { get; set; }
public string Year { get; set; }
public List<PivotViewData> GetVirtualData()
{
List<PivotViewData> VirtualData = new List<PivotViewData>();
for (int i = 1; i <= 10000; i++)
{
PivotViewData p = new PivotViewData
{
ProductID = "PRO-" + ((100 + i)%20),
Year = (new string[] { "FY 2015", "FY 2016", "FY 2017", "FY 2018", "FY 2019" })[new Random().Next(5)],
Country = (new string[] { "Canada", "France", "Australia", "Germany", "France" })[new Random().Next(5)],
Product = (new string[] { "Car", "Van", "Bike", "Flight", "Bus" })[new Random().Next(5)],
Price = (3.4 * i) + 500,
Sold = (i * 15) + 10
};
VirtualData.Add(p);
}
return VirtualData;
}
}
```

Copyright © 2001 -2024 Syncfusion Inc.

`

To bind the data source, set its model type **PivotViewData** to **TValue** of the **PivotEngine** class.

`

```
private PivotEngine<DataSource.PivotViewData> PivotEngine = new
PivotEngine<DataSource.PivotViewData>();
```

`

Then call the data source in **GetData** method of **PivotController.cs** file.

`

```
public async Task<object> GetData(FetchData param)
{
return await _cache.GetOrCreateAsync("dataSource" + param.Hash,
async (cacheEntry) =>
{
cacheEntry.SetSize(1);
cacheEntry.AbsoluteExpiration = DateTimeOffset.UtcNow.AddMinutes(60);
// Here bind the collection type data source.
return new DataSource.PivotViewData().GetVirtualData();
});
}
```

`

Finally set the appropriate report to the Pivot Table sample based on the above data source.

`javascript

```
<script>
import Vue from "vue";
import { PivotViewPlugin } from "@syncfusion/ej2-vue-pivotview";
Vue.use(PivotViewPlugin);
export default {
data () {
return {
dataSourceSettings: {
url: 'https://localhost:44350/api/pivot/post',
mode: 'Server',
rows: [{
```

Copyright © 2001 -2024 Syncfusion Inc.

```
name: 'ProductID', caption: 'Product ID'
}],
formatSettings: [{
name: 'Price', format: 'C'
}],
columns: [{
name: 'Year', caption: 'Production Year'
}],
values: [
{ name: 'Sold', caption: 'Units Sold' },
{ name: 'Price', caption: 'Sold Amount' }
],
},
height: 350
}
}
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
`
```

	FY 2015		FY 2016		FY 2017
	Units Sold	Sold Amount	Units Sold	Sold Amount	Units Sold
PRO-10	7901220	$1,841,712.00	7561880	$1,762,804.00	759
PRO-11	7174625	$1,673,533.00	7338175	$1,711,599.80	716
PRO-12	9168140	$2,135,848.80	7689400	$1,792,704.00	737

PRO-16	7070150	$1,652,838.40	8037500	$1,873,597.60	788

JSON

The JSON data from a local *.json file type can be connected to the Pivot Table. Here, the file can be read by the **StreamReader** option, which will give the result in the string format. The resultant string needs to be converted to collect data that can be bound to the Server-side pivot engine.

In the Server-side application, **sales-analysis.json** file is available under **DataSource** folder and its model type is defined in **DataSource.cs** file.

```
public class PivotJSONData
{
public string Date { get; set; }
public string Sector { get; set; }
public string EnerType { get; set; }
public string EneSource { get; set; }
public int PowUnits { get; set; }
public int ProCost { get; set; }
public List<PivotJSONData> ReadJSONData(string url)
{
WebClient myWebClient = new WebClient();
Stream myStream = myWebClient.OpenRead(url);
StreamReader stream = new StreamReader(myStream);
string result = stream.ReadToEnd();
stream.Close();
return Newtonsoft.Json.JsonConvert.DeserializeObject<List<PivotJSONData>>(result);
}
}
```

To bind the data source, set its model type **PivotJSONData** to **TValue** of the **PivotEngine** class.

```
private PivotEngine<DataSource.PivotJSONData> PivotEngine = new PivotEngine<DataSource.
PivotJSONData>();
```

Then call the data source in **GetData** method of **PivotController.cs** file.

```
public async Task<object> GetData(FetchData param)
{
return await _cache.GetOrCreateAsync("dataSource" + param.Hash,
async (cacheEntry) =>
{
```

Copyright © 2001 -2024 Syncfusion Inc.

```
cacheEntry.SetSize(1);
cacheEntry.AbsoluteExpiration = DateTimeOffset.UtcNow.AddMinutes(60);
// Here bind JSON type data source from the sales-analysis.json file.
return new DataSource.PivotJSONData().ReadJSONData(_hostingEnvironment.ContentRootPath +
"//DataSource//sales-analysis.json");
});
}
```

Finally set the appropriate report to the Pivot Table sample based on the above data source.

```javascript
<script>
import Vue from "vue";
import { PivotViewPlugin } from "@syncfusion/ej2-vue-pivotview";
Vue.use(PivotViewPlugin);
export default {
data () {
return {
dataSourceSettings: {
url: 'https://localhost:44350/api/pivot/post',
mode: 'Server',
type: 'JSON',
rows: [{
name: 'EneSource', caption: 'Energy Source'
}],
formatSettings: [{
name: 'ProCost', format: 'C'
}],
columns: [{
name: 'EnerType', caption: 'Energy Type'
}],
values: [
{ name: 'PowUnits', caption: 'Units Sold' },
{ name: 'ProCost', caption: 'Sold Amount' }
```

```
],
},
height: 350
}
}
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
`
```

	Biomass		Free Energy		Grand Total
	Units Sold	Sold Amount	Units Sold	Sold Amount	Units Sold
Bio-diesel	1042	$1,439.00			1
Ethanol Fuel	595	$1,031.00			
Geo-thermal			1528	$2,115.00	1
Hydro-electric			3378	$3,244.00	3
Solar			7929	$6,210.00	7
Wastage	712	$1,043.00			
Wind			15571	$7,666.00	15

JSON data from any remote server, like a local JSON file, can also be supported. It accepts both directly downloadable files (*.json) and web service URLs. To bind this, the URL of the* .json file of a remote server has to be mapped under the **GetData** method. The rest of the configurations are the same as described above.

In the server-side application, the CDN link is used to connect the same **sales-analysis.json** file which is already hosted in the Syncfusion server.

```
`
public async Task<object> GetData(FetchData param)
{
return await _cache.GetOrCreateAsync("dataSource" + param.Hash,
async (cacheEntry) =>
{
cacheEntry.SetSize(1);
cacheEntry.AbsoluteExpiration = DateTimeOffset.UtcNow.AddMinutes(60);
// Here bind JSON type data source from remote server.
```

```
return new DataSource.PivotJSONData().ReadJSONData("http://cdn.syncfusion.com/data/sales-analysis.json");
});
}
`
```

CSV

The CSV data from a local *.csv file type can be connected to the Pivot Table. Here, the file can be read by the **StreamReader** option, which will give the result in the string format. The resultant string needs to be converted to collect data that can be bound to the server-side pivot engine. Also, in the Pivot Table sample, set the type property under dataSourceSettings as **CSV**.

In the server application, the **sales.csv** file is available under the **DataSource** folder, and its model type is defined in the **DataSource.cs** file.

```
`
public class PivotCSVData
{
public string Region { get; set; }
public string Country { get; set; }
public string ItemType { get; set; }
public string SalesChannel { get; set; }
public string OrderPriority { get; set; }
public string OrderDate { get; set; }
public int OrderID { get; set; }
public string ShipDate { get; set; }
public int UnitsSold { get; set; }
public double UnitPrice { get; set; }
public double UnitCost { get; set; }
public double TotalRevenue { get; set; }
public double TotalCost { get; set; }
public double TotalProfit { get; set; }
public List<string[]> ReadCSVData(string url)
{
List<string[]> data = new List<string[]>();
using (StreamReader reader = new StreamReader(new WebClient().OpenRead(url)))
{
string line;
```

```
while ((line = reader.ReadLine()) != null)
{
line = line.Trim();
if (!string.IsNullOrWhiteSpace(line))
{
data.Add(line.Split(','));
}
}
return data;
}
}
}
```

To bind the data source, set its model type **PivotCSVData** to **TValue** of the **PivotEngine** class.

```
private PivotEngine<DataSource.PivotCSVData> PivotEngine = new PivotEngine<DataSource.
PivotCSVData>();
```

Then call the data source in **GetData** method of **PivotController.cs** file.

```
public async Task<object> GetData(FetchData param)
{
return await _cache.GetOrCreateAsync("dataSource" + param.Hash,
async (cacheEntry) =>
{
cacheEntry.SetSize(1);
cacheEntry.AbsoluteExpiration = DateTimeOffset.UtcNow.AddMinutes(60);
// Here bind CSV type data source from sales.csv file.
return new DataSource.PivotCSVData().ReadCSVData(_hostingEnvironment.ContentRootPath +
"//DataSource//sales.csv");
});
}
```

Finally set the appropriate report to the Pivot Table sample based on the above data source.

Copyright © 2001 -2024 Syncfusion Inc.

```
`javascript
<script>
import Vue from "vue";
import { PivotViewPlugin } from "@syncfusion/ej2-vue-pivotview";
Vue.use(PivotViewPlugin);
export default {

CSV data from any remote server, like a local CSV file, can also be supported. It accepts both directly downloadable files (*.csv) and web service URLs. To bind this, the URL of the* .csv file of a remote server has to be mapped under **GetData** method. The rest of the configurations are the same as described above.

In the server application, the CDN link is used to connect the same **sales.csv** file which is already hosted in the Syncfusion server.

`

public async Task<object> GetData(FetchData param)

{

return await _cache.GetOrCreateAsync("dataSource" + param.Hash,

async (cacheEntry) =>

{

cacheEntry.SetSize(1);

cacheEntry.AbsoluteExpiration = DateTimeOffset.UtcNow.AddMinutes(60);

// Here bind CSV type data source from remote server.

return new DataSource.PivotCSVData().ReadCSVData("http://cdn.syncfusion.com/data/sales-analysis.csv");

});

}

`

DataTable

In the server-side application, there is a manually created DataTable **BusinessObjectsDataView** by mapping the model type **PivotViewData** in **DataSource.cs** file.

`

public class BusinessObjectsDataView

```
{
public DataTable GetDataTable()
{
DataTable dt = new DataTable("BusinessObjectsDataTable");
PropertyDescriptorCollection pdc = TypeDescriptor.GetProperties(typeof(PivotViewData));
foreach (PropertyDescriptor pd in pdc)
{
dt.Columns.Add(new DataColumn(pd.Name, pd.PropertyType));
}
List<PivotViewData> list = new PivotViewData().GetVirtualData();
foreach (PivotViewData bo in list)
{
DataRow dr = dt.NewRow();
foreach (PropertyDescriptor pd in pdc)
{
dr[pd.Name] = pd.GetValue(bo);
}
dt.Rows.Add(dr);
}
return dt;
}
}
```

To bind the data source, set its model type **PivotViewData** to **TValue** of the **PivotEngine** class.

```
private PivotEngine<DataSource.PivotViewData> PivotEngine = new
PivotEngine<DataSource.PivotViewData>();
```

Then call the data source in **GetData** method of **PivotController.cs** file.

```
public async Task<object> GetData(FetchData param)
{
return await _cache.GetOrCreateAsync("dataSource" + param.Hash,
```

Copyright © 2001 -2024 Syncfusion Inc.

```
async (cacheEntry) =>
{
cacheEntry.SetSize(1);
cacheEntry.AbsoluteExpiration = DateTimeOffset.UtcNow.AddMinutes(60);
// Here bind the DataTable.
return new DataSource.BusinessObjectsDataView().GetDataTable();
});
}
`
```

Finally set the appropriate report to the Pivot Table sample based on the above data source.

```javascript
<script>
import Vue from "vue";
import { PivotViewPlugin } from "@syncfusion/ej2-vue-pivotview";
Vue.use(PivotViewPlugin);
export default {
data () {
return {
dataSourceSettings: {
url: 'https://localhost:44350/api/pivot/post',
mode: 'Server',
rows: [{
name: 'ProductID', caption: 'Product ID'
}],
formatSettings: [{
name: 'Price', format: 'C'
}],
columns: [{
name: 'Year', caption: 'Production Year'
}],
values: [
{ name: 'Sold', caption: 'Units Sold' },
{ name: 'Price', caption: 'Sold Amount' }
```

Copyright © 2001 -2024 Syncfusion Inc.

```
],
},
height: 350
}
}
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
`
```

	FY 2015		FY 2016		FY 2017

Dynamic

The model type has to be defined in the aforementioned data sources. However, there is no need to define a model type for the following data sources, which are also supported by the server-side pivot engine.

ExpandoObject

In the server-side application, an **ExpandoObject** type data source is available under the class **PivotExpandoData** in **DataSource.cs** file.

```
`
public class PivotExpandoData
{
public List<ExpandoObject> Orders { get; set; } = new List<ExpandoObject>();
public List<ExpandoObject> GetExpandoData()
{
Orders = Enumerable.Range(1, 75).Select((x) =>
{
dynamic d = new ExpandoObject();
```

Copyright © 2001 -2024 Syncfusion Inc.

```
d.OrderID = 1000 + (x % 100);
d.CustomerID = (new string[] { "ALFKI", "ANANTR", "ANTON", "BLONP", "BOLID" })[new Random().Next(5)];
d.Freight = (new double[] { 2, 1, 4, 5, 3 })[new Random().Next(5)] * x;
d.OrderDate = (new DateTime[] { new DateTime(2010, 11, 5), new DateTime(2018, 10, 3), new DateTime(1995, 9, 9), new DateTime(2012, 8, 2), new DateTime(2015, 4, 11) })[new Random().Next(5)];
d.ShipCountry = (new string[] { "USA", "UK" })[new Random().Next(2)];
d.Verified = (new bool[] { true, false })[new Random().Next(2)];
return d;
}).Cast<ExpandoObject>().ToList<ExpandoObject>();
return Orders;
}
}
```

To bind the data source, set its model type as **ExpandoObject** to **TValue** of the **PivotEngine** class.

```
private PivotEngine<ExpandoObject> PivotEngine = new PivotEngine<ExpandoObject>();
```

Then call the data source in **GetData** method of **PivotController.cs** file.

```
public async Task<object> GetData(FetchData param)
{
return await _cache.GetOrCreateAsync("dataSource" + param.Hash,
async (cacheEntry) =>
{
cacheEntry.SetSize(1);
cacheEntry.AbsoluteExpiration = DateTimeOffset.UtcNow.AddMinutes(60);
// Here returns ExpandoObject type data source.
return new DataSource.PivotExpandoData().GetExpandoData();
});
}
```

Finally set the appropriate report to the Pivot Table sample based on the above data source.

```javascript

Dynamic Objects

In the server-side application, a data source is framed by dynamic objects which is available under the class **PivotDynamicData** in the **DataSource.cs** file.

```
public class PivotDynamicData
{
public List<DynamicDictionary> Orders = new List<DynamicDictionary>() { };
public List<DynamicDictionary> GetDynamicData()
{
Orders = Enumerable.Range(1, 100).Select((x) =>
{
dynamic d = new DynamicDictionary();
d.OrderID = 100 + x;
d.CustomerID = (new string[] { "ALFKI", "ANANTR", "ANTON", "BLONP", "BOLID" })[new Random().Next(5)];
d.Freight = (new double[] { 2, 1, 4, 5, 3 })[new Random().Next(5)] * x;
d.OrderDate = (new DateTime[] { new DateTime(2010, 11, 5), new DateTime(2018, 10, 3), new DateTime(1995, 9, 9), new DateTime(2012, 8, 2), new DateTime(2015, 4, 11) })[new Random().Next(5)];
d.ShipCountry = (new string[] { "USA", "UK" })[new Random().Next(2)];
d.Verified = (new bool[] { true, false })[new Random().Next(2)];
return d;
}).Cast<DynamicDictionary>().ToList<DynamicDictionary>();
return Orders;
}
public class DynamicDictionary : System.Dynamic.DynamicObject
{
Dictionary<string, object> dictionary = new Dictionary<string, object>();
public override bool TryGetMember(GetMemberBinder binder, out object result)
```

```
{
string name = binder.Name;
return dictionary.TryGetValue(name, out result);
}
public override bool TrySetMember(SetMemberBinder binder, object value)
{
dictionary[binder.Name] = value;
return true;
}
//The "GetDynamicMemberNames" method of the "DynamicDictionary" class must be overridden and return the property names to perform data operation and editing while using dynamic objects.
public override System.Collections.Generic.IEnumerable<string> GetDynamicMemberNames()
{
return this.dictionary?.Keys;
}
}
}
```

To bind the data source, set its class **PivotDynamicData** to **TValue** of the **PivotEngine** class.

```
private PivotEngine<DataSource.PivotDynamicData> PivotEngine = new PivotEngine<DataSource.PivotDynamicData>();
```

Then call the data source in **GetData** method of **PivotController.cs** file.

```
public async Task<object> GetData(FetchData param)
{
return await _cache.GetOrCreateAsync("dataSource" + param.Hash,
async (cacheEntry) =>
{
cacheEntry.SetSize(1);
cacheEntry.AbsoluteExpiration = DateTimeOffset.UtcNow.AddMinutes(60);
// Here bind data source with dynamic objects.
return new DataSource.PivotDynamicData().GetDynamicData();
```

Copyright © 2001 -2024 Syncfusion Inc.

```
});
}
`
```

Finally set the appropriate report to the Pivot Table sample based on the above data source.

```
`javascript
<script>
import Vue from "vue";
import { PivotViewPlugin } from "@syncfusion/ej2-vue-pivotview";
Vue.use(PivotViewPlugin);
export default {
data () {
return {
dataSourceSettings: {
url: 'https://localhost:44350/api/pivot/post',
mode: 'Server',
rows: [{
name: 'CustomerID', caption: 'Customer ID'
}],
columns: [{
name: 'ShipCountry', caption: 'Ship Country'
}],
values: [
{ name: 'Freight', caption: 'Units Sold' }
],
},
height: 350
}
}
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

Controller Configuration

Memory Cache

In the server-side application, the Memory Cache option is used to store the data source and engine properties in RAM, which will be used for UI operations. To improve performance, this limits the execution of all initial rendering code to regenerate the aggregated values during each UI operation. The codes below show how we use the memory cache option in the **GetEngine** method to store engine properties.

`

```
public async Task<EngineProperties> GetEngine(FetchData param)
{
isRendered = false;
// Engine properties are stored in memory cache with GUID "parem.Hash".
return await _cache.GetOrCreateAsync("engine" + param.Hash,
async (cacheEntry) =>
{
isRendered = true;
cacheEntry.SetSize(1);
// Memory cache expiration time can be set here.
cacheEntry.AbsoluteExpiration = DateTimeOffset.UtcNow.AddMinutes(60);
PivotEngine.Data = await GetData(param);
return await PivotEngine.GetEngine(param);
});
}
```

`

The engine properties are stored in RAM as a cache with a unique ID (GUID) that is transferred from the client-side source code. The GUID is generated at random and will be changed if the page containing the Pivot Table is refreshed or opened in a new tab/window. As a result, each GUID's memory cache contains unique information, and the component operates independently.

Copyright © 2001 -2024 Syncfusion Inc.

Meanwhile, the memory cache is set to expire after 60 minutes from RAM to free its memory. If the component is still running, the data will be generated and stored for another 60 minutes.

Methods and its needs

- **Post:** Allows to get the information from the client-side source and calls appropriate controller methods.
- **GetEngine:** Allows to store the engine properties in RAM as a cache which fires on initial rendering or when the memory cache is expired.
- **GetData:** Allows to store data source in RAM as a cache which fires on initial rendering or when the memory cache is expired.
- **GetMembers:** Allows to get the members of a field. This fires when the member editor is opened to do a filtering operation.
- **GetRawData:** Allows to get raw data of an aggregated value cell. This fires when the drill-through or editing dialog is opened.
- **GetPivotValues:** Allows to update the stored engine properties in-memory cache and returns the aggregated values to browser to render the Pivot Table. Here, the return value can be modified. The Pivot Table will be rendered browser-based on this.

Pivot chart in Vue Pivotview component

In pivot table component, pivot chart would act as an additional visualization component with its basic and important characteristic like drill down and drill up, 15+ chart types, series customization, axis customization, legend customization, export, print and tooltip. Its main purpose is to show the pivot data in graphical format.

If user prefers, the pivot chart component can also be displayed individually with pivot values and can change the report dynamically with the help of field list and grouping bar. Using the displayOption property in pivot table, user can set the visibility of grid and chart in pivot table component. It holds below properties,

- view: Specifies the pivot table component to display grid alone or chart alone or both.
- primary: Specifies the pivot table to display either grid or chart as primary component during initial loading. It is applicable only when setting the property view to **Both**.

You should inject the PivotChart module to make the its features available in the pivot table.

The below sample displays the pivot chart component based on the pivot report bound on it.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:displayOption="displayOption" :chartSettings="chartSettings"
:height="height"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, PivotChart } from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
```

Copyright © 2001 -2024 Syncfusion Inc.

```
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 240,
      displayOption: { view: 'Chart' },
      chartSettings: { chartSeries: { type: 'Column' } }
    }
  },
    provide: {
        pivotview: [PivotChart]
    }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs177" %}

Data binding

End user can bind both local and remote data binding options available in the component to feed the data. The dataSource property can be assigned either with an instance of DataManager or JavaScript object array collection.

For more information refer here.

Chart Types

Supports 21 different types of charts as follows,

- Line
- Column
- Area
- Bar
- StepArea
- StackingLine
- StackingColumn
- StackingArea
- StackingBar
- StepLine
- Pareto
- Bubble
- Scatter

Copyright © 2001 -2024 Syncfusion Inc.

- Spline
- SplineArea
- StackingLine100
- StackingColumn100
- StackingBar100
- StackingArea100
- Polar
- Radar

Line is the default pivot chart type. User can change the pivot chart type by using the property type in chartSeries.

In the below code sample, the pivot chart type is set as **Bar**.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:displayOption="displayOption" :chartSettings="chartSettings"
:height="height"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, PivotChart } from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 350,
      displayOption: { view: 'Chart' },
      chartSettings: { chartSeries: { type: 'Bar' } }
    }
  },
    provide: {
        pivotview: [PivotChart]
    }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs178" %}

Accumulation Charts

Supports 4 different types of accumulation charts as follows,

- Pie
- Doughnut
- Funnel
- Pyramid

As like other chart types it can be changed using the property type in chartSeries.

In the below code sample, the **Pie** chart is rendered, and the other accumulation charts can be switched using the drop-down list.

APP.VUE

```
<template>
    <div class="control-section" id="pivot-grid-section">
        <div id="dropdown-control" style="margin-bottom:5px;">
            <table style="width: 350px;margin-left: 50;">

Drill Down/Up

In the accumulation charts, drill down and drill up operations can be performed using the built-in context menu option. It will be shown while clicking on the chart series. The context menu has the following options:

Expand - It is to drill down the corresponding series until the last level.

Collapse - It is to drill up the corresponding series until the first level.

Exit - It is to close the context menu.

The drill operation in accumulation charts can be performed only for row headers.

Column Headers and Delimiters

Unlike other chart types, the accumulation charts consider the values of a single column from the pivot table to be drawn. Preferably the first column of the pivot table is considered by default. But it can be changed by defining the column headers using the columnHeader property in chartSettings.

If the column has more than one header, then need to mention all the headers separated by the delimiter **-**, for example,**Germany-Road Bikes**. Using the property columnDelimiter in chartSettings, one can set the desired delimiter to separate the column headers.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:displayOption="displayOption"
            :chartSettings="chartSettings" :height="height"> </ejs-
pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, PivotChart } from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
    data() {
        return {
            dataSourceSettings: {
                dataSource: pivotData,
                expandAll: false,
                drilledMembers: [{ name: 'Country', items: ['Germany'] }],
                columns: [{ name: 'Country' }, { name: 'Products' }],
                values: [{ name: 'Sold', caption: 'Units Sold' }, { name:
'Amount', caption: 'Sold Amount' }],
                rows: [{ name: 'Year' }, { name: 'Quarter' }],
                formatSettings: [{ name: 'Amount', format: 'C0' }],
                filters: []
            },
            height: 350,
```

```
            displayOption: { view: 'Chart' },
            chartSettings: { columnHeader: "Germany-Road Bikes",
columnDelimiter: '-', chartSeries: { type: 'Doughnut' } }
        }
    },
    provide: {
        pivotview: [PivotChart]
    }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";

@import "../node_modules/@syncfusion/ej2-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs181" %}

Label Customization

The data labels are visible by default showing header name. Its visibility can be modified using the visible boolean property in dataLabel. With regard to the label arrangement, the **Smart Labels** options help to arrange labels efficiently without overlapping. It can be disabled by setting the enableSmartLabels property in chartSettings as "false".

The position property in dataLabel allows to specify the position of the data label. The available options are,

- Outside: Positions the label outside the point. It is the default option.
- Inside: Positions the label inside the point.

In the following code sample, the data labels are placed inside.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:displayOption="displayOption"
            :chartSettings="chartSettings" :height="height"> </ejs-
pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, PivotChart } from "@syncfusion/ej2-vue-pivotview";

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs183" %}

Pie and Doughnut Customization

User can draw pie and doughnut charts within the specified range using the startAngle and endAngle properties in chartSeries. The default value of the startAngle property is **0**, and the endAngle property is **360**. By customizing these properties, user can draw semi pie and semi doughnut charts.

Field List

User can enable the field list by setting the property showFieldList in pivot table as **true**.

By using this, user can customize the report dynamically and view the result in pivot chart. For more information regarding the field list, refer the field list topic.

In the following sample, the Popup mode of field list is enabled in the pivot chart.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:showFieldList="showFieldList" :displayOption="displayOption"
:chartSettings="chartSettings" :height="height"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, PivotChart, FieldList } from "@syncfusion/ej2-vue-
pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
```

```
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 350,
      displayOption: { view: 'Chart' },
      chartSettings: { chartSeries: { type: 'Column' }},
      showFieldList: true
    }
  },
    provide: {
        pivotview: [PivotChart, FieldList]
    }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs187" %}

Grouping Bar

User can enable the grouping bar by setting the property showGroupingBar in pivot table as **true**. The grouping bar in pivot chart shows a dropdown list in value axis instead of buttons. The dropdown list holds list of value fields bounded in the dataSourceSettings and it can be switched to draw the pivot chart with the selected value field. This has been defined as the default behavior in the pivot chart component. For more information regarding the grouping bar, refer the grouping bar topic.

For multiple axis support, buttons will be placed in value axis instead of dropdown list.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:showGroupingBar="showGroupingBar" :displayOption="displayOption"
:chartSettings="chartSettings" :height="height"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, PivotChart, GroupingBar } from "@syncfusion/ej2-
vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
```

```
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 240,
      displayOption: { view: 'Chart' },
      chartSettings: { chartSeries: { type: 'Column' }},
      showGroupingBar: true
    }
  },
    provide: {
        pivotview: [PivotChart, GroupingBar]
    }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs188" %}

For accumulation charts alone, a drop-down list will be placed in the column axis instead of the buttons. The drop-down list shows the column headers available in the pivot table. Users can dynamically switch column headers with the help of the drop-down list, and the accumulation chart will be updated accordingly.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:showGroupingBar="showGroupingBar"
            :displayOption="displayOption" :chartSettings="chartSettings"
:height="height"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, PivotChart, GroupingBar } from "@syncfusion/ej2-
vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
    data() {
        return {
            dataSourceSettings: {
                dataSource: pivotData,
                expandAll: false,
                columns: [{ name: 'Year', caption: 'Production Year' }, {
name: 'Quarter' }],
                values: [{ name: 'Sold', caption: 'Units Sold' }, { name:
'Amount', caption: 'Sold Amount' }],
                rows: [{ name: 'Country' }, { name: 'Products' }],
                formatSettings: [{ name: 'Amount', format: 'C0' }],
```

```
                filters: []
            },
            height: 240,
            displayOption: { view: 'Chart' },
            chartSettings: { chartSeries: { type: 'Pie' } },
            showGroupingBar: true
        }
    },
    provide: {
        pivotview: [PivotChart, GroupingBar]
    }
}
</script>
<style>

@import "../node_modules/@syncfusion/ej2-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs189" %}

Single Axis

By default, the pivot chart will be drawn with the value field (measure) which is set first in the report under value axis. But, user can change to specific value field using the property value in chartSettings.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:displayOption="displayOption" :chartSettings="chartSettings"
:height="height"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, PivotChart } from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 350,
      displayOption: { view: 'Chart' },
```

```
      chartSettings: { value: 'Amount', chartSeries: { type: 'Column' } }
    }
  },
    provide: {
        pivotview: [PivotChart]
    }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs190" %}

Multiple Axis

User can draw the pivot chart with multiple value fields by setting the property enableMultipleAxis to **true**. In the following sample, the pivot chart will be drawn with both the “Sold” and “Amount” value fields available in the data source.

The multiple axis support is not applicable for the accumulation chart types like pie, doughnut, pyramid, and funnel.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:displayOption="displayOption" :chartSettings="chartSettings"
:height="height"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, PivotChart } from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 350,
      displayOption: { view: 'Chart' },
      chartSettings: { enableMultipleAxis: true, chartSeries: { type:
'Column' } }
    }
  },
```

```
    provide: {
        pivotview: [PivotChart]
    }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs191" %}

If the user binds more value fields, the result will be multiple pivot charts, and each chart will shrink within the parent container height. To avoid this, set the enableScrollOnMultiAxis property in chartSettings to **true**. By doing so, each pivot chart will only shrink to a minimal "160px" - "180px" height showing a vertical scrollbar for a clear view.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:displayOption="displayOption" :chartSettings="chartSettings"
:height="height"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, PivotChart } from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' },{name: 'Products', type:'Count'}],
        rows: [{ name: 'Country' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 350,
      displayOption: { view: 'Chart' },
      chartSettings: { enableScrollOnMultiAxis:true,
      enableMultipleAxis: true, chartSeries: { type: 'Column' } }
    }
  },
    provide: {
        pivotview: [PivotChart]
    }
}
</script>
<style>
```

```
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs192" %}

Meanwhile, there is another way to display multiple values in a chart. In this approach, the series drawn from multiple values are grouped and displayed in a single chart. And, based on the values, multiple Y axis scales will be framed with different ranges. This can be achieved by setting the properties enableMultipleAxis as **true** and multipleAxisMode as Single in chartSettings.

In the following code sample, the pivot chart can be seen as a single chart with multiple value fields such as **Sold** and **Amount** that are drawn as multiple Y axis.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:displayOption="displayOption" :chartSettings="chartSettings"
:height="height"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, PivotChart } from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 350,
      displayOption: { view: 'Chart' },
      chartSettings: { enableMultipleAxis: true, multipleAxisMode :
'Single', chartSeries: { type: 'Column' } }
    }
  },
    provide: {
        pivotview: [PivotChart]
    }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs193" %}

Additionally, to display chart series for multiple values within a single y-axis, set the properties enableMultipleAxis to **true** and the multipleAxisMode to **Combined**, in the chartSettings.

The y-axis range values will be formatted using the first value field on the value axis. For example, if the first value field is in currency format and the remaining value fields are in different number formats or no format, the y-axis range values will be displayed in the currency format of the first value field.

The pivot chart in the following code sample can be seen as a single chart with multiple value fields such as **Sold** and **Amount** drawn as a single y-axis.

APP.VUE

```
<template>

Show point color based on members

When multiple axes are enabled, you can display the same color for each member in the column axis by setting the showPointColorByMembers property to **true** in the chartSettings. As a result, the end user can easily identify each member across different measures in the entire chart.

Furthermore, end user can see or hide specific members across different measures in the entire chart with a single click on the legend item.

APP.VUE

```
<template>
    <div id="app">

Series customization

User can customize series of the pivot chart using chartSeries in chartSettings. The changes handled in the property will be reflected commonly in all chart series.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:displayOption="displayOption" :chartSettings="chartSettings"
:height="height"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, PivotChart } from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 350,
      displayOption: { view: 'Chart' },
      chartSettings: { chartSeries: { type: 'Column', enableTooltip: false,
border: { color: '#000', width: 2 } } }
    }
  },
    provide: {
        pivotview: [PivotChart]
    }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs196" %}

User can also customize the pivot chart series individually using the chartSeriesCreated event, which occurs after the pivot chart series has been created. You can customize each series individually by iterating them.

In the following sample, the even series are hidden in the pivot chart.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:displayOption="displayOption" :chartSeriesCreated="chartSeriesCreated"
:chartSettings="chartSettings" :height="height"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, PivotChart, ChartSeriesCreatedEventArgs } from
"@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 350,
      displayOption: { view: 'Chart' },
      chartSettings: { chartSeries: { type: 'Column' } }
    }
  },
  methods: {
    chartSeriesCreated: function(args: ChartSeriesCreatedEventArgs) {
        for (let pos:number = 0; pos < args.series.length; pos++) {
            if (pos % 2 == 0) {
                args.series[pos].visible = false;
            }
        }
    },
  }
  provide: {
    pivotview: [PivotChart]
  }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs197" %}

Axis Customization

User can customize axis of the pivot chart using primaryXAxis and primaryYAxis properties in chartSettings.

In the following sample, title of y-axis and x-axis are customized.

Axis customization is not applicable for the accumulation chart types like pie, doughnut, pyramid, and funnel.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:displayOption="displayOption" :chartSettings="chartSettings"
:height="height"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, PivotChart } from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 350,
      displayOption: { view: 'Chart' },
      chartSettings: {
        chartSeries: { type: 'Column' },
        primaryXAxis: { title: 'X axis title'},
        primaryYAxis: { title: 'Y axis title' }
      }
    }
  },
    provide: {
        pivotview: [PivotChart]
    }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs198" %}

Legend customization

User can customize legend using legendSettings in chartSettings. By default, legend will be visible and it can be hidden by setting the property visible in legendSettings as **false**.

The pivot chart support different types of legend shapes as follows,

- Circle
- Rectangle
- VerticalLine
- Pentagon
- InvertedTriangle
- SeriesType
- Triangle
- Diamond
- Cross
- HorizontalLine

Here **SeriesType** would act as the default shape and it can changed using the property LegendShape in chartSeries.

Also user can set the position of the legend in pivot chart using the property position in legendSettings. The available options to set the legend position are as follows,

- Auto: Places the legend based on area type. This is the default.
- Top: Displays the legend at the top of the pivot chart.
- Left: Displays the legend at the left of the pivot chart.
- Bottom: Displays the legend at the bottom of the pivot chart.
- Right: Displays the legend at the right of the pivot chart.
- Custom: Displays the legend based on the given x and y values.

By default, the legend is not visible for the accumulation chart types like pie, doughnut, pyramid, and funnel.

In the following sample, the legend shape and its position can be customized.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:displayOption="displayOption" :chartSettings="chartSettings"
:height="height"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, PivotChart } from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
```

```
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 350,
      displayOption: { view: 'Chart' },
      chartSettings: {
        legendSettings: { position: 'Right' },
        chartSeries: { type: 'Column', legendShape: 'Pentagon' }
      }
    }
  },
    provide: {
        pivotview: [PivotChart]
    }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs199" %}

User interaction

Marker and crossHair

User can enable and customize the marker and crosshair using marker and crosshair properties in chartSettings respectively.

Also user can enable and customize the crosshair tooltip for axes using crosshairTooltip.

Marker and crosshair is not applicable for the accumulation chart types like pie, doughnut, pyramid, and funnel.

In the following sample, the marker and crosshair can be enabled and customized.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:displayOption="displayOption" :chartSettings="chartSettings"
:height="height"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, PivotChart } from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
```

```
        expandAll: false,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 350,
      displayOption: { view: 'Chart' },
      chartSettings: {
        crosshair: { enable: true },
        chartSeries: {
         type: 'Line',
         marker: { fill: '#EEE', height: 10, width: 10, shape: 'Pentagon',
visible: true }
        },
        primaryXAxis: { crosshairTooltip: { enable: true, fill: '#ff0000' }
},
        primaryYAxis: { crosshairTooltip: { enable: true, fill: '#0000FF' }
}
      }
    }
  },
    provide: {
        pivotview: [PivotChart]
    }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs200" %}

Zooming and panning

User can customize zooming and panning option using the property zoomSettings in chartSettings.

The pivot chart support four types of zooming which can be set as follows,

- enablePinchZooming
- enableSelectionZooming
- enableDeferredZooming
- enableMouseWheelZooming

and three modes of zooming direction that specifies whether to zoom vertically or horizontally or in both ways which are,

- x: Pivot chart can be zoomed horizontally.
- y: Pivot chart can be zoomed vertically.
- x,y: Pivot chart can be zoomed both vertically and horizontally.

Copyright © 2001 -2024 Syncfusion Inc.

This can be set using the property mode in zoomSettings. By default, if the pivot chart is zoomed, a toolbar would display with the options - Zoom, ZoomIn, ZoomOut, Pan, Reset. User can also customize its option using the property toolbarItems in zoomSettings.

Zooming and panning is not applicable for the accumulation chart types like pie, doughnut, pyramid, and funnel.

In the following sample, all the four types of zooming are enabled with toolbar options.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:displayOption="displayOption" :chartSettings="chartSettings"
:height="height"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, PivotChart } from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);

```
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs201" %}

Tooltip

By default, tooltip for the pivot chart is enabled. User can customize it by using the property tooltip in chartSettings.

The tooltip can be disabled by setting the property enable in tooltip as **false**.

In the following sample, the default appearance of tooltip is modified.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:displayOption="displayOption" :chartSettings="chartSettings"
:height="height"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, PivotChart } from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 350,
      displayOption: { view: 'Chart' },
      chartSettings: {
        chartSeries: {
         type: 'Column'
        },
        tooltip: {
            enableMarker: true,
            textStyle: { color: '#000' },
            fill: '#FFF',
            opacity: 1,
            border: { color: '#000' }
        }
      }
    }
```

```
  },
    provide: {
        pivotview: [PivotChart]
    }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs202" %}

Export

The pivot chart can be exported using the chartExport method which holds parameters like export type, file name, PDF orientation, width, and height in the same order. The mandatory parameters for this method are export type and file name whereas other parameters are optional.

The following are the four export types:

- PNG
- JPEG
- SVG
- PDF

In the following sample, exporting can be done using an external button named as "Export".

APP.VUE

```
<template>
    <div id="app">
        <ejs-button id="chartexport" :isPrimary="isPrimary" v-
on:click.native="exportClick">Export</ejs-button>
        <ejs-pivotview id="pivotview"
:dataSourceSettings="dataSourceSettings" :displayOption="displayOption"
:chartSettings="chartSettings" :height="height"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, PivotChart } from "@syncfusion/ej2-vue-pivotview";
import { ButtonPlugin, ChangeEventArgs} from "@syncfusion/ej2-vue-buttons";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
Vue.use(ButtonPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
```

Drill down in Vue Pivotview component

Drill down and drill up

The drill down and drill up action helps to view the bound data in detailed and abstract view respectively. By default, if member(s) has children, then expand and collapse icon will be displayed in the respective row/column header. On clicking the icon, expand or collapse action will be performed automatically through built-in source code. Meanwhile, leaf member(s) does not contain expand and collapse icon.

Copyright © 2001 -2024 Syncfusion Inc.

	FY 2015		FY 2016		FY 2017
	Units Sold	Sold Amount	Units Sold	Sold Amount	Units Sold
France	450	$714,955	526	$1,542,104	
Mountain Bikes	197	$335,688	238	$405,552	
Road Bikes	253	$379,267	288	$1,136,552	
Germany	440	$563,515	496	$1,772,104	
United States	546	$754,515	636	$2,263,104	
Grand Total	1436	$2,032,985	1658	$5,577,312	1

Drill position

Allows to drill only the current position of the selected member and exclude the drilled data of selected member in other positions. For example, if "FY 2015" and "FY 2016" have "Quarter 1" member as child in next level, and when end user attempts to drill "Quarter 1" under "FY 2016", only it will be expanded and not "Quarter 1" under "FY 2015".

This feature is built-in and occurs every time when expand or collapse action is done for better performance.

	FY 2015		FY 2016		
	Q1	FY 2015 Tot...	Q1		
			Mountain Bi...	Road Bikes	Q1 Total
France	114	114	27	67	
Germany	74	74	97	57	
United States	144	144	57	97	
Grand Total	332	332	181	221	

Expand all

This property is applicable only for the relational data source.

Allows to either expand or collapse all headers that are displayed in row and column axes. To display all headers in expanded state, set the property expandAll to **true** and to collapse all headers, set the property expandAll to **false**. By default, expandAll property is set to **false**.

APP.VUE

</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs27" %}

Expand all headers for specific fields

This property is applicable only for the relational data source.

Allows to expand or collapse all headers for specific fields (only) in row and column axes. To expand headers for a specific field in row or column axis, set the property expandAll in rows or columns to **true**. By default, expandAll property in rows or columns is set to **false**.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :height="height"
:dataSourceSettings="dataSourceSettings"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin } from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        columns: [{ name: 'Year', caption: 'Production Year', expandAll:
true }, { name: 'Quarter' }],
```

```
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country', expandAll: true }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 350
    }
  }
}
</script>

@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs28" %}

Expand all except specific member(s)

This option is applicable only for the relational data source.

In addition to the previous topic, there is an enhancement to expand all headers expect specific header(s) and similarly to collapse all headers except specific header(s). To achieve this, drilledMember is used. The required properties of the drilledMember are explained below:

- name: It allows to set the field name whose member(s) needs to be specifically drilled.
- items: It allows to set the exact member(s) which needs to be drilled.

The drilledMember option always works in vice-versa with respect to the property expandAll in pivot table. For example, if expandAll is set to **true**, then the member(s) added in items collection alone will be in collapsed state.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :height="height"
:dataSourceSettings="dataSourceSettings"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin } from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: true,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
```

```
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 350
    }
  }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs29" %}

Expand specific member(s)

End user can also manually expand or collapse specific member(s) in each fields under row and column axes using the drilledMembers from code behind. The required properties of the drilledMembers are explained below:

- name: It allows to set the field name whose member(s) needs to be specifically drilled.
- items: It allows to set the exact member(s) which needs to be drilled.
- delimiter: It allows to separate next level of member from its parent member.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :height="height"
:dataSourceSettings="dataSourceSettings"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin } from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 350
    }
  }
}
```

@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs30" %}

Event

The event drill triggers every time when a field is expanded or collapsed. For instance using this event user can alter delimiter and drill action for the respective item. It has the following parameters:

- drillInfo - It holds the current drilled item information.
- pivotview - It holds pivot table instance.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :height="height"
:dataSourceSettings="dataSourceSettings"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, DrillArgs } from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 350
    }
  }
  methods: {
    drill:function(args: DrillArgs) {
        //args.drillInfo --> in this user can get which field is drilled
    }
  }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs31" %}

ActionBegin

The event actionBegin triggers when the UI actions such as drill down and drill up begin. This allows user to identify the current action being performed at runtime. It has the following parameters:

- dataSourceSettings: It holds the current data source settings such as input data source, rows, columns, values, filters, format settings and so on.
- actionName: It holds the name of the current action began. The following are the UI actions and their names:

| Action | Action Name|

|------|------------|

| Expand| Drill down|

| Collapse| Drill up|

- cancel: It allows user to restrict the current action.

In the below sample, drill down and drill up action can be restricted by setting the **args.cancel** option to **true** in the actionBegin event.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :height="height"
:dataSourceSettings="dataSourceSettings" :actionBegin="actionBegin"> </ejs-
pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, PivotActionBeginEventArgs } from "@syncfusion/ej2-
vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: true,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
```

```
      height: 350
    }
  },
  methods: {
    actionBegin: function (args: PivotActionBeginEventArgs) {
      if (args.actionName == 'Drill down' || args.actionName == 'Drill up')
{
            args.cancel = true;
      }
    }
  }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs32" %}

ActionComplete

The event actionComplete triggers when a UI action such as drill down or drill up, is completed. This allows user to identify the current UI actions being completed at runtime. It has the following parameters:

- dataSourceSettings: It holds the current data source settings such as input data source, rows, columns, values, filters, format settings and so on.
- actionName: It holds the name of the current action completed. The following are the UI actions and their names:

| Action | Action Name|

|------|----------|

| Expand| Drill down|

| Collapse| Drill up|

- actionInfo: It holds the unique information about the current UI action. For example, if drill down action is completed, the event argument contains information such as field name and the drill information.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :height="height"
:dataSourceSettings="dataSourceSettings" :actionComplete="actionComplete">
</ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, PivotActionCompleteEventArgs } from
"@syncfusion/ej2-vue-pivotview";
```

```
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: true,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 350
    }
  },
   methods: {
    actionComplete: function (args: PivotActionCompleteEventArgs) {
      if (args.actionName == 'Drill down' || args.actionName == 'Drill up')
{
            // Triggers when the drill operations are completed.
      }
    }
  }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs33" %}

ActionFailure

The event actionFailure triggers when the current UI action fails to achieve the desired result. It has the following parameters:

- actionName: It holds the name of the current action failed. The following are the UI actions and their names:

| Action | Action Name|

|------|------------|

| Expand| Drill down|

| Collapse| Drill up|

- errorInfo: It holds the error information of the current UI action.

APP.VUE

```
<template>
```

```
    <div id="app">
        <ejs-pivotview :height="height"
:dataSourceSettings="dataSourceSettings" :actionFailure="actionFailure">
</ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, PivotActionFailureEventArgs } from
"@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: true,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 350
    }
  },
   methods: {
    actionFailure: function (args: PivotActionFailureEventArgs) {
      if (args.actionName == 'Drill down' || args.actionName == 'Drill up')
{
        // Triggers when the current UI action fails to achieve the desired
result.
      }
    }
  }
}
</script>

</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs34" %}

Data Shaping

Aggregation in Vue Pivotview component

This feature is applicable only for the relational data source.

End user can perform calculations over a group of values (exclusively for value fields bound in value axis) using the aggregation option. By default, values are added (summed) together. The other aggregation types are explained below.

Copyright © 2001 -2024 Syncfusion Inc.

The fields with data type such as number support all aggregation types mentioned below except for **“CalculatedField”**. The fields with data type such as string, date, datetime, boolean, etc., support **“Count”** and **“DistinctCount”** aggregation types alone.

| Operator | Description |

|------|-------------|

| Sum| Displays the pivot table values with sum.|

| Product| Displays the pivot table values with product.|

| Count| Displays the pivot table values with count.|

| DistinctCount| Displays the pivot table values with distinct count.|

| Min| Displays the pivot table with minimum value.|

| Max| Displays the pivot table with maximum value.|

| Avg| Displays the pivot table values with average.|

| Index| Displays the pivot table values with index.|

| PopulationStDev| Displays the pivot table values with standard deviation of population.|

| SampleStDev| Displays the pivot table values with sample standard deviation.|

| PopulationVar| Displays the pivot table values with variance of population.|

| SampleVar| Displays the pivot table values with sample variance.|

| RunningTotals| Displays the pivot table values with running totals.|

| DifferenceFrom| Displays the pivot table values with difference from the value of the base item in the base field.|

| PercentageOfDifferenceFrom| Displays the pivot table values with percentage difference from the value of the base item in the base field.|

| PercentageOfGrandTotal| Displays the pivot table values with percentage of grand total of all values.|

| PercentageOfColumnTotal| Displays the pivot table values in each column with percentage of total values for the column.|

| PercentageOfRowTotal| Displays the pivot table values in each row with percentage of total values for the row.|

| PercentageOfParentTotal| Displays the pivot table values with percentage of total of all values based on selected field.|

| PercentageOfParentColumnTotal| Displays the pivot table values with percentage of its parent total in each column.|

| PercentageOfParentRowTotal| Displays the pivot table values with percentage of its parent total in each row.|

| CalculatedField| Displays the pivot table with calculated field values. It allows user to create a new calculated field alone.|

Assigning aggregation type for value fields through API

For each value field, the aggregation type can be set using the property type in values. Meanwhile, aggregation types like **DifferenceFrom** and **PercentageOfDifferenceFrom** can check for specific field of specific item using baseField and baseItem properties. Likewise, **PercentageOfParentTotal** type can for specific field using baseField property. For instance, the aggregation type **DifferenceFrom** would intake the specified field and its corresponding member as input and its value is compared across other members in the same field and also across different fields to formulate an appropriate output value.

- type: It allows to set the aggregate type of the field.
- baseField: It allows to set the specific field to aggregate the values.
- baseItem: It allows to set the specific member to aggregate the values.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:height="height"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin } from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' type:"DifferenceFrom"
baseField:"Country" baseItem:"France" }, { name: 'Amount', caption: 'Sold
Amount', type: 'Sum' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 350
    }
  }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs1" %}

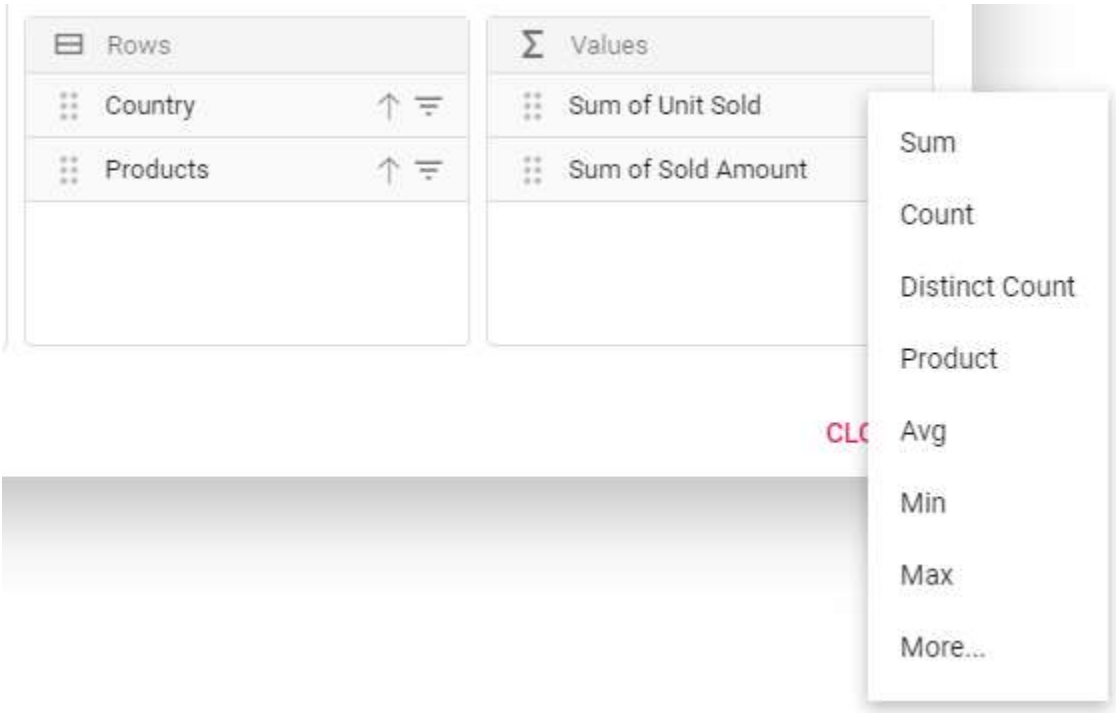
Copyright © 2001 -2024 Syncfusion Inc.

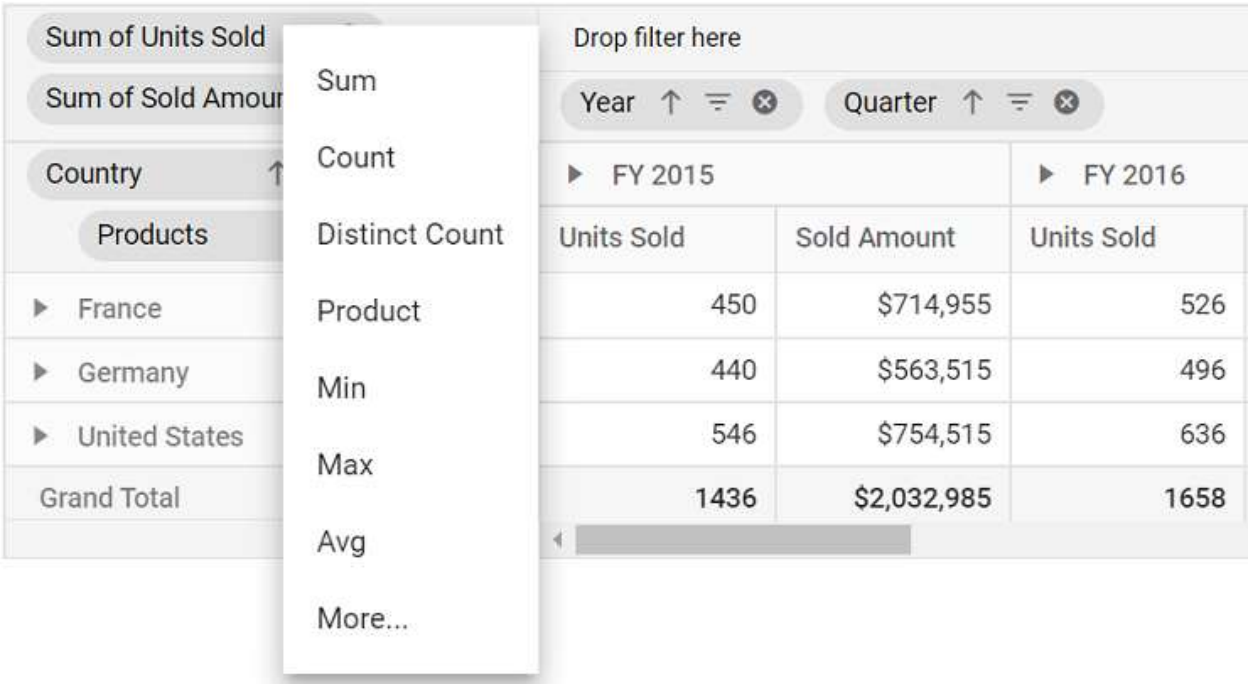
By default, the aggregation will be considered as **Sum** to the value fields which had number type and for the value fields which had non-number type values such as string, date, datetime, boolean, etc., the aggregation type will be considered as **Count**.

Modifying aggregation type for value fields at runtime

Aggregation types can be changed easily through UI at runtime. The value fields bound to grouping bar and field list appears with a dropdown icon which helps to select an appropriate aggregation type for the respective value field. On selection, the values in the pivot table will be changed dynamically.

<!-- markdownlint-disable MD012 -->





Show desired aggregation types in its dropdown menu

By default, all the aggregation types are displayed in the dropdown menu available in buttons. However, based on the request for an application, we may need to show selective aggregation types on our own. This can be achieved using the aggregateTypes property.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:height="height" :showFieldList="showFieldList"
:showGroupingBar="showGroupingBar" :aggregateTypes ="aggregateTypes"> </ejs-
pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, GroupingBar, FieldList } from "@syncfusion/ej2-
vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount', type: 'Sum' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        filters: [],
      },
```

```
      height: 350,
      showFieldList: true,
      showGroupingBar: true,
      aggregateTypes: ['DistinctCount', 'Avg', 'Product']
    }
  },
  provide: {
      pivotview: [GroupingBar, FieldList]
  }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs2" %}

Hiding aggregation type from button text

By default, in value axis each field would be displayed by its name and aggregation type together. To hide aggregation type and display field name alone, set the property showAggregationOnValueField in dataSourceSettings to **false**.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings" :height=
"height" :showGroupingBar="showGroupingBar"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, GroupingBar } from "@syncfusion/ej2-vue-
pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: [],
        showAggregationOnValueField: false
      },
      height: 350,
      showGroupingBar: true
    }
  },
  provide: {
```

```
        pivotview: [GroupingBar]
    }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs3" %}

Hiding aggregation type icon from UI

By default, the icon to set aggregation type is enabled in the grouping bar. To disable this icon, set the property showValueTypeIcon in groupingBarSettings to **false**.

Icon to change the aggregation type can be hidden only in Grouping Bar but not in Field List at the moment.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings" :height=
"height" :showGroupingBar="showGroupingBar"
:groupingBarSettings="groupingBarSettings"> </ejs-pivotview>
    </div>
</template>
<script>

Event

AggregateCellInfo

The event aggregateCellInfo triggers every time while rendering value cell. This allows user to change the cell value and skip formatting if applied. It has following parameters:

- fieldName - It holds current cell's field name.
- row - It holds current cell's row value.
- column - It holds current cell's row value.
- value - It holds value of current cell.
- cellSets - It holds raw data for the aggregated value cell.
- rowCellType - It holds row cell type value.
- columnCellType - It holds column cell type value.
- aggregateType - It holds aggregate type of the cell.
- skipFormatting - boolean property, it allows to skip formatting if applied.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:height="height" :aggregateCellInfo="aggregateCell"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";

import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: [],
      },
      height: 350
```

```
    }
  }
  methods: {
    aggregateCell:function(args: any) {
        args.skipFormatting = false;
    }
  }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs5" %}

ActionBegin

The event actionBegin triggers when clicking and selecting the aggregate type via the dropdown icon in the value field button, which is present in both grouping bar and field list UI. This allows user to identify the current action being performed at runtime. It has the following parameters:

- dataSourceSettings: It holds the current data source settings such as input data source, rows, columns, values, filters, format settings and so on.
- actionName: It holds the name of the current action began. For example, while performing aggregation, the action name will be shown as **Aggregate field**.
- fieldInfo: It holds the selected value field information.

Note: This option is applicable only when the field based UI actions are performed such as filtering, sorting, removing field from grouping bar, editing and aggregation type change.

- cancel: It allows user to restrict the current action.

In the following example, action taken during aggregation type selection via dropdown icon can be restricted by setting the **args.cancel** option to **true** in the actionBegin event.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:height="height" :showGroupingBar="showGroupingBar"
:actionBegin="actionBegin"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, GroupingBar, FieldList, PivotActionBeginEventArgs
} from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
```

```
        dataSource: pivotData,
        expandAll: false,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 350,
      showGroupingBar: true
    }
  },
  methods: {
    actionBegin: function (args: PivotActionBeginEventArgs) {
        if (args.actionName == 'Aggregate field') {
            args.cancel = true;
        }
    }
  },
  provide: {
        pivotview: [GroupingBar, FieldList]
    }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs6" %}

ActionComplete

The event actionComplete triggers when a UI action, such as applying aggregation using the dropdown icon via the value field button, which is present in both the grouping bar and the field list UI, is completed. This allows user to identify the current UI action being completed at runtime. It has the following parameters:

- dataSourceSettings: It holds the current data source settings such as input data source, rows, columns, values, filters, format settings and so on.
- actionName: It holds the name of the current action completed. For example, after completing the aggregation, the action name will be shown as **Field aggregated**.
- fieldInfo: It holds the selected value field information.

Note: This option is applicable only when the field based UI actions are performed such as filtering, sorting, removing field from grouping bar, editing and aggregation type change.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:height="height" :showGroupingBar="showGroupingBar"
```

```
:showFieldList="showFieldList" :actionComplete="actionComplete"> </ejs-
pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, GroupingBar, FieldList,
PivotActionCompleteEventArgs } from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 350,
      showGroupingBar: true,
      showFieldList: true
    }
  },
  methods: {
    actionComplete: function (args: PivotActionCompleteEventArgs) {
        if (args.actionName == 'Field aggregated') {
            // Triggers when the aggregation type is applied.
        }
    }
  },
  provide: {
        pivotview: [GroupingBar, FieldList]
    }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs7" %}

ActionFailure

The event actionFailure triggers when the current UI action fails to achieve the desired result. It has the following parameters:

- actionName: It holds the name of the current action failed. For example, if the action fails while performing the aggregation, then the action name will be shown as **Aggregate field**.
- errorInfo: It holds the error information of the current UI action.

APP.VUE

Calculated field in Vue Pivotview component

Allows end user to create a new calculated field in the pivot table, based on available fields from the bound data source or using simple formula with basic arithmetic operators. It can be added at runtime through the built-in dialog, invoked from Field List UI. To do so, set the allowCalculatedField property in pivot table to **true** in the pivot table. End user can now see a "CALCULATED FIELD" button enabled in Field List UI automatically, which on clicking will invoke the calculated field dialog and perform necessary operation.

Calculated field can also be included in the pivot table through code behind using the calculatedFieldSettings. The required properties to create a new calculate field are:

- name: It allows to indicate the calculated field with a unique name.
- formula: It allows to set the formula.
- formatString: It helps to set the number format for the resultant value.

To use calculated field option, you need to inject the `CalculatedField` module in pivot table.

The calculated field is applicable only for value fields. Also, calculated field created through code behind will be automatically listed in the UI dialog as well.

APP.VUE

```
<template>
    <div id="app">
      <ejs-pivotview id="pivotview" :height="height"
:dataSourceSettings="dataSourceSettings" :showFieldList="showFieldList"
:allowCalculatedField="allowCalculatedField"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, CalculatedField, FieldList } from
"@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        enableSorting: true,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }, { name: 'Total', caption: 'Total Amount', type:
'CalculatedField' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }, { name: 'Total',
format: 'C2' }],
        filters: [],
        calculatedFieldSettings: [{ name: 'Total', formula:
'"Sum(Amount)"+"Sum(Sold)"' }]
      },
```

```
      height: 350,
      allowCalculatedField: true,
      showFieldList: true,
      isPrimary: true
    }
  },
  provide: {
        pivotview: [CalculatedField, FieldList]
    }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs9" %}

Meanwhile, you can also display the calculated field dialog independently through other means. For example, you can invoke the dialog on an external button click which is shown in the below code sample.

APP.VUE

```
<template>
    <div id="app">
        <ejs-button id="calculated-field-btn" :isPrimary="isPrimary" v-
on:click.native="btnClick">Calculated Field</ejs-button>
        <ejs-pivotview id="pivotview" :height="height"
:dataSourceSettings="dataSourceSettings"
:allowCalculatedField="allowCalculatedField"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, CalculatedField } from "@syncfusion/ej2-vue-
pivotview";
import { ButtonPlugin, ChangeEventArgs} from "@syncfusion/ej2-vue-buttons";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
Vue.use(ButtonPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        enableSorting: true,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }, { name: 'Total', caption: 'Total Amount', type:
'CalculatedField' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }, { name: 'Total',
format: 'C2' }],
```

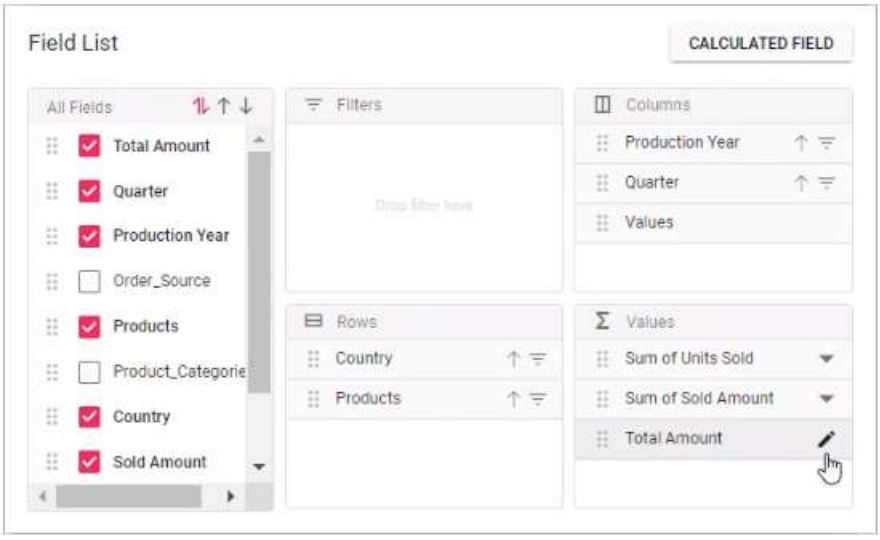
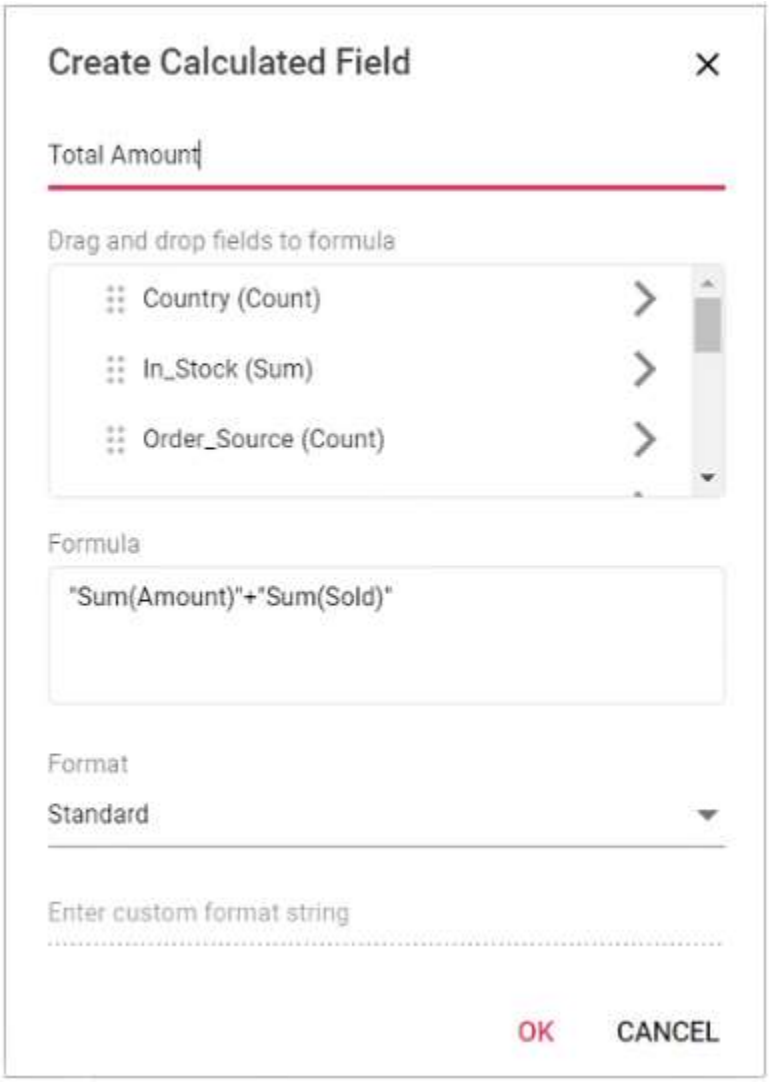
```
        filters: [],
        calculatedFieldSettings: [{ name: 'Total', formula:
'"Sum(Amount)"+"Sum(Sold)"' }]
      },
      height: 320,
      allowCalculatedField: true,
      isPrimary: true
    }
  },
  methods: {
    btnClick: function(args) {
      let pivotGridObj =
document.getElementById('pivotview').ej2_instances[0];
      pivotGridObj.calculatedFieldModule.createCalculatedFieldDialog();
    }
  },
  provide: {
        pivotview: [CalculatedField]
    }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs10" %}

Editing through the field list and the grouping bar

User can also modify the existing calculated field using the built-in edit option available directly in the field list (or) grouping bar. To do so, click the "Edit" icon available in the calculated field button. Now the calculated field dialog is opened and the current calculated field name, formula and format can be changed at runtime.

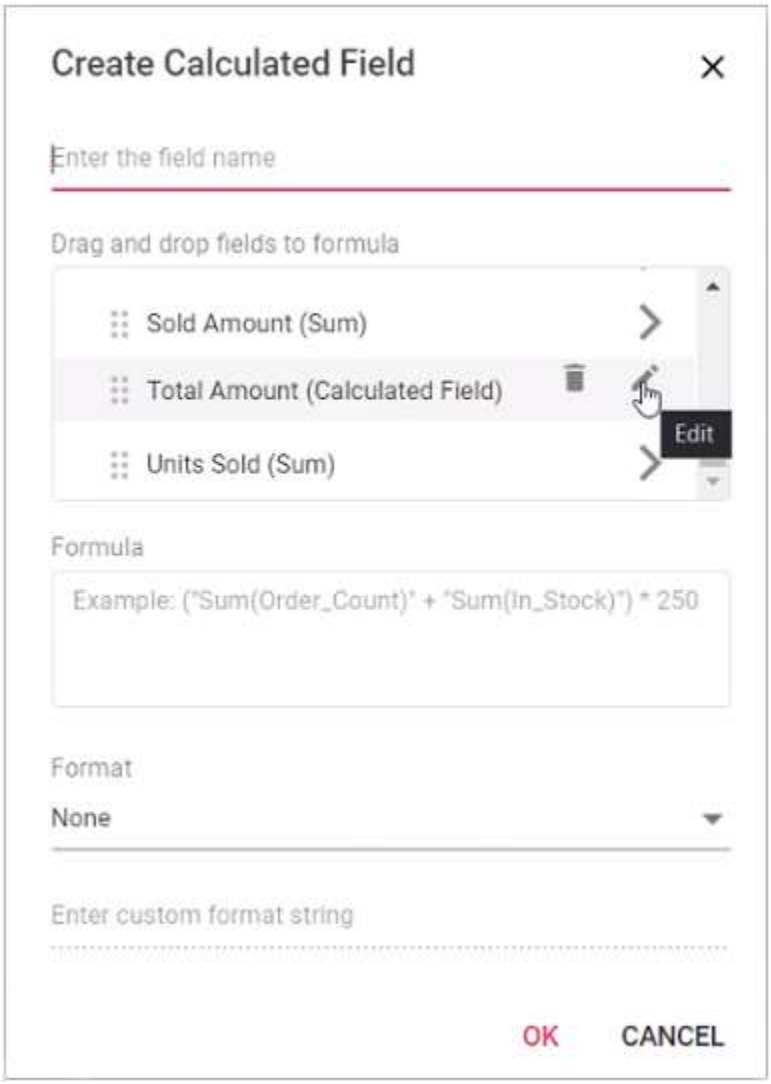




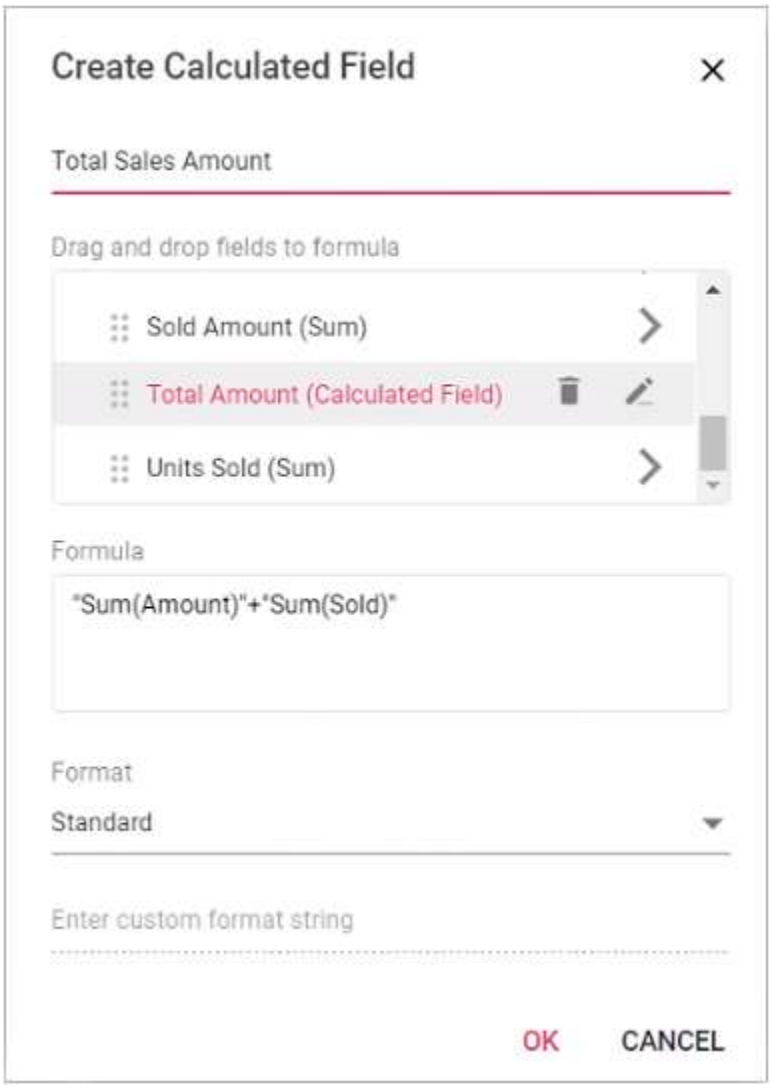
Renaming the existing calculated field

Existing calculated field can be renamed only through the UI at runtime. To do so, open the calculated field dialog, select the target field and click "Edit" icon. User can now see the existing name getting displayed in the text box at the top of the dialog. Now, change the name based on user requirement and click "OK".

<!-- markdownlint-disable MD012 -->



Create Calculated Field
Enter the field name
Drag and drop fields to formula
Sold Amount (Sum)
Total Amount (Calculated Field)
Edit
Units Sold (Sum)
Formula
Example: ("Sum(Order_Count)" + "Sum(In_Stock)") * 250
Format
None
Enter custom format string
OK
CANCEL



Editing the existing calculated field formula

Existing calculated field formula can be edited only through the UI at runtime. To do so, open the calculated field dialog, select the target field and click "Edit" icon. User can now see the existing formula getting displayed in a multiline text box at the bottom of the dialog. Now, change the formula based on user requirement and click "OK".

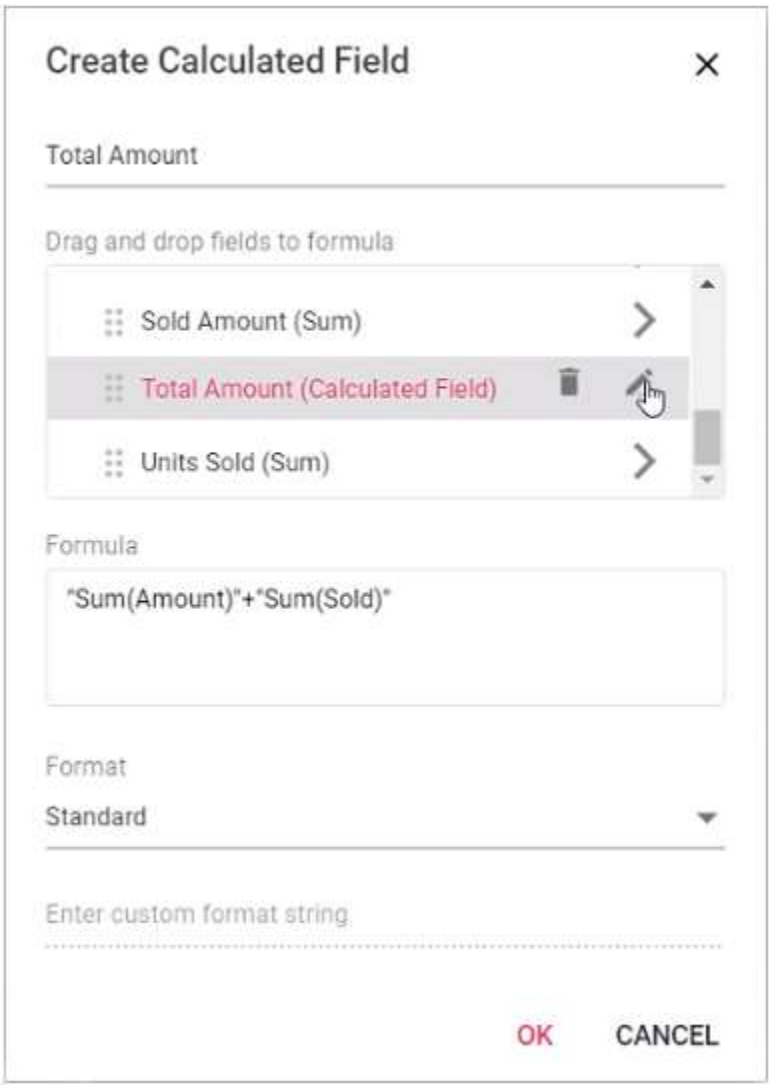
Create Calculated Field
Enter the field name
Drag and drop fields to formula
Sold Amount (Sum)
Total Amount (Calculated Field)
Units Sold (Sum)
Formula
Example: ("Sum(Order_Count)" + "Sum(In_Stock)") * 250
Format
None
Enter custom format string
OK
CANCEL



Reusing the existing formula in a new calculate field

While creating a new calculated field, if user wants to the add the formula of an existing calculated field, it can be done easily. To do so, simply drag-and-drop the existing calculated field to the "Formula" section.

Total Amount (Calculated Field)
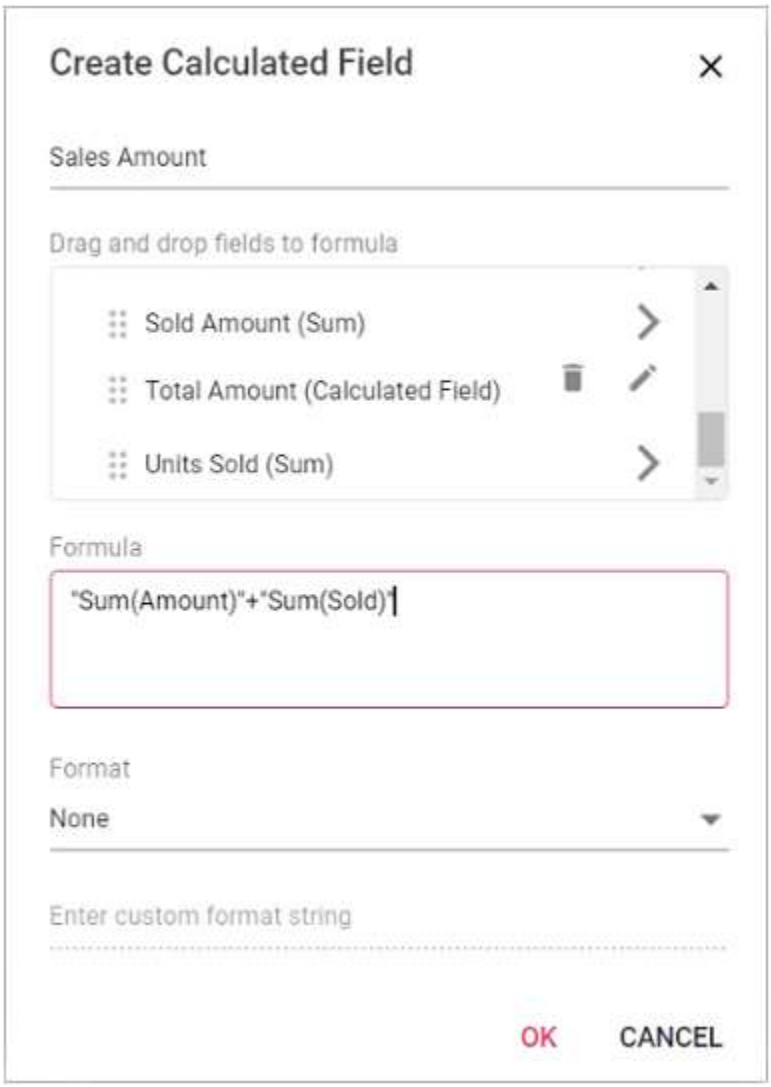
Units Sold (Sum)
Formula
Example: ("Sum(Order_Count)" + "Sum(In_Stock)") * 250
Total Amount (Calculated Field)
Format
None
Enter custom format string
OK
CANCEL



Apply the format to the calculated field values

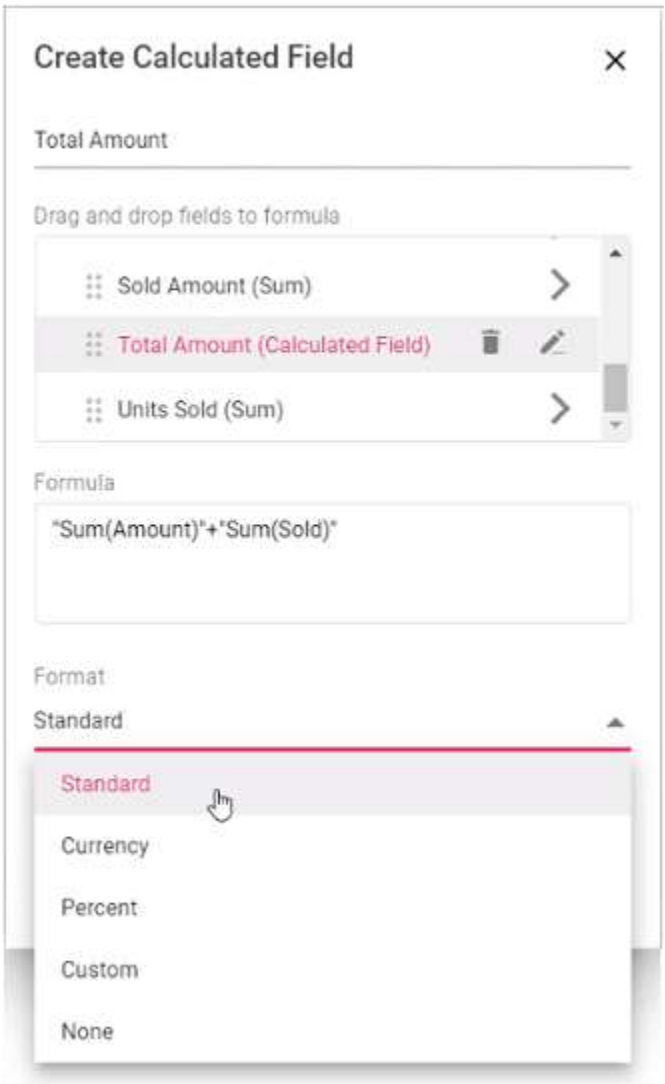
Values in a new or existing calculated field can be formatted via the calculated field UI or code behind. The formatSettings property in code-behind can be used to specify the desired format. For more information about the supported formats refer here.

To apply format to calculated field values at runtime via UI, a built-in dropdown under the "Format" label is available, from which the user can select the pre-defined format options listed below.

- **Standard** - Denotes the numeric type.
- **Currency** - Denotes the currency type.
- **Percent** - Denotes the percentage type.
- **Custom** - Denotes the custom format. For example: "C2". This shows the value "9584.3" as "$9584.30."
- **None** - Denotes that no format will be applied.

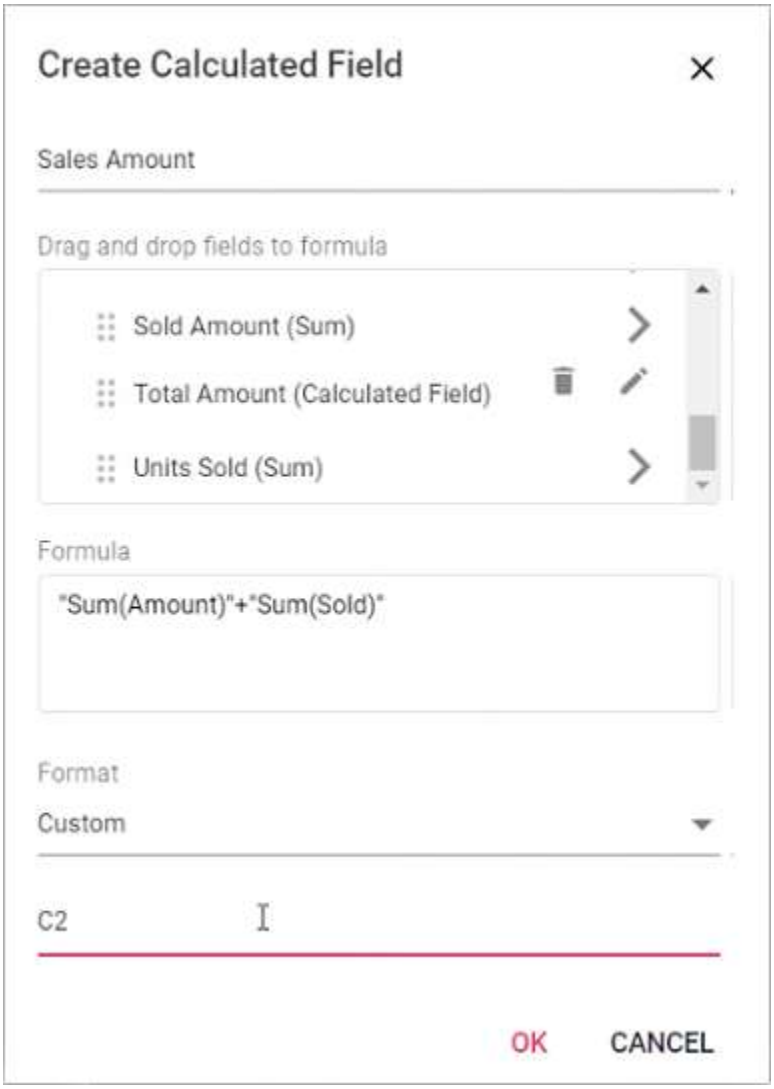
By default, **None** will be selected from the dropdown.

Copyright © 2001 -2024 Syncfusion Inc.



In addition, you can specify the desired custom formats by selecting the **Custom** option from the "Format" dropdown.

Copyright © 2001 -2024 Syncfusion Inc.



Supported operators and functions for the calculated field formula

Below is a list of operators and functions that can be used in the formula to create the calculated fields.

- + – addition operator.

`ts

Syntax: X + Y

`

- - – subtraction operator.

`ts

Syntax: X - Y

`

- * – multiplication operator.

`ts

Syntax: X * Y

`

- / – division operator.

`ts

Syntax: X / Y

`

- `^` – power operator.

Grouping in Vue Pivotview component

This feature is applicable only for the relational data source.

Grouping is the most-useful feature in pivot table and the component automatically groups date, time, number and string. For example, the date type can be formatted and displayed based on year, quarter, month, and more. Likewise, the number type can be grouped range-wise, such as 1-5, 6-10, etc. These group fields will act as individual fields and allows users to drag them between different axes such as columns, rows, values, and filters and create pivot table at runtime.

<!-- markdownlint-disable MD012 -->

Filtering in Vue Pivotview component

Filtering allows to view the pivot table with selective records based on members that can be either included or excluded through UI and code-behind.

The following are the three different types of filtering:

- Member filtering
- Label filtering
- Value filtering

When all the above filtering options are disabled via code-behind, then the filter icon would be disabled in the field list or grouping bar UI.

Member filtering

Sorting in Vue Pivotview component

Member Sorting

Allows to order field members in rows and columns either in ascending or descending order. By default, field members in rows and columns are in ascending order.

Drill through in Vue Pivotview component

Editing in Vue Pivotview component

This feature is applicable only for the relational data source.

Copyright © 2001 -2024 Syncfusion Inc.

Data Formatting

Number formatting in Vue Pivotview component

Allows you to specify the required display format that should be used in values of the pivot table. Supported display formats are:

- Number
- Currency
- Percentage
- Custom

Conditional formatting in Vue Pivotview component

Allows end user to change the appearance of the pivot table value cells with its background color, font color, font family, and font size based on specific conditions.

Report Manipulation

Grouping bar in Vue Pivotview component

Field list in Vue Pivotview component

The pivot table provides a built-in Field List similar to Microsoft Excel. It allows to add or remove fields and also rearrange them between different axes, including column, row, value, and filter along with sort and filter options dynamically at runtime.

The field list can be displayed in two different formats to interact with pivot table. They are:

- **In-built Field List (Popup)**: To display the field list icon in pivot table UI to invoke the built-in dialog.
- **Stand-alone Field List (Fixed)**: To display the field list in a static position within a web page.

In-built Field List (Popup)

To enable the field list in pivot table UI, set the showFieldList property in pivot view to **true**. A small icon will appear on the top left corner of the pivot table and clicking on this icon, field list dialog will appear.

The field list icon will be displayed at the top right corner of the pivot table, when grouping bar is enabled.

To use field list, you need to inject the FieldList module in pivot table.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:height="height" :showFieldList="showFieldList"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, FieldList } from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
```

```
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        allowLabelFilter: true,
        allowValueFilter: true,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 350,
      showFieldList: true
    }
  },
  provide: {
        pivotview: [FieldList]
    }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs61" %}

Stand-alone Field List (Fixed)

The field list can be rendered in a static position, anywhere in web page layout, like a separate component. To do so, you need to set renderMode property to **Fixed** in pivot fieldlist.

To make field list interact with pivot table, you need to use the **updateView** and **update** methods for data source update in both field list and pivot table simultaneously.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview id="pivotview_flist" :height="height"></ejs-

      width: 400px;
      margin-top: 20px;
    }
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs62" %}

Search desired field

End user can search for desired field in the field list UI by typing the field name into the search box at runtime. It can be enabled by setting the enableFieldSearching property to **true** via code-behind.

By default, field search option is disabled in the field list UI.

To enable search box in the static field list UI, set the enableFieldSearching property to **true** in ejs-pivotfieldlist.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview id="pivotview_flist" :height="height"></ejs-
pivotview>
        <ejs-pivotfieldlist id="pivotfieldlist1"
:dataSourceSettings="dataSourceSettings"
```

```
:enginePopulated="fieldEnginePopulated" :renderMode="renderMode"
:enableFieldSearching="enableFieldSearching"></ejs-pivotfieldlist>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, PivotFieldListPlugin, FieldList } from
"@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
Vue.use(PivotFieldListPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],

        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 350,
      showFieldList: true,
      enableFieldSearching: true
    }
  },
  provide: {
        pivotview: [FieldList]
    }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

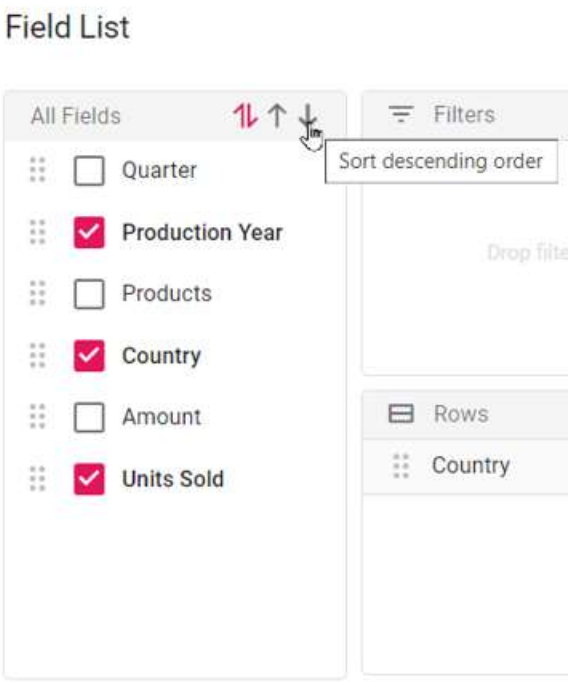
{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs64" %}

Option to sort fields

End user can sort fields in the field list UI to ascending (or) descending (or) default order (as obtained from the data source) using the built-in sort icons.

By default, fields are displayed in the default order.

Copyright © 2001 -2024 Syncfusion Inc.



Sort fields in a desired order

To display the fields in descending order by default, set the defaultFieldListOrder property to **Descending** in the load event.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:height="height" :showGroupingBar="showGroupingBar"
:showFieldList="showFieldList" :load="load"> </ejs-pivotview>
    </div>

```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs261" %}

Group fields under desired folder name

In the field list UI, you can display fields by grouping them under the desired folder name. It can only be configured via code-behind by setting the groupName property in fieldMapping.

You can only group fields to one level using the groupName property.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:height="height" :showFieldList="showFieldList"
:showGroupingBar="showGroupingBar"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, FieldList, GroupingBar } from "@syncfusion/ej2-
vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
      dataSource: pivotData,
      expandAll: false,
      allowLabelFilter: true,
      allowValueFilter: true,
      values: [{ name: 'Sold', caption: 'Units Sold' }],
      columns: [{ name: 'Year', caption: 'Production Year' }],
      rows: [{ name: 'Country' }],
      formatSettings: [{ name: 'Amount', format: 'C0' }],
```

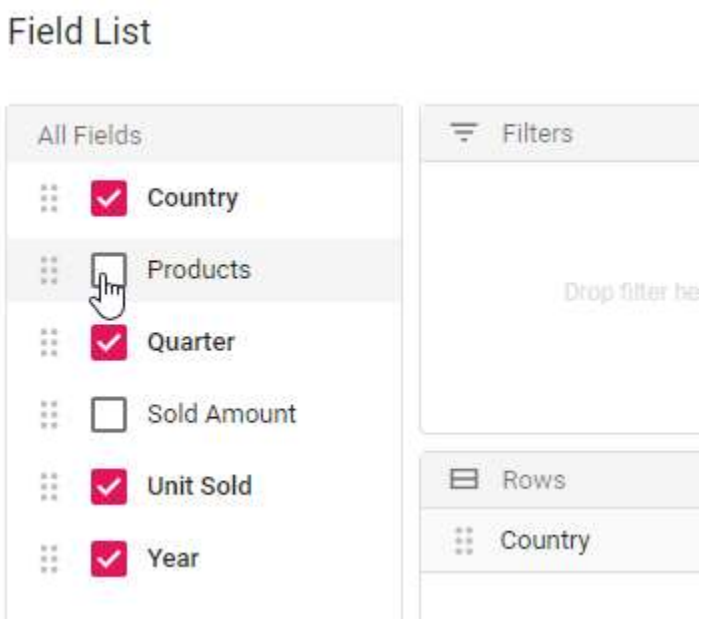
```
      filters: [],
      fieldMapping: [
        { name: 'Quarter', groupName: 'Product category' },
        { name: 'Products', groupName: 'Product category' },
        { name: 'Amount', groupName: 'Product category', caption: 'Sold
Amount' },
      ]
      },
      height: 350,
      showFieldList: true,
      showGroupingBar: true
    }
  },
  provide: {
        pivotview: [FieldList, GroupingBar]
    }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs65" %}

Add or remove fields

Using check box besides each field, end user can select or unselect to add or remove fields respectively from the report at runtime.



Remove specific field(s) from displaying

When a data source is bound to the component, fields will be automatically populated inside the Field List. In such case, user can also restrict specific field(s) from displaying. To do so, set the appropriate field name(s) in excludeFields property belonging to dataSourceSettings.

APP.VUE

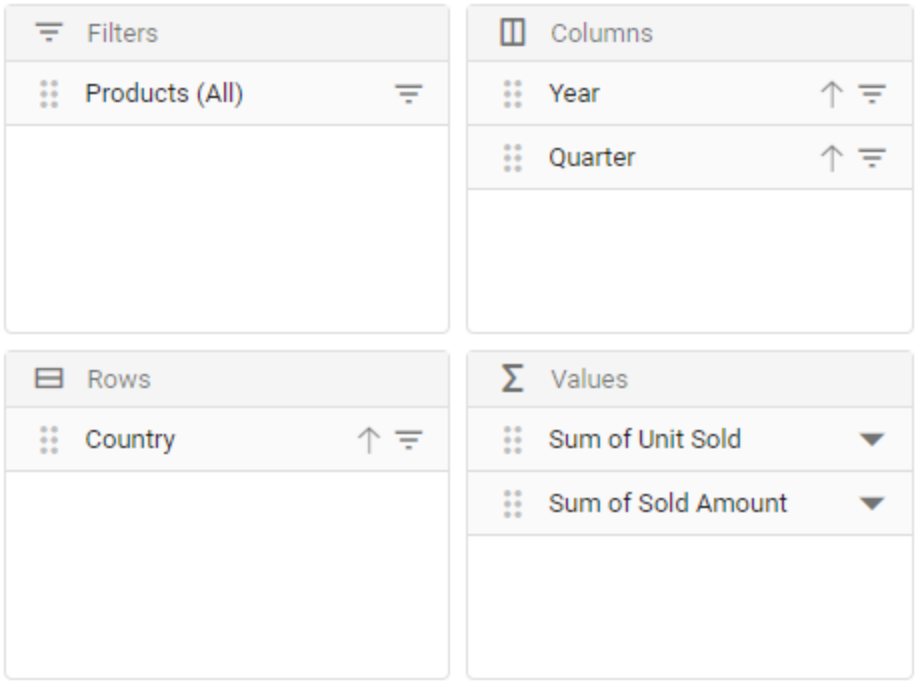
```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:height="height" :showFieldList="showFieldList"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, FieldList } from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        allowLabelFilter: true,
        allowValueFilter: true,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }],
        rows: [{ name: 'Country' }],
        excludeFields:["Products", "Amount" ],
        filters: []
      },
      height: 350,
      showFieldList: true
    }
  },
  provide: {
        pivotview: [FieldList]
    }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs66" %}

Re-arranging fields

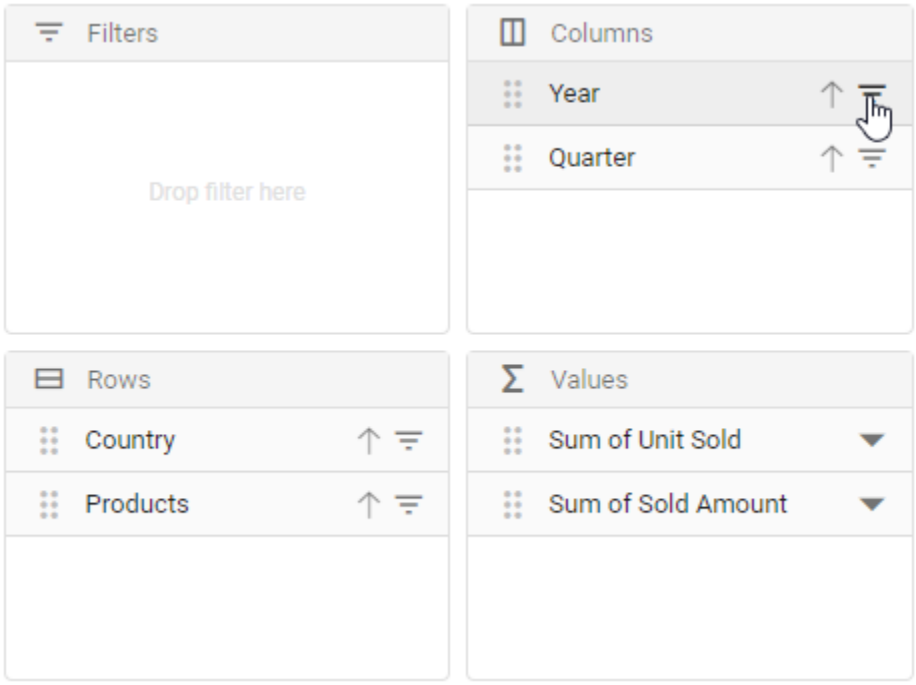
In-order to re-arrange, drag any field from the field list and drop it into the column, row, value, or filter axis using the drag-and-drop holder. It helps end user to alter the report at runtime.

Copyright © 2001 -2024 Syncfusion Inc.



Filtering members

Using the filter icon besides each field in row, column and filter axes, members can be either included or excluded at runtime. To know more about member filtering, refer here.



Copyright © 2001 -2024 Syncfusion Inc.

	FY 2018		Grand Total	
	Units Sold	Sold Amount	Units Sold	Sold Amount
France	16	$27,264	16	$27,264

Calculated fields

The calculated field support allows end user to add a new calculated field based on the available fields from the bound data source using basic arithmetic operators. To enable this support in Field List UI, set the allowCalculatedField property in pivot table to **true** in pivot table. Now a button will be seen automatically inside the field list UI which will invoke the calculated field dialog on click. To know more about calculated field, refer here.

Changing aggregation type of value fields at runtime

End user can perform calculations over a group of values using the aggregation option. The value fields bound to the field list, appears with a dropdown icon, helps to select an appropriate aggregation type at runtime. On selection, the values in the Pivot Table will be changed dynamically. To know more about aggregation, refer here.

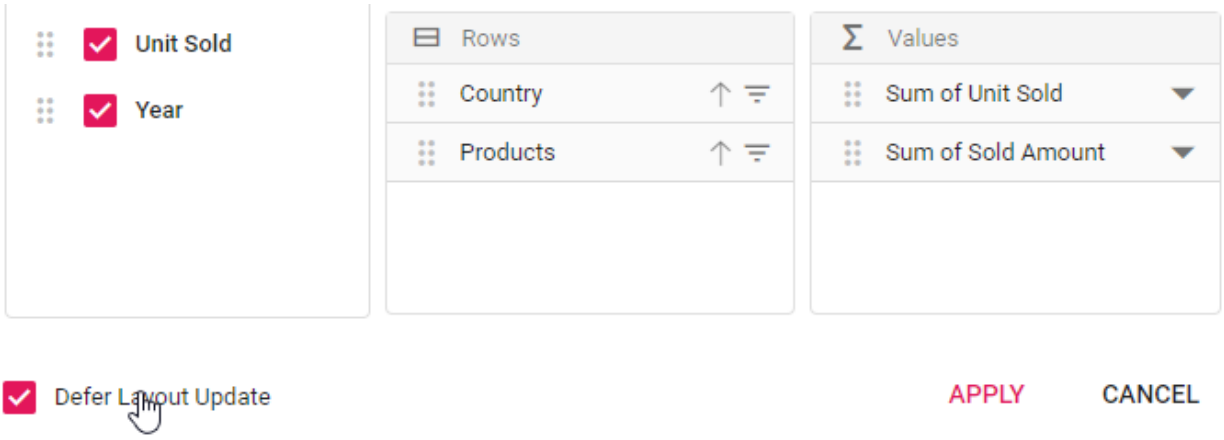
Defer layout update

Defer layout update support to update the pivot table only on demand and not during every user action. To enable this support in Field List UI, set the allowDeferLayoutUpdate property to **true** in pivot table. Now a check box inside Field List UI will be seen in checked state, allowing pivot table to update only on demand. To know more about defer layout, refer here.



Show built-in Field List (Popup) over specific target

By passing the target element to the built-in field list dialog module in the dataBound event, the field list dialog will be displayed over the appropriate target element on a web page. By default, the Pivot Table's parent element is used as the target element to display the built-in field list dialog.

The sample code below shows the built-in field list dialog using `document.body` as the target element.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:height="height" :showFieldList="showFieldList" :dataBound="ondataBound">
</ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, FieldList } from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
```

```
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        allowLabelFilter: true,
        allowValueFilter: true,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 350,
      showFieldList: true
    }
  },
  methods: {
    ondataBound: function() {
     let pivotGridObj =
document.getElementById('pivotview').ej2_instances[0];
     pivotGridObj.pivotFieldListModule.dialogRenderer.fieldListDialog.target
= document.body;
    }
  },
  provide: {
        pivotview: [FieldList]
    }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs67" %}

Show field list using toolbar

It can also be viewed in toolbar by setting showFieldList and showToolbar properties in pivot table to **true**. Also, include the item **FieldList** within the toolbar property in pivot table. When toolbar is enabled, field list icon will be automatically added into the toolbar and the icon won't appear on top left corner in the pivot table component.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview id="pivotview" ref="pivotview"
:dataSourceSettings="dataSourceSettings" :gridSettings="gridSettings"
:height="height" :showToolbar="showToolbar" :toolbar="toolbar"
:showFieldList="showFieldList" > </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
```

Copyright © 2001 -2024 Syncfusion Inc.

```
import {
  PivotViewPlugin,
  IDataSet,
  Toolbar,
  FieldList
} from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 350,
      gridSettings: { columnWidth: 140 },
      showToolbar: true,
      showFieldList: true,
      toolbar: [
        "FieldList"
      ],
    };
  }
  provide: {
    pivotview: [
      Toolbar,
      FieldList
    ]
  }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs68" %}

Invoking dynamic Field List (Customized)

Also, you can display the field list dialog independently through other means. For example, you can invoke the field list dialog on an external button click. To do so, set renderMode property to Popup and since on button click, field list dialog will be invoked.

* Meanwhile, you can display the field list dialog over specific target element within a webpage using target property. By default, the target value is "null", which by default refers the document.body element.

Copyright © 2001 -2024 Syncfusion Inc.

* To make field list interact with pivot table, you need to use the **updateView** and **update** methods for data source update in both field list and pivot table simultaneously.

The below sample code illustrates the field list dialog invoked on an external button click.

APP.VUE

```
<template>
    <div id="app">
        <ejs-button id="flist-btn" :isPrimary="isPrimary" v-
on:click.native="btnClick">Show Field List</ejs-button>
        <ejs-pivotview id="pivotview_flist" :height="height"
:enginePopulated="enginePopulated"></ejs-pivotview>
        <ejs-pivotfieldlist id="pivotfieldlist1"
:dataSourceSettings="dataSourceSettings"
:enginePopulated="fieldEnginePopulated" :renderMode="renderMode"
:target="target"></ejs-pivotfieldlist>
    </div>
</template>
<script>

      if(fieldListObj) {
        fieldListObj.updateView(pivotGridObj);
      }
    }
  }
}
</script>
<style>
    @import "@syncfusion/ej2-vue-pivotview/styles/material.css";
    .e-toggle-field-list {
      display: none !important;
    }
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs69" %}

Set caption to fields which isn't bound to the report

One can set the caption to all fields from the data source even if it is not bound to the actual report. It can be achieved using the enginePopulated event. On doing so, caption of the respective field will be displayed in both grouping bar and field list.

In the sample, we have set caption to the fields Year and Quarter dynamically.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview  id="pivotview_flist"
:dataSourceSettings="dataSourceSettings" :height="height"
:showFieldList="showFieldList" :enginePopulated="fieldEnginePopulated">
</ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, FieldList } from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Products' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
```

```
        rows: [{ name: 'Country' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 350,
      showFieldList: true
    }
  },
  provide: {
        pivotview: [FieldList]
    },
  methods: {
    fieldEnginePopulated: function(args) {
      let pivotTableObj =
document.getElementById('pivotview_flist').ej2_instances[0];
      Object.keys(pivotTableObj.engineModule.fieldList).forEach((key, index)
=> {
                if (key === 'Quarter') {
                    pivotTableObj.engineModule.fieldList[key].caption =
'Production Quarter Year';
                }
                else if (key === 'Year') {
                    pivotTableObj.engineModule.fieldList[key].caption =
'Production Year';
                }
      });
    }
  }
}

Events

EnginePopulated

The enginePopulated event is available in both Pivot Table and Field List.

- The event enginePopulated is triggered in field list whenever the report gets modified. The updated report is passed to the pivot table via updateView method written within this event to refresh the same.

Copyright © 2001 -2024 Syncfusion Inc.

- Likewise, enginePopulated event is triggered in pivot table whenever the report gets modified. The updated report is passed to the field list via update method written within this event to refresh the same.

The event enginePopulated is triggered after engine is populated. It has following parameters - dataSourceSettings, pivotFieldList and pivotValues.

Note: This event is not required for Popup field list since it is a in built one.

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs72" %}

FieldListRefreshed

The event fieldListRefreshed is triggered whenever there is any change done in the field list UI. It has following parameter - dataSourceSettings and pivotValues. It allows user to identify each field list update. This event is applicable only for static field list.

For example, if we perform a sort operation within the field list, the field list will be refreshed. The fieldListRefreshed event will be triggered at that time and the user can perform custom operation inside that event.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:height="height" :showFieldList="showFieldList"
:fieldListRefreshed="fieldListRefreshed"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, FieldList } from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        allowLabelFilter: true,
        allowValueFilter: true,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 350,
      showFieldList: true
    }
  },
  provide: {
```

```
        pivotview: [FieldList]
    },
  methods: {
    fieldListRefreshed: function() {
      //Triggers, whenever field list get refreshed.
    }
  }
}
}

</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs73" %}

OnFieldDropped

The event onFieldDropped fires whenever a field is dropped in an axis. It has following parameters - droppedAxis, droppedField and dataSourceSettings. In this illustration, we have modified the droppedField caption through this event at runtime.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:height="height" :showFieldList="showFieldList"
:onFieldDropped="onFieldDropped"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, FieldList } from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        allowLabelFilter: true,
        allowValueFilter: true,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 350,
      showFieldList: true
    }
  },
```

```
  provide: {
        pivotview: [FieldList]
    },
  methods: {
    onFieldDropped: function(args: FieldDroppedEventArgs) {
      //Triggers, whenever field is dropped in an axis.
        args.droppedField.caption = args.droppedField.name + " --> " +
args.droppedAxis;
    }
  }
}
}
</script>

@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs74" %}

ActionBegin

The event actionBegin triggers when the UI actions such as sorting, filtering, aggregation or edit calculated field, that are present in the field list UI begin. This allows user to identify the current action being performed at runtime. It has the following parameters:

- dataSourceSettings: It holds the current data source settings such as input data source, rows, columns, values, filters, format settings and so on.
- actionName: It holds the name of the current action began. The following are the UI actions and their names:

| Action | Action Name|

|------|-------------|

| Sort icon| Sort field|

| Filter icon| Filter field|

| Aggregation (Value type drop down and menu)| Aggregate field|

| Edit icon| Edit calculated field|

| Calculated field button| Open calculated field dialog|

| Field list| Open field list|

| Field list tree – Sort icon| Sort field tree|

- fieldInfo: It holds the selected field information.

Note: This option is applicable only when the field based UI actions are performed such as filtering, sorting, removing field from grouping bar, editing and aggregation type change.

- cancel: It allows user to restrict the current action.

Copyright © 2001 -2024 Syncfusion Inc.

In the below sample, opening pop-up field list can be restricted by setting the **args.cancel** option to **true** in the actionBegin event.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:height="height" :showFieldList="showFieldList" :actionBegin="actionBegin">
</ejs-pivotview>
    </div>
</template>
<script>

"@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        allowLabelFilter: true,
        allowValueFilter: true,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 350,
      showFieldList: true
    }
  },
  methods: {
    actionBegin: function (args: PivotActionBeginEventArgs) {
      if (args.actionName == 'Open field list') {
        args.cancel = true;
      }
    }
  },
  provide: {
        pivotview: [FieldList]
    }
}
</script>

ActionComplete

The event actionComplete triggers when the UI actions such as sorting, filtering, aggregation or edit calculated field, that are present in the field list UI, is completed. This allows user to identify the current UI actions being completed at runtime. It has the following parameters:

- dataSourceSettings: It holds the current data source settings such as input data source, rows, columns, values, filters, format settings and so on.
- actionName: It holds the name of the current action completed. The following are the UI actions and their names:

| Action | Action Name|

|------|------------|

| Sort icon| Field sorted|

| Filter icon| Field filtered|

| Aggregation(Value type drop down and menu)| Field aggregated|

| Edit icon| Calculated field edited|

| Calculated field button| Calculated field applied|

| Field list| Field list closed|

| Field list tree – Sort icon| Field tree sorted|

- fieldInfo: It holds the selected field information.

Note: This option is applicable only when the field based UI actions are performed such as filtering, sorting, removing field from grouping bar, editing and aggregation type change.

- actionInfo: It holds the unique information about the current UI action. For example, if sorting is completed, the event argument contains information such as sort order and the field name.

APP.VUE

```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs76" %}

ActionFailure

The event actionFailure triggers when the current UI action fails to achieve the desired result. It has the following parameters:

- actionName: It holds the name of the current action failed. The following are the UI actions and their names:

| Action | Action Name|

|------|------------|

| Sort icon| Sort field|

| Filter icon| Filter field|

| Aggregation (Value type drop down and menu)| Aggregate field|

| Edit icon| Edit calculated field|

| Calculated field button| Open calculated field dialog|

Copyright © 2001 -2024 Syncfusion Inc.

| Field list | Open field list |

| Field list tree – Sort icon | Sort field tree |

- errorInfo: It holds the error information of the current UI action.

APP.VUE

See Also

- Customize the icons for pivot table

Defer update in Vue Pivotview component

Defer layout update support allows to update the pivot table component only on demand. On enabling this feature, end user can drag-and-drop fields between row, column, value and filter axes, apply sorting and filtering inside the Field List, resulting in change of pivot report alone but not the pivot table values. Once all operations are performed and on clicking the "Apply" button in the Field List, pivot table will start to update with the last modified report. This also helps in bringing better performance in pivot table component rendering.

The field list can be displayed in two different formats to interact with pivot table. They are:

- **In-built Field List (Popup)**: To display the field list icon in pivot table UI to invoke the built-in dialog.
- **Stand-alone Field List (Fixed)**: To display the field list in a static position within a web page.

In-built Field List (Popup)

To enable deferred updates in the pivot table, set the property allowDeferLayoutUpdate in pivot table as **true**. To make a note, the defer update option can be controlled only via Field List during runtime.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:height="height" :showFieldList="showFieldList"
:allowDeferLayoutUpdate="allowDeferLayoutUpdate"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, FieldList } from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        allowLabelFilter: true,
        allowValueFilter: true,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
```

```
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 350,
      showFieldList: true,
      allowDeferLayoutUpdate: true
    }
  },
  provide: {
        pivotview: [FieldList]
    }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs25" %}

Stand-alone Field List (Fixed)

The field list can be rendered in a static position, anywhere in web page layout, like a separate component. To do so, you need to set renderMode property to **Fixed** in pivot field list.

To enable deferred updates in the static fieldlist, set the property allowDeferLayoutUpdate in pivot field list as **true**. To make a note, the defer update option can be controlled only via Field List during runtime.

To make field list interact with pivot table, you need to use the **UpdateView** and **Update** methods for data source update in both field list and pivot table simultaneously.

Performance

<!-- markdownlint-disable MD036 -->

Virtual scrolling in Vue Pivotview component

Virtual Scrolling

The virtual scrolling option allows you to load the large amounts of data without performance degradation by rendering rows and columns only in the content viewport. The data will refresh dynamically on vertical or horizontal scroll. This feature can be enabled by setting the enableVirtualization property to **true**.

To use the virtual scrolling feature, inject the VirtualScroll module in to the pivot table.

APP.VUE

```

{% previewsample "page.domainurl/code-snippet/pivot-grid/common-cs33" %}

Limitations for virtual scrolling

- In virtual scrolling, the columnWidth property in gridSettings should be in pixel and percentage values are not accepted.
- Resizing columns, setting width to individual columns which affects the calculation used to pick the correct page on scrolling.
- Grouping, which takes additional time to splitting the raw items into the provided format.
- Date Formatting, which takes additional time to convert date format.
- Date Formatting with sorting, here additionally full date time format should be framed to perform sorting along with the provided date format which lags the performance.
- When using OLAP data, subtotals and grandtotals are only displayed when measures are bound at the last position in the rows or columns axis. Otherwise, the data from the pivot table will be shown without summary totals.
- Even if virtual scrolling is enabled, not only is the current view port data retrieved, but also the data for the immediate previous page and the immediate next page. As a result, when the end user scrolls slightly ahead or behind, the next or previous page data is displayed immediately without requiring a refresh. **Note:** If the pivot table's width and height are large, the loading data count in the current, previous, and next view ports (pages) will also increase, affecting performance.

Data Compression

This property is applicable only for the relational data source.

When we bind one million raw data, the pivot table will process all raw data to generate aggregated data during initial rendering and report manipulation. But in data compression, the data will be compressed based on the uniqueness of the raw data, and unique records will be provided as input for the Pivot Table. The compressed data will be used for further operations at all times, reducing the looping complexity and improving the performance of the pivot table. For example, if the pivot table is connected to one million raw data aggregated to 1,000 unique data means, it will be rendered within 3 seconds rather than 10 seconds. You can enable this option by using the allowDataCompression property along with enableVirtualization property.

This options will only function when the virtual scrolling is enabled.

</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/common-cs34" %}

Limitations during data compression

- The following aggregation types will not be supported.
- Average
- Populationstdev
- Samplestdev
- Populationvar
- Samplevar
- If you use any of the aggregations above, it will result in an aggregation type **“Sum”**.
- Distinctcount will act as **“Count”** aggregation type.
- In the calculated field, an existing field can be inserted without altering its default aggregation type Even if we change it, it would use the default aggregation type back for calculation.

Virtual scrolling for static field list

Virtual scrolling automatically works with "Popup" field list on setting the enableVirtualization property in the Pivot Table to **true**. Incase of static field list, which act as a separate component, user need to enable enableVirtualization property in the Pivot Table and also pass the report information to pivot table instance via the load event of the field list.

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs260" %}

Paging in Vue Pivotview component

Paging allows you to load large amounts of data that can be divided and displayed page by page in the pivot table. It can be enabled by setting the enablePaging property to **true**. It can be configured at code-behind by using the pageSettings property, during initial rendering of the component. The properties required are:

- currentRowPage: Allows user to set the current row page number to be displayed in the pivot table.
- currentColumnPage: Allows user to set the current column page number to be displayed in the pivot table.
- rowPageSize: Allows user to set the total number of records to be displayed on each page of the pivot table's row axis.
- columnPageSize: Allows user to set the total number of records to be displayed on each page of the pivot table's column axis.

Pager UI

When paging is enabled, a built-in pager UI appears at the bottom of the pivot table, allowing you to change the current page in the row and column axes by navigating to a desired page using the navigation buttons or an input text box, as well as change the page size via dropdown at runtime.

You can also change the position, visibility, compact view, and template of the row and column pagers by using the pagerSettings.

In order to see and use the pager UI, insert the Pager module into the pivot table using the provide section.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview id="pivotview"
:dataSourceSettings="dataSourceSettings" :height="height"
:enablePaging="enablePaging" :pageSettings="pageSettings"
:pagerSettings="pagerSettings" :gridSettings="gridSettings"> </ejs-
pivotview>
```

```
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, Pager } from "@syncfusion/ej2-vue-pivotview";
import { DataManager, WebApiAdaptor } from '@syncfusion/ej2-data';
Vue.use(PivotViewPlugin);
let remoteData: DataManager = new DataManager({
  url: "https://bi.syncfusion.com/northwindservice/api/orders",
  adaptor: new WebApiAdaptor(),
  crossDomain: true
});
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: remoteData as DataManager,
        expandAll: true,
        filters: [],
        columns: [{ name: 'ProductName', caption: 'Product Name' }],
        rows: [{ name: 'ShipCountry', caption: 'Ship Country' }, { name:
'ShipCity', caption: 'Ship City' }],
        formatSettings: [{ name: 'UnitPrice', format: 'C0' }],
        values: [{ name: 'Quantity' }, { name: 'UnitPrice', caption: 'Unit
Price' }]
      },
      height: 350,
      enablePaging: true,
      pageSettings: {
        rowPageSize: 10,
        columnPageSize: 5,
        currentColumnPage: 1,
        currentRowPage: 1
      },
      pagerSettings: {
        position: 'Bottom',

</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/common-cs25" %}

Show pager UI at top or bottom

You can display the pager UI at top or bottom of the pivot table by using the position property. To show the pager UI at top of the pivot table, set the position property in pagerSettings to **Top**.

By default, the pager UI appears at the bottom of the pivot table.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview id="pivotview"
:dataSourceSettings="dataSourceSettings" :height="height"
:enablePaging="enablePaging" :pageSettings="pageSettings"
:pagerSettings="pagerSettings" :gridSettings="gridSettings"> </ejs-
pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, Pager } from "@syncfusion/ej2-vue-pivotview";
import { DataManager, WebApiAdaptor } from '@syncfusion/ej2-data';
Vue.use(PivotViewPlugin);
let remoteData: DataManager = new DataManager({
  url: "https://bi.syncfusion.com/northwindservice/api/orders",
  adaptor: new WebApiAdaptor(),
  crossDomain: true
});
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: remoteData as DataManager,
        expandAll: true,
        filters: [],
        columns: [{ name: 'ProductName', caption: 'Product Name' }],
        rows: [{ name: 'ShipCountry', caption: 'Ship Country' }, { name:
'ShipCity', caption: 'Ship City' }],
        formatSettings: [{ name: 'UnitPrice', format: 'C0' }],
        values: [{ name: 'Quantity' }, { name: 'UnitPrice', caption: 'Unit
Price' }]
      },
      height: 350,
      enablePaging: true,
      pageSettings: {
        rowPageSize: 10,
        columnPageSize: 5,
        currentColumnPage: 1,
        currentRowPage: 1
      },
      pagerSettings: {
        position: 'Top'
      },
      gridSettings: { columnWidth: 120 },
    }
```

    pivotview: [Pager]
  }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/common-cs26" %}

Inverse pager

Toggles and displays row and column pager. To show the column pager on the left side of the pager UI, set the isInversed property in pagerSettings to **true**.

By default, the row pager is displayed on the left side of the pager UI, while the column pager is displayed on the right side.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview id="pivotview"
:dataSourceSettings="dataSourceSettings" :height="height"
:enablePaging="enablePaging" :pageSettings="pageSettings"
:pagerSettings="pagerSettings" :gridSettings="gridSettings"> </ejs-
pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, Pager } from "@syncfusion/ej2-vue-pivotview";
import { DataManager, WebApiAdaptor } from '@syncfusion/ej2-data';
Vue.use(PivotViewPlugin);
let remoteData: DataManager = new DataManager({
  url: "https://bi.syncfusion.com/northwindservice/api/orders",
  adaptor: new WebApiAdaptor(),
  crossDomain: true
});
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: remoteData as DataManager,
        expandAll: true,
        filters: [],
        columns: [{ name: 'ProductName', caption: 'Product Name' }],
        rows: [{ name: 'ShipCountry', caption: 'Ship Country' }, { name:
'ShipCity', caption: 'Ship City' }],
        formatSettings: [{ name: 'UnitPrice', format: 'C0' }],
        values: [{ name: 'Quantity' }, { name: 'UnitPrice', caption: 'Unit
Price' }]
      },
      height: 350,
      enablePaging: true,
```

        columnPageSize: 5,
        currentColumnPage: 1,
        currentRowPage: 1
      },
      pagerSettings: {
        isInversed: true
      },
      gridSettings: { columnWidth: 120 },
    }
  },
  provide: {
    pivotview: [Pager]
  }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/common-cs27" %}

Compact view

By hiding all except the previous and next navigation buttons, the pager UI can be displayed with the absolute minimum of paging options. The compact view can be enabled by setting the enableCompactView property in pagerSettings to **true**.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview id="pivotview"
:dataSourceSettings="dataSourceSettings" :height="height"
:enablePaging="enablePaging" :pageSettings="pageSettings"
:pagerSettings="pagerSettings" :gridSettings="gridSettings"> </ejs-
pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, Pager } from "@syncfusion/ej2-vue-pivotview";
import { DataManager, WebApiAdaptor } from '@syncfusion/ej2-data';
Vue.use(PivotViewPlugin);
let remoteData: DataManager = new DataManager({
  url: "https://bi.syncfusion.com/northwindservice/api/orders",
  adaptor: new WebApiAdaptor(),
  crossDomain: true
});
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: remoteData as DataManager,
        expandAll: true,
        filters: [],
```

```
        columns: [{ name: 'ProductName', caption: 'Product Name' }],
        rows: [{ name: 'ShipCountry', caption: 'Ship Country' }, { name:
'ShipCity', caption: 'Ship City' }],
        formatSettings: [{ name: 'UnitPrice', format: 'C0' }],
        values: [{ name: 'Quantity' }, { name: 'UnitPrice', caption: 'Unit
Price' }]
      },
      height: 350,
      enablePaging: true,
      pageSettings: {
        rowPageSize: 10,
        columnPageSize: 5,
        currentColumnPage: 1,
        currentRowPage: 1
      },
      pagerSettings: {
        enableCompactView: true
      },
      gridSettings: { columnWidth: 120 },
    }
  },
  provide: {
    pivotview: [Pager]
  }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/common-cs28" %}

Show or hide paging option

By using the showRowPager and showColumnPager properties in pagerSettings, you can show or hide row and column pager separately in the pager UI.

In the following example, row pager has been disabled by setting the showRowPager property in pagerSettings to **false**.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview id="pivotview"
:dataSourceSettings="dataSourceSettings" :height="height"
:enablePaging="enablePaging" :pageSettings="pageSettings"
:pagerSettings="pagerSettings" :gridSettings="gridSettings"> </ejs-
pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, Pager } from "@syncfusion/ej2-vue-pivotview";
import { DataManager, WebApiAdaptor } from '@syncfusion/ej2-data';
Vue.use(PivotViewPlugin);
let remoteData: DataManager = new DataManager({
```

```
  url: "https://bi.syncfusion.com/northwindservice/api/orders",
  adaptor: new WebApiAdaptor(),
  crossDomain: true
});
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: remoteData as DataManager,
        expandAll: true,
        filters: [],
        columns: [{ name: 'ProductName', caption: 'Product Name' }],
        rows: [{ name: 'ShipCountry', caption: 'Ship Country' }, { name:
'ShipCity', caption: 'Ship City' }],
        formatSettings: [{ name: 'UnitPrice', format: 'C0' }],
        values: [{ name: 'Quantity' }, { name: 'UnitPrice', caption: 'Unit
Price' }]
      },
      height: 350,
      enablePaging: true,
      pageSettings: {
        rowPageSize: 10,
        columnPageSize: 5,
        currentColumnPage: 1,
        currentRowPage: 1
      },
      pagerSettings: {
        showRowPager: false
      },
      gridSettings: { columnWidth: 120 },
    }
  },
  provide: {
    pivotview: [Pager]
  }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/common-cs29" %}

Show or hide page size

By using the showRowPageSize and showColumnPageSize properties in pagerSettings, you can show or hide "Rows per page" and "Columns per page" dropdown menu. The dropdown menu contains a list of pre-defined or user-defined page sizes, which will be displayed in the "Rows per page" and "Columns per page" dropdowns, allowing you to change the page size for the row and column axes at runtime.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview id="pivotview"
:dataSourceSettings="dataSourceSettings" :height="height"
:enablePaging="enablePaging" :pageSettings="pageSettings"
```

```
:pagerSettings="pagerSettings" :gridSettings="gridSettings"> </ejs-
pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, Pager } from "@syncfusion/ej2-vue-pivotview";
import { DataManager, WebApiAdaptor } from '@syncfusion/ej2-data';
Vue.use(PivotViewPlugin);
let remoteData: DataManager = new DataManager({
  url: "https://bi.syncfusion.com/northwindservice/api/orders",
  adaptor: new WebApiAdaptor(),
  crossDomain: true
});
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: remoteData as DataManager,
        expandAll: true,
        filters: [],
        columns: [{ name: 'ProductName', caption: 'Product Name' }],
        rows: [{ name: 'ShipCountry', caption: 'Ship Country' }, { name:
'ShipCity', caption: 'Ship City' }],
        formatSettings: [{ name: 'UnitPrice', format: 'C0' }],
        values: [{ name: 'Quantity' }, { name: 'UnitPrice', caption: 'Unit
Price' }]
      },
      height: 350,
      enablePaging: true,
      pageSettings: {
        rowPageSize: 10,
        columnPageSize: 5,
        currentColumnPage: 1,
        currentRowPage: 1
      },
      pagerSettings: {
        showColumnPageSize: false,
        showRowPageSize: false
      },
      gridSettings: { columnWidth: 120 },
    }
  },
  provide: {
    pivotview: [Pager]
  }
}

Customize page size

By using the rowPageSizes and columnPageSizes properties in pagerSettings, you can specify a set of desired page sizes, which will be displayed in the "Rows per page" and "Columns per page" dropdowns, allowing you to change the page size for the row and column axes at runtime.

By default, the "Rows per page" dropdown have pre-defined page sizes of **10, 50, 100, and 200**, while the "Columns per page" dropdown have pre-defined page sizes of **5, 10, 20, 50, and 100**.

In the following example, the "Rows per page" dropdown is set with user-defined page sizes of **10, 20, 30, 40, and 50** and the "Columns per page" dropdown is set with user-defined page sizes of **5, 10, 15, 20, and 30**.

{% previewsample "page.domainurl/code-snippet/pivot-grid/common-cs32" %}

State persistence in Vue Pivotview component

State persistence allows user to maintain the current state of the component along with its report bounded in the browser local storage (cookie). Even if the browser is refreshed or if you move to the next page within the browser, components state will be persisted. State persistence stores the Pivot Table object in the local storage when enablePersistence property in pivot table is set to **true**.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:height="height" :showGroupingBar="showGroupingBar"
:enablePersistence="enablePersistence"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, GroupingBar } from "@syncfusion/ej2-vue-
pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],

<!-- markdownlint-disable MD012 -->

Row and column in Vue Pivotview component

Width and Height

Allows end user to set the pivot table's height and width by using height and width properties in pivot table respectively. The supported formats to set height and width properties are,

- Pixel: For example - 100, 200, "100px", "200px".
- Percentage: For example - "100%", "200%".
- Auto: It is applicable for height property alone in-order to render the pivot table beyond its parent container height without vertical scrollbar. The parent container here would show its vertical scrollbar as soon as the component reaches beyond its dimension.

The pivot table will not be displayed less than **400px**, since it's the minimum width of the component.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:height="height" :width="width"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin } from "@syncfusion/ej2-vue-pivotview";
```

```
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: true,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: '340px',
      width: 550
    }
  }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs205" %}

Row Height

Allows end user to set the height of each pivot table rows commonly using the rowHeight property in gridSettings.

By default, the rowHeight property is set as **36** pixels for desktop layout and **48** pixels for mobile layout.

The height of the column headers alone may vary when grouping bar feature is enabled.

In the below code sample, the rowHeight property is set as **60** pixels.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:height="height" :gridSettings="gridSettings"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin } from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
```

```
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 350,
      gridSettings: {
          rowHeight: 60
      }
    }
  }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs206" %}

Column Width

Allows end user to set the width of each pivot table columns commonly using the columnWidth property in gridSettings.

By default, the columnWidth property is set as **110** pixels to each columns except the first column. For first column, **250** pixels and **200** pixels are set respectively with and without grouping bar.

In the below example, the columnWidth property is set as **200** pixels.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:height="height" :gridSettings="gridSettings"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin } from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
```

```
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 350,
      gridSettings: {
          columnWidth: 120
      }
    }
  }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs207" %}

Reorder

Allows end user to reorder a particular column header from one index to another index within the pivot table through drag-and-drop option. It can be enabled by setting the allowReordering property in gridSettings to **true**.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:height="height" :gridSettings="gridSettings"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin } from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 350,
      gridSettings: {
          allowReordering: true
      }
    }
  }
```

```
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs208" %}

Column Resizing

Allows end user to resize the columns by clicking and dragging the right edge of the column header. While dragging, the width of the respective column will be resized immediately. To enable column resizing option, set the allowResizing property in gridSettings to **true**.

By default, the column resizing option is enabled.

In RTL mode, user can click and drag the left edge of the header cell to resize the column.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:height="height" :gridSettings="gridSettings"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin } from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 350,
      gridSettings: {
          allowResizing: true
      }
    }
  }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs209" %}

Text Wrap

Allows end user to wrap the cell content to the next line when it exceeds the boundary of the cell width. To enable text wrap, set the allowTextWrap property in gridSettings to **true**.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:height="height" :gridSettings="gridSettings"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin } from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 350,
      gridSettings: {
          allowTextWrap: true
      }
    }
  }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs210" %}

Text Align

Allows end user to align the content of the pivot table's row and column headers and value cells by using the textAlign and headerTextAlign properties in the columnRender event under gridSettings. The following alignments are:

Copyright © 2001 -2024 Syncfusion Inc.

- Left - It allows the content to be positioned on the left.
- Right - It allows the content to be positioned on the right.
- Center - It allows the content to be positioned in the middle.
- Justify - It allows the content to be as flexible as possible, when the cell does not occupy the entire available area.

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs211" %}

AutoFit

Allows the user to fit the Pivot Table columns as wide as the content of the cell without wrapping. It auto fits all of the Pivot Table columns by invoking the autoFitColumns method from the grid instance.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview id="pivotview"
:dataSourceSettings="dataSourceSettings" :height="height"
:dataBound="ondataBound"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin } from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: true,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 350,
    }
  },
```

```
  methods: {
    ondataBound: function() {
     let pivotGridObj =
document.getElementById('pivotview').ej2_instances[0];
     pivotGridObj.grid.autoFitColumns();
    }
  },
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs212" %}

The minimum width of 250 pixels is set by default with the grouping bar UI for the first column and cannot be reduced further. So, when the grouping bar is enabled, one can auto fit the Pivot Table columns by calling the autoFitColumns method from the grid instance with the parameter contained pivot table columns field name excluding first column.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview id="pivotview"
:dataSourceSettings="dataSourceSettings" :height="height"
:showGroupingBar="showGroupingBar"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, GroupingBar } from "@syncfusion/ej2-vue-
pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: true,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 350,
      showGroupingBar: true
    }
  },
  methods: {
    trend: function() {
```

```
     let pivotGridObj =
document.getElementById('pivotview').ej2_instances[0];
     if (pivotGridObj.showGroupingBar) {
        let columns = [];
        for (let i = 1; i < (pivotGridObj.grid).columnModel.length; i++) {
          columns.push((pivotGridObj.grid).columnModel[i].field);
        }
        pivotGridObj.grid.autoFitColumns(columns);
      }
    }
  },
  provide: {pivotview: [GroupingBar]}
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs213" %}

Autofit specific columns

During initial rendering, the parameter autoFit in the columnRender event under gridSettings can be set to **true** to auto fit specific columns.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:height="height" :gridSettings="gridSettings"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin } from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: true,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 350,
      gridSettings: {
        columnRender: function(args){
          for (let i = 0; i < args.columns.length; i++) {
                args.columns[i].autoFit = true;
```

```
            }
        }
      }
    }
  }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs214" %}

Grid Lines

Allows end user to display cell border for each cells using gridLines property in gridSettings.

Available mode of grid lines are:

| Modes | Actions |

|-------|---------|

| Both | Displays both the horizontal and vertical grid lines.|

| None | No grid lines are displayed.|

| Horizontal | Displays the horizontal grid lines only.|

| Vertical | Displays the vertical grid lines only.|

| Default | Displays grid lines based on the theme.|

By default, pivot table renders grid lines in **Both** mode.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:height="height" :gridSettings="gridSettings"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin } from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
```

```
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 350,
      gridSettings: {
          gridLines: 'Vertical'
      }
    }
  }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs215" %}

Selection

Selection provides an option to highlight a row or a column or a cell. It can be done through simple mouse down or arrow keys. To enable selection in the pivot table, set the allowSelection property in gridSettings to **true**.

The pivot table supports two types of selection that can be set using type property in selectionSettings. The selection types are:

- **Single**: It is set by default, and it only allows selection of a single row or a column or a cell.
- **Multiple**: Allows you to select multiple rows or columns or cells.

To perform multi-selection, press and hold "CTRL" key and click the desired rows or cells. To select range of rows or cells, press and hold the "SHIFT" key and click the rows or columns or cells.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:height="height" :gridSettings="gridSettings"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin } from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],

      },
      height: 350,
      gridSettings: {
          allowSelection: true,
          selectionSettings: { type: 'Multiple'}
      }
    }
  }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs216" %}

Selection Mode

The pivot table supports four types of selection mode that can be set using mode in selectionSettings. The selection modes are:

- **Row**: It is set by default, and allows user to select only rows.
- **Column**: Allows user to select only columns.
- **Cell**: Allows user to select only cells.
- **Both**: Allows user to select rows and columns at the same time.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:height="height" :gridSettings="gridSettings"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin } from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],

      },
      height: 350,
      gridSettings: {
          allowSelection: true,
          selectionSettings: { mode: 'Both'}
      }
    }
  }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs217" %}

Cell Selection Mode

The pivot table supports two types of cell selection mode that can be set using cellSelectionMode in selectionSettings. The cell selection modes are:

- **Flow**: It is set by default. The range of cells are selected between the start index and end index that includes in-between cells of rows.
- **Box**: Range of cells are selected from the start and end column indexes that includes in-between cells of rows within the range.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:height="height" :gridSettings="gridSettings"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin } from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 350,
      gridSettings: {
```

```
            allowSelection: true,
            selectionSettings: { cellSelectionMode: 'Box', type: 'Multiple',
mode: 'Cell'}
        }
    }
  }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs218" %}

Cell selection requires mode property in selectionSettings to be **Cell** or **Both**, and type property should be **Multiple**.

Changing background color of the selected cell

The background-color of the selected cell can be changed using built-in CSS names. To do so, please refer to the code sample below, which shows that the selected cells are changed to a **green yellow** color.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:height="height" :gridSettings="gridSettings"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin } from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 350,
      gridSettings: {
          allowSelection: true,
          selectionSettings: { cellSelectionMode: 'Box', type: 'Multiple',
mode: 'Cell'}
      }
    }
```

```
  }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
/* csslint ignore:start */
.e-pivotview .e-cellselectionbackground,

.e-pivotview .e-grid .e-rowsheader.e-selectionbackground,
.e-pivotview .e-grid .e-columnsheader.e-selectionbackground {
    background-color: greenYellow !important;
}
/* csslint ignore:end */
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs219" %}

Event

CellSelected

The event cellSelected is triggered when cell selection gets completed. It provides selected cells information with its corresponding column and row headers. It has following parameters - selectedCellsInfo, currentCell and target. This event allows user to view selected cells information and user can pass those selected cells information to any external component for data binding.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :height="height"
:dataSourceSettings="dataSourceSettings" :gridSettings="gridSettings"
:cellSelected="cellSelected"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, PivotCellSelectedEventArgs } from
"@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        enableSorting: true,
        drilledMembers: [{ name: 'Year', items: ['FY 2015'] }, { name:
'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs220" %}

CellSelecting

The event cellSelecting triggers before cell gets selected gets completed. It provides selected cells information with its corresponding column and row headers. It has following parameters - currentCell, data and cancel.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :height="height"
:dataSourceSettings="dataSourceSettings" :gridSettings="gridSettings"
:cellSelecting="cellSelecting"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, PivotCellSelectedEventArgs } from
"@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        enableSorting: true,
        drilledMembers: [{ name: 'Year', items: ['FY 2015'] }, { name:
'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
```

```
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 350,
      gridSettings: {
        allowSelection: true,
        selectionSettings: { mode: 'Both', type: 'Multiple' }
      }
    }
  },
  methods: {
    cellSelecting: function(args: PivotCellSelectedEventArgs) {
        //args.selectedCellsInfo -> get selected cells information.
        //args.pivotValues -> get the pivot values of the pivot table.
    },
  }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs221" %}

Clip Mode

The clip mode provides options to display its overflow cell content in the pivot table. It can be configured using the clipMode property in gridSettings. The pivot table supports three types of clip modes which are:

- **Clip**: Truncates the cell content when it overflows its area.
- **Ellipsis**: Displays ellipsis when the cell content overflows its area.
- **EllipsisWithTooltip**: Displays ellipsis when the cell content overflows its area, also it will display the tooltip while hover on ellipsis is applied.

By default, clipMode value is set to **Ellipsis**.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:height="height" :gridSettings="gridSettings"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin } from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
```

```
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 350,
      gridSettings: {
          clipMode: 'Clip'
      }
    }
  }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs222" %}

Cell Template

User can customize the pivot table cell element by using the cellTemplate property in pivot table The cellTemplate property accepts either an HTML string or the element's ID, which can be used to append additional HTML elements to showcase each cell with custom format.

In this demo, the revenue cost for each year is represented with trend icons.

APP.VUE

```
<template>
    <div id="app">

Events

QueryCellInfo

The event queryCellInfo triggers while rendering row and value cells in the pivot table. It allows the user to customize the element of the current cell.

It has the following parameters:

- cell - it holds the current cell info
- data - it holds entire row data
- column - it holds column information for the current cell
- pivotview - it holds pivot instance

APP.VUE

```
<template>
    <div id="app">

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs223" %}

HeaderCellInfo

The event headerCellInfo triggers while rendering the header cells in the pivot table. It allows the user to customize the element of the current header cell.

It has the following parameters:

- node - it holds the current header cell info

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:height="height" :gridSettings="gridSettings"> </ejs-pivotview>
    </div>
</template>

        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 350,
      gridSettings: {
        columnWidth: 140,
        headerCellInfo: function(args){
```

```
            //triggers for every header cell while rendering
        }
      }
    }
  }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs224" %}

ColumnRender

The event columnRender triggers while framing each columns for rendering in the pivot table. It allows the user to customize the text alignment, column visibility, autofit, re-ordering, minimum and maximum width for a specific column. It has the following parameters:

- columns - It holds the leaf level columns (i.e., value headers) information.
- dataSourceSettings - It holds the current data source settings such as input data source, rows, columns, values, filters, format settings and so on.
- name - It holds the name of the event.
- stackedColumns - It holds the drilled columns (i.e., including column and value headers) information.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:height="height" :gridSettings="gridSettings"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin } from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        filters: []
      },
      height: 350,
```

```
      gridSettings: {
        columnRender: function(args){
          // Here you can customize the specific columns.
          for (var i = 0; i < args.columns.length; i++) {
            args.columns[i].autoFit = true;
            args.columns[i].textAlign = "Right";
          }
        }
      }
    }
  }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs225" %}

CellClick

The event cellClick triggers while clicking a cell in the pivot table. For instance, using this event end-user can either add or remove styles, edit value and also perform any other DOM manipulations. It has the following parameters:

- currentCell - It holds the current cell information.
- data - It holds the clicked cell's data like axis, formatted text, actual text, row header, column header and value informations.

APP.VUE

```
<template>
    <div id="app">

Summary customization in Vue Pivotview component

Show or hide grand totals

Allows to show or hide grand totals in rows and columns using the showGrandTotals property. To hide the grand totals in rows and columns, set the property showGrandTotals in dataSourceSettings to **false**.

End user can also hide grand totals for row or columns separately by setting the property showRowGrandTotals or showColumnGrandTotals in dataSourceSettings to **false** respectively.

By default, showGrandTotals, showRowGrandTotals and showColumnGrandTotals properties in dataSourceSettings are set as **true**.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:height="height" :showFieldList="showFieldList"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, FieldList } from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: [],
```

```
        showGrandTotals: false
      },
      height: 350,
      showFieldList: true
    }
  },
  provide: {
        pivotview: [FieldList]
    }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs236" %}

Show grand totals at top or bottom

Allows to show grand totals either at top or bottom in rows and columns using the grandTotalsPosition property. To show the grand totals at top in rows and columns, set the grandTotalsPosition property in dataSourceSettings to **Top**.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:height="height"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin } from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        grandTotalsPosition: 'Top',
      },
      height: 350
    }
  }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs237" %}

Show or hide sub-totals

Allows to show or hide sub-totals in rows and columns using the showSubTotals property. To hide all the sub-totals in rows and columns, set the property showSubTotals in dataSourceSettings to **false**. End user can also hide sub-totals for rows or columns separately by setting the property showRowSubTotals or showColumnSubTotals in dataSourceSettings to **false** respectively.

By default, showSubTotals, showRowSubTotals and showColumnSubTotals properties in dataSourceSettings are set as **true**.

APP.VUE

Show or hide sub-totals for specific fields

Allows to show or hide sub-totals for specific fields in rows and columns using the showSubTotals property. To hide sub-totals for a specific field in row or column axis, set the property showSubTotals in rows or columns to **false** respectively.

By default, showSubTotals property in rows or columns is set as **true**.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:height="height" :showFieldList="showFieldList"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, FieldList } from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year', showSubTotals:
false }, { name: 'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country', showSubTotal: false }, { name: 'Products'
}],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 350,
      showFieldList: true
    }
  },
  provide: {
        pivotview: [FieldList]
    }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs239" %}

Show sub-totals at top or bottom

Allows to show sub-totals either at top or bottom of the header group in rows and columns by using the subTotalsPosition property. By default, subTotalsPosition property is set to **Auto**, which means that

Copyright © 2001 -2024 Syncfusion Inc.

column sub-totals are displayed at the bottom and row sub-totals are displayed at the top of the header group in the pivot table.

To show sub-totals at top of the header group in rows and columns, set the subTotalsPosition property in dataSourceSettings to **Top**.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :dataSourceSettings="dataSourceSettings"
:height="height" :showFieldList="showFieldList"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin, FieldList } from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        drilledMembers: [{ name: 'Country', items: ['France'] }, { name:
'Year', items: ['FY 2015'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: [],
        subTotalsPosition: 'Top'
      },
      height: 350,
      showFieldList: true
    }
  },
  provide: {
        pivotview: [FieldList]
    }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs240" %}

To show sub-totals at bottom of the header group in rows and columns, set the subTotalsPosition property in dataSourceSettings to **Bottom**.

        filters: [],
        subTotalsPosition: 'Bottom'
      },
      height: 350,
      showFieldList: true
    }
  },
  provide: {
        pivotview: [FieldList]
    }
}
</script>
<style>
@import "@syncfusion/ej2-vue-pivotview/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/pivot-grid/default-cs241" %}

Show or hide totals using toolbar

It can also be achieved using built-in toolbar options by setting the showToolbar property in pivot table to **true**. Also, include the items **GrandTotal** and **SubTotal** within the toolbar property in pivot table. End user can now see "Show/Hide Grand totals" and "Show/Hide Sub totals" icons in toolbar UI automatically.

The grand totals and sub-totals can be dynamically displayed at the top or bottom of the pivot table's row and column axes by using the built-in options "Grand totals position" and "Subtotals position" available in the grand totals and sub-totals drop down menus, respectively.

APP.VUE

```
<template>
    <div id="app">
```

```
        <ejs-pivotview id="pivotview" ref="pivotview"

Hyper link in Vue Pivotview component

The pivot table allows you to show hyperlink option to the link data for individual cells that display in the pivot table. Also, the hyperlink can be enabled separately for row header, column header, value, and

Copyright © 2001 -2024 Syncfusion Inc.

summary cells using the hyperlinkSettings. It can be configured through code behind, during initial rendering. The settings available to show hyperlink to the cells are:

- showHyperlink: It allows to set the visibility of hyperlink in all cells.
- showRowHeaderHyperlink: It allows to set the visibility of hyperlink in row headers.
- showColumnHeaderHyperlink: It allows to set the visibility of hyperlink in column headers.
- showValueCellHyperlink: It allows to set the visibility of hyperlink in value cells.
- showSummaryCellHyperlink: It allows to set the visibility of hyperlink in summary cells.
- headerText: It allows to set the visibility of hyperlink based on header text.
- conditionalSettings: It allows to set the visibility of hyperlink based on specific condition.

By default, the hyperlink options are disabled for all cells in the pivot table.

Hyperlink for all cells

The pivot table has an option to show hyperlink option to all the cells that are currently displaying. To show hyperlink option, you need to set showHyperlink to **true**.

APP.VUE

```
<template>
    <div id="app">
        <ejs-pivotview :height="height"
:dataSourceSettings="dataSourceSettings"
:hyperlinkSettings="hyperlinkSettings"> </ejs-pivotview>
    </div>
</template>
<script>
import Vue from "vue";
import { PivotViewPlugin } from "@syncfusion/ej2-vue-pivotview";
import { pivotData } from './pivotData.js';
Vue.use(PivotViewPlugin);
export default {
  data () {
    return {
      dataSourceSettings: {
        dataSource: pivotData,
        expandAll: false,
        enableSorting: true,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
      },
      height: 350,
      hyperlinkSettings: {
          showHyperlink: true,
          cssClass: 'e-custom-class'
      }
    }
  }
```

```
}
</script>
<style>

Condition based hyperlink

The pivot table has an option to show hyperlink option to the cells based on specific conditions. It can be configured using the conditionalSettings option through code behind, during initial rendering. The settings required to sort are:

- measure: Specifies the value field name to get visibility of hyperlink option for specific measure.
- conditions: Specifies the operator type such as equals, greater than, less than, etc.
- value1: Specifies the start value.
- value2: Specifies the end value.

Event

The event hyperlinkCellClick fires on every hyperlink cell click.

It has following parameters - Cancel and CurrentCell. The parameter CurrentCell is used to customize the host cell element by any means. Meanwhile, when the parameter Cancel is set to **true**, applied customization will not be updated to the host cell element.

Tool bar in Vue Pivotview component

Toolbar option allows to access the frequently used features like switching between pivot table and pivot chart, changing chart types, conditional formatting, exporting, etc... with ease at runtime. This option can be enabled by setting the showToolbar property in pivot table to **true**. The toolbar property in pivot table accepts the collection of built-in toolbar options.

Built-in Toolbar Options

The following table shows built-in toolbar options and its actions.

Built-in Toolbar Options	Actions
New	Creates a new report
Save	Saves the current report
Save As	Save as current report
Rename	Renames the current report
Delete	Deletes the current report
Load	Loads any report from the report list
Grid	Shows pivot table
Chart	Shows a chart in any type from the built-in list and and option to enable/disable multiple axes
Exporting	Exports the pivot table as PDF/Excel/CSV and the pivot chart as PDF and image
Sub-total	Shows or hides sub totals
Grand Total	Shows or hides grand totals
Conditional Formatting	Shows the conditional formatting pop-up to apply formatting
Number Formatting	Shows the number formatting pop-up to apply number formatting
Field List	Shows the fieldlist pop-up
MDX	Shows the MDX query that was run to retrieve data from the OLAP data source. **NOTE: This applies only to the OLAP data source.**

The order of toolbar options can be changed by simply moving the position of items in the **ToolbarItems** collection. Also if end user wants to remove any toolbar option from getting displayed, it can be simply ignored from adding into the **ToolbarItems** collection.
