Timeline view displaying dates of a complete year

It is possible to display a complete year in a timeline view by setting interval value as 12 and defining **TimelineMonth** view option within the views property of Scheduler.

APP.VUE

```
<template>
  <div id='app'>
    <div id='container'>
        <ejs-schedule :height='height' :width='width'
:selectedDate='selectedDate' :eventSettings='eventSettings' :views='views'
:headerRows='headerRows'></ejs-schedule>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { SchedulePlugin, TimelineMonth, TimelineViews } from
'@syncfusion/ej2-vue-schedule';
import { eventData } from './datasource.js';
Vue.use(SchedulePlugin);
export default {
  data (){
    return {
      width: '100%', height: '550px',
      selectedDate: new Date(2018, 0, 1),
      headerRows: [{ option: 'Month' }, { option: 'Date' }],
      views: [{ option: 'TimelineMonth', interval: 12 }],
      eventSettings: { dataSource: eventData }
    }
  },
  provide: {
    schedule: [TimelineMonth]
  }
}
</script>

Customizing the header rows using template

You can customize the text of the header rows and display any images or formatted text on each individual header rows using the built-in template option available within the headerRows property.

APP.VUE

```
<template>
  <div id='app'>
    <div id='container'>
        <ejs-schedule :height='height' :width='width'
:selectedDate='selectedDate' :eventSettings='eventSettings' :views='views'
:headerRows='headerRows'></ejs-schedule>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { SchedulePlugin, TimelineMonth, getWeekNumber } from
'@syncfusion/ej2-vue-schedule';
import { Internationalization } from '@syncfusion/ej2-base';
import { eventData } from './datasource.js';
Vue.use(SchedulePlugin);
var instance = new Internationalization();
var yearHeaderVue = Vue.component('year-header', {
    template: '<span class="year">{{getYearDetails(data)}}</span>',
    data() {
        return {
            data: {}
        };
    },
    methods: {
        getYearDetails: function (value) {
            return 'Year: ' + instance.formatDate(value.date, { skeleton:
'y' });
        }
    }
});
var monthHeaderVue = Vue.component('month-header', {
```

```
    template: '<span class="month">{{getMonthDetails(data)}}</span>',
    data() {
        return {
            data: {}
        };
    },
    methods: {
        getMonthDetails: function (value) {
            return 'Month ' + instance.formatDate(value.date, { skeleton:
'M' });
        }
    }
});
var weekHeaderVue = Vue.component('week-header', {
    template: '<span class="week">{{getWeekDetails(data)}}</span>',
    data() {
        return {

{% previewsample "page.domainurl/code-snippet/schedule/header-rows-cs5" %}

You can refer to our Vue Scheduler feature tour page for its groundbreaking feature representations. You can also explore our Vue Scheduler example to knows how to present and manipulate data.

Row auto height in Vue Schedule component

By default, the height of the Scheduler rows in Timeline views are static and therefore, when the same time range holds multiple overlapping appointments, a `+n more` text indicator will be displayed. With this feature enabled, you can now view all the overlapping appointments present in those specific time range by auto-adjusting the row height based on the presence of the appointments count, instead of displaying the `+n more` text indicators.

To enable auto row height adjustments on Scheduler Timeline views and Month view, set `true` to the rowAutoHeight property whose default value is `false`.

This auto row height adjustment is applicable only on all the Timeline views as well as on the calendar Month view.

Now, let's see how it works on those applicable views with examples.

Calendar month view

By default, the rows of the calendar Month view can hold only the limited appointments count based on its row height, and the rest of the overlapping appointments are indicated with a `+n more` text indicator. The following example shows how the month view row auto-adjusts based on the number of appointments count, when this `RowAutoHeight` feature is enabled.

Timeline views

When the feature RowAutoHeight is enabled in Timeline views, the row height gets auto-adjusted based on the number of overlapping events occupied on the same time range, which is demonstrated in the following example.

APP.VUE

```
<template>
    <div>
        <div id='app'>
            <div id='container'>
                <ejs-schedule height='550px' width='100%'
:selectedDate='selectedDate' :eventSettings='eventSettings'
:rowAutoHeight='rowAutoHeight'>
                    <e-views>
                        <e-view option='TimelineDay'></e-view>
                        <e-view option='TimelineWeek'></e-view>
                        <e-view option='TimelineWorkWeek'></e-view>
                        <e-view option='TimelineMonth'></e-view>
                        <e-view option='Agenda'></e-view>
                    </e-views>

Appointments occupying entire cell

By default, with the feature rowAutoHeight, there will be a space in the bottom of the cell when appointment is rendered. To avoid this space, we can set true to the property ignoreWhitespace with in

eventSettings whereas its default property value is false. In the following code example, the whitespace below the appointments has been ignored.

APP.VUE

```
<template>
    <div>
        <div id='app'>
            <div id='container'>
                <ejs-schedule id='Schedule' width='100%' height='550px'
:eventSettings='eventSettings' :selectedDate='selectedDate'
:currentView='currentView' :group='group' :rowAutoHeight='rowAutoHeight'>
                    <e-views>

{% previewsample "page.domainurl/code-snippet/schedule/ignore-whitespace-cs1" %}

Note: The property `ignoreWhitespace` will be applicable only when `rowAutoHeight` feature is enabled in the Scheduler

You can refer to our Vue Scheduler feature tour page for its groundbreaking feature representations. You can also explore our Vue Scheduler example to knows how to present and manipulate data.

Header bar in Vue Schedule component

The header part of Scheduler can be customized easily with the built-in options available.

Show or Hide header bar

By default, the header bar holds the date and view navigation options, through which the user can switch between the dates and various views. This header bar can be hidden from the UI by setting `false` to the showHeaderBar property. It's default value is `true`.

APP.VUE

```
<template>
  <div id='app'>
    <div id='container'>
        <ejs-schedule :height='height' :selectedDate='selectedData'
:eventSettings='eventSettings' :showHeaderBar='showHeaderBar'></ejs-
schedule>
```

```
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { SchedulePlugin, Day, Week, WorkWeek } from '@syncfusion/ej2-vue-
schedule';
import { scheduleData } from './datasource.js';
Vue.use(SchedulePlugin);
export default {
  data (){
    return {
      height: '550px',
      width: '100%',
      showHeaderBar: false,
      eventSettings: { dataSource: scheduleData  },
      selectedData: new Date(2018, 1, 15),
      views: ['Day', 'Week', 'WorkWeek'],
    }
  },
  provide: {
    schedule: [Day, Week, WorkWeek]
  }
}
</script>
<style>

</style>
```

{% previewsample "page.domainurl/code-snippet/schedule/header-bar-cs1" %}

Customizing header bar using template

Apart from the default date navigation and view options available on the header bar, you can add custom items into the Scheduler header bar by making use of the toolbarItems property. To display the default items, it's essential to assign a name field to each item. The names of the default items are `Previous`, `Next`, `Today`, `DateRangeText`, `NewEvent`, and `Views`. For custom items you can give the name as `Custom` to the `name` field. Here, the default items such as previous, next, date range text, and today have been used along with external icon as custom items.

{% previewsample "page.domainurl/code-snippet/schedule/header-bar-template" %}

Customizing header bar using events

Apart from the default date navigation and view options available on the header bar, you can add custom items into the Scheduler header bar by making use of the actionBegin event. Here, an employee image is added to the header bar, clicking on which will open the popup showing that person's short profile information.

How to display the view options within the header bar popup

By default, the header bar holds the view navigation options, through which the user can switch between various views. You can move this view options to the header bar popup by setting true to the enableAdaptiveUI property.

APP.VUE

```
<template>
  <div id='app'>
    <div id='container'>
        <ejs-schedule :height='height' :selectedDate='selectedData'
:eventSettings='eventSettings' :enableAdaptiveUI='enableAdaptiveUI'></ejs-
schedule>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { SchedulePlugin, Day, Week, WorkWeek, Month, Agenda } from
'@syncfusion/ej2-vue-schedule';
import { scheduleData } from './datasource.js';
Vue.use(SchedulePlugin);
export default {
  data (){
    return {
      height: '550px',
      width: '100%',
      enableAdaptiveUI: true,
      eventSettings: { dataSource: scheduleData  },
      selectedData: new Date(2018, 1, 15),
      views: ['Day', 'Week', 'WorkWeek', 'Month', 'Agenda,'],
    }
  },
  provide: {
    schedule: [Day, Week, WorkWeek, Month, Agenda]
  }
}
</script>

Refer here to know more about adaptive UI in resources scheduler.

Date header customization

The Scheduler UI that displays the date text on all views are considered as the date header cells. You can customize the date header cells of Scheduler either using dateHeaderTemplate or renderCell event.

Using date header template

The dateHeaderTemplate option is used to customize the date header cells of day, week and work-week views.

APP.VUE

```
<template>
  <div id='app'>
    <div id='container'>
        <ejs-schedule height='550px' width='100%'
:selectedDate='selectedDate' :eventSettings='eventSettings'
:dateHeaderTemplate='dateHeaderTemplate' :cssClass='cssClass'>
            <e-views>
                <e-view option='Day'></e-view>
                <e-view option='Week'></e-view>
                <e-view option='Agenda'></e-view>
                <e-view option='TimelineWorkWeek'></e-view>
                <e-view option='TimelineMonth'></e-view>
            </e-views>
        </ejs-schedule>
    </div>
  </div>

```

{% previewsample "page.domainurl/code-snippet/schedule/date-header-cs1" %}

Using renderCell event

In month view, the date header template is not applicable and therefore the same customization can be added beside the date text in month cells by making use of the renderCell event.

APP.VUE

```
<template>
  <div id='app'>
    <div id='container'>
        <ejs-schedule id='Schedule' :height='height'
:selectedDate='selectedData' :eventSettings='eventSettings' :views='views'
:renderCell='onRenderCell'>
        </ejs-schedule>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';
import { createElement } from '@syncfusion/ej2-base';
import { SchedulePlugin, Month } from '@syncfusion/ej2-vue-schedule';
import { scheduleData } from './datasource.js';
Vue.use(SchedulePlugin);
export default {
  data (){
    return {
      height: '550px',

Customizing the date range text

The dateRangeTemplate option allows you to customize the text content of the date range displayed in the scheduler. By default, the date range text is determined by the scheduler view being used. However,

you can use the dateRangeTemplate option to override the default text and specify your own custom text to be displayed.

The dateRangeTemplate property includes startDate, endDate and currentView options, you can customize the date range text using these available options.

APP.VUE

```
<template>
    <div id='app'>
        <div id='container'>
            <ejs-schedule height='550px' width='100%'
:selectedDate='selectedDate'
                :dateRangeTemplate='dateRangeTemplate'>
                <e-views>
                    <e-view option='Day'></e-view>
                    <e-view option='Week'></e-view>

Customizing header indent cells

It is possible to customize the header indent cells using the `headerIndentTemplate` option and change the look and appearance in both the vertical and timeline views. In vertical views, You can customize the header indent cells at the hierarchy level and you can customize the resource header left indent cell in timeline views using the template option.

Example: To customize the header left indent cell to display resources text, refer to the below code example.

APP.VUE

```
<template>
  <div id='app'>
    <div id='container'>
      <ejs-schedule id='Schedule' width='100%' height='550px'
:eventSettings='eventSettings' :selectedDate='selectedDate' :group='group'>
        <e-views>
          <e-view option='Day'></e-view>
          <e-view option='Week'></e-view>
          <e-view option='TimelineWeek'></e-view>
          <e-view option='TimelineMonth'></e-view>
        </e-views>
        <e-resources>
          <e-resource field='OwnerId' title='Owner' name='Owners'
:allowMultiple='allowMultiple' :dataSource='ownerDataSource'
            textField='OwnerText' idField='Id' colorField='OwnerColor'>
          </e-resource>
        </e-resources>
      </ejs-schedule>
    </div>
  </div>
</template>
<script>

You can refer to our Vue Scheduler feature tour page for its groundbreaking feature representations. You can also explore our Vue Scheduler example to knows how to present and manipulate data.

Timescale in Vue Schedule component

The time slots are usually the time cells that are displayed on the Day, Week and Work Week views of both the calendar (to the left most position) and timeline views (at the top position). The timeScale property allows you to control and set the required time slot duration for the work cells displayed on Scheduler. It includes the following sub-options such as,

- enable - When set to true, allows the Scheduler to display the appointments accurately against the exact time duration. If set to false, all the appointments of a day will be displayed one below the other with no grid lines displayed. Its default value is true.
- interval – Defines the time duration on which the time axis to be displayed either in 1 hour or 30 minutes interval and so on. It accepts the values in minutes and defaults to 60.
- slotCount – Decides the number of slot count to be split for the specified time interval duration. It defaults to 2, thus displaying two slots to represent an hour(each slot depicting 30 minutes duration).

Note: The upper limit for rendering slots within a single day, utilizing the **interval** and **slotCount** properties of the **timeScale**, stands at 1000. This constraint aligns with the maximum **colspan** value permissible for the **table** element, also capped at 1000. This particular restriction is relevant exclusively to the TimelineDay, TimelineWeek and TimelineWorkWeek views.

Setting different time slot duration

The interval and slotCount properties can be used together on the Scheduler to set different time slot duration which is depicted in the following code example. Here, six time slots together represents an hour.

Customizing time cells using template

The timeScale property also provides template option to allow customization of time slots which are as follows,

- majorSlotTemplate - The template option to be applied for major time slots. Here, the template accepts either the string or HTMLElement as template design and then the parsed design is displayed onto the time cells. The time details can be accessed within this template.
- minorSlotTemplate - The template option to be applied for minor time slots. Here, the template accepts either the string or HTMLElement as template design and then the parsed design is displayed onto the time cells. The time details can be accessed within this template.

{% previewsample "page.domainurl/code-snippet/schedule/timescale-cs3" %}

Highlighting current date and time

By default, Scheduler indicates current date with a highlighted date header on all views, as well as marks accurately the system's current time on specific views such as Day, Week, Work Week, Timeline Day, Timeline Week and Timeline Work Week views. To stop highlighting the current time indicator on Scheduler views, set `false` to the showTimeIndicator property which defaults to `true`.

APP.VUE

```
<template>
  <div id='app'>
    <div id='container'>
        <ejs-schedule :height='height' :selectedDate='selectedData'
:eventSettings='eventSettings' :showTimeIndicator = 'showTimeIndicator'>
          <e-views>
            <e-view option='Day'></e-view>

{% previewsample "page.domainurl/code-snippet/schedule/timescale-cs4" %}

You can refer to our Vue Scheduler feature tour page for its groundbreaking feature representations. You can also explore our Vue Scheduler example to knows how to present and manipulate data.

Working days in Vue Schedule component

The Scheduler can be customized on various aspects as well as it inherits almost all the calendar-specific features such as options,

- To set custom time range display on Scheduler
- To set different working hours
- To set different working days

Copyright © 2001 -2024 Syncfusion Inc.

- To set different first day of week
- To show/hide weekend days
- To show the week number

Set working days

By default, Scheduler considers the week days from Monday to Friday as Working days and therefore defaults to [1,2,3,4,5] - where 1 represents Monday, 2 represents Tuesday and so on. The days which are not defined in this working days collection are considered as non-working days. Therefore, when the weekend days are set to hide from Scheduler, all those non-working days too gets hidden from the layout.

The Work week and Timeline Work week views displays exactly the defined working days on Scheduler layout, whereas other views displays all the days and simply differentiates the non-working days on UI with inactive cell color.

The working or business hours depiction on Scheduler are usually valid only on these specified working days.

The following example code depicts how to set the Scheduler to display Monday, Wednesday and Friday as working days of a week.

APP.VUE

```
<template>
    <div>
        <div id='app'>
            <div id='container'>

{% previewsample "page.domainurl/code-snippet/schedule/working-days-cs5" %}

Hiding weekend days

The `showWeekend` property is used to either show or hide the weekend days of a week and it is not applicable on Work week view (as non-working days are usually not displayed on work week view). By default, it is set to `true`. The days which are not a part of the working days collection of a Scheduler are usually considered as non-working or weekend days.

Here, the working days are defined as [1, 3, 4, 5] on Scheduler and therefore the remaining days (0, 2, 6 – Sunday, Tuesday and Saturday) are considered as non-working or weekend days and will be hidden from all the views when `showWeekend` property is set to `false`.

{% previewsample "page.domainurl/code-snippet/schedule/working-days-cs6" %}

Show week numbers

It is possible to show the week number count of a week in the header bar of the Scheduler by setting true to `showWeekNumber` property. By default, its default value is `false`. In Month view, the week numbers are displayed as a first column.

The `showWeekNumber` property is not applicable on Timeline views, as it has the equivalent headerRows property to handle such requirement with additional customizations.

Different options in showing week numbers

By default, week numbers are shown in the Scheduler based on the first day of the year. However, the week numbers can be determined based on the following criteria.

Copyright © 2001 -2024 Syncfusion Inc.

FirstDay – The first week of the year is calculated based on the first day of the year.

FirstFourDayWeek – The first week of the year begins from the first week with four or more days.

FirstFullWeek – The first week of the year begins when meeting the first day of the week (firstDayOfWeek) and the first day of the year.

Note: Enable the showWeekNumber property to configure the weekRule property. Also, the weekRule property depends on the value of the firstDayOfWeek property.

Set working hours

Working hours indicates the work hour limit within the Scheduler, which is visually highlighted with an active color on work cells. The working hours can be set on Scheduler using the workHours property which is of object type and includes the following sub-options,

- highlight – enables/disables the highlighting of work hours.
- start - sets the start time of the working/business hour of a day.
- end - sets the end time limit of the working/business hour of a day.

Scheduler displaying custom hours

It is possible to display the event Scheduler layout with specific time durations by hiding the unwanted hours. To do so, set the start and end hour for the Scheduler using the `startHour` and `endHour` properties respectively.

The following code example displays the Scheduler starting from the time range 7.00 AM to 6.00 PM and the remaining hours are hidden on the UI.

APP.VUE

```
<template>
    <div>

Scroll to specific time and date

You can manually scroll to a specific time on Scheduler by making use of the scrollTo method as depicted in the following code example.

APP.VUE

```
<template>
    <div>
```

```
        <div id='app'>
            <div>
                <ejs-timepicker width='100' :value='date' format='HH:mm'
:change='onChange'>
                </ejs-timepicker>
            </div>
            <div id='container'>
                <ejs-schedule ref='ScheduleObj' height='510px' width='100%'
:selectedDate='selectedDate' :eventSettings='eventSettings'>
                    <e-views>
                        <e-view option='Day'></e-view>
                        <e-view option='Week'></e-view>
                        <e-view option='WorkWeek'></e-view>
                    </e-views>
                </ejs-schedule>
            </div>
        </div>
    </div>
</template>

How to scroll to current time on initial load

There are scenarios where you may need to load the Scheduler displaying the system's current time on the currently visible view port area. In such cases, the Scheduler needs to be scrolled to a specific time based on the system's current time which is depicted in the following code example.

APP.VUE

```
<template>
    <div>
        <div id='app'>
            <div id='container'>
                <ejs-schedule ref='scheduleObj' height='550px' width='100%'
:selectedDate='selectedDate' :eventSettings='eventSettings'
:created='onCreated'>
                    <e-views>
                        <e-view option='Day'></e-view>
                        <e-view option='Week'></e-view>
                        <e-view option='TimelineWorkWeek'></e-view>
                    </e-views>
                </ejs-schedule>
            </div>
        </div>
    </div>
</template>
<script>
    import Vue from 'vue';
    import { scheduleData } from './datasource.js';
    import { SchedulePlugin, Day, Week, TimelineViews } from
'@syncfusion/ej2-vue-schedule';
    import { Internationalization } from '@syncfusion/ej2-base';
    Vue.use(SchedulePlugin);
    export default {
        data () {
            return {
                selectedDate: new Date(2018, 1, 15),
                eventSettings: { dataSource: scheduleData }
            }
        },
        provide: {
            schedule: [Day, Week, TimelineViews]
        },
        methods: {
            onCreated: function(){
                let intl = new Internationalization();
                this.$refs.scheduleObj.scrollTo(intl.formatDate(new Date(),

Cell customization in Vue Schedule component

The cells of the Scheduler can be easily customized either using the cell template or `RenderCell` event.

Setting cell dimensions in all views

The height and width of the Scheduler cells can be customized either to increase or reduce its size through the `cssClass` property, which overrides the default CSS applied on cells.

APP.VUE

```
<template>
    <div id='app'>
        <div id='container'>
            <ejs-schedule id='Schedule' width='100%' cssClass='schedule-
cell-dimension' height='550px' :selectedDate='selectedDate'
:eventSettings='eventSettings'>
                <e-views>
                    <e-view option='Day'></e-view>
                    <e-view option='Week'></e-view>
                    <e-view option='WorkWeek'></e-view>
                    <e-view option='Month'></e-view>
                </e-views>

{% previewsample "page.domainurl/code-snippet/schedule/cell-dimension-cs1" %}

Check for cell availability

You can check whether the given time range slots are available for event creation or already occupied by other events using the isSlotAvailable method. In the following code example, if a specific time slot already contains an appointment, then no more appointments can be added to that cell.

Note: The **isSlotAvailable** is centered around verifying appointments within the present view's date range. Yet, it does not encompass an evaluation of availability for recurrence occurrences that fall beyond this particular date range.

APP.VUE

```
<template>
    <div id='app'>
        <div id='container'>
            <ejs-schedule ref='scheduleObj' width='100%' height='550px'
:selectedDate='selectedDate' :eventSettings='eventSettings'
:actionBegin='onActionBegin'>
                <e-views>
                    <e-view option='Week'></e-view>
                    <e-view option='WorkWeek'></e-view>

Customizing cells in all the views

It is possible to customize the appearance of the cells using both template options and renderCell event on all the views.

Using template

The cellTemplate option accepts the template string and is used to customize the cell background with specific images or appropriate text on the given date values.

APP.VUE

```
<template>
    <div id='app'>
        <div id='container'>
            <ejs-schedule ref='scheduleObj' width='100%' height='550px'
:selectedDate='selectedDate' :cellTemplate='cellTemplate'
cssClass='schedule-cell-template'>
                <e-views>
                    <e-view option='Day'></e-view>
                    <e-view option='Week'></e-view>
                    <e-view option='Month'></e-view>
                    <e-view option='TimelineWeek'></e-view>
                </e-views>
            </ejs-schedule>
        </div>
    </div>
</template>
<script>
    import Vue from 'vue';
    import { SchedulePlugin, Day, Week, TimelineViews, Month, View } from
'@syncfusion/ej2-vue-schedule';
    Vue.use(SchedulePlugin);
    var cellTemplateVue = Vue.component("cellTemplate", {
        template: `<div class="templatewrap"><div v-
if="data.type==='workCells'"><div v-

Using renderCell event

An alternative to cellTemplate is the renderCell event, which can also be used to customize the cells with appropriate images or formatted text values.

APP.VUE

```
<template>
    <div id='app'>
        <div id='container'>
            <ejs-schedule ref='scheduleObj' width='100%' height='550px'
:selectedDate='selectedDate' :currentView='currentView'
:renderCell='onRenderCell'>
```

{% previewsample "page.domainurl/code-snippet/schedule/cell-dimension-cs4" %}

You can customize cells such as work cells, month cells, all-day cells, header cells, resource header cells using renderCell event by checking the elementType option within the event. You can check elementType with any of the following.

| Element type | Description |

|-------|---------|

| dateHeader | triggers on header cell rendering.|

| monthDay | triggers on header cell in month view rendering.|

| resourceHeader | triggers on resource header cell rendering.|

| alldayCells | triggers on all day cell rendering.|

| emptyCells | triggers on empty cell rendering on header bar.|

| resourceGroupCells | triggers on rendering of work cells for parent resource.|

| workCells | triggers on work cell rendering.|

| monthCells | triggers on month cell rendering.|

| majorSlot | triggers on major time slot cell rendering.|

| minorSlot | triggers on minor time slot cell rendering.|

| weekNumberCell | triggers on cell displaying week number.|

Customizing cell header in month view

The month header of each date cell in the month view can be customized using the cellHeaderTemplate option which accepts the string or HTMLElement. The corresponding date can be accessed with the template.

APP.VUE

```
<template>
    <div id='app'>
        <div id='container'>
            <ejs-schedule ref='scheduleObj' width='100%' height='550px'
:cellHeaderTemplate='cellHeaderTemplate' cssClass='schedule-cell-header-
template'>
                <e-views>
                    <e-view option='Month'></e-view>
                </e-views>
```

```
            </ejs-schedule>
        </div>
    </div>
</template>
<script>
    import Vue from 'vue';
    import { Internationalization } from '@syncfusion/ej2-base';
    import { SchedulePlugin, Month } from '@syncfusion/ej2-vue-schedule';
    Vue.use(SchedulePlugin);
    var instance = new Internationalization();
    var cellHeaderTemplateVue = Vue.component("cellHeaderTemplate", {
        template: `<div v-html=getDateHeaderText(data.date)></div>`,
        data() {
            return {
                data: {}
            };
        },
        methods: {
            getDateHeaderText: function(date) {
                return instance.formatDate(date, { skeleton: "Ed" });
            }
        }
    });
    export default {
        data () {
            return {
                cellHeaderTemplate: function (e) {
                    return {
                        template: cellHeaderTemplateVue
                    };
                },
            }
        },
        provide: {
            schedule: [Month]
        }
    }
</script>
```

{% previewsample "page.domainurl/code-snippet/schedule/cell-dimension-cs5" %}

Customizing the minimum and maximum date values

Providing the minDate and maxDate property with some date values, allows the Scheduler to set the minimum and maximum date range. The Scheduler date that lies beyond this minimum and maximum date range will be in a disabled state so that the date navigation will be blocked beyond the specified date range.

APP.VUE

```
<template>
    <div id='app'>
        <ejs-schedule height='550px' :selectedDate='selectedDate'
:minDate='minDate' :maxDate='maxDate' :currentView='currentView'>
        </ejs-schedule>
    </div>
</template>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
<script>
  import Vue from 'vue';
  import { scheduleData } from './datasource.js';
  import { SchedulePlugin, Day, WorkWeek, Agenda, Month, Week } from
'@syncfusion/ej2-vue-schedule';
  Vue.use(SchedulePlugin);
  export default {
    data () {
      return {
        selectedDate: new Date(2018, 1, 17),
        minDate: new Date(2017, 4, 17),
        maxDate: new Date(2018, 5, 17)
        eventSettings: { dataSource: scheduleData },
        currentView: 'Month',
      }
    },
    provide: {
      schedule: [Day, WorkWeek, Agenda, Month, Week]
    }
  }
</script>
```

{% previewsample "page.domainurl/code-snippet/schedule/cell-dimension-cs6" %}

By default, the minDate property value is set to new Date(1900, 0, 1) and maxDate property value is set to new Date(2099, 11, 31). The user can also set the customized minDate and maxDate property values.

How to disable multiple cell and row selection in Schedule

By default, the allowMultiCellSelection and allowMultiRowSelection properties of the Schedule are set to true. So, the Schedule allows user to select multiple cells and rows. If the user want to disable this multiple cell and row selection. The user can disable this feature by setting up false to these properties.

You can refer to our Vue Scheduler feature tour page for its groundbreaking feature representations. You can also explore our Vue Scheduler example to knows how to present and manipulate data.

State persistence in Vue Schedule component

State persistence allowed Scheduler to retain the currentView, selectedDate and Scroll position values in the localStorage for state maintenance even if the browser is refreshed or if you move to the next page within the browser. This action is handled through the enablePersistence property which is set to false by default. When it is set to true, currentView, selectedDate and Scroll position values of the scheduler component will be retained even after refreshing the page.

Note: Scheduler id is essential to set state persistence.

The following sample demonstrates how to set state persistence of the Scheduler component.

APP.VUE

{% previewsample "page.domainurl/code-snippet/schedule/working-days-cs4" %}

You can refer to our Vue Scheduler feature tour page for its groundbreaking feature representations. You can also explore our Vue Scheduler example to knows how to present and manipulate data.

Exporting in Vue Schedule component

The Scheduler supports exporting all its appointments both to an Excel or ICS extension file at client-side. It offers different client-side methods to export its appointments in an Excel or ICal format file. Let's look onto the ways on how to implement the exporting functionality in Scheduler.

Copyright © 2001 -2024 Syncfusion Inc.

Excel Exporting

The Scheduler allows you to export all its events into an Excel format file by using the [exportToExcel] client-side method. By default, it exports all the default fields of Scheduler mapped through eventSettings property.

Before you start with excel exporting functionality, you need to import and inject the ExcelExport module from the '@syncfusion/ej2-schedule' package using the Inject method of Scheduler.

APP.VUE

```
<template>
  <div id='app'>
            <div id='container'>
                <ejs-schedule id='Schedule' ref="ScheduleObj"
:cssClass="cssClass" height="550px" :selectedDate='selectedDate'
:eventSettings='eventSettings'
                    :currentView="currentView" :actionBegin="onActionBegin">
                    <e-views>
                        <e-view option="Week"></e-view>
                    </e-views>
                </ejs-schedule>
            </div>
        </div>
</template>
<script>
import Vue from "vue";
import { SchedulePlugin, Week, View, Resize, DragAndDrop, ExcelExport
} from "@syncfusion/ej2-vue-schedule";
import { scheduleData } from './datasource.js';
Vue.use(SchedulePlugin);
export default {
        data: function () {
            return {
                cssClass: 'excel-export',
                eventSettings: { dataSource: scheduleData },
                selectedDate: new Date(2019, 0, 10),
                currentView: 'Week'
            }
        },
        provide: {
            schedule: [Week, Resize, DragAndDrop, ExcelExport]
        },
        methods: {
            onActionBegin: function (args) {
                if (args.requestType === 'toolbarItemRendering') {
                    let exportItem = {
                        align: 'Right', showTextOn: 'Both', prefixIcon: 'e-
icon-schedule-excel-export',
                        text: 'Excel Export', cssClass: 'e-excel-export',
click: this.onExportClick.bind(this)
                    };
                    args.items.push(exportItem);
                }
            },
            onExportClick: function () {
                let scheduleObj = this.$refs.ScheduleObj;
```

```
                scheduleObj.exportToExcel();
            }
        }

    }
</style>
```

{% previewsample "page.domainurl/code-snippet/schedule/excel-export-cs1" %}

Exporting with custom fields

By default, Scheduler exports all the default event fields that are mapped to it through the eventSettings property. To limit the number of fields on the exported excel file, it provides an option to export only the custom fields of the event data. To export such custom fields alone, define the required fields through the ExportOptions interface and pass it as argument to the exportToExcel method as shown in the following example. For example: ['Id', 'Subject', 'StartTime', 'EndTime', 'Location'].

Exporting individual occurrences of a recurring series

By default, the Scheduler exports recurring events as a single data by exporting only its parent record into the excel file. If you want to export each individual occurrences of a recurring series appointment as separate records in an Excel file, define the includeOccurrences option as true through the ExportOptions interface and pass it as argument to the exportToExcel method. By default, the includeOccurrences option is set to false.

Exporting custom event data

By default, the whole event collection bound to the Scheduler gets exported as an excel file. To export only specific events of Scheduler or some custom event collection, you need to pass those custom data collection as a parameter to the exportToExcel method as shown in this following example, through the customData option of ExportOptions interface.

By default, the event data are taken from Scheduler dataSource.

APP.VUE

```
<template>
    <div>
        <div id='app'>
            <div id='container'>

Customizing column header with custom fields exporting

Using fields property, we can only export the defined fields into excel without customizing the header. Now we can provide the alternate support to customize the header of custom fields exporting using the fieldsInfo option through the ExportFieldInfo interface and pass it as an argument to the exportToExcel method as shown in the following example.

Export with custom file name

By default, the Scheduler allows you to download the exported Excel file with a name Schedule.xlsx. It also provides an option to export the excel file with a custom file name, by defining the desired fileName through the ExportOptions interface and passing it as an argument to the exportToExcel method.

Exporting calendar events as ICS file

You can export the Scheduler events to a calendar (.ics) file format, and open it on any of the other default calendars such as Google or Outlook. To export the events of Scheduler to an ICS file, you need to first import the ICalendarExport module from @syncfusion/ej2-schedule package and then inject it using the Schedule.Inject(ICalendarExport) method.

The following code example shows how the Scheduler events are exported to a calendar (.ics) file by making use of the exportToICalendar public method.

APP.VUE

Exporting calendar with custom file name

By default, the calendar is exported with a file name `Calendar.ics`. To change this file name on export, pass the custom string value as `fileName` to the method argument so as to get the file downloaded with this provided name.

The following example downloads the iCal file with a name `ScheduleEvents.ics`.

Import events from other calendars

The events from external calendars (ICS files) can be imported into Scheduler by using the importICalendar method. This method accepts the blob object of an .ics file to be imported, as a mandatory argument.

To import an ICS file containing events into Scheduler, you need to first import the ICalendarImport module from @syncfusion/ej2-schedule package and then inject it using the Schedule.Inject(ICalendarImport) method.

The following example shows how to import an ICS file into Scheduler, using the importICalendar method.

APP.VUE

```
<template>

{% previewsample "page.domainurl/code-snippet/schedule/calendar-import-cs1" %}

How to print the Scheduler element

The Scheduler allows you to print the Scheduler element by using the print client-side method. The print method works in two ways. You can find it below.

- Using print method without options.
- Using a print method with options.

To print the Schedule, you need to import the `Print` module from the `@syncfusion/ej2-vue-schedule` package and then inject it using `provide: {schedule: [Print]}`.

Using print method without options

You can print the Schedule element with the current view by using the print method without passing the options. The following example shows how to print the Scheduler using the `print` method without passing options.

APP.VUE

```
<template>
  <div>
        <div id='app'>
            <div id='container'>
                <ejs-schedule id="Schedule" ref="ScheduleObj" height="520px"
:selectedDate='selectedDate'
                    :eventSettings='eventSettings'
:actionBegin="onActionBegin">
                </ejs-schedule>
            </div>
        </div>
    </div>
</template>
<script>
    import Vue from "vue";
    import { SchedulePlugin, Day, Week, WorkWeek, Month, Agenda, Print }

You can refer to our Vue Scheduler feature tour page for its groundbreaking feature representations. You can also explore our Vue Scheduler example to knows how to present and manipulate data.

Context menu in Vue Schedule component

You can display context menu on work cells and appointments of Scheduler by making use of the ContextMenu control manually from the application end. In the following code example, context menu control is being added from sample end and set its target as Scheduler.

On Scheduler cells, you can display the menu items such as New Event, New Recurring Event and Today option. For appointments, you can display its related options such as Edit Event and Delete Event. The default event window can be opened for appointment creation and editing using the openEditor method of Scheduler.

The deletion of appointments can be done by using the deleteEvent public method. Also, the selectedDate property can be used to navigate between different dates.

You can also display custom menu options on Scheduler cells and appointments. Context menu will open on tap-hold in responsive mode.

Dimensions in Vue Schedule component

The Scheduler dimensions refers to both height and width of the entire layout and it accepts 3 types of values.

Copyright © 2001 -2024 Syncfusion Inc.

- auto
- pixel
- percentage

Auto Height and Width

When height and width of the Scheduler are set to auto, it will try as hard as possible to keep an element the same width as its parent container. In other words, the parent container that holds Scheduler, it's width/height will be the sum of its children. By default, Scheduler is assigned with auto values for both height and width properties.

APP.VUE

```
<template>
  <div id='app'>
    <div id='container'>
        <ejs-schedule :height='height' :width='width'
:selectedDate='selectedDate' :eventSettings='eventSettings'></ejs-schedule>
    </div>
  </div>
</template>
<script>
import Vue from 'vue';

- How to Change Scheduler Cell Dimensions

Localization in Vue Schedule component

The Scheduler integrates different date-time formats and cultures, which allows it to function globally, thus meeting the diverse needs of different regions.

You can adapt the Scheduler to various languages by parsing and formatting the date or number (Internationalization), adding culture specific customization and translation to the text (Localization).

Globalization

The Internationalization library provides support for formatting and parsing the number, date, and time by using the official Unicode CLDR JSON data and also provides the `loadCldr` method to load the culture specific CLDR JSON data.

By default, Scheduler is set to follow the English culture ('en-US'). If you want to go with different culture other than English, follow the below steps.

- Install the `CLDR-Data` package by using the below command (it installs the CLDR JSON data). For more information about CLDR-Data, refer to this link.

```
npm install cldr-data --save
```

Once the package is installed, you can find the culture specific JSON data under the location `/node_modules/cldr-data`.

- Now import the installed CLDR JSON data into the `app.vue` file. To import JSON data, you need to install the JSON plugin loader. Here, we have used the SystemJS JSON plugin loader.

```bash
npm install systemjs-plugin-json --save-dev
```

- Once installed, configure the `system.config.js` configuration settings as shown in the following code to map the `systemjs-plugin-json` loader.

```ts
System.config({
paths: {
```

Copyright © 2001 -2024 Syncfusion Inc.

```
'syncfusion:': 'npm:@syncfusion/'
},
map: {
app: 'app',
//Syncfusion packages mapping
"@syncfusion/ej2-base": "syncfusion:ej2-base/dist/ej2-base.umd.min.js",
"@syncfusion/ej2-data": "syncfusion:ej2-data/dist/ej2-data.umd.min.js",
"@syncfusion/ej2-schedule": "syncfusion:ej2-schedule/dist/ej2-schedule.umd.min.js",
"@syncfusion/ej2-calendars": "syncfusion:ej2-calendars/dist/ej2-calendars.umd.min.js",
"@syncfusion/ej2-buttons": "syncfusion:ej2-buttons/dist/ej2-buttons.umd.min.js",
"@syncfusion/ej2-inputs": "syncfusion:ej2-inputs/dist/ej2-inputs.umd.min.js",
"@syncfusion/ej2-lists": "syncfusion:ej2-lists/dist/ej2-lists.umd.min.js",
"@syncfusion/ej2-navigations": "syncfusion:ej2-navigations/dist/ej2-navigations.umd.min.js",
"@syncfusion/ej2-popups": "syncfusion:ej2-popups/dist/ej2-popups.umd.min.js",
"@syncfusion/ej2-dropdowns": "syncfusion:ej2-dropdowns/dist/ej2-dropdowns.umd.min.js",
"@syncfusion/ej2-splitbuttons": "syncfusion:ej2-splitbuttons/dist/ej2-splitbuttons.umd.min.js",
"cldr-data": 'npm:cldr-data',
"plugin-json": "npm:systemjs-plugin-json/json.js"
},
meta: {
'*.json': { loader: 'plugin-json' }
},
packages: {
'app': { main: 'app', defaultExtension: 'js' },
'cldr-data': { main: 'index.js', defaultExtension: 'js' }
}
});
System.import('app');
`
```

- Now import the required cultures from the installed location to app.vue file as given in the following code example.

```ts
//import the loadCldr from ej2-base
```

```
import { loadCldr} from '@syncfusion/ej2-base';
loadCldr(
require('cldr-data/supplemental/numberingSystems.json'),
require('cldr-data/main/fr-CH/ca-gregorian.json'),
require('cldr-data/main/fr-CH/numbers.json'),
require('cldr-data/main/fr-CH/timeZoneNames.json')
);
`
```

- Set the culture to Scheduler by using the locale property.

Localizing the static Scheduler text

Localization library allows to display all the static text, date content, and time mode of the Scheduler following the localized language. To achieve this, set the locale property of Scheduler, as well as define the translation text of static words of Scheduler through the load method.

For example, the following code example lets you to define the French translation words for all the static words used in Scheduler.

APP.VUE

```
<template>
    <div id='app'>
     <div id='container'>
      <ejs-schedule height='550px' :selectedDate='selectedDate'
:eventSettings='eventSettings'>
           <e-views>
              <e-view option='Day'></e-view>
              <e-view option='Week'></e-view>
              <e-view option='WorkWeek'></e-view>
              <e-view option='Month'></e-view>
            </e-views>
         </ejs-schedule>
        </div>
      </div>
</template>
<script>
    import Vue from 'vue';
    import { scheduleData } from './datasource.js';
    import { L10n, loadCldr, setCulture } from '@syncfusion/ej2-base';
    import { SchedulePlugin, Day, Week, WorkWeek, Month } from
'@syncfusion/ej2-vue-schedule';
    import * as localeText from './locale.json';
    import * as numberingSystems from './numberingSystems.json';
```

```
    import * as gregorian from './ca-gregorian.json';
    import * as numbers from './numbers.json';
    import * as timeZoneNames from './timeZoneNames.json';
    Vue.use(SchedulePlugin);
    L10n.load(localeText);
    loadCldr(numberingSystems, gregorian, numbers, timeZoneNames);
    setCulture('fr-CH');
    export default {
        data () {
            return {
               height: '550px',
               selectedDate: new Date(2018, 0, 15),
               eventSettings: { dataSource: scheduleData }
            }
        },
        provide: {
            schedule: [Day, Week, WorkWeek, Month]
        }
    }

Setting date format

Scheduler can be used with all valid date formats and by default it follows the universal date format "MM/dd/yyyy". If the dateFormat property is not specified particularly, then it will work based on the locale that is assigned to the Scheduler. As the default locale applied on Scheduler is "en-US", this makes it to follow the "MM/dd/yyyy" pattern.

APP.VUE

```
<template>
    <div id='app'>
     <div id='container'>
      <ejs-schedule :dateFormat = 'dateFormat' height='550px'
:selectedDate='selectedDate' :eventSettings='eventSettings'>
           <e-views>
              <e-view option='Day'></e-view>
              <e-view option='Week'></e-view>
              <e-view option='WorkWeek'></e-view>
              <e-view option='Month'></e-view>
            </e-views>
         </ejs-schedule>
        </div>
      </div>
</template>
<script>
    import Vue from 'vue';
    import { scheduleData } from './datasource.js';
    import { SchedulePlugin, Day, Week, WorkWeek, Month } from
'@syncfusion/ej2-vue-schedule';
    Vue.use(SchedulePlugin);
    export default {
        data () {
            return {
               height: '550px',
               dateFormat: 'yyyy/MM/dd',
               selectedDate: new Date(2018, 0, 15),
               eventSettings: { dataSource: scheduleData }
            }
        },
        provide: {
            schedule: [Day, Week, WorkWeek, Month]
        }
    }
</script>
<style>

```

{% previewsample "page.domainurl/code-snippet/schedule/localization-cs3" %}

Setting the time format

Time formats is a way of representing the time value in different string formats in the Scheduler. By default, the time mode of the Scheduler can be either 12 or 24 hours format which is completely based on the `locale` set to the Scheduler. Since the default `locale` value of the Scheduler is en-US, the time mode will be set to 12 hours format automatically. You can also customize the format by using the `timeFormat` property. To know more about the time format standards, refer to the Date and Time Format section.

The following example demonstrates the Scheduler component in 24 hours format.

APP.VUE

```
<template>
    <div id='app'>
     <div id='container'>
      <ejs-schedule :timeFormat='timeFormat' height='550px'
:selectedDate='selectedDate' :eventSettings='eventSettings'>
           <e-views>
              <e-view option='Day'></e-view>
              <e-view option='Week'></e-view>
              <e-view option='WorkWeek'></e-view>
              <e-view option='Month'></e-view>
            </e-views>
         </ejs-schedule>
        </div>
      </div>
</template>
<script>
    import Vue from 'vue';
    import { scheduleData } from './datasource.js';
    import { SchedulePlugin, Day, Week, WorkWeek, Month } from
'@syncfusion/ej2-vue-schedule';
    Vue.use(SchedulePlugin);
    export default {
        data () {
            return {
               height: '550px',
               timeFormat: 'HH:mm',
               selectedDate: new Date(2018, 0, 15),
               eventSettings: { dataSource: scheduleData }
```

Copyright © 2001 -2024 Syncfusion Inc.

```
            }
        },
        provide: {
            schedule: [Day, Week, WorkWeek, Month]
        }
    }
</script>
<style>
  @import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../../node_modules/@syncfusion/ej2-vue-
buttons/styles/material.css";
  @import "../../node_modules/@syncfusion/ej2-vue-
calendars/styles/material.css";
  @import "../../node_modules/@syncfusion/ej2-vue-
dropdowns/styles/material.css";
  @import "../../node_modules/@syncfusion/ej2-vue-
inputs/styles/material.css";
  @import "../../node_modules/@syncfusion/ej2-vue-
navigations/styles/material.css";
  @import "../../node_modules/@syncfusion/ej2-vue-

</style>
```

{% previewsample "page.domainurl/code-snippet/schedule/localization-cs4" %}

Note: timeFormat property only accepts the valid time format's.

Displaying Scheduler in RTL mode

The Scheduler layout and its behavior can be changed as per the common RTL (Right to Left) conventions by setting enableRtl to true. By doing so, the Scheduler will display its usual layout from right to left. It's default value is false.

APP.VUE

```
<template>
    <div id='app'>
     <div id='container'>
      <ejs-schedule width='100%' height='550px' :selectedDate='selectedDate'
:eventSettings='eventSettings' :enableRtl='enableRtl'>
          <e-views>
             <e-view option='Day'></e-view>
             <e-view option='Week'></e-view>
             <e-view option='WorkWeek'></e-view>
           </e-views>
        </ejs-schedule>
       </div>
      </div>
</template>
<script>
    import Vue from 'vue';
    import { scheduleData } from './datasource.js';
    import { SchedulePlugin, Day, Week, WorkWeek } from '@syncfusion/ej2-
vue-schedule';
    Vue.use(SchedulePlugin);
```

Copyright © 2001 -2024 Syncfusion Inc.

```
    export default {
        data () {
            return {
               enableRtl: true,
               selectedDate: new Date(2018, 0, 15),
               eventSettings: { dataSource: scheduleData }
            }
        },
        provide: {
            schedule: [Day, Week, WorkWeek]
        }
    }
</script>
<style>
  @import "../../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../../node_modules/@syncfusion/ej2-vue-

Accessibility in Vue Schedule component

The Scheduler has been designed based on the WAI-ARIA specifications, thus applying the appropriate ARIA roles, states and properties for the Scheduler elements. It is also available with a built-in keyboard navigation support, making it easier for the people who use assistive technologies or who completely rely on the Keyboard support. As per the accessibility standard, the navigated dates, views and other interactive actions performed on the Scheduler will be read out to the target users who use assistive technologies such as screen readers.

The Scheduler makes use of the most required ARIA attributes such as `aria-label` and `role` to support the accessibility in it. To be more accurate, it must be used with an ARIA compliant browser along with the screen reader running from backend.

The accessibility compliance for the Schedule component is outlined below.

ARIA attributes

The Scheduler parent element is assigned with a role of main, to denote it as the main content of a component as well as a unique element of the entire document.

The following ARIA attributes are used in the Scheduler.

| Attributes | Description |

|-------|---------|

| role="main" | Attribute added to the Scheduler element describes the actual role of the element and denote it as a main and unique content. |

| role="button" | Attribute is assigned to the appointments of Scheduler, to denote it as a clickable element. |

| aria-label | Attribute is set to the Scheduler parent element and its default value is Scheduler's current date. On every time, the date is navigated, this attribute is updated with appropriate current date values. It is also assigned to other scheduler UI elements such as previous and next date navigation buttons depicting its purpose, div element displaying date range in the header bar and appointment elements. |

| aria-labelledby | It indicates editor dialog title to the user through assistive technologies. |

| aria-describedby | It indicates editor dialog content description to the user through assistive technologies. |

| aria-disabled | Attribute is set to the appointment element to indicates the disabled state of the Scheduler.

Keyboard interaction

All the Scheduler actions can be controlled via keyboard keys by using the `allowKeyboardInteraction` property which is set to `true` by default. The following are the standard keys that work on Scheduler.

| Keys | Description |

|-----|-----|

| Alt + j | Focuses the Scheduler element [provided from application end]. |

| Tab | Focuses the first or active item on the Scheduler header bar and then move the focus to the next available event elements. If no events present, then focus moves out of the component. |

| Shift + Tab | Reverse focusing of the `Tab` key functionality. Inverse focusing of event elements from the last one and then move onto the first or active item on Scheduler header bar and then moves out of the component.

| Enter | Opens the quick info popup on the selected cells or events. |

| Escape | Closes any of the popup that are in open state. |

| Arrow | To move onto the next available cells in either of the needed directions. (left, right, top and right) |

| Shift + Arrow | For multiple cell selection on either direction. |

| Delete | Deletes one or more selected events. |

| Ctrl + Click on events | To select multiple events. |

| Alt + Number (from 1 to 6) |To switch between the views of Scheduler. |

| Ctrl + Left Arrow | To navigate to the previous date period. |

| Ctrl + Right Arrow | To navigate to the next date period. |

Copyright © 2001 -2024 Syncfusion Inc.

| Left or Right Arrow | On pressing any of these keys, when focus is currently on the Schedule header bar, moves the focus to the previous or next items in the header bar. |

| Space or Enter | It activates any of the focused items. |

| Page Up & Page Down | To scroll through the work cells area. |

| Home | To move the selection to the first cell of Scheduler. |

You can refer to our Vue Scheduler feature tour page for its groundbreaking feature representations. You can also explore our Vue Scheduler example to knows how to present and manipulate data.

Ensuring accessibility

The Scheduler component's accessibility levels are ensured through an accessibility-checker and axe-core software tools during automated testing.

The accessibility compliance of the Scheduler component is shown in the following sample. Open the sample in a new window to evaluate the accessibility of the Scheduler component with accessibility tools.

{% previewsample "https://ej2.syncfusion.com/accessibility/schedule.html" %}

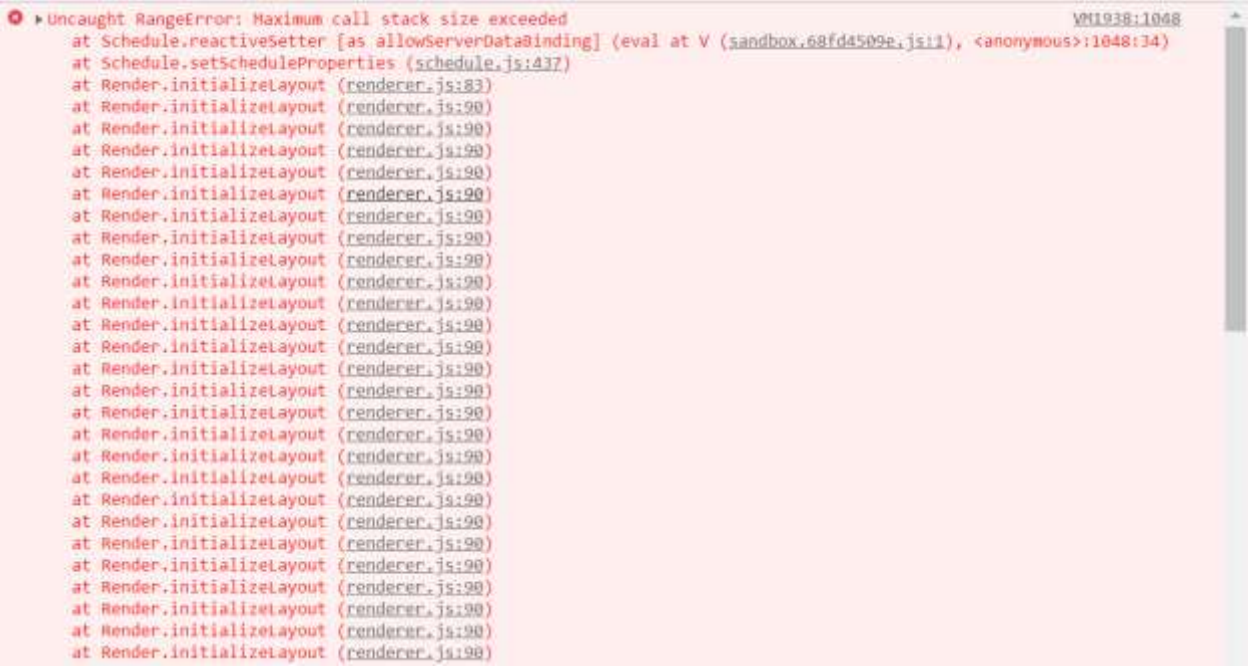
You can refer to our Vue Scheduler feature tour page for its groundbreaking feature representations. You can also explore our Vue Scheduler example to knows how to present and manipulate data.

Frequently asked questions in Vue Schedule component

In this article, you can find some frequently asked questions and corresponding solutions while getting hands-on experience with scheduler control.

Maximum call stack size exceeded

Error Image:



Solution:

The above error occurs when using scheduler views that were not imported into the project. You can resolve this issue by importing the required view modules.

In the below code, Day option is used without injecting, So, it throws the above error. You can resolve this problem by simply injecting the day module in below code.

`

<template>

<ejs-schedule id="Schedule" width="100%" height="550px">

<e-views>

<e-view option="Day"></e-view>

<e-view option="TimelineWeek"></e-view>

Copyright © 2001 -2024 Syncfusion Inc.

```
<e-view option="TimelineMonth"></e-view>
<e-view option="Agenda"></e-view>
</e-views>
</ejs-schedule>
</div>
</div>
</div>
</template>
<script>
import Vue from "vue";
import {
SchedulePlugin,
TimelineViews,
TimelineMonth,
Agenda,
} from "@syncfusion/ej2-vue-schedule";
`
```

Grouping with empty resources

Grouping without providing any resource data will throw the following problems.

- Normal(vertical) views are rendered, but you are not able to perform CRUD operations
- Timeline views not at all render and shows empty scheduler table

So, we suggest to avoid grouping with empty resources in the scheduler.

Not providing e-field in editor template

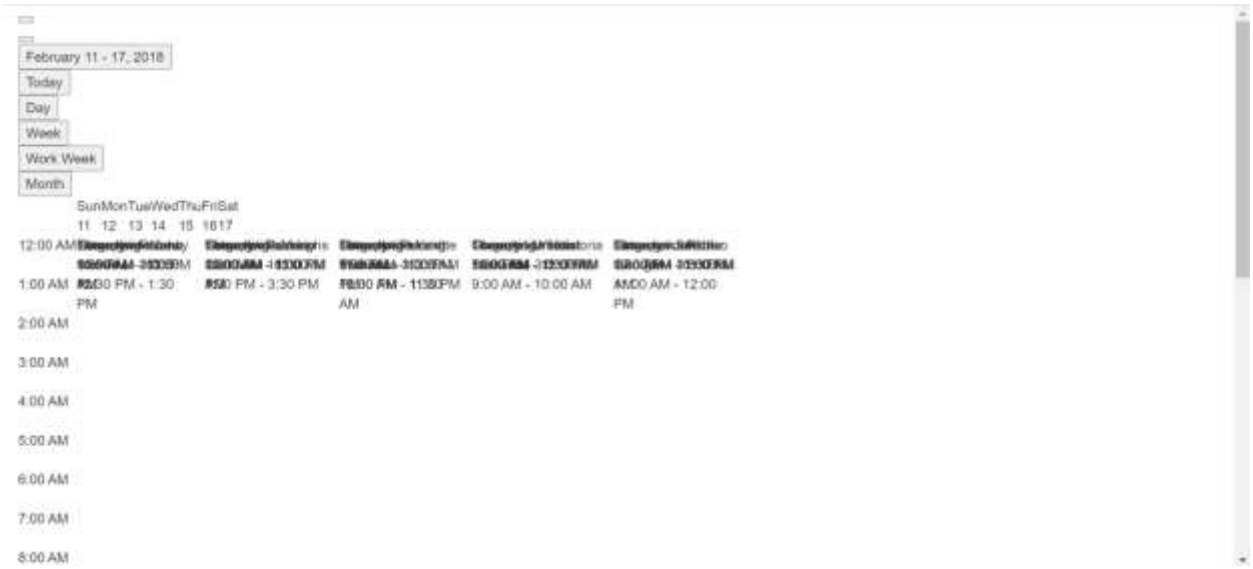
Error: While using editor template, value of `e-field` is missing in editor window.

Solution: `e-field` value is mandatory, we need to add it. Please refer here for more info.

Missing CSS reference

Error Image:

Copyright © 2001 -2024 Syncfusion Inc.



Solution:

The above problem occurs when missing CSS references for the scheduler in a project. You can resolve this issue by providing proper CSS for the scheduler.

`

<! — scheduler CSS is referred from this link —>

<link href="https://cdn.syncfusion.com/ej2/material.css" rel="stylesheet">

or

<! — From here —>

<style>

@import "/node_modules/@syncfusion/ej2-base/styles/material.css";

@import "/node_modules/@syncfusion/ej2-vue-schedule/styles/material.css";

</style>

`

QuickInfoTemplate at bottom

When using the quickInfoTemplate in scheduler, sometimes quickinfo popup not shown fully at the bottom area of scheduler. You can resolve this by using cellClick and eventClick events and below code snippet.

Copyright © 2001 -2024 Syncfusion Inc.

```
<template>
<ejs-schedule
id="Schedule"
width="100%"
height="550px"
:cellClick="onClick"
:eventClick="onClick"

</ejs-schedule>
</template>
.
.
var eventAdded = false;
methods: {
onClick: function () {
if (!this.eventAdded) {
let popupInstance = document.querySelector('.e-quick-popup-wrapper').ej2_instances[0];
popupInstance.open = () => {
popupInstance.refreshPosition();
};
this.eventAdded = true;
}
}
```

Not importing culture files while using localization

Error Image:

```
ERROR TypeError: Cannot read property 'trim' of undefined                errors.ts:30
    at t.e.formatDateRange (util.js:6)
    at t.e.getDateRangeText (util.js:6)
    at e.updateHeader (util.js:6)

While using locale in scheduler, not importing the required culture files properly throws the problem.

Solution: Properly add and import the culture files(numberingSystems, timeZoneNames, loadCldr, L10n etc.,) in your project will resolve the problem.

`javascript

import { loadCldr, L10n } from '@syncfusion/ej2-base';

import * as numberingSystems from './culture-files/numberingSystems.json';

import * as gregorian from './culture-files/ca-gregorian.json';

import * as numbers from './culture-files/numbers.json';

import * as timeZoneNames from './culture-files/timeZoneNames.json';

loadCldr(numberingSystems, gregorian, numbers, timeZoneNames);

L10n.load({

'en-GB': {

schedule: {

day: 'Day',

week: 'Week',

workWeek: 'Work Week',

month: 'Month'

}

}

});

`

How To

Add edit and remove events in Vue Schedule component

CRUD actions can be manually performed on appointments using `addEvent`, `saveEvent` and `deleteEvent` methods as shown below.

Normal event

APP.VUE

```
<template>
    <div>
        <div id='app'>
            <div id='container'>
                <tr>
                    <td>
                        <div>
                            <ejs-button v-on:click.native='onAdd'>Add</ejs-
button>
                        </div>
                    </td>
                    <td>
```

```
                        <div>
                            <ejs-button v-
on:click.native='onSave'>Edit</ejs-button>
                        </div>
                    </td>
                    <td>
                        <div>
                            <ejs-button v-
on:click.native='onDelete'>Delete</ejs-button>
                        </div>
                    </td>

Set default value for event fields in Vue Schedule component

Event window default fields name like Title, Location, etc.. can be customized and default value can be set to Subject field using default property which will be added if an appointment is created with empty subject.

APP.VUE

```
<template>
    <div>
        <div class='col-md-9 control-section'>
            <div class='content-wrapper'>
                <ejs-schedule id='Schedule' width='100%' height='550px'
:eventSettings='eventSettings' :selectedDate='selectedDate'>
                    <e-views>
                        <e-view option='Day'></e-view>
                        <e-view option='Week'></e-view>

Open event editor manually in Vue Schedule component

Open Editor Window externally

Scheduler allows the user to manually open the event editor on specific time or on certain events using openEditor method. To open the editor on specific range of time, user need to pass the cell details as first argument and **Add** as second argument whereas to open it on event pass that event detail and **Save** as arguments. In the following code example, on clicking the respective button will open the respective editor window manually.

Open editor window on single click

By default, Scheduler Editor window will open when double clicking the cells or appointments. You can also open the editor window with single click by using openEditor method in eventClick and cellClick events of scheduler and setting false to showQuickInfo. The following example shows how to open editor window on single click of cells and appointments.

APP.VUE

```
<template>

Prevent date navigation in Vue Schedule component

We can prevent navigation while clicking on the date header by simply removing e-navigate class from header cells which can be achieved in the renderCell event as shown in the following code example.

APP.VUE

```
<template>
    <div>
        <div id='app'>
            <div id='container'>
                <ejs-schedule id='Schedule' width='100%' height='550px'
:eventSettings='eventSettings' :selectedDate='selectedDate'
:renderCell='onRenderCell'>
                    <e-views>
                        <e-view option='Day'></e-view>
                        <e-view option='Week'></e-view>
                        <e-view option='WorkWeek'></e-view>
                        <e-view option='Month'></e-view>
                        <e-view option='Agenda'></e-view>
                    </e-views>
                </ejs-schedule>
            </div>
        </div>
    </div>
</template>

Half yearly view in Vue Schedule component

The year view of our scheduler displays all the 365 days and their related appointments of a particular year. You can customize the year view by using the following properties.

- firstMonthOfYear
- monthsCount
- monthHeaderTemplate

In the following code example, you can see how to render only the last six months of a year in the scheduler. To start with the month of June, `firstMonthYear` is set to 6 and `monthsCount` is set to 6 to render only 6 months.

APP.VUE

```
<template>

Set different work hours in Vue Schedule component

By default, the work hours of the Scheduler is highlighted based on the start and end values provided within the workHours property which remains same for all days. To highlight different work hours range for different days,setWorkHours method. You can pass date object/ multiple date objects collection as first argument and start and end time need to be added as work hours should be passed as second and third arguments respectively. In the following code example, on button click 11:00 AM to 08:00 PM of 15th and 17th February has been added in work hours.

APP.VUE

```
<template>
    <div>
        <div id='app'>
            <div id='container'>
                <tr>
                    <td>
                        <div>

Enable scroll option on all day section in Vue Schedule component

When you have larger number of appointments in all-day row, it is difficult to view all the appointments properly. In that case you can enable scroller option for all-day row by setting true to `enableAllDayScroll` whereas its default value is false. When setting this property to true, individual scroller for all-day row is enabled when it reaches its maximum height on expanding.

Note: This property is not applicable for Scheduler with height `auto`.

Two way binding in Vue Schedule component

We can achieve two-way binding with Vue Scheduler by using the v-model directive in Vue. The following Vue Scheduler properties support two-way binding.

- selectedDate
- currentView

Two-Way Binding with Vue Scheduler Component's selectedDate Property

In the following example, when you change the selectedDate value in the Vue Scheduler component, v-model will automatically update the value in the Date picker component, and if you change the value in the Date picker component, it will automatically update the value in the Vue Scheduler.

Copyright © 2001 -2024 Syncfusion Inc.

The following example demonstrates how to set the two-way-binding with the selectedDate property in the Vue Scheduler.

APP.VUE

```
<template>
  <div id='app'>
    <div id='container'>
        <div class='date-picker-container'>
            <ejs-datepicker id='date-picker' placeholder='Selected date'
floatLabelType="Always"  :value='selectedDate' :showClearButton='false' v-
model='selectedDate'>
            </ejs-datepicker>
        </div>
        <div class="schedule-container">
            <ejs-schedule :height='height' :selectedDate='selectedDate' v-
model='selectedDate' :eventSettings='eventSettings'></ejs-schedule>
        </div>
    </div>
  </div>
</template>

You can refer to our Vue Scheduler feature tour page for its groundbreaking feature representations. You can also explore our Vue Scheduler example to knows how to present and manipulate data.

Manual refresh in Vue Schedule component

In Scheduler, we can able to refresh the layout manually without re-render the DOM element by using the refreshLayout public method. The following example code explains to know how to use the refreshLayout method.

Copyright © 2001 -2024 Syncfusion Inc.

APP.VUE

```
<template>
    <div>
        <div id='app'>
            <div id='container'>
                <tr>
                    <td>
                        <div>
                            <ejs-button cssClass='e-info' v-
on:click.native='onRefreshLayout'>Refresh Layout</ejs-button>
                        </div>
                    </td>
                </tr><br>
                <ejs-schedule id='Schedule' width='100%' height='485px'
:eventSettings='eventSettings' :selectedDate='selectedDate'>

Sidebar

Getting Started with the Vue Sidebar Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using Vue-CLI and integrating the Syncfusion Vue Sidebar component using the Composition API / Options API.

Prerequisites

System requirements for Syncfusion Vue UI components

Dependencies

The following list of dependencies are required to use the Sidebar component in your application.

`js

|-- @syncfusion/ej2-vue-navigations

|-- @syncfusion/ej2-base

|-- @syncfusion/ej2-data

|-- @syncfusion/ej2-vue-base

|-- @syncfusion/ej2-navigations

|-- @syncfusion/ej2-inputs

Copyright © 2001 -2024 Syncfusion Inc.

|-- @syncfusion/ej2-splitbuttons

|-- @syncfusion/ej2-lists

|-- @syncfusion/ej2-popups

|-- @syncfusion/ej2-buttons

`

Setting up the Vue 2 project

To generate a Vue 2 project using Vue-CLI, use the vue create command. Follow these steps to install Vue CLI and create a new project:

`bash

npm install -g @vue/cli

vue create quickstart

cd quickstart

npm run serve

`

or

`bash

yarn global add @vue/cli

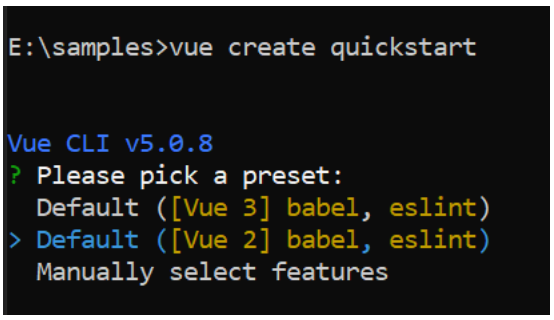
vue create quickstart

cd quickstart

yarn run serve

`

When creating a new project, choose the option Default ([Vue 2] babel, eslint) from the menu.



Once the quickstart project is set up with default settings, proceed to add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion packages are available at npmjs.com. To use Vue components, install the required npm package.

Copyright © 2001 -2024 Syncfusion Inc.

This article uses the Vue Sidebar component as an example. Install the @syncfusion/ej2-vue-navigations package by running the following command:

`bash

npm install @syncfusion/ej2-vue-navigations --save

`

or

`bash

yarn add @syncfusion/ej2-vue-navigations

`

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, the Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the Sidebar component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
navigations/styles/material.css";
</style>
```

Note: If you want to refer the combined component styles, please make use of our CRG (Custom Resource Generator) in your application.

Add Syncfusion Vue component

Follow the below steps to add the Vue Sidebar component using Composition API or Options API:

1\. First, import and register the Sidebar component in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { SidebarComponent as EjsSidebar } from '@syncfusion/ej2-vue-
navigations';
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { SidebarComponent } from '@syncfusion/ej2-vue-navigations';
export default {
```

Copyright © 2001 -2024 Syncfusion Inc.

```
components: {
'ejs-sidebar': SidebarComponent
}
}
</script>
```

2\. In the template section, define the Sidebar component.

~/SRC/APP.VUE

```
<template>
<div id="app">
<ejs-sidebar>
<div class="title"> Sidebar content</div>
</ejs-sidebar>
</div>
</template>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
    <div id="app">
        <div class="wrapper">
            <ejs-sidebar id="default-sidebar">
                <div class="title"> Sidebar content</div>
            </ejs-sidebar>
            <div>
                <div class="title">Main content</div>
                <div class="sub-title">Content goes here.</div>
            </div>
        </div>
    </div>
</template>
<script setup>
import { SidebarComponent as EjsSidebar } from '@syncfusion/ej2-vue-
navigations';
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
navigations/styles/material.css";
.title {
    text-align: center;
    font-size: 20px;
    padding: 15px;
}
.sub-title {
    text-align: center;
    font-size: 16px;
    padding: 10px;
}
#default-sidebar {
    background-color: rgb(25, 118, 210);
```

Copyright © 2001 -2024 Syncfusion Inc.

```
    color: #ffffff;
}
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
    <div id="app">
        <div class="wrapper">
            <ejs-sidebar id="default-sidebar">
                <div class="title"> Sidebar content</div>
            </ejs-sidebar>
            <div>
                <div class="title">Main content</div>
                <div class="sub-title">Content goes here.</div>
            </div>
        </div>
    </div>
</template>
<script>
import { SidebarComponent } from '@syncfusion/ej2-vue-navigations';
export default {
    components: {
        'ejs-sidebar': SidebarComponent
    }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
navigations/styles/material.css";
.title {
    text-align: center;
    font-size: 20px;
    padding: 15px;
}
.sub-title {
    text-align: center;
    font-size: 16px;
    padding: 10px;
}
#default-sidebar {
    background-color: rgb(25, 118, 210);
    color: #ffffff;
}
</style>
```

Run the project

To run the project, use the following command:

`bash

npm run serve

`

or

`bash

yarn run serve

`

{% previewsample "page.domainurl/code-snippet/sidebar/getting-started-cs4" %}

Enable backdrop

Enabling the showBackdrop in the Sidebar component will prevent the main content from user interactions, when it is in expanded state. Here, the DOM elements will not get changed. It only closes the main content by covering with a black backdrop overlay and focuses the Sidebar in the screen. Sidebar can be rendered with specific width by setting `width` property.

Note: To achieve a proper **backdrop**, we suggest that you create a wrapper parent container for the div block in which you intend to enable the backdrop. Set the class name of this parent container as the **target** for the Sidebar. Alternatively, you can place an empty div container after the target container.

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<div id="app">
    <div class="wrapper">
        <ejs-sidebar id="default-sidebar" ref="sidebar"
:showBackdrop="showBackdrop" :closeOnDocumentClick="closeOnDocumentClick">
           <div class="title"> Sidebar content</div>
            <div class="sub-title">
               Click the button to close the Sidebar.
            </div>
            <div class="center-align">
               <button  id="close" v-on:click="closeClick"  class="e-btn
close-btn">Close Sidebar</button>
            </div>
        </ejs-sidebar>
        <div>
            <div class="title">Main content</div>
                <div class="sub-title"> Click the button to open/close the
Sidebar.</div>
                   <div style="padding:20px" class="center-align">
                       <button id="toggle"  class="e-btn e-info" v-
on:click="toggleClick" >Toggle Sidebar</button>
                   </div>

    color: #fafafa;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/sidebar/backdrop-cs1" %}

Position

Positioning the Sidebar to the right or left of the main content can be achieved by using the position property. If the position is not set, the Sidebar will expand from the left to the body element. enablePersistence will persist the component's state between page reloads. change event will be triggered when the state(expand/collapse) of the component is changed.

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<div id="app">
    <ejs-sidebar id="default-sidebar" ref="sidebar" :type="type"
:target="target" :position="position"
:enablePersistence="enablePersistence">

Animate

Animation transitions can be set while expanding or collapsing the Sidebar using the animate property. By default , animate property is set to true. enableRTL will display the sidebar in the right-to-left direction.

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<div id="app">
    <div class="wrapper">
        <ejs-sidebar id="default-sidebar" ref="sidebar" :type="type"
:width="width" :animate="animate" :enableRtl="enableRtl">
           <div class="title"> Sidebar content</div>
            <div class="sub-title">
               Click the button to close the Sidebar
            </div>
            <div class="center-align">
               <button  ejs-button  id="close" v-on:click="closeClick"
class="e-btn close-btn">Close Sidebar</button>
            </div>
        </ejs-sidebar>
        <div>
            <div class="title">Main content</div>
                <div class="sub-title"> Click the button to open/close the
Sidebar.</div>
                    <div style="padding:20px" class="center-align">
                        <button ejs-button id="toggle"  class="e-btn e-info"
v-on:click="toggleClick" >Toggle Sidebar</button>
                    </div>
           </div>
       </div>
    </div>
</template>
<script setup>
import { ref } from 'vue';
import { SidebarComponent as EjsSidebar } from '@syncfusion/ej2-vue-

Close on document click

Sidebar can be closed on document click by setting closeOnDocumentClick to true. If this property is not set, the Sidebar will not close on document click since its default value is false. Sidebar can be kept opened during rendering using isOpen property.

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<div id="app">
    <div class="wrapper">
        <ejs-sidebar id="default-sidebar" ref="sidebar" :width="width"
:type="type" :isOpen="isOpen" :closeOnDocumentClick="closeOnDocumentClick">
           <div class="title"> Sidebar content</div>
        </ejs-sidebar>
        <div>
            <div class="title">Main content</div>
                <div class="sub-title"> Click the button to open the
Sidebar.</div>
                   <div style="padding:20px" class="center-align">
                       <button ejs-button id="toggle"  class="e-btn e-info"
v-on:click="toggleClick" >Open Sidebar</button>
                </div>
           </div>
       </div>
    </div>
</template>

Enable gestures

Expand or collapse the Sidebar while swiping in touch devices using `enableGestures` property. By default, `enableGestures` is set to true.

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<div id="app">
    <div class="wrapper">
        <ejs-sidebar id="default-sidebar" ref="sidebar" :width="width"
:type="type" :enableGestures="enableGestures">
            <div class="title"> Sidebar content</div>
             <div class="sub-title">
                Click the button to close the Sidebar.
             </div>
             <div class="center-align">
                <button  ejs-button  id="close" v-on:click="closeClick"
class="e-btn close-btn">Close Sidebar</button>
             </div>
        </ejs-sidebar>
        <div>
            <div class="title">Main content</div>
                <div class="sub-title"> Click the button to open/close the
Sidebar.</div>
                    <div style="padding:20px" class="center-align">

Getting Started with the Vue Sidebar Component in Vue 3

This article provides a step-by-step guide for setting up a Vite project with a JavaScript environment and integrating the Syncfusion Vue Sidebar component using the Composition API / Options API.

The Composition API is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

The Options API is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

Prerequisites

System requirements for Syncfusion Vue UI components

Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using Vite. To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

`bash

npm create vite@latest

`

or

`bash

yarn create vite

`

Using one of the above commands will lead you to set up additional configurations for the project as below:

1.Define the project name: We can specify the name of the project directly. Let's specify the name of the project as my-project for this article.

`bash

? Project name: » my-project

Copyright © 2001 -2024 Syncfusion Inc.

`

2.Select Vue as the framework. It will create a Vue 3 project.

`bash

? Select a framework: » - Use arrow-keys. Return to submit.

Vanilla

Vue

React

Preact

Lit

Svelte

Others

`

3.Choose JavaScript as the framework variant to build this Vite project using JavaScript and Vue.

`bash

? Select a variant: » - Use arrow-keys. Return to submit.

JavaScript

TypeScript

Customize with create-vue ↗

Nuxt ↗

`

4.Upon completing the aforementioned steps to create the my-project, run the following command to install its dependencies:

`bash

cd my-project

npm install

`

or

`bash

cd my-project

yarn install

`

Now that my-project is ready to run with default settings, let's add Syncfusion components to the project.

Copyright © 2001 -2024 Syncfusion Inc.

Add Syncfusion Vue packages

Syncfusion Vue component packages are available at npmjs.com. To use Syncfusion Vue components in the project, install the corresponding npm package.

This article uses the Vue Sidebar component as an example. To use the Vue Sidebar component in the project, the @syncfusion/ej2-vue-navigations package needs to be installed using the following command:

`bash

npm install @syncfusion/ej2-vue-navigations --save

`

or

`bash

yarn add @syncfusion/ej2-vue-navigations

`

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the Sidebar component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
navigations/styles/material.css";
</style>
```

Add Syncfusion Vue component

Follow the below steps to add the Vue Sidebar component using Composition API or Options API:

1.First, import and register the Sidebar component in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { SidebarComponent as EjsSidebar } from '@syncfusion/ej2-vue-
navigations';
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
import { SidebarComponent } from '@syncfusion/ej2-vue-navigations';
//Component registration
export default {
name: "App",
components: {
"ejs-sidebar": SidebarComponent
}
}
</script>
```

2.Add the component definition in template section.

~/SRC/APP.VUE

```
<template>
<div id="app">
<ejs-sidebar id="default-sidebar">
<div class="title"> Sidebar content</div>
</ejs-sidebar>
<div>
<div class="title">Main content</div>
<div class="sub-title">Content goes here.</div>
</div>
</div>
</template>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<div id="app">
<ejs-sidebar id="default-sidebar">
<div class="title"> Sidebar content</div>
</ejs-sidebar>
<div>
<div class="title">Main content</div>
<div class="sub-title">Content goes here.</div>
</div>
</div>
</template>
<script setup>
import { SidebarComponent as EjsSidebar } from '@syncfusion/ej2-vue-
navigations';
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
navigations/styles/material.css";
#default-sidebar {
background-color: rgb(25, 118, 210);
color: #ffffff;
}
.title {
text-align: center;
font-size: 20px;
```

Copyright © 2001 -2024 Syncfusion Inc.

```
padding: 15px;
}
.sub-title {
text-align: center;
font-size: 16px;
padding: 10px;
}
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<div id="app">
<ejs-sidebar id="default-sidebar">
<div class="title"> Sidebar content</div>
</ejs-sidebar>
<div>
<div class="title">Main content</div>
<div class="sub-title">Content goes here.</div>
</div>
</div>
</template>
<script>

text-align: center;
font-size: 16px;
padding: 10px;
}
</style>
```

Run the project

To run the project, use the following command:

Copyright © 2001 -2024 Syncfusion Inc.

`bash

npm run dev

`

or

`bash

yarn run dev

`

The output will appear as follows:

Enable backdrop

Enabling the showBackdrop in the Sidebar component will prevent the main content from user interactions, when it is in expanded state. Here, the DOM elements will not get changed. It only closes the main content by covering with a black backdrop overlay and focuses the Sidebar in the screen. Sidebar can be rendered with specific width by setting `width` property.

Note: To achieve a proper **backdrop**, we suggest that you create a wrapper parent container for the div block in which you intend to enable the backdrop. Set the class name of this parent container as the **target** for the Sidebar. Alternatively, you can place an empty div container after the target container.

In the following example, the `showBackdrop` and `closeOnDocumentClick` properties are enabled.

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<div id="app">
<div class="wrapper">
<ejs-sidebar id="default-sidebar" :showBackdrop="showBackdrop"
:closeOnDocumentClick="closeOnDocumentClick">
<div class="title"> Sidebar content</div>
</ejs-sidebar>
<div>
<div class="title">Main content</div>
</div>
</div>
```

```
</div>
</template>
<script setup>
import { SidebarComponent as EjsSidebar } from '@syncfusion/ej2-vue-
navigations';
const showBackdrop= true;
const closeOnDocumentClick= true;
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
navigations/styles/material.css";
.title {
text-align: center;
font-size: 20px;
padding: 15px;
}
#default-sidebar {
background-color: rgb(25, 118, 210);
color: #ffffff;
}
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<div id="app">
<div class="wrapper">
<ejs-sidebar id="default-sidebar" :showBackdrop="showBackdrop"
:closeOnDocumentClick="closeOnDocumentClick">
<div class="title"> Sidebar content</div>
</ejs-sidebar>
<div>
<div class="title">Main content</div>
</div>
</div>
</div>
</template>

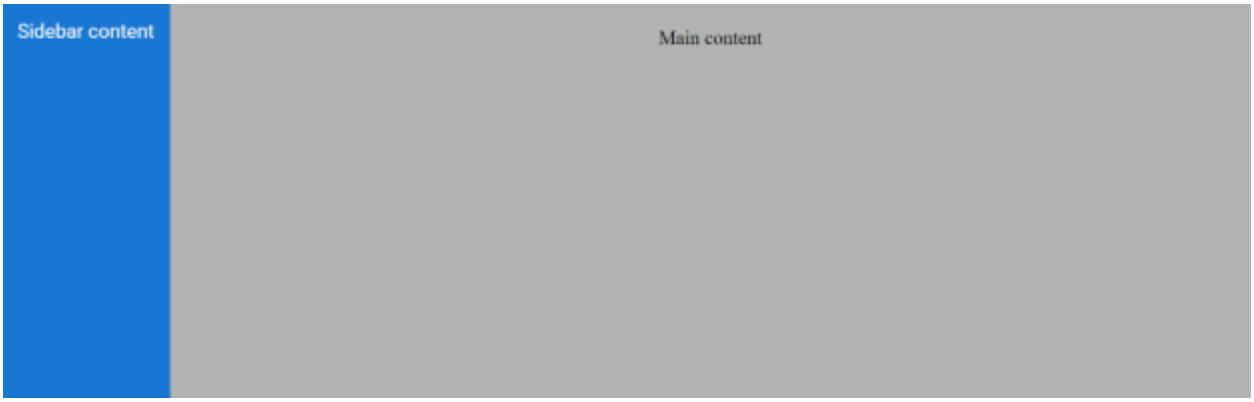
padding: 15px;
}
#default-sidebar {
background-color: rgb(25, 118, 210);
color: #ffffff;
}
</style>
```



Position

Positioning the Sidebar to the right or left of the main content can be achieved by using the position property. If the position is not set, the Sidebar will expand from the left to the body element. enablePersistence will persist the component's state between page reloads. change event will be triggered when the state(expand/collapse) of the component is changed.

In the following example, the position property is set as Right.

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<div id="app">
<div class="wrapper">
<ejs-sidebar id="default-sidebar" :position="position">
<div class="title"> Sidebar content</div>

Animate

Animation transitions can be set while expanding or collapsing the Sidebar using the animate property. By default, animate property is set to true. enableRTL will display the sidebar in the right-to-left direction.

In the following example, the animate property is disabled.

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<div id="app">
<div class="wrapper">
<ejs-sidebar id="default-sidebar" ref="sidebar" :type="type" :width="width"
:animate="animate" :enableRtl="enableRtl">

Close on document click

Sidebar can be closed on document click by setting closeOnDocumentClick to true. If this property is not set, the Sidebar will not close on document click since its default value is false. Sidebar can be kept opened during rendering using isOpen property.

In the following example, the closeOnDocumentClick property is enabled..

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<div id="app">
<div class="wrapper">
<ejs-sidebar id="default-sidebar" ref="sidebar" :width="width" :type="type"

Custom context in Vue Sidebar component

Sidebar has a flexible option to make it initialize, target to any HTML element alongside of the main content of a web page.

By default, Sidebar initializes target to the body element. Using the target property, set target element to initialize the Sidebar inside any HTML element apart from the body element.

If required , zIndex can be set when sidebar act as overlay type.

APP.VUE

```
<template>
<div id="app">
   <ejs-sidebar id="default-sidebar" ref="sidebar" :type="type"
:target="target">
        <div class="title"> Sidebar content</div>
        <div class="sub-title">
           Click the button to close the Sidebar.
        </div>
        <div class="center-align">
          <button ejs-button id="close" v-on:click="closeClick" class="e-btn
close-btn">Close Sidebar</button>
        </div>
    </ejs-sidebar>
        <div id="head">
          <ejs-button id="toggle"  ref="togglebtn" cssClass="e-flat"
iconCss="e-icons burg-icon" isToggle="true" v-
on:click.native="btnClick">Open</ejs-button>
        </div>
        <div>
        <div id="maincontent" class="content">
            <div>
                <div class="title">Main content</div>
```

```
                <div class="center-align">
                   content goes here.
                </div>
            </div>

Variations in Vue Sidebar component

The Sidebar component's expand behaviour can be modified based on the purpose of use.

Expanding types of sidebar

The Sidebar can be set to initialize based on four different types that are consistent with the main component as explained below. When dataBind is invoked, this applies the pending property changes immediately to the component.

| Item | Description |

|-----|-----|

| Over | Sidebar floats over the main content area.|

| Push | Sidebar pushes the main content area to appear side-by-side, and shrinks the main content within the screen width.|

| Slide |Sidebar translates the x and y positions of main content area based on the Sidebar width. The main content area will not be adjusted within the screen width. |

| Auto | Sidebar with Over type in mobile resolution, and Push type in other higher resolutions. |

Auto is the default expand mode.

In the following sample, the types of Sidebar are demonstrated.

APP.VUE

```
<template>
<div id="app">
<ejs-sidebar id="default-sidebar" ref="sidebar" :type="type"
:target="target">
    <div class="title"> Sidebar content</div>
    <div class="sub-title">
        Click the button to close the Sidebar.
    </div>
    <div class="center-align">
        <button ejs-button id="close" v-on:click="closeClick" class="e-btn
close-btn">Close Sidebar</button>
    </div>
</ejs-sidebar>
<div id="head">
    <ejs-button id="toggle" ref="togglebtn"  cssClass="e-flat" iconCss="e-
icons burg-icon" isToggle="true" v-on:click.native="btnClick" >Open</ejs-
button>
</div>
<div>
<div id="maincontent" class="content">
    <div>
        <div class="title">Main content</div>
        <div class="rows">
            <div class="row">
                <ejs-radiobutton id='push' label="Push" name="type"
:change="changeHandler" ></ejs-radiobutton>
            </div>

Auto close in Vue Sidebar component

The Sidebar often behaves differently on mobile display and differently on desktop display. It has an effective feature that offers to set it in opened or closed state depending on the specified resolution. This is achieved through mediaQuery property that allows you to set the Sidebar in an expanded state or collapsed state only in user-defined resolution.

APP.VUE

```
<template>
    <div id="app">
        <ejs-sidebar id="default-sidebar" :width="width"
:mediaQuery="mediaQuery">
            <div class="title"> Sidebar content</div>
        </ejs-sidebar>
        <div>
            <div class="title">Main content</div>
            <div class="sub-title">
                * Sidebar will collapse and expand in based on screen
resolution automatically
            </div>
        </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { SidebarPlugin } from '@syncfusion/ej2-vue-navigations';
Vue.use(SidebarPlugin);
export default {
    data() {
        return {
            width: '280px',
            mediaQuery: window.matchMedia('(min-width: 600px)'),
        }
    }
}
</script>
<style>

Docking sidebar in Vue Sidebar component

Dock state of the Sidebar reserves some space on the page that always remains in a visible state when the Sidebar is collapsed. It is used to show the short term of a content like icons alone instead of lengthy text. To achieve this , set enableDock as true along with required dockSize.

APP.VUE

```
<template>
    <div id="app">
        <div id="wrapper">
            <ejs-sidebar id="dockSidebar" :enableDock='enableDock'
:width='width' :dockSize='dockSize' ref="dockSidebar"
                :position="position">
                <div class="dock">
                    <ul>
                        <li class="sidebar-item" id="toggle" v-
on:click="toggleClick">
                            <span class="e-icons expand"></span>
                            <span class="e-text" title="menu">Menu</span>
                        </li>
                        <li class="sidebar-item">
                            <span class="e-icons home"></span>
                            <span class="e-text" title="home">Home</span>
                        </li>
                        <li class="sidebar-item">
                            <span class="e-icons profile"></span>
                            <span class="e-text"
title="profile">Profile</span>
                        </li>
                        <li class="sidebar-item">
                            <span class="e-icons info"></span>
                            <span class="e-text" title="info">Info</span>
                        </li>
                        <li class="sidebar-item">

- How to add sidebar navigation

Style in Vue Sidebar component

The following content provides the exact CSS structure that can be used to modify the component's appearance based on the user's preference.

Customizing the sidebar

Use the below CSS to customize the sidebar root element.

```
.e-sidebar {
background: #898b2b
}
```

Customizing the sidebar based on the positions

Use the below CSS to customize the left positioned sidebar.

```
.e-sidebar.e-left {
border-right: 2px solid red;
}
```

Use the below CSS to customize the right positioned sidebar.

```
.e-sidebar.e-right {
border-left: 2px solid red;
}
```

Customizing the sidebar based on the active state

Use the below CSS to customize the open state of the left positioned sidebar.

```
.e-sidebar.e-left.e-open {
transition: transform 2.5s ease;
}
```

Use the below CSS to customize the open state of the right positioned sidebar.

```
.e-sidebar.e-right.e-open {
transition: transform 2.5s ease;
```

Copyright © 2001 -2024 Syncfusion Inc.

```
}
```

Use the below CSS to customize the closed state of the left positioned sidebar.

```
.e-sidebar.e-left.e-transition.e-close {
transition: transform 2.5s ease, visibility 1200ms;
}
```

Use the below CSS to customize the closed state of the right positioned sidebar.

```
.e-sidebar.e-right.e-transition.e-close {
transition: transform 2.5s ease, visibility 1200ms;
}
```

Customizing the sidebar with dock state

When you enable the Dock support, the "e-dock" class will be added to the root element. Based on that class, you can also customize all the above stated customization. Use the following CSS to customize the sidebar element with a dock state.

```
.e-sidebar.e-dock {
background: #2d323e;
}
```

Customizing the different types of sidebar

Use the below CSS to customize the auto type sidebar.

```
.e-sidebar.e-left.e-auto {
background-color: pink;
}
```

Use the below CSS to customize the push type sidebar.

```
.e-sidebar.e-left.e-push {
background-color: beige;
```

```
}
```

Use the below CSS to customize the over type sidebar.

```
.e-sidebar.e-left.e-over {
background-color: aqua;
}
```

Use the below CSS to customize the slide type sidebar.

```
.e-sidebar.e-left.e-slide {
background-color: green;
}
```

Customizing the backdrop of the sidebar

Use the below CSS to customize the backdrop of the sidebar.

```
.e-sidebar-overlay {
background-color: aqua;
}
```

Customizing the sidebar in the RTL direction

When you enable the RTL (right to left direction) support, the "e-rtl" class will be added to the root element. Based on that class, you can also customize all the above stated customization. Use the following CSS to customize the sidebar element in the RTL (right to left direction) mode.

```
.e-sidebar.e-left.e-rtl {
background-color: antiquewhite;
}
```

Prevent the animation transition for the Sidebar component

Use the below CSS to prevent the animation transition for the Sidebar component.

```
.e-sidebar-context .e-content-animation {
transition: none !important;
```

transform: none !important;

}

`

Accessibility in Vue Sidebar component

The Sidebar component followed the accessibility guidelines and standards, including ADA, Section 508, WCAG 2.2 standards, and WCAG roles that are commonly used to evaluate accessibility.

The accessibility compliance for the Sidebar component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| WCAG 2.2 Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Section 508 Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Screen Reader Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Right-To-Left Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Color Contrast | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Mobile Device Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Keyboard Navigation Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Accessibility Checker Validation | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Axe-core Accessibility Validation | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> - All features of the component meet the requirement.

<img src="https://cdn.syncfusion.com/content/images/landing-page/intermediate.png" alt="Intermediate"> - Some features of the component do not meet the requirement.

Copyright © 2001 -2024 Syncfusion Inc.

<img src="https://cdn.syncfusion.com/content/images/landing-page/no.png" alt="No"> - The component does not meet the requirement.

WAI-ARIA attributes

The Sidebar component followed the WAI-ARIA patterns to meet accessibility standards. By default, the Sidebar utilizes the complementary role, with the option to modify the ARIA role based on provided attributes to the root element, depending on the specific use case.

If there are multiple complementary landmark roles or aside elements in a document, it is important to provide a label for each landmark using the `aria-label` attribute. Alternatively, if the aside has a descriptive title, it can be referenced using the `aria-labelledby` attribute. This label will help assistive technology users quickly understand the purpose of each landmark.

For optimal accessibility, it is recommended to incorporate a trigger component that is navigable via a keyboard, such as a button. If this is not feasible, inclusion of the `tabIndex` attribute becomes necessary. Furthermore, explicit handling of the `aria-expanded` attribute is required for the trigger element.

Keyboard interaction

The Sidebar component does not have any inbuilt keyboard interaction support. However, you can utilize the keyboard interactions of focusable elements within the Sidebar component.

Ensuring accessibility

The Sidebar component's accessibility levels are ensured through an accessibility-checker and axe-core software tools during automated testing.

The accessibility compliance of the Sidebar component is shown in the following sample. Open the sample in a new window to evaluate the accessibility of the Sidebar component with accessibility tools.

How To

Sidebar with listview in Vue Sidebar component

Any HTML element can be placed in the Sidebar content area. Sidebar supports all types of HTML structures like `TreeView`, `ListView`, etc.

In the following example, the Sidebar is rendered with ListView component in its content area.

APP.VUE

```
<template>
<div id="app">
        <ejs-sidebar id="default-sidebar" ref="sidebar" :width="width"
:type="type">
    <div class="title1">Menu</div>
            <div class="closebtn">
                <button  ejs-button id="close" class="e-btn close-btn" v-
on:click="closeClick">
                    <span id="innerclose" class="e-icons close-icon"></span>
                </button>
```

```
            </div>
            <div id="listcontainer">
          <ejs-listview id='list' :dataSource="dataList" ></ejs-listview>
          </div>
              <div class="sub-title">
                     * ListView component is rendered in the sidebar
container.
                </div>
</ejs-sidebar>
<div>
    <div>
        <div class="title2">Main content</div>
        <div class="sub-title"> Click the button to open/close the Sidebar.
            <div style="padding:20px" class="center-align">
                <button ejs-button id="toggle" class="e-btn e-info" v-
on:click="toggleClick">Toggle Sidebar</button>
            </div>
        </div>
    </div>
</div>
</div>
</template>

Open close sidebar in Vue Sidebar component

Opening and closing the Sidebar can be achieved with built-in public methods.

- show(): Method to open the Sidebar.
- hide(): Method to close the Sidebar.
- toggle(): Method to toggle between open and close states of the Sidebar.

In the following sample, toggle method has been used to show or hide the Sidebar on button click.

APP.VUE

```
<template>
<div id="app">
        <ejs-sidebar id="default-sidebar" ref="sidebar" :open="open"
:close="close" :showBackdrop="showBackdrop">
    <div class="title"> Sidebar content</div>
    <div class="sub-title">
        Click the button to close the Sidebar.
    </div>
    <div class="center-align">
        <button ejs-button id="close" v-on:click="closeClick" class="e-btn
close-btn">Close Sidebar</button>
    </div>
</ejs-sidebar>
<div>
    <div>
        <div class="title">Main content</div>
        <div class="sub-title"> Click the button to Open the Sidebar.
```

```
            <div style="padding:20px" class="center-align">
                <button ejs-button id="open" class="e-btn e-info" v-
on:click="openClick">Open Sidebar</button>
            </div>
        </div>
        <div class="sub-title"> Click the button to open/close the Sidebar.
            <div style="padding:20px" class="center-align">
                <button ejs-button id="toggle" class="e-btn e-info" v-
on:click="toggleClick">Toggle Sidebar</button>
            </div>
        </div>
    </div>
</div>
</template>
<script>

Multiple sidebar in Vue Sidebar component

Two Sidebars can be initialized in a web page with same main content. Sidebars can be initialized on right side or left side of the main content using position property.

The HTML element with class name e-main-content will be considered as the main content and both the Sidebars will behave as side content to this main content area.

APP.VUE

```
<template>
<div id="app">
        <ejs-sidebar id="default" ref="leftsidebar" :width="leftWidth"
:type="leftType">
          <div class="title"> Left Sidebar content</div>

Sidebar with treeview in Vue Sidebar component

The following example demonstrates how to render TreeView component inside the Sidebar with dock state and how to achieve expand and collapse the functionalities simultaneously in the sidebar and Treeview.

On collapse, the LI elements of TreeView show icons only to represent the short sign of the hidden text content. On expand, hidden text content will be set to be visible.

APP.VUE

```
<template>
    <div id="app">
       <div class="col-lg-8 control-section">
           <div class='main-header' id='header-section'>

                <h2 class='sidebar-heading'> Responsive Sidebar With
Treeview</h2>
                <p class='paragraph-content'> This is a graphical aid for
visualising and categorising the site,
                in the style of an expandable and collapsable treeview
component. It auto-expands to display the node(s),
                 if any, corresponding to the currently viewed title,
highlighting that node(s) and its ancestors. Load-on-demand
                 when expanding nodes is available where supported (most
graphical browsers), falling back to a full-page reload.
                 MediaWiki-supported caching, aside from squid, has been
considered so that unnecessary re-downloads of content are
                  avoided where possible. The complete expanded/collapsed
state of the treeview persists across page views in most
                  situations</p>

Fixed sidebar in Vue Sidebar component

The Sidebar does not require any specific style to make it as a fixed one. By default, the Sidebar position will be in fixed state. The following example demonstrates that the Sidebar is rendered with a fixed position. The position of the Sidebar will not change when scrolling the main content area.

APP.VUE

```
<template>
    <div id="app">
       <!-- Declaration of sidebar element-->
        <div class="col-lg-8 control-section">
            <ejs-sidebar  id="default-sidebar" :width='width' >
                <div class="sidebar-header header-cover" style="background-
color:#0378d5">
                    <div class="image-container">
                        <div class="sidebar-image">
                        </div>
                    </div>
                    <div style="padding: 0 0 5px 0;">
                        <a class="sidebar-brand" href="#settings-dropdown">

Sidebar with variation animation in Vue Sidebar component

In the following example, the sidebar is rendered with custom animation effects. Click the buttons available in the main content area to check how the custom animations works with sidebar.

Sidebar will automatically adjust expanding animation to match any custom size specified in CSS styles.

APP.VUE

```
<template>
    <div id="app">
       <div class="col-lg-8 control-section">
           <!-- Declaration of sidebar element-->
            <ejs-sidebar  id="sidebar-element"  class="sidebar"
:showBackdrop="showBackdrop" :closeOnDocumentClick="closeOnDocumentClick"
ref="sidebar" :width="width" >
                <div class="title"> Sidebar content</div>
                <div class="sub-title">
                    * Sidebar is rendered with animation effect
                </div>
                <div class="center-align">
                    <!-- Declaration of button element-->
                    <button  ejs-button  id="close_btn" v-
on:click="closeClick_btn"  class="e-btn close-btn">Close Sidebar</button>
                </div>
            </ejs-sidebar>
            <!-- End of sidebar element-->
        </div>
        <div class="content">
            <div class="title">Sidebar Transitions</div>
            <div class="sub-title"> * Click the below button to render the
Sidebar with animation effect.</div>
            <div class="center-align">
               <!-- Declaration of button element-->
                <button  ejs-button  id="zoom" v-on:click="zoom"  class="e-
btn e-info">Zoom Sidebar</button>
                <button  ejs-button  id="open_door" v-on:click="open_door"
class="e-btn e-info">Open Door</button>
                <button  ejs-button  id="bottom_top" v-on:click="bottom_top"
class="e-btn e-info">Bottom to Top</button>
            </div>
            <div class="center-align">
                <!-- Declaration of button element-->
                <button  ejs-button  id="rotate" v-on:click="rotate"
class="e-btn e-info">Rotate </button>
                <button  ejs-button  id="rotate_3d" v-on:click="rotate_3d"
class="e-btn e-info">Rotate 3D </button>
                <button  ejs-button  id="reverse" v-on:click="reverse"
class="e-btn e-info">Reverse Slide Out </button>
            </div>
        </div>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
    </div>
</template>
<script>
import Vue from 'vue';

Signature

Getting Started with the Vue Signature Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using Vue-CLI and integrating the Syncfusion Vue Signature component using the Composition API / Options APILink to the Video.

To get start quickly with Vue Signature, you can check on this video:

Prerequisites

System requirements for Syncfusion Vue UI components

Dependencies

The list of dependencies required to use the Signature component in your application is given below:

`javascript

|-- @syncfusion/ej2-vue-inputs

|-- @syncfusion/ej2-vue-base

|-- @syncfusion/ej2-base

|-- @syncfusion/ej2-inputs

`

Setting up the Vue 2 project

To generate a Vue 2 project using Vue-CLI, use the vue create command. Follow these steps to install Vue CLI and create a new project:

`bash

npm install -g @vue/cli

vue create quickstart

cd quickstart

npm run serve

`

or

`bash

yarn global add @vue/cli

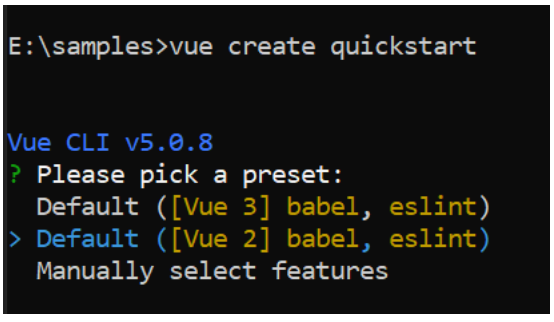
vue create quickstart

cd quickstart

yarn run serve

`

When creating a new project, choose the option Default ([Vue 2] babel, eslint) from the menu.



Once the quickstart project is set up with default settings, proceed to add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion packages are available at npmjs.com. To use Vue components, install the required npm package.

This article uses the Vue Signature component as an example. Install the @syncfusion/ej2-vue-inputs package by running the following command:

`bash

npm install @syncfusion/ej2-vue-inputs --save

`

or

`bash

yarn add @syncfusion/ej2-vue-inputs

`

Add Syncfusion Vue component

Follow the below steps to add the Vue Signature component using Composition API or Options API:

1\. First, import and register the Signature component in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { SignatureComponent as EjsSignature } from '@syncfusion/ej2-vue-
inputs';
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { SignatureComponent } from '@syncfusion/ej2-vue-inputs';
export default {
components: {
'ejs-signature': SignatureComponent
}
}
</script>
```

2\. In the template section define the Signature component.

~/SRC/APP.VUE

```
<template>
<ejs-signature></ejs-signature>
</template>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<div class='wrap'>
    <h4>Sign here</h4>
```

```
    <ejs-signature id="signature"></ejs-signature>
</div>
</template>
<script setup>
import { SignatureComponent as EjsSignature } from '@syncfusion/ej2-vue-
inputs';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
#signature {
    border: 1px solid lightgray;
    height: 100%;
    width: 100%;
}
.wrap {
    height: 300px;
    width: 550px;
}
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<div class='wrap'>
    <h4>Sign here</h4>
    <ejs-signature id="signature"></ejs-signature>
</div>
</template>
<script>
import { SignatureComponent } from '@syncfusion/ej2-vue-inputs';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
export default {
    components: {
        'ejs-signature': SignatureComponent
    }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
#signature {
    border: 1px solid lightgray;
    height: 100%;
    width: 100%;
}
.wrap {
    height: 300px;
    width: 550px;
}
</style>
```

Copyright © 2001 -2024 Syncfusion Inc.

Run the project

To run the project, use the following command:

`bash

npm run serve

`

or

`bash

yarn run serve

`

{% previewsample "page.domainurl/code-snippet/signature/default-cs7" %}

Getting Started with the Vue Signature Component in Vue 3

This article provides a step-by-step guide for setting up a Vite project with a JavaScript environment and integrating the Syncfusion Vue Signature component using the Composition API / Options API.

The Composition API is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

The Options API is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

Prerequisites

System requirements for Syncfusion Vue UI components

Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using Vite. To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

`bash

npm create vite@latest

`

or

`bash

yarn create vite

`

Using one of the above commands will lead you to set up additional configurations for the project as below:

1.Define the project name: We can specify the name of the project directly. Let's specify the name of the project as my-project for this article.

`bash

Copyright © 2001 -2024 Syncfusion Inc.

? Project name: » my-project

`

2.Select Vue as the framework. It will create a Vue 3 project.

`bash

? Select a framework: » - Use arrow-keys. Return to submit.

Vanilla

Vue

React

Preact

Lit

Svelte

Others

`

3.Choose JavaScript as the framework variant to build this Vite project using JavaScript and Vue.

`bash

? Select a variant: » - Use arrow-keys. Return to submit.

JavaScript

TypeScript

Customize with create-vue ↗

Nuxt ↗

`

4.Upon completing the aforementioned steps to create the my-project, run the following command to install its dependencies:

`bash

cd my-project

npm install

`

or

`bash

cd my-project

yarn install

`

Copyright © 2001 -2024 Syncfusion Inc.

Now that my-project is ready to run with default settings, let's add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion Vue component packages are available at npmjs.com. To use Syncfusion Vue components in the project, install the corresponding npm package.

This article uses the Vue Signature component as an example. To use the Vue Signature component in the project, the @syncfusion/ej2-vue-inputs package needs to be installed using the following command:

`bash

npm install @syncfusion/ej2-vue-inputs --save

`

or

`bash

yarn add @syncfusion/ej2-vue-inputs

`

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the Signature component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
</style>
```

The order of importing CSS styles should be in line with its dependency graph.

Add Syncfusion Vue component

Follow the below steps to add the Vue Signature component using Composition API or Options API:

1.First, import and register the Signature component and its child directives in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { SignatureComponent as EjsSignature} from '@syncfusion/ej2-vue-
inputs';
</script>
```

Copyright © 2001 -2024 Syncfusion Inc.

OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { SignatureComponent } from '@syncfusion/ej2-vue-inputs';
//Component registration
export default {
name: "App",
components: {
'ejs-signature': SignatureComponent
}
}
</script>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<div class='wrap'>
<h4>Sign here</h4>
<ejs-signature id="signature"></ejs-signature>
</div>
</template>
<script setup>
import { SignatureComponent as EjsSignature} from '@syncfusion/ej2-vue-
inputs';
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<div class='wrap'>
<h4>Sign here</h4>
<ejs-signature id="signature"></ejs-signature>
</div>
</template>
<script>
import { SignatureComponent } from '@syncfusion/ej2-vue-inputs';
// Component registration
export default {
name: "App",
// Declaring component and its directives
components: {
'ejs-signature': SignatureComponent
},
// Bound properties declarations
data() {
return {
};
}
};
</script>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
#signature {
border: 1px solid lightgray;
height: 100%;
width: 100%;
}
.wrap {
height: 300px;
width: 550px;
}
</style>
```

Run the project

To run the project, use the following command:

`bash

npm run dev

`

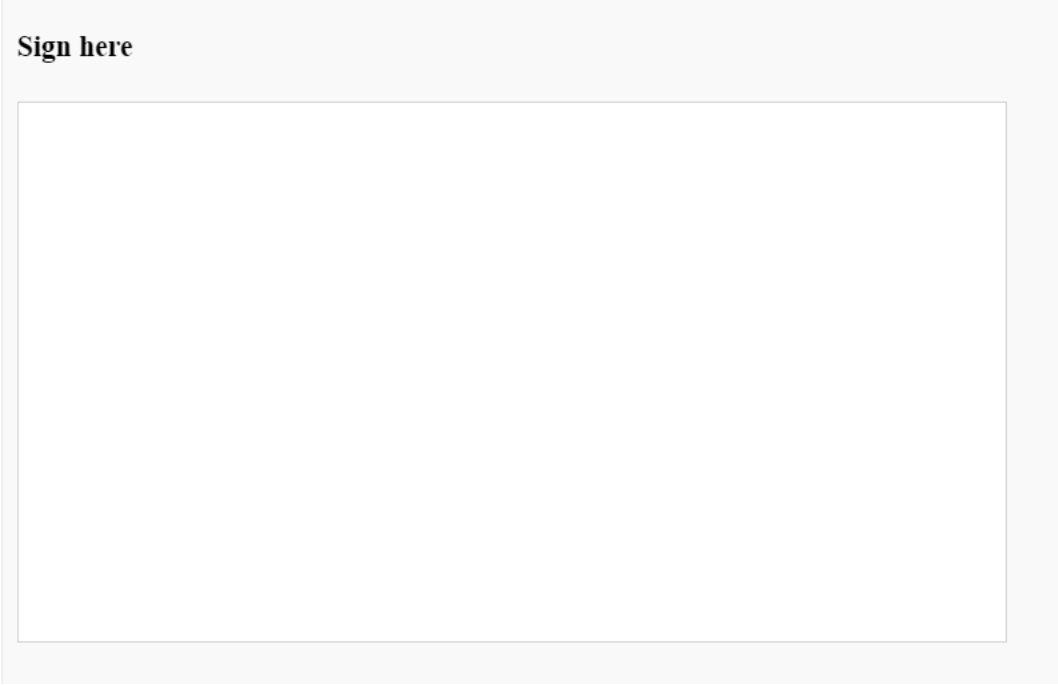
or

`bash

yarn run dev

`

The output will appear as follows:



For migrating from Vue 2 to Vue 3, refer to the migration documentation.

Customization in Vue Signature component

The Signature component draws stroke/path using moveTo() and lineTo() methods to connect one or more points while drawing in canvas. The stroke width can be modified by using its color and width. And the background can be modified by using its background color and background image.

Stroke Width

The variable stroke width is based on the values of maxStrokeWidth, minStrokeWidth and velocity for smoother and realistic signature. The default value of minimum stroke width is set as 0.5, maximum stroke width is set as 2.5 and velocity is set as 0.7.

In the following example, minimum stroke width is set as 0.5, maximum stroke width is set as 3 and velocity is set as 0.7.

APP.VUE

```
<template>
<div class='wrap'>
    <h4>Sign here</h4>
    <ejs-signature id="signature" :maxStrokeWidth="3" :mixStrokeWidth="0.5"
:velocity="0.7"></ejs-signature>
</div>
</template>
<script>
import Vue from 'vue';
import { SignaturePlugin } from '@syncfusion/ej2-vue-inputs';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(SignaturePlugin);
export default {}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
#signature {
    border: 1px solid lightgray;
    height: 100%;
    width: 100%;
}
.wrap {
    height: 300px;
    width: 550px;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/signature/default-cs2" %}

Stroke Color

Color of the stroke can be specified by using strokeColor property and it accepts hexadecimal code, RGB, and text. The default value of this property is “#000000”.

Copyright © 2001 -2024 Syncfusion Inc.

APP.VUE

```
<template>
<div class='wrap'>
    <div id="input">
        <input type="text" id="text" placeholder="Enter the Stroke Color
Value" >
        <ejs-button cssClass="e-primary" v-on:click.native="onSet">Set
Stroke Color</ejs-button>
    </div>
    <div id="signature-control">
        <ejs-signature id="signature"></ejs-signature>
    </div>
</div>
</template>
<script>
import Vue from 'vue';
import { SignaturePlugin } from "@syncfusion/ej2-vue-inputs";
import { ButtonPlugin } from '@syncfusion/ej2-vue-buttons';
import { getComponent } from '@syncfusion/ej2-base';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(SignaturePlugin);
Vue.use(ButtonPlugin);
export default {
   data: function() {
    return {
    };
  },
  methods: {
    onSet: function() {
        var signature = getComponent(document.getElementById('signature'),
'signature');
        var color = document.getElementById('text').value;
        signature.strokeColor = color;
    }
  }
}
</script>
<style>

    height: 300px;
    width: 550px;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/signature/default-cs3" %}

Background Color

Background color of a signature can be specified by using backgroundColor property and it accepts hexadecimal code, RGB, and text. The default value of this property is “#ffffff”.

APP.VUE

```
<template>
<div class='wrap'>
    <div id="input">
        <input type="text" id="text" placeholder="Enter the Background Color Value" >
        <ejs-button cssClass="e-primary" v-on:click.native="onSet">Set Background Color</ejs-button>
    </div>
    <div id="signature-control">
        <ejs-signature id="signature"></ejs-signature>
    </div>
</div>
</template>
<script>
import Vue from 'vue';
import { SignaturePlugin } from "@syncfusion/ej2-vue-inputs";
import { ButtonPlugin } from '@syncfusion/ej2-vue-buttons';
import { getComponent } from '@syncfusion/ej2-base';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(SignaturePlugin);
Vue.use(ButtonPlugin);
export default {
   data: function() {
    return {
    };
  },
  methods: {
    onSet: function() {
        var signature = getComponent(document.getElementById('signature'), 'signature');
        var bgColor = document.getElementById('text').value;
        signature.backgroundColor = bgColor;
    }
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
```

Copyright © 2001 -2024 Syncfusion Inc.

```
#signature {
  border: 1px solid lightgray;
  height: 100%;
  width: 100%;
}
#signature-control {
  height: 250px;
}
#input {
  margin-bottom: 30px;
}
#text {
  height: 30px;
  width: 300px;
}
.wrap {
    height: 300px;
    width: 550px;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/signature/default-cs4" %}

Background Image

Background image of a signature can be specified by using backgroundImage property. The background image can be set by either hosting the image in our local IIS or online image.

APP.VUE

```

Save Signature

The Signature component saves the signature as base64, blob, and image like PNG, JPEG, and SVG.

Save as Base64

The getSignature method is used to get the signature as base64 with the PNG, JPEG, and SVG type. This can be loaded to signature using load method.

APP.VUE

Save with Background

The saveWithBackground property is used to saves the signature with its background and its default value is true. So, by default the signature is saved with its background.

In the following sample, the background color is set as 'rgb(103 58 183)' and save with background as true.

Draw in Vue Signature component

Draw

The draw method is used to drawn a text as signature with different font families like Arial, Serif, with different font sizes. It accepts text, font family, font size as its parameters. The default font family is “Arial”, and the default font size is “30”.

APP.VUE

```
<template>
<div class='wrap'>
    <div id="signature-control">
            <ejs-signature id="signature"></ejs-signature>
        </div>

User interaction in Vue Signature component

The below interactions were available in Signature, and we can walk through one by one.

- Undo and Redo
- Clear
- Disabled
- ReadOnly

Undo and Redo

In the Signature, every action can be maintained as a snap for undo and redo operations. And maintained SnapIndex for indexing the snap collection.

The undo method reverts the last action of signature by decreasing SnapIndex value to index previous snap. Here, canUndo method is used to ensure whether undo can be performed or not.

The redo method reverts the last undo action of the signature by increasing the SnapIndex to get the next snap. Here, canRedo method is used to ensure whether redo can be performed or not.

Clear

The clear method is used to clears the signature and makes the canvas empty. This is also considered in Undo/ Redo. Here, isEmpty method is used to ensure whether the signature is empty or not.

Disabled

The disabled property is used to enables/disables the signature component. In the disabled state, the user is not allowed to draw signature. And it can’t be focused until the user enabled the signature.

ReadOnly

The isReadOnly property is used to enables/disables the ReadOnly Signature. It can be focused but it prevents drawing in Signature.

The following sample explains about user interactions available in signature.

Accessibility in Vue Signature component

The Signature component followed the accessibility guidelines and standards, including ADA, Section 508, WCAG 2.2 standards, and WCAG roles that are commonly used to evaluate accessibility.

The accessibility compliance for the Signature component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| WCAG 2.2 Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Section 508 Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Screen Reader Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Right-To-Left Support | Not Applicable |

| Color Contrast | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Mobile Device Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Keyboard Navigation Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Accessibility Checker Validation | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Axe-core Accessibility Validation | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> - All features of the component meet the requirement.

<img src="https://cdn.syncfusion.com/content/images/landing-page/intermediate.png" alt="Intermediate"> - Some features of the component do not meet the requirement.

<img src="https://cdn.syncfusion.com/content/images/landing-page/no.png" alt="No"> - The component does not meet the requirement.

Keyboard interaction

The Signature component followed the keyboard interaction guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Signature component.

| **Press** | **To do this** |

| --- | --- |

| Ctrl + Z | Undo the last action. |

| Ctrl + Y | Redo the last action. |

| Ctrl + S | To save the signature. |

| delete | Erases all the signature strokes signed by user. |

Ensuring accessibility

The Signature component's accessibility levels are ensured through an accessibility-checker and axe-core software tools during automated testing.

The accessibility compliance of the Signature component is shown in the following sample. Open the sample in a new window to evaluate the accessibility of the Signature component with accessibility tools.

How To

Integrate toolbar in Vue Signature component

The Signature component integrates with the toolbar and the interaction performed using the change event of the toolbar. In that, canUndo, canRedo and isEmpty methods were used to enable/disable undo, redo, and clear buttons.

Skeleton

Getting Started with the Vue Skeleton Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using Vue-CLI and integrating the Syncfusion Vue Skeleton component using the Composition API / Options API.

Prerequisites

System requirements for Syncfusion Vue UI components

Dependencies

The following list of dependencies are required to use the Skeleton component in your application.

`js

|-- @syncfusion/ej2-vue-notifications

|-- @syncfusion/ej2-vue-base

|-- @syncfusion/ej2-base

|-- @syncfusion/ej2-notifications

`

Setting up the Vue 2 project

To generate a Vue 2 project using Vue-CLI, use the vue create command. Follow these steps to install Vue CLI and create a new project:

`bash

npm install -g @vue/cli

vue create quickstart

cd quickstart

npm run serve

`

or

`bash

yarn global add @vue/cli

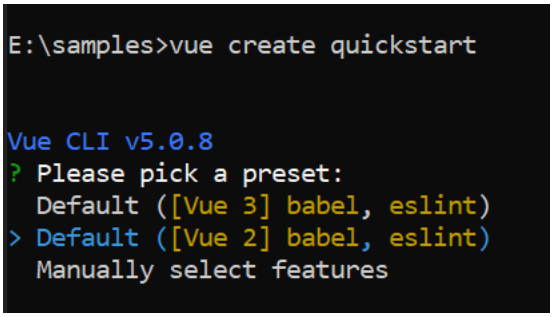
vue create quickstart

cd quickstart

yarn run serve

`

When creating a new project, choose the option Default ([Vue 2] babel, eslint) from the menu.



Once the quickstart project is set up with default settings, proceed to add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion packages are available at npmjs.com. To use Vue components, install the required npm package.

This article uses the Vue Skeleton component as an example. Install the @syncfusion/ej2-vue-notifications package by running the following command:

`bash

npm install @syncfusion/ej2-vue-notifications --save

`

or

`bash

yarn add @syncfusion/ej2-vue-notifications

`

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, the Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the Skeleton component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
```

Copyright © 2001 -2024 Syncfusion Inc.

```
@import "../node_modules/@syncfusion/ej2-notifications/styles/material.css";
</style>
```

Add Syncfusion Vue component

Follow the below steps to add the Vue Skeleton component using Composition API or Options API:

1\. First, import and register the Skeleton component in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { SkeletonComponent as EjsSkeleton } from "@syncfusion/ej2-vue-notifications";
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { SkeletonComponent } from "@syncfusion/ej2-vue-notifications";
export default {
components: {
'ejs-skeleton': SkeletonComponent
}
}
</script>
```

2\. In the template section, define the Skeleton component with the height property.

~/SRC/APP.VUE

```
<template>
<div>
<ejs-skeleton height='15px'></ejs-skeleton>
</div>
</template>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
    <div>
        <ejs-skeleton height='15px'></ejs-skeleton>
    </div>
</template>
<script setup>
import { SkeletonComponent as EjsSkeleton } from "@syncfusion/ej2-vue-notifications";
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
```

Copyright © 2001 -2024 Syncfusion Inc.

```
    @import "../node_modules/@syncfusion/ej2-
notifications/styles/material.css";
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
    <div>
        <ejs-skeleton height='15px'></ejs-skeleton>
    </div>
</template>
<script>
    import { SkeletonComponent } from "@syncfusion/ej2-vue-notifications";
    export default {
        components: {
            'ejs-skeleton': SkeletonComponent
        },
        data: function () {
            return {};
        }
    }
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
    @import "../node_modules/@syncfusion/ej2-
notifications/styles/material.css";
</style>
```

Run the project

To run the project, use the following command:

`bash

npm run serve

`

or

`bash

yarn run serve

`

{% previewsample "page.domainurl/code-snippet/skeleton/getting-started-cs1" %}

Getting Started with Syncfusion Skeleton Component in Vue 3

This article provides a step-by-step guide for setting up a Vite project with a JavaScript environment and integrating the Syncfusion Vue Skeleton component using the Composition API / Options API.

The Composition API is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

Copyright © 2001 -2024 Syncfusion Inc.

The Options API is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

Prerequisites

System requirements for Syncfusion Vue UI components

Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using Vite. To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

`bash

npm create vite@latest

`

or

`bash

yarn create vite

`

Using one of the above commands will lead you to set up additional configurations for the project as below:

1.Define the project name: We can specify the name of the project directly. Let's specify the name of the project as my-project for this article.

`bash

? Project name: » my-project

`

2.Select Vue as the framework. It will create a Vue 3 project.

`bash

? Select a framework: » - Use arrow-keys. Return to submit.

Vanilla

Vue

React

Preact

Lit

Svelte

Others

`

3.Choose JavaScript as the framework variant to build this Vite project using JavaScript and Vue.

`bash

? Select a variant: » - Use arrow-keys. Return to submit.

JavaScript

TypeScript

Customize with create-vue ↗

Nuxt ↗

`

4.Upon completing the aforementioned steps to create the my-project, run the following command to install its dependencies:

`bash

cd my-project

npm install

`

or

`bash

cd my-project

yarn install

`

Now that my-project is ready to run with default settings, let's add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion Vue component packages are available at npmjs.com. To use Syncfusion Vue components in the project, install the corresponding npm package.

This article uses the Vue Skeleton component as an example. To use the Vue Skeleton component in the project, the @syncfusion/ej2-vue-notifications package needs to be installed using the following command:

`bash

npm install @syncfusion/ej2-vue-notifications --save

`

or

`bash

yarn add @syncfusion/ej2-vue-notifications

`

Adding CSS reference for Syncfusion Vue Skeleton component

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

Copyright © 2001 -2024 Syncfusion Inc.

In this article, Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the Button component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
notifications/styles/material.css";
</style>
```

Adding Syncfusion Vue Skeleton component in the application

Follow the below steps to add the Vue Skeleton component using Composition API or Options API:

1. First, import and register the Skeleton component in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { SkeletonComponent as EjsSkeleton } from "@syncfusion/ej2-vue-
notifications";
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { SkeletonComponent } from '@syncfusion/ej2-vue-notifications';
// Component registration
export default {
name: "App",
components: {
'ejs-skeleton': SkeletonComponent
}
}
</script>
```

2. Add the component definition in template section.

~/SRC/APP.VUE

```
<template>
<div>
<ejs-skeleton height='15px'></ejs-skeleton>
</div>
</template>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

Copyright © 2001 -2024 Syncfusion Inc.

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<div>
<ejs-skeleton height='15px'></ejs-skeleton>
</div>
</template>
<script setup>
import { SkeletonComponent as EjsSkeleton } from "@syncfusion/ej2-vue-
notifications";
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
notifications/styles/material.css";
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<div>
<ejs-skeleton height='15px'></ejs-skeleton>
</div>
</template>
<script>
import { SkeletonComponent } from '@syncfusion/ej2-vue-notifications';
// Component registration
export default {
name: "App",
components: {
'ejs-skeleton': SkeletonComponent
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
notifications/styles/material.css";
</style>
```

Skeleton Shapes

The shape property can be used to display skeleton in different shapes like circle, square, rectangle and text.

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<div class="control-section">
<div style="width: 200px">
<ejs-skeleton style="margin-right: 30px" shape="Circle" width="48px"></ejs-
skeleton>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
<ejs-skeleton shape="Square" width="48px"></ejs-skeleton>
<br /><br />
<ejs-skeleton height="15px"></ejs-skeleton>
<br /><br />
<ejs-skeleton shape="Rectangle" height='50px'></ejs-skeleton>
</div>
</div>
</template>
<script setup>
import { SkeletonComponent as EjsSkeleton} from '@syncfusion/ej2-vue-
notifications';
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
notifications/styles/material.css";
.control-section {
padding: 20px;
}
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<div class="control-section">
<div style="width: 200px">
<ejs-skeleton style="margin-right: 30px" shape="Circle" width="48px"></ejs-
skeleton>
<ejs-skeleton shape="Square" width="48px"></ejs-skeleton>
<br /><br />
<ejs-skeleton height="15px"></ejs-skeleton>
<br /><br />
<ejs-skeleton shape="Rectangle" height='50px'></ejs-skeleton>
</div>
</div>
</template>
<script>
import { SkeletonComponent } from '@syncfusion/ej2-vue-notifications';
// Component registration
export default {
name: "App",
components: {
'ejs-skeleton': SkeletonComponent
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
notifications/styles/material.css";
.control-section {
padding: 20px;
}
</style>
```

Copyright © 2001 -2024 Syncfusion Inc.

Run the project

To run the project, use the following command:

`bash

npm run dev

`

or

`bash

yarn run dev

`

The output will appear as follows:

For migrating from Vue 2 to Vue 3, refer to the migration documentation.

Shapes in Vue Skeleton component

The Skeleton control support various built-in shape variants to design layout of the page. You can use the shape property to create a preview of any layout.

The Skeleton component supports the following content shapes:

Circle skeleton shape

`

<template>

<ejs-skeleton shape= 'Circle' width= "48px"></ejs-skeleton>

</template>

Copyright © 2001 -2024 Syncfusion Inc.

```
<script>
import Vue from 'vue';
import { SkeletonPlugin } from "@syncfusion/ej2-vue-notifications";
Vue.use(SkeletonPlugin);
export default { }
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-notifications/styles/material.css";
</style>
`
```

Square skeleton shape

```
`
<template>
<div>
<ejs-skeleton shape= 'Square' width= "48px"></ejs-skeleton>
</div>
</template>
<script>
import Vue from 'vue';
import { SkeletonPlugin } from "@syncfusion/ej2-vue-notifications";
Vue.use(SkeletonPlugin);
export default { }
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-notifications/styles/material.css";
</style>
`
```

Rectangle skeleton shape

```
`
<template>
<div>
<ejs-skeleton shape= 'Rectangle' width= "50px"></ejs-skeleton>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
</div>
</template>
<script>
import Vue from 'vue';
import { SkeletonPlugin } from "@syncfusion/ej2-vue-notifications";
Vue.use(SkeletonPlugin);
export default { }
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-notifications/styles/material.css";
</style>
`
```

Text skeleton shape

```
`
<template>
<div>
<ejs-skeleton shape= 'Text' width= "15px"></ejs-skeleton>
</div>
</template>
<script>
import Vue from 'vue';
import { SkeletonPlugin } from "@syncfusion/ej2-vue-notifications";
Vue.use(SkeletonPlugin);
export default { }
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-notifications/styles/material.css";
</style>
`
```

Below example demonstrates the above functionalities of a Skeleton component.

APP.VUE

```
      display: flex;
      justify-content: space-between;
    }
</style>
```

{% previewsample "page.domainurl/code-snippet/skeleton/shapes-cs1" %}

Shimmer effect in Vue Skeleton component

You can use the shimmerEffect property to change animation effect in the skeleton control. Skeleton supports Wave, Pulse and Fade effects and by default, the shimmerEffect is set to Wave effect.

`

<template>

<ejs-skeleton shape= 'Circle' width= "60px" shimmerEffect= 'Pulse'></ejs-skeleton>

</template>

<script>

import Vue from 'vue';

import { SkeletonPlugin } from "@syncfusion/ej2-vue-notifications";

Vue.use(SkeletonPlugin);

export default { }

</script>

<style>

@import "../node_modules/@syncfusion/ej2-base/styles/material.css";

@import "../node_modules/@syncfusion/ej2-notifications/styles/material.css";

</style>

`

Below example demonstrates a list with pulse effect skeleton.

APP.VUE

```
<template>
    <div>
        <ul id="skeleton-list" class="e-card">
            <li>
                <div class='listProfile'>
                    <ejs-skeleton shape="Circle" width="40px"
shimmerEffect='Pulse'></ejs-skeleton>
                </div>
                <div>
                    <ejs-skeleton width="60%" height='15px'
shimmerEffect='Pulse'></ejs-skeleton><br>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
                    <ejs-skeleton width="40%" height='15px'
shimmerEffect='Pulse'></ejs-skeleton>
                </div>
            </li>
            <li>
                <div class='listProfile'>
                    <ejs-skeleton shape="Circle" width="40px"
shimmerEffect='Pulse'></ejs-skeleton>
                </div>
                <div>
                    <ejs-skeleton width="60%" height='15px'
shimmerEffect='Pulse'></ejs-skeleton><br>
                    <ejs-skeleton width="40%" height='15px'
shimmerEffect='Pulse'></ejs-skeleton>
                </div>
            </li>
        </ul>
    </div>
</template>
<script>
    import Vue from 'vue';
    import { SkeletonPlugin } from "@syncfusion/ej2-vue-notifications";
    Vue.use(SkeletonPlugin);
    export default {
        data: function () {
            return {};
        }
    }
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
    @import "../node_modules/@syncfusion/ej2-
notifications/styles/material.css";

Styles in Vue Skeleton component

You can customize skeleton control in the below ways.

Copyright © 2001 -2024 Syncfusion Inc.

cssClass

You can customize the style of a Skeleton control by using cssClass. The appearance of Vue Skeleton can be customized by changing the wave color, background color, width, and height. For detailed information, refer index.css file below.

APP.VUE

```
<template>
    <div>
        <ejs-skeleton shape= 'Circle' width= "60px" cssClass= "e-customize"></ejs-skeleton>
    </div>
</template>
<script>
    import Vue from 'vue';
    import { SkeletonPlugin } from "@syncfusion/ej2-vue-notifications";
    Vue.use(SkeletonPlugin);
    export default { }
</script>
<style>
    @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
    @import "../node_modules/@syncfusion/ej2-notifications/styles/material.css";
    .e-customize.e-skeleton.e-shimmer-wave::after{
    background-image: linear-gradient(90deg, transparent calc(50% - 100px),
    rgb(30 128 234 / 50%) 50%,
    transparent calc(50% + 100px));
    }
    .e-customize.e-skeleton.e-skeleton-circle{
        background-color: #a8c1f2;
    }
</style>
```

{% previewsample "page.domainurl/code-snippet/skeleton/styles-cs1" %}

Visible

You can use the visible property which defines the visible state of Skeleton.

`

<template>

<ejs-skeleton shape= 'Circle' width= "60px" visible='false'></ejs-skeleton>

</template>

<script>

import Vue from 'vue';

import { SkeletonPlugin } from "@syncfusion/ej2-vue-notifications";

Vue.use(SkeletonPlugin);

export default { }

Copyright © 2001 -2024 Syncfusion Inc.

```
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-notifications/styles/material.css";
</style>
`
```

Accessibility in Vue Skeleton component

Accessibility is achieved in the Skeleton component through WAI-ARIA standard. The Skeleton component can be effectively accessed through assistive technologies such as screen readers.

ARIA attributes

The Skeleton component characterized with complete ARIA accessibility support that helps to be accessible by on-screen readers and other assistive technology devices. The following ARIA attributes are applicable for Skeleton component based on its state.

Properties	Functionality
role	This attribute is added to the input element to describe the actual role.
aria-label	Attribute provides the text label with some default description for the Skeleton.
aria-live	The aria-live attribute indicates the priority of updates to a live region.
aria-busy	This attribute is set to true when component is shown.

Smith Chart

Getting Started with the Vue Smithchart Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using Vue-CLI and integrating the Syncfusion Vue Smithchart component

Prerequisites

System requirements for Syncfusion Vue UI components

Dependencies

The following list of minimum dependencies are required to use the Smith chart:

```
`javascript
|-- @syncfusion/ej2-vue-charts
|-- @syncfusion/ej2-charts
|-- @syncfusion/ej2-base
|-- @syncfusion/ej2-data
|-- @syncfusion/ej2-svg-base
|-- @syncfusion/ej2-pdf-export
|-- @syncfusion/ej2-compression
```

Copyright © 2001 -2024 Syncfusion Inc.

|-- @syncfusion/ej2-file-utils

|-- @syncfusion/ej2-vue-base

`

Setting up the Vue 2 project

To generate a Vue 2 project using Vue-CLI, use the vue create command. Follow these steps to install Vue CLI and create a new project:

`bash

npm install -g @vue/cli

vue create quickstart

cd quickstart

npm run serve

`

or

`bash

yarn global add @vue/cli

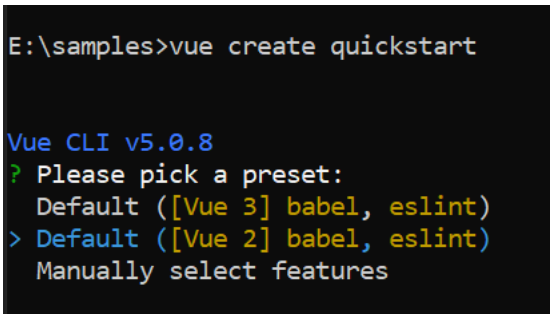
vue create quickstart

cd quickstart

yarn run serve

`

When creating a new project, choose the option `Default ([Vue 2] babel, eslint)` from the menu.



Once the `quickstart` project is set up with default settings, proceed to add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion packages are available at npmjs.com. To use Vue components, install the required npm package.

This article uses the Vue Smithchart component as an example. Install the `@syncfusion/ej2-vue-charts` package by running the following command:

`bash

npm install @syncfusion/ej2-vue-charts --save

`

or

`bash

yarn add @syncfusion/ej2-vue-charts

`

Add Syncfusion Vue component

Follow the below steps to add the Vue Smithchart component:

1\. First, import and register the Smithchart component in the script section of the **src/App.vue** file.

~SRC/APP.VUE

```
<script>
import { SmithchartComponent } from "@syncfusion/ej2-vue-charts";
export default {
components: {
'ejs-smithchart': SmithchartComponent
}
}
</script>
```

2\. In the template section, define the Smithchart component.

~SRC/APP.VUE

```
<template>
<div id="app">
<ejs-smithchart></ejs-smithchart>
</div>
</template>
```

Run the project

To run the project, use the following command:

`bash

npm run serve

`

or

`bash

yarn run serve

`

The following example shows a basic Smith chart.

`

<template>

Copyright © 2001 -2024 Syncfusion Inc.

```
<ejs-smithchart id="smithchart"></ejs-smithchart>
</template>
<script>
import { SmithchartComponent } from '@syncfusion/ej2-vue-charts';
export default {
components: {
'ejs-smithchart': SmithchartComponent
}
}
</script>
`
```

Module Injection

The smith chart component is segregated into individual feature-wise modules. To use a particular feature, inject its feature module using the provide option on component creation. The module available in smith chart and its descriptions is as follows.

- SmithchartLegend - Inject this provider to use legend feature.
- TooltipRender - Inject this provider to use tooltip feature.

In the current application, the above basic Smith chart is modified to visualize transmission lines. For this application, the tooltip and legend features of the Smith chart are used. The feature modules available in the Smith chart and their descriptions are as follows.

Now, import the above mentioned modules from the Smithchart package, and inject it into the Smith chart control using the provide option.

```
`
<template>
<div class="control_wrapper">
<ejs-smithchart id="smithchart"></ejs-smithchart>
</div>
</template>
<script>
import { SmithchartComponent, SmithchartLegend, TooltipRender } from "@syncfusion/ej2-vue-charts";
export default {
components: {
'ejs-smithchart': SmithchartComponent
},
```

Copyright © 2001 -2024 Syncfusion Inc.

data: function() {

return {

}

},

provide:{

smithchart:[Legend, TooltipRender]

}

}

</script>

`

Add series to Smith chart

The Smith chart has the following two type of specification for adding series:

- dataSource - Data object can be bound directly by specifying the resistance and reactance values.
- points - Collection of resistance and reactance values can be bound directly to render the series.

The following two ways demonstrate adding two series to the Smith chart.

- First series Transmission1 shows dataSource bound series.
- Second series Transmission2 shows points bound series.

~/SRC/APP.VUE

```
<template>
    <div class="control_wrapper">
        <ejs-smithchart id="smithchart">
                <e-seriesCollection>
                    <e-series :dataSource='dataSource' :name='name'
:reactance='reactance' :resistance='resistance'></e-series>
                    <e-series :points='points' :name='name2'></e-series>
                </e-seriesCollection>
        </ejs-smithchart>
    </div>
</template>
<script>
import { SmithchartComponent, SeriesDirective, SeriesCollectionDirective }
from "@syncfusion/ej2-vue-charts";
export default {
  components: {
    'ejs-smithchart': SmithchartComponent,
    'e-series': SeriesDirective,
    'e-seriesCollection': SeriesCollectionDirective
  },
  data: function() {
    return {
      dataSource: [
```

```
                { resistance: 0, reactance: 0.05 }, { resistance: 0,
reactance: 0.05 },
                { resistance: 0, reactance: 0.05 }, { resistance: 0,
reactance: 0.05 },
                { resistance: 0, reactance: 0.05 }, { resistance: 0,
reactance: 0.05 },
                { resistance: 0, reactance: 0.05 }, { resistance: 0,
reactance: 0.05 },
                { resistance: 0, reactance: 0.05 }, { resistance: 0,
reactance: 0.05 },
                { resistance: 0.3, reactance: 0.1 }, { resistance: 0.5,
reactance: 0.2 },
                { resistance: 1.5, reactance: 0.5 }, { resistance: 2.0,
reactance: 0.5 },
                { resistance: 2.5, reactance: 0.4 }, { resistance: 3.5,
reactance: 0.0 },
                { resistance: 2.5, reactance: 0.4 }, { resistance: 3.5,
reactance: 0.0 },
                { resistance: 2.5, reactance: 0.4 }, { resistance: 3.5,
reactance: 0.0 },
                { resistance: 4.5, reactance: -0.5 }, { resistance: 5.0,
reactance: -1.0 }
            ],
            name: 'Transmission1',
            reactance: 'reactance', resistance: 'resistance',
            points: [{ resistance: 0, reactance: 0.15 }, { resistance: 0,
reactance: 0.15 },
            { resistance: 0, reactance: 0.15 }, { resistance: 0.3,
reactance: 0.2 },
            { resistance: 0.3, reactance: 0.2 }, { resistance: 0.3,
reactance: 0.2 },
            { resistance: 0.3, reactance: 0.2 }, { resistance: 0.3,
reactance: 0.2 },
            { resistance: 0.5, reactance: 0.4 }, { resistance: 1.0,
reactance: 0.8 },
            { resistance: 2.5, reactance: 1.3 }, { resistance: 3.5,
reactance: 1.6 },
            { resistance: 3.5, reactance: 1.6 }, { resistance: 3.5,
reactance: 1.6 },
            { resistance: 4.5, reactance: 2.0 }, { resistance: 6.0,
reactance: 4.5 },
            { resistance: 8, reactance: 6 }, { resistance: 10, reactance: 25
}],
            name2: 'Transmission2'
    }
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/smithchart/getting-started-cs1" %}

Add title to Smith chart

The following APIs are used in the Smith chart:

- `title` - Adds title to the Smith chart.

Copyright © 2001 -2024 Syncfusion Inc.

- text - Sets text to the title.
- visible - Toggles the title.

~/SRC/APP.VUE

```
<template>
    <div class="control_wrapper">
        <ejs-smithchart id="smithchart" :title='title'>
                <e-seriesCollection>
                    <e-series :dataSource='dataSource' :name='name'
:reactance='reactance' :resistance='resistance'></e-series>
                    <e-series :points='points' :name='name2'></e-series>
                </e-seriesCollection>
        </ejs-smithchart>
    </div>
</template>
<script>
import { SmithchartComponent, SeriesDirective, SeriesCollectionDirective }
from "@syncfusion/ej2-vue-charts";
export default {
  components: {
    'ejs-smithchart': SmithchartComponent,
    'e-series': SeriesDirective,
    'e-seriesCollection': SeriesCollectionDirective
  },
  data: function() {
    return {
      title: { text: 'Transmission lines applied for both impedance and
admittance'},
      dataSource: [
                { resistance: 0, reactance: 0.05 }, { resistance: 0,
reactance: 0.05 },
                { resistance: 0, reactance: 0.05 }, { resistance: 0,
reactance: 0.05 },
                { resistance: 0, reactance: 0.05 }, { resistance: 0,

Enable marker to the Smith chart

To use marker in series and its customization in Smith chart, use series `marker` API. To display marker for a particular series, specify the `marker visible` to true. The following sample marker is enabled for the first series only.

~/SRC/APP.VUE

```
<template>
    <div class="control_wrapper">
        <ejs-smithchart id="smithchart">
                <e-seriesCollection>
                    <e-series :title='title' :dataSource='dataSource'
:name='name' :reactance='reactance' :resistance='resistance'
:marker='marker'></e-series>
                    <e-series :points='points' :name='name2'></e-series>
                </e-seriesCollection>
        </ejs-smithchart>
    </div>
</template>
<script>
import { SmithchartComponent, SeriesDirective, SeriesCollectionDirective }
from "@syncfusion/ej2-vue-charts";
export default {
  components: {
    'ejs-smithchart': SmithchartComponent,
    'e-series': SeriesDirective,
    'e-seriesCollection': SeriesCollectionDirective
  },
  data: function() {
    return {
```

Copyright © 2001 -2024 Syncfusion Inc.

```
        title: { text: 'Transmission lines applied for both impedance and
admittance'},
        dataSource: [
                { resistance: 0, reactance: 0.05 }, { resistance: 0,
reactance: 0.05 },
                { resistance: 0, reactance: 0.05 }, { resistance: 0,
reactance: 0.05 },
                { resistance: 0, reactance: 0.05 }, { resistance: 0,
reactance: 0.05 },
                { resistance: 0, reactance: 0.05 }, { resistance: 0,
reactance: 0.05 },
                { resistance: 0, reactance: 0.05 }, { resistance: 0,
reactance: 0.05 },
                { resistance: 0.3, reactance: 0.1 }, { resistance: 0.5,
reactance: 0.2 },
                { resistance: 1.5, reactance: 0.5 }, { resistance: 2.0,
reactance: 0.5 },
                { resistance: 2.5, reactance: 0.4 }, { resistance: 3.5,
reactance: 0.0 },
                { resistance: 2.5, reactance: 0.4 }, { resistance: 3.5,
reactance: 0.0 },
                { resistance: 2.5, reactance: 0.4 }, { resistance: 3.5,
reactance: 0.0 },
                { resistance: 4.5, reactance: -0.5 }, { resistance: 5.0,
reactance: -1.0 }
            ],
        name: 'Transmission1',
        reactance: 'reactance', resistance: 'resistance',
        marker: {
                visible: true
        },
        points: [{ resistance: 0, reactance: 0.15 }, { resistance: 0,
reactance: 0.15 },
            { resistance: 0, reactance: 0.15 }, { resistance: 0.3,
reactance: 0.2 },
            { resistance: 0.3, reactance: 0.2 }, { resistance: 0.3,
reactance: 0.2 },
            { resistance: 0.3, reactance: 0.2 }, { resistance: 0.3,
reactance: 0.2 },
            { resistance: 0.5, reactance: 0.4 }, { resistance: 1.0,
reactance: 0.8 },
            { resistance: 2.5, reactance: 1.3 }, { resistance: 3.5,
reactance: 1.6 },
            { resistance: 3.5, reactance: 1.6 }, { resistance: 3.5,
reactance: 1.6 },
            { resistance: 4.5, reactance: 2.0 }, { resistance: 6.0,
reactance: 4.5 },
            { resistance: 8, reactance: 6 }, { resistance: 10, reactance: 25
}],
            name2: 'Transmission2'
    }
  }
}
</script>
```

Enable data label to marker

To use marker data label and its customization in Smith chart, use marker dataLabel. To display data label for a particular series marker, specify the dataLabel visible to true in that series marker. The following sample data label is enabled for the first series.

~/SRC/APP.VUE

```
<template>
    <div class="control_wrapper">
        <ejs-smithchart id="smithchart">
                <e-seriesCollection>
                    <e-series :title='title' :dataSource='dataSource'
:name='name' :reactance='reactance' :resistance='resistance'
:marker='marker'></e-series>
                    <e-series :points='points' :name='name2'></e-series>
                </e-seriesCollection>
        </ejs-smithchart>
    </div>
</template>
<script>
import { SmithchartComponent, SeriesDirective, SeriesCollectionDirective }
from "@syncfusion/ej2-vue-charts";
export default {
  components: {
    'ejs-smithchart': SmithchartComponent,
    'e-series': SeriesDirective,
    'e-seriesCollection': SeriesCollectionDirective
  },
  data: function() {
    return {
        title: { text: 'Transmission lines applied for both impedance and
admittance'},
        dataSource: [
                { resistance: 0, reactance: 0.05 }, { resistance: 0,
reactance: 0.05 },
                { resistance: 0, reactance: 0.05 }, { resistance: 0,
reactance: 0.05 },
                { resistance: 0, reactance: 0.05 }, { resistance: 0,
reactance: 0.05 },
                { resistance: 0, reactance: 0.05 }, { resistance: 0,
reactance: 0.05 },
                { resistance: 0, reactance: 0.05 }, { resistance: 0,
reactance: 0.05 },
                { resistance: 0.3, reactance: 0.1 }, { resistance: 0.5,
reactance: 0.2 },

Enable legend for Smith chart

The legend feature is used to denote the corresponding series. To enable the legend, inject the SmithchartLegend module using the provide option and set visible to true in legendSettings. The following sample shows enabling legend for Smith chart. The series name can be customized using the series name.

~/SRC/APP.VUE

```
<template>
    <div class="control_wrapper">
        <ejs-smithchart id="smithchart" :legendSettings='legendSettings'>
                <e-seriesCollection>
                    <e-series :title='title' :dataSource='dataSource'
:name='name' :reactance='reactance' :resistance='resistance'
marker='marker'></e-series>
                    <e-series :points='points' :name='name2'></e-series>
                </e-seriesCollection>
        </ejs-smithchart>
    </div>
</template>

Getting Started with the Vue Smith Chart Component in Vue 3

This article provides a step-by-step guide for setting up a Vite project with a JavaScript environment and integrating the Syncfusion Vue Smith Chart component using the Composition API / Options API.

The Composition API is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

The Options API is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

Prerequisites

System requirements for Syncfusion Vue UI components

Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using Vite. To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

`bash

npm create vite@latest

`

or

`bash

yarn create vite

`

Using one of the above commands will lead you to set up additional configurations for the project as below:

1.Define the project name: We can specify the name of the project directly. Let's specify the name of the project as my-project for this article.

`bash

? Project name: » my-project

`

2.Select Vue as the framework. It will create a Vue 3 project.

`bash

? Select a framework: » - Use arrow-keys. Return to submit.

Copyright © 2001 -2024 Syncfusion Inc.

Vanilla

Vue

React

Preact

Lit

Svelte

Others

`

3.Choose JavaScript as the framework variant to build this Vite project using JavaScript and Vue.

`bash

? Select a variant: » - Use arrow-keys. Return to submit.

JavaScript

TypeScript

Customize with create-vue ↗

Nuxt ↗

`

4.Upon completing the aforementioned steps to create the my-project, run the following command to install its dependencies:

`bash

cd my-project

npm install

`

or

`bash

cd my-project

yarn install

`

Now that my-project is ready to run with default settings, let's add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion Vue component packages are available at npmjs.com. To use Syncfusion Vue components in the project, install the corresponding npm package.

This article uses the Vue Smith Chart component as an example. To use the Vue Smith Chart component in the project, the @syncfusion/ej2-vue-charts package needs to be installed using the following command:

Copyright © 2001 -2024 Syncfusion Inc.

`bash

npm install @syncfusion/ej2-vue-charts --save

`

or

`bash

yarn add @syncfusion/ej2-vue-charts

`

Add Syncfusion Vue component

Follow the below steps to add the Vue Smith Chart component using Composition API or Options API:

1.First, import and register the Smith Chart component and its child directives in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { SmithchartComponent as EjsSmithchart, SmithchartLegend,
TooltipRender, SeriesCollectionDirective as ESeriesCollection,
SeriesDirective as ESeries } from "@syncfusion/ej2-vue-charts";
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { SmithchartComponent, SmithchartLegend, TooltipRender,
SeriesCollectionDirective, SeriesDirective } from "@syncfusion/ej2-vue-
charts";
//Component registration
export default {
name: "App",
components: {
"ejs-smithchart": SmithchartComponent,
"e-seriesCollection": SeriesCollectionDirective,
"e-series" : SeriesDirective
}
}
</script>
```

2.In the template section, define the Smith Chart component with the [dataSource] property.

~/SRC/APP.VUE

```
<template>
<ejs-smithchart id="smithchart" :title='title'
:legendSettings='legendSettings'>
<e-seriesCollection>
<e-series :points='dataSource' :marker='marker' :tooltip='tooltip'
:name='name' :reactance='reactance' :resistance='resistance'></e-series>
<e-series :points='points' :tooltip='tooltip' :name='name1'></e-series>
</e-seriesCollection>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
</ejs-smithchart>
</template>
```

3.Declare the values for the dataSource property in the script section.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
const dataSource = [
{ resistance: 0, reactance: 0.05 }, { resistance: 0, reactance: 0.05 },
{ resistance: 0, reactance: 0.05 }, { resistance: 0, reactance: 0.05 },
{ resistance: 0, reactance: 0.05 }, { resistance: 0, reactance: 0.05 },
{ resistance: 0, reactance: 0.05 }, { resistance: 0, reactance: 0.05 },
{ resistance: 0, reactance: 0.05 }, { resistance: 0, reactance: 0.05 },
{ resistance: 0.3, reactance: 0.1 }, { resistance: 0.5, reactance: 0.2 },
{ resistance: 1.5, reactance: 0.5 }, { resistance: 2.0, reactance: 0.5 },
{ resistance: 2.5, reactance: 0.4 }, { resistance: 3.5, reactance: 0.0 },
{ resistance: 2.5, reactance: 0.4 }, { resistance: 3.5, reactance: 0.0 },
{ resistance: 2.5, reactance: 0.4 }, { resistance: 3.5, reactance: 0.0 },
{ resistance: 4.5, reactance: -0.5 }, { resistance: 5.0, reactance: -1.0 }
];
const points = [
{ resistance: 0, reactance: 0.15 }, { resistance: 0, reactance: 0.15 },
{ resistance: 0, reactance: 0.15 }, { resistance: 0.3, reactance: 0.2 },
{ resistance: 0.3, reactance: 0.2 }, { resistance: 0.3, reactance: 0.2 },
{ resistance: 0.3, reactance: 0.2 }, { resistance: 0.3, reactance: 0.2 },
{ resistance: 0.5, reactance: 0.4 }, { resistance: 1.0, reactance: 0.8 },
{ resistance: 2.5, reactance: 1.3 }, { resistance: 3.5, reactance: 1.6 },
{ resistance: 3.5, reactance: 1.6 }, { resistance: 3.5, reactance: 1.6 },
{ resistance: 4.5, reactance: 2.0 }, { resistance: 6.0, reactance: 4.5 },
{ resistance: 8, reactance: 6 }, { resistance: 10, reactance: 25 }
];
const tooltip = { visible: true };
const legendSettings = { visible: true };
const marker = {
visible: true,
dataLabel: {
visible: true
}
};
const title = { text: 'Transmission lines applied for both impedance and
admittance'};
const name = 'Transmission1';
const name1 = 'Transmission2';
const reactance = 'reactance';
const resistance = 'resistance';
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
data() {
return {
dataSource: [
{ resistance: 0, reactance: 0.05 }, { resistance: 0, reactance: 0.05 },
{ resistance: 0, reactance: 0.05 }, { resistance: 0, reactance: 0.05 },
```

Copyright © 2001 -2024 Syncfusion Inc.

```
{ resistance: 0, reactance: 0.05 }, { resistance: 0, reactance: 0.05 },
{ resistance: 0, reactance: 0.05 }, { resistance: 0, reactance: 0.05 },
{ resistance: 0, reactance: 0.05 }, { resistance: 0, reactance: 0.05 },
{ resistance: 0.3, reactance: 0.1 }, { resistance: 0.5, reactance: 0.2 },
{ resistance: 1.5, reactance: 0.5 }, { resistance: 2.0, reactance: 0.5 },
{ resistance: 2.5, reactance: 0.4 }, { resistance: 3.5, reactance: 0.0 },
{ resistance: 2.5, reactance: 0.4 }, { resistance: 3.5, reactance: 0.0 },
{ resistance: 2.5, reactance: 0.4 }, { resistance: 3.5, reactance: 0.0 },
{ resistance: 4.5, reactance: -0.5 }, { resistance: 5.0, reactance: -1.0 }
],
points: [
{ resistance: 0, reactance: 0.15 }, { resistance: 0, reactance: 0.15 },
{ resistance: 0, reactance: 0.15 }, { resistance: 0.3, reactance: 0.2 },
{ resistance: 0.3, reactance: 0.2 }, { resistance: 0.3, reactance: 0.2 },
{ resistance: 0.3, reactance: 0.2 }, { resistance: 0.3, reactance: 0.2 },
{ resistance: 0.5, reactance: 0.4 }, { resistance: 1.0, reactance: 0.8 },
{ resistance: 2.5, reactance: 1.3 }, { resistance: 3.5, reactance: 1.6 },
{ resistance: 3.5, reactance: 1.6 }, { resistance: 3.5, reactance: 1.6 },
{ resistance: 4.5, reactance: 2.0 }, { resistance: 6.0, reactance: 4.5 },
{ resistance: 8, reactance: 6 }, { resistance: 10, reactance: 25 }
],
tooltip: {
visible: true
},
legendSettings: {
visible: true
},
marker: {
visible: true,
dataLabel: {
visible: true
}
},
title: { text: 'Transmission lines applied for both impedance and
admittance'},
name: 'Transmission1',
name1: 'Transmission2',
reactance: 'reactance',
resistance: 'resistance'
};
}
</script>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<ejs-smithchart id="smithchart" :title='title'
:legendSettings='legendSettings'>

```

Run the project

To run the project, use the following command:

`bash

npm run dev

`

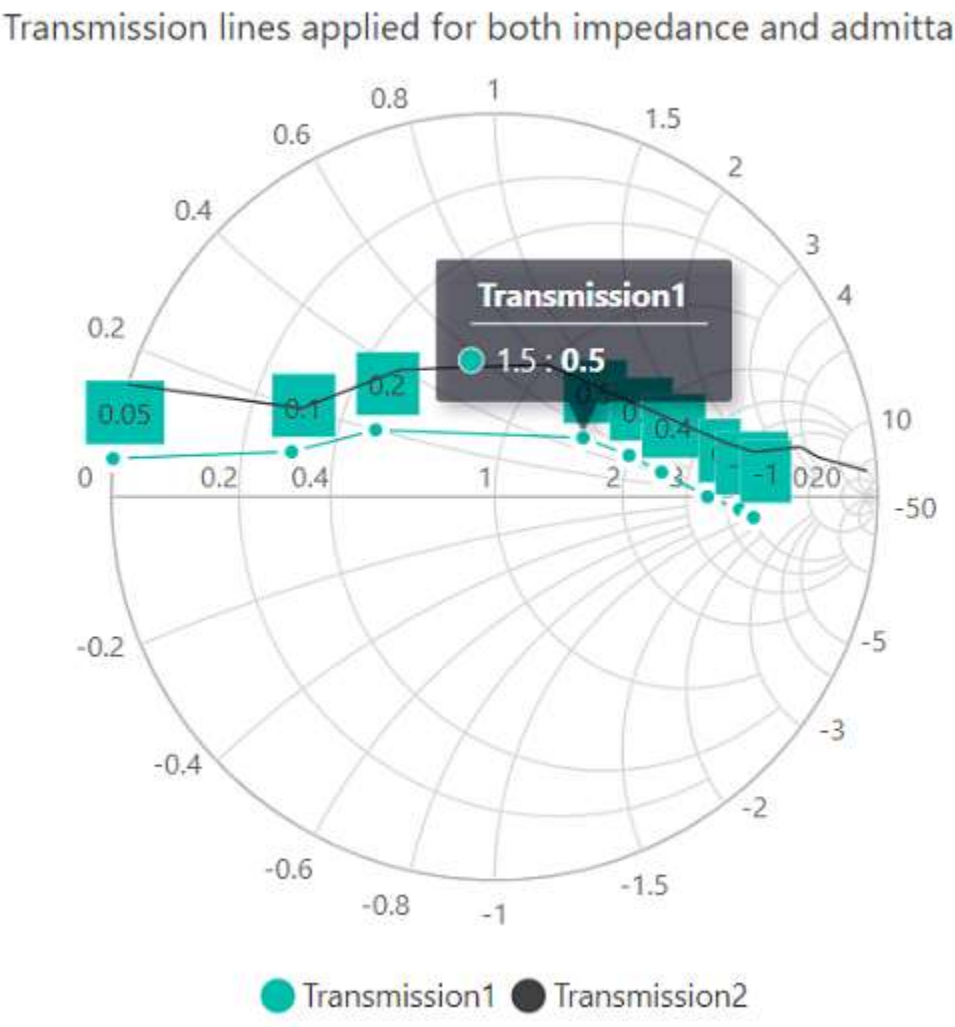
or

`bash

yarn run dev

`

The output will appear as follows:



Sample: vue-3-smith-chart-getting-started.

For migrating from Vue 2 to Vue 3, refer to the migration documentation.

Working with data in Vue Smithchart component

Smithchart can visualise the data bound from local data. The data you bind for the smithchart, should be an array of object and that should contain the field resistance and rectangle. This should be bind to points or datasource in the smithchart.

Data Binding

You can bind simple JSON data to smithchart using point property in series. JSON data should contain [resistance] and [reactance] fields. This JSON data should be bind to points or datasource in the smithchart. You can any number of JSON for points or datasource as per your requirement.

Smithchart dimensions in Vue Smithchart component

You can render the smithchart either corresponding to its container size or you can set the size of the smithchart as per your requirement. To render the smithchart corresponding to its container size, you need to set the size for the smithchart container. Else to set the size for the smithchart as per your requirement, you can use the width and height properties in the smithchart.

Size for Container

You can render smithchart to it's container size. To achieve this, you need to specify the width and height of the smithchart's container via inline or CSS as demonstrated below.

`javascript

`

APP.VUE

```
<template>
    <div class="control_wrapper">
        <ejs-smithchart id="smithchart">
                <e-seriesCollection>
                    <e-series :dataSource='dataSource' :name='name'
:reactance='reactance' :resistance='resistance'></e-series>
                </e-seriesCollection>
        </ejs-smithchart>
    </div>
</template>
<script>
import Vue from 'vue';
import { SmithchartPlugin } from "@syncfusion/ej2-vue-charts";
Vue.use(SmithchartPlugin);
export default {
  data: function() {
    return {
      dataSource: [
```

```
                    { resistance: 10, reactance: 25 }, { resistance: 8,
reactance: 6 },
                  { resistance: 6, reactance: 4.5 }, { resistance: 4.5,
reactance: 2 },
                  { resistance: 3.5, reactance: 1.6 }, { resistance: 2.5,
reactance: 1.3 },
                  { resistance: 2, reactance: 1.2 }, { resistance: 1.5,
reactance: 1 },
                  { resistance: 1, reactance: 0.8 }, { resistance: 0.5,
reactance: 0.4 },
                  { resistance: 0.3, reactance: 0.2 }, { resistance: 0,
reactance: 0.15 }
              ],
              name: 'Transmission1',
              reactance: 'reactance', resistance: 'resistance',
    }
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/smithchart/getting-started-cs10" %}

Size for Smithchart

<!-- markdownlint-disable MD036 -->

You can also set size for smithchart directly through [width] and [height] properties. Using this properties, you can directly mention the width and height of the smithchart in pixels or you can set the width and height in percentage.

In Pixel

In smithchart's width and height property, you can directly give values in pixels like below demonstration. This will render smithchart in same size as you mentioned in you code.

APP.VUE

```
<template>
    <div class="control_wrapper">
        <ejs-smithchart id="smithchart" :width='width' :height='height'>
                <e-seriesCollection>
                    <e-series :dataSource='dataSource' :name='name'
:reactance='reactance' :resistance='resistance'></e-series>
                </e-seriesCollection>
        </ejs-smithchart>
    </div>
</template>
<script>
import Vue from 'vue';
import { SmithchartPlugin } from "@syncfusion/ej2-vue-charts";
Vue.use(SmithchartPlugin);
export default {
  data: function() {
    return {
        width: '650px',
        height: '300px',
        dataSource: [
```

```
                    { resistance: 10, reactance: 25 }, { resistance: 8,
reactance: 6 },
                  { resistance: 6, reactance: 4.5 }, { resistance: 4.5,
reactance: 2 },
                  { resistance: 3.5, reactance: 1.6 }, { resistance: 2.5,
reactance: 1.3 },
                  { resistance: 2, reactance: 1.2 }, { resistance: 1.5,
reactance: 1 },
                  { resistance: 1, reactance: 0.8 }, { resistance: 0.5,
reactance: 0.4 },
                  { resistance: 0.3, reactance: 0.2 }, { resistance: 0,
reactance: 0.15 },
              ],
              name: 'Transmission1',
              reactance: 'reactance', resistance: 'resistance',
    }
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/smithchart/getting-started-cs11" %}

In percentage

You can also specify the width and height of the smithchart in percentage. If you mention the width and height in percentage, then smithchart will be render as per the percentage of it's container size. You can set the values in percentage like below demonstration.

APP.VUE

```
<template>
    <div class="control_wrapper">
        <ejs-smithchart id="smithchart" :width='width' :height='height'>
                <e-seriesCollection>
                    <e-series :dataSource='dataSource' :name='name'
:reactance='reactance' :resistance='resistance'></e-series>
                </e-seriesCollection>
        </ejs-smithchart>
    </div>
</template>
<script>
import Vue from 'vue';
import { SmithchartPlugin } from "@syncfusion/ej2-vue-charts";
Vue.use(SmithchartPlugin);
export default {
  data: function() {
    return {
        width: '90%',
        height: '80%',
        dataSource: [
                    { resistance: 10, reactance: 25 }, { resistance: 8,
reactance: 6 },
                  { resistance: 6, reactance: 4.5 }, { resistance: 4.5,
reactance: 2 },
                  { resistance: 3.5, reactance: 1.6 }, { resistance: 2.5,
reactance: 1.3 },
```

```
                { resistance: 2, reactance: 1.2 }, { resistance: 1.5,
reactance: 1 },
                { resistance: 1, reactance: 0.8 }, { resistance: 0.5,
reactance: 0.4 },
                { resistance: 0.3, reactance: 0.2 }, { resistance: 0,
reactance: 0.15 },
            ],
            name: 'Transmission1',
            reactance: 'reactance', resistance: 'resistance',
    }
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/smithchart/getting-started-cs12" %}

Title subtitle in Vue Smithchart component

Enable title

Title and subtitle is used to depicts the information about the data plotted in the smithchart. You can set the title and subtitle of the smithchart using the [text] property in title and subtitle. By default visibility of the title as well as subtitle is enabled. You need to set simply text for title and subtitle in your sample as like below.

APP.VUE

```
<template>
    <div class="control_wrapper">
        <ejs-smithchart id="smithchart" :title='title'>
                <e-seriesCollection>
                    <e-series :dataSource='dataSource' :name='name'
:reactance='reactance' :resistance='resistance'></e-series>
                </e-seriesCollection>
        </ejs-smithchart>
    </div>
</template>
<script>
import Vue from 'vue';
import { SmithchartPlugin } from "@syncfusion/ej2-vue-charts";
Vue.use(SmithchartPlugin);
export default {
  data: function() {
    return {
        title : {
        text: 'Impedance Transmission',
        subtitle: {
            text: 'Transmission'
        }
    },
        dataSource: [
                 { resistance: 10, reactance: 25 }, { resistance: 8,
reactance: 6 },
                { resistance: 6, reactance: 4.5 }, { resistance: 4.5,
reactance: 2 },
                { resistance: 3.5, reactance: 1.6 }, { resistance: 2.5,
reactance: 1.3 },
```

Smithchart axis in Vue Smithchart component

Like chart, Smithchart is having support for two types of axis.

- Horizontal axis - axis drawn as straight line in the horizontal direction of the chart.
- Radial axis - axis is drawn as circular path.

Labels Customization

Axis labels are used to denote what kind of data is bound for smithchart. Using axis labels, you can easily identify in which interval chart is rendered. Using following properties we can customize the axis labels for horizontal and radial axis.

- [labelPosition] - used to place the labels either inside or outside the axis line.
- [labelIntersectAction] - used to hide the labels when intersect with other one.
- [labelStyle] - used to customize the properties such as font size, family, weight, opacity.

APP.VUE

```

Gridlines

To make the data in a chart that displays axes easier to read, you can display horizontal and radial axis gridlines. Gridlines extend from any horizontal and radial axes across the plot area of the smithchart.

Both horizontal and radial axis are having support for major as well as minor gridlines. Major gridlines are drawn from the position in which labels are rendered. Minor gridlines are drawn between two major gridlines as per the count we set in settings.

We can customize following things, in major as well as minor gridlines.

- [width] - used to customize the width of gridlines.
- [dashArray] - used to customize whether gridline have to render as normal line or dashed line.
- [visible] - used to enable or disable the visibility of the gridlines.
- [opacity] - used to customize the opacity of the major gridlines.
- [count] - used to customize the count of the minor gridlines.

                { resistance: 0.3, reactance: 0.1 }, { resistance: 0,
reactance: 0.05 },],
        name2: 'Transmission2'
    }
  },
}
</script>
```

{% previewsample "page.domainurl/code-snippet/smithchart/getting-started-cs8" %}

Axisline

As name suggests that, it is a line in smithchart that can be configured to denotes the axis. By default, visibility of the axis line is true. You can customize its visibility by using visible property in axis Line. Other than visibility of the axis line, you can customize the following properties of the axis line.

- [width] - used to customize the width of the axis line.
- [dashArray] - used to render the axis line as dashed line.
- [visible] - used to enable or disable the visibility of the axis line.

Smithchart legend in Vue Smithchart component

Legend is a key used in smithchart, that contains symbol and descriptions. It provides valuable information for interpreting what the smithchart is displaying and can be represented in various colors, shapes or other identifiers based on the data. In simple words, we can define that legend is used to denote the series rendered in the smithchart.

Position and Alignment

By default visibility of the legend is false. To enable the legend, kindly set visible as true in legendSettings. Default position for the legend is bottom. By using [position] property, you can change the position of the legend. You can either place the legend at bottom, top, right and left side of the smithchart. To use the legend in smithchart, you need to import and inject the SmithchartLegend from chart.

APP.VUE

```
<template>
    <div class="control_wrapper">
        <ejs-smithchart id="smithchart" :legendSettings='legendSettings'>
                <e-seriesCollection>
                    <e-series :dataSource='dataSource' :name='name'
:reactance='reactance' :resistance='resistance'></e-series>
                    <e-series :points='points' :name='name2'></e-series>
                </e-seriesCollection>
        </ejs-smithchart>
    </div>
</template>
<script>
import Vue from 'vue';
import { SmithchartPlugin,SmithchartLegend } from "@syncfusion/ej2-vue-
charts";
Vue.use(SmithchartPlugin);
export default {
  data: function() {
    return {
        legendSettings: {
            visible: true,
            position: 'Top'
```

```
            },
        dataSource: [
                    { resistance: 10, reactance: 25 }, { resistance: 8,
reactance: 6 },
                { resistance: 6, reactance: 4.5 }, { resistance: 4.5,
reactance: 2 },
                { resistance: 3.5, reactance: 1.6 }, { resistance: 2.5,
reactance: 1.3 },
                { resistance: 2, reactance: 1.2 }, { resistance: 1.5,
reactance: 1 },
                { resistance: 1, reactance: 0.8 }, { resistance: 0.5,
reactance: 0.4 },
                { resistance: 0.3, reactance: 0.2 }, { resistance: 0,
reactance: 0.15 },
             ],
        name: 'Transmission1',
        reactance: 'reactance', resistance: 'resistance',
        points: [{ resistance: 20, reactance: -50 }, { resistance: 10,
reactance: -10 },
                { resistance: 9, reactance: -4.5 }, { resistance: 8,
reactance: -3.5 },
                { resistance: 7, reactance: -2.5 }, { resistance: 6,
reactance: -1.5 },
                { resistance: 5, reactance: -1 }, { resistance: 4.5,
reactance: -0.5 },
                { resistance: 3.5, reactance: 0 }, { resistance: 2.5,
reactance: 0.4 },
                { resistance: 2, reactance: 0.5 }, { resistance: 1.5,
reactance: 0.5 },
                { resistance: 1, reactance: 0.4 }, { resistance: 0.5,
reactance: 0.2 },
                { resistance: 0.3, reactance: 0.1 }, { resistance: 0,
reactance: 0.05 }],
        name2: 'Transmission2'
    }
  },
provide:{
    smithchart:[SmithchartLegend]
}
}
</script>
```

{% previewsample "page.domainurl/code-snippet/smithchart/getting-started-cs13" %}

Custom Position

Other than these positions, you can place the legend anywhere in the smithchart. To achieve this, you have to set position as custom in legendSettings and specify the x and y coordinates using the x and y properties in the location.

APP.VUE

```
<template>
    <div class="control_wrapper">
        <ejs-smithchart id="smithchart" :legendSettings='legendSettings'>
                <e-seriesCollection>
```

```
                    <e-series :dataSource='dataSource'  :name='name'
:reactance='reactance' :resistance='resistance'></e-series>
                    <e-series :points='points'  :name='name2'></e-series>
                </e-seriesCollection>
        </ejs-smithchart>
    </div>
</template>
<script>
import Vue from 'vue';
import { SmithchartPlugin,SmithchartLegend } from "@syncfusion/ej2-vue-
charts";
Vue.use(SmithchartPlugin);
export default {
  data: function() {
    return {
        legendSettings: {
        visible: true,
        position: 'Custom',
        location:{
            x: 80,
            y: 100
        }
    },
        dataSource: [
                 { resistance: 10, reactance: 25 }, { resistance: 8,
reactance: 6 },

Customization

Legend Shape

By default, legend is rendered in the circle shape and the color of the shape is as same as series color in the smithchart. Using the property [shape] in legend settings, you can change the icon shape of the legend as rectangle, triangle and so on.

APP.VUE

```
<template>
    <div class="control_wrapper">
        <ejs-smithchart id="smithchart" :legendSettings='legendSettings'>
                <e-seriesCollection>
                    <e-series :dataSource='dataSource' :name='name'
:reactance='reactance' :resistance='resistance'></e-series>
                    <e-series :points='points' :name='name2'></e-series>
                </e-seriesCollection>
        </ejs-smithchart>
    </div>
</template>

}
</script>
```

{% previewsample "page.domainurl/code-snippet/smithchart/getting-started-cs16" %}

Legend Size

By default, legend takes 20% - 25% of the chart's height horizontally, when it is placed on top or bottom position and 20% - 25% of the width vertically, while placing on left or right position of the chart. You can change this default legend size by using the [width] and [height] property of the legendSettings.

APP.VUE

Smithchart tooltip in Vue Smithchart component

Smithchart will display details about the points through tooltip, when the mouse is moved over the point. By default, tooltip is disabled. To enable the tooltip for smithchart, you need to import and inject TooltipRender module from chart. And also set the property visible as true, in tooltip settings. You can customize the tooltip's visibility and appearance differently each series in the smithchart.

APP.VUE

Smithchart marker in Vue Smithchart component

Markers and Datalabels are used to provide information about the data points in the series. You can add a shape to adorn each data point. By default marker and datalabel both are disabled in smithchart. You can enable both of them by setting visible property as true in marker and datalabel settings

Marker

Default visibility of marker is false. You can enable the marker by setting property visible as true in marker settings. This will add marker for each point in the series. Using marker setting, you can customize marker differently for each series in smithchart.

APP.VUE

```
<template>
    <div class="control_wrapper">
        <ejs-smithchart id="smithchart"  >
                <e-seriesCollection>
                    <e-series :dataSource='dataSource' :name='name'
:marker='marker' :reactance='reactance' :resistance='resistance'></e-series>
                </e-seriesCollection>
        </ejs-smithchart>
    </div>
</template>
<script>
import Vue from 'vue';
import { SmithchartPlugin } from "@syncfusion/ej2-vue-charts";
Vue.use(SmithchartPlugin);
export default {
  data: function() {
    return {
        marker: {
                dataLabel: {
                    visible: true,
                    fill: '#99ffcc',
                    opacity: 1,
                    border: {
                        color: '#1aff8c',
                        width: 2,
                    }
                }
```

Copyright © 2001 -2024 Syncfusion Inc.

Smithchart series in Vue Smithchart component

You can add any number of series to the smithchart as per your requirement. You can use series setting to either add or customize the data. For the points or datasource added in the series, line is drawn. You can customize the each series as per your requirement with marker, datalabel, animation, opacity and so on.

points or datasource

For adding values in the smithchart, you can use either points or datasource in the series. Points and datasource both should be array of object which should contain the field names resistance and rectangle.

APP.VUE

```
<template>
    <div class="control_wrapper">
```

```
        <ejs-smithchart id="smithchart"  >
                <e-seriesCollection>
                    <e-series :dataSource='dataSource' :name='name'
:reactance='reactance' :resistance='resistance'></e-series>
                </e-seriesCollection>
        </ejs-smithchart>
    </div>
</template>
<script>
import Vue from 'vue';
import { SmithchartPlugin } from "@syncfusion/ej2-vue-charts";
Vue.use(SmithchartPlugin);
export default {
  data: function() {
    return {
        dataSource: [
                 { resistance: 10, reactance: 25 }, { resistance: 8,
reactance: 6 },
                { resistance: 6, reactance: 4.5 }, { resistance: 4.5,
reactance: 2 },
                { resistance: 3.5, reactance: 1.6 }, { resistance: 2.5,
reactance: 1.3 },
                { resistance: 2, reactance: 1.2 }, { resistance: 1.5,
reactance: 1 },
                { resistance: 1, reactance: 0.8 }, { resistance: 0.5,
reactance: 0.4 },
                { resistance: 0.3, reactance: 0.2 }, { resistance: 0,
reactance: 0.15 },
             ],
             name: 'Transmission1',
             reactance: 'reactance', resistance: 'resistance',
    }
  }
}
</script>
```

{% previewsample "page.domainurl/code-snippet/smithchart/getting-started-cs24" %}

Series customization

Using following options in series settings, you can customize each series in smithchart as per your requirement.

- [fill] - Used to customize the fill color for the series.
- [enableSmartLabels] - Used to place the data labels on the smithchart without overlapping with each other.
- [visibility] - Used to handle the visibility of the series.
- [opacity] - Used to control the opacity of the series line.
- [width] - Used to customize the width of the series line.

APP.VUE

Smithchart print in Vue Smithchart component

Print

The rendered smithchart can be printed directly from the browser by calling the public method print. ID of the smithchart's div element must be passed as argument to that method.

`

<template>

```
<div class="control_wrapper">
<ejs-smithchart id="smithchart" ref='smithchart' >
<e-seriesCollection>
<e-series :dataSource='dataSource' :name='name' :reactance='reactance' :resistance='resistance'
:loaded='loaded'></e-series>
</e-seriesCollection>
</ejs-smithchart>
</div>
</template>
<script>
import Vue from 'vue';
import { SmithchartPlugin } from "@syncfusion/ej2-vue-charts";
Vue.use(SmithchartPlugin);
export default {
data: function() {
return {
dataSource: [
{ resistance: 10, reactance: 25 }, { resistance: 8, reactance: 6 },
{ resistance: 6, reactance: 4.5 }, { resistance: 4.5, reactance: 2 },
{ resistance: 3.5, reactance: 1.6 }, { resistance: 2.5, reactance: 1.3 },
{ resistance: 2, reactance: 1.2 }, { resistance: 1.5, reactance: 1 },
{ resistance: 1, reactance: 0.8 }, { resistance: 0.5, reactance: 0.4 },
{ resistance: 0.3, reactance: 0.2 }, { resistance: 0, reactance: 0.15 },
],
name: 'Transmission1',
reactance: 'reactance', resistance: 'resistance',
}
},
methods: {
loaded: function(args) {
args.smithchart.print();
}
}
```

Copyright © 2001 -2024 Syncfusion Inc.

```
}
</script>
```

Export

The rendered smithchart can be exported to JPEG , PNG, SVG or PDF format by using export method in smithchart. Input parameters for this method are Export Type for format and fileName of result.

```
<template>
<div class="control_wrapper">
<ejs-smithchart id="smithchart" ref='smithchart'  >
<e-seriesCollection>
<e-series :dataSource='dataSource' :name='name' :reactance='reactance' :resistance='resistance' :loaded='loaded'></e-series>
</e-seriesCollection>
</ejs-smithchart>
</div>
</template>
<script>
import Vue from 'vue';
import { SmithchartPlugin } from "@syncfusion/ej2-vue-charts";
Vue.use(SmithchartPlugin);
export default {
data: function() {
return {
dataSource: [
{ resistance: 10, reactance: 25 }, { resistance: 8, reactance: 6 },
{ resistance: 6, reactance: 4.5 }, { resistance: 4.5, reactance: 2 },
{ resistance: 3.5, reactance: 1.6 }, { resistance: 2.5, reactance: 1.3 },
{ resistance: 2, reactance: 1.2 }, { resistance: 1.5, reactance: 1 },
{ resistance: 1, reactance: 0.8 }, { resistance: 0.5, reactance: 0.4 },
{ resistance: 0.3, reactance: 0.2 }, { resistance: 0, reactance: 0.15 },
],
name: 'Transmission1',
reactance: 'reactance', resistance: 'resistance',
```

```
}
},
methods: {
loaded: function(args) {
args.smithchart.export('PNG', 'export');
}
}
}
</script>
`
```

Accessibility in Vue Smithchart component

The Smith chart component followed the accessibility guidelines and standards, including ADA, Section 508, WCAG 2.2 standards, and WCAG roles that are commonly used to evaluate accessibility.

The accessibility compliance for the Smith chart component is outlined below.

Accessibility Criteria	Compatibility
WCAG 2.2 Support	Section 508 Support	
Screen Reader Support	Color Contrast	Mobile Device Support	
Keyboard Navigation Support	
Accessibility Checker Validation	
Axe-core Accessibility Validation	
```
<style>
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
```

}

</style>

<img src="https://cdn.syncfusion.com/content/images/documentation/full.png" alt="Yes"> - All features of the component meet the requirement.

<img src="https://cdn.syncfusion.com/content/images/documentation/partial.png" alt="Intermediate"> - Some features of the component do not meet the requirement.

<img src="https://cdn.syncfusion.com/content/images/documentation/not-supported.png" alt="No"> - The component does not meet the requirement.

WAI-ARIA attributes

The Smith chart component followed the WAI-ARIA patterns to meet the accessibility. The following ARIA attributes are used in the Smith chart component:

- img (role)
- region (role)
- aria-label (attribute)
- aria-hidden (attribute)

Keyboard interaction

The Smith chart component followed the keyboard interaction guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Smith chart component.

| **Press** | **To do this** |

| --- | --- |

| Tab | Moves the focus to the next element in the Smith chart. |

| Shift + Tab | Moves the focus to the previous element in the Smith chart. |

| Ctrl + P | Prints the Smith chart. |

Ensuring accessibility

The Smith chart component's accessibility levels are ensured through an accessibility-checker and axe-core software tools during automated testing.

The accessibility compliance of the Smith chart component is shown in the following sample. Open the sample in a new window to evaluate the accessibility of the Smith chart component with accessibility tools.

{% previewsample "https://ej2.syncfusion.com/accessibility/smith-chart.html" %}

Sparkline

Getting Started with the Vue Sparkline Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using Vue-CLILink to the Video and integrating the Syncfusion Vue Sparkline component.

To get start quickly with Vue Sparkline, you can check on this video:

Prerequisites

System requirements for Syncfusion Vue UI components

Dependencies

The following list of minimum dependencies are required to use the sparkline:

`js

|-- @syncfusion/ej2-vue-charts

|-- @syncfusion/ej2-base

|-- @syncfusion/ej2-data

|-- @syncfusion/ej2-pdf-export

|-- @syncfusion/ej2-file-utils

|-- @syncfusion/ej2-compression

|-- @syncfusion/ej2-svg-base

|-- @syncfusion/ej2-sparkline

|-- @syncfusion/ej2-vue-base

`

Setting up the Vue 2 project

To generate a Vue 2 project using Vue-CLI, use the vue create command. Follow these steps to install Vue CLI and create a new project:

`bash

npm install -g @vue/cli

vue create quickstart

cd quickstart

npm run serve

`

or

`bash

yarn global add @vue/cli

vue create quickstart

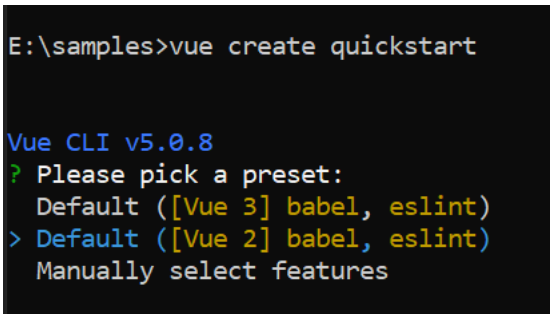
cd quickstart

yarn run serve

Copyright © 2001 -2024 Syncfusion Inc.

`

When creating a new project, choose the option Default ([Vue 2] babel, eslint) from the menu.



Once the quickstart project is set up with default settings, proceed to add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion packages are available at npmjs.com. To use Vue components, install the required npm package.

This article uses the Vue Sparkline component as an example. Install the @syncfusion/ej2-vue-charts package by running the following command:

`bash

npm install @syncfusion/ej2-vue-charts --save

`

or

`bash

yarn add @syncfusion/ej2-vue-charts

`

Add Syncfusion Vue component

Follow the below steps to add the Vue Sparkline component:

1\. First, import and register the Sparkline component in the script section of the **src/App.vue** file.

~/SRC/APP.VUE

```
<script>
import { SparklineComponent } from "@syncfusion/ej2-vue-charts";
export default {
components: {
'ejs-sparkline': SparklineComponent
}
}
</script>
```

2\. In the template section, define the Sparkline component.

~/SRC/APP.VUE

```
<template>
<div id="app">
<ejs-sparkline></ejs-sparkline>
</div>
</template>
```

Run the project

To run the project, use the following command:

`bash

npm run serve

`

or

`bash

yarn run serve

`

The following example shows a basic Sparkline.

`

<template>

<ejs-sparkline id="sparkline"></ejs-sparkline>

</template>

<script>

import { SparklineComponent } from '@syncfusion/ej2-vue-charts';

export default {

components: {

'ejs-sparkline': SparklineComponent

}

}

</script>

`

Since the data source has not been specified to the sparkline, no shape will be rendered. Only an empty SVG element is appended to the sparkline container.

Module Injection

The sparkline component is segregated into individual feature-wise modules. To use a particular feature, inject its feature module using the provide option on component creation. The module available in sparkline and its descriptions is as follows.

- SparklineTooltip - Inject this provider to use tooltip series.

Copyright © 2001 -2024 Syncfusion Inc.

In the current application, the above basic sparkline is modified to visualize the types of sparkline.

In this application, tooltip feature of the sparkline is used. Now, import the SparklineTooltip module from the sparkline package, and inject it into the sparkline control using the provide option.

```
<template>
<div class="control_wrapper">
<ejs-sparkline id="sparkline"></ejs-sparkline>
</div>
</template>
<script>
import { SparklineComponent, SparklineTooltip } from "@syncfusion/ej2-vue-charts";
export default {
components: {
'ejs-sparkline': SparklineComponent
},
data: function() {
return {
}
},
provide:{
sparkline:[SparklineTooltip]
}
}
</script>
```

Bind data source to Sparkline

The [dataSource] property is used for binding data source to the sparkline. This property takes the collection value as input. For example, the list of objects can be provided as input.

~/SRC/APP.VUE

```
<template>
    <div class="control_wrapper">
    <div>
        <ejs-sparkline id="sparkline" align="center"
:dataSource='dataSource' xName='xval' yName='yval' :height='height'
:width='width'></ejs-sparkline>
    </div>
    </div>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
</template>
<script>
import { SparklineComponent } from "@syncfusion/ej2-vue-charts";
export default {
  components: {
    'ejs-sparkline': SparklineComponent
  },
  data: function() {
    return {
    height: '100px',
    width: '70%',
    dataSource: [
            { x: 0, xval: '2005', yval: 20090440 },
            { x: 1, xval: '2006', yval: 20264080 },
            { x: 2, xval: '2007', yval: 20434180 },
            { x: 3, xval: '2008', yval: 21007310 },
            { x: 4, xval: '2009', yval: 21262640 },
            { x: 5, xval: '2010', yval: 21515750 },
            { x: 6, xval: '2011', yval: 21766710 },
            { x: 7, xval: '2012', yval: 22015580 },
            { x: 8, xval: '2013', yval: 22262500 },
            { x: 9, xval: '2014', yval: 22507620 },
        ]
    }
  }
}
</script>
<style>
.spark {
    border: 1px solid rgb(209, 209, 209);
    border-radius: 2px;
    width: 100%;
    height: 100%;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/sparkline/getting-started-cs14" %}

Change the type of Sparkline

You can change the sparkline type by setting the [type] property to [Line], [Column], [WinLoss], [Pie], or [Area]. Here, the sparkline type has been set to [area].

~/SRC/APP.VUE

```
<template>
    <div class="control_wrapper">
    <div>
        <ejs-sparkline id="sparkline" align="center"
:dataSource='dataSource' xName='xval' yName='yval' :type='type'
:height='height' :width='width'></ejs-sparkline>
        </div>
    </div>
</template>
<script>
import { SparklineComponent } from "@syncfusion/ej2-vue-charts";
export default {
```

Copyright © 2001 -2024 Syncfusion Inc.

```
  components: {
    'ejs-sparkline': SparklineComponent
  },
  data: function() {
    return {
    height: '100px',
    width: '70%',
    dataSource: [
            { x: 0, xval: '2005', yval: 20090440 },
            { x: 1, xval: '2006', yval: 20264080 },
            { x: 2, xval: '2007', yval: 20434180 },
            { x: 3, xval: '2008', yval: 21007310 },
            { x: 4, xval: '2009', yval: 21262640 },
            { x: 5, xval: '2010', yval: 21515750 },
            { x: 6, xval: '2011', yval: 21766710 },
            { x: 7, xval: '2012', yval: 22015580 },
            { x: 8, xval: '2013', yval: 22262500 },
            { x: 9, xval: '2014', yval: 22507620 },
        ],
    // Assign the 'area' as type of Sparkline
    type:'Area'
    }
  }
}
</script>
<style>
.spark {
    border: 1px solid rgb(209, 209, 209);
    border-radius: 2px;
    width: 100%;
    height: 100%;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/sparkline/getting-started-cs15" %}

Enable tooltip for Sparkline

The sparkline displays additional information through tooltip when the mouse is hovered over the sparkline. You can enable tooltip by setting the [visible] property to true in [tooltipSettings] and injecting SparklineTooltip module using the provide option.

~/SRC/APP.VUE

```
<template>
    <div class="control_wrapper">
    <div>
        <ejs-sparkline id="sparkline" align="center"
:dataSource='dataSource' xName='xval' yName='yval' :type='type'
:tooltipSettings='tooltipSettings' :height='height' :width='width'></ejs-
sparkline>
    </div>
    </div>
</template>
<script>
import Vue from 'vue';
```

Copyright © 2001 -2024 Syncfusion Inc.

```
import { SparklineComponent, SparklineTooltip } from "@syncfusion/ej2-vue-
charts";
export default {
  components: {
    'ejs-sparkline': SparklineComponent
  },
  data: function() {
    return {
    height: '100px',
    width: '70%',
    dataSource: [
            { x: 0, xval: '2005', yval: 20090440 },
            { x: 1, xval: '2006', yval: 20264080 },
            { x: 2, xval: '2007', yval: 20434180 },
            { x: 3, xval: '2008', yval: 21007310 },
            { x: 4, xval: '2009', yval: 21262640 },
            { x: 5, xval: '2010', yval: 21515750 },
            { x: 6, xval: '2011', yval: 21766710 },
            { x: 7, xval: '2012', yval: 22015580 },
            { x: 8, xval: '2013', yval: 22262500 },
            { x: 9, xval: '2014', yval: 22507620 },
        ],
    // Assign the 'area' as type of Sparkline
    type:'Area',
     // To enable the tooltip for Sparkline
    tooltipSettings: {
        visible: true,
        format: '${xval} : ${yval}'
    }
    }
  },
provide:{
    sparkline:[SparklineTooltip]
}
}
</script>
<style>
.spark {
    border: 1px solid rgb(209, 209, 209);
    border-radius: 2px;
    width: 100%;
    height: 100%;
}
</style>
```

Getting Started with the Vue Sparkline Component in Vue 3

This article provides a step-by-step guide for setting up a Vite project with a JavaScript environment and integrating the Syncfusion Vue Sparkline component using the Composition API / Options API.

The Composition API is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

Copyright © 2001 -2024 Syncfusion Inc.

The Options API is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

Prerequisites

System requirements for Syncfusion Vue UI components

Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using Vite. To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

`bash

npm create vite@latest

`

or

`bash

yarn create vite

`

Using one of the above commands will lead you to set up additional configurations for the project as below:

1.Define the project name: We can specify the name of the project directly. Let's specify the name of the project as my-project for this article.

`bash

? Project name: » my-project

`

2.Select Vue as the framework. It will create a Vue 3 project.

`bash

? Select a framework: » - Use arrow-keys. Return to submit.

Vanilla

Vue

React

Preact

Lit

Svelte

Others

`

3.Choose JavaScript as the framework variant to build this Vite project using JavaScript and Vue.

`bash

? Select a variant: » - Use arrow-keys. Return to submit.

JavaScript

TypeScript

Customize with create-vue ↗

Nuxt ↗

`

4.Upon completing the aforementioned steps to create the my-project, run the following command to install its dependencies:

`bash

cd my-project

npm install

`

or

`bash

cd my-project

yarn install

`

Now that my-project is ready to run with default settings, let's add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion Vue component packages are available at npmjs.com. To use Syncfusion Vue components in the project, install the corresponding npm package.

This article uses the Vue Sparkline component as an example. To use the Vue Sparkline component in the project, the @syncfusion/ej2-vue-charts package needs to be installed using the following command:

`bash

npm install @syncfusion/ej2-vue-charts --save

`

or

`bash

yarn add @syncfusion/ej2-vue-charts

`

Add Syncfusion Vue component

Follow the below steps to add the Vue Sparkline component using Composition API or Options API:

Copyright © 2001 -2024 Syncfusion Inc.

1.First, import and register the Sparkline component and its child directives in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { SparklineComponent as EjsSparkline, SparklineTooltip } from
"@syncfusion/ej2-vue-charts";
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { SparklineComponent, SparklineTooltip } from "@syncfusion/ej2-vue-
charts";
//Component registration
export default {
name: "App",
components: {
"ejs-sparkline": SparklineComponent
}
}
</script>
```

2.In the template section, define the Sparkline component with the dataSource property.

~/SRC/APP.VUE

```
<template>
<ejs-sparkline id="sparkline" :dataSource='dataSource' :height='height'
:xName='xName' :yName='yName' :type='type'
:tooltipSettings='tooltipSettings'></ejs-sparkline>
</template>
```

3.Declare the values for the dataSource property in the script section.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
const dataSource = [
{ x: 0, xval: '2005', yval: 20090440 },
{ x: 1, xval: '2006', yval: 20264080 },
{ x: 2, xval: '2007', yval: 20434180 },
{ x: 3, xval: '2008', yval: 21007310 },
{ x: 4, xval: '2009', yval: 21262640 },
{ x: 5, xval: '2010', yval: 21515750 },
{ x: 6, xval: '2011', yval: 21766710 },
{ x: 7, xval: '2012', yval: 22015580 },
{ x: 8, xval: '2013', yval: 22262500 },
{ x: 9, xval: '2014', yval: 22507620 }
];
const type = 'Area';
const xName = 'xval';
const yName = 'yval';
```

Copyright © 2001 -2024 Syncfusion Inc.

```
const height = '200px';
const tooltipSettings = {
visible: true,
format: '${xval} : ${yval}'
};
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
data() {
return {
dataSource: [
{ x: 0, xval: '2005', yval: 20090440 },
{ x: 1, xval: '2006', yval: 20264080 },
{ x: 2, xval: '2007', yval: 20434180 },
{ x: 3, xval: '2008', yval: 21007310 },
{ x: 4, xval: '2009', yval: 21262640 },
{ x: 5, xval: '2010', yval: 21515750 },
{ x: 6, xval: '2011', yval: 21766710 },
{ x: 7, xval: '2012', yval: 22015580 },
{ x: 8, xval: '2013', yval: 22262500 },
{ x: 9, xval: '2014', yval: 22507620 }
],
type:'Area',
xName:'xval',
yName:'yval',
height:'200px',
tooltipSettings: {
visible: true,
format: '${xval} : ${yval}'
}
};
}
</script>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<ejs-sparkline id="sparkline" :dataSource='dataSource' :height='height'
:xName='xName' :yName='yName' :type='type'
:tooltipSettings='tooltipSettings'></ejs-sparkline>
</template>
<script setup>
import { provide } from 'vue';
import { SparklineComponent as EjsSparkline, SparklineTooltip } from
"@syncfusion/ej2-vue-charts";
const dataSource = [
{ x: 0, xval: '2005', yval: 20090440 },
{ x: 1, xval: '2006', yval: 20264080 },
{ x: 2, xval: '2007', yval: 20434180 },
{ x: 3, xval: '2008', yval: 21007310 },
{ x: 4, xval: '2009', yval: 21262640 },
{ x: 5, xval: '2010', yval: 21515750 },
```

Copyright © 2001 -2024 Syncfusion Inc.

```
{ x: 6, xval: '2011', yval: 21766710 },
{ x: 7, xval: '2012', yval: 22015580 },
{ x: 8, xval: '2013', yval: 22262500 },
{ x: 9, xval: '2014', yval: 22507620 }
];
const type = 'Area';
const xName = 'xval';
const yName = 'yval';
const height = '200px';
const tooltipSettings = {
visible: true,
format: '${xval} : ${yval}'
};
const sparkline = [SparklineTooltip];
provide('sparkline', sparkline);
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<ejs-sparkline id="sparkline" :dataSource='dataSource' :height='height'
:xName='xName' :yName='yName' :type='type'
:tooltipSettings='tooltipSettings'></ejs-sparkline>
</template>
<script>
import { SparklineComponent, SparklineTooltip } from "@syncfusion/ej2-vue-
charts";
//Component registration
export default {
name: "App",
components: {
"ejs-sparkline": SparklineComponent
},
data() {
return {
dataSource: [
{ x: 0, xval: '2005', yval: 20090440 },
{ x: 1, xval: '2006', yval: 20264080 },
{ x: 2, xval: '2007', yval: 20434180 },
{ x: 3, xval: '2008', yval: 21007310 },
{ x: 4, xval: '2009', yval: 21262640 },
{ x: 5, xval: '2010', yval: 21515750 },
{ x: 6, xval: '2011', yval: 21766710 },
{ x: 7, xval: '2012', yval: 22015580 },
{ x: 8, xval: '2013', yval: 22262500 },
{ x: 9, xval: '2014', yval: 22507620 }
],
type:'Area',
xName:'xval',
yName:'yval',
height:'200px',
tooltipSettings: {
visible: true,
format: '${xval} : ${yval}'
}
};
```

Copyright © 2001 -2024 Syncfusion Inc.

```
},
provide: {
sparkline:[SparklineTooltip]
},
};
</script>
```

Run the project

To run the project, use the following command:

`bash

npm run dev

`

or

`bash

yarn run dev

`

The output will appear as follows:

Sample: vue-3-sparkline-charts-getting-started.

For migrating from Vue 2 to Vue 3, refer to the migration documentation.

Sparkline dimensions in Vue Sparkline component

Size for container

Sparkline can be rendered to its container size. You can set the size through inline or CSS as shown in the following code.

APP.VUE

```
<template>
    <div class="control_wrapper">
    <div class="spark">
        <ejs-sparkline id="sparkline" align="center"
:dataSource='dataSource' xName='xval' yName='yval' :height='height'
:width='width'></ejs-sparkline>
    </div>
    </div>
```

```
</template>
<script>
import Vue from 'vue';
import { SparklinePlugin } from "@syncfusion/ej2-vue-charts";
Vue.use(SparklinePlugin);
export default {
  data: function() {
    return {
    height: '350px',
    width: '650px',
    dataSource: [
            { x: 0, xval: '2005', yval: 20090440 },
            { x: 1, xval: '2006', yval: 20264080 },
            { x: 2, xval: '2007', yval: 20434180 },
            { x: 3, xval: '2008', yval: 21007310 },
            { x: 4, xval: '2009', yval: 21262640 },
            { x: 5, xval: '2010', yval: 21515750 },
            { x: 6, xval: '2011', yval: 21766710 },
            { x: 7, xval: '2012', yval: 22015580 },
            { x: 8, xval: '2013', yval: 22262500 },
            { x: 9, xval: '2014', yval: 22507620 },
        ]
    }
  }
}
</script>
<style>
.spark {
    width: 100%;
    height: 100%;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/sparkline/getting-started-cs24" %}

<!-- markdownlint-disable MD036 -->

Size for sparkline

<!-- markdownlint-disable MD036 -->

You can also set the size for sparkline directly using the width and height properties.

In pixel

You can set the size for sparkline in pixel as demonstrated in the following code.

APP.VUE

```
<template>
    <div class="control_wrapper">
    <div class="spark">
        <ejs-sparkline id="sparkline" align="center"
:dataSource='dataSource' xName='xval' yName='yval' :height='height'
:width='width'></ejs-sparkline>
    </div>
    </div>
</template>
<script>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
import Vue from 'vue';
import { SparklinePlugin } from "@syncfusion/ej2-vue-charts";
Vue.use(SparklinePlugin);
export default {
  data: function() {
    return {
    height: '150px',
    width: '350px',
    dataSource: [
            { x: 0, xval: '2005', yval: 20090440 },
            { x: 1, xval: '2006', yval: 20264080 },
            { x: 2, xval: '2007', yval: 20434180 },
            { x: 3, xval: '2008', yval: 21007310 },
            { x: 4, xval: '2009', yval: 21262640 },
            { x: 5, xval: '2010', yval: 21515750 },
            { x: 6, xval: '2011', yval: 21766710 },
            { x: 7, xval: '2012', yval: 22015580 },
            { x: 8, xval: '2013', yval: 22262500 },
            { x: 9, xval: '2014', yval: 22507620 },
        ]
    }
  }
}
</script>
<style>
.spark {
    width: 100%;
    height: 100%;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/sparkline/getting-started-cs25" %}

In percentage

By setting values in percentage, sparkline gets its dimension with respect to its container. For example, when the height is set to ‘50%’, sparkline is rendered to half of its container height.

APP.VUE

```
<template>
    <div class="control_wrapper">
    <div class="spark">
        <ejs-sparkline id="sparkline" align="center"
:dataSource='dataSource' xName='xval' yName='yval' :height='height'
:width='width'></ejs-sparkline>
    </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { SparklinePlugin } from "@syncfusion/ej2-vue-charts";
Vue.use(SparklinePlugin);
export default {
  data: function() {
    return {
    height: '50%',
```

Copyright © 2001 -2024 Syncfusion Inc.

```
    width: '80%',
    dataSource: [
            { x: 0, xval: '2005', yval: 20090440 },
            { x: 1, xval: '2006', yval: 20264080 },
            { x: 2, xval: '2007', yval: 20434180 },
            { x: 3, xval: '2008', yval: 21007310 },
            { x: 4, xval: '2009', yval: 21262640 },
            { x: 5, xval: '2010', yval: 21515750 },
            { x: 6, xval: '2011', yval: 21766710 },
            { x: 7, xval: '2012', yval: 22015580 },
            { x: 8, xval: '2013', yval: 22262500 },
            { x: 9, xval: '2014', yval: 22507620 },
        ]
    }
  }
}
</script>
<style>
.spark {
    width: 100%;
    height: 100%;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/sparkline/getting-started-cs26" %}

Sparkline types in Vue Sparkline component

Different types of shapes can be used to represent the sparkline. You can change the sparkline type by setting the type property. Sparkline supports the following types:

- Line
- Column
- Win-Loss
- Pie
- Area

The following code sample shows different types of sparklines.

<!-- markdownlint-disable MD036 -->

Line

The [Line] type is used to render the sparkline series as line.

APP.VUE

```
<template>
    <div class="control_wrapper">
    <div class="spark">
        <ejs-sparkline id="sparkline" align="center"
:dataSource='dataSource' xName='xval' yName='yval' :height='height'
:type='type' :width='width'></ejs-sparkline>
    </div>
    </div>
</template>
```

```
<script>
import Vue from 'vue';
import { SparklinePlugin } from "@syncfusion/ej2-vue-charts";
Vue.use(SparklinePlugin);
export default {
  data: function() {
    return {
    height: '100px',
    width: '70%',
    type:'Line',
    dataSource: [
            { x: 0, xval: '2005', yval: 20090440 },
            { x: 1, xval: '2006', yval: 20264080 },
            { x: 2, xval: '2007', yval: 20434180 },
            { x: 3, xval: '2008', yval: 21007310 },
            { x: 4, xval: '2009', yval: 21262640 },
            { x: 5, xval: '2010', yval: 21515750 },
            { x: 6, xval: '2011', yval: 21766710 },
            { x: 7, xval: '2012', yval: 22015580 },
            { x: 8, xval: '2013', yval: 22262500 },
            { x: 9, xval: '2014', yval: 22507620 },
        ]
    }
  }
}
</script>
<style>
.spark {
    width: 100%;
    height: 100%;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/sparkline/getting-started-cs27" %}

Column

The [Column] type is used to render the sparkline series as column.

APP.VUE

```
<template>
    <div class="control_wrapper">
    <div class="spark">
        <ejs-sparkline id="sparkline" align="center"
:dataSource='dataSource' xName='xval' yName='yval' :type='type'
:height='height' :width='width'></ejs-sparkline>
    </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { SparklinePlugin } from "@syncfusion/ej2-vue-charts";
Vue.use(SparklinePlugin);
export default {
  data: function() {
    return {
```

Copyright © 2001 -2024 Syncfusion Inc.

```
    height: '150px',
     width: '200px',
     type:'Column',
     dataSource: [
             { x: 0, xval: '2005', yval: 20090440 },
             { x: 1, xval: '2006', yval: 20264080 },
             { x: 2, xval: '2007', yval: 20434180 },
             { x: 3, xval: '2008', yval: 21007310 },
             { x: 4, xval: '2009', yval: 21262640 },
             { x: 5, xval: '2010', yval: 21515750 },
             { x: 6, xval: '2011', yval: 21766710 },
             { x: 7, xval: '2012', yval: 22015580 },
             { x: 8, xval: '2013', yval: 22262500 },
             { x: 9, xval: '2014', yval: 22507620 },
         ]
     }
   }
}
</script>
<style>
.spark {
    width: 100%;
    height: 100%;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/sparkline/getting-started-cs28" %}

Pie

The [Pie] type is used to render the sparkline series as pie.

APP.VUE

```
<template>
    <div class="control_wrapper">
    <div class="spark">
        <ejs-sparkline id="sparkline" align="center"
:dataSource='dataSource' xName='xval' yName='yval' :type='type'
:height='height' :width='width'></ejs-sparkline>
    </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { SparklinePlugin } from "@syncfusion/ej2-vue-charts";
Vue.use(SparklinePlugin);
export default {
  data: function() {
    return {
    height: '200px',
    width: '70%',
    type:'Pie',
    dataSource: [
             { x: 0, xval: '2005', yval: 20090440 },
             { x: 1, xval: '2006', yval: 20264080 },
             { x: 2, xval: '2007', yval: 20434180 },
```

Axis customization in Vue Sparkline component

You can customize axis value types and min and max values of the sparkline.

Change value type of the sparkline

You can change the sparkline value type by setting the [valueType] property to [Numeric], [Category], or [DateTime].

<!-- markdownlint-disable MD036 -->

DateTime

You can assign date-time values to the sparkline by setting the [valueType] property to [DateTime].

APP.VUE

```
<template>
    <div class="control_wrapper">
    <div class="spark">
        <ejs-sparkline id="sparkline" align="center"
:dataSource='dataSource' xName='xDate' yName='yval' :type='type'
:valueType='valueType' :height='height' :width='width'></ejs-sparkline>
    </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { SparklinePlugin } from "@syncfusion/ej2-vue-charts";
Vue.use(SparklinePlugin);
export default {
  data: function() {
    return {
    height: '150px',
    width: '130px',
    // Assign the "Column" as type of the sparkline
    type:'Column',
    // Assign the "DateTime" as value type to the sparkline
    valueType: 'DateTime',
    dataSource: [
            { xDate: new Date(2018, 0, 1), x: 0, yval: 4 },
            { xDate: new Date(2018, 0, 2), x: 1, yval: 4.5 },
            { xDate: new Date(2018, 0, 3), x: 2, yval: 8 },
            { xDate: new Date(2018, 0, 4), x: 3, yval: 7 },

Change value of axis

You can set horizontal axis line value of the sparkline by setting [value] to the [axisSettings] property. The following code example shows this.

APP.VUE

```
<template>
    <div class="control_wrapper">
    <div class="spark">
        <ejs-sparkline id="sparkline" align="center"
:dataSource='dataSource' :type='type' :valueType= 'valueType'
:axisSettings='axisSettings' xName='x' yName='yval' :height='height'
:width='width'></ejs-sparkline>
    </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { SparklinePlugin } from "@syncfusion/ej2-vue-charts";
Vue.use(SparklinePlugin);
export default {
  data: function() {
    return {
    height: '150px',
    width: '130px',
   dataSource: [
            { x: 0, yval: 50 },
            { x: 1, yval: 30 },
            { x: 2, yval: 20 },
            { x: 3, yval: 30 },
            { x: 4, yval: 50 },
            { x: 5, yval: 40 },
            { x: 6, yval: 20 },
            { x: 7, yval: 10 },
            { x: 8, yval: 30 },
            { x: 9, yval: 10 },
            { x: 10, yval: 40 }
        ],
    // Set the value to horizontal axis of sparkline
    axisSettings: {
          value: 25
    },
    // Assign the 'Column' as type of the sparkline
    type:'Column',
    // Assign the 'Numeric' as value type of the sparkline
    valueType: 'Numeric'
    }
  }
}
</script>
<style>
```

```
.spark {
    width: 100%;
    height: 100%;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/sparkline/getting-started-cs9" %}

Axis line customization

Axis of the sparkline can be collapsed using the [visible] property in [lineSettings]; this is not applicable for win-loss. You can customize the [color], [width], [opacity], and [dashArray] of axis line.

APP.VUE

```
<template>
    <div class="control_wrapper">
    <div class="spark">
        <ejs-sparkline id="sparkline" align="center"
:dataSource='dataSource' :axisSettings='axisSettings' :valueType='valueType'
xName='x' yName='yval' :height='height' :width='width'></ejs-sparkline>
    </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { SparklinePlugin } from "@syncfusion/ej2-vue-charts";
Vue.use(SparklinePlugin);
export default {
  data: function() {
    return {
    height: '150px',
    width: '130px',
    dataSource: [
            { x: 0, yval: 50 },
            { x: 1, yval: 30 },
            { x: 2, yval: 20 },
            { x: 3, yval: 30 },
            { x: 4, yval: 50 },
            { x: 5, yval: 40 },
            { x: 6, yval: 20 },
            { x: 7, yval: 10 },
            { x: 8, yval: 30 },
            { x: 9, yval: 10 },
            { x: 10, yval: 40 }
        ],
    // Set the value to horizontal axis
    axisSettings: {
    // To configure axis line settings
         lineSettings: {
            visible: true,
            color: "#ff14ae",
            dashArray:5
            }
    },
    // Assign the value type as 'Numeric' to the sparkline

Range band in Vue Sparkline component

This section explains how to customize the sparkline with multiple range bands.

Range band customization

The range band feature is used to highlight a particular range along with the y-axis using the [startRange] and [endRange] properties. You can also customize the [color] and [opacity] of the range band.

APP.VUE

```
<template>
    <div class="control_wrapper">
    <div class="spark">
        <ejs-sparkline id="sparkline" align="center"
:dataSource='dataSource' :rangeBandSettings ='rangeBandSettings' fill=
'#0d3c9b' :lineWidth='lineWidth' :height='height' :width='width'></ejs-
sparkline>
    </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { SparklinePlugin } from "@syncfusion/ej2-vue-charts";
Vue.use(SparklinePlugin);
export default {
  data: function() {
    return {
    height: '150px',
    width: '150px',
    lineWidth: 2,
    dataSource:   [0, 6, 4, 1, 3, 2, 5],
    // To configure range band settings
    rangeBandSettings: [
            {
                startRange: 1,
                endRange: 3,
                color: '#bfd4fc',
                opacity:0.4
            }
    ]
    }
  }
}
</script>
<style>
.spark {
    width: 100%;
    height: 100%;
```

```
}
</style>
```

{% previewsample "page.domainurl/code-snippet/sparkline/getting-started-cs22" %}

Multiple range band customization

You can define multiple range bands to a sparkline as shown in the following code sample.

APP.VUE

```
<template>
    <div class="control_wrapper">
    <div class="spark">
        <ejs-sparkline id="sparkline" align="center"
:dataSource='dataSource' fill= '#0d3c9b'
:rangeBandSettings='rangeBandSettings' :lineWidth='lineWidth'
:height='height' :width='width'></ejs-sparkline>
    </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { SparklinePlugin } from "@syncfusion/ej2-vue-charts";
Vue.use(SparklinePlugin);
export default {
  data: function() {
    return {
    height: '150px',
    width: '150px',
    lineWidth: 2,
    dataSource:   [0, 6, 4, 1, 3, 2, 5],
    rangeBandSettings: [
            {
                startRange: 1,
                endRange: 2,
                color: '#bfd4fc',
                opacity:0.4
            },
            {
                startRange: 4,
                endRange: 5,
                color: 'red',
                opacity:0.4
            }
        ]
    }
  }
}
</script>
<style>
.spark {
    width: 100%;
    height: 100%;
}
</style>
```

Marker in Vue Sparkline component

This section explains how to add markers to the sparklines.

Adding marker to the sparkline

To add marker to the sparkline, specify the `visible` of `markerSettings` as following values. The `visible` will accept multiple values too.

- All - Enables markers for all points.
- Start - Enables marker for the start point.
- End - Enables marker for the end point.
- High - Enables marker for the high point.
- Low - Enables marker for the low point.
- Negative - Enables markers for the negative points.

The following code example shows enabling markers for all points.

APP.VUE

```
<template>
    <div class="control_wrapper">
    <div class="spark">
        <ejs-sparkline id="sparkline" align="center"
:dataSource='dataSource' :axisSettings='axisSettings'
:markerSettings='markerSettings' :height='height' :width='width'></ejs-
sparkline>
    </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { SparklinePlugin } from "@syncfusion/ej2-vue-charts";
Vue.use(SparklinePlugin);
export default {
  data: function() {
    return {
    height: '200px',
    width: '350px',
    axisSettings: {
        minX: -1, maxX: 7, maxY: 7, minY: -1
    }
    dataSource:   [0, 6, 4, 1, 3, 2, 5],
    // To enable markers for all points
    markerSettings: {
        visible: ['All']
    }
    }
  }
}
</script>
<style>
.spark {
    width: 100%;
    height: 100%;
```

```
}
</style>
```

{% previewsample "page.domainurl/code-snippet/sparkline/getting-started-cs19" %}

Adding marker to special point

In sparkline, markers can be enabled for particular points such as the start, end, low, high, or negative. The following code examples shows enabling markers for the high and low points.

APP.VUE

```
<template>
    <div class="control_wrapper">
    <div class="spark">
        <ejs-sparkline id="sparkline" align="center"
:dataSource='dataSource' :lowPointColor='lowPointColor'
:markerSettings='markerSettings' :highPointColor='highPointColor'
:axisSettings='axisSettings' :height='height' :width='width'></ejs-
sparkline>
    </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { SparklinePlugin } from "@syncfusion/ej2-vue-charts";
Vue.use(SparklinePlugin);
export default {
  data: function() {
    return {
    height: '200px',
    width: '350px',
    axisSettings: {
        minX: -1, maxX: 7, maxY: 7, minY: -1
    }
    dataSource:   [3, 6, 4, 1, 3, 2, 5],
    // To enable marker for high and low points with color customization
    highPointColor: 'blue',
    lowPointColor: 'red',
    markerSettings: {
        visible: ['High', 'Low']
    }
    }
  }
}
</script>
<style>
.spark {
    width: 100%;
    height: 100%;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/sparkline/getting-started-cs20" %}

Customizing markers

Sparkline markers can be customized in terms of fill color, border color, width, opacity, and size. The following code example shows customizing marker's fill, border, and size.

APP.VUE

```
<template>
    <div class="control_wrapper">
    <div class="spark">
        <ejs-sparkline id="sparkline" align="center"
:dataSource='dataSource' :markerSettings='markerSettings' fill=
'blue':axisSettings='axisSettings' :height='height' :width='width'></ejs-
sparkline>
    </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { SparklinePlugin } from "@syncfusion/ej2-vue-charts";
Vue.use(SparklinePlugin);
export default {
  data: function() {
    return {
    height: '200px',
    width: '350px',
    axisSettings: {
        minX: -1, maxX: 7, maxY: 7, minY: -1
    }
    dataSource:   [3, 6, 4, 1, 3, 2, 5],
    // To enable marker for high and low points with color customization
    markerSettings: {
        visible: ['All'],
        size: 5, fill: 'white', border: { color: 'blue', width: 2}
    }
    }
  }
}
</script>
<style>
.spark {
    width: 100%;
    height: 100%;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/sparkline/getting-started-cs21" %}

Data labels in Vue Sparkline component

Data labels are used to display values of data points to improve the readability.

Enable data label

To enable data label for sparkline series, provide `visible` of the `dataLabelSettings` as following possible values:

- All - Enables data label of all points.

Copyright © 2001 -2024 Syncfusion Inc.

- Start - Enables data label of the start point.
- End - Enables data label of the end point.
- High - Enables data label of the high point.
- Low - Enables data label of the low point.
- Negative - Enables data labels of the negative points.

The following example shows enabling sparkline data label for all points.

APP.VUE

```
<template>
    <div class="control_wrapper">
    <div class="spark">
        <ejs-sparkline id="sparkline" align="center"
:dataSource='dataSource' :dataLabelSettings='dataLabelSettings' fill= 'blue'
:axisSettings='axisSettings' :height='height' :width='width'></ejs-
sparkline>
    </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { SparklinePlugin } from "@syncfusion/ej2-vue-charts";
Vue.use(SparklinePlugin);
export default {
  data: function() {
    return {
    height: '200px',
    width: '350px',
    axisSettings: {
        minX: -1, maxX: 7, maxY: 7, minY: -1
    },
    dataSource:   [0, 6, 4, 1, 3, 2, 5],
    // To enable data label for all points
    dataLabelSettings: {
        visible: ['All']
    },
    }
  }
}
</script>
<style>
.spark {
    width: 100%;
    height: 100%;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/sparkline/getting-started-cs11" %}

Customize data label

Data labels can be customized using the fill, border, opacity, and textStyle. The following code example shows customizing data label border, text color, and fill color.

APP.VUE

```
<template>
    <div class="control_wrapper">
    <div class="spark">
        <ejs-sparkline id="sparkline" align="center"
:axisSettings='axisSettings' fill= 'blue'
:dataLabelSettings='dataLabelSettings' :dataSource='dataSource'
:height='height' :width='width'></ejs-sparkline>
    </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { SparklinePlugin } from "@syncfusion/ej2-vue-charts";
Vue.use(SparklinePlugin);
export default {
  data: function() {
    return {
    height: '200px',
    width: '350px',
    axisSettings: {
        minX: -1, maxX: 7, maxY: 8, minY: -1
    },
    dataSource:   [0, 6, 4, 1, 3, 2, 5],
    // To customize data label fill, border, and text color
    dataLabelSettings: {
        visible: ['All'],
        border: { color: 'blue', width: 1},
        fill: 'blue', opacity: 0.4,
        textStyle: {
            color: 'white'
        }
    }
    }
  }
}
</script>
<style>
.spark {
    width: 100%;
    height: 100%;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/sparkline/getting-started-cs12" %}

Format data label text

The text of data labels can be formatted using the format API in the sparkline dataLabelSettings. By default, data label shows the y-value of point. The following code example shows how to display x and y-values for points.

APP.VUE

```
<template>
    <div class="control_wrapper">
    <div class="spark">
```

```
        <ejs-sparkline id="sparkline" align="center"
:dataSource='dataSource' :axisSettings='axisSettings'
:dataLabelSettings='dataLabelSettings' fill= 'blue'valueType= 'Category'
xName='x' yName='y' :height='height' :width='width'></ejs-sparkline>
    </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { SparklinePlugin } from "@syncfusion/ej2-vue-charts";
Vue.use(SparklinePlugin);
export default {
  data: function() {
    return {
     height: '200px',
    width: '500px',
    axisSettings: {
        minX: -1, maxX: 7, maxY: 8, minY: -1
    },
    dataSource:   [{x: 'Mon', y: 3 },{x: 'Tue', y: 5 },{x: 'Wed', y: 2 },{x:
'Thu', y: 4 },{x: 'Fri', y: 6 },],
    // To enable data label for all points
    dataLabelSettings: {
        format: '${x} : ${y}'
        visible: ['All'],
        border: { color: 'blue', width: 1},
        fill: 'blue', opacity: 0.4,
        textStyle: {
            color: 'white'
        }
    }
    }
  }
}
</script>
<style>
.spark {
    width: 100%;
    height: 100%;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/sparkline/getting-started-cs13" %}

User interaction in Vue Sparkline component

Sparkline has two user interaction features: tooltip and tracker line.

Tooltip

The sparkline provides options to display details about values of data points through tooltips when hovering the mouse over data point. To use tooltip in sparkline, inject the `SparklineTooltip` module to sparkline using the inject method.

The following code example shows enabling tooltip for sparkline with format.

APP.VUE

```
<template>
    <div class="control_wrapper">
    <div class="spark">
        <ejs-sparkline id="sparkline" align="center"
:dataSource='dataSource' :axisSettings='axisSettings' :valueType='valueType'
fill= 'blue' xName='x' yName='y' :tooltipSettings='tooltipSettings'
:height='height' :width='width'></ejs-sparkline>
    </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { SparklinePlugin,SparklineTooltip } from "@syncfusion/ej2-vue-
charts";
Vue.use(SparklinePlugin);
export default {
  data: function() {
    return {
    height: '200px',
    width: '500px',
    axisSettings: {
        minX: -1, maxX: 7, maxY: 8, minY: -1
    },
    valueType: 'Category',
    dataSource:   [{x: 'Mon', y: 3 },{x: 'Tue', y: 5 },{x: 'Wed', y: 2 },{x:
'Thu', y: 4 },{x: 'Fri', y: 6 }],
    // To enable tooltip for sparkline
    tooltipSettings: {
        visible: true,
        format: '${x} : ${y}'
    }
    }
  },
provide:{
    sparkline:[SparklineTooltip]
}
}
</script>
<style>
.spark {
    width: 100%;
    height: 100%;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/sparkline/getting-started-cs34" %}

Tooltip customization

The fill color, text styles, format, and border of the tooltip can be customized. The following code example shows customization of tooltip's fill color and text style.

APP.VUE

```
<template>
    <div class="control_wrapper">
    <div class="spark">
```

```
        <ejs-sparkline id="sparkline" align="center"
:dataSource='dataSource' :axisSettings='axisSettings' :valueType='valueType'
fill= 'blue' xName='x' yName='y' :tooltipSettings='tooltipSettings'
:height='height' :width='width'></ejs-sparkline>
    </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { SparklinePlugin,SparklineTooltip } from "@syncfusion/ej2-vue-
charts";
Vue.use(SparklinePlugin);
export default {
  data: function() {
    return {
    height: '200px',
    width: '500px',
    axisSettings: {
        minX: -1, maxX: 7, maxY: 8, minY: -1
    },
    valueType: 'Category',
    dataSource:   [{x: 'Mon', y: 3 },{x: 'Tue', y: 5 },{x: 'Wed', y: 2 },{x:
'Thu', y: 4 },{x: 'Fri', y: 6 }],
    // To enable tooltip for sparkline
    tooltipSettings: {
        visible: true,
        format: '${x} : ${y}',
        fill: '#033e96',
        textStyle: {
            color: 'white'
        },
    }
    }
  },
provide:{
    sparkline:[SparklineTooltip]
}
}
</script>
<style>
.spark {
    width: 100%;
    height: 100%;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/sparkline/getting-started-cs35" %}

Tooltip template

Sparkline tooltip has template support. By using tooltip template, you can customize tooltips. The following code example shows more customization options provided to `sparktooltip` css class that is used in tooltip template div. Using this template, images also can be added to tooltip.

`

.sparktooltip {

border-radius: 5px;

background: #008cff;

color: #FFFFFF !important;

font-size: 16px;

font-style: italic;

padding: 8px;

}

`

APP.VUE

```
<template>
    <div class="control_wrapper">
    <div class="spark">
        <ejs-sparkline id="sparkline" align="center"
:dataSource='dataSource' :axisSettings='axisSettings'  valueType= 'Category'
fill= '#033e96' xName='x' yName='y' :tooltipSettings='tooltipSettings'
:height='height' :width='width'></ejs-sparkline>
    </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { SparklinePlugin,SparklineTooltip } from "@syncfusion/ej2-vue-
charts";
var contentTemplate = function() {
  return { template: contentVue };
};
var contentVue = Vue.component("contentTemplate", {
  template: '<div style="border-radius: 5px; background: #008cff;color:
#FFFFFF !important;font-size: 16px;font-style: italic;padding:
8px;">{{data.x}} : {{data.y}}</div>',
  data() {
    return {
      data: {}
    };
  }
});
Vue.use(SparklinePlugin);
export default {
  data: function() {
    return {
    height: '200px',
    width: '500px',
    axisSettings: {
        minX: -1, maxX: 7, maxY: 8, minY: -1
    },
    dataSource:   [{x: 'Mon', y: 3 },{x: 'Tue', y: 5 },{x: 'Wed', y: 2 },{x:
'Thu', y: 4 },{x: 'Fri', y: 6 },],
    // To enable tooltip template for sparkline with fill color, border
radius and padding customization
    tooltipSettings: {
```

```
        visible: true,
        template: contentTemplate
    }
    }
  },
provide:{
    sparkline:[SparklineTooltip]
}
}
</script>
<style>
.spark {
    width: 100%;
    height: 100%;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/sparkline/getting-started-cs36" %}

Track line

The track line tracks data points that are closer to the mouse position or touch contact.

To enable track lines for sparkline, specify the `visible` option of `trackLineSettings` to true. Based on theme, tracker color will be changed. The default value of tracker color is black.

To use track line in sparkline, inject the `SparklineTooltip` module to sparkline using the inject method.

APP.VUE

```
<template>
    <div class="control_wrapper">
    <div class="spark">
        <ejs-sparkline id="sparkline" align="center"
:dataSource='dataSource' fill= '#033e96' :axisSettings='axisSettings'
:tooltipSettings='tooltipSettings' :height='height' :width='width'></ejs-
sparkline>
    </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { SparklinePlugin,SparklineTooltip } from "@syncfusion/ej2-vue-
charts";
Vue.use(SparklinePlugin);
export default {
  data: function() {
    return {
    height: '200px',
    width: '500px',
    axisSettings: {
        minX: -1, maxX: 46, maxY: 10, minY: -1
    },
    dataSource:   [5, 3, 4, 6, 8, 7, 9, 1, 3, 5, 3, 4, 6, 8, 7, 9, 1, 3, 5,
2, 4, 6, 7, 9, 5, 8, 3, 6, 1, 7, 4, 2, 5, 2, 4, 6, 7, 9, 5, 8, 3, 6, 1, 7,
4, 2],
    // To enable tooltip template for sparkline with fill color, border
radius and padding customization
```

```
    tooltipSettings: {
        trackLineSettings: {
            visible: true,
            color: '#033e96',
            width: 1
        }
    }
    }
  },
provide:{
    sparkline:[SparklineTooltip]
}
}
</script>
<style>
.spark {
    width: 100%;
    height: 100%;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/sparkline/getting-started-cs37" %}

Appearance in Vue Sparkline component

The appearance of the sparkline can be customized using margin, container Area border, and container Area background.

Sparkline border

The container Area border of the sparkline is used to render border to cover sparkline area.

The following code example shows the sparkline with overall border.

APP.VUE

```
<template>
    <div class="control_wrapper">
    <div class="spark">
        <ejs-sparkline id="sparkline" align="center"
:dataSource='dataSource' :border='border' fill= '#b2cfff'
:containerArea='containerArea' :type='type' :height='height'
:width='width'></ejs-sparkline>
    </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { SparklinePlugin } from "@syncfusion/ej2-vue-charts";
Vue.use(SparklinePlugin);
export default {
  data: function() {
    return {
    // To render border around the sparkline
    containerArea: {
        border: { color: '#033e96', width: 2 }
    },
    border: { color: '#033e96', width: 1 },
```

Copyright © 2001 -2024 Syncfusion Inc.

```
    height: '200px',
    width: '350px',
    type: 'Area',
    fill: '#b2cfff'
    dataSource: [3, 6, 4, 1, 3, 2, 5]
    }
  }
}
</script>
<style>
.spark {
    width: 100%;
    height: 100%;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/sparkline/getting-started-cs1" %}

Sparkline padding

Padding is used to specify padding value between container and sparkline. By default, padding value of the sparkline is 5. Sparkline padding values are specified by the left, right, top, and bottom.

The following code example shows the sparkline with overall padding is set to 20.

APP.VUE

```
<template>
    <div class="control_wrapper">
    <div class="spark">
        <ejs-sparkline id="sparkline" align="center"
:dataSource='dataSource' :border='border' :containerArea='containerArea'
:padding='padding' fill= '#b2cfff' :type='type' :height='height'
:width='width'></ejs-sparkline>
    </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { SparklinePlugin } from "@syncfusion/ej2-vue-charts";
Vue.use(SparklinePlugin);
export default {
  data: function() {
    return {
    containerArea: {
        border: { color: '#033e96', width: 2 }
    },
    // To render sparkline with padding
    padding: { left: 20, right: 20, bottom: 20, top: 20},
    border: { color: '#033e96', width: 1 },
    height: '200px',
    width: '350px',
    type: 'Area',
    dataSource: [3, 6, 4, 1, 3, 2, 5]
    }
  }
}
```

Copyright © 2001 -2024 Syncfusion Inc.

```
</script>
<style>
.spark {
    width: 100%;
    height: 100%;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/sparkline/getting-started-cs2" %}

Sparkline area customization

The background color of the sparkline area can be customized using the containerArea background color. By default, the sparkline background color is transparent.

APP.VUE

```
<template>
    <div class="control_wrapper">
    <div class="spark">
        <ejs-sparkline id="sparkline" align="center" :padding='padding'
:border='border' fill= '#b2cfff' :containerArea='containerArea'
:dataSource='dataSource' :type='type' :height='height' :width='width'></ejs-
sparkline>
    </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { SparklinePlugin } from "@syncfusion/ej2-vue-charts";
Vue.use(SparklinePlugin);
export default {
  data: function() {
    return {
    containerArea: {
        border: { color: '#033e96', width: 2 },
        // To render sparkline with background
        background: '#eff1f4',
    },
    padding: { left: 20, right: 20, bottom: 20, top: 20},
    border: { color: '#033e96', width: 2 },
    height: '200px',
    width: '350px',
    type: 'Area',
    dataSource: [3, 6, 4, 1, 3, 2, 5]
    }
  }
}
</script>
<style>
.spark {
    width: 100%;
    height: 100%;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/sparkline/getting-started-cs3" %}

Sparkline theme

Datalabel and track line colors of the sparkline will be changed based on theme. For example, for dark theme, the color of datalabel and track line should be white; for light theme, their value should be black. The possible values for sparkline theme are Material, Fabric, Bootstrap, and Highcontrast.

The following code example shows the color for datalabel and track line is set to white for dark theme.

APP.VUE

```
<template>
    <div class="control_wrapper">
    <div class="spark">
        <ejs-sparkline id="sparkline" align="center"
:dataSource='dataSource' :border='border' fill= '#007dd1' lineWidth= 3
:axisSettings='axisSettings' :dataLabelSettings='dataLabelSettings' theme=
'Highcontrast' :type='type' :tooltipSettings='tooltipSettings'
:height='height' :width='width'></ejs-sparkline>
    </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { SparklinePlugin,SparklineTooltip } from "@syncfusion/ej2-vue-
charts";
Vue.use(SparklinePlugin);
export default {
  data: function() {
    return {
    dataLabelSettings: { visible: ['All']},
    tooltipSettings: {
        trackLineSettings: { visible: true }
    },
    axisSettings: {
        minX: -1, maxX: 7
    },
    border: { color: 'transparent', width: 2 },
    height: '200px',
    width: '350px',
    type: 'Line',
    dataSource: [3, 6, 4, 1, 3, 2, 5]
    }
  },
provide:{
    sparkline:[SparklineTooltip]
}
}
</script>
<style>
.spark {
    width: 100%;
    height: 100%;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/sparkline/getting-started-cs4" %}

Localization in Vue Sparkline component

The sparkline control supports localization. The default culture for localization is en-US. You can change the culture using the setCulture method.

Tooltip format

Sparkline tooltip supports localization. The following code sample shows tooltip text with currency format based on culture.

APP.VUE

```
<template>
    <div class="control_wrapper">
    <div class="spark">
        <ejs-sparkline id="sparkline" align="center"
:dataSource='dataSource' :containerArea='containerArea' :border='border'
fill= '#b2cfff' :padding='padding' lineWidth= 3 format= 'c0'
useGroupingSeparator= 'true' :type='type' :tooltipSettings='tooltipSettings'
:height='height' :width='width'></ejs-sparkline>
    </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { SparklinePlugin,SparklineTooltip } from "@syncfusion/ej2-vue-
charts";
Vue.use(SparklinePlugin);
export default {
  data: function() {
    return {
   containerArea: {
        border: { color: '#033e96', width: 2 }
    },
    tooltipSettings: {
        visible: true
    },
    padding: { left: 20, right: 20, bottom: 20, top: 20},
    border: { color: '#033e96', width: 2 },
    height: '200px',
    width: '350px',
    type: 'Area',
    dataSource: [30000, 60000, 40000, 10000, 30000, 20000, 50000]
    }
  },
provide:{
    sparkline:[SparklineTooltip]
}
}
</script>
<style>
.spark {
    width: 100%;
    height: 100%;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/sparkline/getting-started-cs17" %}

Rtl

If you set the enableRtl property to true, then the sparkline will be rendered from rigt-to-left direction.

The following example shows the sparkline is render from "Right-to-left".

APP.VUE

```
<template>
    <div class="control_wrapper">
    <div class="spark">
        <ejs-sparkline id="sparkline" align="center"
:dataSource='dataSource' :enableRtl='enableRtl' :height='height'
:width='width'></ejs-sparkline>
    </div>
    </div>
</template>
<script>
import Vue from 'vue';
import { SparklinePlugin,SparklineTooltip } from "@syncfusion/ej2-vue-
charts";
Vue.use(SparklinePlugin);
export default {
  data: function() {
    return {
    height: '150px',
    width: '150px',
    enableRtl: true
    dataSource: [30000, 60000, 40000, 10000, 30000, 20000, 50000]
    }
  }
}
</script>
<style>
.spark {
    width: 100%;
    height: 100%;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/sparkline/getting-started-cs18" %}

Accessibility in Vue Sparkline component

The Sparkline component followed the accessibility guidelines and standards, including ADA, Section 508, WCAG 2.2 standards, and WCAG roles that are commonly used to evaluate accessibility.

The accessibility compliance for the Sparkline component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| WCAG 2.2 Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/intermediate.png" alt="Intermediate"> |

Copyright © 2001 -2024 Syncfusion Inc.

| Section 508 Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/intermediate.png" alt="Intermediate"> |

| Screen Reader Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/intermediate.png" alt="Intermediate"> |

| Right-To-Left Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Color Contrast | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Mobile Device Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Keyboard Navigation Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/intermediate.png" alt="Intermediate"> |

| Accessibility Checker Validation | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Axe-core Accessibility Validation | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> - All features of the component meet the requirement.

<img src="https://cdn.syncfusion.com/content/images/landing-page/intermediate.png" alt="Intermediate"> - Some features of the component do not meet the requirement.

<img src="https://cdn.syncfusion.com/content/images/landing-page/no.png" alt="No"> - The component does not meet the requirement.

WAI-ARIA attributes

The Sparkline component followed the WAI-ARIA patterns to meet the accessibility. The following ARIA attributes are used in the Sparkline component:

- img (role)
- aria-label (attribute)
- aria-hidden (attribute)

Keyboard interaction

The Sparkline component followed the keyboard interaction guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Sparkline component.

Copyright © 2001 -2024 Syncfusion Inc.

| **Press** | **To do this** |

| --- | --- |

| Ctrl + P | Prints the Sparkline. |

Ensuring accessibility

The Sparkline component's accessibility levels are ensured through an accessibility-checker and axe-core software tools during automated testing.

The accessibility compliance of the Sparkline component is shown in the following sample. Open the sample in a new window to evaluate the accessibility of the Sparkline component with accessibility tools.

{% previewsample "https://ej2.syncfusion.com/accessibility/spark-line-chart.html" %}

SpeedDial

Getting Started with the Vue Speed dial Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using Vue-CLI and integrating the Syncfusion Vue Speed dial component using the Composition API / Options API.

Prerequisites

System requirements for Syncfusion Vue UI components

Dependencies

The list of dependencies required to use the Speed Dial component in your application is given as follows:

`js

|-- @syncfusion/ej2-vue-buttons

|-- @syncfusion/ej2-base

|-- @syncfusion/ej2-buttons

|-- @syncfusion/ej2-vue-base

`

Setting up the Vue 2 project

To generate a Vue 2 project using Vue-CLI, use the vue create command. Follow these steps to install Vue CLI and create a new project:

`bash

npm install -g @vue/cli

vue create quickstart

cd quickstart

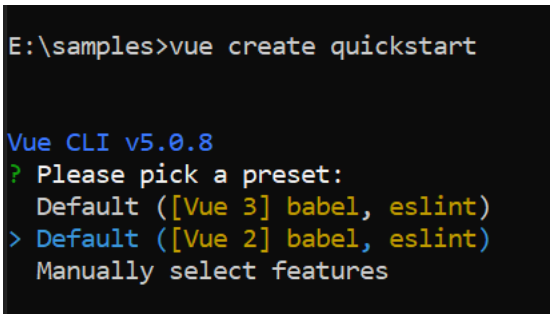
npm run serve

Copyright © 2001 -2024 Syncfusion Inc.

```
or

```bash
yarn global add @vue/cli
vue create quickstart
cd quickstart
yarn run serve
```

When creating a new project, choose the option `Default ([Vue 2] babel, eslint)` from the menu.



Once the `quickstart` project is set up with default settings, proceed to add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion packages are available at npmjs.com. To use Vue components, install the required npm package.

This article uses the Vue Speed dial component as an example. Install the `@syncfusion/ej2-vue-buttons` package by running the following command:

```bash
npm install @syncfusion/ej2-vue-buttons --save
```

or

```bash
yarn add @syncfusion/ej2-vue-buttons
```

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

Copyright © 2001 -2024 Syncfusion Inc.
```

In this article, the Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the Speed dial component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
</style>
```

Add Syncfusion Vue component

Follow the below steps to add the Vue Speed dial component using Composition API or Options API:

1\. First, import and register the Speed dial component in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { SpeedDialComponent as EjsSpeeddial } from "@syncfusion/ej2-vue-buttons";
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { SpeedDialComponent } from "@syncfusion/ej2-vue-buttons";
export default {
components: {
'ejs-speeddial': SpeedDialComponent
}
}
</script>
```

2\. In the template section define the Speed dial component with, content, target and items property.

~/SRC/APP.VUE

```
<template>
<div>
<div id="targetElement" style="position:relative;min-height:350px;border:1px solid;"></div>
<ejs-speeddial id='speeddial'  content='Edit' target='#targetElement' :items='items'></ejs-speeddial>
</div>
</template>
```

3\. Declare the value for the items property in the script section.

COMPOSITION API (~/SRC/APP.VUE)

```
<script>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
const items = [
{
text:'Cut'
},
{
text:'Copy'
},
{
text:'Paste'
}
];
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
data() {
return {
items: [
{
text:'Cut'
},
{
text:'Copy'
},
{
text:'Paste'
}
]
};
}
</script>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
    <div>
        <div id="targetElement" style="position:relative;min-
height:350px;border:1px solid;"></div>
        <ejs-speeddial id='speeddial'  content='Edit'
target='#targetElement' :items='items'></ejs-speeddial>
    </div>
</template>
<script setup>
import { SpeedDialComponent as EjsSpeeddial } from "@syncfusion/ej2-vue-
buttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
const items = [
  {
      text:'Cut'
  },
  {
      text:'Copy'
```

Copyright © 2001 -2024 Syncfusion Inc.

```
  },
  {
      text:'Paste'
  }
];
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-vue-buttons/styles/material.css';
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
    <div>
        <div id="targetElement" style="position:relative;min-
height:350px;border:1px solid;"></div>
        <ejs-speeddial id='speeddial'  content='Edit'
target='#targetElement' :items='items'></ejs-speeddial>
    </div>
</template>
<script>
import { SpeedDialComponent } from "@syncfusion/ej2-vue-buttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
export default {
    components: {
        'ejs-speeddial': SpeedDialComponent
    },
    data() {
        return {
            items: [
                {
                    text:'Cut'
                },
                {
                    text:'Copy'
                },
                {
                    text:'Paste'
                }
            ]
        };
    }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
</style>
```

Run the project

To run the project, use the following command:

`bash

Copyright © 2001 -2024 Syncfusion Inc.

npm run serve

`

or

`bash

yarn run serve

`

{% previewsample "page.domainurl/code-snippet/speed-dial/getting-started-cs1" %}

Getting Started with Syncfusion SpeedDial Component in Vue 3

This article provides a step-by-step guide for setting up a Vite project with a JavaScript environment and integrating the Syncfusion Vue SpeedDial component using the Composition API / Options API.

The Composition API is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

The Link to the Video is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

To get started quickly with Vue 3 Speed dial, you can check out this video:

Prerequisites

System requirements for Syncfusion Vue UI components

Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using Vite. To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

`bash

npm create vite@latest

`

or

`bash

yarn create vite

`

Using one of the above commands will lead you to set up additional configurations for the project as below:

1.Define the project name: We can specify the name of the project directly. Let's specify the name of the project as my-project for this article.

`bash

? Project name: » my-project

`

Copyright © 2001 -2024 Syncfusion Inc.

2.Select Vue as the framework. It will create a Vue 3 project.

`bash

? Select a framework: » - Use arrow-keys. Return to submit.

Vanilla

Vue

React

Preact

Lit

Svelte

Others

`

3.Choose JavaScript as the framework variant to build this Vite project using JavaScript and Vue.

`bash

? Select a variant: » - Use arrow-keys. Return to submit.

JavaScript

TypeScript

Customize with create-vue ↗

Nuxt ↗

`

4.Upon completing the aforementioned steps to create the my-project, run the following command to install its dependencies:

`bash

cd my-project

npm install

`

or

`bash

cd my-project

yarn install

`

Now that my-project is ready to run with default settings, let's add Syncfusion components to the project.

Copyright © 2001 -2024 Syncfusion Inc.

Add Syncfusion Vue packages

Syncfusion Vue component packages are available at npmjs.com. To use Syncfusion Vue components in the project, install the corresponding npm package.

This article uses the Vue Speed Dial component as an example. To use the Vue Speed Dial component in the project, the @syncfusion/ej2-vue-buttons package needs to be installed using the following command:

`bash

npm install @syncfusion/ej2-vue-buttons --save

`

or

`bash

yarn add @syncfusion/ej2-vue-buttons

`

Adding CSS reference for Syncfusion Vue Speed Dial component

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the Button component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
</style>
```

Adding Syncfusion Vue Speed Dial component in the application

Follow the below steps to add the Vue Speed Dial component using Composition API or Options API:

1. First, import and register the Speed Dial component in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { SpeedDialComponent as ejsSpeeddial } from "@syncfusion/ej2-vue-
buttons";
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
import { SpeedDialComponent } from "@syncfusion/ej2-vue-buttons";
//Component registration
export default {
name: "App",
components: {
"ejs-speeddial": SpeedDialComponent
}
}
</script>
```

2. In the template section, define the Speed Dial component with the items property

~/SRC/APP.VUE

```
<template>
<div id="targetElement" style="position:relative;min-height:350px;min-width:
350px;border:1px solid;">
<ejs-speeddial id='speeddial'  content='Edit' target='#targetElement'
:items='items'></ejs-speeddial>
</div>
</template>
```

3. Declare the values for the items property in the script section.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
const items = [
{
text: 'Cut'
},
{
text: 'Copy'
},
{
text: 'Paste'
}];
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
data () {
return {
items:[
{
text: 'Cut'
},
{
text: 'Copy'
},
{
text: 'Paste'
```

Copyright © 2001 -2024 Syncfusion Inc.

```
}]
};
}
</script>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<div id="targetElement" style="position:relative;min-height:350px;min-width:
350px;border:1px solid;">
<ejs-speeddial id='speeddial'  content='Edit' target='#targetElement'
:items='items' @click="click"></ejs-speeddial>
</div>
</template>
<script setup>
import { SpeedDialComponent as ejsSpeeddial } from "@syncfusion/ej2-vue-
buttons";
const items = [
{
text: 'Cut'
},
{
text: 'Copy'
},
{
text: 'Paste'
}];
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-buttons/styles/material.css";
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<div id="targetElement" style="position:relative;min-height:350px;min-
width:350px;border:1px solid;">
<ejs-speeddial id='speeddial'  content='Edit' target='#targetElement'
:items='items'></ejs-speeddial>
</div>
</template>
<script>
import { SpeedDialComponent } from "@syncfusion/ej2-vue-buttons";
export default {
name: "App",
components: {
"ejs-speeddial": SpeedDialComponent
},
data () {
return {
items:[
{
text: 'Cut'
```

Copyright © 2001 -2024 Syncfusion Inc.

```
},
{
text: 'Copy'
},
{
text: 'Paste'
}]
};
}
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
</style>
```

Run the project

To run the project, use the following command:

`bash

npm run dev

`

or

`bash

yarn run dev

`

The output will appear as follows:

For migrating from Vue 2 to Vue 3, refer to the migration documentation.

Items in Vue Speed dial component

The Vue Speed Dial action items can be added by using items property.

| Fields | Type | Description |

|------|------|------------|

| text | string | Defines the text content of SpeedDialItem. |

| iconCss | string | Defines one or more CSS classes to include an icon or image in Speed Dial item. |

| disabled | boolean | Defines whether to enable or disable the SpeedDialItem. |

| id | string | Defines a unique value for the SpeedDialItem which can be used to identify the item in event args. |

| title | string | Defines the title of SpeedDialItem to display tooltip. |

Icons in Speed Dial items

You can customize the icon and text of Speed Dial action items using iconCss and text properties.

Icon only

You can show icon only in SpeedDial items by setting iconCss property. You can show tooltip on hover to show additional details to end-user by setting title property.

APP.VUE

```
<template>
    <div>
        <div id="targetElement" style="position:relative;min-
height:350px;border:1px solid;"></div>
        <ejs-speeddial id='speeddial' openIconCss='e-icons e-edit'
closeIconCss='e-icons e-close' target='#targetElement' :items='items'></ejs-
speeddial>
    </div>
</template>
<script>
    import Vue from 'vue';
    import { SpeedDialPlugin } from "@syncfusion/ej2-vue-buttons";
    import { enableRipple } from '@syncfusion/ej2-base';
    enableRipple(true);
    Vue.use(SpeedDialPlugin);
    export default {
        data() {
            return {
                items: [
                    { iconCss: 'e-icons e-cut' },
                    { iconCss: 'e-icons e-copy' },
                    { iconCss: 'e-icons e-paste' }
                ]
            };
        }
    }
</script>
<style>

```

{% previewsample "page.domainurl/code-snippet/speed-dial/items-cs4" %}

Animation

The Speed Dial items can be animated during the opening and closing of the popup action items. You can customize the animation's effect, delay, and duration by setting animation property. By default, Speed Dial animates with a fade effect and supports all speeddialanimation effects.

Below example demonstrates the Speed Dial items with applied Zoom effect.

APP.VUE

```
<template>
    <div>
        <div id="targetElement" style="position:relative;min-height:350px;border:1px solid;"></div>
        <ejs-speeddial id='speeddial' openIconCss='e-icons e-edit' closeIconCss='e-icons e-close' content='Edit' target='#targetElement' :items='items' :animation='animation'></ejs-speeddial>
    </div>
</template>
<script>
    import Vue from 'vue';
    import { SpeedDialPlugin } from "@syncfusion/ej2-vue-buttons";
    import { enableRipple } from '@syncfusion/ej2-base';
    enableRipple(true);
    Vue.use(SpeedDialPlugin);
    export default {
        data() {
            return {
                items: [
                    { text: 'Cut', iconCss: 'e-icons e-cut' },
                    { text: 'Copy', iconCss: 'e-icons e-copy' },
                    { text: 'Paste', iconCss: 'e-icons e-paste' }
                ],
                animation: { effect: 'Zoom' }
            };
        }
    }
</script>

base/styles/material.css';
    @import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
</style>
```

{% previewsample "page.domainurl/code-snippet/speed-dial/items-cs5" %}

Template

The Speed Dial supports to customize the action items and entire pop-up container by setting itemTemplate and popupTemplate properties. For more details about templates, check out the link here.

Positions in Vue Speed dial component

The Speed dial control can be positioned anywhere on the target using the position property. If the target is not defined, then Speed Dial is positioned based on the browser viewport.

The position values of Speed Dial are as follows:

- TopLeft
- TopCenter
- TopRight
- MiddleLeft
- MiddleCenter
- MiddleRight
- BottomLeft
- BottomCenter
- BottomRight

APP.VUE

```
<template>
    <div>
        <div id="targetElement" style="position:relative;min-
height:350px;border:1px solid;"></div>
        <ejs-speeddial id='speeddial' content='Add' position='BottomLeft'
target='#targetElement'></ejs-speeddial>
    </div>
</template>
<script>
    import Vue from 'vue';
    import { SpeedDialPlugin } from "@syncfusion/ej2-vue-buttons";
    import { enableRipple } from '@syncfusion/ej2-base';
    enableRipple(true);
    Vue.use(SpeedDialPlugin);
    export default {
        data() {
            return { };
        }
    }

Opens items on hover

You can open the Speed Dial action items on mouse hover by setting the opensOnHover property.

`

<template>

<ejs-speeddial id='speeddial' openIconCss='e-icons e-edit' closeIconCss='e-icons e-close' target='#targetElement' opensOnHover= true :items='items'></ejs-speeddial>

</template>

<script>

import Vue from 'vue';

import { SpeedDialPlugin } from "@syncfusion/ej2-vue-buttons";

Vue.use(SpeedDialPlugin);

export default {

data() {

return {

items: [

{ iconCss: 'e-icons e-cut' },

{ iconCss: 'e-icons e-copy' },

{ iconCss: 'e-icons e-paste' }

]

};

}

}

</script>

<style>

@import 'https://ej2.syncfusion.com/vue/documentation/node_modules/@syncfusion/ej2-base/styles/material.css';

@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';

</style>

`

Programmatically show/hide Speed Dial items

You can open/close the Speed Dial action items programmatically using show and hide methods.

Copyright © 2001 -2024 Syncfusion Inc.

Below example demonstrates open/close action items on button click.

APP.VUE

```
<template>
    <div>
        <div id="targetElement" style="position:relative;min-
height:350px;border:1px solid;">
        <ejs-button id="show" class="e-primary" v-
on:click.native="showClick"> Show </ejs-button>
        <ejs-button id="hide" class="e-primary" v-
on:click.native="hideClick"> Hide </ejs-button></div>
        <ejs-speeddial ref="speeddial" id='speeddial' openIconCss='e-icons
e-edit' closeIconCss='e-icons e-close' opensOnHover= true
target='#targetElement' :items='items'></ejs-speeddial>
    </div>
</template>
<script>
    import Vue from 'vue';
    import { SpeedDialPlugin, ButtonPlugin } from "@syncfusion/ej2-vue-
buttons";
    import { enableRipple } from '@syncfusion/ej2-base';
    enableRipple(true);
    Vue.use(SpeedDialPlugin);
    Vue.use(ButtonPlugin);
    export default {
        data() {
            return {
                items: [
                    { iconCss: 'e-icons e-cut' },
                    { iconCss: 'e-icons e-copy' },
                    { iconCss: 'e-icons e-paste' }
                ]
            };
        },
        methods: {
            showClick: function () {
                this.$refs.speeddial.show();
            },
            hideClick: function () {
                this.$refs.speeddial.hide();
            }
        }
    }
</script>
<style>
    @import '../node_modules/@syncfusion/ej2-base/styles/material.css';

Programmatically refresh the position

You can refresh the position of the Speed Dial using refreshPosition method when the targetposition is changed.

APP.VUE

```
<template>
    <div>
        <div id="targetElement" style="position:relative;min-
height:350px;border:1px solid;">
        <ejs-button id="refresh" class="e-primary" v-
on:click.native="refresh"> Refresh </ejs-button></div>
        <ejs-speeddial ref="speeddial" id='speeddial' openIconCss='e-icons
e-edit' closeIconCss='e-icons e-close' target='#targetElement'
position='MiddleRight' :items='items'></ejs-speeddial>
    </div>
</template>
<script>
    import Vue from 'vue';
    import { SpeedDialPlugin, ButtonPlugin } from "@syncfusion/ej2-vue-
buttons";
    import { enableRipple } from '@syncfusion/ej2-base';
    enableRipple(true);
    Vue.use(SpeedDialPlugin);
    Vue.use(ButtonPlugin);
    export default {
        data() {
            return {
                items: [
                    { iconCss: 'e-icons e-cut' },
                    { iconCss: 'e-icons e-copy' },
                    { iconCss: 'e-icons e-paste' }
                ]
            };
        },
        methods: {
            refresh: function () {
                document.getElementById("targetElement").style.minHeight =
"300px";
                this.$refs.speeddial.refreshPosition();
            }
        }
    }
</script>
<style>
    @import '../node_modules/@syncfusion/ej2-base/styles/material.css';
    @import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
    #hide {
        float: right;
    }
</style>
```

Display modes in Vue Speed dial component

The action items in Vue Speed Dial can be displayed in Linear and Radial display modes by setting mode property.

Linear display mode

In Linear display mode, Speed Dial action items are displayed in a list-like format either horizontally or vertically. By default, Speed Dial items are displayed in Linear mode.

Direction

You can open the action items on the top, left, up, and down side of the Speed Dial button by setting direction property. The default value is Auto where the action items are displayed based on the positionof the Speed Dial.

The Linear directions of Speed Dial are as follows:

- Left - Action items are displayed on the left side of the button.
- Right - Action items are displayed on the right side of the button.
- Up - Action items are displayed on the top of the button.
- Down - Action items are displayed on the bottom of the button.
- Auto - Action items display direction auto calculated based on position of the Speed Dial. If Speed Dial is position at bottom right, then action items displayed at top.

APP.VUE

```
<template>
    <div>
        <div id="targetElement" style="position:relative;min-
height:350px;border:1px solid;"></div>
        <ejs-speeddial id='speeddial' openIconCss='e-icons e-edit'
closeIconCss='e-icons e-close' target='#targetElement' mode='Linear'
direction='Left' :items='items'></ejs-speeddial>
    </div>
</template>

{% previewsample "page.domainurl/code-snippet/speed-dial/radial-cs1" %}

Radial display mode (Radial Menu)

In Radial mode, Speed Dial action items are displayed in a circular pattern like a radial menu. For more details about radial mode, check out the link here.

Radial menu in Vue Speed dial component

The React Speed Dial action items can be displayed in a circular patter like a radial menu by setting mode property. You can customize the direction, startAngle, endAngle and offset by setting radialSettings property.

Radial menu direction

You can open the action items in either clockwise or anticlockwise by setting direction property. The default value is Auto where the action items are displayed based on the position property of the Speed Dial.

`

<template>

<ejs-speeddial id='speeddial' openIconCss='e-icons e-edit' closeIconCss='e-icons e-close' target='#targetElement' mode= 'Radial' :items='items' :radialSettings='radialSettings'></ejs-speeddial>

</template>

<script>

import Vue from 'vue';

import { SpeedDialPlugin } from "@syncfusion/ej2-vue-buttons";

Vue.use(SpeedDialPlugin);

export default {

data() {

return {

items: [

{ iconCss: 'e-icons e-cut' },

{ iconCss: 'e-icons e-copy' },

{ iconCss: 'e-icons e-paste' },

{ iconCss: 'e-icons e-edit' },

{ iconCss: 'e-icons e-save' }

],

radialSettings: { direction: 'AntiClockwise' }

};

}

```
}
</script>
<style>
@import 'https://ej2.syncfusion.com/vue/documentation/node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
</style>
`
```

Radial menu start and end angle

You can modify the start and end angle of action items by setting startAngle and endAngle properties. If the angle is not defined, the action items are displayed based on the position property of the Speed Dial.

```
`
<template>
<ejs-speeddial id='speeddial' openIconCss='e-icons e-edit' closeIconCss='e-icons e-close' target='#targetElement' mode= 'Radial' position='MiddleCenter' :items='items' :radialSettings='radialSettings'></ejs-speeddial>
</template>
<script>
import Vue from 'vue';
import { SpeedDialPlugin } from "@syncfusion/ej2-vue-buttons";
Vue.use(SpeedDialPlugin);
export default {
data() {
return {
items: [
{ iconCss: 'e-icons e-cut' },
{ iconCss: 'e-icons e-copy' },
{ iconCss: 'e-icons e-paste' },
{ iconCss: 'e-icons e-edit' },
{ iconCss: 'e-icons e-save' }
],
radialSettings: { direction: 'AntiClockwise', startAngle: 180, endAngle: 360 }
};
}
```

Copyright © 2001 -2024 Syncfusion Inc.

```

@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
</style>
`
```

Offset

You can modify the offset distance between action items and Speed Dial button using offset property.

```
`
<template>
<ejs-speeddial id='speeddial' openIconCss='e-icons e-edit' closeIconCss='e-icons e-close' target='#targetElement' mode= 'Radial' :items='items' :radialSettings='radialSettings'></ejs-speeddial>
</template>
<script>
import Vue from 'vue';
import { SpeedDialPlugin } from "@syncfusion/ej2-vue-buttons";
Vue.use(SpeedDialPlugin);
export default {
data() {
return {
items: [
{ iconCss: 'e-icons e-cut' },
{ iconCss: 'e-icons e-copy' },
{ iconCss: 'e-icons e-paste' },
{ iconCss: 'e-icons e-edit' },
{ iconCss: 'e-icons e-save' }
],
radialSettings: { offset: '80px' }
};
}
}
</script>
```

Template in Vue Speed dial component

This section explains available templates in SpeedDial component and its usage.

Copyright © 2001 -2024 Syncfusion Inc.

Item template

You can use the itemTemplate property to set a template content for the SpeedDial items. The template content is defined as a child content of itemTemplate tag directive.

APP.VUE

```
<template>
    <div>
      <div id="targetElement" style="position:relative;min-
height:350px;border:1px solid;"></div>
      <ejs-speeddial id='speeddial'  openIconCss='e-icons e-edit'
content="Edit" :itemTemplate ="itemTemplateContent" target='#targetElement'
:items='items'>
      </ejs-speeddial>
    </div>
</template>
<script>
import Vue from 'vue';
import { SpeedDialPlugin  } from "@syncfusion/ej2-vue-buttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(SpeedDialPlugin);
export default {
    data() {
        return {
            itemTemplateContent:"<div class='itemlist'><span class='icon
${iconCss}' style='padding:3px'></span><span class='text' style='padding:0
5px'>${text}</span></div>",
            items: [
                { iconCss: 'e-icons e-cut', text: 'Cut' },
                { iconCss: 'e-icons e-copy', text: 'Copy' },
                { iconCss: 'e-icons e-paste', text: 'Paste' }
            ]
        };
    }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
.itemlist .text {
  padding: 0 5px;
}
.e-speeddial-li .itemlist {
  display: inherit;
  width: 100%;
  border: 1px solid transparent;
  align-items: center;
  padding: 5px;
  border-radius: 500px;
  background-color: rgba(104, 99, 104, 0.1);
  box-shadow: 0 0 4px grey;
}
.e-speeddial-li .itemlist:hover {
  background-color: rgb(224, 224, 224);
}
</style>
```

{% previewsample "page.domainurl/code-snippet/speed-dial/template-cs1" %}

Popup template

You can use the popupTemplate property to set a template content for popup of SpeedDial component. The template content is defined as a child content of popupTemplate tag directive.

APP.VUE

```
<template>
  <div>
    <div id="targetElement" style="position:relative;min-
height:350px;border:1px solid;"></div>
    <ejs-speeddial id='speeddial'  openIconCss='e-icons e-edit'
content="Edit" :popupTemplate="popupTemplateContent"
cssClass='popupSpeedDial' target='#targetElement'>
      <template v-slot:popupTemplateContent>
        <div>
          <div class="speeddial-form">
              <p>Here you can customize your code.</p>
          </div>
        </div>
      </template>
    </ejs-speeddial>
  </div>
</template>
<script>
import Vue from 'vue';
import { SpeedDialPlugin  } from "@syncfusion/ej2-vue-buttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(SpeedDialPlugin);
export default {
  data() {
        return {
          popupTemplateContent:"<div><div class='speeddial-form'><p>Here you
can customize your code.</p></div></div>"
        };
    }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
.speeddial-form {
  width: 200px;
  height: 80px;
  text-align: center;
  border-radius: 15px;
  box-shadow: rgb(0 0 0 / 10%) 0px 10px 15px -3px, rgb(0 0 0 / 5%) 0px 4px
6px -2px;
  background: #f5f5f5;
  padding: 15px;
}
</style>
```

Styles in Vue Speed dial component

This section briefs different ways to style SpeedDial component.

SpeedDial button

You can customize the icon and text of Vue Speed Dial button using openIconCss, closeIconCss and content properties.

Icon only

You can use the openIconCss and closeIconCss properties to show icons in speed dial button. You can also show tooltip on hover to show additional details to end-user by setting title attribute.

APP.VUE

```
<template>
    <div>
        <div id="targetElement" style="position:relative;min-
height:350px;border:1px solid;"></div>
        <ejs-speeddial id='speeddial' openIconCss='e-icons e-edit'
target='#targetElement'></ejs-speeddial>
    </div>
</template>
<script>
import Vue from 'vue';
import { SpeedDialPlugin  } from "@syncfusion/ej2-vue-buttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(SpeedDialPlugin);
export default {}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
</style>
```

{% previewsample "page.domainurl/code-snippet/speed-dial/styles-cs1" %}

Text only

You can show only text in Speed Dial button by setting content property without setting icon properties..

APP.VUE

```
<template>
    <div>
        <div id="targetElement" style="position:relative;min-
height:350px;border:1px solid;"></div>
        <ejs-speeddial id='speeddial' content='Edit'
target='#targetElement'></ejs-speeddial>
    </div>
</template>
<script>
import Vue from 'vue';
import { SpeedDialPlugin  } from "@syncfusion/ej2-vue-buttons";
import { enableRipple } from '@syncfusion/ej2-base';
```

Copyright © 2001 -2024 Syncfusion Inc.

```
enableRipple(true);
Vue.use(SpeedDialPlugin);
export default {}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
</style>
```

{% previewsample "page.domainurl/code-snippet/speed-dial/styles-cs2" %}

Icon with text

You show icon and text in SpeedDial button using openIconCss, closeIconCss and content properties together.

APP.VUE

```
<template>
    <div>
        <div id="targetElement" style="position:relative;min-
height:350px;border:1px solid;"></div>
        <ejs-speeddial id='speeddial' content='Edit' openIconCss='e-icons e-
edit' target='#targetElement'></ejs-speeddial>
    </div>
</template>
<script>
import Vue from 'vue';
import { SpeedDialPlugin  } from "@syncfusion/ej2-vue-buttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(SpeedDialPlugin);
export default {}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
</style>
```

{% previewsample "page.domainurl/code-snippet/speed-dial/styles-cs3" %}

Disabled

You can enable or disable the SpeedDial component using disabled property.

`

<template>

<ejs-speeddial id='speeddial' content='Edit' disabled=true></ejs-speeddial>

</template>

<script>

import Vue from 'vue';

import { SpeedDialPlugin } from "@syncfusion/ej2-vue-buttons";

import { enableRipple } from '@syncfusion/ej2-base';

Copyright © 2001 -2024 Syncfusion Inc.

enableRipple(true);

Vue.use(SpeedDialPlugin);

export default {}

</script>

<style>

@import '../node_modules/@syncfusion/ej2-base/styles/material.css';

@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';

</style>

`

cssClass

The Vue Speed Dial supports the following predefined styles that can be defined using the cssClass property. You can customize by setting the cssClass property with the below defined class.

| cssClass | Description |

| -------- | -------- |

| e-primary | Used to represent a primary action. |

| e-outline | Used to represent an appearance of button with outline. |

| e-info | Used to represent an informative action. |

| e-success | Used to represent a positive action. |

| e-warning | Used to represent an action with caution. |

| e-danger | Used to represent a negative action. |

APP.VUE

```
<template>
    <div>
        <div id="targetElement" style="position:relative;min-
height:350px;border:1px solid;"></div>
        <ejs-speeddial id='speeddial' content='Edit' cssClass='e-warning'
target='#targetElement'></ejs-speeddial>
    </div>
</template>
<script>
import Vue from 'vue';
import { SpeedDialPlugin  } from "@syncfusion/ej2-vue-buttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(SpeedDialPlugin);
export default {}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
</style>
```

{% previewsample "page.domainurl/code-snippet/speed-dial/styles-cs4" %}

Visible

You can set the Speed Dial button to visible/hidden state using visible property.

`

<template>

<ejs-speeddial id='speeddial' content='Edit' visible=false></ejs-speeddial>

</template>

<script>

import Vue from 'vue';

import { SpeedDialPlugin } from "@syncfusion/ej2-vue-buttons";

import { enableRipple } from '@syncfusion/ej2-base';

enableRipple(true);

Vue.use(SpeedDialPlugin);

export default {}

</script>

<style>

@import '../node_modules/@syncfusion/ej2-base/styles/material.css';

@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';

</style>

`

Tooltip

You can show tooltip on hover to show additional details to end-user by setting title to Speed Dial button.

APP.VUE

```
<template>
    <div>
        <div id="targetElement" style="position:relative;min-
height:350px;border:1px solid;"></div>
        <ejs-speeddial id='speeddial'  openIconCss='e-icons e-edit'
target='#targetElement' :items='items'></ejs-speeddial>
    </div>
</template>
<script>
import Vue from 'vue';
import { SpeedDialPlugin  } from "@syncfusion/ej2-vue-buttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(SpeedDialPlugin);
export default {
    data() {
        return {
```

Copyright © 2001 -2024 Syncfusion Inc.

```
            items: [
                { iconCss:'e-icons e-cut', title:'Cut' },
                { iconCss:'e-icons e-copy', title:'Copy' },
                { iconCss:'e-icons e-paste', title:'Paste' }
            ]
        };
    }
}
</script>
<style>

'https://ej2.syncfusion.com/vue/documentation/node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
</style>
```

{% previewsample "page.domainurl/code-snippet/speed-dial/styles-cs5" %}

Opens on hover

You can use opensOnHover property to open actions items on hover itself. By default action items displayed only when clicking the speed dial button.

APP.VUE

```
<template>
    <div>
        <div id="targetElement" style="position:relative;min-height:350px;border:1px solid;"></div>
        <ejs-speeddial id='speeddial'  openIconCss='e-icons e-edit' closeIconCss='e-icons e-close' opensOnHover=true target='#targetElement' :items='items'></ejs-speeddial>
    </div>
</template>
<script>
import Vue from 'vue';
import { SpeedDialPlugin  } from "@syncfusion/ej2-vue-buttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(SpeedDialPlugin);
export default {
    data() {
        return {
            items: [
                { iconCss: 'e-icons e-cut' },
                { iconCss: 'e-icons e-copy' },
                { iconCss: 'e-icons e-paste' }
            ]
        };
    }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
</style>
```

{% previewsample "page.domainurl/code-snippet/speed-dial/styles-cs6" %}

Modal in Vue Speed dial component

You can use the modal property to set the Speed Dial as modal which adds an overlay to prevent the background interaction.

APP.VUE

```
<template>
    <div>
        <div id="targetElement" style="position:relative;min-
height:350px;border:1px solid;"></div>
        <ejs-speeddial id='speeddial'  openIconCss='e-icons e-edit'
modal=true target='#targetElement' :items='items'></ejs-speeddial>
    </div>
</template>
<script>
import Vue from 'vue';
import { SpeedDialPlugin  } from "@syncfusion/ej2-vue-buttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(SpeedDialPlugin);
export default {
    data() {
        return {
            items: [
                { iconCss:'e-icons e-cut'},
                { iconCss:'e-icons e-copy'},
                { iconCss:'e-icons e-paste'}
            ]
        };
    }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';

Event in Vue Speed dial component

This section explains the Speed Dial events that will be triggered when appropriate actions are performed.

clicked

The SpeedDial component triggers the clicked event with SpeedDialItemEventArgs argument when an action item is clicked. You can use this event to perform the required action.

`

<template>

<ejs-speeddial id='speeddial' content='Edit' target='#targetElement' :items='items'
:clicked="clicked"></ejs-speeddial>

Copyright © 2001 -2024 Syncfusion Inc.

```
</template>
<script>
import Vue from 'vue';
import { SpeedDialPlugin  } from "@syncfusion/ej2-vue-buttons";
Vue.use(SpeedDialPlugin);
export default {
data () {
return {
items: [
{ text: 'Cut' },
{ text: 'Copy' },
{ text: 'Paste' }
]
};
},
methods: {
clicked: function(args) {
//Your required action here
}
}
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
</style>
`
```

created

The Speed Dial component triggers the created event when SpeedDial component rendering is completed.

```
`
<template>
<ejs-speeddial id='speeddial' content='Edit'  target='#targetElement' :items='items'
:created="created"></ejs-speeddial>
```

```
</template>
<script>
import Vue from 'vue';
import { SpeedDialPlugin  } from "@syncfusion/ej2-vue-buttons";
Vue.use(SpeedDialPlugin);
export default {
data () {
return {
items: [
{ text: 'Cut' },
{ text: 'Copy' },
{ text: 'Paste' }
]
};
},
methods: {
created: function(args) {
//Your required action here
}
}
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
</style>
`
```

beforeOpen

The SpeedDial component triggers the beforeOpen event with SpeedDialBeforeOpenCloseEventArgs argument before the SpeedDial popup is opened.

```
`
<template>
<ejs-speeddial id='speeddial' content='Edit'  target='#targetElement' :items='items'
:beforeOpen="beforeOpen"></ejs-speeddial>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
</template>
<script>
import Vue from 'vue';
import { SpeedDialPlugin  } from "@syncfusion/ej2-vue-buttons";
Vue.use(SpeedDialPlugin);
export default {
data () {
return {
items: [
{ text: 'Cut' },
{ text: 'Copy' },
{ text: 'Paste' }
]
};
},
methods: {
beforeOpen: function(args) {
//Your required action here
}
}
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
</style>
`
```

onOpen

The SpeedDial component triggers the onOpen event with SpeedDialOpenCloseEventArgs argument when SpeedDial popup is opened.

```
`
<template>
<ejs-speeddial id='speeddial' content='Edit'  target='#targetElement' :items='items'
:onOpen="onOpen"></ejs-speeddial>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
</template>
<script>
import Vue from 'vue';
import { SpeedDialPlugin  } from "@syncfusion/ej2-vue-buttons";
Vue.use(SpeedDialPlugin);
export default {
data () {
return {
items: [
{ text: 'Cut' },
{ text: 'Copy' },
{ text: 'Paste' }
]
};
},
methods: {
onOpen: function(args) {
//Your required action here
}
}
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
</style>
`
```

beforeClose

The SpeedDial component triggers the beforeClose event with SpeedDialBeforeOpenCloseEventArgs argument before the SpeedDial popup is closed.

```
`
<template>
<ejs-speeddial id='speeddial' content='Edit'  target='#targetElement' :items='items'
:beforeClose="beforeClose"></ejs-speeddial>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
</template>
<script>
import Vue from 'vue';
import { SpeedDialPlugin  } from "@syncfusion/ej2-vue-buttons";
Vue.use(SpeedDialPlugin);
export default {
data () {
return {
items: [
{ text: 'Cut' },
{ text: 'Copy' },
{ text: 'Paste' }
]
};
},
methods: {
beforeClose: function(args) {
//Your required action here
}
}
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
</style>
`
```

onClose

The SpeedDial component triggers the onClose event with SpeedDialOpenCloseEventArgs argument when SpeedDial popup is closed.

```
`
<template>
<ejs-speeddial id='speeddial' content='Edit'  target='#targetElement' :items='items'
:onClose="onClose"></ejs-speeddial>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
</template>
<script>
import Vue from 'vue';
import { SpeedDialPlugin  } from "@syncfusion/ej2-vue-buttons";
Vue.use(SpeedDialPlugin);
export default {
data () {
return {
items: [
{ text: 'Cut' },
{ text: 'Copy' },
{ text: 'Paste' }
]
};
},
methods: {
onClose: function(args) {
//Your required action here
}
}
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
</style>
`
```

beforeItemRender

The SpeedDial component triggers the beforeItemRender event with SpeedDialItemEventArgs argument for each SpeedDialItem once it is rendered.

```
`
<template>
<ejs-speeddial id='speeddial' content='Edit'  target='#targetElement' :items='items'
:beforeItemRender="beforeItemRender"></ejs-speeddial>
```

Copyright © 2001 -2024 Syncfusion Inc.

</template>
<script>
import Vue from 'vue';
import { SpeedDialPlugin } from "@syncfusion/ej2-vue-buttons";
Vue.use(SpeedDialPlugin);
export default {
data () {
return {
items: [
{ text: 'Cut' },
{ text: 'Copy' },
{ text: 'Paste' }
]
};
},
methods: {
beforeItemRender: function(args) {
//Your required action here
}
}
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
</style>
`

Below example demonstrates the clicked event of the Speed Dial component.

APP.VUE

```
<template>
    <div>
        <div id="targetElement" style="position:relative;min-
height:350px;border:1px solid;"></div>
        <ejs-speeddial id='speeddial' content='Edit'
target='#targetElement' :items='items' :clicked="clicked"></ejs-speeddial>
    </div>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
</template>
<script>
import Vue from 'vue';
import { SpeedDialPlugin  } from "@syncfusion/ej2-vue-buttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(SpeedDialPlugin);
export default {
    data () {
        return {
            items: [
                { text: 'Cut' },
                { text: 'Copy' },
                { text: 'Paste' }
            ]
        };
    },
    methods: {
      clicked: function(args) {
          alert(args.item.text+" is clicked");
      }
    }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
</style>
```

{% previewsample "page.domainurl/code-snippet/speed-dial/action-cs1" %}

Accessibility in Vue Speed dial component

Accessibility is achieved in the Speed Dial component through WAI-ARIA standard and keyboard navigations. The Speed Dial component can be effectively accessed through assistive technologies such as screen readers.

Keyboard interaction

The Speed Dial component is interactive with below keyboard shortcuts.

| Keyboard shortcuts | Actions |

|----------|----------|

| Enter | Open/close the menu. If a SpeedDial item is focused, should triggers the clicked event for the item. |

| Up-arrow | Navigates up or to the previous menu item. |

| Left-Arrow | Navigates left or to the previous menu item. |

| Down-Arrow | Navigates down or to the previous menu item. |

| Right-Arrow | Navigates right or to the previous menu item. |

| Home | Navigates to the first menu item. |

| End | Navigates to the last menu item. |

Copyright © 2001 -2024 Syncfusion Inc.

| Esc | Closes the menu. |

ARIA attributes

The following ARIA attributes are used in SpeedDial component based on its state.

| Properties | Functionality |

| ---------- | ---------- |

| role | This attribute is added to the input element to describe the actual role. |

| aria-label | Attribute provides the text label with some default description for the SpeedDial and its items. |

| aria-expanded | It indicates whether the SpeedDial current state is expanded or collapsed. |

| aria-haspopup | It indicates whether the SpeedDial has popup items or not. |

| aria-controls | Attribute is set to the SpeedDial button and it points to the corresponding content. |

| aria-disabled | It indicates the disabled state of the SpeedDial and its items. |

Spinner

Getting Started with the Vue Spinner Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using Vue-CLI and integrating the Syncfusion Vue Spinner component using the Composition API / Options API.

Prerequisites

System requirements for Syncfusion Vue UI components

Setting up the Vue 2 project

To generate a Vue 2 project using Vue-CLI, use the vue create command. Follow these steps to install Vue CLI and create a new project:

`bash

npm install -g @vue/cli

vue create quickstart

cd quickstart

npm run serve

`

or

`bash

yarn global add @vue/cli

vue create quickstart

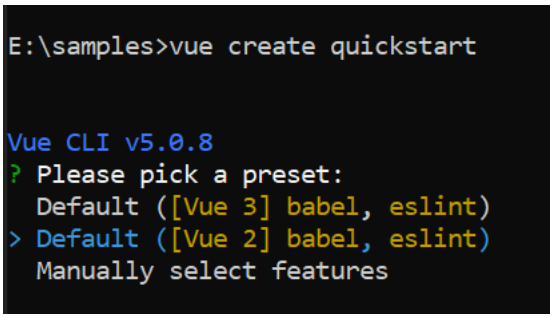
cd quickstart

yarn run serve

`

Copyright © 2001 -2024 Syncfusion Inc.

When creating a new project, choose the option Default ([Vue 2] babel, eslint) from the menu.



Once the quickstart project is set up with default settings, proceed to add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion packages are available at npmjs.com. To use Vue components, install the required npm package.

Install the @syncfusion/ej2-vue-popups package by running the following command:

`bash

npm install @syncfusion/ej2-vue-popups --save

`

or

`bash

yarn add @syncfusion/ej2-vue-popups

`

Add Syncfusion Vue component

Follow the below steps to add the Vue Spinner component using Composition API or Options API:

1\. First, import and register the Spinner component in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { onMounted } from 'vue';
import { createSpinner, showSpinner, hideSpinner } from '@syncfusion/ej2-
vue-popups';
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { createSpinner, showSpinner, hideSpinner } from '@syncfusion/ej2-
vue-popups';
</script>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
   <div id="app">
    </div>
</template>
<script setup>
import { onMounted } from 'vue';
import { createSpinner, showSpinner, hideSpinner } from '@syncfusion/ej2-
vue-popups';
onMounted (() => {
    //createSpinner() method is used to create spinner
    createSpinner({
    // Specify the target for the spinner to show
    target: document.getElementById('app')
  });

  // showSpinner() will make the spinner visible
  showSpinner(document.getElementById('app'));
  setInterval(() => {
    // hideSpinner() method used hide spinner
    hideSpinner(document.getElementById('app'));
  }, 100000);
});
</script>
<style>
 @import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
   <div id="app">
    </div>
</template>
<script>
import { createSpinner, showSpinner, hideSpinner } from '@syncfusion/ej2-
vue-popups';
export default {
  name: 'app',
  mounted: function() {
    //createSpinner() method is used to create spinner
    createSpinner({
      // Specify the target for the spinner to show
      target: document.getElementById('app')
    });
    // showSpinner() will make the spinner visible
    showSpinner(document.getElementById('app'));
    setInterval(function(){
      // hideSpinner() method used hide spinner
      hideSpinner(document.getElementById('app'));
    }, 100000);
  }
}
</script>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
<style>
 @import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
</style>
```

Run the project

To run the project, use the following command:

`bash

npm run serve

`

or

`bash

yarn run serve

`

{% previewsample "page.domainurl/code-snippet/spinner/getting-started-cs1" %}

Getting Started with the Vue Spinner Component in Vue 3

This article provides a step-by-step guide for setting up a Vite project with a JavaScript environment and integrating the Syncfusion Vue Spinner component using the Composition API / Options API.

The Composition API is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

The Options API is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

Prerequisites

System requirements for Syncfusion Vue UI components

Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using Vite. To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

`bash

npm create vite@latest

`

or

`bash

yarn create vite

`

Using one of the above commands will lead you to set up additional configurations for the project as below:

Copyright © 2001 -2024 Syncfusion Inc.

1.Define the project name: We can specify the name of the project directly. Let's specify the name of the project as my-project for this article.

`bash

? Project name: » my-project

`

2.Select Vue as the framework. It will create a Vue 3 project.

`bash

? Select a framework: » - Use arrow-keys. Return to submit.

Vanilla

Vue

React

Preact

Lit

Svelte

Others

`

3.Choose JavaScript as the framework variant to build this Vite project using JavaScript and Vue.

`bash

? Select a variant: » - Use arrow-keys. Return to submit.

JavaScript

TypeScript

Customize with create-vue ↗

Nuxt ↗

`

4.Upon completing the aforementioned steps to create the my-project, run the following command to install its dependencies:

`bash

cd my-project

npm install

`

or

`bash

cd my-project

Copyright © 2001 -2024 Syncfusion Inc.

yarn install

`

Now that my-project is ready to run with default settings, let's add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion Vue component packages are available at npmjs.com. To use Syncfusion Vue components in the project, install the corresponding npm package.

To use the Vue Spinner component in the project, the @syncfusion/ej2-vue-popups package needs to be installed using the following command:

`bash

npm install @syncfusion/ej2-vue-popups --save

`

or

`bash

yarn add @syncfusion/ej2-vue-popups

`

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the Spinner component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-popups/styles/material.css";
</style>
```

The order of importing CSS styles should be in line with its dependency graph.

Adding Syncfusion Vue3 Spinner component in the application

You have completed all the necessary configurations needed for rendering the Syncfusion Vue component. Now, you are going to add the Spinner.

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<div id="app"></div>
</template>
<script>
import { onMounted } from 'vue';
```

Copyright © 2001 -2024 Syncfusion Inc.

```
import { createSpinner, showSpinner, hideSpinner } from "@syncfusion/ej2-vue-popups";
export default {
name: "App",
setup() {
onMounted(() => {
const appElement = document.getElementById("app");
const spinner = createSpinner({
target: appElement,
});
showSpinner(appElement);
setInterval(() => {
hideSpinner(appElement);
}, 100000);
});
return {};
},
};
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-popups/styles/material.css";
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<div id="app"></div>
</template>
<script>
import { createSpinner, showSpinner, hideSpinner } from "@syncfusion/ej2-vue-popups";
export default {
name: "App",
mounted: function () {
//createSpinner() method is used to create spinner
createSpinner({
// Specify the target for the spinner to show
target: document.getElementById("app"),
});
// showSpinner() will make the spinner visible
showSpinner(document.getElementById("app"));
setInterval(function () {
// hideSpinner() method used hide spinner
hideSpinner(document.getElementById("app"));
}, 100000);
},
data: function () {
return {};
},
methods: {},
};
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-popups/styles/material.css";
```

Copyright © 2001 -2024 Syncfusion Inc.

```
</style>
```

Run the project

To run the project, use the following command:

`bash

npm run dev

`

or

`bash

yarn run dev

`

The output will appear as follows:

Template in Vue Spinner component

You can use custom templates on the Spinner instead of the default Spinner by specifying the template in the setSpinner method.

The following steps explains you on how to define template for Spinner.

- Import the setSpinner method from ej2-vue-popups library into your vue as shown in below.

`ts

import { setSpinner } from '@syncfusion/ej2-vue-popups';

`

- Pass your custom template to the setSpinner method like as below.

`ts

// Specify the template content to be displayed in the Spinner

setSpinner({ template: ' '});

`

You should set the template to the Spinner before creating the respective Essential JS 2 component.

Also,until we replace setSpinner template, the further Essential JS 2 component rendering is created with given template only.

Copyright © 2001 -2024 Syncfusion Inc.

- Now, render the Essential JS 2 component. It's render the Spinner with the template specified in the setSpinner method.

In the below sample, we have rendered the Grid component with custom Spinner using setSpinner method.

You have to define the styles for the template in index.css.

APP.VUE

```
<template>
   <div id="app">
     <ejs-grid  ref='elementRef1' id='grid1'  :dataSource="data"
:created='onGridCreated'>
     <e-columns>
      <e-column field='OrderID' headerText='Order ID' textAlign='Right'
width=90></e-column>
      <e-column field='CustomerID' headerText='Customer ID' width=120></e-
column>
      <e-column field='Freight' headerText='Freight' textAlign='Right'
format='C2' width=90></e-column>
     </e-columns>
    </ejs-grid>
        <br/>
       <br/>
      <ejs-grid  ref='elementRef2' id='grid2'  :dataSource="data" >
      <e-columns>
      <e-column field='OrderID' headerText='Order ID' textAlign='Right'
width=90></e-column>
      <e-column field='CustomerID' headerText='Customer ID' width=120></e-
column>
      <e-column field='Freight' headerText='Freight' textAlign='Right'
format='C2' width=90></e-column>
     </e-columns>
     </ejs-grid>
    </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin} from "@syncfusion/ej2-vue-grids";
import { setSpinner } from '@syncfusion/ej2-vue-popups';
import { orderDetails } from './datasource.ts';
Vue.use(GridPlugin);
export default {
  name: 'app',
  data: function(){
        return {
           data: orderDetails.slice(0, 7)
        }
   },
  methods: {
       onGridCreated: function(args){
        setSpinner({ template: '<div style="width:100%;height:100%"
class="custom-rolling"><div></div></div>' });
       },
    }
```

Copyright © 2001 -2024 Syncfusion Inc.

```
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
          .e-spinner-pane.e-spin-hide {
              display: block;
          }
          @keyframes custom-rolling {
              0% {
                  -webkit-transform: translate(-50%, -50%) rotate(0deg);
                  transform: translate(-50%, -50%) rotate(0deg);
              }
              100% {
                  -webkit-transform: translate(-50%, -50%) rotate(360deg);
                  transform: translate(-50%, -50%) rotate(360deg);
              }
            }
            @-webkit-keyframes custom-rolling {
              0% {
                  -webkit-transform: translate(-50%, -50%) rotate(0deg);
                  transform: translate(-50%, -50%) rotate(0deg);
              }
              100% {
                  -webkit-transform: translate(-50%, -50%) rotate(360deg);
                  transform: translate(-50%, -50%) rotate(360deg);
              }
            }
            .custom-rolling {
              position: relative;
            }
            .custom-rolling div,
            .custom-rolling div:after {
              border: 16px solid #51CACC;
              border-radius: 50%;
              border-top-color: transparent;
              height: 160px;
              position: absolute;
              width: 160px;
            }
            .custom-rolling div {
              -webkit-animation: custom-rolling 1.3s linear infinite;
              animation: custom-rolling 1.3s linear infinite;
              top: 100px;
              left: 100px;
            }
            .custom-rolling div:after {
              -ms-transform: rotate(90deg);
              -webkit-transform: rotate(90deg);
              transform: rotate(90deg);
            }
            .custom-rolling {
              -webkit-transform: translate(-31px, -31px) scale(0.31)
translate(31px, 31px);
              height: 62px !important;
              transform: translate(-31px, -31px) scale(0.31) translate(31px,
31px);
              width: 62px !important;
```

Copyright © 2001 -2024 Syncfusion Inc.

```
            }
</style>
```

{% previewsample "page.domainurl/code-snippet/spinner/setspinner-cs1" %}

Types in Vue Spinner component

By default, the Spinner is loaded in the applicable Essential JS 2 component based on the theme imported into the page. Based on the theme, the type is set to the Spinner.

The available types are:

- Material
- Fabric
- Bootstrap

You can change the Essential JS 2 component spinner type by passing the type of the spinner as parameter to the setSpinner method like as below.

`ts

// Specify the type of the Spinner to be displayed

setSpinner({ type: 'Bootstrap'});

`

After Essential JS 2 component creation only, you can change the Essential JS 2 component spinner type.

APP.VUE

```
<template>
   <div id="app">
     <ejs-grid  ref='elementRef' id='grid'  :dataSource="data"
:created='onGridCreated'>
     <e-columns>
      <e-column field='OrderID' headerText='Order ID' textAlign='Right'
width=90></e-column>
      <e-column field='CustomerID' headerText='Customer ID' width=120></e-
column>
      <e-column field='Freight' headerText='Freight' textAlign='Right'
format='C2' width=90></e-column>
     </e-columns>
    </ejs-grid>
    </div>
</template>
<script>
import Vue from "vue";
import { GridPlugin} from "@syncfusion/ej2-vue-grids";
import { setSpinner } from '@syncfusion/ej2-vue-popups';
import { orderDetails } from './datasource.ts';
Vue.use(GridPlugin);
export default {
  name: 'app',
  data: function(){
        return {
           data: orderDetails.slice(0, 7)
```

```
        }
    },
  methods: {
        onGridCreated: function(args){
            setSpinner({ type: 'Bootstrap' });
        },
    }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-grids/styles/material.css";
.e-spinner-pane.e-spin-hide {
        display: block;
      }
</style>
```

{% previewsample "page.domainurl/code-snippet/spinner/setspinner-cs2" %}

Style in Vue Spinner component

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

Customizing the spinner

Use the following CSS to customize the spinner stroke color.

Material theme

`css

.e-spinner-pane .e-spinner-inner .e-spin-material {

stroke: green;

}

`

Fabric theme

`css

.e-spinner-pane .e-spinner-inner .e-spin-fabric {

stroke: green;

}

`

Bootstrap theme

`css

.e-spinner-pane .e-spinner-inner .e-spin-bootstrap {

fill: green;

stroke: green;

}

`

Copyright © 2001 -2024 Syncfusion Inc.

Bootstrap4 theme

```css
.e-spinner-pane .e-spinner-inner .e-spin-bootstrap4 {
stroke: green;
}
```

High Contrast theme

```css
.e-spinner-pane .e-spinner-inner .e-spin-high-contrast .e-path-arc {
stroke: green;
}
```

SplitButton

Getting Started with the Vue Split button Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using Vue-CLI and integrating the Syncfusion Vue Split button component using the Composition API / Options API.

Prerequisites

System requirements for Syncfusion Vue UI components

Dependencies

The list of dependencies required to use the SplitButton component in your application is given as follows:

```js
|-- @syncfusion/ej2-vue-splitbuttons
|-- @syncfusion/ej2-base
|-- @syncfusion/ej2-splitbuttons
|-- @syncfusion/ej2-vue-base
|-- @syncfusion/ej2-popups
|-- @syncfusion/ej2-buttons
```

Setting up the Vue 2 project

To generate a Vue 2 project using Vue-CLI, use the vue create command. Follow these steps to install Vue CLI and create a new project:

```bash
npm install -g @vue/cli
vue create quickstart
```

cd quickstart

npm run serve

`

or

`bash

yarn global add @vue/cli

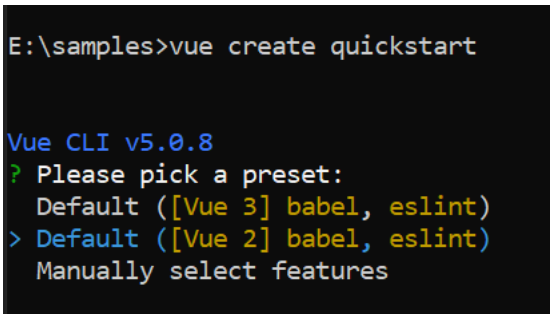
vue create quickstart

cd quickstart

yarn run serve

`

When creating a new project, choose the option Default ([Vue 2] babel, eslint) from the menu.



Once the quickstart project is set up with default settings, proceed to add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion packages are available at npmjs.com. To use Vue components, install the required npm package.

This article uses the Vue Split button component as an example. Install the @syncfusion/ej2-vue-splitbuttons package by running the following command:

`bash

npm install @syncfusion/ej2-vue-splitbuttons --save

`

or

`bash

yarn add @syncfusion/ej2-vue-splitbuttons

`

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

Copyright © 2001 -2024 Syncfusion Inc.

In this article, the Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the Split button component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
</style>
```

Add Syncfusion Vue component

Follow the below steps to add the Vue Split button component using Composition API or Options API:

1\. First, import and register the Split button component in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { SplitButtonComponent as EjsSplitbutton } from "@syncfusion/ej2-vue-splitbuttons";
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { SplitButtonComponent } from "@syncfusion/ej2-vue-splitbuttons";
export default {
components: {
'ejs-splitbutton': SplitButtonComponent
}
}
</script>
```

2\. In the template section, define the Split button component with the items and content property.

~/SRC/APP.VUE

```
<template>
<ejs-splitbutton :items='items' content='Paste'></ejs-splitbutton>
</template>
```

3\. Declare the value for the items property in the script section.

COMPOSITION API (~/SRC/APP.VUE)

```
<script>
const items = [
{
text: 'Cut'
```

Copyright © 2001 -2024 Syncfusion Inc.

```
},
{
text: 'Copy'
},
{
text: 'Paste'
}];
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
data () {
return {
items:[
{
text: 'Cut'
},
{
text: 'Copy'
},
{
text: 'Paste'
}]
};
}
</script>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<ejs-splitbutton :items='items' content='Paste'></ejs-splitbutton>
</template>
<script setup>
import { SplitButtonComponent as EjsSplitbutton } from "@syncfusion/ej2-vue-splitbuttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
const items = [
{
    text: 'Cut'
},
{
    text: 'Copy'
},
{
    text: 'Paste'
}];
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
```

Copyright © 2001 -2024 Syncfusion Inc.

```
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<ejs-splitbutton :items='items' content='Paste'></ejs-splitbutton>
</template>
<script>
import { SplitButtonComponent } from "@syncfusion/ej2-vue-splitbuttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
export default {
    components: {
        'ejs-splitbutton': SplitButtonComponent
    },
    data () {
        return {
            items:[
            {
                text: 'Cut'
            },
            {
                text: 'Copy'
            },
            {
                text: 'Paste'
            }]
        };
    }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
</style>
```

Run the project

To run the project, use the following command:

`bash

npm run serve

`

or

`bash

yarn run serve

`

{% previewsample "page.domainurl/code-snippet/split-button/default-cs2" %}

Getting Started with the Vue SplitButton Component in Vue 3

This article provides a step-by-step guide for setting up a Vite project with a JavaScript environment and integrating the Syncfusion Vue SplitButton component using the Composition API / Options API.

The Composition API is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

The Options API is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

Prerequisites

System requirements for Syncfusion Vue UI components

Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using Vite. To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

`bash

npm create vite@latest

`

or

`bash

yarn create vite

`

Using one of the above commands will lead you to set up additional configurations for the project as below:

1.Define the project name: We can specify the name of the project directly. Let's specify the name of the project as my-project for this article.

`bash

? Project name: » my-project

`

2.Select Vue as the framework. It will create a Vue 3 project.

`bash

? Select a framework: » - Use arrow-keys. Return to submit.

Vanilla

Vue

React

Preact

Lit

Svelte

Others

`

3.Choose JavaScript as the framework variant to build this Vite project using JavaScript and Vue.

`bash

? Select a variant: » - Use arrow-keys. Return to submit.

JavaScript

TypeScript

Customize with create-vue ↗

Nuxt ↗

`

4.Upon completing the aforementioned steps to create the my-project, run the following command to install its dependencies:

`bash

cd my-project

npm install

`

or

`bash

cd my-project

yarn install

`

Now that my-project is ready to run with default settings, let's add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion Vue component packages are available at npmjs.com. To use Syncfusion Vue components in the project, install the corresponding npm package.

This article uses the Vue SplitButton component as an example. To use the Vue SplitButton component in the project, the @syncfusion/ej2-vue-splitbuttons package needs to be installed using the following command:

`bash

npm install @syncfusion/ej2-vue-splitbuttons --save

Copyright © 2001 -2024 Syncfusion Inc.

`

or

`bash

yarn add @syncfusion/ej2-vue-splitbuttons

`

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the SplitButton component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
</style>
```

The order of importing CSS styles should be in line with its dependency graph.

Add Syncfusion Vue component

Follow the below steps to add the Vue SplitButton component using Composition API or Options API:

1.First, import and register the SplitButton component and its child directives in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { SplitButtonComponent as EjsSplitbutton } from "@syncfusion/ej2-vue-splitbuttons";
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { SplitButtonComponent } from "@syncfusion/ej2-vue-splitbuttons";
//Component registration
export default {
name: "App",
components: {
"ejs-splitbutton": SplitButtonComponent
}
}
</script>
```

Copyright © 2001 -2024 Syncfusion Inc.

2.In the template section, define the SplitButton component with the items property and content property.

~/SRC/APP.VUE

```
<template>
<ejs-splitbutton :items='items' content='content'></ejs-splitbutton>
</template>
```

3.Declare the values for the items and content property in the script section.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
const content = 'Paste';
const items:[
{
text: 'Cut'
},
{
text: 'Copy'
},
{
text: 'Paste'
}
];
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
data() {
return {
content = 'Paste',
items:[
{
text: 'Cut'
},
{
text: 'Copy'
},
{
text: 'Paste'
}
],
};
}
</script>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
<ejs-splitbutton :items='items' content='content'></ejs-splitbutton>
</template>
<script setup>
import { SplitButtonComponent as EjsSplitbutton } from "@syncfusion/ej2-vue-splitbuttons";
const content = 'Paste';
const items:[
{
text: 'Cut'
},
{
text: 'Copy'
},
{
text: 'Paste'
}
];
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<ejs-splitbutton :items='items' content='content'></ejs-splitbutton>
</template>
<script>
import { SplitButtonComponent } from "@syncfusion/ej2-vue-splitbuttons";
// Component registration
export default {
name: "App",
// Declaring component and its directives
components: {
"ejs-splitbutton": SplitButtonComponent
},
// Bound properties declarations
data() {
return {
content = 'Paste',
items:[
{
text: 'Cut'
},
{
text: 'Copy'
},
{
text: 'Paste'
}
],
};
}
```

Copyright © 2001 -2024 Syncfusion Inc.

```
};
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
</style>
```

Run the project

To run the project, use the following command:

`bash

npm run dev

`

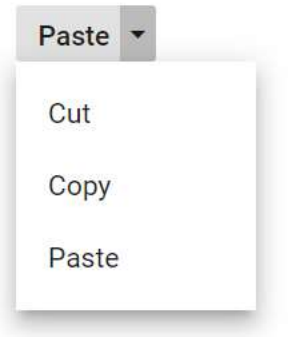
or

`bash

yarn run dev

`

The output will appear as follows:



Sample: vue-3-split-button-getting-started.

For migrating from Vue 2 to Vue 3, refer to the migration documentation.

Icons and separator in Vue Split button component

SplitButton icons

SplitButton can have an icon to provide the visual representation of the action. To place the icon on a SplitButton, set the iconCss property to e-icons with the required icon CSS. By default, the icon is positioned to the left side of the SplitButton. You can customize the icon's position by using the iconPosition property.

Copyright © 2001 -2024 Syncfusion Inc.

In the following example, the SplitButton with default iconPosition and iconPosition as Top is showcased:

APP.VUE

```
<template>
    <div>
        <ejs-splitbutton :items='items' iconCss='e-sb-icons e-
paste'>Paste</ejs-splitbutton>
        <ejs-splitbutton :items='items' iconCss='e-sb-icons e-paste'
iconPosition="Top">Paste</ejs-splitbutton>
    </div>
</template>
<script>
import Vue from 'vue';
import { SplitButtonPlugin } from "@syncfusion/ej2-vue-splitbuttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(SplitButtonPlugin);
export default {
    data () {
        return {
            items:[
            {
                text: 'Undo'
            },
            {
                text: 'Redo'
            },
            {
                text: 'Cut'
            },
            {
                text: 'Copy'
            },
            {
                text: 'Paste'
            }]
        };
    }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';

```

{% previewsample "page.domainurl/code-snippet/split-button/default-cs8" %}

The Essential JS 2 provides a set of icons that can be loaded by applying e-icons class name to the element. You can also use third party icons on the SplitButton using the iconCssproperty.

Vertical button

Vertical Button in SplitButton can be achieved by adding e-vertical class using cssClass property.

The following example illustrates how to provide vertical support in SplitButton component.

APP.VUE

```
<template>
    <ejs-splitbutton :items='items' iconCss='e-sb-icons e-paste'
cssClass='e-vertical' iconPosition="Top">Paste</ejs-splitbutton>
</template>
<script>
import Vue from 'vue';
import { SplitButtonPlugin } from "@syncfusion/ej2-vue-splitbuttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(SplitButtonPlugin);
export default {
    data () {
        return {
            items:[
            {
                text: 'Undo'
            },
            {
                text: 'Redo'
            },
            {
                text: 'Cut'
            },
            {
                text: 'Copy'
            },
            {
                text: 'Paste'
            }]
        };
    }
}
</script>
<style>

{% previewsample "page.domainurl/code-snippet/split-button/default-cs9" %}

The Essential JS 2 provides a set of icons that can be loaded by applying e-icons class name to the element. You can also use third party icons on the SplitButton using the iconCss property.

Separator

The Separators are the horizontal lines that are used to separate the popup items. You cannot select the separators. You can enable separators to group the popup items using the separator property.

The following example illustrates how to enable separator support in SplitButton component.

APP.VUE

```
<template>
    <ejs-splitbutton :items='items' iconCss='e-sb-icons e-paste'>Paste</ejs-
splitbutton>
</template>
```

Copyright © 2001 -2024 Syncfusion Inc.

- SplitButton popup with icons

Popup items in Vue Split button component

Icons

The Popup action item have an icon or image to provide visual representation of the action. To place the icon on a popup item, set the iconCss property to e-icons with the required icon CSS. By default, the icon is positioned to the left side of the popup action item.

In the following sample, the icons for Cut, Copy, and Paste menu items are added using the iconCss property.

APP.VUE

```
<template>
    <ejs-splitbutton :items='items' iconCss='e-sb-icons e-paste'>Paste</ejs-
splitbutton>
</template>
<script>
import Vue from 'vue';

Template

Item templating

Popup items can be customized by using the beforeItemRender event. The item render event triggers while rendering each Popup action item. The event argument will be used to identify the action item and customize it based on the requirement.

In the following example, the icons in each li items is right aligned by appending span element while li rendering:

APP.VUE

```
<template>
    <ejs-splitbutton :items='items' iconCss='e-sb-icons e-paste'
:beforeItemRender='onBeforeItemRender'></ejs-splitbutton>
</template>
<script>
import Vue from 'vue';
import { SplitButtonPlugin } from "@syncfusion/ej2-vue-splitbuttons";
import { enableRipple, createElement } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(SplitButtonPlugin);
export default {
    data () {
        return {
            items:[
            {
                text: 'Cut',
            },
            {
                text: 'Copy',
            },
            {
                text: 'Paste',
            }]
        };
    },
    methods: {
        onBeforeItemRender: function(args){
            var shortCutSpan = createElement('span');
            var text = args.item.text;
            args.element.appendChild(shortCutSpan);
            shortCutSpan.setAttribute('class','shortcut');
            var clsName = (text == 'Copy') ? 'e-icons' : 'e-sb-icons';
            shortCutSpan.classList.add(clsName);
            (text === 'Cut') ? shortCutSpan.classList.add('e-cut') : (text
=== 'Paste') ? shortCutSpan.classList.add('e-paste') :
shortCutSpan.classList.add('e-copy');
        }
    }
}
</script>
<style>

Popup templating

The whole popup can be customized as per the requirement and it can be customized by handling it in target property.

In the following sample, the whole popup item is customized as color palette by giving div as target and it can be achieved using target property.

APP.VUE

```
<template>
    <div>
        <div id='dropdowntarget'>
            <div id= "first">
                <div id='black'></div>
                <div id='red'></div>
                <div id='green'></div>
                <div id='gray'></div>
                <div id='blue'></div>
                <div id='violet'></div>
                <div id='brown'></div>
                <div id='darkgoldenrod'></div>
                <div id='aquamarine'></div>
            </div>
        </div>
        <ejs-splitbutton  target='#dropdowntarget' iconCss='e-sb-icons e-
color'></ejs-splitbutton>
    </div>
</template>
<script>
import Vue from 'vue';
import { SplitButtonPlugin } from "@syncfusion/ej2-vue-splitbuttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(SplitButtonPlugin);
export default {
    data () {
        return {
            items:[
            {
                text: 'Cut',
                iconCss: 'e-icons e-cut'
            },
            {

Accessibility in Vue Split button component

The Split button component followed the accessibility guidelines and standards, including ADA, Section 508, WCAG 2.2 standards, and WCAG roles that are commonly used to evaluate accessibility.

The accessibility compliance for the Split button component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| WCAG 2.2 Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Section 508 Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Screen Reader Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Right-To-Left Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

Copyright © 2001 -2024 Syncfusion Inc.

| Color Contrast | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Mobile Device Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Keyboard Navigation Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Accessibility Checker Validation | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Axe-core Accessibility Validation | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> - All features of the component meet the requirement.

<img src="https://cdn.syncfusion.com/content/images/landing-page/intermediate.png" alt="Intermediate"> - Some features of the component do not meet the requirement.

<img src="https://cdn.syncfusion.com/content/images/landing-page/no.png" alt="No"> - The component does not meet the requirement.

WAI-ARIA attributes

The Split button component followed the [WAI-ARIA] patterns to meet the accessibility. The following ARIA attributes are used in the Split button component:

| Attributes | Purpose |

| --- | --- |

| `role` | Indicates the Split button component as `button`, Split button popup as `menu`, and the Split button popup action items as `menuitem`. |

| `aria-haspopup` | Indicates the availability and type of interactive Split button popup element. |

| `aria-expanded` | Indicates whether the Split button popup can be expanded or collapsed, as well as indicates whether its current state is expanded or collapsed. |

| `aria-owns` | Identifies an elements in order to define a visual, functional, or contextual parent/child relationship between DOM elements where the DOM hierarchy cannot be used to represent the relationship. |

| `aria-disabled` | Indicates that the element is perceivable but disabled, so it is not editable or otherwise operable. |

Copyright © 2001 -2024 Syncfusion Inc.

Keyboard interaction

The Split button component followed the [keyboard interaction] guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Split button component.

| **Press** | **To do this** |

| --- | --- |

| Esc | Closes the opened popup. |

| Enter | Opens the popup, or activates the highlighted item and closes the popup. |

| Spacer | Opens the popup. |

| Up | Navigates up or to the previous action item. |

| Down | Navigates down or to the next action item. |

| Alt + Up Arrow | Closes the popup. |

| Alt + Down Arrow | Opens the popup. |

Ensuring accessibility

The Split button component's accessibility levels are ensured through an accessibility-checker and axe-core software tools during automated testing.

The accessibility compliance of the Split button component is shown in the following sample. Open the sample in a new window to evaluate the accessibility of the Split button component with accessibility tools.

{% previewsample "page.domainurl/code-snippet/split-button/default-cs1" %}

Style and appearance in Vue Split button component

To modify the SplitButton appearance, you need to override the default CSS of SplitButton component. Please find the list of CSS classes and its corresponding section in SplitButton. Also, you have an option to create your own custom theme for the controls using our Theme Studio.

CSS Class | Purpose of Class

|.e-dropdown-btn|To customize the button part in splitbutton

|.e-split-btn|To customize the dropdown part in split button

|.e-dropdown-popup ul .e-item|To customize the progress button list items

|.e-dropdown-popup ul .e-item .e-menu-icon |To customize the progress button list items icon

How To

Create right to left splitbutton in Vue Split button component

SplitButton component has RTL support. This can be achieved by setting enableRtl as `true`.

The following example illustrates how to enable right-to-left support in SplitButton component.

Copyright © 2001 -2024 Syncfusion Inc.

APP.VUE

```
<template>
    <ejs-splitbutton :items='items' iconCss='e-sb e-sigma'
enableRtl='true'>Autosum</ejs-splitbutton>
</template>
<script>
import Vue from 'vue';
import { SplitButtonPlugin } from "@syncfusion/ej2-vue-splitbuttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(SplitButtonPlugin);
export default {
    data () {
        return {
            items:[
            {
                text: 'Autosum'
            },
            {
                text: 'Average'
            },
            {
                text: 'Count numbers',
            },
            {
                text: 'Min'
            },
            {
                text: 'Max'
            }]
        };
    }
}

Group items in popup in Vue Split button component

Grouped items are possible in SplitButton by templating entire popup with ListView. Check ListView grouping and create such items. Create ListView with id listview and provide element of the ListView as target of SplitButton to render it in popup area.

Install Syncfusion List packages using below command.

`bash

npm install @syncfusion/ej2-vue-list --save

`

In this following example, ListView is created and its element is set as target for SplitButton.

APP.VUE

```
<template>
<div>
    <ejs-splitbutton target='#listview'>ClipBoard</ejs-splitbutton>
    <ejs-listview id='listview' :dataSource='items' :fields='fields'
sortOrder='Descending'>
    </ejs-listview>
</div>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
</template>
<script>
import Vue from 'vue';
import { SplitButtonPlugin } from "@syncfusion/ej2-vue-splitbuttons";
import { ListViewPlugin } from '@syncfusion/ej2-vue-lists';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(SplitButtonPlugin);
Vue.use(ListViewPlugin);
export default {
    data () {
        return {
            items:[
            {
                'text': 'Cut',
                'category': 'Basic'
            },
            {
                'text': 'Copy',
                'category': 'Basic'
            },
            {
                'text': 'Paste',
                'category': 'Basic'
            },
            {
                'text': 'Paste as Formula',
                'category': 'Advanced'
            },
            {
                'text': 'Paste as Hyperlink',
                'category': 'Advanced'
            }],
            fields: { groupBy: 'category' }
        };
    }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';

  }
</style>
```

{% previewsample "page.domainurl/code-snippet/split-button/default-cs4" %}

Open a dialog on popup item click in Vue Split button component

This section explains about how to open a dialog on SplitButton popup item click. This can be achieved by handling dialog open in select event of the SplitButton.

Install Syncfusion Popup packages using below command.

Copyright © 2001 -2024 Syncfusion Inc.

`bash

npm install @syncfusion/ej2-vue-popups --save

`

In the following example, Dialog will open while selecting Update... item:

APP.VUE

```
<template>
<div>
    <ejs-splitbutton :items='items' :select='onSelect'>Help</ejs-
splitbutton>
    <ejs-dialog id="dialog" content="Are you sure want to update?"
header='Software Update' :buttons='buttons' width='250px' :visible='false'
></ejs-dialog>
</div>
</template>
<script>
import Vue from 'vue';
import { SplitButtonPlugin } from "@syncfusion/ej2-vue-splitbuttons";
import { DialogPlugin } from "@syncfusion/ej2-vue-popups";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(SplitButtonPlugin);
Vue.use(DialogPlugin);
export default {
    data () {
        return {
            items:[
            {
                text: 'Help'
            },
            {
                text: 'About'
            },
            {
                text: 'Update...'
            }],
            buttons: [{
                buttonModel: {
                    isPrimary: true,
                    content: 'Ok',
                },
                click: function () {
                    this.hide();
                }
            },
            {
                buttonModel: {
                    isPrimary: true,
                    content: 'Cancel',
                },
                click: function () {
                    this.hide();
                }
            }]
```

```
        };
    },
    methods: {
        onSelect: function(args) {
            if (args.item.text === 'Update...') {
                document.getElementById("dialog").ej2_instances[0].show();
            }
        }
    }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';

Set the disabled state in Vue Split button component

SplitButton component can be enabled or disabled by disabled property. To disable SplitButton component, set the disabled property as true.

The following example illustrates how to set the disable state in SplitButton component.

APP.VUE

```
<template>
    <ejs-splitbutton :items='items' iconCss='e-sb e-sigma'
disabled='true'>Autosum</ejs-splitbutton>
</template>
<script>
import Vue from 'vue';
import { SplitButtonPlugin } from "@syncfusion/ej2-vue-splitbuttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(SplitButtonPlugin);
export default {
    data () {
        return {
            items:[
            {
                text: 'Autosum'
            },
            {
                text: 'Average'
            },
            {
                text: 'Count numbers',
            },
            {
                text: 'Min'
```

Copyright © 2001 -2024 Syncfusion Inc.

```
            },
            {
                text: 'Max'
            }]
        };
    }
}

Underline a character in a text in Vue Split button component

To underline a particular character in a text, it can be handled in beforeItemRender event by adding <u> tag in between the text and given as innerHTML in li rendering.

In the following example, C is underlined in the text Copy:

APP.VUE

```
<template>
    <ejs-splitbutton :items='items'
:beforeItemRender='itemRender'>Paste</ejs-splitbutton>
</template>
<script>
import Vue from 'vue';
import { SplitButtonPlugin } from "@syncfusion/ej2-vue-splitbuttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(SplitButtonPlugin);
export default {
    data () {
        return {
            items:[
            {
                text: 'Cut'
            },
            {
                text: 'Copy'
            },
            {
                text: 'Paste'
            }]
        };
    },
    methods: {
        itemRender: function(args) {
            if (args.item.text === 'Copy') {
                //To underline a particular text.
                args.element.innerHTML = '<u>C</u>opy';
            }
        }
    }

Splitter

Getting Started with the Vue Splitter Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using Vue-CLI and integrating the Syncfusion Vue Splitter component.

Prerequisites

System requirements for Syncfusion Vue UI components

Dependencies

The following list of dependencies required to use the Splitter component in your application:

`js

|-- @syncfusion/ej2-layouts

|-- @syncfusion/ej2-base

|-- @syncfusion/ej2-vue-layouts

|-- @syncfusion/ej2-vue-base

`

Setting up the Vue 2 project

To generate a Vue 2 project using Vue-CLI, use the vue create command. Follow these steps to install Vue CLI and create a new project:

`bash

npm install -g @vue/cli

vue create quickstart

cd quickstart

npm run serve

`

or

`bash

yarn global add @vue/cli

vue create quickstart

cd quickstart

yarn run serve

`

When creating a new project, choose the option Default ([Vue 2] babel, eslint) from the menu.

```
E:\samples>vue create quickstart

Vue CLI v5.0.8
? Please pick a preset:
  Default ([Vue 3] babel, eslint)
> Default ([Vue 2] babel, eslint)
  Manually select features
```

Once the quickstart project is set up with default settings, proceed to add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion packages are available at npmjs.com. To use Vue components, install the required npm package.

This article uses the Vue Splitter component as an example. Install the @syncfusion/ej2-vue-layouts package by running the following command:

`bash

npm install @syncfusion/ej2-vue-layouts --save

`

or

`bash

yarn add @syncfusion/ej2-vue-layouts

`

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, the Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the Splitter component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-vue-layouts/styles/material.css';
</style>
```

Add Syncfusion Vue component

Follow the below steps to add the Vue Splitter component using:

1\. First, import and register the Splitter component in the script section of the **src/App.vue** file.

~/SRC/APP.VUE

```
<script>
import { SplitterComponent, PanesDirective, PaneDirective } from
'@syncfusion/ej2-vue-layouts';
export default {
components: {
'ejs-splitter': SplitterComponent,
'e-pane': PaneDirective,
'e-panes': PanesDirective
}
}
</script>
```

2\. In the template section, define the Splitter component with the height property.

~/SRC/APP.VUE

```
<template>
<div id="app" class="col-lg-12 control-section default-splitter">
<ejs-splitter id='default-splitter' height='250px'>
<e-panes>
<e-pane></e-pane>
<e-pane></e-pane>
</e-panes>
</ejs-splitter>
</div>
</template>
```

Load content to the pane

You can load the pane contents in either HTML element or string types using content property.

For detailed information, refer to the Pane Content section

~/SRC/APP.VUE

```
<template>
<div id="app" class="col-lg-12 control-section default-splitter">
<ejs-splitter id='default-splitter' height='250px'>
<e-panes>
<e-pane content='Left Pane'></e-pane>
<e-pane content='Middle Pane'></e-pane>
<e-pane content='Right Pane'></e-pane>
</e-panes>
</ejs-splitter>
</div>
</template>
<script>
import { SplitterComponent, PanesDirective, PaneDirective } from
'@syncfusion/ej2-vue-layouts';
export default {
components: {
'ejs-splitter': SplitterComponent,
'e-pane': PaneDirective,
'e-panes': PanesDirective
},
name: 'app',
data () {
```

Copyright © 2001 -2024 Syncfusion Inc.

```
return { }
}
}
</script>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

~/SRC/APP.VUE

```
<template>
<div id="app" class="col-lg-12 control-section default-splitter">
    <ejs-splitter id='default-splitter' height='250px'>
        <e-panes>
            <e-pane content='Left Pane'></e-pane>
            <e-pane content='Middle Pane'></e-pane>
            <e-pane content='Right Pane'></e-pane>
        </e-panes>
    </ejs-splitter>
</div>
</template>
<script>
import { SplitterComponent, PanesDirective, PaneDirective } from
'@syncfusion/ej2-vue-layouts';
export default {
  components: {
    'ejs-splitter': SplitterComponent,
    'e-pane': PaneDirective,
    'e-panes': PanesDirective
  },
  name: 'app',
    data () {
    return { }
  }
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-vue-layouts/styles/material.css';
#app {
    margin: 60px auto;
    max-width: 700px;
}
.e-splitter {
    margin: 0 auto;
}
.e-pane {
  text-align: center;
  align-items: center;
  display: grid;
}
</style>
```

Run the project

To run the project, use the following command:

`bash

npm run serve

`

or

`bash

yarn run serve

`

{% previewsample "page.domainurl/code-snippet/splitter/getting-started-cs1" %}

Getting Started with the Vue Splitter Component in Vue 3

This article provides a step-by-step guide for setting up a Vite project with a JavaScript environment and integrating the Syncfusion Vue Splitter component using the Composition API / Options API.

The Composition API is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

The Options API is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

Prerequisites

System requirements for Syncfusion Vue UI components

Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using Vite. To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

`bash

npm create vite@latest

`

or

`bash

yarn create vite

`

Using one of the above commands will lead you to set up additional configurations for the project as below:

Copyright © 2001 -2024 Syncfusion Inc.

1.Define the project name: We can specify the name of the project directly. Let's specify the name of the project as my-project for this article.

`bash

? Project name: » my-project

`

2.Select Vue as the framework. It will create a Vue 3 project.

`bash

? Select a framework: » - Use arrow-keys. Return to submit.

Vanilla

Vue

React

Preact

Lit

Svelte

Others

`

3.Choose JavaScript as the framework variant to build this Vite project using JavaScript and Vue.

`bash

? Select a variant: » - Use arrow-keys. Return to submit.

JavaScript

TypeScript

Customize with create-vue ↗

Nuxt ↗

`

4.Upon completing the aforementioned steps to create the my-project, run the following command to install its dependencies:

`bash

cd my-project

npm install

`

or

`bash

cd my-project

Copyright © 2001 -2024 Syncfusion Inc.

yarn install

`

Now that my-project is ready to run with default settings, let's add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion Vue component packages are available at npmjs.com. To use Syncfusion Vue components in the project, install the corresponding npm package.

This article uses the Vue Splitter component as an example. To use the Vue Splitter component in the project, the @syncfusion/ej2-vue-layouts package needs to be installed using the following command:

`bash

npm install @syncfusion/ej2-vue-layouts --save

`

or

`bash

yarn add @syncfusion/ej2-vue-layouts

`

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the Splitter component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-vue-layouts/styles/material.css';
</style>
```

The order of importing CSS styles should be in line with its dependency graph.

Add Syncfusion Vue component

Follow the below steps to add the Vue Splitter component using Composition API or Options API:

1.First, import and register the Splitter component and its child directives in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
import { SplitterComponent as EjsSplitter, PanesDirective as EPanes,
PaneDirective as Epane } from "@syncfusion/ej2-vue-layouts";
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { SplitterComponent, PanesDirective, PaneDirective } from
"@syncfusion/ej2-vue-layouts";
//Component registration
export default {
name: "App",
components: {
'ejs-splitter' : SplitterComponent,
'e-panes': PanesDirective,
'e-pane': PaneDirective
},
}
</script>
```

2.In the template section, define the Splitter component with the dataSource property and column definitions.

~/SRC/APP.VUE

```
<template>
<ejs-splitter id='default-splitter' height='250px'>
<e-panes>
<e-pane content='Left Pane'></e-pane>
<e-pane content='Middle Pane'></e-pane>
<e-pane content='Right Pane'></e-pane>
</e-panes>
</ejs-splitter>
</template>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<ejs-splitter id='default-splitter' height='250px'>
<e-panes>
<e-pane content='Left Pane'></e-pane>
<e-pane content='Middle Pane'></e-pane>
<e-pane content='Right Pane'></e-pane>
</e-panes>
</ejs-splitter>
</template>
<script setup>
import { SplitterComponent as EjsSplitter, PanesDirective as EPanes,
PaneDirective as Epane } from "@syncfusion/ej2-vue-layouts";
const data = [];
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
```

Copyright © 2001 -2024 Syncfusion Inc.

```
@import '../node_modules/@syncfusion/ej2-vue-layouts/styles/material.css';
#app {
margin: 60px auto;
max-width: 700px;
}
.e-splitter {
margin: 0 auto;
}
.e-pane {
text-align: center;
align-items: center;
display: grid;
}
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<ejs-splitter id='default-splitter' height='250px'>
<e-panes>
<e-pane content='Left Pane'></e-pane>
<e-pane content='Middle Pane'></e-pane>
<e-pane content='Right Pane'></e-pane>
</e-panes>
</ejs-splitter>
</template>
<script>
import { SplitterComponent, PanesDirective, PaneDirective } from
"@syncfusion/ej2-vue-layouts";
export default {
name: 'App',
components: {
'ejs-splitter' : SplitterComponent,
'e-panes': PanesDirective,
'e-pane': PaneDirective
},
data() {
return {
};
}
}
</script>
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-vue-layouts/styles/material.css';
#app {
margin: 60px auto;
max-width: 700px;
}
.e-splitter {
margin: 0 auto;
}
.e-pane {
text-align: center;
align-items: center;
display: grid;
```

Copyright © 2001 -2024 Syncfusion Inc.

```
}
</style>
```

Run the project

To run the project, use the following command:

`bash

npm run dev

`

or

`bash

yarn run dev

`

The output will appear as follows:

Pane sizing in Vue Splitter component

Splitter allows you to provide pane sizes either in pixel or percentage formats.

Auto size panes

The splitter's panes are adjusted automatically during resizing if the size is not specified externally to panes, because the panes are designed based on flex layout by default. When add/remove or show/hide the panes, the panes are auto aligned within its container.

APP.VUE

```
<template>
<div id="app" class="col-lg-12 control-section default-splitter">
    <ejs-splitter id='splitter' ref='splitterObj'  width='600px'
height='200px'>
        <e-panes>
            <e-pane :content='content1'></e-pane>
            <e-pane :content='content2'></e-pane>
            <e-pane :content='content3'></e-pane>
        </e-panes>
    </ejs-splitter>
</div>
</template>
<script>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
import Vue from "vue";
import { SplitterPlugin } from '@syncfusion/ej2-vue-layouts';
Vue.use(SplitterPlugin);
var contentVue1 = Vue.component("contentTemp1", {
    template: `<div class="content">
        <h3 class="h3">Grid </h3>
        The ASP.NET DataGrid component, or DataTable is a feature-rich
component used to display data in a tabular format.
    </div>`,
    data() {
        return {
            data: {}
        };
    }
});
var contentVue2 = Vue.component("contentTemp2", {
    template: `<div class="content">
        <h3 class="h3">Schedule </h3>
        The ASP.NET Scheduler, a.k.a. event calendar, facilitates almost all
calendar features, thus allowing users to manage their time efficiently
    </div>`,
    data() {
        return {
            data: {}
        };
    }
});
var contentVue3 = Vue.component("contentTemp3", {
    template: `<div class="content">
        <h3 class="h3">Chart </h3>
        ASP.NET charts, a well-crafted easy-to-use charting package, is used
to add beautiful charts in web and mobile applications
    </div>`,
    data() {
        return {
            data: {}
        };
    }
});
export default {
    name: 'app',
    data () {
        return {
        content1: function (){
            return { template: contentVue1 }
        },
        content2: function (){
            return { template: contentVue2 }
        },
        content3: function (){
            return { template: contentVue3 }
        }
        }
    }
}
</script>
<style>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
@import "../node_modules/@syncfusion/ej2-vue-layouts/styles/material.css";
#app {
    margin: 65px auto;
}
.content {
    padding: 10px;
}
.e-splitter {
    margin: 0 auto;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/splitter/resize-min-max-cs4" %}

Fixed pane

You can render the split panes with fixed size in both horizontal and vertical mode. Even if you provide fixed sizes to all the panes, the last pane is considered as a flexible pane.

Last pane is flexible because the splitter needs one pane as flexible pane always, to adjust its remaining layout space.

APP.VUE

```
<template>
<div id="app" class="col-lg-12 control-section default-splitter">
    <ejs-splitter id='splitter' ref='splitterObj'  width='600px'
height='200px'>
        <e-panes>
            <e-pane :content='content1' size ='200px'></e-pane>
            <e-pane :content='content2' size ='200px'></e-pane>
            <e-pane :content='content3' size ='200px'></e-pane>
        </e-panes>
    </ejs-splitter>
</div>
</template>
<script>
import Vue from "vue";
import { SplitterPlugin } from '@syncfusion/ej2-vue-layouts';
Vue.use(SplitterPlugin);
var contentVue1 = Vue.component("contentTemp1", {
    template: `<div>Left pane</div>`,
    data() {
        return {
            data: {}
        };
    }
});
var contentVue2 = Vue.component("contentTemp2", {
    template: `<div>Middle pane</div>`,
    data() {
        return {
            data: {}
        };
    }
});
var contentVue3 = Vue.component("contentTemp3", {
```

```
    template: `<div>Right pane</div>`,
    data() {
        return {
            data: {}
        };
    }
});
export default {
    name: 'app',
    data () {
        return {
        content1: function (){
            return { template: contentVue1 }
        },
        content2: function (){
            return { template: contentVue2 }
        },
        content3: function (){
            return { template: contentVue3 }
        }
        }
    }
}

{% previewsample "page.domainurl/code-snippet/splitter/resize-min-max-cs6" %}

Pane content in Vue Splitter component

This section explains how to provide plain text content or HTML markup or integrate other JavaScript UI components as content of splitter.

HTML Markup

Splitter is a layout based container component. You can render the pane contents from existing HTML markups. Converting HTML markup as splitter pane is easy way to add the panes content dynamically.

APP.VUE

```
<template>
<div id="app" class="col-lg-12 control-section default-splitter">
    <ejs-splitter id='splitter' ref='splitterObj'  width='600px'
height='200px'>
        <e-panes>
            <e-pane :content='content1' size = '200px'></e-pane>
            <e-pane :content='content2' size = '200px'></e-pane>
            <e-pane :content='content3' size = '200px'></e-pane>
        </e-panes>
    </ejs-splitter>
</div>
</template>
<script>
import Vue from "vue";
import { SplitterPlugin } from '@syncfusion/ej2-vue-layouts';
Vue.use(SplitterPlugin);
var contentVue1 = Vue.component("contentTemp1", {
    template: `<div class="content"><h3 class="h3">PARIS </h3>Paris, the
city of lights and love - this short guide is full of ideas for how to make
the most of the romanticism...</div>`,
    data() {
        return {
            data: {}
        };
    }
});
var contentVue2 = Vue.component("contentTemp2", {
    template: `<div class="content"><h3 class="h3">CAMEMBERT </h3>The
village in the Orne département of Normandy where the famous French cheese
is originated from.</div>`,
    data() {
        return {
```

Copyright © 2001 -2024 Syncfusion Inc.

```
            data: {}
        };
    }
});
var contentVue3 = Vue.component("contentTemp3", {
    template: `<div class="content"><h3 class="h3">GRENOBLE </h3>The capital
city of the French Alps and a major scientific center surrounded by many ski
resorts, host of the Winter Olympics in 1968.</div>`,
    data() {
        return {
            data: {}
        };
    }
});
export default {
    name: 'app',
    data () {
        return {
        content1: function (){
            return { template: contentVue1 }
        },
        content2: function (){
            return { template: contentVue2 }
        },
        content3: function (){
            return { template: contentVue3 }
        }
        }
    }
}

}
.content {
    padding: 10px;
}
.e-splitter {
    margin: 0 auto;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/splitter/resize-min-max-cs1" %}

JavaScript UI components

You can render any JavaScript UI components along with their native and control events within splitter as pane content.

You can refer Accordion within splitter and Listview within splitter examples.

Plain content

You can add the plain text as a pane contents using either inner HTML or content API

APP.VUE

```
<template>
<div id="app" class="col-lg-12 control-section default-splitter">
    <ejs-splitter id='splitter' ref='splitterObj'  width='600px'
height='200px'>
        <e-panes>
            <e-pane content='Left Pane' size ='200px'></e-pane>
            <e-pane content='Middle Pane' size ='200px'></e-pane>
            <e-pane content='Right Pane' size ='200px'></e-pane>
        </e-panes>
    </ejs-splitter>
</div>
</template>
<script>
import Vue from "vue";
import { SplitterPlugin } from '@syncfusion/ej2-vue-layouts';
Vue.use(SplitterPlugin);
export default {
    name: 'app',
    data () {
        return { }
    }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-layouts/styles/material.css";
#app {
    text-align: center;
    margin: 65px auto;
}
.content {
  justify-content: center;
  text-align: center;
  align-items: center;
  padding: 9px;
}
.e-splitter {
    margin: 0 auto;
}
.e-pane {
  text-align: center;
  align-items: center;
  display: grid;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/splitter/resize-min-max-cs2" %}

Pane content using selector

You can set HTML element as pane content using the query selectors such as ID or CSS class selectors.

The following code demonstrates how to fetch an element from the document and load it to pane using its ID.

APP.VUE

```
<template>
```

```
<div id="app" class="col-lg-12 control-section default-splitter">
    <ejs-splitter id='splitter' ref='splitterObj' width='600px'
height='200px'>
        <e-panes>
            <e-pane content='#left-pane-content' min='60px' size
='200px'></e-pane>
            <e-pane content='#middle-pane-content'  min='60px' size
='200px'></e-pane>
            <e-pane content='#last-pane-content'  min='60px' size
='200px'></e-pane>
        </e-panes>
    </ejs-splitter>
    <!-- pane contents -->
    <div id="left-pane-content" style="display: none;">
        <div>Left pane<div id='panetext'>size: 25%</div>
            <div id='panetext'>min: 60px</div>
        </div>
    </div>
    <div id="middle-pane-content" style="display: none;">
        <span>Middle pane<div id="panetext">size: 50%</div>
            <div id="panetext">min: 60px</div>
        </span>
    </div>
    <div id="last-pane-content" style="display: none;">
        <span>Right pane<div id="panetext">size: 25%</div>
            <div id="panetext">min: 60px</div>
        </span>
    </div>
</div>
</template>
<script>
import Vue from "vue";
import { SplitterPlugin } from '@syncfusion/ej2-vue-layouts';
Vue.use(SplitterPlugin);
export default {

Split panes in Vue Splitter component

This section explain about split panes behaviours.

Horizontal layout

By default, splitter will render in horizontal orientation. Splitter container will be splitted as panes in horizontal flow direction with vertical separator.

APP.VUE

```
<template>
<div id="app" class="col-lg-12 control-section default-splitter">
    <ejs-splitter id='default-splitter' width='600px' height='230px'>
        <e-panes>
            <e-pane :content ='content1' size ='200px'></e-pane>
            <e-pane :content ='content2' size ='200px'></e-pane>
            <e-pane :content ='content3' size ='200px'></e-pane>
        </e-panes>
    </ejs-splitter>
</div>
</template>
<script>
import Vue from "vue";
import { SplitterPlugin } from '@syncfusion/ej2-vue-layouts';
Vue.use(SplitterPlugin);
var contentVue1 = Vue.component("contentTemp1", {
    template: `<div class="content">
                    <h3 class="h3">Grid </h3>
                    The ASP.NET DataGrid component, or DataTable is a
feature-rich component used to display data in a tabular format.
                </div>`,
    data() {
        return {
            data: {}
        };
    }
});
var contentVue2 = Vue.component("contentTemp2", {
    template: `<div class="content">
                    <h3 class="h3">Schedule </h3>
                    The ASP.NET Scheduler, a.k.a. event calendar,
facilitates almost all calendar features, thus allowing users to manage
their time efficiently
                </div>`,
    data() {
        return {
            data: {}
        };
    }
```

Copyright © 2001 -2024 Syncfusion Inc.

```
});
var contentVue3 = Vue.component("contentTemp3", {
    template: `<div class="content">
                    <h3 class="h3">Chart </h3>
                    ASP.NET charts, a well-crafted easy-to-use charting
package, is used to add beautiful charts in web and mobile applications
                </div>`,
    data() {
        return {
            data: {}
        };
    }
});
export default {
  name: 'app',
    data () {
    return {
    content1: function (){
        return { template: contentVue1 }
    },
    content2: function (){
        return { template: contentVue2 }
    },
    content3: function (){
        return { template: contentVue3 }
    }
    }
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-layouts/styles/material.css";
#app {
    margin: 65px auto;
}
.content {
    padding: 10px;
}
.e-splitter {
    margin: 0 auto;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/splitter/split-panes-cs1" %}

Vertical layout

By setting orientation API as Vertical, splitter will render in vertical orientation. Splitter container will be splitted as panes in vertical flow direction with horizontal separator.

APP.VUE

```
<template>
<div id="app" class="col-lg-12 control-section default-splitter">
    <ejs-splitter id='vertical-splitter' orientation = 'Vertical'
width='600px' height='300px'>
        <e-panes>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
            <e-pane :content ='content1' size ='100px'></e-pane>
            <e-pane :content ='content2' size ='100px'></e-pane>
            <e-pane :content ='content3'></e-pane>
        </e-panes>
    </ejs-splitter>
</div>
</template>
<script>
import Vue from "vue";
import { SplitterPlugin } from '@syncfusion/ej2-vue-layouts';
Vue.use(SplitterPlugin);
var contentVue1 = Vue.component("contentTemp1", {
    template: `<div class="content">
                    <h3 class="h3">Grid</h3>
                    The ASP.NET DataGrid component, or DataTable is a
feature-rich component used to display data in a tabular format.
                </div>`,
    data() {
        return {
            data: {}
        };
    }
});
var contentVue2 = Vue.component("contentTemp2", {
    template: `<div class="content">
                    <h3 class="h3">Schedule </h3>
                    The ASP.NET Scheduler, a.k.a. event calendar,
facilitates almost all calendar features, thus allowing users to manage
their time efficiently
                </div>`,
    data() {
        return {
            data: {}
        };
    }
});
var contentVue3 = Vue.component("contentTemp3", {
    template: `<div class="content">
                    <h3 class="h3">Chart </h3>
                    ASP.NET charts, a well-crafted easy-to-use charting
package, is used to add beautiful charts in web and mobile applications
              </div>`,
    data() {
        return {
            data: {}
        };
    }
});
export default {
  name: 'app',
    data () {
    return {
    content1: function (){
        return { template: contentVue1 }
    },
    content2: function (){
        return { template: contentVue2 }
```

Copyright © 2001 -2024 Syncfusion Inc.

```
    },
    content3: function (){
        return { template: contentVue3 }
    }
    }
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-layouts/styles/material.css";
.content {
  padding: 8px;
}
.e-splitter {
    margin: 0 auto;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/splitter/panes-orientation-cs1" %}

You can also render multiple panes in splitter with both Horizontal/Vertical orientations.

Separator

By default, pane separator will be render with 1px width/height. You can customize the separator size by using separatorSize API.

For horizontal orientation, it will be considered as separator width.

For vertical orientation, it will be considered as separator height.

APP.VUE

```
<template>
<div id="app" class="col-lg-12 control-section default-splitter">
    <ejs-splitter id='splitter' width='600px' height='235px' separatorSize=
'5'>
        <e-panes>
            <e-pane :content ='content1' size ='200px'></e-pane>
            <e-pane :content ='content2' size ='200px'></e-pane>
            <e-pane :content ='content3' size ='200px'></e-pane>
        </e-panes>
    </ejs-splitter>
</div>
</template>
<script>
import Vue from "vue";
import { SplitterPlugin } from '@syncfusion/ej2-vue-layouts';
Vue.use(SplitterPlugin);
var contentVue1 = Vue.component("contentTemp1", {
    template: `<div class="content">
                    <h3 class="h3">PARIS </h3>
                    Paris, the city of lights and love - this short guide is
full of ideas for how to make the most of the romanticism...
                </div>`,
    data() {
        return {
            data: {}
```

```
        };
    }
});
var contentVue2 = Vue.component("contentTemp2", {
    template: `<div class="content">
                    <h3 class="h3">CAMEMBERT </h3>
                    The village in the Orne département of Normandy where
the famous French cheese is originated from.
                </div>`,
    data() {
        return {
            data: {}
        };
    }
});
var contentVue3 = Vue.component("contentTemp3", {

{% previewsample "page.domainurl/code-snippet/splitter/panes-separator-cs1" %}

Nested Splitter

Splitter provides support to render the nested pane to achieve the complex layouts. You can use the same `<div>` element for splitter pane and nested splitter.

Also you can render the nested splitter using direct child of the splitter pane. For this, nested splitter should have `100%` width and height to match with the parent pane dimensions.

APP.VUE

```
<template>
<div id="app" class="col-lg-12 control-section default-splitter">
    <ejs-splitter id='nested-splitter' width='600px' height='265px'
:created='onCreate' >
        <e-panes>
            <e-pane :content ='content1' size ='200px'></e-pane>
            <e-pane :content ='content2' size ='200px'></e-pane>
            <e-pane :content ='content3' size ='200px'></e-pane>
        </e-panes>
    </ejs-splitter>
</div>
</template>
<script>
import Vue from "vue";
import { SplitterPlugin } from '@syncfusion/ej2-vue-layouts';
import {Splitter} from '@syncfusion/ej2-layouts';
Vue.use(SplitterPlugin);
var contentVue1 = Vue.component("contentTemp1", {
    template: `<div class="content">
                    <h3 class="h3">PARIS </h3>
                    Paris, the city of lights and love - this short guide is
full of ideas for how to make the most of the romanticism...
                </div>`,
    data() {
        return {
            data: {}
        };
    }
});
var contentVue2 = Vue.component("contentTemp2", {
    template: `<div class="content">
                    <h3 class="h3">CAMEMBERT </h3>
                    The village in the Orne département of Normandy where
the famous French cheese is originated from.
                </div>`,
    data() {
        return {
            data: {}
        };
    }
});
var contentVue3 = Vue.component("contentTemp3", {
    template: `<div>
                <div id ='vertical_splitter' class="vertical_splitter">
```

</style>
```

{% previewsample "page.domainurl/code-snippet/splitter/nested-splitter-cs1" %}

Add or remove pane

You can add or remove panes programmatically to the splitter, by using addPane and removePane methods.

Add pane

You can add the panes dynamically in the splitter by passing paneProperties along with index to the addPane method

APP.VUE

```
<template>
<div id="app" class="col-lg-12 control-section default-splitter">
    <ejs-splitter id='splitter' ref='splitterObj'  width='700px'
height='200px'>
        <e-panes>
            <e-pane content ='Pane 1' size ='300px'></e-pane>
            <e-pane content ='Pane 2' size ='300px'></e-pane>
        </e-panes>
    </ejs-splitter>
    <div class="addBtn">
      <button id='addButton' class="e-btn" v-on:click = 'addPane'>Add
Pane</button>
    </div>
</div>
</template>
<script>
import Vue from "vue";
import { SplitterPlugin } from '@syncfusion/ej2-vue-layouts';
import { PanePropertiesModel } from '@syncfusion/ej2-layouts';
Vue.use(SplitterPlugin);
export default {
  name: 'app',
    data () {
    return {
    }
  },
  methods: {
    addPane: function () {
         this.$refs.splitterObj.$el.ej2_instances[0].addPane({
      size: '200px',
      content: 'New Pane',
      min: '30px',
      max: '250px',
```

```
      }, 1);
    }
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-layouts/styles/material.css";
#app {
    margin: 65px auto;
}
#splitter1 div.e-pane-horizontal {
    padding: 5px;
}
.addBtn {
  margin-top: 20px;
  text-align: initial;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/splitter/add-pane-cs1" %}

Remove pane

You can remove the split panes dynamically by passing the pane index to removePane method.

APP.VUE

```
<template>
<div id="app" class="col-lg-12 control-section default-splitter">
    <ejs-splitter id='splitter' ref='splitterObj'  width='700px'
height='200px'>
        <e-panes>
            <e-pane content ='Pane 1' size ='300px'></e-pane>
            <e-pane content ='Pane 2' size ='300px'></e-pane>
            <e-pane content ='Pane 3' size ='300px'></e-pane>
        </e-panes>
    </ejs-splitter>

Expand collapse in Vue Splitter component

Collapsible panes

The Vue Splitter panes can be configured with built-in expand and collapse functionalities. By default, the collapsible behavior is disabled. Enable the collapsible behavior in the paneSettings property to show or hide the expand or collapse icons in the panes. You can dynamically expand and collapse the panes by using the corresponding icons.

The following code shows how to enable collapsible behavior.

APP.VUE

```
<template>
<div id="app" class="col-lg-12 control-section default-splitter">
    <ejs-splitter id='splitter' ref='splitterObj'  width='600px'
height='200px'>
        <e-panes>
            <e-pane :content='content1' size ='200px' :collapsible=true></e-
pane>
            <e-pane :content='content2' size ='200px' :collapsible=true></e-
pane>
            <e-pane :content='content3' size ='200px' :collapsible=true></e-
pane>
        </e-panes>
    </ejs-splitter>
</div>
```

{% previewsample "page.domainurl/code-snippet/splitter/expand-collapse-cs1" %}

Programmatically control the expand and collapse action

The Vue Splitter provides public method to control the expand and collapse behavior programmatically using the expand and collapse methods. Refer to the following code example.

APP.VUE

```
<template>
<div id="app" class="col-lg-12 control-section default-splitter">
    <ejs-splitter id='splitter' ref='splitterObj'  width='600px'
height='200px'>
        <e-panes>
            <e-pane :collapsible=true content='Left Pane' size ='200px'></e-
pane>
            <e-pane :collapsible=true content='Middle Pane' size
='200px'></e-pane>
            <e-pane :collapsible=true content='Right Pane' size
='200px'></e-pane>
        </e-panes>
    </ejs-splitter>
    <div style="margin: 10px">
        <ejs-button id='expand' v-on:click.native="expandClick">Expand</ejs-
button>
        <ejs-button id='collapse' v-
on:click.native="collapseClick">Collapse</ejs-button>
    </div>
</div>
</template>
<script>
import Vue from "vue";
import { SplitterPlugin } from '@syncfusion/ej2-vue-layouts';
import { ButtonPlugin } from '@syncfusion/ej2-vue-buttons';
Vue.use(SplitterPlugin);
Vue.use(ButtonPlugin);
export default {
    name: 'app',
    data () {
        return { }
    },
    methods: {
        expandClick : function() {
            this.$refs.splitterObj.expand(0);
        },
        collapseClick : function() {
            this.$refs.splitterObj.collapse(0);
        }
    }
```

Copyright © 2001 -2024 Syncfusion Inc.

```
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-layouts/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-buttons/styles/material.css";
#app {
    text-align: center;
    margin: 45px auto;
}
.content {
  justify-content: center;
  text-align: center;
  align-items: center;
  padding: 9px;
}
.e-splitter {
    margin: 0 auto;
}
.e-pane {
  text-align: center;
  align-items: center;
  display: grid;
}
#collapse {
  margin-left: 10px;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/splitter/expand-collapse-method-cs1" %}

Specify initial state to panes

You can render specific panes with collapsed state on page load. Specify a Boolean value to the collapsed property to control this behavior. The following code explains how to collapse panes on rendering (the second panes renders with collapsed state).

APP.VUE

```
<template>
<div id="app" class="col-lg-12 control-section default-splitter">
    <ejs-splitter id='splitter' ref='splitterObj'  width='600px'
height='200px'>
        <e-panes>
            <e-pane content='Left Pane' size ='200px' :collapsible=true></e-
pane>
            <e-pane :collapsed=true content='Middle Pane' size ='200px'
:collapsible=true></e-pane>
            <e-pane content='Right Pane' size ='200px'
:collapsible=true></e-pane>
        </e-panes>
    </ejs-splitter>
</div>
</template>
<script>
import Vue from "vue";
import { SplitterPlugin } from '@syncfusion/ej2-vue-layouts';
Vue.use(SplitterPlugin);
```

Copyright © 2001 -2024 Syncfusion Inc.

```
export default {
    name: 'app',
    data () {
        return { }
    }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-layouts/styles/material.css";
#app {
    text-align: center;
    margin: 65px auto;
}
.content {
  justify-content: center;
  text-align: center;
  align-items: center;
  padding: 9px;
}
.e-splitter {
    margin: 0 auto;
}
.e-pane {
  text-align: center;
  align-items: center;
  display: grid;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/splitter/collapsed-cs1" %}

- Resizable split panes

Resizing in Vue Splitter component

By default, resizing will be enable for split panes. Resizing gripper element will be add to the separator to makes the resize easy.

Horizontal splitter will allows to resize in horizontal directions.

Vertical splitter will allows to resize in vertical directions.

While resizing, previous and next panes will be adjust its dimensions automatically.

Min and Max validation

Splitter allows you to set the minimum and maximum sizes for each pane. Resizing will not be occur over the minimum and maximum values.

APP.VUE

```
<template>
<div id="app" class="col-lg-12 control-section default-splitter">
    <ejs-splitter id='splitter' ref='splitterObj'  width='600px'
height='200px'>
        <e-panes>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
            <e-pane :content='content1' size ='200px' min='20%'
max='40%'></e-pane>
            <e-pane :content='content2' size ='200px' min='30%'
max='60%'></e-pane>
            <e-pane :content='content3' size ='200px'></e-pane>
        </e-panes>
    </ejs-splitter>
</div>
</template>
<script>
import Vue from "vue";
import { SplitterPlugin } from '@syncfusion/ej2-vue-layouts';
Vue.use(SplitterPlugin);
var contentVue1 = Vue.component("contentTemp1", {
    template: `<div class="content">
                    <h3 class="h3">Grid </h3>
                    The ASP.NET DataGrid component, or DataTable is a
feature-rich component used to display data in a tabular format.
                </div>`,
    data() {
        return {
            data: {}
        };
    }
});
var contentVue2 = Vue.component("contentTemp2", {
    template: `<div class="content">
                    <h3 class="h3">Schedule </h3>
                    The ASP.NET Scheduler, a.k.a. event calendar,
facilitates almost all calendar features, thus allowing users to manage
their time efficiently
                </div>`,
    data() {
        return {
            data: {}
        };
    }
});
var contentVue3 = Vue.component("contentTemp3", {
    template: `<div class="content">
                    <h3 class="h3">Chart </h3>
                    ASP.NET charts, a well-crafted easy-to-use charting
package, is used to add beautiful charts in web and mobile applications
                </div>`,
    data() {
        return {
            data: {}
        };
    }
});
export default {

    padding: 10px;
```

```
}
.e-splitter {
    margin: 0 auto;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/splitter/resize-min-max-cs8" %}

Refresh content on resizing

While resizing the panes, you can refresh the pane contents by using either resizeStart, resizing or resizeStop events.

Customize the resize grip and cursor

You can customize the resize gripper icon and cursor in css level.

APP.VUE

```
<template>
<div id="app" class="col-lg-12 control-section default-splitter">
    <ejs-splitter id='splitter' ref='splitterObj'  width='600px'
height='200px'>

- Collapsible panes

Different layouts in Vue Splitter component

By using splitter component, you can create the different layouts with multiple and nested panes.

Code editor style layout

Step 1:

Create the element with two child to render the outer splitter and render the first pane of vertical splitter as a horizontal splitter.

```
<template>
<ejs-splitter id='outerSplitter' ref="splitterObj" :created='onCreate' orientation='Vertical' class='splitterContent' width='100%' height='400px'>
<e-panes>
<e-pane size="53%" min ="30%" ></e-pane>
<e-pane :content='pane4Content'></e-pane>
</e-panes>
</ejs-splitter>
</template>
<style>
.code-editor #code-text {
margin-left: 5px;
}
.code-editor .code-preview {
margin-top: 15px;
font-size: 12px;
}
.code-editor #target {
margin: 20px auto;
max-width: 600px;
}
.code-editor.control-section{
```

Copyright © 2001 -2024 Syncfusion Inc.

```
min-height: 370px;
margin-bottom: 15px;
margin-top: 10px;
}
.code-editor .h3 {
font-size: 14px;
margin: 4px;
}
.code-editor .content {
padding: 12px;
}
.code-editor .splitter-image {
margin: 0 auto;
display: flex;
height: 115px;
margin-top: 10px;
}
</style>
`
`javascript
<script>
import Vue from "vue";
import { SplitterPlugin } from '@syncfusion/ej2-vue-layouts';
import { Splitter } from '@syncfusion/ej2-layouts';
Vue.use(SplitterPlugin);
export default Vue.extend({
data: function() {
return {
pane4Content: function () {
return { template : pane4Content }
},
pane1Content: `<div><div class="content"><h3 class="h3">HTML</h3><div class="code-
preview"><<span>!DOCTYPE html></span><div><<span>html></span></div>
```

```
<div><<span>body></span></div><<span>div</span> id="custom-image"><div style="margin-left: 5px"><<span>img</span> src="src/albert.png"></div>

<div><<span>div</span>></div><div><<span>/body></span></div><div><<span>/html></span></div></div></div></div>`,

pane2Content: `<div><div class="content"><h3 class="h3">CSS</h3><div class="code-preview"><span>img {</span><div id="code-text">margin:<span>0 auto;</span></div>

<div id="code-text">display:<span>flex;</span></div><div id="code-text">height:<span>70px;</span></div><span>}</span></div></div></div>`,

pane3Content: `<div><div class="content"><h3 class="h3">JavaScript</h3><div class="code-preview"><span>var </span>

image = document.getElementById("custom-image");<div>image.addEventListener("click", function() {</div>

<div style="padding-left: 20px;">// Code block for click action</div><span>
}</span></div></div></div>`,

pane4Content: `

<div>

<div class="content">

<h3 class="h3">Preview of sample</h3>

<div class="splitter-image">

<img class="img1" src="https://ej2.syncfusion.com/demos/src/listview/images/albert.png" style="width: 20%;margin: 0 auto;">

</div>

</div>

</div>

`

}

},

methods: {

onCreate: function () {

document.getElementById('outerSplitter').querySelector('.e-pane-vertical').setAttribute('id', 'Innersplitter');

this.splitterObj1 = new Splitter({

height: '220px',

paneSettings: [

{ size: '29%', min: '23%', content: this.pane1Content },

{ size: '20%', min: '15%', content: this.pane2Content },
```

```
{ size: '35%', min: '35%', content: this.pane3Content }
],
width: '100%'
});
this.splitterObj1.appendTo('#Innersplitter');
}
}
});
</script>
```

Once the above configurations has been completed, you will get the output like this

Outlook style layout

Step 1:

Create the element with three panes and place the elements within the pane to render `treeview`, `listview` and `RTE`.

```
<template>
<ejs-splitter id='splitter' ref="splitterObj" width='100%' height='498px'>
<e-panes>
<e-pane size="28%" min="27%" :content='pane1Content'></e-pane>
<e-pane size="33%" min ="23%" :content='pane2Content'></e-pane>
<e-pane size="37%" min ="30%" :content='pane3Content'></e-pane>
</e-panes>
</ejs-splitter>
</template>
<style>
.outlook-style #target {
margin: 20px auto;
max-width: 820px;
}
.outlook-style #discard {
margin-left: 7px;
}
.outlook-style table {
```

Copyright © 2001 -2024 Syncfusion Inc.

```
width: 100%;
border: none;
}
.outlook-style td {
padding: 2px;
}
.outlook-style.control-section {
min-height: 370px;
}
.outlook-style .e-treeview .e-list-text {
width: 100%;
}
.outlook-style #groupedList.e-listview .e-list-group-item {
height: 0;
}
.outlook-style #splitter1 .settings.e-list-wrapper.e-list-multi-line.e-list-avatar {
padding: 15px;
}
.outlook-style #buttonSection {
padding: 7px;
}
.outlook-style #createpostholder {
padding-left: 3px;
padding-right: 4px;
}
</style>
<script>
import Vue from "vue";
import { SplitterPlugin } from '@syncfusion/ej2-vue-layouts';
import pane1Content from "./outlook-pane1-content.vue";
import pane2Content from "./outlook-pane2-content.vue";
import pane3Content from "./outlook-pane3-content.vue";
Vue.use(SplitterPlugin);
```

Copyright © 2001 -2024 Syncfusion Inc.

```
export default Vue.extend({
data: function() {
return {
pane1Content: function () {
return { template : pane1Content }
},
pane2Content: function () {
return { template : pane2Content }
},
pane3Content: function () {
return { template : pane3Content }
}
}
}
});
</script>
```

Step 2 :

Create the separate template files to render the inner components.

Below template defined for treeview

```
<template>
<div>
<div class="tree-template-control-wrapper">
<ejs-treeview id="template" :fields="fields" cssClass="custom" :nodeTemplate="treeTemplate"></ejs-treeview>
</div>
</div>
</template>
<style>
.tree-template-control-wrapper .e-treeview .e-list-text {
width: 100%;
}
```

```
</style>
<script>
import Vue from "vue";
import { TreeViewPlugin } from "@syncfusion/ej2-vue-navigations";
Vue.use(TreeViewPlugin);
var mailBox = [
{ id: 1, name: 'Favorites', hasChild: true},
{ id: 2, pid: 1, name: 'Sales Reports', count: '4' },
{ id: 3, pid: 1, name: 'Sent Items'},
{ id: 4, pid: 1, name: 'Marketing Reports ', count: '6'},
{ id: 5, name: 'Andrew Fuller', hasChild: true, expanded: true },
{ id: 6, pid: 5, name: 'Inbox',  selected: true , count: '20'},
{ id: 7, pid: 5,  name: 'Drafts', count: '5'},
{ id: 8, pid: 5,  name: 'Deleted Items'},
{ id: 9, pid: 5, name: 'Sent Items'},
{ id: 10, pid: 5, name: 'Sales Reports' , count: '4'},
{ id: 11, pid: 5, name: 'Marketing Reports', count: '6' },
{ id: 12, pid: 5, name: 'Outbox' },
{ id: 13, pid: 5, name: 'Junk Email'},
{ id: 14, pid: 5, name: 'RSS Feed'},
{ id: 15, pid: 5, name: 'Trash' }
];
var treeTemplate = Vue.component("demo", {
template: '<div><div class="treeviewdiv"><div style="float:left"><span
class="treeName">{{data.name}}</span></div>' +
'<div v-if="data.count" style="margin-right: 5px; float:right"><span class="treeCount e-badge e-badge-
primary">{{data.count}}</span></div></div></div>',
data() {
return {
data: {}
};
}
});
export default Vue.extend ({
```

Copyright © 2001 -2024 Syncfusion Inc.

```
data: function() {
return {
fields: { dataSource: mailBox, id: 'id', parentID: 'pid', text: 'name', hasChildren: 'hasChild' },

Subject	

```
</div>
<div class="forum">
<div id="createpostholder">
<ejs-richtexteditor ref="rteInstance" height='262px'></ejs-richtexteditor>
<div id="buttonSection">
<ejs-button :isPrimary="isPrimary" id="send" >Send</ejs-button>
<ejs-button id="discard" >Discard</ejs-button>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
</div>
</div>
</div>
</div>
</template>
<script>
import Vue from "vue";
import { RichTextEditorPlugin, Link, Image, HtmlEditor, Toolbar } from "@syncfusion/ej2-vue-richtexteditor";
import { ButtonPlugin } from '@syncfusion/ej2-vue-buttons';
import { TextBoxPlugin } from '@syncfusion/ej2-vue-inputs';
Vue.use(TextBoxPlugin);
Vue.use(RichTextEditorPlugin);
Vue.use(ButtonPlugin);
export default Vue.extend({
data: function() {
return {
isPrimary: true
};
},
mounted: function() {
this.$nextTick(function () {
this.$refs.rteInstance.$el.ej2_instances[0].refresh();
})
},
provide:{
richtexteditor:[Link, Image, HtmlEditor, Toolbar]
}
});
</script>
`
```

Once the above configurations has been completed, you will get the output like this.

- Multiple panes in Splitter

Style in Vue Splitter component

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

Customizing the split bar

Use the following CSS to customize the split bar properties.

Horizontal split bar

`css

/ default split bar color /

.e-splitter .e-split-bar.e-split-bar-horizontal{

background: blue;

}

/ split bar color in hover and active state /

.e-splitter .e-split-bar.e-split-bar-horizontal.e-split-bar-hover,

.e-splitter .e-split-bar.e-split-bar-horizontal.e-split-bar-active {

background: green;

}

`

Vertical split bar

`css

/ default split bar color /

.e-splitter .e-split-bar.e-split-bar-vertical {

background: blue;

}

/ split bar color in hover and active state /

.e-splitter .e-split-bar.e-split-bar-vertical.e-split-bar-hover,

.e-splitter .e-split-bar.e-split-bar-vertical.e-split-bar-active {

background: green;

}

`

Customizing the split bar resize handle

Use the following CSS to customize the split bar resize handle.

Copyright © 2001 -2024 Syncfusion Inc.

Horizontal split bar resize handle

```css
/ default split bar resize handle color /
.e-splitter .e-split-bar.e-split-bar-horizontal .e-resize-handler {
color: rgba(20, 27, 233, 0.54);
}
/ default split bar resize handle color in hover and active state /
.e-splitter .e-split-bar.e-split-bar-horizontal.e-split-bar-hover .e-resize-handler,
.e-splitter .e-split-bar.e-split-bar-horizontal.e-split-bar-active .e-resize-handler {
color: green;
}
```

Vertical split bar resize handle

```css
/ default split bar resize handle color /
.e-splitter .e-split-bar.e-split-bar-vertical .e-resize-handler {
color: rgba(20, 27, 233, 0.54);
}
/ default split bar resize handle color in hover and active state /
.e-splitter .e-split-bar.e-split-bar-vertical.e-split-bar-hover .e-resize-handler,
.e-splitter .e-split-bar.e-split-bar-vertical.e-split-bar-active .e-resize-handler {
color: green;
}
```

Customizing the split bar arrows

Use the following CSS to customize the split bar arrows.

Horizontal split bar resize arrows

```css
/ split bar arrows /
.e-splitter .e-split-bar.e-split-bar-horizontal.e-split-bar-hover .e-navigate-arrow.e-arrow-left::before, .e-splitter .e-split-bar.e-split-bar-horizontal.e-split-bar-active .e-navigate-arrow.e-arrow-left::before, .e-splitter .e-split-bar.e-split-bar-horizontal.e-split-bar-hover .e-navigate-arrow.e-arrow-left::after, .e-splitter .e-split-bar.e-split-bar-horizontal.e-split-bar-active .e-navigate-arrow.e-arrow-left::after, .e-splitter .e-split-bar.e-split-bar-horizontal.e-split-bar-hover .e-navigate-arrow.e-arrow-right::before, .e-splitter .e-split-bar.e-split-bar-horizontal.e-split-bar-active .e-navigate-arrow.e-arrow-right::before, .e-
```

Copyright © 2001 -2024 Syncfusion Inc.

```
splitter .e-split-bar.e-split-bar-horizontal.e-split-bar-hover .e-navigate-arrow.e-arrow-right::after, .e-splitter .e-split-bar.e-split-bar-horizontal.e-split-bar-active .e-navigate-arrow.e-arrow-right::after {

background-color: green;

}

/ split bar arrows - circular border /

.e-splitter .e-split-bar.e-split-bar-horizontal.e-split-bar-hover .e-navigate-arrow.e-arrow-left, .e-splitter .e-split-bar.e-split-bar-horizontal.e-split-bar-hover .e-navigate-arrow.e-arrow-right {

border-color: rgba(33, 227, 22, 0.5);

}
```

Vertical split bar resize arrows

```
`css

/ split bar arrows /

.e-splitter .e-split-bar.e-split-bar-vertical.e-split-bar-hover .e-navigate-arrow.e-arrow-up::before, .e-splitter .e-split-bar.e-split-bar-vertical.e-split-bar-active .e-navigate-arrow.e-arrow-up::before, .e-splitter .e-split-bar.e-split-bar-vertical.e-split-bar-hover .e-navigate-arrow.e-arrow-up::after, .e-splitter .e-split-bar.e-split-bar-vertical.e-split-bar-active .e-navigate-arrow.e-arrow-up::after, .e-splitter .e-split-bar.e-split-bar-vertical.e-split-bar-hover .e-navigate-arrow.e-arrow-down::before, .e-splitter .e-split-bar.e-split-bar-vertical.e-split-bar-active .e-navigate-arrow.e-arrow-down::before, .e-splitter .e-split-bar.e-split-bar-vertical.e-split-bar-hover .e-navigate-arrow.e-arrow-down::after, .e-splitter .e-split-bar.e-split-bar-vertical.e-split-bar-active .e-navigate-arrow.e-arrow-down::after {

background-color: green;

}

/ split bar arrows - circular border /

.e-splitter .e-split-bar.e-split-bar-vertical.e-split-bar-hover .e-navigate-arrow.e-arrow-up, .e-splitter .e-split-bar.e-split-bar-vertical.e-split-bar-hover .e-navigate-arrow.e-arrow-down {

border-color: rgba(33, 227, 22, 0.5);

}
`
```

To hide the resize handle in Splitter

Use the following CSS to hide the resize handler in the split bar

Hide the horizontal split bar resize arrow

```
`css

.e-splitter .e-split-bar.e-split-bar-horizontal .e-resize-handler {

display: none;

}
`
```

Copyright © 2001 -2024 Syncfusion Inc.

Hide the vertical split bar resize arrow

`css

.e-splitter .e-split-bar.e-split-bar-vertical .e-resize-handler {

display: none;

}

`

Globalization in Vue Splitter component

RTL

Specifies the direction of the Splitter component using the enableRtl property. For writing systems that require it like Arabic, Hebrew, etc., the direction can be switched to right-to-left.

The following code shows how to enable RTL behavior.

APP.VUE

```
 html
<template>
    <div id="app" class="col-lg-12 control-section default-splitter">
        <ejs-splitter id='splitter' height='200px' enableRtl='true'>
            <e-panes>
                <e-pane content='Left Pane' size='200px'></e-pane>
                <e-pane content='Middle Pane' size='200px'></e-pane>
                <e-pane content='Right Pane' size='200px'></e-pane>
            </e-panes>
        </ejs-splitter>
    </div>
</template>
<script>
    import Vue from "vue";
    import { SplitterPlugin} from '@syncfusion/ej2-vue-layouts';
    Vue.use(SplitterPlugin);
    export default {
        name: 'app',
        data() {
            return {}
        }
    }
</script>
<style>
.e-pane {
    align-items: center;
    padding: 9px;
    display: flex;
}
    @import "../node_modules/@syncfusion/ej2-vue-
layouts/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/splitter/rtl-cs1" %}

- Different Layouts

Accessibility in Vue Splitter component

The Splitter component followed the accessibility guidelines and standards, including ADA, Section 508, WCAG 2.2 standards, and WCAG roles that are commonly used to evaluate accessibility.

The accessibility compliance for the Splitter component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| WCAG 2.2 Support | |

| Section 508 Support | |

| Screen Reader Support | |

| Right-To-Left Support | |

| Color Contrast | |

| Mobile Device Support | |

| Keyboard Navigation Support | |

| Accessibility Checker Validation | |

| Axe-core Accessibility Validation | |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

 - All features of the component meet the requirement.

 - Some features of the component do not meet the requirement.

Copyright © 2001 -2024 Syncfusion Inc.

<img src="https://cdn.syncfusion.com/content/images/landing-page/no.png" alt="No"> - The component does not meet the requirement.

Keyboard interaction

You can use the following key shortcuts to access the splitter without interruptions:

| **Keyboard shortcuts** | **Actions** |

| --- | --- |

| Tab | Helps in focusing the splitter on the page and switching between the consecutive splitter bars. |

| Shift + Tab | Helps in focusing the previous splitter bar element on the splitter. |

| Right arrow | Helps in moving the active horizontal orientated splitter bar to its Right side. |

| Left arrow | Helps in moving the active horizontal orientated splitter bar to its Left side. |

| Up arrow | Helps in moving the active vertical orientated splitter bar to its Up side. |

| Down arrow | Helps in moving the active vertical orientated splitter bar to its Down side. |

| Enter | Helps to toggle between expand and collapse actions of the splitter bar when it is active. |

Ensuring accessibility

The Splitter component's accessibility levels are ensured through an accessibility-checker and axe-core software tools during automated testing.

The accessibility compliance of the Splitter component is shown in the following sample. Open the sample in a new window to evaluate the accessibility of the Splitter component with accessibility tools.

{% previewsample "https://ej2.syncfusion.com/accessibility/splitter.html" %}

- Accessibility in Syncfusion Vue components

Spreadsheet

Overview of the Vue Spreadsheet component

The Vue Spreadsheet is an user interactive component to organize and analyze data in tabular format with configuration options for customization. It will load data by importing an Excel/CSV file or from local and remote data sources such as JSON, RESTful services, OData services, and more. The populated data can be exported as Excel with xlsx, xls, CSV and PDF formats.

Key features

- Data sources: Bind the Spreadsheet component with an array of objects or data from a web service using DataManager.
- Virtualization: Provides the option to load large amount of data without performance degradation.
- Selection: Provides the option to select a cell or range of cells.
- Editing: Provides the option to dynamically edit a cell.

Copyright © 2001 -2024 Syncfusion Inc.

- Formulas: Provides built-in calculation library with pre-defined formulas and named range support.
- Clipboard: Provides the option to perform clipboard operations.
- Cell formatting: Provides the option to customize the appearance of cells.
- Number formatting: Provides the option to format the cell value.
- Open: Provides the option to open Excel and CSV files in Spreadsheet.
- Save: Provides the option to save Spreadsheet data as Excel, CSV, and PDF documents.
- Sorting: Helps you to arrange the data to particular order in a selected range of cells.
- Filtering: Helps you to view specific rows in the Spreadsheet by hiding the other rows.
- Undo Redo: Provides the option to perform undo redo operations in Spreadsheet.
- Collaborative editing: Provides the option for real time changes across multiple users in the Spreadsheet.
- Hyperlink: Provides the option to navigate to web link or cell reference within the sheet or to other sheet in Spreadsheet.
- Resize: Allows you to change the row height and column width. Auto fit the rows and columns based on its content.
- Wrap text: Provides the option to display the large content as multiple lines in a single cell.
- Data validation: Provides the option to validate edited values based on data validation rules defined for a cell or range of cells.
- Find and replace: Provides the option to find the data and replace it across all sheets in Spreadsheet.
- Protect sheet: Provides the option to restrict user actions like cell editing, row and column insertion, deletion, and resizing.
- Borders: Provides the option to customize cell gridlines such as color and its style for enhanced UI.
- Show/hide: Provides the option to show/hide rows, columns and sheets.
- Insert/delete: Provides the option to insert/delete rows, columns and sheets.
- Merge cells: Provides the option to combine two or more cells located in the same row or column into a single cell.
- Conditional formatting: Provides the option to format a cell or range of cells based on conditions applied.
- Autofill: Provides the option to fill or copy a series or pattern of values and formats into adjacent cells in any direction.
- Clear: Provides the option to clear the content, formats, and hyperlinks applied to a cell or range of cells in a Spreadsheet.
- Aggregates: Provides the option to check the sum, average, count, and more for the selected cells or range in the sheet.
- Picture: Allows you to view, insert, and modify a picture in a Spreadsheet with customizing options.
- Chart: Transforms your Spreadsheet data to an intuitive overview for better understanding and to make smart business decisions.
- Freeze panes: Allows you to keep the specified rows and columns always visible at the top and left side of the sheet while scrolling through the sheet.
- Password protection: Allows you to protect the workbook with a password.
- Multi-line editing: Allows you to insert a line break between paragraphs of the text within a cell in a Spreadsheet.
- Calculate range selection: Helps you to select a range or multiple ranges when editing a formula in a cell.

Copyright © 2001 -2024 Syncfusion Inc.

- Right-to-left (RTL): Aligns content in the Spreadsheet component from right to left.
- Templates: Templates can be used to create custom user experiences in the Spreadsheet.
- Globalization: Personalize the Spreadsheet component with different languages, as well as culture-specific number, date, and time formatting.
- Accessibility: Provides with built-in accessibility support which helps to access all the Spreadsheet component features through the keyboard, screen readers, or other assistive technology devices.

Getting Started with the Vue Spreadsheet Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using Vue-CLI and integrating the Syncfusion Vue Spreadsheet component using the Composition API / Options API.

Prerequisites

System requirements for Syncfusion Vue UI components

Dependencies

The following list of dependencies are required to use the Spreadsheet control in your application:

```
|-- @syncfusion/ej2-vue-spreadsheet
|-- @syncfusion/ej2-vue-base
|-- @syncfusion/ej2-base
|-- @syncfusion/ej2-dropdowns
|-- @syncfusion/ej2-navigations
|-- @syncfusion/ej2-grids
```

Setting up the Vue 2 project

To generate a Vue 2 project using Vue-CLI, use the vue create command. Follow these steps to install Vue CLI and create a new project:

```bash
npm install -g @vue/cli
vue create quickstart
cd quickstart
npm run serve
```

or

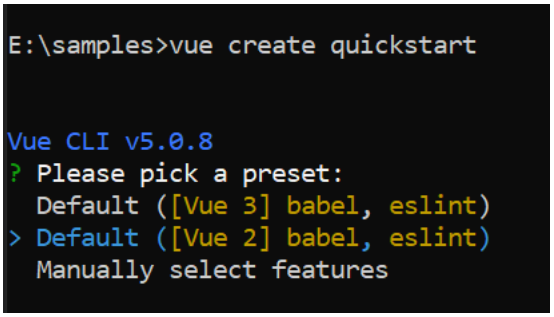
```bash
yarn global add @vue/cli
vue create quickstart
cd quickstart
```

Copyright © 2001 -2024 Syncfusion Inc.

yarn run serve

`

When creating a new project, choose the option Default ([Vue 2] babel, eslint) from the menu.



Once the quickstart project is set up with default settings, proceed to add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion packages are available at npmjs.com. To use Vue components, install the required npm package.

This article uses the Vue Spreadsheet component as an example. Install the @syncfusion/ej2-vue-spreadsheet package by running the following command:

`bash

npm install @syncfusion/ej2-vue-spreadsheet --save

`

or

`bash

yarn add @syncfusion/ej2-vue-spreadsheet

`

The **--save** will instruct NPM to include the spreadsheet package inside of the **dependencies** section of the **package.json**.

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, the Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the Spreadsheet component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-dropdowns/styles/material.css';
```

Copyright © 2001 -2024 Syncfusion Inc.

```
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-navigations/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-grids/styles/material.css';
@import "../node_modules/@syncfusion/ej2-vue-
spreadsheet/styles/material.css";
</style>
```

Add Syncfusion Vue component

Follow the below steps to add the Vue Spreadsheet component using Composition API or Options API:

1\. First, import and register the Spreadsheet component in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { SpreadsheetComponent as EjsSpreadsheet } from "@syncfusion/ej2-vue-
spreadsheet";
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { SpreadsheetComponent } from "@syncfusion/ej2-vue-spreadsheet";
export default {
components: {
'ejs-spreadsheet': SpreadsheetComponent
}
}
</script>
```

2\. In the template section define the Spreadsheet component

~/SRC/APP.VUE

```
<template>
<ejs-spreadsheet></ejs-spreadsheet>
</template>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
   <ejs-spreadsheet></ejs-spreadsheet>
</template>
<script setup>
import { SpreadsheetComponent as EjsSpreadsheet } from "@syncfusion/ej2-vue-
spreadsheet";
</script>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
<style>
 @import "../node_modules/@syncfusion/ej2-vue-
spreadsheet/styles/material.css";
 @import '../node_modules/@syncfusion/ej2-base/styles/material.css';
 @import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
 @import '../node_modules/@syncfusion/ej2-dropdowns/styles/material.css';
 @import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
 @import '../node_modules/@syncfusion/ej2-navigations/styles/material.css';
 @import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
 @import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
 @import '../node_modules/@syncfusion/ej2-grids/styles/material.css';
 @import "../node_modules/@syncfusion/ej2-spreadsheet/styles/material.css";
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
   <ejs-spreadsheet></ejs-spreadsheet>
</template>
<script>
import { SpreadsheetComponent } from "@syncfusion/ej2-vue-spreadsheet";
export default {
   components: {
      'ejs-spreadsheet': SpreadsheetComponent
   }
}
</script>
<style>
 @import "../node_modules/@syncfusion/ej2-vue-
spreadsheet/styles/material.css";
 @import '../node_modules/@syncfusion/ej2-base/styles/material.css';
 @import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
 @import '../node_modules/@syncfusion/ej2-dropdowns/styles/material.css';
 @import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
 @import '../node_modules/@syncfusion/ej2-navigations/styles/material.css';
 @import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
 @import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
 @import '../node_modules/@syncfusion/ej2-grids/styles/material.css';
 @import "../node_modules/@syncfusion/ej2-spreadsheet/styles/material.css";
</style>
```

Run the project

To run the project, use the following command:

`bash

npm run serve

`

Getting Started with the Vue Spreadsheet Component in Vue 3

This article provides a step-by-step guide for setting up a Vite project with a JavaScript environment and integrating the Syncfusion Vue Spreadsheet component using the Composition API / Options API.

The Composition API is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

The Options API is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

Prerequisites

System requirements for Syncfusion Vue UI components

Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using Vite. To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

`bash

npm create vite@latest

`

or

`bash

yarn create vite

`

Using one of the above commands will lead you to set up additional configurations for the project as below:

1.Define the project name: We can specify the name of the project directly. Let's specify the name of the project as my-project for this article.

`bash

? Project name: » my-project

`

2.Select Vue as the framework. It will create a Vue 3 project.

`bash

Copyright © 2001 -2024 Syncfusion Inc.

? Select a framework: » - Use arrow-keys. Return to submit.

Vanilla

Vue

React

Preact

Lit

Svelte

Others

`

3.Choose JavaScript as the framework variant to build this Vite project using JavaScript and Vue.

`bash

? Select a variant: » - Use arrow-keys. Return to submit.

JavaScript

TypeScript

Customize with create-vue ↗

Nuxt ↗

`

4.Upon completing the aforementioned steps to create the my-project, run the following command to install its dependencies:

`bash

cd my-project

npm install

`

or

`bash

cd my-project

yarn install

`

Now that my-project is ready to run with default settings, let's add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion Vue component packages are available at npmjs.com. To use Syncfusion Vue components in the project, install the corresponding npm package.

Copyright © 2001 -2024 Syncfusion Inc.

This article uses the Vue Spreadsheet component as an example. To use the Vue Spreadsheet component in the project, the @syncfusion/ej2-vue-spreadsheet package needs to be installed using the following command:

`bash

npm install @syncfusion/ej2-vue-spreadsheet --save

`

or

`bash

yarn add @syncfusion/ej2-vue-spreadsheet

`

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the Spreadsheet component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-dropdowns/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-grids/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
spreadsheet/styles/material.css";
</style>
```

The order of importing CSS styles should be in line with its dependency graph.

Add Syncfusion Vue component

Follow the below steps to add the Vue Spreadsheet component using Composition API or Options API:

1.First, import and register the Spreadsheet component and its child directives in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
import { SpreadsheetComponent as EjsSpreadsheet, RangesDirective as ERanges,
RangeDirective as ERange, SheetsDirective as ESheets, SheetDirective as
ESheet} from "@syncfusion/ej2-vue-spreadsheet";
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { SpreadsheetComponent, RangesDirective, RangeDirective,
SheetsDirective, SheetDirective } from "@syncfusion/ej2-vue-spreadsheet";
export default {
name: "App",
// Declaring component and its directives
components: {
"ejs-spreadsheet": SpreadsheetComponent,
"e-sheets": SheetsDirective,
"e-sheet": SheetDirective,
"e-ranges": RangesDirective,
"e-range": RangeDirective,
}
}
</script>
```

2.In the template section, define the Spreadsheet component with sheets directives. Sheet directives are used to define the sheet definition for the Spreadsheet component.

~/SRC/APP.VUE

```
<template>
<ejs-spreadsheet>
<e-sheets>
<e-sheet>
<e-ranges>
<e-range :dataSource="data"></e-range>
</e-ranges>
</e-sheet>
</e-sheets>
</ejs-spreadsheet>
</template>
```

3.Declare the values for the dataSource property in the script section.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
const data = [
{
OrderID: 10248,
Name: "VINET",
Country: "France",
},
{
OrderID: 10249,
Name: "TOMSP",
Country: "Germany",
```

Copyright © 2001 -2024 Syncfusion Inc.

```
}
];
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
data() {
return {
data:[
{
OrderID: 10248,
Name: "VINET",
Country: "France",
},
{
OrderID: 10249,
Name: "TOMSP",
Country: "Germany",
}
],
};
}
</script>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<ejs-spreadsheet>
<e-sheets>
<e-sheet>
<e-ranges>
<e-range :dataSource="data"></e-range>
</e-ranges>
</e-sheet>
</e-sheets>
</ejs-spreadsheet>
</template>
<script setup>
import { SpreadsheetComponent as EjsSpreadsheet, RangesDirective as ERanges,
RangeDirective as ERange, SheetsDirective as ESheets, SheetDirective as
ESheet} from "@syncfusion/ej2-vue-spreadsheet";
const data = [
{
OrderID: 10248,
Name: "VINET",
Country: "France",
},
{
OrderID: 10249,
Name: "TOMSP",
Country: "Germany",
}
];
```

Copyright © 2001 -2024 Syncfusion Inc.

```
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-dropdowns/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-grids/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
spreadsheet/styles/material.css";
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<ejs-spreadsheet>
<e-sheets>
<e-sheet>
<e-ranges>
<e-range :dataSource="data"></e-range>
</e-ranges>
</e-sheet>
</e-sheets>
</ejs-spreadsheet>
</template>
<script>
import { SpreadsheetComponent, RangesDirective, RangeDirective,
SheetsDirective, SheetDirective } from "@syncfusion/ej2-vue-spreadsheet";
export default {
name: "App",
// Declaring component and its directives
components: {
"ejs-spreadsheet": SpreadsheetComponent,
"e-sheets": SheetsDirective,
"e-sheet": SheetDirective,
"e-ranges": RangesDirective,
"e-range": RangeDirective,
},
// Bound properties declarations
data() {
return {
data:[
{
OrderID: 10248,
Name: "VINET",
Country: "France",
},
{
OrderID: 10249,
Name: "TOMSP",
Country: "Germany",
}
],
};
```

Copyright © 2001 -2024 Syncfusion Inc.

```
},
};
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-dropdowns/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-grids/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
spreadsheet/styles/material.css";
</style>
```

Run the project

To run the project, use the following command:

`bash

npm run dev

`

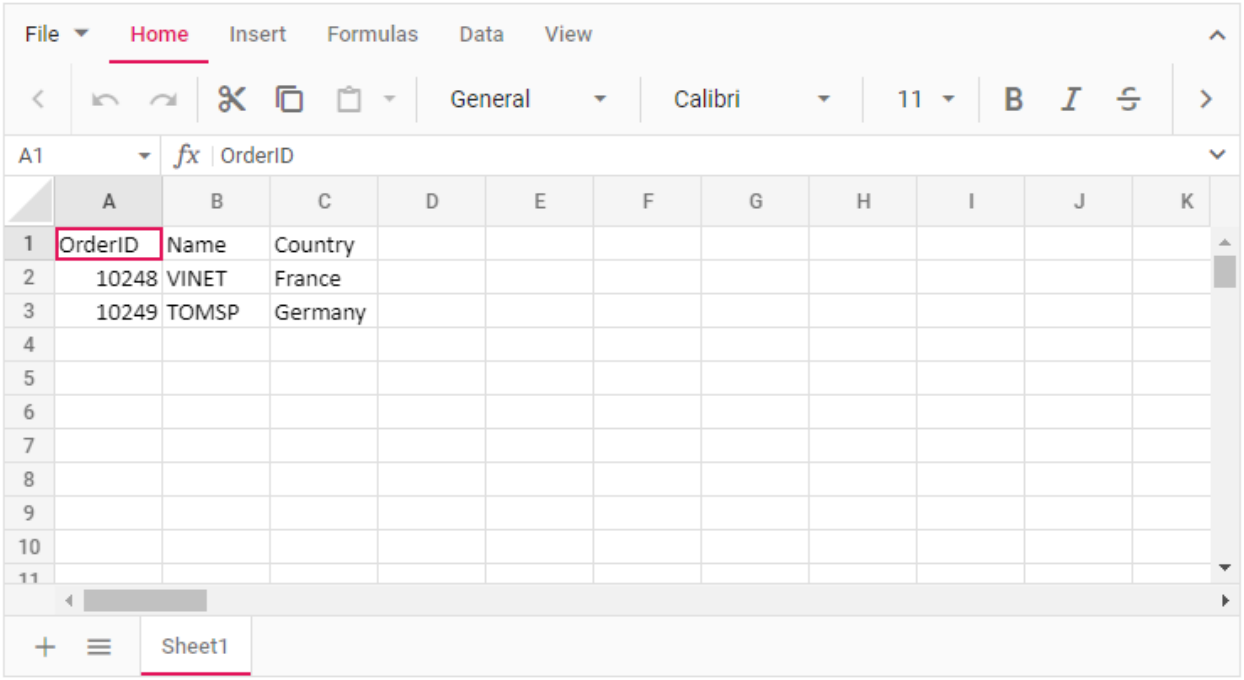
or

`bash

yarn run dev

`

The output will appear as follows:



For Migrating from Vue 2 to Vue 3 refer the Migration documentation

Data binding in Vue Spreadsheet component

The Spreadsheet uses [DataManager], which supports both RESTful JSON data services and local JavaScript object array binding to a range. The dataSource property can be assigned either with the instance of [DataManager] or JavaScript object array collection.

To bind data to a cell, use cell data binding support.

Local data

To bind local data to the Spreadsheet, you can assign a JavaScript object array to the dataSource property.

Refer to the following code example for local data binding.

APP.VUE

```
<template>
   <ejs-spreadsheet ref="spreadsheet">
   <e-sheets>
          <e-sheet>
            <e-ranges>
              <e-range :dataSource="dataSource"></e-range>
            </e-ranges>
          </e-sheet>
        </e-sheets></ejs-spreadsheet>
</template>
<script>
import Vue from "vue";
import { SpreadsheetPlugin } from "@syncfusion/ej2-vue-spreadsheet";
import { defaultData } from './data.js';
Vue.use(SpreadsheetPlugin);
export default {
   data: () => {
    return {
      dataSource: defaultData,
    }
  }
}
</script>
<style>
 @import "../node_modules/@syncfusion/ej2-vue-
spreadsheet/styles/material.css";
 @import '../node_modules/@syncfusion/ej2-base/styles/material.css';
 @import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
 @import '../node_modules/@syncfusion/ej2-dropdowns/styles/material.css';
 @import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
 @import '../node_modules/@syncfusion/ej2-navigations/styles/material.css';
 @import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
 @import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
 @import '../node_modules/@syncfusion/ej2-grids/styles/material.css';
 @import "../node_modules/@syncfusion/ej2-spreadsheet/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/spreadsheet/local-data-binding-cs1" %}

Copyright © 2001 -2024 Syncfusion Inc.

The local data source can also be provided as an instance of the [DataManager]. By default, [DataManager] uses [JsonAdaptor] for local data-binding.

Remote data

To bind remote data to the Spreadsheet control, assign service data as an instance of [DataManager] to the dataSource property. To interact with remote data source, provide the service endpoint url.

Refer to the following code example for remote data binding.

APP.VUE

```
<template>
    <ejs-spreadsheet>
            <e-sheets>
                <e-sheet name="Shipment Details" :columns="columns">
                    <e-ranges>
                        <e-range :dataSource="dataSource" :query="query"
:showFieldAsHeader="false" startCell="A2"></e-range>
                    </e-ranges>
                    <e-rows>
                        <e-row>
                            <e-cells>
                                <e-cell value="Order ID"></e-cell>
                                <e-cell value="Customer Name"></e-cell>
                                <e-cell value="Freight"></e-cell>
                                <e-cell value="Ship Name"></e-cell>
                                <e-cell value="Ship City"></e-cell>
                                <e-cell value="Ship Country"></e-cell>
                            </e-cells>
                        </e-row>
                    </e-rows>
                </e-sheet>
            </e-sheets>
        </ejs-spreadsheet>
</template>
<script>
import Vue from "vue";
import { SpreadsheetPlugin } from "@syncfusion/ej2-vue-spreadsheet";
import { DataManager, Query } from "@syncfusion/ej2-data";
import { defaultData } from './data.js';
Vue.use(SpreadsheetPlugin);
export default {
   data: () => {
    return {
     dataSource: new DataManager({
                    // Remote service url.
                    url:
"https://services.syncfusion.com/vue/production/api/Orders",
                    crossDomain: true
                }),
        query: new Query().select(['OrderID', 'CustomerID', 'Freight',
'ShipName', 'ShipCity', 'ShipCountry']).take(200),
        columns: [{ width: 100 }, { width: 130 }, { width: 100 }, { width:
220 }, { width: 150 }, { width: 180 }],
    }
  }
}
```

```

{% previewsample "page.domainurl/code-snippet/spreadsheet/remote-data-binding-cs1" %}

By default, DataManager uses **ODataAdaptor** for remote data-binding.

Binding with OData services

OData is a standardized protocol for creating and consuming data. You can retrieve data from OData service using the DataManager. Refer to the following code example for remote Data binding using OData service.

APP.VUE

```
<template>
    <ejs-spreadsheet ref="spreadsheet">
            <e-sheets>
                <e-sheet name="Order Details" :columns="columns"
:created="created">
                    <e-ranges>
                        <e-range :dataSource="dataSource"></e-range>
                    </e-ranges>
                </e-sheet>
            </e-sheets>
        </ejs-spreadsheet>
</template>
<script>
import Vue from "vue";
import { SpreadsheetPlugin } from "@syncfusion/ej2-vue-spreadsheet";
import { DataManager, ODataAdaptor } from "@syncfusion/ej2-data";
Vue.use(SpreadsheetPlugin);
export default {
   data: () => {
    return {
     dataSource: new DataManager({
                    // Remote service url.
                    url:
"https://services.syncfusion.com/vue/production/api/Orders",
                    adaptor: new ODataAdaptor(),
                    crossDomain: true
                }),
        columns: [{ width: 80 }, { width: 80 }, { width: 80 }, { width: 80
}, { width: 80 }, { width: 80 }, { width: 280 }, { width: 180 }, { width: 80
}, { width: 180 }, { width: 180 }],
```

```
    }
  },
  methods: {
    created: function () {
        //Applies cell and number formatting to specified range of the
active sheet.
        this.$refs.spreadsheet.cellFormat({ fontWeight: 'bold', textAlign:
'center', verticalAlign: 'middle' },'A1:K1');
      }
    }
}
</script>
<style>
 @import "../node_modules/@syncfusion/ej2-vue-
spreadsheet/styles/material.css";
 @import '../node_modules/@syncfusion/ej2-base/styles/material.css';
 @import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
 @import '../node_modules/@syncfusion/ej2-dropdowns/styles/material.css';
 @import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
 @import '../node_modules/@syncfusion/ej2-navigations/styles/material.css';
 @import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
 @import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';

 @import "../node_modules/@syncfusion/ej2-spreadsheet/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/spreadsheet/remote-data-binding-cs2" %}

Web API

You can use WebApiAdaptor to bind spreadsheet with Web API created using OData endpoint.

APP.VUE

```
<template>
    <ejs-spreadsheet ref="spreadsheet">
            <e-sheets>
                <e-sheet name="Order Details" :columns="columns"
:created="created">
                    <e-ranges>
                        <e-range :dataSource="dataSource"></e-range>
                    </e-ranges>
                </e-sheet>
            </e-sheets>
        </ejs-spreadsheet>
</template>
<script>
import Vue from "vue";
import { SpreadsheetPlugin } from "@syncfusion/ej2-vue-spreadsheet";
import { DataManager, WebApiAdaptor } from "@syncfusion/ej2-data";
Vue.use(SpreadsheetPlugin);
export default {
   data: () => {
    return {
     dataSource: new DataManager({
                    // Remote service url.
```

```
                    url:
"https://services.syncfusion.com/vue/production/api/Orders",
                    adaptor: new WebApiAdaptor(),
                    crossDomain: true
                }),
        columns: [{ width: 80 }, { width: 80 }, { width: 80 }, { width: 80
}, { width: 80 }, { width: 80 }, { width: 280 }, { width: 180 }, { width: 80
}, { width: 180 }, { width: 180 }],
    }
  },
  methods: {
    created: function () {
        //Applies cell and number formatting to specified range of the
active sheet.
        this.$refs.spreadsheet.cellFormat({ fontWeight: 'bold', textAlign:
'center', verticalAlign: 'middle' },'A1:K1');
      }
    }
}
</script>
<style>
 @import "../node_modules/@syncfusion/ej2-vue-
spreadsheet/styles/material.css";
 @import '../node_modules/@syncfusion/ej2-base/styles/material.css';
 @import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';

</style>
```

{% previewsample "page.domainurl/code-snippet/spreadsheet/remote-data-binding-cs3" %}

Cell data binding

The Spreadsheet control can bind the data to individual cell in a sheet . To achive this you can use the `value` property.

Refer to the following code example for cell data binding.

APP.VUE

```
<template>
     <ejs-spreadsheet >
            <e-sheets>
                <e-sheet name="Monthly Budget">
                    <e-rows>
                        <e-row>
                            <e-cells>
                                <e-cell value="Category"></e-cell>
                                <e-cell value="Planned cost"></e-cell>
                                <e-cell value="Actual cost"></e-cell>
                            </e-cells>
                        </e-row>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
                        <e-row>
                            <e-cells>
                                <e-cell value="Food"></e-cell>
                                <e-cell value="$7000"></e-cell>
                                <e-cell value="$8120"></e-cell>
                            </e-cells>
                        </e-row>
                        <e-row>
                            <e-cells>
                                <e-cell value="Loan"></e-cell>
                                <e-cell value="$1500"></e-cell>
                                <e-cell value="$1500"></e-cell>
                            </e-cells>
                        </e-row>

{% previewsample "page.domainurl/code-snippet/spreadsheet/cell-data-binding-cs1" %}

The cell data binding also supports formula, style, number format, and more.

Dynamic data binding and Datasource change event

You can dynamically change the datasource of the spreadsheet by changing the dataSource property of the range object of the sheet. The dataSourceChanged event handler will be triggered when editing, inserting, and deleting a row in the datasource range. This event will be triggered with a parameter named action which indicates the edit, add and delete actions for the respective ones.

The following table defines the arguments of the dataSourceChanged event.

| Property | Type | Description |

|-----|-----|-------|

| action | string | Indicates the type of action such as edit, add, and delete performed in the datasource range. |

| data | object[] | Modified data for edit action; New data for add action; Deleted data for delete action. |

| rangeIndex | number | Specifies the range index of the datasource. |

| sheetIndex | number | Specifies the sheet index of the datasource. |

For add action, the value for all the fields will be null in the data. In the case that you do not want the primary key field to be null which needs to be updated in the backend service, you can use edit action after updating the primary key field to update in the backend service.

For inserting a row at the end of the datasource range, you should insert a row below at the end of the range to trigger the dataSourceChanged event with action add.

Open save in Vue Spreadsheet component

The native data format for Spreadsheet is JSON. When you open an excel file, it needs to be read and converted to client side Spreadsheet model. The converted client side Spreadsheet model is sent as

JSON which is used to render Spreadsheet. Similarly, when you save the Spreadsheet, the client Spreadsheet model is sent to the server as JSON for processing and saved as Excel file formats. Server configuration is used for this process.

Open

The Spreadsheet control opens an Excel document with its data, style, format, and more. To enable this feature, set allowOpen as true and assign service url to the openUrl property.

User Interface:

In user interface you can open an Excel document by clicking File > Open menu item in ribbon.

The following sample shows the Open option by using the openUrl property in the Spreadsheet control. You can also use the beforeOpen event to trigger before opening an Excel file.

APP.VUE

```
<template>
   <ejs-spreadsheet :openUrl="openUrl" :allowOpen="true"
:beforeOpen="beforeOpen"></ejs-spreadsheet>
</template>
<script>
import Vue from "vue";
import { SpreadsheetPlugin } from "@syncfusion/ej2-vue-spreadsheet";
Vue.use(SpreadsheetPlugin);
export default {
   data: () => {
    return {
      openUrl:
'https://services.syncfusion.com/vue/production/api/spreadsheet/open',
    }
  },
  methods: {
    beforeOpen: function (args) {
        // your code snippets here
      }
    }
}
</script>
<style>
 @import "../node_modules/@syncfusion/ej2-vue-
spreadsheet/styles/material.css";
 @import '../node_modules/@syncfusion/ej2-base/styles/material.css';
 @import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
 @import '../node_modules/@syncfusion/ej2-dropdowns/styles/material.css';
 @import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
 @import '../node_modules/@syncfusion/ej2-navigations/styles/material.css';
 @import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
 @import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
 @import '../node_modules/@syncfusion/ej2-grids/styles/material.css';
 @import "../node_modules/@syncfusion/ej2-spreadsheet/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/spreadsheet/open-cs1" %}

Please find the below table for the beforeOpen event arguments.

Copyright © 2001 -2024 Syncfusion Inc.

| **Parameter** | **Type** | **Description** |

| ----- | ----- | ----- |

| file | FileList or string or File | To get the file stream. FileList - contains length and item index.
 File - specifies the file lastModified and file name. |

| cancel | boolean | To prevent the open operation. |

| requestData | object | To provide the Form data. |

* Use Ctrl + O keyboard shortcut to open Excel documents.

* The default value of the allowOpen property is true. For demonstration purpose, we have showcased the allowOpen property in previous code snippet.

Open an external URL excel file while initial load

You can achieve to access the remote excel file by using the created event. In this event you can fetch the excel file and convert it to a blob. Convert this blob to a file and open this file by using Spreadsheet component open method.

APP.VUE

```
<template>
   <ejs-spreadsheet ref="spreadsheet" :openUrl="openUrl" :allowOpen="true"
:created="created"></ejs-spreadsheet>
</template>
<script>
import Vue from "vue";
import { SpreadsheetPlugin } from "@syncfusion/ej2-vue-spreadsheet";
Vue.use(SpreadsheetPlugin);
export default {
   data: () => {
    return {
      openUrl:
'https://services.syncfusion.com/vue/production/api/spreadsheet/open',
    }
  },
  methods: {
    created: function () {
         fetch("https://cdn.syncfusion.com/scripts/spreadsheet/Sample.xlsx")
// fetch the remote url
                .then((response) => {
                    response.blob().then((fileBlob) => { // convert the
excel file to blob
                    var file = new File([fileBlob], "Sample.xlsx");
//convert the blob into file
                    this.$refs.spreadsheet.open({ file: file }); // open the
file into Spreadsheet
                    })
                })
      }
    }
}
</script>
<style>
 @import "../node_modules/@syncfusion/ej2-vue-
spreadsheet/styles/material.css";
```

```
 @import '../node_modules/@syncfusion/ej2-base/styles/material.css';
 @import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
 @import '../node_modules/@syncfusion/ej2-dropdowns/styles/material.css';
 @import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
 @import '../node_modules/@syncfusion/ej2-navigations/styles/material.css';
 @import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
 @import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
 @import '../node_modules/@syncfusion/ej2-grids/styles/material.css';
 @import "../node_modules/@syncfusion/ej2-spreadsheet/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/spreadsheet/open-cs2" %}

To add custom header during open

You can add your own custom header to the open action in the Spreadsheet. For processing the data, it has to be sent from server to client side and adding customer header can provide privacy to the data with the help of Authorization Token. Through the beforeOpen event, the custom header can be added to the request during open action.

APP.VUE

```
<template>
  <ejs-spreadsheet
    :openUrl="openUrl"
    :allowOpen="true"
    :beforeOpen="beforeOpen"
  ></ejs-spreadsheet>
</template>
<script>
import Vue from "vue";
import { SpreadsheetPlugin } from "@syncfusion/ej2-vue-spreadsheet";
Vue.use(SpreadsheetPlugin);
export default {
  data: () => {
    return {
      openUrl:

"https://services.syncfusion.com/vue/production/api/spreadsheet/open",
    };
  },
  methods: {
    beforeOpen: function (args) {
      args.requestData["headers"] = {
        Authorization: "YOUR TEXT",
      };
    },
  },
};
</script>

```

{% previewsample "page.domainurl/code-snippet/spreadsheet/custom-header-cs1" %}

Open excel file into a read-only mode

You can open excel file into a read-only mode by using the openComplete event. In this event, you must protect all the sheets and lock its used range cells by using protectSheet and lockCells methods

APP.VUE

```
<template>
   <ejs-spreadsheet ref="spreadsheet" :openUrl="openUrl" :allowOpen="true"
:openComplete="openComplete"></ejs-spreadsheet>
</template>
<script>
import Vue from "vue";
import { SpreadsheetPlugin, getRangeAddress } from "@syncfusion/ej2-vue-
spreadsheet";
Vue.use(SpreadsheetPlugin);
export default {
   data: () => {
    return {
      openUrl:
'https://services.syncfusion.com/vue/production/api/spreadsheet/open',
    }
  },
  methods: {
    openComplete: function () {
        let spreadsheet = this.$refs.spreadsheet.ej2Instances;
        let sheets = spreadsheet.sheets;
        for (let index = 0; index < sheets.length; index++) {
            let name = spreadsheet.sheets[index].name;
            let protectSetting = {
                selectCells: true,
                formatCells: false,
            };
            //To protect the sheet using sheet name
            spreadsheet.protectSheet(name, protectSetting);
            let address = getRangeAddress([
                0,
                0,
                sheets[index].usedRange.rowIndex,
                sheets[index].usedRange.colIndex,
            ]);
            //To lock the used range cells
            spreadsheet.lockCells(name + '!' + address, true);
          }
        }
    }
}
```

{% previewsample "page.domainurl/code-snippet/spreadsheet/open-readonly-cs1" %}

External workbook confirmation dialog

When you open an excel file that contains external workbook references, you will see a confirmation dialog. This dialog allows you to either continue with the file opening or cancel the operation. This confirmation dialog will appear only if you set the AllowExternalWorkbook property value to **false** during the open request, as shown below. This prevents the spreadsheet from displaying inconsistent data.

`csharp

public IActionResult Open(IFormCollection openRequest)

{

OpenRequest open = new OpenRequest();

open.AllowExternalWorkbook = false;

open.File = openRequest.Files[0];

return Content(Workbook.Open(open));

}

`

This feature is only applicable when importing an Excel file and not when loading JSON data or binding cell data.

![External workbook confirmation dialog](./images/external-reference-dialog-alert%20.png)

Supported file formats

The following list of Excel file formats are supported in Spreadsheet:

- MS Excel (.xlsx)
- MS Excel 97-2003 (.xls)
- Comma Separated Values (.csv)
- Excel Macro-Enabled Workbook (.xlsm)
- Excel Binary Workbook(.xlsb)

Copyright © 2001 -2024 Syncfusion Inc.

Save

The Spreadsheet control saves its data, style, format, and more as Excel file document. To enable this feature, set allowSave as true and assign service url to the saveUrl property.

User Interface:

In user interface, you can save Spreadsheet data as Excel document by clicking File > Save As menu item in ribbon.

The following sample shows the Save option by using the saveUrl property in the Spreadsheet control. You can also use the beforeSave event to trigger before saving the Spreadsheet as an Excel file.

APP.VUE

```
<template>
   <ejs-spreadsheet :saveUrl="saveUrl" :allowSave="true"
:beforeSave="beforeSave">
   <e-sheets>
          <e-sheet>
            <e-ranges>
              <e-range :dataSource="dataSource"></e-range>
            </e-ranges>

{% previewsample "page.domainurl/code-snippet/spreadsheet/open-save-cs1" %}

Please find the below table for the beforeSave event arguments.

| **Parameter** | **Type** | **Description** |

| ----- | ----- | ----- |

| url | string | Specifies the save url. |

| fileName | string | Specifies the file name. |

| saveType | SaveType | Specifies the saveType like Xlsx, Xls, Csv and Pdf. |

| customParams | object | Passing the custom parameters from client to server while performing save operation. |

| isFullPost | boolean | It sends the form data from client to server, when set to true. It fetches the data from client to server and returns the data from server to client, when set to false. |

| needBlobData | boolean | You can get the blob data if set to true. |

| cancel | boolean | To prevent the save operations. |

* Use Ctrl + S keyboard shortcut to save the Spreadsheet data as Excel file.

* The default value of allowSave property is true. For demonstration purpose, we have showcased the allowSave property in previous code snippet.

* Demo purpose only, we have used the online web service url link.

To send and receive custom params from client to server

Passing the custom parameters from client to server by using beforeSave event.

{% previewsample "page.domainurl/code-snippet/spreadsheet/open-save-cs2" %}

Server side code snippets:

`c#

public IActionResult Save(SaveSettings saveSettings, string customParams)

{

Console.WriteLine(customParams); // you can get the custom params in controller side

return Workbook.Save(saveSettings);

}

`

To add custom header during save

You can add your own custom header to the save action in the Spreadsheet. For processing the data, it has to be sent from client to server side and adding customer header can provide privacy to the data with the help of Authorization Token. Through the fileMenuItemSelect event, the custom header can be added to the request during save action.

To change the PDF orientation

By default, the PDF document is created in **Portrait** orientation. You can change the orientation of the PDF document by using the args.pdfLayoutSettings.orientation argument settings in the beforeSave event.

The possible values are:

- **Portrait** - Used to display content in a vertical layout.
- **Landscape** - Used to display content in a horizontal layout.

Supported file formats

The following list of Excel file formats are supported in Spreadsheet:

- MS Excel (.xlsx)
- MS Excel 97-2003 (.xls)
- Comma Separated Values (.csv)
- Portable Document Format (.pdf)

Methods

To save the Spreadsheet document as an xlsx, xls, csv, or pdf file, by using save method should be called with the url, fileName and saveType as parameters. The following code example shows to save the spreadsheet file as an xlsx, xls, csv, or pdf in the button click event.

Server Configuration

Import and export are processed in server-side using Spreadsheet server library. The following code snippets shows server configuration using WebAPI service,

`c#

[Route("api/[controller]")]

public class SpreadsheetController : Controller

{

//To open excel file

[AcceptVerbs("Post")]

[HttpPost]

[EnableCors("AllowAllOrigins")]

[Route("Open")]

public IActionResult Open(IFormCollection openRequest)

{

OpenRequest open = new OpenRequest();

open.File = openRequest.Files[0];

return Content(Workbook.Open(open));

}

//To save as excel file

[AcceptVerbs("Post")]

[HttpPost]

[EnableCors("AllowAllOrigins")]

[Route("Save")]

public IActionResult Save([FromForm]SaveSettings saveSettings)

{

return Workbook.Save(saveSettings);

}

}

`

Server Dependencies

Open and save helper functions are shipped in the Syncfusion.EJ2.Spreadsheet package, which is available in Essential Studio and nuget.org. Following list of dependencies required for Spreadsheet open and save operations.

- Syncfusion.EJ2
- Syncfusion.EJ2.Spreadsheet
- Syncfusion.Compression.Base
- Syncfusion.XlsIO.Base

And also refer this for more information.

Note

You can refer to our Vue Spreadsheet feature tour page for its groundbreaking feature representations. You can also explore our Vue Spreadsheet example to knows how to present and manipulate data.

Worksheet in Vue Spreadsheet component

Worksheet is a collection of cells organized in the form of rows and columns that allows you to store, format, and manipulate the data.

Add sheet

You can dynamically add or insert a sheet by one of the following ways,

- Click the Add Sheet button in the sheet tab. This will add a new empty sheet next to current active sheet.
- Right-click on the sheet tab, and then select Insert option from the context menu to insert a new empty sheet before the current active sheet.
- Using insertSheet method, you can insert one or more sheets at your desired index.

The following code example shows the insert sheet operation in spreadsheet.

APP.VUE

```
<template>
  <ejs-spreadsheet ref="spreadsheet" :created="created"
:showFormulaBar="false" :showRibbon="false">
                <e-sheets>
                  <e-sheet name="Price Details">
                    <e-ranges>
                      <e-range :dataSource="dataSource"></e-range>
                    </e-ranges>
                    <e-columns>
                      <e-column :width=150></e-column>
                      <e-column :width=110></e-column>
                      <e-column :width=110></e-column>
```

```

{% previewsample "page.domainurl/code-snippet/spreadsheet/insert-sheet-cs1" %}

Delete sheet

The Spreadsheet has support for removing an existing worksheet. You can dynamically delete the existing sheet by the following way,

- Right-click on the sheet tab, and then select Delete option from context menu.
- Using delete method to delete the sheets.

Rename sheet

You can dynamically rename an existing worksheet in the following way,

- Right-click on the sheet tab, and then select Rename option from the context menu.

Headers

By default, the row and column headers are visible in worksheets. You can dynamically show or hide worksheet headers by using one of the following ways,

- Switch to View tab, and then select Hide Headers option to hide both the row and column headers.
- Set showHeaders property in sheets as true or false to show or hide the headers at initial load. By default, the showHeaders property is enabled in each worksheet.

Gridlines

Gridlines act as a border like appearance of cells. They are used to distinguish cells on the worksheet. You can dynamically show or hide gridlines by using one of the following ways,

- Switch to View tab, and then select Hide Gridlines option to hide the gridlines in worksheet.
- Set showGridLines property in sheets as true or false to show or hide the gridlines at initial load. By default, the showGridLines property is enabled in each worksheet.

The following code example shows the headers and gridlines operation in spreadsheet.

APP.VUE

```
<template>
   <ejs-spreadsheet ref="spreadsheet" :created="created"
:showFormulaBar="false"
                :showSheetTabs="false">
                <e-sheets>
                  <!-- Hiding the headers and gridlines in 'Price Details'
sheet -->
                  <e-sheet :showGridLines="false" :showHeaders="false">
                    <e-ranges>
```

Sheet visibility

Hiding a worksheet can help prevent unauthorized or accidental changes to your file.

There are three visibility state as like Microsoft Excel,

| State | Description |

|-------|---------|

| `Visible` | You can see the worksheet once the component is loaded. |

| `Hidden` | This worksheet is not visible, but you can unhide by selecting the sheet from `List All Sheets` dropdown menu. |

| `VeryHidden` | This worksheet is not visible and cannot be unhidden. Changing the state property to `Visible` is the only way to view this sheet. |

The following code example shows the three types of sheet visibility state.

APP.VUE

```
<template>
   <ejs-spreadsheet ref="spreadsheet" :created="created" :openUrl="openUrl"
                  :saveUrl="saveUrl" :showFormulaBar="false"
:showRibbon="false">
                  <e-sheets>
                    <!-- By default, state is set as 'visible'. We don’t  need
to said it in the sample. -->
                    <e-sheet name="Visible Sheet" state="Visible">
                      <e-ranges>
                        <e-range :dataSource="dataSource"></e-range>
                      </e-ranges>
                      <e-columns>
                        <e-column :width=150></e-column>
                        <e-column :width=110></e-column>
                        <e-column :width=110></e-column>
                        <e-column :width=85></e-column>
                        <e-column :width=85></e-column>
                        <e-column :width=85></e-column>
                        <e-column :width=85></e-column>
                        <e-column :width=85></e-column>
                      </e-columns>
                    </e-sheet>
                    <!-- Sets sheet state as 'VeryHidden'. It can't be
unhidden. -->
                    <e-sheet name="Very Hidden Sheet" state="VeryHidden">
                      <e-ranges>
                        <e-range :dataSource="dataSource"></e-range>
                      </e-ranges>
                      <e-columns>
                        <e-column :width=150></e-column>
                        <e-column :width=110></e-column>
                        <e-column :width=110></e-column>

Cell range in Vue Spreadsheet component

A group of cells in a sheet is known as cell range.

Wrap text

Wrap text allows you to display large content as multiple lines in a single cell. By default, the wrap text support is enabled. Use the allowWrap property to enable or disable the wrap text support in spreadsheet.

Wrap text can be applied or removed to a cell or range of cells in the following ways,

- Using the `wrap` property in `cell`, you can enable or disable wrap text to a cell at initial load.
- Select or deselect wrap button from ribbon toolbar to apply or remove the wrap text to the selected range.
- Using the wrap method, you can apply or remove the wrap text once the component is loaded.

The following code example shows the wrap text functionality in spreadsheet.

APP.VUE

```
<template>

{% previewsample "page.domainurl/code-snippet/spreadsheet/wrap-text-cs1" %}

Limitations of Wrap text

The following features have some limitations in wrap text:

- Sorting with wrap text applied data.
- Merge with wrap text.

Merge cells

Merge cells allows users to span two or more cells in the same row or column into a single cell. When cells with multiple values are merged, top-left most cell data will be the data for the merged cell. By default, the merge cells option is enabled. Use allowMerge property to enable or disable the merge cells option in spreadsheet.

You can merge the range of cells in the following ways,

- Set the `rowSpan` and `colSpan` property in `cell` to merge the number of cells at initial load.
- Select the range of cells and apply merge by selecting the desired option from ribbon toolbar.
- Use merge method to merge the range of cells, once the component is loaded.

The available merge options in spreadsheet are,

| Type | Action |

|-------|---------|

| Merge All | Combines all the cells in a range in to a single cell (default). |

| Merge Horizontally | Combines cells in a range as row-wise. |

| Merge Vertically | Combines cells in a range as column-wise. |

| UnMerge | Splits the merged cells into multiple cells. |

The following code example shows the merge cells operation in spreadsheet.

APP.VUE

```
<template>
```

```
    <ejs-spreadsheet ref="spreadsheet" :created="created"
:showFormulaBar="false">
  <e-sheets>
    <e-sheet name="Merge Cells">
      <e-ranges>
        <e-range :dataSource="dataSource"></e-range>
      </e-ranges>
      <e-columns>
        <e-column :width=90></e-column>
        <e-column :width=150></e-column>

- Merge with wrap text.

Data Validation

Data Validation is used to restrict the user from entering the invalid data. You can use the allowDataValidation property to enable or disable data validation.

* The default value for `allowDataValidation` property is `true`.

Apply Validation

You can apply data validation to restrict the type of data or the values that users enter into a cell.

You can apply data validation by using one of the following ways,

- Select the Data tab in the Ribbon toolbar, and then choose the Data Validation item.
- Use the addDataValidation() method programmatically.

Clear Validation

Clear validation feature is used to remove data validations from the specified ranges or the whole worksheet.

You can clear data validation rule by one of the following ways,

- Select the Data tab in the Ribbon toolbar, and then choose the Clear Validation item.
- Use the removeDataValidation() method programmatically.

Highlight Invalid Data

Highlight invalid data feature is used to highlight the previously entered invalid values.

You can highlight an invalid data by using one of the following ways,

- Select the Data tab in the Ribbon toolbar, and then choose the Highlight Invalid Data item.
- Use the addInvalidHighlight() method programmatically.

Clear Highlighted Invalid Data

Clear highlight feature is used to remove the highlight from invalid cells.

You can clear the highlighted invalid data by using the following ways,

- Select the Data tab in the Ribbon toolbar, and then choose the Clear Highlight item.

Copyright © 2001 -2024 Syncfusion Inc.

- Use the removeInvalidHighlight() method programmatically.

Limitations of Data validation

The following features have some limitations in Data Validation:

- Entire row data validation.
- Insert row between the data validation.
- Copy/paste with data validation.
- Delete cells between data validation applied range.

Copyright © 2001 -2024 Syncfusion Inc.

Clear

Clear feature helps you to clear the cell contents (formulas and data), formats (including number formats, conditional formats, and borders) in a spreadsheet. When you apply clear all, both the contents and the formats will be cleared simultaneously.

Apply Clear Feature

You can apply clear feature by using one of the following ways,

- Select the clear icon in the Ribbon toolbar under the Home Tab.
- Using the clear() method to clear the values.

Clear has the following types in the spreadsheet,

| Options | Uses |

|-----|------|

| Clear All | Used to clear all contents, formats, and hyperlinks. |

| Clear Formats | Used to clear the formats (including number formats, conditional formats, and borders) in a cell. |

| Clear Contents | Used to clear the contents (formulas and data) in a cell. |

| Clear Hyperlinks | Used to clear the hyperlink in a cell. |

Methods

Clear the cell contents and formats in the Spreadsheet document by using the clear method. The clear method has type and range as parameters. The following code example shows how to clear the cell contents and formats in the button click event.

- Filtering

Editing in Vue Spreadsheet component

You can edit the contents of a cell directly in the cell or by typing in the formula bar. By default, the editing feature is enabled in the spreadsheet. Use the allowEditing property to enable or disable the editing feature.

Edit cell

You can start editing by one of the following ways,

- Double click a cell to start the edit mode.
- Press F2 key to edit the active cell.
- Use formula bar to perform editing.
- Use BACKSPACE or SPACE key to clear the cell content and start the edit mode.
- Using the startEdit method.

Save cell

If the cell is in editable state, you can save the edited cell by one of the following ways,

- Perform mouse click on any other cell rather than the current editing cell.
- Press Enter or Tab keys to save the edited cell content.
- Using the endEdit method.

Cancel editing

To cancel the editing without saving the changes, you can use one of the following ways,

- Press ESCAPE key, this will remove the editable state and update the unchanged cell content.
- Using the closeEdit method.

The following sample shows how to prevent the editing and cell save. Here E column prevent the editing by using cancel argument as true in cellEdit event. In D column, prevent saving the edited changes by using cancel argument as true in beforeCellSave and use closeEdit method in spreadsheet.

Limitations

- Text overflow in cells is not supported in Editing.

Note

You can refer to our Vue Spreadsheet feature tour page for its groundbreaking feature representations. You can also explore our Vue Spreadsheet example to knows how to present and manipulate data.

Formulas in Vue Spreadsheet component

Formulas are used for calculating the data in a worksheet. You can refer the cell reference from same sheet or from different sheets.

Usage

You can set formula for a cell in the following ways,

- Using the formula property from cell, you can set the formula or expression to each cell at initial load.
- Set the formula or expression through data binding.
- You can set formula for a cell by editing.
- Using the updateCell method, you can set or update the cell formula.

Create User Defined Functions / Custom Functions

The Spreadsheet includes a number of built-in formulas. For your convenience, a list of supported formulas can be found here.

You can define and use an unsupported formula, i.e. a user defined/custom formula, in the spreadsheet by using the addCustomFunction function. Meanwhile, remember that you should define a user defined/custom formula whose results should only return a single value. If a user-defined/custom formula returns an array, it will be time-consuming to update adjacent cell values.

The following code example shows an unsupported formula in the spreadsheet.

APP.VUE

```
<template>
  <ejs-spreadsheet
    ref="spreadsheet"
    :created="created"
    :showRibbon="false"
    :showSheetTabs="false"
  >
    <e-sheets>
      <e-sheet>
        <e-ranges>
          <e-range :dataSource="dataSource" startCell="A2"></e-range>
        </e-ranges>
        <e-columns>
          <e-column :width="150"></e-column>

Second, if you want to directly compute any formula or expression, you can use the computeExpression method. This method will work for both built-in and used-defined/custom formula.

The following code example shows how to use computeExpression method in the spreadsheet.

APP.VUE

```
<template>
  <ejs-spreadsheet
    ref="spreadsheet"
    :created="created"
    :showRibbon="false"
    :showSheetTabs="false"
  >
    <e-sheets>
```

```
      <e-sheet>
        <e-ranges>
          <e-range :dataSource="dataSource" startCell="A2"></e-range>
        </e-ranges>
        <e-columns>
          <e-column :width="150"></e-column>
          <e-column :width="120"></e-column>
          <e-column :width="120"></e-column>
          <e-column :width="120"></e-column>
          <e-column :width="120"></e-column>
        </e-columns>
        <e-rows>
          <e-row :height="40" customHeight="true">
            <e-cells>
              <e-cell value="Monthly Expense" colSpan="5"></e-cell>
              <e-cell formula="=SUM(E2:E10)"></e-cell>
            </e-cells>

{% previewsample "page.domainurl/code-snippet/spreadsheet/formula-cs2" %}

Formula bar

Formula bar is used to edit or enter cell data in much easier way. By default, the formula bar is enabled in the spreadsheet. Use the showFormulaBar property to enable or disable the formula bar.

Named Ranges

You can define a meaningful name for a cell range and use it in the formula for calculation. It makes your formula much easier to understand and maintain. You can add named ranges to the Spreadsheet in the following ways,

- Using the definedNames collection, you can add multiple named ranges at initial load.
- Use the addDefinedName method to add a named range dynamically.
- You can remove an added named range dynamically using the removeDefinedName method.
- Select the range of cells, and then enter the name for the selected range in the name box.

The following code example shows the usage of named ranges support.

APP.VUE

```

Supported Formulas

The list of supported formulas can be find in following link.

Formula Error Dialog

If you enter an invalid formula in a cell, an error dialog with an error message will appear. For instance, a formula with the incorrect number of arguments, a formula without parenthesis, etc.

| Error Message | Reason |

|-------|---------|

| We found that you typed a formula with an invalid arguments | Occurs when passing an argument even though it wasn't needed. |

| We found that you typed a formula with an empty expression | Occurs when passing an empty expression in the argument. |

| We found that you typed a formula with one or more missing opening or closing parenthesis | Occurs when an open parenthesis or a close parenthesis is missing. |

| We found that you typed a formula which is improper | Occurs when passing a single reference but a range was needed. |

| We found that you typed a formula with a wrong number of arguments | Occurs when the required arguments were not passed. |

| We found that you typed a formula which requires 3 arguments | Occurs when the required 3 arguments were not passed. |

| We found that you typed a formula with a mismatched quotes | Occurs when passing an argument with mismatched quotes. |

| We found that you typed a formula with a circular reference | Occurs when passing a formula with circular cell reference. |

| We found that you typed a formula which is invalid | Except in the cases mentioned above, all other errors will fall into this broad category. |

Formatting in Vue Spreadsheet component

Formatting options make your data easier to view and understand. The different types of formatting options in the Spreadsheet are,

- Number Formatting
- Text Formatting
- Cell Formatting

Number Formatting

Number formatting provides a type for your data in the Spreadsheet. Use the allowNumberFormatting property to enable or disable the number formatting option in the Spreadsheet. The different types of number formatting supported in Spreadsheet are,

Types	Format
General(default)	NA
Number	0.00
Currency	$#,##0.00
Accounting	*($ #,##0.00);($ (#,##0.00);*($* "-"??*);(@_)*
ShortDate	mm-dd-yyyy
LongDate	dddd, mmmm dd, yyyy

Copyright © 2001 -2024 Syncfusion Inc.

| Time | h:mm:ss AM/PM |

| Percentage | 0.00% |

| Fraction | # ?/? |

| Scientific |0.00E+00 |

| Text | @ |

Number formatting can be applied in following ways,

- Using the format property in cell, you can set the desired format to each cell at initial load.
- Using the numberFormat method, you can set the number format to a cell or range of cells.
- Selecting the number format option from ribbon toolbar.

The following code example shows the number formatting in cell data.

Limitations of Number Formatting

- Custom number formatting is not supported.

Text and cell formatting

Text and cell formatting enhances the look and feel of your cell. It helps to highlight a particular cell or range of cells from a whole workbook. You can apply formats like font size, font family, font color, text alignment, border etc. to a cell or range of cells. Use the allowCellFormatting property to enable or disable the text and cell formatting option in Spreadsheet. You can set the formats in following ways,

- Using the `style` property, you can set formats to each cell at initial load.
- Using the cellFormat method, you can set formats to a cell or range of cells.
- You can also apply by clicking the desired format option from the ribbon toolbar.

Fonts

Various font formats supported in the spreadsheet are font-family, font-size, bold, italic, strike-through, underline and font color.

Text Alignment

You can align text in a cell either vertically or horizontally using the `textAlign` and `verticalAlign` property.

Indents

To enhance the appearance of text in a cell, you can change the indentation of a cell content using `textIndent` property.

Fill color

To highlight cell or range of cells from whole workbook you can apply background color for a cell using `backgroundColor` property.

Borders

You can add borders around a cell or range of cells to define a section of worksheet or a table. The different types of border options available in the spreadsheet are,

| Types | Actions |

|-------|---------|

| Top Border | Specifies the top border of a cell or range of cells.|

| Left Border | Specifies the left border of a cell or range of cells.|

| Right Border | Specifies the right border of a cell or range of cells.|

| Bottom Border | Specifies the bottom border of a cell or range of cells.|

| No Border | Used to clear the border from a cell or range of cells.|

| All Border | Specifies all border of a cell or range of cells.|

| Horizontal Border | Specifies the top and bottom border of a cell or range of cells.|

| Vertical Border | Specifies the left and right border of a cell or range of cells.|

| Outside Border | Specifies the outside border of a range of cells.|

Copyright © 2001 -2024 Syncfusion Inc.

| Inside Border | Specifies the inside border of a range of cells.|

You can also change the color, size, and style of the border. The size and style supported in the spreadsheet are,

| Types | Actions |

|-------|---------|

| Thin | Specifies the 1px border size (default).|

| Medium | Specifies the 2px border size.|

| Thick | Specifies the 3px border size.|

| Solid | Used to create the solid border (default).|

| Dashed | Used to create the dashed border.|

| Dotted | Used to create the dotted border.|

| Double | Used to create the double border.|

Borders can be applied in the following ways,

- Using the border, borderLeft, borderRight, borderBottom properties, you can set the desired border to each cell at initial load.
- Using the setBorder method, you can set various border options to a cell or range of cells.
- Selecting the border options from ribbon toolbar.

The following code example shows the style formatting in text and cells of the spreadsheet.

APP.VUE

```
<template>

{% previewsample "page.domainurl/code-snippet/spreadsheet/cell-format-cs1" %}

Limitations of Formatting

The following features are not supported in Formatting:

- Insert row/column between the formatting applied cells.
- Formatting support for row/column.

Conditional Formatting

Conditional formatting helps you to format a cell or range of cells based on the conditions applied. You can enable or disable conditional formats by using the allowConditionalFormat property.

* The default value for the `allowConditionalFormat` property is `true`.

Apply Conditional Formatting

You can apply conditional formatting by using one of the following ways,

- Select the conditional formatting icon in the Ribbon toolbar under the Home Tab.
- Using the conditionalFormat() method to define the condition.
- Using the `conditionalFormats` in sheets model.

Conditional formatting has the following types in the spreadsheet,

Highlight cells rules

Highlight cells rules option in the conditional formatting enables you to highlight cells with a preset color depending on the cell's value.

The following options can be given for the highlight cells rules as type,

* 'GreaterThan', 'LessThan', 'Between', 'EqualTo', 'ContainsText', 'DateOccur', 'Duplicate', 'Unique'.

The following preset colors can be used for formatting styles,

* `“RedFT”` - Light Red Fill with Dark Red Text,

* `“YellowFT”` - Yellow Fill with Dark Yellow Text,

* `“GreenFT”` - Green Fill with Dark Green Text,

* `“RedF”` - Red Fill,

* `“RedT”` - Red Text.

Top bottom rules

Top bottom rules option in the conditional formatting allows you to apply formatting to the cells that satisfy a statistical condition with other cells in the range.

The following options can be given for the top bottom rules as type,

* 'Top10Items', 'Bottom10Items', 'Top10Percentage', 'Bottom10Percentage', 'BelowAverage', 'AboveAverage'.

Data Bars

You can apply data bars to represent the data graphically inside a cell. The longest bar represents the highest value and the shorter bars represent the smaller values.

The following options can be given for the data bars as type,

* 'BlueDataBar', 'GreenDataBar', 'RedDataBar', 'OrangeDataBar', 'LightBlueDataBar', 'PurpleDataBar'.

Color Scales

Using color scales, you can format your cells with two or three colors, where different color shades represent the different cell values. In the Green-Yellow-Red(GYR) Color Scale, the cell that holds the minimum value is colored as red. The cell that holds the median is colored as yellow, and the cell that holds the maximum value is colored as green. All other cells are colored proportionally.

The following options can be given for the color scales as type,

* 'GYRColorScale', 'RYGColorScale', 'GWRColorScale', 'RWGColorScale', 'BWRColorScale', 'RWBColorScale', 'WRColorScale', 'RWColorScale', 'GWColorScale', 'WGColorScale', 'GYColorScale', 'YGColorScale'.

Copyright © 2001 -2024 Syncfusion Inc.

Icon Sets

Icon sets will help you to visually represent your data with icons. Every icon represents a range of values. In the Three Arrows(colored) icon, the green arrow icon represents the values greater than 67%, the yellow arrow icon represents the values between 33% to 67%, and the red arrow icon represents the values less than 33%.

The following options can be given for the icon sets as type,

* 'ThreeArrows', 'ThreeArrowsGray', 'FourArrowsGray', 'FourArrows', 'FiveArrowsGray', 'FiveArrows', 'ThreeTrafficLights1', 'ThreeTrafficLights2', 'ThreeSigns', 'FourTrafficLights', 'FourRedToBlack', 'ThreeSymbols', 'ThreeSymbols2', 'ThreeFlags', 'FourRating', 'FiveQuarters', 'FiveRating', 'ThreeTriangles', 'ThreeStars', 'FiveBoxes'.

Custom Format

Using the custom format for conditional formatting you can set cell styles like color, background color, font style, font weight, and underline.

In the MAY and JUN columns, we have applied conditional formatting custom format.

* In the Conditional format, custom format supported for Highlight cell rules and Top bottom rules.

Clear Rules

You can clear the defined rules by using one of the following ways,

- Using the “Clear Rules” option in the Conditional Formatting button of HOME Tab in the ribbon to clear the rule from selected cells.
- Using the clearConditionalFormat() method to clear the defined rules.

Limitations of Conditional formatting

The following features have some limitations in Conditional Formatting:

- Insert row/column between the conditional formatting.
- Conditional formatting with formula support.
- Copy and paste the conditional formatting applied cells.
- Custom rule support.

Freeze pane in Vue Spreadsheet component

Freeze Panes helps you to keep particular rows or columns visible when scrolling the sheet content in the spreadsheet. You can specify the number of frozen rows and columns using the frozenRows and frozenColumns properties inside the Sheet property.

Apply freezepanes on UI

User Interface:

In the active spreadsheet, click the cell where you want to create freeze panes. Freeze panes can be done in any of the following ways:

- Select the View tab in the Ribbon toolbar and choose the Freeze Panes item.
- Use the freezePanes method programmatically.

FrozenRows

It allows you to keep a certain number of rows visible while scrolling vertically through the rest of the worksheet.

User Interface:

In the active spreadsheet, select the cell where you want to create frozen rows. Frozen rows can be done in any one of the following ways:

- Select the View tab in the Ribbon toolbar and choose the Freeze Rows item.
- You can specify the number of frozen rows using the frozenRows property inside the Sheet property.

FrozenColumns

It allows you to keep a certain number of columns visible while scrolling horizontally through the rest of the worksheet.

User Interface:

In the active spreadsheet, select the cell where you want to create frozen columns. Frozen columns can be done in any one of the following ways:

- Select the View tab in the Ribbon toolbar and choose the Freeze Columns item.

Copyright © 2001 -2024 Syncfusion Inc.

- You can specify the number of frozen columns using the frozenColumns property inside the Sheet property.

In this demo, the frozenColumns is set as '2', and the frozenRows is set as '2'. Hence, the two columns on the left and the top two rows are frozen.

Limitations

Here, we have listed out the limitations with Freeze Panes feature.

- Merging the cells between freeze and unfreeze area.
- If images and charts are added inside the freeze area cells, their portion in the unfreeze area will not move when scrolling.

Note

Context menu in Vue Spreadsheet component

Context Menu is used to improve user interaction with Spreadsheet using the popup menu. This will open when right-clicking on Cell/Column Header/Row Header/ Pager in the Spreadsheet. You can use enableContextMenu property to enable/disable context menu.

The default value for the `enableContextMenu` property is `true`.

Context Menu Items in Row Cell

Please find the table below for default context menu items and their actions.

| Context Menu items | Action |

|-------|---------|

| Cut | Cut the selected cells data to the clipboard, you can select a cell where you want to move the data. |

| Copy | Copy the selected cells data to the clipboard, so that you can paste it to somewhere else. |

| Paste | Paste the data from clipboard to spreadsheet. |

| Paste Special | `Values` - Paste the data values from clipboard to spreadsheet. `Formats` - Paste the data formats from clipboard to spreadsheet. |

| Filter | Perform filtering to the selected cells based on an active cell's value. |

| Sort | Perform sorting to the selected range of cells by ascending or descending. |

| Hyperlink | Create a link in the spreadsheet to navigate to web links or cell reference within the sheet or other sheets in the Spreadsheet. |

Context Menu Items in Row Header / Column Header

Please find the table below for default context menu items and their actions.

| Context Menu items | Action |

|-------|---------|

Copyright © 2001 -2024 Syncfusion Inc.

| Cut | Cut the selected row/column header data to the clipboard, you can select a cell where you want to move the data. |

| Copy | Copy the selected row/column header data to the clipboard, so that you can paste it to somewhere else. |

| Paste | Paste the data from clipboard to spreadsheet. |

| Paste Special | Values - Paste the data values from clipboard to spreadsheet. Formats - Paste the data formats from clipboard to spreadsheet. |

| Insert Columns | Insert new rows or columns into the worksheet. |

| Delete Columns | Delete existing rows or columns from the worksheet. |

| Hide Columns | Hide the rows and columns. |

| UnHide Columns | Show the hidden rows and columns. |

Context Menu Items in Pager

Please find the table below for default context menu items and their actions.

| Context Menu items | Action |

|-------|---------|

| Insert | Insert a new worksheet in front of an existing worksheet in the spreadsheet. |

| Delete | Delete the selected worksheet from the spreadsheet. |

| Rename | Rename the selected worksheet. |

| Protect Sheet | Prevent unwanted changes from others by limiting their ability to edit. |

| Hide |Hide the selected worksheet. |

Context Menu Customization

You can perform the following context menu customization options in the spreadsheet

- Add Context Menu Items
- Remove Context Menu Items
- Enable/Disable Context Menu Items

Add Context Menu Items

You can add the custom items in context menu using the addContextMenuItems in contextmenuBeforeOpen event

In this demo, Custom Item is added after the Paste item in the context menu.

APP.VUE

```
<template>
  <ejs-spreadsheet ref="spreadsheet"
:contextMenuBeforeOpen="contextMenuBeforeOpen"></ejs-spreadsheet>
</template>
<script>
import Vue from "vue";
import { SpreadsheetPlugin } from "@syncfusion/ej2-vue-spreadsheet";
Vue.use(SpreadsheetPlugin);
```

Copyright © 2001 -2024 Syncfusion Inc.

```
export default {
  methods: {
    contextMenuBeforeOpen: function (args) {
      var spreadsheet = this.$refs.spreadsheet;
      if (args.element.id === spreadsheet.$el.id + '_contextmenu') {
        // To add context menu items.
        spreadsheet.addContextMenuItems([{ text: 'Custom Item' }], 'Paste
Special', false); //To pass the items, Item before / after that the element
to be inserted, Set false if the items need to be inserted before the text.
      }
    }
  }
}
</script>

@import "../node_modules/@syncfusion/ej2-spreadsheet/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/spreadsheet/contextmenu/addContextMenu-cs1" %}

Remove Context Menu Items

You can remove the items in context menu using the removeContextMenuItems in contextmenuBeforeOpen event

In this demo, Insert Column item has been removed from the row/column header context menu.

APP.VUE

```
<template>
   <ejs-spreadsheet ref="spreadsheet"
:contextMenuBeforeOpen="contextMenuBeforeOpen"></ejs-spreadsheet>
</template>
<script>
import Vue from "vue";
import { SpreadsheetPlugin } from "@syncfusion/ej2-vue-spreadsheet";
Vue.use(SpreadsheetPlugin);
export default {
  methods: {
  contextMenuBeforeOpen: function () {
        var spreadsheet = this.$refs.spreadsheet;
        // To remove context menu items.
         spreadsheet.removeContextMenuItems(["Insert Column"], false);
//Items that needs to be removed, Set `true` if the given `text` is a unique
id.
      }
    }
```

Copyright © 2001 -2024 Syncfusion Inc.

```
}
</script>
<style>

 @import "../node_modules/@syncfusion/ej2-spreadsheet/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/spreadsheet/contextmenu/addContextMenu-cs2" %}

Enable/Disable Context Menu Items

You can enable/disable the items in context menu using the enableContextMenuItems in contextmenuBeforeOpen event

In this demo, Rename item is disabled in the pager context menu.

APP.VUE

```
<template>
   <ejs-spreadsheet ref="spreadsheet"
:contextMenuBeforeOpen="contextMenuBeforeOpen"></ejs-spreadsheet>
</template>
<script>
import Vue from "vue";
import { SpreadsheetPlugin } from "@syncfusion/ej2-vue-spreadsheet";
Vue.use(SpreadsheetPlugin);
export default {
  methods: {
  contextMenuBeforeOpen: function () {
        var spreadsheet = this.$refs.spreadsheet;
        //To enable / disable context menu items.
        spreadsheet.enableContextMenuItems(['Rename'], false, false); //
Contextmenu Items that needs to be enabled / disabled, Set true / false to
enable / disable the menu items, Set true if the given text is a unique id.
      }
    }
}
</script>
<style>
 @import "../node_modules/@syncfusion/ej2-vue-

Template in Vue Spreadsheet component

Cell Template is used for adding HTML elements into Spreadsheet. You can add the cell template in spreadsheet by using the `template` property and specify the address using the `address` property inside the `ranges` property. You can customize the Html elements similar to Syncfusion components (TextBox, DropDownList, RadioButton, MultiSelect, DatePicker etc) by using the `beforeCellRender` event. In this demo, Cell template is applied to `C2:C9` and instantiated with Html input components like TextBox, RadioButton, TextArea. You need to bind the events to perform any operations through HTML elements or Syncfusion components. Here, we have added `change` event in to the MultiSelect control, and we have updated the selected data into the spreadsheet cell through that change event.

Illustrations in Vue Spreadsheet component

Illustrations help you to insert an image, shapes, and graphic objects in the Essential JS 2 spreadsheet.

Image

Adding images to a spreadsheet can enhance the visual appeal and help to convey information more clearly.

* The default value for the `allowImage` property is `true`.

Insert Image

You can insert the image by using one of the following ways,

- Selecting the Insert tab in the Ribbon toolbar, and then choose the Image tab.
- Use the `insertImage()` method programmatically.

The available parameters in `insertImage()` method are,

| Parameter | Type | Description |

|-----|------|----|

| images | `ImageModel` | Specifies the options to insert image in spreadsheet. |

| range(optional) | `string` | Specifies the range in spreadsheet. |

The available arguments in `ImageModel` are:

- src: Specifies the image source.
- id: Specifies the image element id.
- height: Specifies the height of the image.
- width: Specifies the width of the image.
- top: Specifies the top position of the image.
- left: Specifies the left side of the image.

* In a spreadsheet, you can add many types of image files, including IMAGE, JPG, PNG, GIF, and JPEG files.

Delete Image

- If you want to delete the image, just select the image, and then press the Delete key.
- Use the `deleteImage()` method programmatically.

The available parameters in `deleteImage()` method are,

Copyright © 2001 -2024 Syncfusion Inc.

| Parameter | Type | Description |

|-----|------|----|

| id | string | Specifies the id of the image element to be deleted. |

| range(optional) | string | Specifies the range in spreadsheet. |

Image Customization

Image feature allows you to view and insert an image in a spreadsheet, and you can change the height and width of the image by resizing and moving it to another position.

Height and Width

- You can change the height and width of the image by resizing.
- Use the height and width property in the insertImage() method programmatically.

Top and Left

- You can change the position of the image by drag and drop.
- Use the top and left property in the insertImage() method programmatically.

Limitations of Image

The following features have some limitations in Image:

- Corner resizing option in the image element.
- Copy and paste the external image.

Chart

A chart is a graphical representation of data, that organizes and represents a set of numerical or qualitative data. It mostly displays the selected range of data in terms of x-axis and y-axis. You can use the allowChart property to enable or disable the chart functionality.

* The default value for the allowChart property is true.

Types of chart

The following types of charts are available in the Spreadsheet.

* Column Chart

* Bar Chart

* Area Chart

* Line Chart

* Pie Chart

* Scatter Chart

Insert Chart

You can insert the chart by using one of the following ways,

- Select the chart icon in the Ribbon toolbar under the Insert Tab.
- Use the insertChart() method programmatically.

The available parameter in the insertChart() method is,

| Parameter | Type | Description |

|-----|------|----|

| chart | ChartModel | Specifies the options to insert a chart in the spreadsheet. |

The available arguments in the ChartModel are:

- type: Specifies the type of chart.
- theme: Specifies the theme of a chart.
- isSeriesInRows: Specifies to switch the row or a column.
- range: Specifies the selected range or specified range.
- id: Specifies the chart element id.
- markerSettings: Specifies the marker settings. The marker is used to provide information about the data points in the series and is currently only applicable to the line chart.

Delete Chart

- If you want to delete the chart, just select the chart, and then press the Delete key.
- Use the deleteChart() method programmatically.

The available parameter in the deleteChart() method is,

| Parameter | Type | Description |

|-----|------|----|

| id | string | Specifies the id of the chart element to be deleted. |

Chart Customization

Chart feature allows you to view and insert a chart in a spreadsheet, and you can change the height and width of the chart by resizing and moving it to another position.

- You can change the height and width of the chart by resizing.
- You can change the position of the chart by drag and drop.

Limitations of Chart

The following features have some limitations in the Chart:

- Insert row/delete row between the chart data source will not reflect the chart.
- Copy/paste into the chart data source will not reflect the chart.
- Corner resizing option in chart element.

Note

You can refer to our Vue Spreadsheet feature tour page for its groundbreaking feature representations. You can also explore our Vue Spreadsheet example to knows how to present and manipulate data.

Rows and columns in Vue Spreadsheet component

Spreadsheet is a tabular format consisting of rows and columns. The intersection point of rows and columns are called as cells. The list of operations that you can perform in rows and columns are,

- Insert
- Delete
- Show and Hide

Insert

You can insert rows or columns anywhere in a spreadsheet. Use the allowInsert property to enable or disable the insert option in Spreadsheet.

Row

The rows can be inserted in the following ways,

- Using insertRow method, you can insert the rows once the component is loaded.
- Using context menu, insert the empty rows in the desired position.

The following code example shows the options for inserting rows in the spreadsheet.

APP.VUE

```
<template>
  <ejs-spreadsheet ref="spreadsheet" :created="created"
:showFormulaBar="false"

Column

The columns can be inserted in the following ways,

- Using insertColumn method, you can insert the columns once the component is loaded.
- Using context menu, insert the empty columns in the desired position.

The following code example shows the options for inserting columns in the spreadsheet.

APP.VUE

```
<template>
  <ejs-spreadsheet ref="spreadsheet" :created="created"
:showFormulaBar="false"
                 :showSheetTabs="false" :showRibbon="false">
                 <e-sheets>
                   <e-sheet>
                     <e-ranges>
                       <e-range :dataSource="dataSource" startCell="A2"></e-
range>
                     </e-ranges>
                     <e-columns>
                       <e-column :width=90></e-column>
                       <e-column :width=220></e-column>
                       <e-column :width=90></e-column>
                       <e-column :width=140></e-column>
                       <e-column :width=100></e-column>
                       <e-column :width=100></e-column>
                     </e-columns>
                   </e-sheet>
                 </e-sheets>
               </ejs-spreadsheet>

Delete

Delete support provides an option for deleting the rows and columns in the spreadsheet. Use allowDelete property to enable or disable the delete option in Spreadsheet.

The rows and columns can be deleted dynamically in the following ways,

- Using delete method, you can delete the loaded rows and columns.
- Using context menu, you can delete the selected rows and columns.

The following code example shows the delete operation of rows and columns in the spreadsheet.

APP.VUE

```
<template>
  <ejs-spreadsheet ref="spreadsheet" :created="created"
:showFormulaBar="false"
                :allowDelete="true" :showRibbon="false">
```

```
                <e-sheets>
                  <e-sheet name="Sheet1">
                    <e-ranges>
                      <e-range :dataSource="dataSource" ></e-range>
                    </e-ranges>
                    <e-columns>
                      <e-column :width=90></e-column>
                      <e-column :width=220></e-column>
                      <e-column :width=90></e-column>

Limitations of insert and delete

The following features have some limitations in Insert/Delete:

- Insert row/column between the formatting applied cells.
- Insert row/column between the data validation.
- Insert row/column between the conditional formatting applied cells.
- Insert/delete row/column between the filter applied cells.

Hide and show

You can show or hide the rows and columns in the spreadsheet through property binding, method, and context menu.

Row

The rows can be hidden or shown through the following ways,

- Using `hidden` property in row, you can hide/show the rows at initial load.
- Using `hideRow` method, you can hide the rows by specifying the start and end row index, set the last argument `hide` as `false` to unhide the hidden rows.
- Right-click on the row header and select the desired option from context menu

Column

The columns can be hidden or shown through following ways,

- Using `hidden` property in columns, you can hide/show the columns at initial load.

Copyright © 2001 -2024 Syncfusion Inc.

- Using hideColumn method, you can hide the columns by specifying the start and end column index, set the last argument hide as false to unhide the hidden columns.
- Right-click on the column header and select the desired option from context menu

The following code example shows the hide/show rows and columns operation in the spreadsheet.

APP.VUE

```
<template>
  <ejs-spreadsheet ref="spreadsheet" :created="created"
:showFormulaBar="false"
                :showSheetTabs="false" :showRibbon="false">

Size

You can change the size of rows and columns in the spreadsheet by using setRowsHeight and setColumnsWidth methods.

Row

You can change the height of single or multiple rows by using the setRowsHeight method.

You can provide the following type of ranges to the method:

- Single row range: ['2:2']
- Multiple rows range: ['1:100']
- Multiple rows with discontinuous range: ['1:10', '15:25', '30:40']
- Multiple rows with different sheets: [Sheet1!1:50, 'Sheet2!1:50', 'Sheet3!1:50']

The following code example shows how to change the height for single/multiple rows in the spreadsheet.

APP.VUE

```
<template>
  <ejs-spreadsheet ref="spreadsheet" :created="created">
                <e-sheets>
                  <e-sheet>
                    <e-ranges>
                      <e-range :dataSource="dataSource"></e-range>
                    </e-ranges>
                  </e-sheet>
                </e-sheets>
              </ejs-spreadsheet>
```

Changing text in column headers

Using the beforeCellRender event, you can change the text in the column headers. In that event, you can use the e-header-cell class to identify the header cell element and update its text value.

The following code example shows how to change the text in the column headers.

APP.VUE

Copyright © 2001 -2024 Syncfusion Inc.

```
<template>
  <ejs-spreadsheet ref="spreadsheet"
:beforeCellRender="beforeCellRender"></ejs-spreadsheet>
</template>
<script>
import Vue from "vue";
import { SpreadsheetPlugin } from "@syncfusion/ej2-vue-spreadsheet";
Vue.use(SpreadsheetPlugin);
export default {
  methods: {
    beforeCellRender: function (args) {
      // Condition to check whether the rendered element is header cell.
      if (
        args.colIndex >= 0 &&
        args.colIndex <= 10 &&

Filter in Vue Spreadsheet component

Filtering helps you to view specific rows in the spreadsheet by hiding the other rows. You can use the allowFiltering property to enable or disable filtering functionality.

Copyright © 2001 -2024 Syncfusion Inc.

* The default value for allowFiltering property is true.

By default, the Filter module is injected internally into Spreadsheet to perform filtering.

Apply filter on UI

In the active sheet, select a range of cells to filter by value of the cell. The filtering can be done by any of the following ways:

- Select the filter item in the Ribbon toolbar.
- Right-click the sheet, select the filter item in the context menu.
- Use the applyFilter() method programmatically.
- Use Ctrl + Shift + L keyboard shortcut to apply the filter.

* Use Alt + Up/Down keyboard shortcut to open the filter dialog.

Filter by criteria

The applyFilter() method will apply the filter UI, based on the predicate and range given in the arguments.

* The beforeFilter event will be triggered before filtering the specified range.

* The filterComplete event will be triggered after the filter action is completed successfully.

The following code example shows filter functionality in the Spreadsheet control.

APP.VUE

```
<template>
   <ejs-spreadsheet ref="spreadsheet" :allowFiltering='true'
:dataBound="dataBound">
   <e-sheets>

Filter by cell value

To apply a filter for a cell value, right-click the cell and choose filter -> Filter By Selected Cell's Value option from the menu. It applies the filter based on the value of the selected cell in the current sheet.

Clear filter

After applying filter to a certain column, you may want to clear it to make all filtered rows visible again. It can be done in the following ways,

- Choose Clear option in ribbon toolbar under Filter and Sort. It clears the filters applied in the spreadsheet for all fields.
- Use the clearFilter() method programmatically, to clear the applied filters in spreadsheet for all fields.

Copyright © 2001 -2024 Syncfusion Inc.

Clear filter on a field

After filtering, you can clear/reset the filter for a field alone. It can be done in the following ways,

- Click filter icon in the column's header and then choose Clear Filter option from the filter dialog.
- You can right-click on a filtered column cell and choose Clear Filter from . option from the context menu.
- Use the clearFilter(field) method programmatically, to clear the filter in a particular column.

Reapply filter

When you want to reapply the filter after some changes happened in the rows. It can be done in the following ways,

- You can choose Reapply option in ribbon toolbar under Filter and Sort to reapply the filtered columns again.
- You can right-click on a filtered cell and choose Reapply option from the context menu. It reapplies the filters again in the Spreadsheet for all the fields.

Known error validations

The following errors have been handled for filtering,

- *Out of range validation:* When the selected range is not a used range of the active sheet, it is considered as invalid and the out of range alert with the message Select a cell or range inside the used range and try again will be displayed. No filter will be performed if the range is invalid.

Limitations

The following features have some limitations in Filter:

- Insert/delete row/column between the filter applied cells.
- Merge cells with filter.
- Copy/cut paste the filter applied cells.

Note

You can refer to our Vue Spreadsheet feature tour page for its groundbreaking feature representations. You can also explore our Vue Spreadsheet example to knows how to present and manipulate data.

Sort in Vue Spreadsheet component

Sorting helps arranging the data to a specific order in a selected range of cells. You can use the allowSorting property to enable or disable sorting functionality.

Copyright © 2001 -2024 Syncfusion Inc.

* The default value for allowSorting property is true.

By default, the sort module is injected internally into Spreadsheet to perform sorting.

Sort by cell value

In the active Spreadsheet, select a range of cells to sort by cell value. The range sort can be done by any of the following ways:

- Select the sort item in the Ribbon toolbar and choose the ascending or descending item.
- Right-click the sheet, select the sort item in the context menu and choose the ascending/descending item.
- Use the sort() method programmatically.

The cell values can be sorted in the following orders:

- Ascending
- Descending

* Ascending is the default order for sorting.

The sort() method with empty arguments will sort the selected range by active cell's column as sort column in ascending order.

* The beforeSort event will be triggered before sorting the specified range.

* The sortComplete event will be triggered after the sort action is completed successfully.

The following code example shows Sort functionality in the Spreadsheet control.

APP.VUE

```
<template>
   <ejs-spreadsheet ref="spreadsheet" :allowSorting='true'
:dataBound="dataBound" :beforeSort="beforeSort"
:sortComplete="sortComplete">
   <e-sheets>
          <e-sheet>
            <e-ranges>
              <e-range :dataSource="dataSource"></e-range>
            </e-ranges>
          </e-sheet>
        </e-sheets></ejs-spreadsheet>
</template>
<script>

```

{% previewsample "page.domainurl/code-snippet/spreadsheet/sort-by-cell-cs1" %}

Data contains header

You can specify whether the selected range of cells contains header. To specify, you need to set the containsHeader property to true and pass it as sortOption arguments of the sort() method.

* If the containsHeader property is not set and active cell column's first cell value type is differed from the second cell value type, the first row data in the range are marked as column headers.

You can also enable or disable this property using beforeSort event arguments,

`ts

beforeSort: function (args) {

args.sortOptions.containsHeader = true;

}

`

In the custom sort dialog, the Data contains header checkbox is checked on load. Thus, the default value for containsHeader is true in custom sort dialog.

Copyright © 2001 -2024 Syncfusion Inc.

Case sensitive sort

The default sort functionality of Spreadsheet is a case insensitive sorting. When you want to perform sorting with case sensitive, you need to set the caseSensitive property to true and pass it as sortOption arguments of the sort() method.

Case sensitive sorting is applicable only for cells with alphabets. In ascending order sorting with case sensitive enabled, the cells with lower case text will be placed above the cells with upper case text.

* The default value for the caseSensitive property is false.

You can also enable or disable this property using beforeSort event arguments,

`ts

beforeSort: function (args) {

args.sortOptions.caseSensitive = true;

}

`

In the custom sort dialog, the Case sensitive checkbox is unchecked on load as the default value is false.

Sort multiple columns

When you want to perform sorting on multiple columns, it can be done by any of the following ways:

- Select the Custom sort… menu item from the Ribbon toolbar item or context menu item.
- Use the sort() method programmatically by providing sort criteria.

* The current sorting functionality supports sorting based on cell values only.

Custom sort dialog

The custom sort dialog helps sorting multiple columns in the selected range by utilizing the rich UI. This dialog will be appeared while choosing the Custom sort… from the Ribbon item or context menu item. By default, sort criteria with the first column name from the selected range will be appeared in the dialog on initial load and it cannot be removed.

You can add multiple criteria using the Add Column button at the bottom of the dialog. Thus, multiple columns can be specified with different sort order. The newly added sort criteria items can be removed using the delete icons at the end of each items.

You can refer to the Data contains header topic to learn more about Data contains header checkbox. To learn more about Case sensitive checkbox, you can refer to Case sensitive sort topic.

Passing sort criteria manually

The multi-column sorting can also be performed manually by passing sort options to the sort() method programmatically. The sortOption have the following arguments:

- sortDescriptors – Sort criteria collection that holds the collection of field name, sort order, and sortComparer.
- containsHeader – Boolean argument that specifies whether the range has headers in it.
- caseSensitive – Boolean argument that specifies whether the range needs to consider case.

Copyright © 2001 -2024 Syncfusion Inc.

* All the arguments are optional.

* When a sortDescriptor is specified without field, the field of the first sortDescriptor from the collection will be assigned from active cell's column name and others will be ignored. Hence, it will act as single column sorting.

APP.VUE

{% previewsample "page.domainurl/code-snippet/spreadsheet/passing-sort-cs1" %}

Custom sort comparer

The sortDescriptor holds the sortComparer property, which is a function and it is used to customize the sort comparer for specific sort criteria. Each sortDescriptor can be customized using the custom sort comparer function.

By customizing sort comparer, you can define the sort action as desired.

* The sortComparer is an optional property of sortDescriptor.

For custom sort comparer example, refer to the Sort a range by custom list in the how-to section.

Known error validations

The following errors have been handled for sorting,

- *Out of range validation:* When the selected range is not a used range of the active sheet, it is considered as invalid and the out of range alert with the message Select a cell or range inside the used range and try again will be displayed. No sort will be performed if the range is invalid.
- *Empty field validation:* When the sort criteria does not have a column selected (empty) in the custom sort dialog, it will become invalid, and an error message Sort criteria column should not be empty will be displayed on OK button click.
- *Duplicate field validation:* When the column names of added sort criteria are repeated more than once in the custom sort dialog, it will become invalid and an error message is mentioned more than once. Duplicate columns must be removed will be displayed on OK button click.

Limitations

- Sorting is not supported with formula contained cells.

Note

You can refer to our Vue Spreadsheet feature tour page for its groundbreaking feature representations. You can also explore our Vue Spreadsheet example to knows how to present and manipulate data.

Link in Vue Spreadsheet component

Hyperlink is used to navigate to web links or cell reference within the sheet or to other sheets in Spreadsheet. You can use the allowHyperlink property to enable or disable hyperlink functionality.

* The default value for `allowHyperlink` property is `true`.

Insert Link

You can insert a hyperlink in a worksheet cell for quick access to related information.

User Interface:

In the active spreadsheet, click the cell where you want to create a hyperlink. Insert hyperlink can be done by any of the following ways:

- Select the INSERT tab in the Ribbon toolbar and choose the `Link` item.
- Right-click the cell and then click Hyperlink item in the context menu.
- Use `Ctrl + K` keyboard shortcut to apply the hyperlink.
- Use the addHyperlink method programmatically.

Edit Hyperlink

You can change an existing hyperlink in your workbook by changing its destination or the text that is used to represent it.

User Interface:

In the active spreadsheet, Select the cell that contains the hyperlink that you want to change. Editing the hyperlink while opening the dialog can be done by any one of the following ways:

- Select the INSERT tab in the Ribbon toolbar and choose the `Link` item.
- Right-click the cell and then click Edit Hyperlink item in the context menu, or you can press Ctrl+K.

In the Edit Link dialog box, make the changes that you want, and click UPDATE.

Remove Hyperlink

Performing this operation remove a single hyperlink without losing the display text.

User Interface:

In the active spreadsheet, click the cell where you want to remove a hyperlink. remove hyperlink can be done by any of the following ways:

- Right-click the cell and then click Remove Hyperlink item in the context menu.
- Use the removeHyperlink() method programmatically.

Copyright © 2001 -2024 Syncfusion Inc.

How to change target attribute

There is an event named beforeHyperlinkClick which triggers only on clicking hyperlink. You can customize where to open the hyperlink by using the target property in the arguments of that event.

Selection in Vue Spreadsheet component

Selection provides interactive support to highlight the cell, row, or column that you select. Selection can be done through Mouse, Touch, or Keyboard interaction. To enable selection, set `mode` as `Single` | `Multiple` in selectionSettings. If you set `mode` to `None`, it disables the UI selection.

* The default value for `mode` in `selectionSettings` is `Multiple`.

Copyright © 2001 -2024 Syncfusion Inc.

You have the following options in Selection,

- Cell selection
- Row selection
- Column selection

Cell selection

Cell selection is used to select a single or multiple cells. It can be performed using the selectRange method.

User Interface:

- Click on a cell to select it (or) use the arrow keys to navigate to it and select it.
- To select a range, select a cell, then use the left mouse button to select and drag over to other cells (or) use the Shift + arrow keys to select the range.
- To select non-adjacent cells and cell ranges, hold Ctrl and select the cells.

You can quickly locate and select specific cells or ranges by entering their names or cell references in the Name box, which is located to the left of the formula bar, and also select named or unnamed cells or ranges by using the Go To (Ctrl+G) command.

Row selection

Row selection is used to select a single or multiple rows.

User Interface:

You can perform row selection in any of the following ways,

- By clicking the row header.
- To select multiple rows, select a row header with the left mouse button and drag over to other row headers (or) use the Shift + arrow keys to select multiple rows.
- To select non-adjacent rows, hold Ctrl and select the row header.
- You can also use the selectRange method for row selection.

The following sample shows the row selection in the spreadsheet, here selecting the 5th row using the selectRange method.

{% previewsample "page.domainurl/code-snippet/spreadsheet/selection-cs3" %}

Limitations

- We have a limitation while performing the Select All(ctrl + A). You can do this only by clicking the Select All button at the top left corner.

Note

You can refer to our Vue Spreadsheet feature tour page for its groundbreaking feature representations. You can also explore our Vue Spreadsheet example to knows how to present and manipulate data.

Clipboard in Vue Spreadsheet component

The Spreadsheet provides support for the clipboard operations (cut, copy, and paste). Clipboard operations can be enabled or disabled by setting the enableClipboard property in Spreadsheet.

By default, the enableClipboard property is true.

Cut

It is used to cut the data from selected range of cells, rows or columns in a spreadsheet and make it available in the clipboard.

User Interface:

Cut can be done in one of the following ways.

- Using Cut button in the Ribbon's HOME tab to perform cut operation.
- Using Cut option in the Context Menu.
- Using Ctrl + X | Command + X keyboard shortcut.
- Using the cut method.

Copy

It is used to copy the data from selected range of cells, rows or columns in a spreadsheet and make it available in the clipboard.

User Interface:

Copyright © 2001 -2024 Syncfusion Inc.

Copy can be done in one of the following ways.

- Using Copy button in the Ribbon's HOME tab to perform copy operation.
- Using Copy option in the Context Menu.
- Using Ctrl + C | Command + C keyboard shortcut.
- Using the copy method.

Paste

It is used to paste the clipboard data to the selected range, rows or columns. You have the following options in Paste,

- Paste Special - You can paste the values with formatting.
- Paste - You can paste only the values without formatting.

It also performs for external clipboard operation. If you perform cut and paste, clipboard data will be cleared, whereas in copy and paste the clipboard contents will be maintained. If you perform paste inside the copied range, the clipboard data will be cleared.

User Interface:

Paste can be done in one of the following ways.

- Using Paste button in the Ribbon's HOME tab to perform paste operation.
- Using Paste option in the Context Menu.
- Using Ctrl + V | Command + V keyboard shortcut.
- Using the paste method.

If you use the Keyboard shortcut key for cut (Ctrl + X) | copy (Ctrl + C) from other sources, you should use Ctrl + V shortcut while pasting into the spreadsheet.

{% previewsample "page.domainurl/code-snippet/spreadsheet/clipboard-cs2" %}

Limitations

- External clipboard is not fully supported while copying data from another source and pasting into a spreadsheet, it only works with basic supports (Values, Number, cell, and Text formatting).
- If you copy =SUM(A2,B2) and paste, the formula reference will change depending on the pasted cell address but we don't have support for nested formula(formula reference will be same).
- Clipboard is not supported with conditional formatting (values only pasting).
- We have limitation while copying the whole sheet data and pasting it into another sheet.

Note

You can refer to our Vue Spreadsheet feature tour page for its groundbreaking feature representations. You can also explore our Vue Spreadsheet example to knows how to present and manipulate data.

Scrolling in Vue Spreadsheet component

Scrolling helps you to move quickly to different areas of the worksheet. It moves faster if we use horizontal and vertical scroll bars. Scrolling can be enabled by setting the allowScrolling as true.

By default, the allowScrolling property is true.

You have the following options in Scrolling by using scrollSettings.

- Finite scrolling.
- Virtual scrolling.

Finite Scrolling

Finite scrolling supports two type of modes in scrolling. You can use the isFinite property in scrollSettings to specify the mode of scrolling.

- Finite - This mode does not create a new row/column when the scrollbar reaches the end. This can be achieved by setting the isFinite property as true.
- Infinite - This mode creates a new row/column when the scrollbar reaches the end. This can be achieved by setting the isFinite property as false.

By Default, the isFinite property is false.

Virtual Scrolling

- Virtual scrolling allows you to load data that you require (load data based on viewport size) without buffering the entire huge database. You can set the enableVirtualization property in scrollSettings as true.

In virtual scrolling enableVirtualization is set to true means, it allows you to load the spreadsheet data while scrolling.

By Default, the enableVirtualization property is true.

User Interface:

You can scroll through the worksheet using one of the following ways,

- Using the arrow keys.
- Using the Horizontal and Verticalscroll bars.
- Using the mouse wheel.

Finite scrolling with defined rows and columns

If you want to perform scrolling with defined rows and columns, you must define rowCount and colCount in the sheets property and set isFinite as true and enableVirtualization as false in scrollSettings.

The following code example shows the finite scrolling with defined rows and columns in the spreadsheet. Here, we used rowCount as 20 and colCount as 20, after reaching the 20th row or 20th column you can't able to scroll.

Protect sheet in Vue Spreadsheet component

Sheet protection helps you to prevent the users from modifying the data in the spreadsheet.

Protect Sheet

Protect sheet feature helps you to prevent the unknown users from accidentally changing, editing, moving, or deleting data in a spreadsheet.

You can use the isProtected property to enable or disable the Protecting functionality.

* The default value for isProtected property is false.

By default in protected sheet, selecting, formatting, inserting, deleting functionalities are disabled. To enable some of the above said functionalities the protectSettings options are used in a protected spreadsheet.

The available protectSettings options in spreadsheet are,

| Options | Uses |

|-----|------|

| Select Cells | Used to perform Cell Selection. |

| Format Cells | Used to perform Cell formatting. |

| Format Rows | Used to perform Row formatting. |

| Format Columns | Used to perform Column formatting. |

| Insert Link | Used to perform Hyperlink Insertions. |

* The default value for all protectSettings options are false.

By default, the Protect Sheet module is injected internally into the Spreadsheet to perform sheet protection function.

User Interface:

In the active Spreadsheet, the sheet protection can be done by any of the following ways:

- Select the Protect Sheet item in the Ribbon toolbar under the Data Tab, and then select your desired options.
- Right-click the sheet tab, select the Protect Sheet item in the context menu, and then select your desired options.
- Use the protectSheet() method programmatically.

The following example shows Protect Sheet functionality in the Spreadsheet control.

APP.VUE

```
<template>
  <ejs-spreadsheet ref="spreadsheet" :created="created">
                <e-sheets>
                  <e-sheet name="Budget" :isProtected="true"
:protectSettings="{ selectCells: true }">
                    <e-ranges>
                      <e-range :dataSource="dataSource1"></e-range>
                    </e-ranges>
                    <e-columns>
                      <e-column :width=100></e-column>
                      <e-column :width=100></e-column>
                      <e-column :width=100></e-column>
                      <e-column :width=100></e-column>
                    </e-columns>
                  </e-sheet>

{% previewsample "page.domainurl/code-snippet/spreadsheet/protect-sheet-cs1" %}

Unprotect Sheet

Unprotect sheet is used to enable all the functionalities that are already disabled in a protected spreadsheet.

User Interface:

In the active Spreadsheet, the sheet Unprotection can be done by any of the following ways:

- Select the Unprotect Sheet item in the Ribbon toolbar under the Data Tab.
- Right-click the sheet tab, select the Unprotect Sheet item in the context menu.
- Use the unprotectSheet() method programmatically.

Unlock the particular cells in the protected sheet

In protected spreadsheet, to make some particular cell or range of cells are editable, you can use lockCells() method, with the parameter range and isLocked property as false.

APP.VUE

```
<template>
 <div> <ejs-button id='customBtn' v-on:click.native="btnClick"> Unlock
cells</ejs-button>
 <div id="dialog"></div>
              <ejs-spreadsheet ref="spreadsheet" id="spreadsheet"
:created="created">
                <e-sheets>
                  <e-sheet name="Budget" :isProtected="true"
:protectSettings="{ selectCells: true }">
                    <e-ranges>
                      <e-range :dataSource="dataSource1"></e-range>
                    </e-ranges>

Limitations of Protect Sheet

- Password protection is not supported in Protect sheet feature.

Protect Workbook

Protect workbook feature helps you to protect the workbook so that users cannot insert, delete, rename, hide the sheets in the spreadsheet.

You can use the password property to protect workbook with password.

You can use the isProtected property to protect or unprotect the workbook without the password.

The default value for isProtected property is false.

User Interface:

In the active Spreadsheet, you can protect the worksheet by selecting the Data tab in the Ribbon toolbar and choosing the Protect Workbook item. Then, enter the password and confirm it and click on OK.

The following example shows Protect Workbook by using the isProtected property in the Spreadsheet control.

APP.VUE

```
<template>
   <ejs-spreadsheet ref="spreadsheet" :isProtected="true">
   <e-sheets>
          <e-sheet>
            <e-ranges>
              <e-range :dataSource="dataSource"></e-range>

Unprotect Workbook

Unprotect Workbook is used to enable the insert, delete, rename, move, copy, hide or unhide sheets feature in the spreadsheet.

User Interface:

In the active Spreadsheet, the workbook Unprotection can be done in any of the following ways:

- Select the Unprotect Workbook item in the Ribbon toolbar under the Data Tab and provide the valid password in the dialog box.

Limitations of Protect Workbook

- Encryption with password is not supported in the Protect workbook feature.

Note

You can refer to our Vue Spreadsheet feature tour page for its groundbreaking feature representations. You can also explore our Vue Spreadsheet example to knows how to present and manipulate data.

Searching in Vue Spreadsheet component

Find and Replace helps you to search for the target text and replace the found text with alternative text within the sheet or workbook. You can use the allowFindAndReplace property to enable or disable the Find and Replace functionality.

* The default value for allowFindAndReplace property is true.

Copyright © 2001 -2024 Syncfusion Inc.

Find

Find feature is used to select the matched contents of a cell within the sheet or workbook. It is extremely useful when working with large set of data source.

User Interface:

Find can be done by any of the following ways:

- Select the Search icon in the Ribbon toolbar or use Ctrl + F key to open the Find dialog.
- Use find Next and find Previous buttons to search the given value in the workbook.
- Select the option button in Find dialog to open the Find and Replace dialog. Then, select the below properties for enhanced searching.

* Search within: To search the target in a sheet (default) or in an entire workbook.

* Search by: It enhance the search, either By Rows (default), or By Columns.

* Match case: To find the matched value with case sensitive.

* Match exact cell contents: To find the exact matched cell value with entire match cases.

- Using find() method to perform find operation.

Replace

Replace feature is used to change the find contents of a cell within sheet or workbook. Replace All is used to change all the matched contents of a cell within sheet or workbook.

User Interface:

Replace can be done by any of the following ways:

- Use Ctrl + H key to open the Find and Replace dialog.
- Use Replace button to change the found value in sheet or workbook.
- Using Replace All button, all the matched criteria can be replaced with find value based on sheet or workbook.
- Using replace() method to perform replace operation by passing the argument args.replaceby as replace.
- Using replace() method to perform replace all operation by passing the argument args.replaceby as replaceall.

Go to

Go to feature is used to navigate to a specific cell address in the sheet or workbook.

User Interface:

- Use Ctrl + G key to open the Go To dialog.
- Use goTo() method to perform Go To operation.

In the following sample, searching can be done by following ways:

- Select the Home tab in the Ribbon toolbar, and then select the Search icon.

Copyright © 2001 -2024 Syncfusion Inc.

- Enter any value in the search textbox.
- Select the next (or) previous button to find the entered value in the spreadsheet.
- You can have more options to find values by selecting the more options in the search toolbar.

Limitations

- Undo/redo for Replace All is not supported in this feature.

Note

You can refer to our Vue Spreadsheet feature tour page for its groundbreaking feature representations. You can also explore our Vue Spreadsheet example to knows how to present and manipulate data.

Accessibility in Vue Spreadsheet component

The Spreadsheet component followed the accessibility guidelines and standards, including ADA, Section 508, WCAG 2.2 standards, and WCAG roles that are commonly used to evaluate accessibility.

The accessibility compliance for the Spreadsheet component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| WCAG 2.2 Support | <img src="https://cdn.syncfusion.com/content/images/documentation/partial.png" alt="Intermediate"> |

| Section 508 Support | <img src="https://cdn.syncfusion.com/content/images/documentation/partial.png" alt="Intermediate"> |

| Screen Reader Support | <img src="https://cdn.syncfusion.com/content/images/documentation/partial.png" alt="Intermediate"> |

| Right-To-Left Support | <img src="https://cdn.syncfusion.com/content/images/documentation/full.png" alt="Yes"> |

| Color Contrast | <img src="https://cdn.syncfusion.com/content/images/documentation/full.png" alt="Yes"> |

| Mobile Device Support | <img src="https://cdn.syncfusion.com/content/images/documentation/full.png" alt="Yes"> |

| Keyboard Navigation Support | <img src="https://cdn.syncfusion.com/content/images/documentation/partial.png" alt="Intermediate"> |

Copyright © 2001 -2024 Syncfusion Inc.

| Accessibility Checker Validation | <img src="https://cdn.syncfusion.com/content/images/documentation/full.png" alt="Yes"> |

| Axe-core Accessibility Validation | <img src="https://cdn.syncfusion.com/content/images/documentation/full.png" alt="Yes"> |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<img src="https://cdn.syncfusion.com/content/images/documentation/full.png" alt="Yes"> - All features of the component meet the requirement.

<img src="https://cdn.syncfusion.com/content/images/documentation/partial.png" alt="Intermediate"> - Some features of the component do not meet the requirement.

<img src="https://cdn.syncfusion.com/content/images/documentation/not-supported.png" alt="No"> - The component does not meet the requirement.

WAI-ARIA attributes

The Spreadsheet component followed the WAI-ARIA patterns to meet the accessibility. The following ARIA attributes are used in the Spreadsheet component:

| Attributes | Purpose |

|-------|---------|

| grid (role) | This role is added to the spreadsheet content table and describes the collection of rows and columns. |

| gridcell (role) | This role is added to the cell element and describes the rows <td> element. |

| rowheader (role) | This role is added to the row header and describes the header of the rows. |

| colheader (role) | This role is added to the column header and describes the header of the columns. |

| aria-rowindex (attribute) | This attribute describes the table's row index in the spreadsheet. |

| aria-colindex (attribute) | This attribute describes the table's column index in the spreadsheet. |

| aria-selected (attribute) | This attribute describes an item's (cell, menu, checkbox, etc.) current selected state in the spreadsheet. |

| aria-rowcount (attribute) | This attribute describes the total number of rows in the table. |

| aria-colcount (attribute) | This attribute describes the total number of columns in the table. |

| aria-busy (attribute) | This attribute describes a currently updated or modified element. |

| aria-label (attribute) | This attribute describes the accessible name for the interactive elements. |

| textbox (role) | This role is assigned to the textbox that accepts text input. |

Copyright © 2001 -2024 Syncfusion Inc.

| menu (role) | This role has been added to the menu and describes the menu items. |

| aria-expanded (attribute) | This attribute describes the control (for example, dropdown) is expanded or collapsed. |

| aria-multiline (attribute) | This attribute defines what the Alt + Enter key does in the spreadsheet editor. |

Keyboard interaction

The Spreadsheet component followed the keyboard interaction guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Spreadsheet component.

| Press | To do this |

|----------|-------------|

| Up arrow | Navigate from the active cell to the previous cell in the same column. |

| Down arrow | Navigate from the active cell to the next cell in the same column. |

| Left arrow | Navigate from the active cell to the previous cell in the same row. |

| Right arrow | Navigate from the active cell to the next cell in the same row. |

| Tab | Navigate the active cell to the next cell in the same row. |

| Shift + Tab | Navigate the active cell to the previous cell in the same row. |

| Home | Moves the selection to starting column in worksheet. |

| Ctrl + Home | Move the selection to the first visible cell on a worksheet. |

| Shift + Home | Extend the cell selection to the first column of a worksheet. |

| Ctrl + Shift + Home | Extend the selection of cells to the beginning of the worksheet. |

| Ctrl + End | Move to the last cell on a worksheet, right most last column and last row cell. |

| Page Up | Move page up. |

| Page Down | Move page down. |

| Shift + Page Up | Perform page up by selecting all cells between. |

| Shift + Page Down | Perform page down by selecting all cells between. |

| Ctrl + Up | Navigate to the non-blank cell before the active cell in the same column. |

| Ctrl + Down | Navigate to the last non-blank cell in the same column as the active cell. |

| Ctrl + Left | Navigate to the non-blank cell before the active cell in the same row. |

| Ctrl + Right | Navigate to the last non-blank cell in the same row as the active cell. |

| Shift + Up | Extend the selection of cells to the previous row. |

| Shift + Down | Extend the selection of cells to the next row. |

| Shift + Left | Extend the selection of cells to the previous column. |

| Shift + Right | Extend the selection of cells to the next column. |

Copyright © 2001 -2024 Syncfusion Inc.

| Ctrl + Shift + Up | Extend the cell selection to the previous non-blank cell in the same column as the active cell. |

| Ctrl + Shift + Down | Extend the cell selection to the last non-blank cell in the same column as the active cell. |

| Ctrl + Shift + Left | Extend the cell selection to the previous non-blank cell in the same row as the active cell. |

| Ctrl + Shift + Right | Extend the cell selection to the last non-blank cell in the same row as the active cell. |

| Enter | Navigate the active cell to the next cell in the same column. |

| Shift + Enter | Navigate to the previous cell in the same column from the active cell. |

| Alt + Enter | While editing, add a new line. |

| Enter | Complete the cell editing and select the cell below in the same column. |

| Shift + Enter | Complete the cell editing and select the cell above in the same column. |

| Tab | Complete the cell editing and select the next cell in the same row. |

| Shift + Tab | Complete the cell editing and select the previous cell in the same row. |

| Alt | Focus on the active ribbon tab. |

| Left | Move the focus to the previous items in the ribbon content. |

| Right | Move the focus to the next items in the ribbon content. |

| Alt + Down | Open the ribbon dropdown menu. |

| Esc / Alt + Up | Close the ribbon dropdown menu. |

Ensuring accessibility

The Spreadsheet component's accessibility levels are ensured through an accessibility-checker and axe-core software tools during automated testing.

The accessibility compliance of the Spreadsheet component is shown in the following sample. Open the sample in a new window to evaluate the accessibility of the Spreadsheet component with accessibility tools.

{% previewsample "https://ej2.syncfusion.com/accessibility/spreadsheet.html" %}

Keyboard shortcuts in Vue Spreadsheet component

The keyboard shortcuts supported in the spreadsheet are,

| Shortcut | Description |

|-------|---------|

| Ctrl + O | Displays dialog to open a file. |

| Ctrl + S / Alt + F2 | Saves the workbook. |

Copyright © 2001 -2024 Syncfusion Inc.

| F2 | Enables edit mode. |

| ESC | Cancel edit mode and discard the changes. |

| Backspace and SPACE | Clears content of the active cell and enables edit mode. |

| Ctrl + C | Copies the selected cells. |

| Ctrl + X | Cuts the selected cells. |

| Ctrl + V | Paste the clipboard(cut or copied) content in the new selected range. |

| Ctrl + B | Applies or removes **bold** formatting. |

| Ctrl + I | Applies or removes *italic* formatting. |

| Ctrl + U | Applies or removes underline. |

| Ctrl + 5 | Applies or removes ~~strikethrough~~. |

| Ctrl + Z | Reverses (Undo) the last action. |

| Ctrl + Y | Repeats (Redo) the last reversed action. |

| Ctrl + K | It opens the Insert Hyperlink dialog for adding new hyperlink to a cell. If the selected cell already contains hyperlink, it opens the Edit Hyperlink dialog. |

| Ctrl + F / Shift + F5 | Opens Find dialog. |

| Ctrl + H | Opens Find and Replace dialog. |

| Ctrl + G | Opens GoTo dialog, which helps to navigate to cell. |

| Ctrl + Shift + L | Applies filter to the first row of the selected range or used range. |

| Alt + F | Opens the File menu. |

| Alt + H | Go to Home tab. |

| Alt + N | Go to Insert tab. |

| Alt + M | Go to Formulas tab. |

| Alt + A | Go to Data tab. |

| Alt + W | Go to View tab. |

| Tab | Navigate the active cell to the next cell in the same row. |

| Shift + Tab | Navigate the active cell to the previous cell in the same row. |

| Right or Left arrow| Move the focus to next or previous item in the tab if the focus is on ribbon tab.|

| Up arrow | When a menu is open, move focus to the next item. |

| Down arrow | When a menu is open, move focus to the previous item. |

| Spacebar or Enter | Activate a selected button. |

| Ctrl + F8 | Expand or collapse the ribbon content. |

| Ctrl + Shift + U | Expand or collapse the formula bar. |

| Ctrl + 9 | Hide the selected row. |

Copyright © 2001 -2024 Syncfusion Inc.

| Ctrl + 0 | Hide the selected column. |

| Home | Moves the selection to starting column in worksheet. |

| Ctrl + Home | Move the selection to the first visible cell on a worksheet. |

| Ctrl + Shift + Home | Extend the selection of cells to the beginning of the worksheet. |

| Ctrl + End | Move to the last cell on a worksheet, right most last column and last row cell. |

| Ctrl + & | Apply an outline border to the selected cells. |

| Ctrl + Shift + & | Apply an outline border to the cells that you've chosen. |

| Ctrl + Shift + ~ | Apply the General number format. |

| Ctrl + Shift + $ | Apply the Currency format with two decimal places (negative numbers in parentheses). |

| Shift + F10 | Open the context menu. |

| Ctrl + % | Apply the Percentage format with no decimal places. |

| Ctrl + ^ | Apply the Scientific number format with two decimal places. |

| Ctrl + Shift + # |Apply the Date format with the day, month, and year. |

| Ctrl + Shift + @ | Apply the Time format with the hour and minute, and AM or PM. |

| Ctrl + Shift + ! | Apply the Number format with two decimal places, thousands separator, and minus sign (-) for negative values. |

| Ctrl + Spacebar | Select an entire column in a worksheet. |

| Shift + Spacebar | Select an entire row in a worksheet. |

| Shift + F3 | Opens Insert Function dialog. |

| Ctrl + Alt + N | Opens new workbook. |

| Shift + Page Down | Perform page down by selecting all cells between. |

| Shift + Page Up | Perform page up by selecting all cells between. |

| Ctrl + Left | Navigate to the non-blank cell before the active cell in the same row. |

| Ctrl + Right | Navigate to the last non-blank cell in the same row as the active cell. |

| Ctrl + Up | Navigate to the first non-blank cell in the same row as the active cell. |

| Ctrl + Down | Navigate to the last cell that is not blank in the same column as the active cell. |

| Ctrl + Shift + Left | Extend the cell selection to the previous non-blank cell in the same row as the active cell. |

| Ctrl + Shift + Right | Extend the cell selection to the last non-blank cell in the same row as the active cell. |

| Ctrl + Shift + Up | Extend the selection of cells to the first non-blank cell in the same row as the active cell. |

| Ctrl + Shift + Down | Extend the selection of cells to the last non-blank cell in the same row as the active cell. |

Copyright © 2001 -2024 Syncfusion Inc.

| Shift + Alt + K | Open the List All Sheets dropdown option. |

| Up arrow | Navigate from the active cell to the previous cell in the same column. |

| Down arrow | Navigate from the active cell to the next cell in the same column. |

| Left arrow | Navigate from the active cell to the previous cell in the same row. |

| Right arrow | Navigate from the active cell to the next cell in the same row. |

| Page Up | Move page up. |

| Page Down | Move page down. |

| Shift + Up | Extend the selection of cells to the previous row. |

| Shift + Down | Extend the selection of cells to the next row. |

| Shift + Left | Extend the selection of cells to the previous column. |

| Shift + Right | Extend the selection of cells to the next column. |

| Ctrl + Top | Navigate to the non-blank cell before the active cell in the same column. |

| Ctrl + Shift + Top | Extend the cell selection to the previous non-blank cell in the same column as the active cell. |

| Ctrl + Shift + Bottom | Extend the cell selection to the last non-blank cell in the same column as the active cell. |

| Enter | Navigate the active cell to the next cell in the same column. |

| Shift + Enter | Navigate to the previous cell in the same column from the active cell. |

| Alt + Down | Open the list data validation menu and filter menu. |

| Alt + Up | Close the list data validation menu and filter menu. |

| Delete | Remove the contents of the cell. |

| Shift + Home | Extend the cell selection to the first column of a worksheet. |

| Shift + F11 | Add a new sheet. |

| Ctrl + Shift + 9 | Unhide the selected rows. |

| Ctrl + Shift + 0 | Unhide the selected columns. |

| Ctrl + D | Fill the cell down. |

| Ctrl + R | Fill the cell right. |

| Alt + Enter | While editing, add a new line. |

| Enter | Complete the cell editing and select the cell below in the same column. |

| Shift + Enter | Complete the cell editing and select the cell above in the same column. |

| Tab | Complete the cell editing and select the next cell in the same row. |

| Shift + Tab | Complete the cell editing and select the previous cell in the same row. |

| Alt | Focus on the active ribbon tab. |

| Left | Move the focus to the previous items in the ribbon content. |

Copyright © 2001 -2024 Syncfusion Inc.

| Right | Move the focus to the next items in the ribbon content. |

| Alt + Down | Open the ribbon dropdown menu. |

| Esc / Alt + Up | Close the ribbon dropdown menu. |

Ribbon in Vue Spreadsheet component

It helps to organize a spreadsheet's features into a series of tabs. By clicking the expand or collapse icon, you can expand or collapse the ribbon toolbar dynamically.

Ribbon Customization

You can customize the ribbon using the following methods,

| Method | Action |

|-------|---------|

| hideRibbonTabs | Used to show or hide the existing ribbon tabs. |

| enableRibbonTabs | Used to enable or disable the existing ribbon tabs. |

| addRibbonTabs | Used to add custom ribbon tabs. |

| hideToolbarItems | Used to show or hide the existing ribbon toolbar items. |

| enableToolbarItems | Used to enable or disable the specified toolbar items. |

| addToolbarItems | Used to add the custom items in ribbon toolbar. |

| hideFileMenuItems | Used to show or hide the ribbon file menu items. |

| enableFileMenuItems | Used to enable or disable file menu items. |

| addFileMenuItems | Used to add custom file menu items. |

The following code example shows the usage of ribbon customization.

APP.VUE

```
<template>
   <ejs-spreadsheet ref="spreadsheet" :created="created"
:fileMenuBeforeOpen="fileMenuBeforeOpen"
                :fileMenuItemSelect="fileMenuItemSelect" :openUrl="openUrl"
:saveUrl="saveUrl" :showFormulaBar="false" :showSheetTabs="false"
:allowInsert="false" :allowDelete="false" :allowMerge="false">
                <e-sheets>
                  <e-sheet>
                    <e-ranges>
                      <e-range :dataSource="dataSource"></e-range>
                    </e-ranges>
                    <e-columns>

Global local in Vue Spreadsheet component

Localization

The Localization library allows you to localize the default text content of the Spreadsheet. The Spreadsheet has static text on some features (cell formatting, Merge, Data validation, etc.) that can be changed to other cultures (Arabic, Deutsch, French, etc.) by defining the

locale value and translation object.

The following list of properties and their values are used in the Spreadsheet.

Locale keywords |Text

Cut | Cut

Copy | Copy

Paste | Paste

PasteSpecial | Paste Special

All | All

Description | Description

UnsupportedFile | Unsupported File

InvalidUrl | Invalid Url

SUM | Adds a series of numbers and/or cells.

SUMIF | Adds the cells based on the specified condition.

SUMIFS | Adds the cells based on the specified conditions.

ABS | Returns the value of a number without its sign.

RAND | Returns a random number between 0 and 1.

RANDBETWEEN | Returns a random integer based on the specified values.

FLOOR | Rounds a number down to the nearest multiple of a given factor.

CEILING | Rounds a number up to the nearest multiple of a given factor.

PRODUCT | Multiplies a series of numbers and/or cells.

AVERAGE | Calculates average for the series of numbers and/or cells excluding text.

AVERAGEIF | Calculates average for the cells based on the specified criterion.

AVERAGEIFS | Calculates average for the cells based on the specified conditions.

AVERAGEA | Calculates the average for the cells evaluating TRUE as 1 text and FALSE as 0.

COUNT | Counts the cells that contain numeric values in a range.

COUNTIF | Counts the cells based on the specified condition.

COUNTIFS | Counts the cells based on specified conditions.

COUNTA | Counts the cells that contain values in a range.

MIN | Returns the smallest number of the given arguments.

MAX | Returns the largest number of the given arguments.

DATE | Returns the date based on the given year, month, and day.

DAY | Returns the day from the given date.

DAYS | Returns the number of days between two dates.

IF | Returns value based on the given expression.

IFS | Returns value based on the given multiple expressions.

AND | Returns TRUE if all the arguments are TRUE otherwise returns FALSE.

OR | Returns TRUE if any of the arguments are TRUE otherwise returns FALSE.

IFERROR | Returns value if no error found else it will return specified value.

Copyright © 2001 -2024 Syncfusion Inc.

CHOOSE | Returns a value from the list of values based on the index number.

INDEX | Returns the value of the cell in a given range based on row and column number.

FIND | Returns the position of a string within another string which is case sensitive.

CONCATENATE | Combines two or more strings together.

CONCAT | Concatenates a list or a range of text strings.

SUBTOTAL | Returns subtotal for a range using the given function number.

RADIANS | Converts degrees into radians.

MATCH | Returns the relative position of a specified value in the given range.

DefineNameExists | This name already exists try a different name.

CircularReference | When a formula refers to one or more circular references this may result in an incorrect calculation.

Loading translations

To load translation object in an application, use load function of the L10n class.

The following example demonstrates the Spreadsheet in French culture. In the below sample we have translated the ribbon tab names and Home tab content (clipboard, cell style).

APP.VUE

```
<template>
   <ejs-spreadsheet ref="spreadsheet" locale="fr-CH">
   <e-sheets>
          <e-sheet>
            <e-ranges>
              <e-range :dataSource="dataSource"></e-range>
            </e-ranges>
          </e-sheet>
        </e-sheets></ejs-spreadsheet>
</template>
<script>
import Vue from "vue";
import { L10n } from '@syncfusion/ej2-base';
import { SpreadsheetPlugin } from "@syncfusion/ej2-vue-spreadsheet";
import { defaultData } from './data.js';
Vue.use(SpreadsheetPlugin);
L10n.load({
    'fr-CH': {
        'spreadsheet': {
            'File': 'Fichier',
```

```
            'Home': 'Accueil',
            'Insert': 'Insérer',
            'Formulas': 'Formules',
            'Data': 'Les données',
            'View': 'Vue',
            'Cut': 'Coupe',
            'Copy': 'Copie',
            'Paste': 'Pâte',
            'PasteSpecial': 'Pâte spéciale',
            'All': 'Tous les',
            'Values': 'Valeurs',
            'Formats': 'Les formats',
            'Font': 'fonte',
            'FontSize': 'Taille de police',
            'Bold': 'Audacieux',
            'Italic': 'Italique',
            'Underline': 'Souligner',
            'Strikethrough': 'Barré',
            'TextColor': 'Couleur du texte',
            'FillColor': 'La couleur de remplissage',

Internationalization

The Internationalization library is used to globalize number, date, and time values in the spreadsheet component.

The following example demonstrates the Spreadsheet in French [fr-CH] culture. In the below sample we have globalized the Date(Date column), Time(Time column), and Currency(Amount column) formats.

`

```
<template>
<ejs-spreadsheet ref="spreadsheet" locale="fr-CH" :created="created">
<e-sheets>
<e-sheet>
<e-ranges>
<e-range :dataSource="dataSource"></e-range>
</e-ranges>
</e-sheet>
</e-sheets></ejs-spreadsheet>
</template>
<script>
import Vue from "vue";
import {
L10n,
setCulture,
setCurrencyCode,
loadCldr,
} from "@syncfusion/ej2-base";
import { SpreadsheetPlugin } from "@syncfusion/ej2-vue-spreadsheet";
import { defaultData } from './data.js';
L10n.load({
'fr-CH': {
'spreadsheet': {
'File': 'Fichier',
'Home': 'Accueil',
```

```
'Insert': 'Insérer',
'Formulas': 'Formules',
'Data': 'Les données',
'View': 'Vue',
'Cut': 'Coupe',
'Copy': 'Copie',
'Paste': 'Pâte',
'PasteSpecial': 'Pâte spéciale',
'All': 'Tous les',
'Values': 'Valeurs',
'Formats': 'Les formats',
'Font': 'fonte',
'FontSize': 'Taille de police',
'Bold': 'Audacieux',
'Italic': 'Italique',
'Underline': 'Souligner',
'Strikethrough': 'Barré',
'TextColor': 'Couleur du texte',
'FillColor': 'La couleur de remplissage',
'HorizontalAlignment': 'Alignement horizontal',
'AlignLeft': 'Alignez à gauche',
'AlignCenter': 'centre',
'AlignRight': 'Aligner à droite',
'VerticalAlignment': 'Alignement vertical',
'AlignTop': 'Aligner en haut',
'AlignMiddle': 'Aligner le milieu',
'AlignBottom': 'Aligner le bas',
'InsertFunction': 'Insérer une fonction',
'Delete': 'Effacer',
'Rename': 'Rebaptiser',
'Hide': 'Cacher',
'Unhide': 'Démasquer',
'NumberFormat': 'Nombre Format',
```

Copyright © 2001 -2024 Syncfusion Inc.

```
}
}
});
Vue.use(SpreadsheetPlugin);
import * as numberingSystems from "./numberingSystems.json";
import * as gregorian from "./ca-gregorian.json";
import * as numbers from "./numbers.json";
import * as timeZoneNames from "./timeZoneNames.json";
import * as currencies from "./currencies.json";

Internalization sample link

Right to left (RTL)

RTL provides an option to switch the text direction and layout of the Spreadsheet component from right to left. It improves the user experiences and accessibility for users who use right-to-left languages (Arabic, Farsi, Urdu, etc.). To enable RTL Spreadsheet, set the enableRtl to true.

APP.VUE

```
<template>
   <ejs-spreadsheet ref="spreadsheet" locale="ar-AE" :enableRtl="true">
   <e-sheets>
          <e-sheet>
            <e-ranges>
              <e-range :dataSource="dataSource"></e-range>
            </e-ranges>
          </e-sheet>
        </e-sheets></ejs-spreadsheet>
</template>
<script>
import Vue from "vue";
import { L10n } from '@syncfusion/ej2-base';
import { SpreadsheetPlugin } from "@syncfusion/ej2-vue-spreadsheet";
import { defaultData } from './data.js';

Undo redo in Vue Spreadsheet component

Undo option helps you to undone the last action performed and Redo option helps you to do the same action which is reverted in the Spreadsheet. You can use the allowUndoRedo property to enable or disable undo redo functionality in spreadsheet.

* The default value for allowUndoRedo property is true.

By default, the UndoRedo module is injected internally into Spreadsheet to perform undo redo.

Undo

It reverses the last action you performed with Spreadsheet. Undo can be done by any of the following ways:

- Select the undo item from HOME tab in Ribbon toolbar.
- Use Ctrl + Z keyboard shortcut to perform the undo.
- Use the undo method programmatically.

Redo

It reverses the last undo action you performed with Spreadsheet. Redo can be done by any of the following ways:

- Select the redo item from HOME tab in Ribbon toolbar.
- Use Ctrl + Y keyboard shortcut to perform the redo.
- Use the redo method programmatically.

Update custom actions in UndoRedo collection

You can update your own custom actions in UndoRedo collection, by using the updateUndoRedoCollection method. And also customize the undo redo operations of your custom action by using actionComplete event.

The following code example shows How to update and customize your own actions for undo redo functionality in the Spreadsheet control.

APP.VUE

```
<template>
  <div>
    <ejs-button id='customBtn' v-
on:click.native="updateCollection">add/remove Class</ejs-button>
    <ejs-spreadsheet ref="spreadsheet" :actionComplete="actionComplete">
      <e-sheets>
          <e-sheet>
            <e-ranges>
              <e-range :dataSource="dataSource"></e-range>
            </e-ranges>
             <e-columns>
              <e-column :width="width1"></e-column>
              <e-column :width="width2"></e-column>
            </e-columns>
          </e-sheet>
        </e-sheets></ejs-spreadsheet>

Use Cases

Collaborative editing in Vue Spreadsheet component

The collaborative editing support allows you to work at a spreadsheet collaboratively with other users. Multiple users can access to the the same spreadsheet simultaneously.

Dependencies

The following list of dependencies are required to use the collaborative editing support in spreadsheet.

`js

|-- @aspnet/signalr

|-- eventsource

|-- request

|-- ws

`

* Run the command `npm i @aspnet/signalr` to install `@aspnet/signalr` packages in your application.

Client configuration

To broadcast the data for every action in the spreadsheet, you need to transfer the data to the server through `send` method in `actionComplete` event and receive the same data by using the `dataReceived` method. In the `dataReceived` method, you need to update the action to the connected clients through `updateAction` method.

The following code example shows `Collaborative Editing` support in the Spreadsheet control.

`

```
<template>
<ejs-spreadsheet ref="spreadsheet" :actionComplete="actionComplete" :showFormulaBar="false">
<e-sheets>
<e-sheet>
<e-columns>
<e-column :width=180></e-column>
<e-column :width=130></e-column>
<e-column :width=130></e-column>
</e-columns>
</e-sheet>
</e-sheets>
</ejs-spreadsheet>
</template>
<script>
import Vue from "vue";
import { SpreadsheetPlugin } from "@syncfusion/ej2-vue-spreadsheet";
import * as signalR from '@aspnet/signalr';
Vue.use(SpreadsheetPlugin);
export default {
data: () => {
return {
connection: null,
}
},
mounted: function () {
var spreadsheet = this.$refs.spreadsheet;
this.connection = new
signalR.HubConnectionBuilder().withUrl('https://localhost:44385/hubs/spreadsheethub', { // localhost
from AspNetCore service
skipNegotiation: true,
transport: signalR.HttpTransportType.WebSockets
}).build();
this.connection.start().then(() => { // to start the server
console.log('server connected!!!');
```

Copyright © 2001 -2024 Syncfusion Inc.

```
}).catch(err => console.log(err));
this.connection.on('dataReceived', (data) => {
var model = JSON.parse(data);
spreadsheet.updateAction(model); // update the action to the connected clients
});
},
methods: {
actionComplete: function(args) {
this.connection.send('BroadcastData', JSON.stringify(args)); // send the action data to the server
}
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-spreadsheet/styles/material.css";
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-dropdowns/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-navigations/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-grids/styles/material.css';
@import "../node_modules/@syncfusion/ej2-spreadsheet/styles/material.css";
</style>
`
```

Server configuration

To make the communication between the server to the connected clients and from clients to the server, you need to configure the signalR Hubs using the following code.

```
`js
import * as signalR from '@aspnet/signalr';
// For signalR Hub connection
```

public connection = new signalR.HubConnectionBuilder().withUrl('https://localhost:44385/hubs/spreadsheethub', { // localhost from AspNetCore service

skipNegotiation: true,

transport: signalR.HttpTransportType.WebSockets

}).build();

`

Hub configuration

Initially create a AspNetCore project and add the hub file for sending and receiving the data between server and clients.

`javascript

using Microsoft.AspNetCore.SignalR;

using System.Threading.Tasks;

namespace WebApplication.Hubs

{

public class SpreadsheetHub : Hub

{

public async Task BroadcastData(string data)

{

await Clients.Others.SendAsync("dataReceived", data);

}

}

}

`

To configure the SignalR middleware by registering the following service in the ConfigureServices method of the Startup class.

`javascript

services.AddSignalR(e =>

{

e.MaximumReceiveMessageSize = int.MaxValue; // Option to increase message size for inserting image feature. By default, SignalR send messages up to 32 KB.

});

`

To set up the SignalR routes by calling MapHub in the Configure method of the Startup class.

`javascript

Copyright © 2001 -2024 Syncfusion Inc.

```
app.UseEndpoints(endpoints =>
{
endpoints.MapRazorPages();
endpoints.MapHub<SpreadsheetHub>("/hubs/spreadsheethub");
});
```

For hosting the service, you may use the above code snippet or download and run the local service.

Prevent the particular action update for collaborative client

Using the `action` argument from the `actionComplete` event, you can prevent the particular action update for collaborative client.

The following code example shows how to prevent collaborative client from updating the `format` action.

```
<template>
<ejs-spreadsheet ref="spreadsheet" :actionComplete="actionComplete" :showFormulaBar="false">
<e-sheets>
<e-sheet>
<e-columns>
<e-column :width=180></e-column>
<e-column :width=130></e-column>
<e-column :width=130></e-column>
</e-columns>
</e-sheet>
</e-sheets>
</ejs-spreadsheet>
</template>
<script>
import Vue from "vue";
import { SpreadsheetPlugin } from "@syncfusion/ej2-vue-spreadsheet";
import * as signalR from '@aspnet/signalr';
Vue.use(SpreadsheetPlugin);
export default {
data: () => {
return {
connection: null,
```

Copyright © 2001 -2024 Syncfusion Inc.

```
}
},
mounted: function () {
var spreadsheet = this.$refs.spreadsheet;
this.connection = new signalR.HubConnectionBuilder().withUrl('https://localhost:44385/hubs/spreadsheethub', { // localhost from AspNetCore service
skipNegotiation: true,
transport: signalR.HttpTransportType.WebSockets
}).build();
this.connection.start().then(() => { // to start the server
console.log('server connected!!!');
}).catch(err => console.log(err));
this.connection.on('dataReceived', (data) => {
var model = JSON.parse(data);
spreadsheet.updateAction(model); // update the action to the connected clients
});
},
methods: {
actionComplete: function(args) {
if (args.action != 'format'){
this.connection.send('BroadcastData', JSON.stringify(args)); // send the action data to the server
}
}
}
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-spreadsheet/styles/material.css";
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-dropdowns/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-navigations/styles/material.css';
```

@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';

@import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';

@import '../node_modules/@syncfusion/ej2-grids/styles/material.css';

@import "../node_modules/@syncfusion/ej2-spreadsheet/styles/material.css";

</style>

`

Perform import action for collaborative clients

Using the action argument from the actionComplete event, you can identity whether the import action is performed or not. If the action is import, then you need to send the response data to the server and also update the same to the collaborative clients.

The following code example shows how to perform the import functionality for collaborative clients.

`

<template>

<ejs-spreadsheet ref="spreadsheet" :openUrl="openUrl" :actionComplete="actionComplete"></ejs-spreadsheet>

</template>

<script>

import { SpreadsheetComponent } from "@syncfusion/ej2-vue-spreadsheet";

import { isNullOrUndefined } from "@syncfusion/ej2-base";

import * as signalR from '@microsoft/signalr';

export default {

components: {

"ejs-spreadsheet": SpreadsheetComponent,

},

data: () => {

return {

connection: null,

openUrl: 'https://services.syncfusion.com/vue/production/api/spreadsheet/open',

}

},

mounted: function () {

// Fetch the spreadsheet instance.

var spreadsheet = this.$refs.spreadsheet;

this.connection = new signalR.HubConnectionBuilder().withUrl('https://localhost:44385/hubs/spreadsheethub', {

Copyright © 2001 -2024 Syncfusion Inc.

```
skipNegotiation: true,
transport: signalR.HttpTransportType.WebSockets
}).build();
this.connection.start().then(() => {
console.log('server connected!!!');
}).catch(err => console.log(err));
this.connection.on('dataReceived', (data) => {
const model = JSON.parse(
data
);
// Condition to check whether action performed is import.
if (isNullOrUndefined(model['action'])) {
// Load the imported excel file data as JSON to the connected clients.
const jsonData = { Workbook: model };
spreadsheet.openFromJson({ file: jsonData });
}
else {
// Update the action details to the connected clients.
spreadsheet.updateAction(model);
}
});
},
methods: {
actionComplete: function (args) {
if (args.action === 'import') {
// Send the action data to the server in args.response at the time of importing an excel file.
this.connection.send("BroadcastData", JSON.stringify(args.response.data));
}
else {
// Send the action data to the server for other than import actions.
this.connection.send("BroadcastData", JSON.stringify(args));
}
}
```

Copyright © 2001 -2024 Syncfusion Inc.

}

}

</script>

How To

Sort a range by custom list in Vue Spreadsheet component

You can also define the sorting of cell values based on your own customized personal list. In this article, custom list is achieved using custom sort comparer.

In the following demo, the Trustworthiness column is sorted based on the custom lists Perfect, Sufficient, and Insufficient.

APP.VUE

```
<template>
   <ejs-spreadsheet ref="spreadsheet" :allowSorting='true'
:dataBound="dataBound" :sortComplete="sortComplete">
   <e-sheets>
          <e-sheet>
            <e-ranges>
              <e-range :dataSource="dataSource"></e-range>
            </e-ranges>
          </e-sheet>
        </e-sheets></ejs-spreadsheet>
</template>
<script>
import Vue from "vue";
import { SpreadsheetPlugin } from "@syncfusion/ej2-vue-spreadsheet";
import { DataManager, DataUtil } from '@syncfusion/ej2-data';
import { tradeData } from './data.js';
Vue.use(SpreadsheetPlugin);
export default {
```

```
    data: () => {
     return {
       dataSource: tradeData,
     }
   },
   methods: {
     dataBound: function () {
         var spreadsheet = this.$refs.spreadsheet;
         if (spreadsheet.ej2Instances.activeSheetIndex === 0) {
            spreadsheet.sort({sortDescriptors: { field: 'F',  sortComparer:
this.mySortComparer }, containsHeader: true}, 'A1:H20');
         }
     },
     sortComplete: function (args) {
         var spreadsheet = this.$refs.spreadsheet;
         spreadsheet.selectRange(args.range);
         // code here.
     },
     mySortComparer: function (x, y) {
    // custom sort comparer to sort based on the custom list.
     var customList = ['Perfect', 'Sufficient', 'Insufficient'];
     var comparer = DataUtil.fnSort('Ascending');
     return comparer(x ? customList.indexOf(x.value) : x, y ?
customList.indexOf(y.value) : y);
      };
   }
}
</script>
<style>

Print in Vue Spreadsheet component

You can use the print method by importing from ej2-base package. Here, the Select event in the dropdown and the dataBound event are used to print the single/multiple sheets of data. To print the

single/multiple sheets, use the dropdown button and select the Print (or) Print All option. In the following sample, you can be able to print the single/multiple sheets.

APP.VUE

```
<template><div>
<ejs-dropdownbutton :items='items' :select='itemSelect'>Print</ejs-
dropdownbutton>
  <ejs-spreadsheet id="spreadsheet" ref="spreadsheet" :created="created"
:dataBound="dataBound">
                <e-sheets>
                  <e-sheet name="Budget">
                    <e-ranges>
                      <e-range :dataSource="dataSource1"></e-range>
                    </e-ranges>
                    <e-columns>
                      <e-column :width=100></e-column>
                      <e-column :width=100></e-column>
                      <e-column :width=100></e-column>
                      <e-column :width=100></e-column>
                    </e-columns>
                  </e-sheet>
                  <e-sheet name="Salary">
                    <e-ranges>
                      <e-range :dataSource="dataSource2"></e-range>
                    </e-ranges>
                    <e-columns>
                      <e-column :width=100></e-column>
                      <e-column :width=100></e-column>
                      <e-column :width=100></e-column>
                      <e-column :width=100></e-column>
                      </e-columns>
                  </e-sheet>
                </e-sheets>

Changing the active sheet while importing a file in Vue Spreadsheet component

You can change the active sheet of imported file by updating activeSheetIndex property on the openComplete event.

The following code example shows how to set the active sheet when importing an Excel file.

APP.VUE

```
<template>
  <ejs-spreadsheet ref="spreadsheet" :openUrl="openUrl" :saveUrl="saveUrl"
:openComplete="openComplete"></ejs-spreadsheet>
</template>
<script>
import Vue from "vue";
import { SpreadsheetPlugin } from "@syncfusion/ej2-vue-spreadsheet";
Vue.use(SpreadsheetPlugin);
export default {
  data: () => {
    return {
      openUrl:
'https://services.syncfusion.com/vue/production/api/spreadsheet/open',
      saveUrl:
'https://services.syncfusion.com/vue/production/api/spreadsheet/save'
    }
```

Copyright © 2001 -2024 Syncfusion Inc.

```
  },
  methods: {
    openComplete: function () {
      var spreadsheet = this.$refs.spreadsheet;
      if (spreadsheet) {
        spreadsheet.activeSheetIndex = 2;
      }
    }
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-vue-
spreadsheet/styles/material.css";

{% previewsample "page.domainurl/code-snippet/spreadsheet/change-active-sheet-cs1" %}

Import an excel document using file uploader in ##Platform_Name## Spreadsheet component

If you explore your machine to select and upload an excel document using the file uploader, you will receive the uploaded document as a raw file in the success event of the file uploader. In this success event, you should pass the received raw file as an argument to the Spreadsheet's open method to see the appropriate output.

The following code example shows how to import an excel document using file uploader in spreadsheet.

APP.VUE

```
<template>
  <div>
    <ejs-spreadsheet
      id="spreadsheet"
      ref="spreadsheet"
      :openUrl="openUrl"
    ></ejs-spreadsheet>
    <ejs-uploader
      :asyncSettings="path"
      :success="onSuccess"
      :allowedExtensions="allowExtentions"
    ></ejs-uploader>
  </div>
</template>
<script>
import Vue from "vue";
import { SpreadsheetPlugin } from "@syncfusion/ej2-vue-spreadsheet";
import { UploaderPlugin } from "@syncfusion/ej2-vue-inputs";
import { getComponent } from "@syncfusion/ej2-base";
```

```
Vue.use(UploaderPlugin);
Vue.use(SpreadsheetPlugin);
export default {
  data: () => {
    return {
      allowExtentions: ".xlsx, .xls, .csv",
      path: {
        saveUrl:

"https://services.syncfusion.com/vue/production/api/FileUploader/Save",
        removeUrl:

"https://services.syncfusion.com/vue/production/api/FileUploader/Remove",
      },
      openUrl:

Identify the context menu opened in Vue Spreadsheet component

The Spreadsheet includes several context menus that will open and display depending on the action. When you right-click on a cell, for example, a context menu with options related to the cell element appears.

The class name returned by the contextMenuBeforeOpen event can be used to identify the context menu that is opened. The context menus and their class names are tabulated below.

| Class name | Context menu name |

|-------|---------|

| .e-sheet-content | Cell context menu |

| .e-toolbar-item | Footer context menu |

| .e-rowhdr-table | Row header context menu |

| .e-colhdr-table | Column header context menu |

The following code example shows how to identify the context menu opened.

APP.VUE

```
<template>
  <ejs-spreadsheet
    ref="spreadsheet"
    :contextMenuBeforeOpen="contextMenuBeforeOpen"
  ></ejs-spreadsheet>
</template>
<script>
import Vue from "vue";
import { SpreadsheetPlugin } from "@syncfusion/ej2-vue-spreadsheet";
import { closest } from "@syncfusion/ej2-base";
Vue.use(SpreadsheetPlugin);
export default {
  methods: {
    contextMenuBeforeOpen: function (args) {
      if (closest(args.event.target, ".e-sheet-content")) {
        console.log("Cell Context Menu");
      } else if (closest(args.event.target, ".e-colhdr-table")) {
        console.log("Column Header Context Menu");
      } else if (closest(args.event.target, ".e-rowhdr-table")) {
        console.log("Row Header Context Menu");
      } else if (closest(args.event.target, ".e-toolbar-item")) {
        console.log("Footer Context Menu");
      }
    },
  },
};

Save and open Spreadsheet data as a Base64 string in Vue Spreadsheet component

In the Spreadsheet component, there is currently no direct option to save and open data as a Base64 string. You can achieve this by saving the Spreadsheet data as blob data and then converting that saved blob data to a Base64 string using FileReader.

You can get the Spreadsheet data as blob in the saveComplete event when you set the needBlobData as **true** and isFullPost as **false** in the beforeSave event.

The following code example shows how to save and open the spreadsheet data as base64 string.

APP.VUE

```
<template>
  <div>
    <ejs-button class="e-btn custom-btn" v-
on:click.native="importBtn">Import Base64</ejs-button>
    <ejs-button class="e-btn custom-btn" v-
on:click.native="exportBtn">Export as Base64</ejs-button>
    <ejs-spreadsheet ref="spreadsheet" :openUrl="openUrl"
:beforeSave="beforeSave" :saveComplete="saveComplete">
      <e-sheets>
        <e-sheet name="Car Sales Report">
          <e-ranges>
            <e-range :dataSource="dataSource"></e-range>
          </e-ranges>
          <e-columns>
            <e-column :width=180></e-column>
            <e-column :width=130></e-column>
            <e-column :width=130></e-column>
            <e-column :width=180></e-column>
            <e-column :width=120></e-column>
            <e-column :width=130></e-column>
          </e-columns>
        </e-sheet>
      </e-sheets>
    </ejs-spreadsheet>
  </div>
</template>
<script>

Insert a sheet programmatically and make it the active sheet in Vue Spreadsheet component

A sheet is a collection of cells organized in the form of rows and columns that allows you to store, format, and manipulate the data. Using insertSheet method, you can insert one or more sheets at the desired index. Then, you can make the inserted sheet as active sheet by focusing the start cell of that sheet using the goTo method.

The following code example shows how to insert a sheet programmatically and make it the active sheet.

APP.VUE

```
<template>
  <div>
    <ejs-button class="e-btn custom-btn" v-
on:click.native="insertSheet">Insert Sheet</ejs-button>
    <ejs-spreadsheet ref="spreadsheet">
      <e-sheets>
        <e-sheet name="Car Sales Report">
          <e-ranges>
            <e-range :dataSource="dataSource"></e-range>
          </e-ranges>
          <e-columns>
            <e-column :width=180></e-column>
            <e-column :width=130></e-column>
            <e-column :width=130></e-column>
            <e-column :width=180></e-column>
            <e-column :width=130></e-column>
            <e-column :width=120></e-column>
          </e-columns>
        </e-sheet>
      </e-sheets>
    </ejs-spreadsheet>
  </div>
</template>
<script>
import Vue from "vue";

Get the filtered rows in Vue Spreadsheet component

Filtering allows you to view specific rows in a spreadsheet while hiding the others. The allowFiltering property allows you to enable or disable filtering functionality through the UI. You can also use the allowFiltering property and applyFilter method combination to filter data via code behind. The filtered rows can be identified by iterating through the row collection on the sheet and using the isFiltered property available in each row object.

The following code example shows how to get the filtered rows.

APP.VUE

```
<template>
  <div>
    <ejs-button class="e-btn custom-btn" @click="getFilterData">Get Filtered
Data</ejs-button>
    <ejs-spreadsheet ref="spreadsheet" :created="created">
      <e-sheets>
        <e-sheet>
          <e-ranges>
            <e-range :dataSource="dataSource"></e-range>
          </e-ranges>
```

```
          <e-columns>
            <e-column :width="width1"></e-column>
            <e-column :width="width2"></e-column>
            <e-column :width="width2"></e-column>
            <e-column :width="width1"></e-column>
            <e-column :width="width2"></e-column>
            <e-column :width="width3"></e-column>
          </e-columns>
        </e-sheet>
      </e-sheets></ejs-spreadsheet>
  </div>
</template>

Mobile responsiveness in Vue Spreadsheet component

The Spreadsheet control rendered in desktop mode will be adaptive in all mobile devices where the layout gets adjusted based on their parent element’s dimensions to accommodate any resolution.

You can see the overflowed items of ribbon header, ribbon content, and sheet tab using touch and swipe action. The right navigation arrow is added at the end of the ribbon content through which the user can navigate towards overflowed items. Once you reached the rightmost end of the ribbon content, the right navigation arrow will change to left navigation arrow through which you can navigate to the left of the ribbon content.

Stepper

Getting Started with the Vue Stepper Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using Vue-CLI and integrating the Syncfusion Vue Stepper component using the Composition API / Options API.

Prerequisites

System requirements for Syncfusion Vue UI components

Dependencies

The following list of dependencies are required to use the Stepper component in your application.

`js

|-- @syncfusion/ej2-vue-navigations

|-- @syncfusion/ej2-base

|-- @syncfusion/ej2-popups

|-- @syncfusion/ej2-navigations

|-- @syncfusion/ej2-vue-base

`

Setting up the Vue 2 project

To generate a Vue 2 project using Vue-CLI, use the vue create command. Follow these steps to install Vue CLI and create a new project:

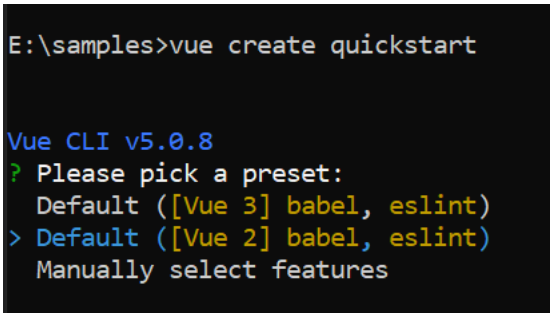
Copyright © 2001 -2024 Syncfusion Inc.

`bash
npm install -g @vue/cli
vue create quickstart
cd quickstart
npm run serve
`

or

`bash
yarn global add @vue/cli
vue create quickstart
cd quickstart
yarn run serve
`

When creating a new project, choose the option `Default ([Vue 2] babel, eslint)` from the menu.



Once the `quickstart` project is set up with default settings, proceed to add Syncfusion components to the project.

Adding Syncfusion Vue packages

Syncfusion packages are available at npmjs.com. To use Vue components, install the required npm package.

Install the `@syncfusion/ej2-vue-navigations` package by running the following command:

`bash
npm install @syncfusion/ej2-vue-navigations --save
`

or

`bash
yarn add @syncfusion/ej2-vue-navigations
`

Copyright © 2001 -2024 Syncfusion Inc.

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, the Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the Stepper component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
</style>
```

Adding Syncfusion Vue component

Follow the below steps to add the Vue Stepper component using Composition API or Options API:

1\. First, import and register the Stepper component in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { StepperComponent as EjsStepper } from "@syncfusion/ej2-vue-
navigations";
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { StepperComponent } from "@syncfusion/ej2-vue-navigations";
export default {
components: {
'ejs-stepper': StepperComponent
}
}
</script>
```

2\. In the template section, define the Stepper component.

~/SRC/APP.VUE

```
<template>
<ejs-stepper id="stepper"></ejs-stepper>
</template>
```

Adding steps

You can use the <e-step> directive within the <e-steps> directive to define each step.

Copyright © 2001 -2024 Syncfusion Inc.

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<ejs-stepper id="stepper">
<e-steps>
<e-step></e-step>
<e-step></e-step>
<e-step></e-step>
<e-step></e-step>
<e-step></e-step>
</e-steps>
</ejs-stepper>
</template>
<script setup>
import { StepperComponent as EjsStepper, StepsDirective as ESteps,
StepDirective as EStep  } from "@syncfusion/ej2-vue-navigations";
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<ejs-stepper id="stepper">
<e-steps>
<e-step></e-step>
<e-step></e-step>
<e-step></e-step>
<e-step></e-step>
<e-step></e-step>
</e-steps>
</ejs-stepper>
</template>
<script>
import { StepperComponent, StepsDirective, StepDirective } from
"@syncfusion/ej2-vue-navigations";
export default {
components: {
'ejs-stepper': StepperComponent,
"e-steps": StepsDirective,
"e-step": StepDirective
}
};
</script>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
  <ejs-stepper id="stepper">
      <e-steps>
        <e-step></e-step>
        <e-step></e-step>
        <e-step></e-step>
        <e-step></e-step>
        <e-step></e-step>
      </e-steps>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
  </ejs-stepper>
</template>
<script setup>
  import { StepperComponent as EjsStepper, StepsDirective as ESteps,
StepDirective as EStep  } from "@syncfusion/ej2-vue-navigations";
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-
navigations/styles/material.css";
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
  <ejs-stepper id="stepper">
        <e-steps>
          <e-step></e-step>
          <e-step></e-step>
          <e-step></e-step>
          <e-step></e-step>
          <e-step></e-step>
        </e-steps>
  </ejs-stepper>
</template>
<script>
import { StepperComponent, StepsDirective, StepDirective } from
"@syncfusion/ej2-vue-navigations";
export default {
    components: {
      'ejs-stepper': StepperComponent,
      "e-steps": StepsDirective,
      "e-step": StepDirective
    }
};
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-
navigations/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-base/styles/material.css";
</style>
```

Run the project

To run the project, use the following command:

`bash

npm run serve

`

Copyright © 2001 -2024 Syncfusion Inc.

or

`bash

yarn run serve

`

{% previewsample "page.domainurl/code-snippet/stepper/getting-started-cs1" %}

Configure icon and label

You can define the step icon and label by setting the iconCss and label properties using <e-step> directive.

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
  <div class="iconWithLabel">
    <ejs-stepper id="stepper">
        <e-steps>
            <e-step label='Cart' iconCss='sf-icon-cart'></e-step>
            <e-step label='Address' iconCss='sf-icon-user'></e-step>
            <e-step label='Delivery' iconCss='sf-icon-transport'></e-step>
            <e-step label='Payment' iconCss='sf-icon-payment'></e-step>
            <e-step label='Ordered' iconCss='sf-icon-success'></e-step>
        </e-steps>
    </ejs-stepper>
  </div>
</template>

<script setup>
  import { StepperComponent as EjsStepper, StepsDirective as ESteps,
StepDirective as EStep  } from "@syncfusion/ej2-vue-navigations";
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-
navigations/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-base/styles/material.css";

Getting Started with Syncfusion Stepper Component in Vue 3

This article provides a step-by-step guide for setting up a Vite project with a JavaScript environment and integrating the Syncfusion Vue Stepper component using the Composition API / Options API.

The Composition API is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

The Options API is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

Prerequisites

System requirements for Syncfusion Vue UI components

Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using Vite. To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

`bash

npm create vite@latest

`

or

`bash

yarn create vite

`

Using one of the above commands will lead you to set up additional configurations for the project as below:

1.Define the project name: We can specify the name of the project directly. Let's specify the name of the project as my-project for this article.

`bash

? Project name: » my-project

`

2.Select Vue as the framework. It will create a Vue 3 project.

`bash

? Select a framework: » - Use arrow-keys. Return to submit.

Vanilla

Vue

React

Preact

Lit

Svelte

Others

`

3.Choose JavaScript as the framework variant to build this Vite project using JavaScript and Vue.

`bash

? Select a variant: » - Use arrow-keys. Return to submit.

JavaScript

TypeScript

Customize with create-vue ↗

Nuxt ↗

`

4.Upon completing the aforementioned steps to create the my-project, run the following command to install its dependencies:

`bash

cd my-project

npm install

`

or

`bash

cd my-project

Copyright © 2001 -2024 Syncfusion Inc.

yarn install

`

Now that my-project is ready to run with default settings, let's add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion Vue component packages are available at npmjs.com. To use Syncfusion Vue components in the project, install the corresponding npm package.

To use the Vue Stepper component in the project, the @syncfusion/ej2-vue-navigations package needs to be installed using the following command:

`bash

npm install @syncfusion/ej2-vue-navigations --save

`

or

`bash

yarn add @syncfusion/ej2-vue-navigations

`

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the Button component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
navigations/styles/material.css";
</style>
```

Adding Syncfusion Vue Stepper component

Follow the below steps to add the Vue Stepper component using Composition API or Options API:

Importing the component and directives

First, import and register the Stepper component in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { StepperComponent as EjsStepper, StepsDirective as ESteps,
StepDirective as EStep  } from "@syncfusion/ej2-vue-navigations";
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { StepperComponent, StepsDirective, StepDirective } from
"@syncfusion/ej2-vue-navigations";
export default {
components: {
'ejs-stepper': StepperComponent,
"e-steps": StepsDirective,
"e-step": StepDirective
}
};
</script>
```

Adding the Stepper component

Add the component definition in template section.

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<ejs-stepper id="stepper"></ejs-stepper>
</template>
<script setup>
import { StepperComponent as EjsStepper } from "@syncfusion/ej2-vue-
navigations";
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
navigations/styles/material.css";
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<ejs-stepper id="stepper"></ejs-stepper>
</template>
<script>
import { StepperComponent } from "@syncfusion/ej2-vue-navigations";
export default {
components: {
'ejs-stepper': StepperComponent
}
};
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
```

Copyright © 2001 -2024 Syncfusion Inc.

```
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
navigations/styles/material.css";
</style>
```

Adding steps

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<ejs-stepper id="stepper">
<e-steps>
<e-step></e-step>
<e-step></e-step>
<e-step></e-step>
<e-step></e-step>
<e-step></e-step>
</e-steps>
</ejs-stepper>
</template>
<script setup>
import { StepperComponent as EjsStepper, StepsDirective as ESteps,
StepDirective as EStep  } from "@syncfusion/ej2-vue-navigations";
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
navigations/styles/material.css";
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<ejs-stepper id="stepper">
<e-steps>
<e-step></e-step>
<e-step></e-step>
<e-step></e-step>
<e-step></e-step>
<e-step></e-step>
</e-steps>
</ejs-stepper>
</template>
<script>
import { StepperComponent, StepsDirective, StepDirective } from
"@syncfusion/ej2-vue-navigations";
export default {
components: {
'ejs-stepper': StepperComponent,
"e-steps": StepsDirective,
"e-step": StepDirective
```

Copyright © 2001 -2024 Syncfusion Inc.

```
}
};
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
navigations/styles/material.css";
</style>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<div class="iconWithLabel">
<ejs-stepper id="stepper">
<e-steps>
<e-step label='Cart' iconCss='sf-icon-cart'></e-step>
<e-step label='Address' iconCss='sf-icon-user'></e-step>
<e-step label='Delivery' iconCss='sf-icon-transport'></e-step>
<e-step label='Payment' iconCss='sf-icon-payment'></e-step>
<e-step label='Ordered' iconCss='sf-icon-success'></e-step>
</e-steps>
</ejs-stepper>
</div>
</template>
<script setup>
import { StepperComponent as EjsStepper, StepsDirective as ESteps,
StepDirective as EStep  } from "@syncfusion/ej2-vue-navigations";
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
navigations/styles/material.css";

```

Run the project

To run the project, use the following command:

`bash

npm run dev

`

or

`bash

yarn run dev

`

The output will appear as follows:

For migrating from Vue 2 to Vue 3, refer to the migration documentation.

Steps in Vue Stepper component

The Vue Stepper allows you to add steps using the <e-step> directive . Each step can be configured with options such as iconCss, text, label, cssClass and more.

Adding steps

You can define the icon and text content for each step using the iconCss, text and label properties.

Copyright © 2001 -2024 Syncfusion Inc.

Defining icon CSS

You can define the CSS class to show the icon for each step using the iconCss property.

APP.VUE

```
<template>
  <div class="step-icon">
    <ejs-stepper id="stepper">
      <e-steps>
        <e-step iconCss='sf-icon-cart'></e-step>
        <e-step iconCss='sf-icon-transport'></e-step>
        <e-step iconCss='sf-icon-payment'></e-step>
        <e-step iconCss='sf-icon-success'></e-step>
      </e-steps>
    </ejs-stepper>
  </div>
</template>
<script>

```
  .sf-icon-cart:before { content: "\e710"; }
  .sf-icon-transport:before { content: "\e702"; }
  .sf-icon-payment:before { content: "\e706"; }
  .sf-icon-success:before { content: "\e715"; }
  .step-icon {
    margin-top: 30px;
    padding: 30px;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/stepper/icon" %}

Defining text content

You can define text instead of an icon by setting the `text` property and display label content for a step using the `label` property.

When both label and text are defined, the label takes priority for display based on the `stepType`.

APP.VUE

```
<template>
  <div class="step-text">
    <ejs-stepper id="stepper" stepType="indicator">
      <e-steps>
        <e-step text='A'></e-step>
        <e-step text='B'></e-step>
        <e-step text='C'></e-step>
        <e-step text='D'></e-step>
      </e-steps>
    </ejs-stepper>
    <ejs-stepper id="labelStepper">
      <e-steps>
        <e-step label='Cart'></e-step>
        <e-step label='Delivery Address'></e-step>
        <e-step label='Payment'></e-step>
        <e-step label='Confirmation'></e-step>
      </e-steps>
    </ejs-stepper>
  </div>
</template>
<script>
import { StepperComponent, StepsDirective, StepDirective } from
"@syncfusion/ej2-vue-navigations";
export default {
  components: {
    'ejs-stepper': StepperComponent,
    "e-steps": StepsDirective,
    "e-step": StepDirective
  }
};
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
```

```
  @import "../node_modules/@syncfusion/ej2-vue-
navigations/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-base/styles/material.css";
  .step-text {
    margin-top: 30px;
    padding: 30px;
  }
  #labelStepper {
    margin-top: 50px;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/stepper/text" %}

Optional steps

You can show whether the step is optional or not by using optional property. By default, the optional property is false.

APP.VUE

```
<template>
  <div class="optional-step">
    <ejs-stepper id="stepper">
      <e-steps>
        <e-step iconCss='sf-icon-cart'></e-step>
        <e-step iconCss='sf-icon-transport'></e-step>
        <e-step iconCss='sf-icon-payment' optional=true></e-step>
        <e-step iconCss='sf-icon-success'></e-step>
      </e-steps>
    </ejs-stepper>
  </div>
</template>
<script>
import { StepperComponent, StepsDirective, StepDirective } from
"@syncfusion/ej2-vue-navigations";
export default {
  components: {
    'ejs-stepper': StepperComponent,
    "e-steps": StepsDirective,
    "e-step": StepDirective
  }
};
</script>

Disabling steps

You can use the disabled property to disable a step, preventing user interaction when set to true. By default, the value is false.

APP.VUE

```
<template>
  <div class="disabled-step">
    <ejs-stepper id="stepper">
      <e-steps>
        <e-step iconCss='sf-icon-cart'></e-step>
        <e-step iconCss='sf-icon-transport'></e-step>
        <e-step iconCss='sf-icon-payment' disabled="true"></e-step>
        <e-step iconCss='sf-icon-success'></e-step>
      </e-steps>
    </ejs-stepper>
  </div>
</template>

Setting active step

You can set the active step by specifying its index using the activeStep property. The default value is 0.

APP.VUE

```
<template>
  <div class="step-icon">
    <ejs-stepper id="stepper" :activeStep=1>
      <e-steps>
        <e-step iconCss='sf-icon-cart'></e-step>
        <e-step iconCss='sf-icon-transport'></e-step>
        <e-step iconCss='sf-icon-payment'></e-step>
        <e-step iconCss='sf-icon-success'></e-step>
      </e-steps>
```

Copyright © 2001 -2024 Syncfusion Inc.

```

Step status

Each step's progress state can be specified using the `status` property. The possible values are `NotStarted`, `InProgress` and `Completed`. By default, the value is `NotStarted`.

APP.VUE

```
<template>
  <div class="stepper-section">
    <ejs-stepper id="stepper" ref="stepper" :stepChanged="stepChanged">
      <e-steps>
        <e-step label='Cart' iconCss='sf-icon-cart'></e-step>
        <e-step label='Payment' iconCss='sf-icon-payment'></e-step>
        <e-step label='Ordered' iconCss='sf-icon-success'></e-step>
      </e-steps>
    </ejs-stepper>

Step styling

You can use the cssClass property to customize the appearance of each step.

APP.VUE

```
<template>
  <div class="stepper-customize">
    <ejs-stepper id="iconStepper">
      <e-steps>
        <e-step iconCss='sf-icon-cart' label='Cart'></e-step>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
        <e-step iconCss='sf-icon-transport' label='Delivery Address'></e-
step>
        <e-step iconCss='sf-icon-payment' label='Payment' cssClass="custom-
step" optional=true></e-step>
        <e-step iconCss='sf-icon-success' label='Confirmation'></e-step>
      </e-steps>
    </ejs-stepper>
  </div>
</template>
<script>
import { StepperComponent, StepsDirective, StepDirective } from

Step validation

You can set the validation state for each step to displaying a success or error icon by using isValid property.

To know more about Stepper validation, please refer to the Validation section.

Step types in Vue Stepper component

The Stepper component provides support for displaying steps with the following step types.

Default type

In default type, the Stepper displays steps with a combination of both indicators and labels by setting the stepType property as Default. By default, the Stepper displays steps in the Default type.

APP.VUE

```
<template>
  <div class="step-default">
    <ejs-stepper id="stepper" stepType="default">
        <e-steps>
          <e-step label='Cart' iconCss='sf-icon-cart'></e-step>
          <e-step label='Delivery' iconCss='sf-icon-transport'></e-step>
          <e-step label='Payment' iconCss='sf-icon-payment'></e-step>
          <e-step label='Ordered' iconCss='sf-icon-success'></e-step>
        </e-steps>
    </ejs-stepper>
  </div>
</template>
<script>
import { StepperComponent, StepsDirective, StepDirective } from

</style>
```

{% previewsample "page.domainurl/code-snippet/stepper/defaultStepType" %}

Label type

In label type, the Stepper displays the steps with only the step labels by setting the stepType property as Label.

When both label and text are defined, the label takes priority in displaying the steps.

APP.VUE

```
<template>
  <div class="step-label">
    <ejs-stepper id="stepper" stepType="label">
        <e-steps>
          <e-step label='Cart' iconCss='sf-icon-cart'></e-step>
          <e-step label='Delivery' iconCss='sf-icon-transport'></e-step>
          <e-step label='Payment' iconCss='sf-icon-payment'></e-step>
          <e-step label='Ordered' iconCss='sf-icon-success'></e-step>
        </e-steps>
  </ejs-stepper>
  </div>
</template>

Label positions

You can display the label on the top, bottom, left, or right side of the steps using the labelPosition property.

The following label positions are supported in Stepper:

| Value | Description |

|-----|-----|

| Top | Positions the label at the top of each step. |

| Bottom | Positions the label at the bottom of each step. |

Copyright © 2001 -2024 Syncfusion Inc.

| Start | Positions the label to the left side of each step. |

| End | Positions the label to the right side of each step. |

APP.VUE

```
<template>
  <div class="step-label-position">
    <div class="e-btn-group">
      <input type="radio" id="start" name="position" value="start" v-
on:click="updateLabelPosition" />
      <label class="e-btn" for="start">Start</label>

Indicator type

In indicator type, the Stepper displays steps with only the step indicators by setting the stepType property as Indicator.

APP.VUE

```
<template>
  <div class="step-indicator">
    <ejs-stepper id="stepper" stepType="indicator">
        <e-steps>
          <e-step></e-step>

Linear flow in Vue Stepper component

The Stepper component enables users to progress sequentially through each step, ensuring navigation from one step to the next in a linear way by setting the linear property to true. The default value is false allowing navigation between any steps and vice versa.

The example demonstrates the functionality of both linear and non-linear flow in the Stepper.

APP.VUE

```
<template>
  <div class="step-type">
    <div class="e-btn-group">
      <input type="radio" id="linear" name="Linear"  value="true" v-
on:click="updateLinear" checked/>
      <label class="e-btn" for="linear">Linear</label>
      <input type="radio" id="nonLinear" name="Linear" value="false" v-
on:click="updateLinear" />
      <label class="e-btn" for="nonLinear">Non-Linear</label>
    </div>
    <div class="linear-stepper-control">
      <ejs-stepper id="stepper" ref="stepper" linear="true">
        <e-steps>
          <e-step label='Cart' iconCss='sf-icon-cart'></e-step>
          <e-step label='Delivery Address' iconCss='sf-icon-transport'></e-
step>
          <e-step label='Payment' iconCss='sf-icon-payment'
optional=true></e-step>
          <e-step label='Confirmation' iconCss='sf-icon-success'></e-step>
        </e-steps>
      </ejs-stepper>
    </div>
  </div>

Steps validation in Vue Stepper component

The Stepper component allows you to set the validation state for each step, displaying either a success or error icon. You can define the success state of a step by setting the `isValid` property to `true`. If set to `false`, the step will display an error state. By default, the `isValid` property is `null`.

Based on the `stepType`, the validation state icon will be displayed either as an indicator or as part of the step label/text.

APP.VUE

```
<template>
  <div class="step-validation">
```

```
    <ejs-stepper id="stepper">
      <e-steps>
        <e-step iconCss='sf-icon-cart' :isValid=true></e-step>
        <e-step iconCss='sf-icon-transport'></e-step>
        <e-step iconCss='sf-icon-payment' :isValid=false></e-step>
        <e-step iconCss='sf-icon-success'></e-step>
      </e-steps>
    </ejs-stepper>
    <ejs-stepper id="labelStep">
      <e-steps>
        <e-step label='Cart' :isValid=true></e-step>
        <e-step label='Address'></e-step>
        <e-step label='Payment' :isValid=false></e-step>
        <e-step label='Confirmation'></e-step>
      </e-steps>
    </ejs-stepper>

Template in Vue Stepper component

The Stepper component allows you to customize the default appearance and content of each step, creating a personalized experience for the user. You can use the template propety to set the template content for the steps.

The step model and current step index are passed as `step` and `currentStep` properties in the template context for customization.

APP.VUE

```
<template>
  <div class="stepper-template-wrapper">
    <ejs-stepper id="stepper" :activeStep=1 :template="tempContent">
      <e-steps>
        <e-step label='PowerPoint' iconCss='sf-icon-powerpoint'></e-step>
        <e-step label='Presentation' iconCss='sf-icon-projector'></e-step>
        <e-step label='Backup' iconCss='sf-icon-onedrive'></e-step>
      </e-steps>
    </ejs-stepper>
  </div>
</template>
<script>
import { StepperComponent, StepsDirective, StepDirective } from
"@syncfusion/ej2-vue-navigations";
export default {
  components: {
    'ejs-stepper': StepperComponent,
    "e-steps": StepsDirective,
    "e-step": StepDirective
  },
  data() {
    return {
      tempContent: '<div class="template-content"><span
class="${step.iconCss}"></span><br><span class="e-
label">${step.label}</span></div>'
    };
  }
};
</script>

Tooltip in Vue Stepper component

The Stepper component supports tooltip to show additional information in the steps by setting the showTooltip property to true.

The tooltip appears when the user hovers over the step, providing the information such as the label or text. By default, the showTooltip property is false.

APP.VUE

```
<template>
  <div class="step-tooltip">
    <ejs-stepper id="stepper" showTooltip="true">
      <e-steps>
        <e-step label='Cart' iconCss='sf-icon-cart'></e-step>
        <e-step label='Shipped' iconCss='sf-icon-transport'></e-step>
        <e-step label='Payment' iconCss='sf-icon-transport'></e-step>
        <e-step label='Delivered' iconCss='sf-icon-success'></e-step>
      </e-steps>
    </ejs-stepper>
  </div>
</template>

Tooltip template

You can use the tooltipTemplate property to specify a custom template for the tooltips, providing detailed information about the steps.

APP.VUE

```
<template>
  <div class="step-tooltip-template">
    <ejs-stepper id="stepper" showTooltip="true"
:tooltipTemplate="tooltipContent">
      <e-steps>
        <e-step text='Review your cart items' label='Cart' iconCss='sf-icon-
cart'></e-step>
        <e-step text='Enter your delivery address' label='Delivery Address'
iconCss='sf-icon-transport'></e-step>
        <e-step text='Complete your purchase securely' label='Payment'
iconCss='sf-icon-payment'></e-step>
        <e-step text='Verify your order details' label='Confirmation'
iconCss='sf-icon-success'></e-step>
      </e-steps>
    </ejs-stepper>
  </div>
</template>
<script>
import { StepperComponent, StepsDirective, StepDirective } from
"@syncfusion/ej2-vue-navigations";
export default {
  components: {
    'ejs-stepper': StepperComponent,
    "e-steps": StepsDirective,
    "e-step": StepDirective
  },
  data() {
    return {
      tooltipContent: '<span class="template-content"><span class="stepper-
icon ${value.iconCss}"></span><span class="step-
label">${value.text}</span></span>'
    };
  }
```

Animation in Vue Stepper component

The Stepper progress state can be animated, smoothly transitioning from one step to another. You can customize the animation's duration and delay by using the animation property.

You can disable the animation by setting the enable property to false. By default, the value is true.

| Fields | Type | Description |

|------|------|-------------|

| duration | number | Specifies the duration of the animated transition for each step. The default value is 2000 milliseconds. |

| delay | number | Specifies the delay to initiate the animated transition for each step in milliseconds. The default value is 0. |

The example demonstrates the animation duration and delay settings for the Stepper.

Globalization in Vue Stepper component

Localization

The Localization library allows you to localize the default text content of the Stepper. You can change the static text content used for the optional property to other cultures (Arabic, Deutsch, French, etc.) by defining the locale value and its translation object.

Locale key | en-US (default) |

|-----|-----|

| optional | Optional |

In this example, the French culture is set to Stepper and the default text is updated with the content defined by the locale key.

APP.VUE

```
<template>
  <div class="step-locale">
    <ejs-stepper id="stepper" :locale='locale'>
        <e-steps>
          <e-step label='Cart' iconCss='sf-icon-cart'></e-step>
          <e-step label='Delivery Address' iconCss='sf-icon-transport'></e-
step>
          <e-step label='Payment' iconCss='sf-icon-payment'
optional=true></e-step>
          <e-step label='Confirmation' iconCss='sf-icon-success'></e-step>
        </e-steps>
    </ejs-stepper>
  </div>
</template>
<script>
import { StepperComponent, StepsDirective, StepDirective } from
"@syncfusion/ej2-vue-navigations";
import { L10n } from '@syncfusion/ej2-base';
L10n.load({
  'fr-BE': {
      'stepper': {
      'optional': "facultatif"
    }
  }
});
export default {
  components: {
    'ejs-stepper': StepperComponent,
    "e-steps": StepsDirective,
    "e-step": StepDirective
  },
  data() {
    return {
```

```
      locale: 'fr-BE'
    }
  }
};

RTL

RTL provides an option to switch the text direction and layout of the Stepper component from right to left by setting the enableRtl property to true.

APP.VUE

```
<template>
  <div class="rtl-step">
    <ejs-stepper id="stepper" enableRtl="true">
        <e-steps>
```

```
          <e-step text='Cart' iconCss='sf-icon-cart'></e-step>
          <e-step text='Delivery Address' iconCss='sf-icon-transport'></e-
step>
          <e-step text='Payment' iconCss='sf-icon-payment'
optional=true></e-step>
          <e-step text='Confirmation' iconCss='sf-icon-success'></e-step>
        </e-steps>
    </ejs-stepper>
  </div>
</template>

Accessibility in Vue Stepper component

Accessibility is achieved in the Stepper component through WAI-ARIA standard and keyboard navigations. The Stepper component can be effectively accessed through assistive technologies such as screen readers.

Keyboard interaction

The Stepper component is interactive with the below keyboard shortcuts.

| **Keyboard shortcuts** | **Actions** |

| --- | --- |

| Up Arrow | Focuses the previous step in a vertical Stepper. |

| Down Arrow | Focuses the next step in a vertical Stepper. |

| Left Arrow | Focuses the previous step in a horizontal Stepper. |

| Right Arrow | Focuses the next step in a horizontal Stepper. |

| Home | Focuses on the first step of the Stepper. |

| End | Focuses on the last step of the Stepper. |

| Enter / Space | Activates the currently focused step. |

ARIA attribute

The following ARIA attributes are used in Stepper component based on its state.

| Properties | Functionality |

| ---------- | ---------- |

| aria-label | Attribute provide a descriptive text that labels the interactive element for accessibility. |

| aria-current | Attribute denotes the currently active step in the Stepper. |

| aria-disabled| Indicates when the step is disabled and cannot be interacted. |

Events in Vue Stepper component

This section describes the Stepper events that will be triggered when an appropriate actions are performed. The following events are available in the Stepper component.

created

The Stepper component triggers the created event when the control rendering is completed.

APP.VUE

```
<template>
  <div class="created-event">
    <ejs-stepper id="stepper" :created="stepCreated">
      <e-steps>
        <e-step></e-step>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
        <e-step></e-step>
        <e-step></e-step>
        <e-step></e-step>
      </e-steps>
    </ejs-stepper>
  </div>
</template>

  .created-event {
    margin-top: 30px;
    padding: 30px;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/stepper/step-created" %}

stepChanged

The Stepper component triggers the stepChanged event after the active step is changed.

APP.VUE

```
<template>
  <div class="stepChanged-event">
    <ejs-stepper id="stepper" :stepChanged="stepChanged">
      <e-steps>
        <e-step></e-step>
        <e-step></e-step>
        <e-step></e-step>
        <e-step></e-step>
      </e-steps>
    </ejs-stepper>
  </div>
</template>
<script>
```

```
import { StepperComponent, StepsDirective, StepDirective } from
"@syncfusion/ej2-vue-navigations";
export default {
  components: {
    'ejs-stepper': StepperComponent,
    "e-steps": StepsDirective,
    "e-step": StepDirective
  },
  methods: {
    stepChanged: function(args) {
      alert("Step Changed from " + args.previousStep + " to " +
args.activeStep)
    }
  }
};
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-
navigations/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-base/styles/material.css";
  .stepChanged-event {
    margin-top: 30px;
    padding: 30px;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/stepper/step-changed" %}

stepChanging

The Stepper component triggers the stepChanging event before the active step change.

APP.VUE

```
<template>
  <div class="stepChanging-event">
    <ejs-stepper id="stepper" :stepChanging="stepChanging">
      <e-steps>
        <e-step></e-step>
        <e-step></e-step>
        <e-step></e-step>
        <e-step></e-step>
      </e-steps>
    </ejs-stepper>
  </div>
</template>
<script>
import { StepperComponent, StepsDirective, StepDirective } from
"@syncfusion/ej2-vue-navigations";
export default {
  components: {
    'ejs-stepper': StepperComponent,
    "e-steps": StepsDirective,
    "e-step": StepDirective
```

Copyright © 2001 -2024 Syncfusion Inc.

```
  },
  methods: {
    stepChanging: function(args) {
      alert("Step changing from " + args.previousStep + " to " +
args.activeStep)
    }
  }
};
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-
navigations/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-base/styles/material.css";
  .stepChanging-event {
    margin-top: 30px;
    padding: 30px;
  }
</style>
```

{% previewsample "page.domainurl/code-snippet/stepper/step-changing" %}

stepClick

The Stepper component triggers the stepClick event when the step is clicked.

APP.VUE

```
<template>
  <ejs-stepper id="stepper" :stepClick="stepClick">
    <e-steps>
      <e-step></e-step>
      <e-step></e-step>
      <e-step></e-step>
      <e-step></e-step>
    </e-steps>
  </ejs-stepper>
</template>
<script>
import { StepperComponent, StepsDirective, StepDirective } from
"@syncfusion/ej2-vue-navigations";
export default {
  components: {
    'ejs-stepper': StepperComponent,
    "e-steps": StepsDirective,
    "e-step": StepDirective
  },
  methods: {
    stepClick: function(args) {
      //Your required action here
    }
  }
};
</script>
<style>
```

```
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-
navigations/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-base/styles/material.css";
</style>
```

beforeStepRender

The Stepper component triggers the beforeStepRender event before rendering each step.

APP.VUE

```
<template>
  <ejs-stepper id="stepper" :beforeStepRender="beforeStepRender">
    <e-steps>
      <e-step></e-step>
      <e-step></e-step>
      <e-step></e-step>
      <e-step></e-step>
    </e-steps>
  </ejs-stepper>
</template>
<script>
import { StepperComponent, StepsDirective, StepDirective } from
"@syncfusion/ej2-vue-navigations";
export default {
  components: {
    'ejs-stepper': StepperComponent,
    "e-steps": StepsDirective,
    "e-step": StepDirective
  },
  methods: {
    beforeStepRender: function(args) {
      //Your required action here
    }
  }
};
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-
navigations/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-base/styles/material.css";
</style>
```

Stock Chart

Getting Started with the Vue Stock chart Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using Vue-CLI and integrating the Syncfusion Vue Stock chart component

Copyright © 2001 -2024 Syncfusion Inc.

Prerequisites

System requirements for Syncfusion Vue UI components

Dependencies

The list of minimum dependencies required to use stock chart are follows:

```
|-- @syncfusion/ej2-charts
|-- @syncfusion/ej2-base
|-- @syncfusion/ej2-data
|-- @syncfusion/ej2-pdf-export
|-- @syncfusion/ej2-file-utils
|-- @syncfusion/ej2-compression
|-- @syncfusion/ej2-svg-base
|-- @syncfusion/ej2-navigations
|-- @syncfusion/ej2-calendars
|-- @syncfusion/ej2-popups
|-- @syncfusion/ej2-lists
|-- @syncfusion/ej2-inputs
|-- @syncfusion/ej2-buttons
|-- @syncfusion/ej2-splitbuttons
```

Setting up the Vue 2 project

To generate a Vue 2 project using Vue-CLI, use the vue create command. Follow these steps to install Vue CLI and create a new project:

```bash
npm install -g @vue/cli
vue create quickstart
cd quickstart
npm run serve
```

or

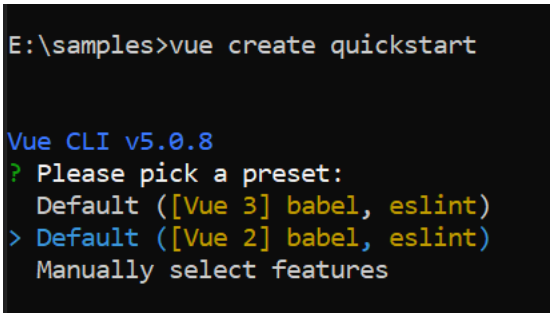
```bash
yarn global add @vue/cli
vue create quickstart
cd quickstart
```

Copyright © 2001 -2024 Syncfusion Inc.

yarn run serve

`

When creating a new project, choose the option Default ([Vue 2] babel, eslint) from the menu.



Once the quickstart project is set up with default settings, proceed to add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion packages are available at npmjs.com. To use Vue components, install the required npm package.

This article uses the Vue Stock chart component as an example. Install the @syncfusion/ej2-vue-charts package by running the following command:

`bash

npm install @syncfusion/ej2-vue-charts --save

`

or

`bash

yarn add @syncfusion/ej2-vue-charts

`

The **--save** will instruct NPM to include the chart package inside of the dependencies section of the package.json.

Add Syncfusion Vue component

Follow the below steps to add the Vue Stock chart component:

1\. First, import and register the Stock chart component in the script section of the **src/App.vue** file.

~/SRC/APP.VUE

```
<script>
import { StockChartPlugin } from '@syncfusion/ej2-vue-charts';
export default {
components: {
'ejs-stockchart': StockChartComponent
}
}
</script>
```

2\. In the template section, define the Stock chart component.

~/SRC/APP.VUE

```
<template>
<div id="app">
<ejs-stockchart></ejs-stockchart>
</div>
</template>
```

Run the project

To run the project, use the following command:

`bash

npm run serve

`

or

`bash

yarn run serve

`

Module Injection

To create stock chart with additional features, inject the required modules. The following modules are used to extend stock chart's basic functionality.

•CandleSeries - Inject this module to use candle series.

•DateTime - Inject this module to use date time axis.

•RangeTooltip - Inject this module to show the tooltip.

These modules should be injected to the provide section as follows,

`javascript

<script>

import { StockChartComponent, CandleSeries, DateTime, RangeTooltip } from "@syncfusion/ej2-vue-charts";

export default {

components: {

'ejs-stockchart': StockChartComponent

},

provide: {

stockChart: [CandleSeries, DateTime, RangeTooltip]

}

Copyright © 2001 -2024 Syncfusion Inc.

```
};
</script>
`
```

Populate Stock Chart with Data

This section explains how to plot below JSON data to the Stock Chart. Please find the below imported datasource.

```
`javascript
export default {
data() {
return {
data: [{
x: new Date( '2012-04-02' ),
open : 85.9757,
high : 90.6657,
low : 85.7685,
close : 90.5257,
volume : 660187068
},
{
x: new Date( '2012-04-09' ),
open : 89.4471,
high : 92,
low : 86.2157,
close : 86.4614,
volume : 912634864
},
{
x: new Date( '2012-04-16' ),
open : 87.1514,
high : 88.6071,
low : 81.4885,
close : 81.8543,
volume : 1221746066
},
```

{

x: new Date('2012-04-23'),

open : 81.5157,

high : 88.2857,

low : 79.2857,

close : 86.1428,

volume : 965935749

},

{

x: new Date('2012-04-30'),

open : 85.4,

high : 85.4857,

low : 80.7385,

close : 80.75,

volume : 615249365

}];

};

}

};

`

Add a series object to the Stock chart by using series property and then set the JSON data to dataSource property.

Since the JSON contains category data, set the valueType for horizontal axis to Category. By default, the axis valueType is Numeric.

~/SRC/APP.VUE

```
<template>
  <div class="control-section">
    <div>
      <ejs-stockchart
        id="stockchartcontainer"
        :primaryXAxis="primaryXAxis"
        :primaryYAxis="primaryYAxis"
        :title="title">
        <e-stockchart-series-collection>
          <e-stockchart-series :dataSource="seriesData" type="Candle"
volume='volume' xName='date' low='low' high='high' open='open'
close='close'></e-stockchart-series>
        </e-stockchart-series-collection>
      </ejs-stockchart>
    </div>
```

```
  </div>
</template>
<script>
import { chartData } from "./datasource.js";
import {
  StockChartComponent, StockChartSeriesCollectionDirective,
StockChartSeriesDirective, DateTime, CandleSeries, RangeTooltip,
LineSeries,SplineSeries,
  HiloOpenCloseSeries, HiloSeries, RangeAreaSeries, Trendlines,
EmaIndicator, RsiIndicator,BollingerBands,  TmaIndicator, MomentumIndicator,
SmaIndicator, AtrIndicator, AccumulationDistributionIndicator,
MacdIndicator, StochasticIndicator, Export
} from "@syncfusion/ej2-vue-charts";
export default {
  components: {
    'ejs-stockchart': StockChartComponent,
    'e-stockchart-series-collection': StockChartSeriesCollectionDirective,
    'e-stockchart-series': StockChartSeriesDirective
  },
  data() {
    return {
        seriesData: chartData,
        primaryXAxis: {
            valueType: "DateTime",
            majorGridLines: { color: "transparent" },
        },
        primaryYAxis: {
            majorTickLines: { color: "transparent", width: 0 }
        },
      title: 'AAPL Stock Price',
    };
  },
  provide: {
    stockChart: [
      DateTime, RangeTooltip, LineSeries, SplineSeries, CandleSeries,
HiloOpenCloseSeries, HiloSeries, RangeAreaSeries, Trendlines, EmaIndicator,
RsiIndicator,
      BollingerBands, TmaIndicator, MomentumIndicator, SmaIndicator,
AtrIndicator, AccumulationDistributionIndicator, MacdIndicator,
StochasticIndicator,Export
    ]
  }
};
</script>
```

{% previewsample "page.domainurl/code-snippet/stockchart/getting-started-cs1" %}

Add Stock Chart Title

You can add a title using title property to the Stock Chart to provide quick information to the user about the data plotted in the Chart.

~/SRC/APP.VUE

```
<template>
    <div id="app">
```

```
        <ejs-stockchart :valueType='valueType' :labelFormat='labelFormat'
:title='title'>
            <e-stockchart-series-collection>
                <e-stockchart-series :dataSource='seriesData' type='Candle'
xName='date' low='low' high='high' open='open' close='close' width=2>
                </e-stockchart-series>
            </e-stockchart-series-collection>
        </ejs-stockchart>
    </div>
</template>
<script>
import { StockChartComponent, StockChartSeriesCollectionDirective,
StockChartSeriesDirective, DateTime, CandleSeries, RangeTooltip,
LineSeries,SplineSeries,
  HiloOpenCloseSeries, HiloSeries, RangeAreaSeries, Trendlines,
EmaIndicator, RsiIndicator,BollingerBands,  TmaIndicator, MomentumIndicator,
SmaIndicator, AtrIndicator, AccumulationDistributionIndicator,
MacdIndicator, StochasticIndicator, Export} from "@syncfusion/ej2-vue-
charts";
import { chartData } from "./datasource.js";
export default {
  components: {
    'ejs-stockchart': StockChartComponent,
    'e-stockchart-series-collection': StockChartSeriesCollectionDirective,
    'e-stockchart-series': StockChartSeriesDirective
  },
  data() {
    return {
     valueType: 'DateTime',
     seriesData: chartData,
     labelFormat: 'MMM-yy',
     title: 'Sales Analysis'
    };
  },
  provide: {
    stockChart: [
      DateTime, RangeTooltip, LineSeries, SplineSeries,
CandleSeries,HiloOpenCloseSeries, HiloSeries, RangeAreaSeries, Trendlines,
EmaIndicator, RsiIndicator,
      BollingerBands, TmaIndicator, MomentumIndicator, SmaIndicator,
AtrIndicator,      AccumulationDistributionIndicator,  MacdIndicator,
StochasticIndicator, Export
    ]
  }
};
</script>
```

{% previewsample "page.domainurl/code-snippet/stockchart/getting-started-cs2" %}

Add Crosshair

Crosshair has a vertical and horizontal line to view the value of the axis at mouse or touch position.

Crosshair lines can be enabled by using enable property in the crosshair. Likewise tooltip label for an axis can be enabled by using enable property of crosshairTooltip in the corresponding axis.

~/SRC/APP.VUE

Copyright © 2001 -2024 Syncfusion Inc.

```
<template>
    <div id="app">
        <ejs-stockchart :title='title'  :crosshair="crosshair">
            <e-stockchart-series-collection>
                <e-stockchart-series :dataSource='seriesData' type='Candle'>
                </e-stockchart-series>
            </e-stockchart-series-collection>
        </ejs-stockchart>
    </div>
</template>
<script>
import { chartData } from "./datasource.js";
import {
  StockChartComponent, StockChartSeriesCollectionDirective,
StockChartSeriesDirective, DateTime, CandleSeries, RangeTooltip,
LineSeries,SplineSeries,Crosshair,
  HiloOpenCloseSeries, HiloSeries, RangeAreaSeries, Trendlines,
EmaIndicator, RsiIndicator,BollingerBands,  TmaIndicator, MomentumIndicator,
SmaIndicator, AtrIndicator, AccumulationDistributionIndicator,
MacdIndicator, StochasticIndicator, Export
} from "@syncfusion/ej2-vue-charts";
export default {
  components: {
    'ejs-stockchart': StockChartComponent,
    'e-stockchart-series-collection': StockChartSeriesCollectionDirective,
    'e-stockchart-series': StockChartSeriesDirective
  },
  data() {
    return {
     title: 'Sales Analysis',
     seriesData: chartData,
       crosshair: {
        enable: true,
      }
    };
  },
   provide: {
    stockChart: [
      DateTime, RangeTooltip, LineSeries, SplineSeries,
CandleSeries,HiloOpenCloseSeries, HiloSeries, RangeAreaSeries, Trendlines,
EmaIndicator, RsiIndicator,Crosshair,
      BollingerBands, TmaIndicator, MomentumIndicator, SmaIndicator,
AtrIndicator,      AccumulationDistributionIndicator,  MacdIndicator,
StochasticIndicator, Export
    ]
  }
};
</script>
```

{% previewsample "page.domainurl/code-snippet/stockchart/getting-started-cs3" %}

Add Trackball

Trackball is used to track a data point closest to the mouse or touch position. Trackball marker indicates the

closest point and trackball tooltip displays the information about the point. To use trackball feature, we need to inject Crosshair and Tooltip into the provide.

Trackball can be enabled by setting the enable property of the crosshair to true and shared property in tooltip to true in chart.

~/SRC/APP.VUE

```
<template>
    <div id="app">
         <ejs-stockchart id= "container" :title='title'
:primaryXAxis='primaryXAxis' :crosshair='crosshair' :tooltip='tooltip'>
            <e-stockchart-series-collection>
                <e-stockchart-series :dataSource='seriesData' type='Line'
xName='x' yName='y' name='John' > </e-stockchart-series>
                <e-stockchart-series :dataSource='seriesData' type='Line'
xName='x' yName='y1' name='Andrew' > </e-stockchart-series>
                <e-stockchart-series :dataSource='seriesData' type='Line'
xName='x' yName='y2' name='Thomas' > </e-stockchart-series>
                <e-stockchart-series :dataSource='seriesData' type='Line'
xName='x' yName='y3' name='Mark' > </e-stockchart-series>
                <e-stockchart-series :dataSource='seriesData' type='Line'
xName='x' yName='y4' name='William' > </e-stockchart-series>
            </e-stockchart-series-collection>
        </ejs-stockchart>
    </div>
</template>
<script>
import {
  StockChartComponent, StockChartSeriesCollectionDirective,
StockChartSeriesDirective, DateTime, CandleSeries, RangeTooltip,
LineSeries,SplineSeries,Crosshair,
  HiloOpenCloseSeries, HiloSeries, RangeAreaSeries, Trendlines,
EmaIndicator, RsiIndicator,BollingerBands,  TmaIndicator, MomentumIndicator,
SmaIndicator, AtrIndicator, Tooltip,AccumulationDistributionIndicator,
MacdIndicator, StochasticIndicator, Export
} from "@syncfusion/ej2-vue-charts";
export default {

      BollingerBands, TmaIndicator, MomentumIndicator, SmaIndicator,
AtrIndicator,      AccumulationDistributionIndicator,  MacdIndicator,
StochasticIndicator, Export
    ]
  }
};
</script>
<style>
 #container {
   height: 350px;
 }
</style>
```

{% previewsample "page.domainurl/code-snippet/stockchart/getting-started-cs4" %}

You can refer to our Vue Stock Chart feature tour page for its groundbreaking feature representations. You can also explore our Vue Stock Chart example that shows you how to present and manipulate data.

Getting Started with the Vue Stock Chart Component in Vue 3

This article provides a step-by-step guide for setting up a Vite project with a JavaScript environment and integrating the Syncfusion Vue Stock Chart component using the Composition API / Options API.

Copyright © 2001 -2024 Syncfusion Inc.

The Composition API is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

The Options API is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

Prerequisites

System requirements for Syncfusion Vue UI components

Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using Vite. To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

`bash

npm create vite@latest

`

or

`bash

yarn create vite

`

Using one of the above commands will lead you to set up additional configurations for the project as below:

1.Define the project name: We can specify the name of the project directly. Let's specify the name of the project as my-project for this article.

`bash

? Project name: » my-project

`

2.Select Vue as the framework. It will create a Vue 3 project.

`bash

? Select a framework: » - Use arrow-keys. Return to submit.

Vanilla

Vue

React

Preact

Lit

Svelte

Others

`

Copyright © 2001 -2024 Syncfusion Inc.

3.Choose JavaScript as the framework variant to build this Vite project using JavaScript and Vue.

`bash

? Select a variant: » - Use arrow-keys. Return to submit.

JavaScript

TypeScript

Customize with create-vue ↗

Nuxt ↗

`

4.Upon completing the aforementioned steps to create the my-project, run the following command to install its dependencies:

`bash

cd my-project

npm install

`

or

`bash

cd my-project

yarn install

`

Now that my-project is ready to run with default settings, let's add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion Vue component packages are available at npmjs.com. To use Syncfusion Vue components in the project, install the corresponding npm package.

This article uses the Vue Stock Chart component as an example. To use the Vue Stock Chart component in the project, the @syncfusion/ej2-vue-charts package needs to be installed using the following command:

`bash

npm install @syncfusion/ej2-vue-charts --save

`

or

`bash

yarn add @syncfusion/ej2-vue-charts

`

Copyright © 2001 -2024 Syncfusion Inc.

Add Syncfusion Vue component

Follow the below steps to add the Vue Stock Chart component using Composition API or Options API:

1.First, import and register the Stock Chart component and its child directives in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { StockChartComponent as EjsStockchart,
StockChartSeriesCollectionDirective as EStockchartSeriesCollection,
StockChartSeriesDirective as EStockchartSeries, StockChart, DateTime,
RangeTooltip, LineSeries, SplineSeries, CandleSeries, HiloOpenCloseSeries,
HiloSeries, RangeAreaSeries, Trendlines, EmaIndicator, RsiIndicator,
BollingerBands, TmaIndicator, MomentumIndicator, SmaIndicator, AtrIndicator,
AccumulationDistributionIndicator, MacdIndicator, StochasticIndicator,
Export } from "@syncfusion/ej2-vue-charts";
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { StockChartComponent, StockChartSeriesCollectionDirective,
StockChartSeriesDirective, StockChart, DateTime, RangeTooltip, LineSeries,
SplineSeries, CandleSeries, HiloOpenCloseSeries, HiloSeries,
RangeAreaSeries, Trendlines, EmaIndicator, RsiIndicator,
BollingerBands, TmaIndicator, MomentumIndicator, SmaIndicator, AtrIndicator,
AccumulationDistributionIndicator, MacdIndicator, StochasticIndicator,
Export } from "@syncfusion/ej2-vue-charts";
//Component registration
export default {
name: "App",
components: {
"ejs-stockchart": StockChartComponent,
"e-stockchart-series-collection": StockChartSeriesCollectionDirective,
"e-stockchart-series": StockChartSeriesDirective
}
}
</script>
```

2.In the template section, define the Stock Chart component with the dataSource property.

~/SRC/APP.VUE

```
<template>
<ejs-stockchart :primaryXAxis="primaryXAxis" :primaryYAxis="primaryYAxis"
:title="title">
<e-stockchart-series-collection>
<e-stockchart-series :dataSource="seriesData" type="Candle" volume="volume"
xName="date" low="low" high="high" open="open" close="close" yName="open">
</e-stockchart-series>
</e-stockchart-series-collection>
</ejs-stockchart>
</template>
```

Copyright © 2001 -2024 Syncfusion Inc.

3.Declare the values for the dataSource property in the script section.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
const seriesData = [
{
date: new Date('2012-04-02'),
open: 85.9757,
high: 90.6657,
low: 85.7685,
close: 90.5257,
volume: 660187068
},
{
date: new Date('2012-04-09'),
open: 89.4471,
high: 92,
low: 86.2157,
close: 86.4614,
volume: 912634864
},
....
];
const primaryXAxis = { valueType: "DateTime" };
const primaryYAxis = { majorTickLines: { color: "transparent", width: 0 } };
const title = "AAPL Stock Price";
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
data() {
return {
seriesData: [
{
date: new Date('2012-04-02'),
open: 85.9757,
high: 90.6657,
low: 85.7685,
close: 90.5257,
volume: 660187068
},
{
date: new Date('2012-04-09'),
open: 89.4471,
high: 92,
low: 86.2157,
close: 86.4614,
volume: 912634864
},
....
],
primaryXAxis: {
valueType: "DateTime"
```

Copyright © 2001 -2024 Syncfusion Inc.

```
},
primaryYAxis: {
majorTickLines: { color: "transparent", width: 0 },
},
title: "AAPL Stock Price"
};
}
</script>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<ejs-stockchart :primaryXAxis="primaryXAxis" :primaryYAxis="primaryYAxis"
:title="title">
<e-stockchart-series-collection>
<e-stockchart-series :dataSource="seriesData" type="Candle" volume="volume"
xName="date" low="low" high="high" open="open" close="close" yName="open">
</e-stockchart-series>
</e-stockchart-series-collection>
</ejs-stockchart>
</template>
<script setup>
import { provide } from 'vue';
import { StockChartComponent as EjsStockchart,
StockChartSeriesCollectionDirective as EStockchartSeriesCollection,
StockChartSeriesDirective as EStockchartSeries, StockChart, DateTime,
RangeTooltip, LineSeries, SplineSeries, CandleSeries, HiloOpenCloseSeries,
HiloSeries, RangeAreaSeries, Trendlines, EmaIndicator, RsiIndicator,
BollingerBands, TmaIndicator, MomentumIndicator, SmaIndicator, AtrIndicator,
AccumulationDistributionIndicator, MacdIndicator, StochasticIndicator,
Export } from "@syncfusion/ej2-vue-charts";
const seriesData = [
{
date: new Date('2012-04-02'),
open: 85.9757,
high: 90.6657,
low: 85.7685,
close: 90.5257,
volume: 660187068
},
{
date: new Date('2012-04-09'),
open: 89.4471,
high: 92,
low: 86.2157,
close: 86.4614,
volume: 912634864
},
....
];
const primaryXAxis = { valueType: "DateTime" };
const primaryYAxis = { majorTickLines: { color: "transparent", width: 0 } };
const title = "AAPL Stock Price";
```

```
const stockChart = [ DateTime, RangeTooltip, LineSeries, SplineSeries,
CandleSeries, HiloOpenCloseSeries, HiloSeries, RangeAreaSeries, Trendlines,
EmaIndicator, RsiIndicator, BollingerBands, TmaIndicator, MomentumIndicator,
SmaIndicator, AtrIndicator, AccumulationDistributionIndicator,
MacdIndicator, StochasticIndicator,Export ];
provide('stockChart', stockChart);
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<ejs-stockchart :primaryXAxis="primaryXAxis" :primaryYAxis="primaryYAxis"
:title="title">
<e-stockchart-series-collection>
<e-stockchart-series :dataSource="seriesData" type="Candle" volume="volume"
xName="date" low="low" high="high" open="open" close="close" yName="open">
</e-stockchart-series>
</e-stockchart-series-collection>
</ejs-stockchart>
</template>
<script>
import { StockChartComponent, StockChartSeriesCollectionDirective,
StockChartSeriesDirective, StockChart, DateTime, RangeTooltip, LineSeries,
SplineSeries, CandleSeries, HiloOpenCloseSeries, HiloSeries,
RangeAreaSeries, Trendlines, EmaIndicator, RsiIndicator,
BollingerBands, TmaIndicator, MomentumIndicator, SmaIndicator, AtrIndicator,
AccumulationDistributionIndicator, MacdIndicator, StochasticIndicator,
Export } from "@syncfusion/ej2-vue-charts";
//Component registration
export default {
name: "App",
components: {
"ejs-stockchart": StockChartComponent,
"e-stockchart-series-collection": StockChartSeriesCollectionDirective,
"e-stockchart-series": StockChartSeriesDirective
},
data() {
return {
seriesData: [
{
date: new Date('2012-04-02'),
open: 85.9757,
high: 90.6657,
low: 85.7685,
close: 90.5257,
volume: 660187068
},
{
date: new Date('2012-04-09'),
open: 89.4471,
high: 92,
low: 86.2157,
close: 86.4614,
volume: 912634864
},
....
```

Copyright © 2001 -2024 Syncfusion Inc.

```
],
primaryXAxis: {
valueType: "DateTime"
},
primaryYAxis: {
majorTickLines: { color: "transparent", width: 0 },
},
title: "AAPL Stock Price"
};
},
provide: {
stockChart: [ DateTime, RangeTooltip, LineSeries, SplineSeries,
CandleSeries,HiloOpenCloseSeries, HiloSeries, RangeAreaSeries, Trendlines,
EmaIndicator, RsiIndicator, BollingerBands, TmaIndicator, MomentumIndicator,
SmaIndicator, AtrIndicator, AccumulationDistributionIndicator,
MacdIndicator, StochasticIndicator, Export ]
},
};
</script>
```

Run the project

To run the project, use the following command:

`bash

npm run dev

`

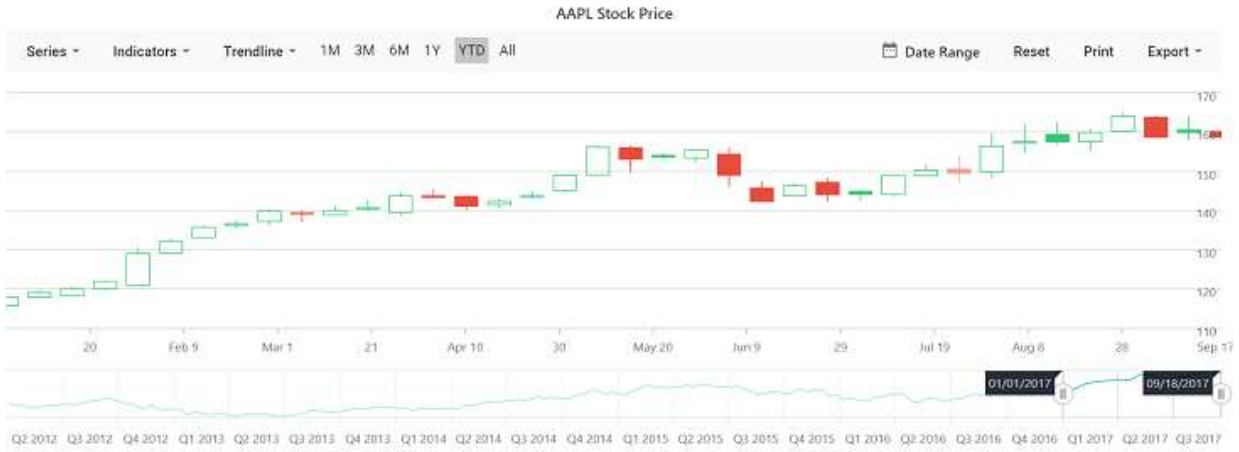
or

`bash

yarn run dev

`

The output will appear as follows:



Sample: vue-3-stock-chart-getting-started.

For migrating from Vue 2 to Vue 3, refer to the migration documentation.

Working with data in Vue Stock chart component

Stock Chart can visualise data bound from local or remote data.

Local Data

You can bind a simple JSON data to the chart using dataSource property in series.

APP.VUE

```
<template>
  <div class="control-section">
    <div>
      <ejs-stockchart
        id="stockchartcontainer"
        :primaryXAxis="primaryXAxis"
        :primaryYAxis="primaryYAxis"
        :title="title">
        <e-stockchart-series-collection>
          <e-stockchart-series :dataSource="seriesData" type="Candle"
volume='volume' xName='date' low='low' high='high' open='open'
close='close'></e-stockchart-series>
        </e-stockchart-series-collection>
      </ejs-stockchart>
    </div>
  </div>
</template>
<script>
import Vue from "vue";
import { chartData } from "./datasource.js";
import {
  StockChartPlugin, DateTime, CandleSeries, RangeTooltip,
LineSeries,SplineSeries,
  HiloOpenCloseSeries, HiloSeries, RangeAreaSeries, Trendlines,
EmaIndicator, RsiIndicator,BollingerBands,  TmaIndicator, MomentumIndicator,
SmaIndicator, AtrIndicator, AccumulationDistributionIndicator,
MacdIndicator, StochasticIndicator, Export
} from "@syncfusion/ej2-vue-charts";
Vue.use(StockChartPlugin);
export default {
  data() {
    return {
        seriesData:chartData,
        primaryXAxis: {
            valueType: "DateTime",
            majorGridLines: { color: "transparent" },
        },
        primaryYAxis: {
            majorTickLines: { color: "transparent", width: 0 }
        },
      title: 'AAPL Stock Price',
```

```
    };
  },
  provide: {
    stockChart: [
      DateTime, RangeTooltip, LineSeries, SplineSeries, CandleSeries,
HiloOpenCloseSeries, HiloSeries, RangeAreaSeries, Trendlines, EmaIndicator,
RsiIndicator,
      BollingerBands, TmaIndicator, MomentumIndicator, SmaIndicator,
AtrIndicator, AccumulationDistributionIndicator, MacdIndicator,
StochasticIndicator,Export
    ]
  }
};
</script>
<style>

Chart dimensions in Vue Stock chart component

Size for Container

Stock Chart can render to its container size. You can set the size via inline or CSS as demonstrated below.

APP.VUE

```
<template>
  <div class="control-section" width='650px' height='350px'>
    <div>
      <ejs-stockchart
        id="stockchartcontainer"
        :primaryXAxis="primaryXAxis"
        :primaryYAxis="primaryYAxis"
        :title="title">
        <e-stockchart-series-collection>
          <e-stockchart-series :dataSource="seriesData" type="Candle"
volume='volume' xName='date' low='low' high='high' open='open'
close='close'></e-stockchart-series>
        </e-stockchart-series-collection>
      </ejs-stockchart>
    </div>
  </div>
</template>
<script>
import Vue from "vue";
import { chartData } from "./datasource.js";
import {
```

Copyright © 2001 -2024 Syncfusion Inc.

```
  StockChartPlugin, DateTime, CandleSeries, RangeTooltip,
LineSeries,SplineSeries,
  HiloOpenCloseSeries, HiloSeries, RangeAreaSeries, Trendlines,
EmaIndicator, RsiIndicator,BollingerBands,  TmaIndicator, MomentumIndicator,
SmaIndicator, AtrIndicator, AccumulationDistributionIndicator,
MacdIndicator, StochasticIndicator, Export
} from "@syncfusion/ej2-vue-charts";
Vue.use(StockChartPlugin);
export default {
  data() {
    return {
        seriesData:chartData,
        primaryXAxis: {
            valueType: "DateTime",
            majorGridLines: { color: "transparent" },
        },
        primaryYAxis: {
            majorTickLines: { color: "transparent", width: 0 }
        },
      title: 'AAPL Stock Price',
    };
  },
  provide: {
    stockChart: [
      DateTime, RangeTooltip, LineSeries, SplineSeries, CandleSeries,
HiloOpenCloseSeries, HiloSeries, RangeAreaSeries, Trendlines, EmaIndicator,
RsiIndicator,
      BollingerBands, TmaIndicator, MomentumIndicator, SmaIndicator,
AtrIndicator,      AccumulationDistributionIndicator,  MacdIndicator,
StochasticIndicator,Export
    ]
  }
};
</script>
<style>
#container {
   height: 350px;
 }
</style>
```

{% previewsample "page.domainurl/code-snippet/stockchart/chart-dimensions-cs1" %}

Size for Stock Chart

You can also set size for stock chart directly through width and

height properties.

<!-- markdownlint-disable MD036 -->

- In Pixel

<!-- markdownlint-disable MD036 -->

You can set the size of stock chart in pixel as demonstrated below.

APP.VUE

```
<template>
  <div class="control-section">
    <div>
      <ejs-stockchart
        id="stockchartcontainer"
        width='650px'
        height='350px'
        :primaryXAxis="primaryXAxis"
        :primaryYAxis="primaryYAxis"
        :title="title">
        <e-stockchart-series-collection>
          <e-stockchart-series :dataSource="seriesData" type="Candle"
volume='volume' xName='date' low='low' high='high' open='open'
close='close'></e-stockchart-series>
        </e-stockchart-series-collection>
      </ejs-stockchart>
    </div>
  </div>
</template>
<script>
import Vue from "vue";
import { chartData } from "./datasource.js";
import {
  StockChartPlugin, DateTime, CandleSeries, RangeTooltip,
LineSeries,SplineSeries,
  HiloOpenCloseSeries, HiloSeries, RangeAreaSeries, Trendlines,
EmaIndicator, RsiIndicator,BollingerBands,  TmaIndicator, MomentumIndicator,
SmaIndicator, AtrIndicator, AccumulationDistributionIndicator,
MacdIndicator, StochasticIndicator, Export
} from "@syncfusion/ej2-vue-charts";
Vue.use(StockChartPlugin);
export default {
  data() {
    return {
        seriesData:chartData,
        primaryXAxis: {
            valueType: "DateTime",
            majorGridLines: { color: "transparent" },
        },
        primaryYAxis: {
            majorTickLines: { color: "transparent", width: 0 }
        },
      title: 'AAPL Stock Price',
    };
  },
  provide: {
    stockChart: [
      DateTime, RangeTooltip, LineSeries, SplineSeries, CandleSeries,
HiloOpenCloseSeries, HiloSeries, RangeAreaSeries, Trendlines, EmaIndicator,
RsiIndicator,
      BollingerBands, TmaIndicator, MomentumIndicator, SmaIndicator,
AtrIndicator,      AccumulationDistributionIndicator,  MacdIndicator,
StochasticIndicator,Export
    ]
  }
};
</script>
```

Copyright © 2001 -2024 Syncfusion Inc.

```
<style>
#container {
   height: 350px;
 }
</style>
```

{% previewsample "page.domainurl/code-snippet/stockchart/chart-dimensions-cs2" %}

In Percentage

By setting value in percentage, stock chart gets its dimension with respect to its container. For example, when the height is ‘50%’, stock chart renders to half of the container height.

APP.VUE

```
<template>
  <div class="control-section">
    <div>
      <ejs-stockchart
        id="stockchartcontainer"
         width='80%' height='90%'
        :primaryXAxis="primaryXAxis"
        :primaryYAxis="primaryYAxis"
        :title="title">
        <e-stockchart-series-collection>
          <e-stockchart-series :dataSource="seriesData" type="Candle"
volume='volume' xName='date' low='low' high='high' open='open'
close='close'></e-stockchart-series>
        </e-stockchart-series-collection>
      </ejs-stockchart>
    </div>
  </div>
</template>
<script>
import Vue from "vue";
import { chartData } from "./datasource.js";
import {
  StockChartPlugin, DateTime, CandleSeries, RangeTooltip,
LineSeries,SplineSeries,
  HiloOpenCloseSeries, HiloSeries, RangeAreaSeries, Trendlines,
EmaIndicator, RsiIndicator,BollingerBands,TmaIndicator, MomentumIndicator,
SmaIndicator, AtrIndicator, AccumulationDistributionIndicator,
MacdIndicator, StochasticIndicator, Export, Tooltip, Crosshair
} from "@syncfusion/ej2-vue-charts";
Vue.use(StockChartPlugin);
export default {
  data() {
    return {
        seriesData:chartData,
        primaryXAxis: {
            valueType: "DateTime",
            majorGridLines: { color: "transparent" },
        },
        primaryYAxis: {
            majorTickLines: { color: "transparent", width: 0 }
        },
```

```
      title: 'AAPL Stock Price',
    };
  },
  provide: {
    stockChart: [
      DateTime, Tooltip, Crosshair, RangeTooltip, LineSeries, SplineSeries,
CandleSeries,     HiloOpenCloseSeries, HiloSeries, RangeAreaSeries,
Trendlines, EmaIndicator, RsiIndicator,
      BollingerBands, TmaIndicator, MomentumIndicator, SmaIndicator,
AtrIndicator,      AccumulationDistributionIndicator,  MacdIndicator,
StochasticIndicator,Export
    ]
  }
};
</script>
<style>
#container {
   height: 350px;
 }
</style>
```

{% previewsample "page.domainurl/code-snippet/stockchart/chart-dimensions-cs3" %}

Note: When you do not specify the size, it takes 450px as the height and window size as its width.

Axis types in Vue Stock chart component

DateTime axis

DateTime axis uses date time scale and displays the date time values as axis labels in the specified format. To use DateTime axis, set the valueType of axis to DateTime.

APP.VUE

```
<template>
  <div class="control-section">
    <div>
      <ejs-stockchart
        id="stockchartcontainer"
        :primaryXAxis="primaryXAxis"
        :primaryYAxis="primaryYAxis"
        :title="title">
        <e-stockchart-series-collection>
          <e-stockchart-series :dataSource="seriesData" type="Candle"
volume='volume' xName='date' low='low' high='high' open='open'
close='close'></e-stockchart-series>
        </e-stockchart-series-collection>
      </ejs-stockchart>
    </div>
  </div>
</template>
<script>
import Vue from "vue";
import { chartData } from "./datasource.js";
import {
  StockChartPlugin, DateTime, CandleSeries, RangeTooltip,
LineSeries,SplineSeries,
```

Copyright © 2001 -2024 Syncfusion Inc.

```
  HiloOpenCloseSeries, HiloSeries, RangeAreaSeries, Trendlines,
EmaIndicator, RsiIndicator,BollingerBands,  TmaIndicator, MomentumIndicator,
SmaIndicator, AtrIndicator, AccumulationDistributionIndicator,
MacdIndicator, StochasticIndicator, Export
} from "@syncfusion/ej2-vue-charts";
Vue.use(StockChartPlugin);
export default {
  data() {
    return {
        seriesData:chartData,
        primaryXAxis: {
            valueType: "DateTime",
            majorGridLines: { color: "transparent" },
        },
        primaryYAxis: {
            lineStyle: { color: "transparent" },
            majorTickLines: { color: "transparent", width: 0 }
        },
      title: 'AAPL Stock Price'
    };
  },
  provide: {
    stockChart: [
      DateTime, RangeTooltip, LineSeries, SplineSeries, CandleSeries,
HiloOpenCloseSeries, HiloSeries, RangeAreaSeries, Trendlines, EmaIndicator,
RsiIndicator,
      BollingerBands, TmaIndicator, MomentumIndicator, SmaIndicator,
AtrIndicator,      AccumulationDistributionIndicator,  MacdIndicator,
StochasticIndicator,Export
    ]
  }
};
</script>
<style>
#container {
   height: 350px;
 }
</style>
```

{% previewsample "page.domainurl/code-snippet/stockchart/axis-types-cs1" %}

Note: To use this axis, we need to inject DateTimeService into the provide and set the valueType of axis to DateTime.

DateTimeCategory axis

DateTimeCategory axis in the stock chart is used to display only business days. To use DateTimeCategory axis, set the valueType of axis to DateTimeCategory.

APP.VUE

```
<template>
  <div class="control-section">
    <div>
      <ejs-stockchart
        id="stockchartcontainer"
        :primaryXAxis="primaryXAxis"
```

```
        :crosshair="crosshair"
        :tooltip="tooltip">
        <e-stockchart-series-collection>
          <e-stockchart-series :dataSource="seriesData" type="Line"
xName='x' yName='y'></e-stockchart-series>
        </e-stockchart-series-collection>
      </ejs-stockchart>
    </div>
  </div>
</template>
<script>
import Vue from "vue";
import {
  StockChartPlugin, DateTimeCategory, CandleSeries, RangeTooltip,

Note: To use this axis, we need to inject DateTimeCategoryService into the provide and set the valueType of axis to DateTimeCategory.

Logarithmic axis

<!-- markdownlint-disable MD033 -->

Logarithmic axis uses logarithmic scale and it is very useful in visualizing data, when it has numerical values in both lower order of magnitude (eg: 10⁻⁶) and higher order of magnitude (eg: 10⁶). To use Logarithmic axis, set the valueType of axis to Logarithmic.

- Axis Customization

Axis customization in Vue Stock chart component

Axis Crossing

An axis can be positioned in the Stock Chart area using crossesAt properties. The crossesAt property specifies the values (datetime, numeric, or logarithmic) at which the axis line has to be intersected with the vertical axis or vice-versa, and the crossesInAxis property specifies the axis name with which the axis line has to be crossed.

Series types in Vue Stock chart component

Essential JS 2 StockChart supports 6 major types of series namely Line, Spline, Hilo, HiloOpenClose, Hollow Candle and Candle . By using the series dropdown button you can navigate between the above listed series types.

<!-- markdownlint-disable MD036 -->

Line

To render a line series, use series type as Line and

inject LineSeries into the provide.

Spline

To render a spline series, use series type as Spline and inject SplineSeries into the provide.

Hilo

To render a hilo series, use series type as Hilo and

inject HiloSeries into the provide.

HiloOpenClose

To render a hiloOpenClose series, use series type as HiloOpenClose and inject HiloOpenCloseSeries into the provide.

HollowCandle

To render a hollowcandle series, use series type as Candle and set enableSolidCandle as false. Now inject CandleSeries into the provide.

Candle

To render a candle series, use series type as Candle and inject CandleSeries into the provide.

Trend lines in Vue Stock chart component

Trendlines are used to show the direction and speed of price.

StockChart supports 6 types of trendlines namely Linear,Exponential,Logarithmic,Polynomial,Power,Moving Average. By using trendline dropdown button you can add or remove the required trendline type.

Linear

A linear trendline is a best fit straight line that is used with simpler data sets. To render a linear trendline, use trendline type as Linear and inject

Trendlines module using provide.

Copyright © 2001 -2024 Syncfusion Inc.

Exponential

An exponential trendline is a curved line that is most useful when data values rise or fall at increasingly higher rates. You cannot create an exponential trendline, if your data contains zero or negative values.

To render a exponential trendline, use trendline type as Exponential and inject Trendlines module using provide.

Logarithmic

A logarithmic trendline is a best-fit curved line that is most useful when the rate of change in the data increases or decreases quickly and then levels out. A logarithmic trendline can use negative and/or positive values.

To render a logarithmic trendline, use trendline type as Logarithmic and inject Trendlines module using provide.

Polynomial

A polynomial trendline is a curved line that is used when data fluctuates.

To render a polynomial trendline, use trendline type as Polynomial and inject Trendlines module using provide.

polynomialOrder used to define the polynomial value.

Power

A power trendline is a curved line that is best used with data sets that compare measurements that increase at a specific rate.

To render a power trendline, use trendline type as Power and inject Trendlines module using provide.

Moving Average

A moving average trendline smoothen out fluctuations in data to show a pattern or trend more clearly.

To render a moving average trendline, use trendline type as MovingAverage and inject Trendlines module using provide.

period property defines the period to find the moving average.

<!-- markdownlint-disable MD036 -->

Technical indicators in Vue Stock chart component

A technical indicator is a mathematical calculation based on historic price, volume or open interest information that aims to forecast financial market direction.

StockChart supports 10 types of technical indicators namely Accumulation Distribution, ATR, EMA,SMA,TMA,Momentum,MACD,RSI,Stochastic,Bollinger Band. By using indicator dropdown box you can add an remove the required indicators types.

Accumulation Distribution

Accumulation Distribution combines price and volume to show how money may be flowing into or out of stock.

To render a Accumulation Distribution Indicator, use indicator type as AccumulationDistribution and inject AccumulationDistributionIndicator into the provide. To calculate the signal line volume field is additionally added with dataSource.

Average True Range (ATR)

ATR measures the stock volatility by comparing the current value with the previous value. To render a Average True Range (ATR) Indicator, use indicator type as Atr and inject AtrIndicator into the provide.

Exponential Moving Average (EMA)

Moving average Indicators are used to define the direction of the trend. To render a EMA Indicator,

use indicator type as Ema and inject EmaIndicator into the provide.

Momentum

Momentum shows the speed at which the price of the stock is changing. To render a Momentum indicator, use indicator type as Momentumand inject MomentumIndicator into the provide. Momentum indicator will be represented by two lines (upperLine,

signalLine).In momentum indicator the upperBand value is always renders at the value 100.

Moving Average Convergence Divergence (MACD)

MACD is based on the difference between two EMA's. To render a MACD Indicator, use indicator type as Macd and inject MacdIndicator into the provide.MACD indicator will be represented by MACD line,signal line, MACD histogram. MACD histogram is used to differentiate MACD line and signal line.

Relative Strength Index (RSI)

RSI shows how strongly a stock is moving in its current direction. To render a RSI Indicator, use indicator type as Rsi and inject RsiIndicator into the provide.RSI indicator will be represented by three lines (upperBand, lowerBand, signalLine). The upperBand and lowerBand values are customized by overBought and overSold properties of indicator and the signalLine is calculated by RSI formula.

Simple Moving Average (SMA)

Moving average Indicators are used to define the direction of the trend. To render a SMA Indicator, use indicator type as Sma and inject SmaIndicator into the provide.

Copyright © 2001 -2024 Syncfusion Inc.

Stochastic

It shows how a stock is, when compared to previous state. To render a Stochastic indicator, use indicator type as Stochastic and inject StochasticIndicator into the provide. stochastic indicator will be represented by four lines (upperLine, lowerLine, periodLine, signalLine). In stochastic indicator the upperBand value and lowerBand value is customized by overBought and overSold properties of indicators and the periodLine and signalLine is render based on stochastic formula.

Triangular Moving Average (TMA)

Moving average Indicators are used to define the direction of the trend. To render a TMA Indicator, use indicator type as Tma and inject TmaIndicator into the provide.

Bollinger Band

A StockChart overlay that shows the upper and lower limits of normal price movements based on the standard deviation of prices. To render a Bollinger Band, use indicator type as BollingerBand and inject BollingerBands into the provide.

Bollinger band will be represented by three lines (upperLine, lowerLine, signalLine).The default values of the Bollinger Band period is 14 and standardDeviations is 2.

Legend in Vue Stock chart component

Legend provides information about the series rendered in the Stock Chart which can be customized using legend properties. Legend can be added to a Stock Chart by enabling the visible option in the legendSettings.

Position and Alignment

By using the position property, legend can be placed at Left, Right, Top, Bottom or Custom of the Stock Chart. The legend is positioned at the bottom of the Stock Chart, by default.

Legend Size

By default, legend takes 20% - 25% of the Stock Chart's height horizontally, when it is placed on top or bottom position and 20% - 25% of the Stock Chart's width vertically, when placed on left or right position of the Stock Chart. The default legend size can be changed by using the width and height property of the legendSettings.

Legend Title

The title for legend can be set using title property in legendSettings. Customize the fontStyle, size, fontWeight, color, textAlignment, fontFamily, opacity and textOverflow of legend title. titlePosition is used to set the legend position in Top, Left and Right position. maximumTitleWidth is used to set the width of the legend title. By default, it will be 100px.

Note: To use legend feature, we need to inject StockLegend into the Provide.

Tool tip in Vue Stock chart component

<!-- markdownlint-disable MD036 -->

StockChart will display details about the points through tooltip, when the mouse is moved over the point.

Default tooltip

By default, tooltip is not visible. Enable the tooltip by setting enable property to true and by injecting Tooltip

into the provide.

APP.VUE

Period selector in Vue Stock chart component

The period selector allows to select a range with specified periods. By default the period selector is enabled in stock chart.

Copyright © 2001 -2024 Syncfusion Inc.

Periods

Periods is an array of objects that allows users to specify the range of periods. The interval property specifies the count value of the button, and the text property specifies the text to be displayed on button. The intervalType property allows users to customize the intervals of the buttons. The intervalType property supports the following interval types:

- Auto
- Years
- Quarter
- Months
- Weeks
- Days
- Hours
- Minutes
- Seconds

Range selector in Vue Stock chart component

The left and right thumb of RangeNavigator are used to indicate the selected range in the large collection of data. Following are the ways you can select a range.

- By dragging the thumbs.
- By tapping on the labels.
- By setting the start and end through Date Range button.

Following code example shows the enableSelector property allows users to toggle the visibility of enable selector.

APP.VUE

Appearance in Vue Stock chart component

Stock Chart Title

Chart can be given a title using title property, to show the information about the data plotted.

APP.VUE

```
<template>
  <div class="control-section">
    <div>
      <ejs-stockchart
        id="stockchartcontainer"
        :primaryXAxis="primaryXAxis"
        :primaryYAxis="primaryYAxis"
        :title="title">
        <e-stockchart-series-collection>
          <e-stockchart-series :dataSource="seriesData" type="Candle"
volume='volume' xName='date' low='low' high='high' open='open'
close='close'></e-stockchart-series>
        </e-stockchart-series-collection>
      </ejs-stockchart>
    </div>
  </div>
</template>
<script>
import Vue from "vue";
import { chartData } from "./datasource.js";
import {
  StockChartPlugin, DateTime, CandleSeries, Tooltip, Crosshair,
RangeTooltip, LineSeries,SplineSeries,
  HiloOpenCloseSeries, HiloSeries, RangeAreaSeries, Trendlines,
EmaIndicator, RsiIndicator,BollingerBands,  TmaIndicator, MomentumIndicator,
SmaIndicator, AtrIndicator, AccumulationDistributionIndicator,
MacdIndicator, StochasticIndicator, Export
} from "@syncfusion/ej2-vue-charts";
Vue.use(StockChartPlugin);
export default {
  data() {
    return {
        seriesData:chartData,
        primaryXAxis: {
            valueType: "DateTime",
            majorGridLines: { color: "transparent" },
        },
        primaryYAxis: {

Accessibility in Vue Stock chart component

The Stock chart component followed the accessibility guidelines and standards, including ADA, Section 508, WCAG 2.2 standards, and WCAG roles that are commonly used to evaluate accessibility.

The accessibility compliance for the Stock chart component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| WCAG 2.2 Support | <img src="https://cdn.syncfusion.com/content/images/documentation/full.png" alt="Yes"> |

| Section 508 Support | <img src="https://cdn.syncfusion.com/content/images/documentation/full.png" alt="Yes"> |

| Screen Reader Support | <img src="https://cdn.syncfusion.com/content/images/documentation/full.png" alt="Yes"> |

| Right-To-Left Support | <img src="https://cdn.syncfusion.com/content/images/documentation/full.png" alt="Yes"> |

| Color Contrast | <img src="https://cdn.syncfusion.com/content/images/documentation/full.png" alt="Yes"> |

| Mobile Device Support | <img src="https://cdn.syncfusion.com/content/images/documentation/full.png" alt="Yes"> |

| Keyboard Navigation Support | <img src="https://cdn.syncfusion.com/content/images/documentation/full.png" alt="Yes"> |

| Accessibility Checker Validation | <img src="https://cdn.syncfusion.com/content/images/documentation/full.png" alt="Yes"> |

| Axe-core Accessibility Validation | <img src="https://cdn.syncfusion.com/content/images/documentation/full.png" alt="Yes"> |

Copyright © 2001 -2024 Syncfusion Inc.

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<img src="https://cdn.syncfusion.com/content/images/documentation/full.png" alt="Yes"> - All features of the component meet the requirement.

<img src="https://cdn.syncfusion.com/content/images/documentation/partial.png" alt="Intermediate"> - Some features of the component do not meet the requirement.

<img src="https://cdn.syncfusion.com/content/images/documentation/not-supported.png" alt="No"> - The component does not meet the requirement.

WAI-ARIA attributes

The Stock chart component followed the WAI-ARIA patterns to meet the accessibility. The following ARIA attributes are used in the Stock chart component:

- img (role)
- button (role)
- region (role)
- aria-label (attribute)
- aria-hidden (attribute)
- aria-pressed (attribute)

Keyboard interaction

The Stock chart component followed the keyboard interaction guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Stock chart component.

| **Press** | **To do this** |

| --- | --- |

| Alt + J | Moves the focus to the Stock chart element. |

| Tab | Moves the focus to the next element in the Stock chart. |

| Shift + Tab | Moves the focus to the previous element in the Stock chart. |

| Down Arrow | Moves the focus to the data point left side from the selected point. |

| Up Arrow | Moves the focus to the data point right side from the selected point. |

| ESC | Cancel the tooltip for the data point. |

| Ctrl + P | Prints the Stock chart. |

Copyright © 2001 -2024 Syncfusion Inc.

Ensuring accessibility

The Stock chart component's accessibility levels are ensured through an accessibility-checker and axe-core software tools during automated testing.

The accessibility compliance of the Stock chart component is shown in the following sample. Open the sample in a new window to evaluate the accessibility of the Stock chart component with accessibility tools.

{% previewsample "https://ej2.syncfusion.com/accessibility/stock-chart.html" %}

Switch

Getting Started with the Vue Switch Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using Vue-CLI and integrating the Syncfusion Vue Switch component using the Composition API / Options API.

Prerequisites

System requirements for Syncfusion Vue UI components

Dependencies

The list of dependencies required to use the Switch component in your application is given below:

`js

|-- @syncfusion/ej2-vue-buttons

|-- @syncfusion/ej2-base

|-- @syncfusion/ej2-buttons

|-- @syncfusion/ej2-vue-base

`

Setting up the Vue 2 project

To generate a Vue 2 project using Vue-CLI, use the vue create command. Follow these steps to install Vue CLI and create a new project:

`bash

npm install -g @vue/cli

vue create quickstart

cd quickstart

npm run serve

`

or

`bash

yarn global add @vue/cli

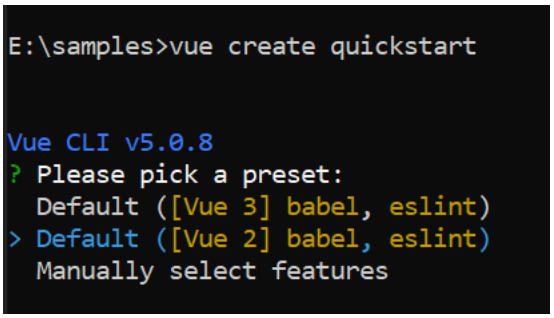
vue create quickstart

cd quickstart

yarn run serve

`

When creating a new project, choose the option Default ([Vue 2] babel, eslint) from the menu.



Once the quickstart project is set up with default settings, proceed to add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion packages are available at npmjs.com. To use Vue components, install the required npm package.

This article uses the [Vue Switch component]https://www.syncfusion.com/vue-components/vue-toggle-switch-button) as an example. Install the @syncfusion/ej2-vue-buttons package by running the following command:

`bash

npm install @syncfusion/ej2-vue-buttons --save

`

or

`bash

yarn add @syncfusion/ej2-vue-buttons

`

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, the Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the Switch component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
```

Copyright © 2001 -2024 Syncfusion Inc.

```
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
</style>
```

Add Syncfusion Vue component

Follow the below steps to add the Vue Switch component using Composition API or Options API:

1\. First, import and register the Switch component in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { SwitchComponent as EjsSwitch } from "@syncfusion/ej2-vue-buttons";
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { SwitchComponent } from "@syncfusion/ej2-vue-buttons";
export default {
components: {
'ejs-switch': SwitchComponent
}
}
</script>
```

2\. In the template section, define the Switch component with the checked property.

~/SRC/APP.VUE

```
<template>
<ejs-switch checked=true></ejs-switch>
</template
```

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
  <ejs-switch checked=true></ejs-switch>
</template>
<script setup>
import { SwitchComponent as EjsSwitch } from "@syncfusion/ej2-vue-buttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
.e-switch-wrapper {
  margin: 18px;
}
</style>
```

Copyright © 2001 -2024 Syncfusion Inc.

OPTIONS API (~/SRC/APP.VUE)

```
<template>
  <ejs-switch checked=true></ejs-switch>
</template>
<script>
import { SwitchComponent } from "@syncfusion/ej2-vue-buttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
export default {
  components: {
    'ejs-switch': SwitchComponent
  }
}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
.e-switch-wrapper {
  margin: 18px;
}
</style>
```

Run the project

To run the project, use the following command:

`bash

npm run serve

`

or

`bash

yarn run serve

`

{% previewsample "page.domainurl/code-snippet/switch/getting-started-cs2" %}

Set text on Switch

Switch component has text support. This can be achieved by setting onLabel

and offLabel on Switch.

Switch does not have text support for material themes, and does not support long custom text.

Getting Started with the Vue Switch Component in Vue 3

This article provides a step-by-step guide for setting up a Vite project with a JavaScript environment and integrating the Syncfusion Vue Switch component using the Composition API / Options API.

The Composition API is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

Copyright © 2001 -2024 Syncfusion Inc.

The Options API is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

Prerequisites

System requirements for Syncfusion Vue UI components

Set up the Vite project

A recommended approach for beginning with Vue is to scaffold a project using Vite. To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

`bash

npm create vite@latest

`

or

`bash

yarn create vite

`

Using one of the above commands will lead you to set up additional configurations for the project as below:

1.Define the project name: We can specify the name of the project directly. Let's specify the name of the project as my-project for this article.

`bash

? Project name: » my-project

`

2.Select Vue as the framework. It will create a Vue 3 project.

`bash

? Select a framework: » - Use arrow-keys. Return to submit.

Vanilla

Vue

React

Preact

Lit

Svelte

Others

`

3.Choose JavaScript as the framework variant to build this Vite project using JavaScript and Vue.

`bash

Copyright © 2001 -2024 Syncfusion Inc.

? Select a variant: » - Use arrow-keys. Return to submit.

JavaScript

TypeScript

Customize with create-vue ↗

Nuxt ↗

`

4.Upon completing the aforementioned steps to create the my-project, run the following command to install its dependencies:

`bash

cd my-project

npm install

`

or

`bash

cd my-project

yarn install

`

Now that my-project is ready to run with default settings, let's add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion Vue component packages are available at npmjs.com. To use Syncfusion Vue components in the project, install the corresponding npm package.

This article uses the Vue Switch component as an example. To use the Vue Switch component in the project, the @syncfusion/ej2-vue-buttons package needs to be installed using the following command:

`bash

npm install @syncfusion/ej2-vue-buttons --save

`

or

`bash

yarn add @syncfusion/ej2-vue-buttons

`

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

Copyright © 2001 -2024 Syncfusion Inc.

In this article, Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the Switch component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-buttons/styles/material.css";
</style>
```

The order of importing CSS styles should be in line with its dependency graph.

Add Syncfusion Vue component

Follow the below steps to add the Vue Switch component using Composition API or Options API:

1.First, import and register the Switch component and its child directives in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import { SwitchComponent as EjsSwitch } from "@syncfusion/ej2-vue-buttons";
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
import { SwitchComponent } from "@syncfusion/ej2-vue-buttons";
//Component registration
export default {
name: "App",
components: {
"ejs-switch": SwitchComponent
}
}
</script>
```

2.In the template section, define the Switch component with the checked property.

~/SRC/APP.VUE

```
<template>
<ejs-switch checked="isChecked"></ejs-switch>
</template>
```

3.Declare the values for the checked property in the script section.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
bool isChecked = true;
</script>
```

Copyright © 2001 -2024 Syncfusion Inc.

OPTIONS API (~/SRC/APP.VUE)

```
<script>
data() {
return {
isChecked: true,
};
}
</script>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<ejs-switch checked="isChecked"></ejs-switch>
</template>
<script setup>
import { SwitchComponent as EjsSwitch } from "@syncfusion/ej2-vue-buttons";
bool isChecked = true;
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-buttons/styles/material.css";
</style>
```

OPTIONS API (~/SRC/APP.VUE)

```
<template>
<ejs-switch checked="isChecked"></ejs-switch>
</template>
<script>
import { SwitchComponent } from "@syncfusion/ej2-vue-buttons";
// Component registration
export default {
name: "App",
// Declaring component and its directives
components: {
"ejs-switch": SwitchComponent
},
// Bound properties declarations
data() {
return {
isChecked: true,
};
}
};
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-buttons/styles/material.css";
</style>
```

Copyright © 2001 -2024 Syncfusion Inc.

Run the project

To run the project, use the following command:

`bash

npm run dev

`

or

`bash

yarn run dev

`

The output will appear as follows:

![vue-3-js-switch](images/vue-3-js-switch.png)

Sample: vue-3-switch-getting-started.

For migrating from Vue 2 to Vue 3, refer to the migration documentation.

Accessibility in Vue Switch component

The Switch component followed the accessibility guidelines and standards, including ADA, Section 508, WCAG 2.2 standards, and WCAG roles that are commonly used to evaluate accessibility.

The accessibility compliance for the Switch component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| WCAG 2.2 Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Section 508 Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Screen Reader Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Right-To-Left Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Color Contrast | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Mobile Device Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

Copyright © 2001 -2024 Syncfusion Inc.

| Keyboard Navigation Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Accessibility Checker Validation | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Axe-core Accessibility Validation | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> - All features of the component meet the requirement.

<img src="https://cdn.syncfusion.com/content/images/landing-page/intermediate.png" alt="Intermediate"> - Some features of the component do not meet the requirement.

<img src="https://cdn.syncfusion.com/content/images/landing-page/no.png" alt="No"> - The component does not meet the requirement.

WAI-ARIA attributes

The Switch component followed the WAI-ARIA patterns to meet the accessibility. The following ARIA attributes are used in the Switch component:

| Attributes | Purpose |

| --- | --- |

| role | Indicates the switch component. |

| aria-disabled | Indicates that the element is perceivable but disabled, so it is not editable or otherwise operable. |

Keyboard interaction

The Switch component followed the keyboard interaction guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Switch component.

| **Press** | **To do this** |

| --- | --- |

| Space | When the switch has focus, pressing the Space key changes the state of the switch. |

Ensuring accessibility

The Switch component's accessibility levels are ensured through an accessibility-checker and axe-core software tools during automated testing.

Copyright © 2001 -2024 Syncfusion Inc.

The accessibility compliance of the Switch component is shown in the following sample. Open the sample in a new window to evaluate the accessibility of the Switch component with accessibility tools.

Two way binding in Vue Switch component

It can be achieved by using the v-model directive in vue. In the following sample, when you enable or disable a value in one Switch will automatically enable or disable the value in other Switch. It updates the other Switch using value property.

APP.VUE

```
<template>
<div>
<div id="wrapper1">
<ejs-switch v-model="value" :checked="value"></ejs-switch>
</div>
<div id="wrapper2">
<ejs-switch v-model="value" :checked="value"></ejs-switch>
</div>
</div>
</template>
<script>
import Vue from 'vue';
import { SwitchPlugin } from "@syncfusion/ej2-vue-buttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(SwitchPlugin);
export default {
  data(){
    return{
      value: true
    }
  }
}
</script>
<style>
  @import '../node_modules/@syncfusion/ej2-base/styles/material.css';
  @import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
.e-switch-wrapper {
  margin: 18px;
}
#wrapper1 {
  float: left;
  padding: 0 0 0 80px;
}
#wrapper2 {
  float: right;
  padding: 0 460px 0 0;
}
</style>
```

Style and appearance in Vue Switch component

To modify the Switch appearance, you need to override the default CSS of Switch component. Please find the list of CSS classes and its corresponding section in Switch. Also, you have an option to create your own custom theme for the controls using our Theme Studio.

CSS Class | Purpose of Class

|.e-switch-wrapper .e-switch-inner|To customize the line of the switch in off mode

|.e-switch-wrapper .e-switch-handle|To customize the handle of the switch in off mode

|.e-switch-wrapper:not(.e-switch-disabled):hover .e-switch-handle:not(.e-switch-active)|To customize the handle of the switch in off mode when hover

|.e-switch-wrapper:not(.e-switch-disabled):hover .e-switch-inner:not(.e-switch-active)|To customize the line of the switch in off mode when hover

|.e-switch-wrapper .e-switch-handle.e-switch-active|To customize the handle of the switch in on mode

|.e-switch-wrapper .e-switch-on|To customize the line of the switch in on mode

|.e-switch-wrapper:hover .e-switch-handle.e-switch-active|To customize the handle of the switch in on mode when hover

|.e-switch-wrapper:hover .e-switch-inner.e-switch-active .e-switch-on|To customize the line of the switch in on mode when hover

How To

Change size in Vue Switch component

The different Switch sizes available are default and small. To reduce the size of default Switch to small, set the cssClass property to e-small.

APP.VUE

```
<template>
        <table class='size'>
            <tr>
                <td class='lSize'>Small</td>
                <td>
                    <ejs-switch id="switch1" checked=true cssClass="e-
small"></ejs-switch>
                </td>
            </tr>
            <tr>
                <td class='lSize'>Default</td>
                <td>
                    <ejs-switch id="switch2"></ejs-switch>
                </td>
            </tr>
        </table>
</template>
<script>
import Vue from 'vue';
import { SwitchPlugin } from "@syncfusion/ej2-vue-buttons";
```

```
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(SwitchPlugin);
export default {}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/fabric.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/fabric.css";
.size tr td {
  padding: 10px;
}
.size .lSize {
  font-family: "Roboto", "Segoe UI", "GeezaPro", "DejaVu Serif", "sans-
serif";
  font-size: 13px;
  cursor: pointer;
  user-select: none;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/switch/getting-started-cs3" %}

Enable ripple for switch label in Vue Switch component

By default, label with ripple effect is not available in Switch. You can achieve this using `rippleMouseHandler` method.

The following example illustrates how to enable ripple effect for labels in Switch component.

APP.VUE

```
<template>
    <table class='switch-control'>
        <tr>
            <td class='lSize'><label for='switch1'>USB
Tethering</label></td>
            <td>
                <ejs-switch id="switch1"></ejs-switch>
            </td>
        </tr>
    </table>
</template>
<script>
import Vue from 'vue';
import { SwitchPlugin } from "@syncfusion/ej2-vue-buttons";
import { enableRipple } from '@syncfusion/ej2-base';
import { rippleMouseHandler } from '@syncfusion/ej2-buttons';
enableRipple(true);
Vue.use(SwitchPlugin);
export default {
    mounted: function(){
        var elemArray = document.querySelectorAll('.switch-control label');
        for (var i = 0, len = elemArray.length; i < len; i++) {
            elemArray[i].addEventListener('mouseup', rippleHandler);
            elemArray[i].addEventListener('mousedown', rippleHandler);
        }
        function rippleHandler(e) {
```

```
            var rippleSpan =
this.parentElement.nextElementSibling.querySelector('.e-ripple-container');
            rippleSpan && rippleMouseHandler(e, rippleSpan);
        }
    }
};
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/fabric.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/fabric.css";
.switch-control tr td {
  padding: 10px;
}
.switch-control .lSize {
  font-family: "Roboto", "Segoe UI", "GeezaPro", "DejaVu Serif", "sans-
serif";
  font-size: 13px;
  cursor: pointer;
  user-select: none;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/switch/getting-started-cs5" %}

Enable rtl in Vue Switch component

Switch component has RTL support. This can be achieved by setting enableRtl as true.

The following example illustrates how to enable right-to-left support in Switch component.

APP.VUE

```
<template>
  <ejs-switch enableRtl=true></ejs-switch>
</template>
<script>
import Vue from 'vue';
import { SwitchPlugin } from "@syncfusion/ej2-vue-buttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(SwitchPlugin);
export default {}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/fabric.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/fabric.css";
.e-switch-wrapper {
  margin: 18px;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/switch/getting-started-cs6" %}

Set disabled state in Vue Switch component

Switch can be disabled by setting the disabled property to true.

The following example illustrates how to disable support in Switch component.

Copyright © 2001 -2024 Syncfusion Inc.

APP.VUE

```
<template>
  <ejs-switch disabled=true ></ejs-switch>
</template>
<script>
import Vue from 'vue';
import { SwitchPlugin } from "@syncfusion/ej2-vue-buttons";
Vue.use(SwitchPlugin);
export default {}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/fabric.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/fabric.css";
.e-switch-wrapper {
  margin-top: 18px;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/switch/getting-started-cs7" %}

Submit name and value in form in Vue Switch component

The name attribute of the Switch is used to group Switches. When the Switches are grouped in form, the checked items

value attribute will post to the server on form submit. The disabled and unchecked Switch values will not be sent to

the server on form submit.

In the following code snippet, USB and Wi-Fi in the checked state, and Bluetooth is in disabled state. Values that are in checked state only be sent on form submit.

APP.VUE

```
<template>
    <form>
        <table class='size'>
            <tr>
                <td class='lSize'><label>USB</label></td>
                <td>
                    <ejs-switch id="switch1" name="tethering" value="USB"
checked=true></ejs-switch>
                </td>
            </tr>
            <tr>
                <td class='lSize'><label>Wi-Fi</label></td>
                <td>
                    <ejs-switch id="switch2" name="hotspot" value="wifi"
checked=true></ejs-switch>
                </td>
            </tr>
            <tr>
                <td class='lSize'><label class="e-
disabled">Bluetooth</label></td>
                <td>
```

```
                    <ejs-switch id="switch3" name="tethering"
value="bluetooth" disabled=true></ejs-switch>
                </td>
            </tr>
            <tr>
                <td>
                    <ejs-button id="btn" isPrimary=true>Submit</ejs-button>
                </td>
            </tr>
        </table>
    </form>
</template>
<script>
import Vue from 'vue';
import { SwitchPlugin, ButtonPlugin } from "@syncfusion/ej2-vue-buttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(SwitchPlugin);
Vue.use(ButtonPlugin);
export default {}
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/fabric.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/fabric.css";
.size tr td {
  padding: 10px;
}
.size .lSize {
  font-family: "Roboto", "Segoe UI", "GeezaPro", "DejaVu Serif", "sans-
serif";
  font-size: 13px;
  cursor: pointer;
  user-select: none;
}
</style>
```

Change switch state using toggle method in Vue Switch component

This section explains about how to toggle between the switch states using toggle method.

APP.VUE

```
<template>
  <ejs-switch ref="toggleSwitch" checked=true :created="created"></ejs-
switch>
</template>
<script>
import Vue from 'vue';
import { SwitchPlugin } from "@syncfusion/ej2-vue-buttons";
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
Vue.use(SwitchPlugin);
export default {
  methods: {
    created: function(args) {
```

Copyright © 2001 -2024 Syncfusion Inc.

```
      this.$refs.toggleSwitch.toggle();
    }
  }
};
</script>
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/fabric.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/fabric.css";
.e-switch-wrapper {
  margin: 18px;
}
</style>
```

{% previewsample "page.domainurl/code-snippet/switch/getting-started-cs4" %}

Switch triggers change event on every state stage to perform custom operations.

Tab

Getting Started with the Vue Tab Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using Vue-CLI and integrating the Syncfusion Vue Tab component

Prerequisites

System requirements for Syncfusion Vue UI components

Dependencies

The following is the list of dependencies required to use the Tab component in your application.

`javascript

|-- @syncfusion/ej2-vue-navigations

|-- @syncfusion/ej2-base

|-- @syncfusion/ej2-vue-base

|-- @syncfusion/ej2-navigations

|-- @syncfusion/ej2-inputs

|-- @syncfusion/ej2-buttons

`

Setting up the Vue 2 project

To generate a Vue 2 project using Vue-CLI, use the vue create command. Follow these steps to install Vue CLI and create a new project:

`bash

npm install -g @vue/cli

vue create quickstart

cd quickstart

npm run serve

Copyright © 2001 -2024 Syncfusion Inc.

`

or

`bash

yarn global add @vue/cli

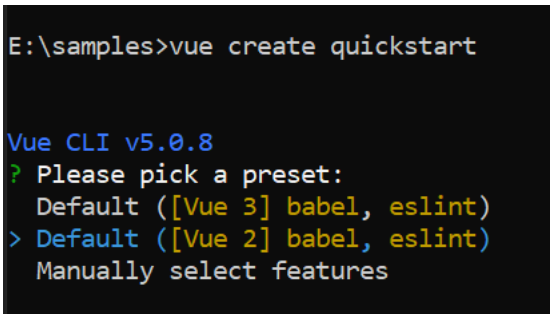
vue create quickstart

cd quickstart

yarn run serve

`

When creating a new project, choose the option Default ([Vue 2] babel, eslint) from the menu.



Once the quickstart project is set up with default settings, proceed to add Syncfusion components to the project

Add Syncfusion Vue packages

Syncfusion packages are available at npmjs.com. To use Vue components, install the required npm package.

This article uses the Vue Tab component as an example. Install the @syncfusion/ej2-vue-navigations package by running the following command:

`bash

npm install @syncfusion/ej2-vue-navigations --save

`

or

`bash

yarn add @syncfusion/ej2-vue-navigations

`

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

Copyright © 2001 -2024 Syncfusion Inc.

In this article, the Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the Tab component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-
navigations/styles/material.css";
</style>
```

Add Syncfusion Vue component

Follow the below steps to add the Vue Tab component:

1\. First, import and register the Tab component in the script section of the **src/App.vue** file.

~/SRC/APP.VUE

```
<script>
import { TabComponent, TabItemDirective, TabItemsDirective } from
'@syncfusion/ej2-vue-navigations';
export default {
components: {
'ejs-tab': TabComponent,
'e-tabitem': TabItemDirective,
'e-tabitems': TabItemsDirective
}
}
</script>
```

2\. In the template section, define the Tab component with content and header properties

~/SRC/APP.VUE

```
<template>
<div id="app">
<ejs-tab id='element'>
<e-tabitems>
<e-tabitem :header='headerText0' :content="content0"></e-tabitem>
<e-tabitem :header='headerText1' :content="content1"></e-tabitem>
<e-tabitem :header='headerText2' :content="content2"></e-tabitem>
</e-tabitems>
</ejs-tab>
</div>
</template>
```

3\. Declare the value for the content and header properties in the script section.

~/SRC/APP.VUE

```
<script>
data: function(){
```

Copyright © 2001 -2024 Syncfusion Inc.

```
return {
headerText0: { text: 'ASP.NET' },
headerText1: { text: 'ASP.NET MVC' },
headerText2: { text: 'JavaScript' },
content0: 'ASP.NET is an open-source server-side web application framework
designed for web development to produce ' +
'dynamic web pages. It was developed by Microsoft to allow programmers to
build dynamic web sites, web applications ' +
'and web services. It was first released in January 2002 with version 1.0 of
the .NET Framework, and is the successor ' +
'to Microsoft\'\s Active Server Pages (ASP) technology. ASP.NET is built on
the Common Language Runtime (CLR), allowing ' +
'programmers to write ASP.NET code using any supported .NET language. The
ASP.NET SOAP extension framework allows ' +
'ASP.NET components to process SOAP messages.',
content1: 'The ASP.NET MVC is a web application framework developed by
Microsoft, which implements the ' +
'model-view-controller (MVC) pattern. It is open-source software, apart from
the ASP.NET Web Forms component which is ' +
'proprietary. In the later versions of ASP.NET, ASP.NET MVC, ASP.NET Web
API, and ASP.NET Web Pages (a platform using ' +
'only Razor pages) will merge into a unified MVC 6.The project is called
ASP.NET vNext.',
content2: 'JavaScript (JS) is an interpreted computer programming language.

        }
   }
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-
navigations/styles/material.css";
</style>
```

Run the project

To run the project, use the following command:

`bash

npm run serve

Copyright © 2001 -2024 Syncfusion Inc.

`

or

`bash

yarn run serve

`

{% previewsample "page.domainurl/code-snippet/tab/getting-started-cs1" %}

Initialize the Tab using HTML elements

The Tab component can be rendered based on the given HTML element using <ejs-tab> tag.

Header section must be enclosed with in a wrapper element using e-tab-header class and corresponding content must be mapped with e-content class.

You need to follow the below structure of HTML elements to render the Tab,

`

<ejs-tab id="element"> --> Root Tab element

 --> Tab header

 --> Header Item

 --> Tab content

 --> Content Item

</ejs-tab>

`

~/SRC/APP.VUE

```
<template>
    <div id="app">
    <ejs-tab id='element'>
         <div class="e-tab-header">
                <div>Twitter </div>
                <div>Facebook </div>
                <div>WhatsApp </div>
            </div>
            <div class="e-content">
                <div>
                        Twitter is an online social networking service that
enables users to send and read short 140-character messages called 'tweets'.
Registered users can read and post tweets, but those who are unregistered
can only read them. Users access Twitter through the website interface, SMS
or mobile device app Twitter Inc. is based in San Francisco and has more
than 25 offices around the world. Twitter was created in March 2006 by Jack
```

```
Dorsey, Evan Williams, Biz Stone, and Noah Glass and launched in July 2006.
The service rapidly gained worldwide popularity, with more than 100 million
users posting 340 million tweets a day in 2012.The service also handled 1.6
billion search queries per day.
                </div>
                <div>
                        Facebook is an online social networking service
headquartered in Menlo Park, California. Its website was launched on
February 4, 2004, by Mark Zuckerberg with his Harvard College roommates and
fellow students Eduardo Saverin, Andrew McCollum, Dustin Moskovitz and Chris
Hughes.The founders had initially limited the website's membership to
Harvard students, but later expanded it to colleges in the Boston area, the
Ivy League, and Stanford University. It gradually added support for students
at various other universities and later to high-school students.
                </div>
                <div>
                        WhatsApp Messenger is a proprietary cross-platform
instant messaging client for smartphones that operates under a subscription
business model. It uses the Internet to send text messages, images, video,
user location and audio media messages to other users using standard
cellular mobile numbers. As of February 2016, WhatsApp had a user base of up
to one billion,[10] making it the most globally popular messaging
application. WhatsApp Inc., based in Mountain View, California, was acquired
by Facebook Inc. on February 19, 2014, for approximately US$19.3 billion.
                </div>
            </div>
    </ejs-tab>

navigations/styles/material.css";
</style>
```

{% previewsample "page.domainurl/code-snippet/tab/tab-container-cs1" %}

Initialize the Tab using V-slot Template

In the Vue Tab component, the v-slot directive is used to define a slot template in the component's template where users can insert custom content. Refer to the following code sample.

~/SRC/APP.VUE

```
<template>
        <div id="app">
                <ejs-tab id="element">
                        <e-tabitems>
                                <e-tabitem :header='datePickerText'
:content="'datePickerTemplate'">
                                        <template v-slot:datePickerTemplate>
                                                <ejs-datepicker></ejs-
datepicker>
                                        </template>
                                </e-tabitem>
                                <e-tabitem :header='calendarText'
:content="'calendarTemplate'">
                                        <template v-slot:calendarTemplate>
                                                <ejs-calendar></ejs-
calendar>
                                        </template>
                                </e-tabitem>
                        </e-tabitems>
                </ejs-tab>
        </div>
</template>
<script>
import Vue from 'vue';
import { TabPlugin } from '@syncfusion/ej2-vue-navigations';
import { DatePickerPlugin, CalendarPlugin } from '@syncfusion/ej2-vue-
calendars';
Vue.use(TabPlugin);
Vue.use(DatePickerPlugin);
Vue.use(CalendarPlugin);
export default {
        name: 'app',
        data: function () {
                return {
                        datePickerText: { text: 'Datepicker' },
                        calendarText: { text: 'Calendar' },                }
        }
}
</script>

<style>
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-calendars/styles/material.css';

Note: You can refer to our Vue Tab feature tour page for its groundbreaking feature representations. You can also explore our Vue Tab Component example that shows how to render the Tab in Vue.

Getting Started with Syncfusion Vue Tab Component in Vue 3

This article provides a step-by-step guide for setting up a Vite project with a JavaScript environment and integrating the Syncfusion Vue Tab component using the Composition API / Options API.

The Composition API is a new feature introduced in Vue.js 3 that provides an alternative way to organize and reuse component logic. It allows developers to write components as functions that use smaller, reusable functions called composition functions to manage their properties and behavior.

The Options API is the traditional way of writing Vue.js components, where the component logic is organized into a series of options that define the component's properties and behavior. These options include data, methods, computed properties, watchers, lifecycle hooks, and more.

Prerequisites

System requirements for Syncfusion Vue UI components

Setup the Vite project

A recommended approach for beginning with Vue is to scaffold a project using Vite. To create a new Vite project, use one of the commands that are specific to either NPM or Yarn.

`bash

npm create vite@latest

`

or

`bash

yarn create vite

`

Using one of the above commands will lead you to set up additional configurations for the project as below:

1.Define the project name: We can specify the name of the project directly. Let's specify the name of the project as my-project for this article.

`bash

? Project name: » my-project

`

2.Select Vue as the framework. It will creates a Vue 3 project.

`bash

? Select a framework: » - Use arrow-keys. Return to submit.

Vanilla

Vue

React

Copyright © 2001 -2024 Syncfusion Inc.

Preact

Lit

Svelte

Others

`

3.Choose JavaScript as framework variant to build this Vite project using JavaScript and Vue.

`bash

? Select a variant: » - Use arrow-keys. Return to submit.

JavaScript

TypeScript

Customize with create-vue ↗

Nuxt ↗

`

4.Upon completing the aforementioned steps to create the my-project, run the following command to install its dependencies:

`bash

cd my-project

npm install

`

or

`bash

cd my-project

yarn install

`

Now that my-project is ready to run with default settings, let's add Syncfusion Vue Tab component to the project.

Adding Syncfusion Vue packages

Syncfusion Vue component packages are available at npmjs.com. To use Syncfusion Vue components in the project, install the corresponding npm package.

This article uses the Vue Tab component as an example. To use the Vue Tab component in the project, the @syncfusion/ej2-vue-navigations package needs to be installed using the following command.

`bash

npm install @syncfusion/ej2-vue-navigations --save

`

Copyright © 2001 -2024 Syncfusion Inc.

or

`bash

yarn add @syncfusion/ej2-vue-navigations

`

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the Tab component and its dependents were imported into the <style> section of the **src/App.vue** file.

`html

<style>

@import "../node_modules/@syncfusion/ej2-base/styles/material.css";

@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";

@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";

@import "../node_modules/@syncfusion/ej2-vue-navigations/styles/material.css";

</style>

`

Adding Syncfusion Vue Tab component in the application

Follow the below steps to add the Vue Tab component using Composition API:

1.First, import and register the Tab component and its child directives in the script section of the **src/App.vue** file. If you are using the Composition API, you should add the setup attribute to the script tag to indicate that Vue will be using the Composition API.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
import {
TabComponent as EjsTab, TabItemsDirective as ETabitems, TabItemDirective as
ETabitem
} from "@syncfusion/ej2-vue-navigations";
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
import {
TabComponent,
TabItemDirective,
TabItemsDirective,
} from "@syncfusion/ej2-vue-navigations";
export default {
```

Copyright © 2001 -2024 Syncfusion Inc.

```
name: "App",
components: {
"ejs-tab": TabComponent,
"e-tabitem": TabItemDirective,
"e-tabitems": TabItemsDirective,
}
}
</script>
```

2.Add the component definition in template section.

`html

<template>

<ejs-tab id="tab">

<e-tabitems>

<e-tabitem :header="headerText0" :content="content0"></e-tabitem>

<e-tabitem :header="headerText1" :content="content1"></e-tabitem>

<e-tabitem :header="headerText2" :content="content2"></e-tabitem>

</e-tabitems>

</ejs-tab>

</template>

`

3.Declare the properties for Tab component.

COMPOSITION API (~/SRC/APP.VUE)

```
<script setup>
const headerText0 = { text: "ASP.NET" };
const headerText1 = { text: "ASP.NET MVC" };
const headerText2 = { text: "JavaScript" };
const content0 =
"ASP.NET is an open-source server-side web application framework designed
for web development to produce " +
"dynamic web pages. It was developed by Microsoft to allow programmers to
build dynamic web sites, web applications " +
"and web services. It was first released in January 2002 with version 1.0 of
the .NET Framework, and is the successor " +
"to Microsoft's Active Server Pages (ASP) technology. ASP.NET is built on
the Common Language Runtime (CLR), allowing " +
"programmers to write ASP.NET code using any supported .NET language. The
ASP.NET SOAP extension framework allows " +
"ASP.NET components to process SOAP messages.";
const content1 =
"The ASP.NET MVC is a web application framework developed by Microsoft,
which implements the " +
"model-view-controller (MVC) pattern. It is open-source software, apart from
the ASP.NET Web Forms component which is " +
"proprietary. In the later versions of ASP.NET, ASP.NET MVC, ASP.NET Web
API, and ASP.NET Web Pages (a platform using " +
```

Copyright © 2001 -2024 Syncfusion Inc.

```
"only Razor pages) will merge into a unified MVC 6.The project is called
ASP.NET vNext.";
const content2 =
"JavaScript (JS) is an interpreted computer programming language. It was
originally implemented as " +
"part of web browsers so that client-side scripts could interact with the
user, control the browser, communicate " +
"asynchronously, and alter the document content that was displayed.[5] More
recently, however, it has become common in " +
"both game development and the creation of desktop applications.";
</script>
```

OPTIONS API (~/SRC/APP.VUE)

```
<script>
data: function() {
return {
headerText0: { text: "ASP.NET" },
headerText1: { text: "ASP.NET MVC" },
headerText2: { text: "JavaScript" },
content0: "ASP.NET is an open-source server-side web application framework
designed for web development to produce " +
"dynamic web pages. It was developed by Microsoft to allow programmers to
build dynamic web sites, web applications " +
"and web services. It was first released in January 2002 with version 1.0 of
the .NET Framework, and is the successor " +
"to Microsoft's Active Server Pages (ASP) technology. ASP.NET is built on
the Common Language Runtime (CLR), allowing " +
"programmers to write ASP.NET code using any supported .NET language. The
ASP.NET SOAP extension framework allows " +
"ASP.NET components to process SOAP messages.",
content1: "The ASP.NET MVC is a web application framework developed by
Microsoft, which implements the " +
"model-view-controller (MVC) pattern. It is open-source software, apart from
the ASP.NET Web Forms component which is " +
"proprietary. In the later versions of ASP.NET, ASP.NET MVC, ASP.NET Web
API, and ASP.NET Web Pages (a platform using " +
"only Razor pages) will merge into a unified MVC 6.The project is called
ASP.NET vNext.",
content2: "JavaScript (JS) is an interpreted computer programming language.
It was originally implemented as " +
"part of web browsers so that client-side scripts could interact with the
user, control the browser, communicate " +
"asynchronously, and alter the document content that was displayed.[5] More
recently, however, it has become common in " +
"both game development and the creation of desktop applications."
}
}
</script>
```

Here is the summarized code for the above steps in the **src/App.vue** file:

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
<ejs-tab id="tab">
```

```
<e-tabitems>
<e-tabitem :header="headerText0" :content="content0"></e-tabitem>
<e-tabitem :header="headerText1" :content="content1"></e-tabitem>
<e-tabitem :header="headerText2" :content="content2"></e-tabitem>
</e-tabitems>
</ejs-tab>
</template>
<script setup>
import {
TabComponent as EjsTab, TabItemsDirective as ETabitems, TabItemDirective as
ETabitem
} from "@syncfusion/ej2-vue-navigations";
const headerText0 = { text: "ASP.NET" };
const headerText1 = { text: "ASP.NET MVC" };
const headerText2 = { text: "JavaScript" };
const content0 =
"ASP.NET is an open-source server-side web application framework designed

Run the project

To run the project, use the following command:

`bash

npm run dev

`

or

`bash

yarn run dev

`

The output will appear as follows:

Refer the sample Vue 3 using Composition API Tab getting started

For migrating from Vue 2 to Vue 3, refer to the migration documentation.

See also

- Getting Started with Vue UI Components using Composition API and TypeScript
- Getting Started with Vue UI Components using Options API and TypeScript

Adaptive in Vue Tab component

The following section explains about rendering Tab when its width exceeds the viewable area or particularly in a given width. The available

modes are as follows:

- Scrollable
- Popup

Scrollable

The default overflow mode is Scrollable. Scrollable display mode supports displaying the Tab header items in a single line with horizontal

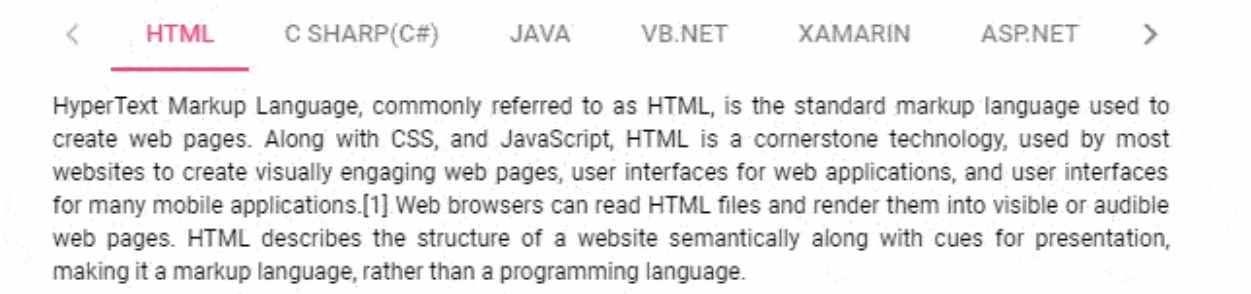
scrolling enabled, when the item overflows to the available space.

Copyright © 2001 -2024 Syncfusion Inc.

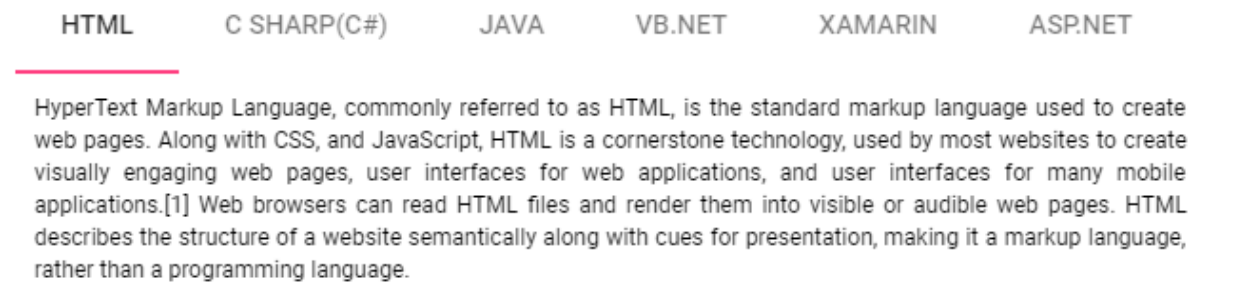
- The right and left navigation arrow is added at the start and end of the Tab header through which user can navigate towards overflowed

items of the Tab header.

- You can also see the overflowed items using touch and swipe action on the header and content section.
- By default, navigation icon in the left direction is disabled, you can see the overflowed items by moving in the right direction.
- By clicking the arrow or by holding the arrow continuously, you can see the overflowed items.



- In devices the navigation icons are not available. You can touch and swipe to see the overflowed items of the Tab header.



APP.VUE

```
<template>
    <div id="app">
    <ejs-tab id="element" heightAdjustMode='Auto' overflowMode='Scrollable'>
            <e-tabitems>
                 <e-tabitem :header='headerText0' :content="content0"></e-
tabitem>
                    <e-tabitem :header='headerText1'
:content="content1"></e-tabitem>
                    <e-tabitem :header='headerText2'

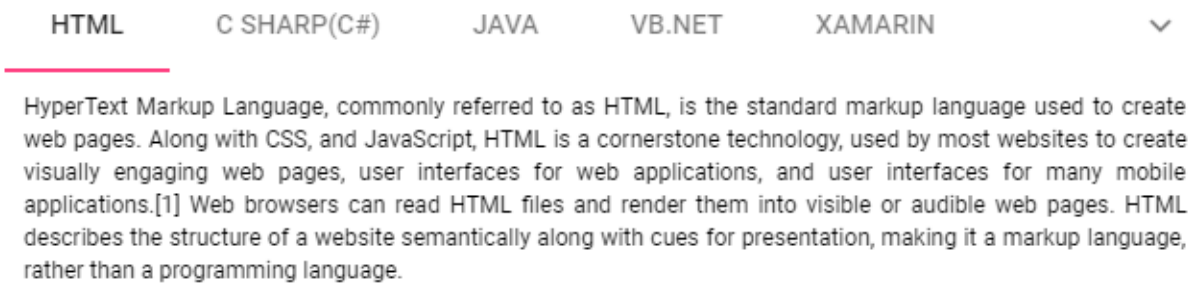
Popup

The Popup is the another type of overflowMode in which the Tab container holds the items that can be placed within the available space.

The rest of the overflowing items for which there is no space to fit within the viewing area are moved to overflow popup container.

- The items placed in popup can be viewed by opening the popup with the help of drop-down icon given at the end of the Tab header.
- If the popup height exceeds the height of the visible area, you can scroll through the popup items and select one.



APP.VUE

```
<template>
    <div id="app">
   <ejs-tab id="element" heightAdjustMode='Auto' overflowMode='Popup'>
     <e-tabitems>
                    <e-tabitem :header='headerText0'
:content="content0"></e-tabitem>
                    <e-tabitem :header='headerText1'
:content="content1"></e-tabitem>

Header in Vue Tab component

This section explains about modifying the style of Tab header, and configuring its icons and positions.

Styles

You can customize header styles by adding predefined classes in the Tab root element. The pre-defined CSS class names are as follows:

- **e-fill**: The Selected Tab header background is set as solid fill.
- **e-background**: Tab header has a solid fill background, and the selected header has a highlighted border.
- **e-background e-accent**: Tab header has a solid fill background, and the selected header has a highlighted border with accent color.

Copyright © 2001 -2024 Syncfusion Inc.

If the above custom style classes are not included in the root element, the default style is applied to the Tab items.

Icon positions

You can customize the position of the Tab header icons using the iconPosition property. This property depends on the header items iconCss property. By default, Tab header icon is placed on left position. The position values are as follows:

- **Left**: Icon is placed on the left of the Tab header item.
- **Right**: Icon is placed on the right of the Tab header item.
- **Top**: Icon is placed on the top of the Tab header item.
- **Bottom**: Icon is placed on the bottom of the Tab header item.

Localization in Vue Tab component

Localization library allows to localize the default text content of Tab. In Tab, The close button's tooltip text alone will be localize based on culture.

| Locale key | en-US (default) |

|------|------|-------------|

| closeButtonTitle | close |

Loading translations

To load translation object in an application use load function of L10n class.

In the below sample, French culture is set to Tab and change the close button's tooltip text.

APP.VUE

```
<template>
  <div id="app">
    <ejs-tab id='element' locale="fr-BE" :showCloseButton=true >
        <e-tabitems>
                    <e-tabitem :header='headerText0'
:content="content0"></e-tabitem>
                    <e-tabitem :header='headerText1'
:content="content1"></e-tabitem>
                    <e-tabitem :header='headerText2'
:content="content2"></e-tabitem>
      </e-tabitems>
    </ejs-tab>
  </div>
</template>
<script>
import Vue from 'vue';
import { TabPlugin } from '@syncfusion/ej2-vue-navigations';
import { L10n } from '@syncfusion/ej2-base';
Vue.use(TabPlugin);
L10n.load({
    'fr-BE': {
        'tab': {
        'closeButtonTitle': "Fermer"
        }
    }
});
```

```
export default {
    data: function() {
        return {
          headerText0: { text: 'ASP.NET' },
          headerText1: { text: 'ASP.NET MVC' },
          headerText2: { text: 'JavaScript' },
        content0: 'ASP.NET is an open-source server-side web application
framework designed for web development to produce ' +
        'dynamic web pages. It was developed by Microsoft to allow
programmers to build dynamic web sites, web applications ' +
        'and web services. It was first released in January 2002 with
version 1.0 of the .NET Framework, and is the successor ' +
        'to Microsoft\'\s Active Server Pages (ASP) technology. ASP.NET is
built on the Common Language Runtime (CLR), allowing ' +
        'programmers to write ASP.NET code using any supported .NET
language. The ASP.NET SOAP extension framework allows ' +
        'ASP.NET components to process SOAP messages.',
         content1: 'The ASP.NET MVC is a web application framework developed
by Microsoft, which implements the ' +
        'model-view-controller (MVC) pattern. It is open-source software,
apart from the ASP.NET Web Forms component which is ' +
        'proprietary. In the later versions of ASP.NET, ASP.NET MVC, ASP.NET
Web API, and ASP.NET Web Pages (a platform using ' +
        'only Razor pages) will merge into a unified MVC 6.The project is
called ASP.NET vNext.',
         content2: 'JavaScript (JS) is an interpreted computer programming
language. It was originally implemented as ' +
        'part of web browsers so that client-side scripts could interact
with the user, control the browser, communicate ' +
        'asynchronously, and alter the document content that was
displayed.[5] More recently, however, it has become common in ' +
        'both game development and the creation of desktop applications.',
        }

Orientation in Vue Tab component

This section explains about modifying the position and modes of Tab header.

It allows placing the header section inside the Tab component at different positions by using the headerPlacement property. The available positions are as follows:

- **Top**: Tab header items can be arranged horizontally, and their content can be placed after the header.

Copyright © 2001 -2024 Syncfusion Inc.

- **Bottom**: Tab header items can be arranged horizontally, and their content can be placed before the header.
- **Left**: Tab header items can be arranged vertically, and their content can be placed after the header.
- **Right**: Tab header items can be arranged vertically, and their content can be placed before the header.

It is also adaptable to the available space when the tab items exceed the view space. You can customize the modes by using `overflowMode` property. The available modes are as follows:

- Scrollable
- Popup

APP.VUE

```
<template>
<div id='container'>
        <div id="default" style="padding-top:20px">

Drag and drop in Vue Tab component

The Tab component allows you to drag and drop any item by setting allowDragAndDrop to **true**. Items can be reordered to any place by dragging and dropping them onto the desired location.

- If you need to prevent dragging action for a particular item, the onDragStart event can be used which will trigger when the item drag is started. If you need to prevent dropping action for a particular item, the dragged event can be used which will trigger when the drag action is stopped.
- The dragArea defines the area in which the draggable element movement will be occurring. Outside that area will be restricted for the draggable element movement.
- The onDragStart event will be triggered before dragging the item from Tab.
- The dragging event will be triggered when the Tab item is being dragged.
- The dragged event will be triggered when the Tab item is dropped on the target element successfully.

In the following sample, the allowDragAndDrop property is enabled.

Drag and drop item between tabs

It is possible to drag and drop the tab items between two tabs, by manually saving those dropped items as new tab item data through the addTab method of Tab and removing the dragged item through the removeTab method of Tab.

In this example, we have used the tab control as an external source, and the item from the tab component is dragged and dropped onto another Tab. Therefore, it is necessary to use the onDragStart and dragged event of the Tab component, where we can form an event object and save it using the addTab method of the Tab and remove the dragged item through removeTab method of Tab using the dragged item index.

Drag and drop items to external source

It is possible to drag and drop the items to any of the external sources from the Tab, by manually saving those dropped items as new node data through the addNodes method of Treeview and removing the dragged item through the removeTab method of Tab.

In this example, we have used the tree view control as an external source, and the item from the tab component is dragged and dropped onto the child nodes of the tree view component. Therefore, it is necessary to use the dragged event of the Tab component, where we can form an event object and save it using the addNodes method of the Treeview and remove the dragged item through the removeTab method of Tab using the dragged item index.

Drag and drop items from external source

It is possible to drag and drop the items from any of the external sources into the Tab, by manually saving those dropped items as new item data through the addTab method of Tab and removing the dragged node through the removeNodes method of Treeview.

In this example, we have used the tree view control as an external source, and the child nodes from the tree view component are dragged and dropped onto the Tab. Therefore, it is necessary to use the nodeDragStop event of the Treeview component, where we can form an event object and save it using the addTab method of the Tab and remove the dragged node through the removeNodes method of Treeview.

Accessibility in Vue Tab component

The Tab component followed the accessibility guidelines and standards, including ADA, Section 508, WCAG 2.2 standards, and WCAG roles that are commonly used to evaluate accessibility.

The accessibility compliance for the Tab component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| WCAG 2.2 Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Section 508 Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Screen Reader Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Right-To-Left Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Color Contrast | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Mobile Device Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

Copyright © 2001 -2024 Syncfusion Inc.

| Keyboard Navigation Support | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Accessibility Checker Validation | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

| Axe-core Accessibility Validation | <img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<img src="https://cdn.syncfusion.com/content/images/landing-page/yes.png" alt="Yes"> - All features of the component meet the requirement.

<img src="https://cdn.syncfusion.com/content/images/landing-page/intermediate.png" alt="Intermediate"> - Some features of the component do not meet the requirement.

<img src="https://cdn.syncfusion.com/content/images/landing-page/no.png" alt="No"> - The component does not meet the requirement.

ARIA attributes

Tab component is designed by considering WAI-ARIA standard. Tab is supported with ARIA Accessibility which is accessible by on-screen readers, and other assistive technology devices.

The following list of attributes are added in the Tab.

| **Roles and Attributes** | **Functionalities** |

| --- | --- |

| tablist | Attribute is set to the Tab header element that describes actual role of the element.|

| tab | Attribute is set to the Tab items element to indicates an interactive element inside a tablist that, when activated, displays its associated tabpanel.|

| tabpanel | Attribute is set to the Tab content that describes the role for viewing the active content.|

| aria-orientation | Attribute is set to the Tab header element indicates the Tab header orientation. Default value of this attribute is horizontal. |

| aria-selected | Attribute set to the Tab items to indicates the selection state for Tab items. Active Tab is set to true for this attribute. |

| aria-labelledby | Attribute is set to the Tab content element to indicates the associated Tab header for the content. |

| aria-controls | Attribute is set to the Tab items element to indicates the associated tabpanel for the header. |

Copyright © 2001 -2024 Syncfusion Inc.

| aria-haspopup | Attribute is set to the Popup element to indicates the popup mode in the Tab. The default value of this attribute is false. If popup mode is enabled, the attribute value is set to true. |

| aria-disabled | Attribute set to the Tab items to It indicates the disabled state of the Tab. |

Keyboard interaction

By default, keyboard navigation is enabled. This component implements keyboard navigation support by following the WAI-ARIA practices. Once focused on the active Tab element, you can use the following key combination for interacting with the Tab.

Key	Description
Left	Moves focus to the previous Tab. If focus is on the first Tab, the focus will not move to any Tab.
Right	Moves focus to the next Tab. If focus is on the last Tab element, the focus will not move to any Tab.
Enter or Space	Selects the Tab if it is not selected. Opens the popup dropdown icon if it is focussed. Select the Tab item as active when popup item is focussed.
Esc(Escape)	Closes the popup if popup is in opened state.
Down or Up	When the popup is open and focused, it will move to previous/next Tab items of the popup in the vertical direction.
Home	Moves focus to the first Tab.
End	Moves focus to the last Tab.
Shift + F10	If popup mode is enabled, it opens the popup when the Tab is focused.
Delete	Deletes the Tab, if close button is enabled in Tab header.
Tab	To Move focus through the interactive elements.
Shift + Tab	To Move focus through the interactive elements.

Ensuring accessibility

The Tab component's accessibility levels are ensured through an accessibility-checker and axe-core software tools during automated testing.

The accessibility compliance of the Tab component is shown in the following sample. Open the sample in a new window to evaluate the accessibility of the Tab component with accessibility tools.

Style in Vue Tab component

The following content provides the exact CSS structure that can be used to modify the control’s appearance based on user preference.

Copyright © 2001 -2024 Syncfusion Inc.

Customizing Tab

Use the following CSS to customize the Tab.

```
.e-tab {
border: 5px solid rgb(173, 255, 47);
}
```

Customizing the Tab items

Use the following CSS to customize the header items of Tab.

```
.e-tab .e-tab-header .e-toolbar-items {
background: #9faed8;
border: 2px solid blue;
}
```

Use the following CSS to customize the content items of Tab.

```
.e-tab .e-content .e-item {
color: #a78515;
font-size: 14px;
}
```

Customizing Tab's header

Use the following CSS to customize the header of Tab control.

```
.e-tab .e-tab-header {
background: #badfba !important;
}
```

Customizing Tab's header icon

Use the following CSS to customize the header item icon of Tab control.

```
.e-tab .e-tab-header .e-toolbar-item .e-tab-icon {
color: #badfba !important;
```

Copyright © 2001 -2024 Syncfusion Inc.

}
`

Customizing Tab's content

Use the following CSS to customize the content of Tab control.

`css
.e-tab .e-content {
background: #d1f6d1 !important;
}
`

Customizing the hover state of Tab control

Use the following CSS to customize the tab item when hovering.

`css
.e-tab .e-tab-header .e-toolbar-item .e-tab-wrap:hover {
background: #d1f6d1 !important;
}
`

Use the following CSS to customize the tab item popup icon when hovering.

`css
.e-tab .e-tab-header .e-hor-nav .e-popup-up-icon:hover,
.e-tab .e-tab-header .e-hor-nav .e-popup-down-icon:hover {
background: #d1f6d1 !important;
}
`

Customizing selected item of Tab control

Use the following CSS to customize the selected tab item.

`css
.e-tab .e-tab-header .e-toolbar-item.e-active {
background: #d1f4d1;
}
`

Use the following CSS to customize the selected tab item text and icon.

`css
.e-tab .e-tab-header .e-toolbar-item.e-active .e-tab-text,
.e-tab .e-tab-header .e-toolbar-item.e-active .e-tab-icon {

Copyright © 2001 -2024 Syncfusion Inc.

color: green !important;

}

`

How To

Load content through post in Vue Tab component

The Tab supports to load external contents through AJAX library. Refer to the following steps.

- Import the Ajax module from ej2-base and initialize with URL path.
- Get the data from Ajax Success event, then initialize the Tab with retrieved external path data.

APP.VUE

```
<template>
   <div id="wrapper" style='margin-top: 20px'>
     <div>
            <ejs-tab id="element" ref=element>
                <e-tabitems>
                    <e-tabitem :header='headerText0'
:content="content0"></e-tabitem>
                    <e-tabitem :header='headerText1'
:content="content1"></e-tabitem>
                    <e-tabitem :header='headerText2' ></e-tabitem>
                </e-tabitems>
            </ejs-tab>
      </div>
 </div>
</template>

Prevent content swipe selection in Vue Tab component

We can prevent the tab selection on touch swipe action by using the Tab selecting event. Refer the below sample with preventing swipe selection.

APP.VUE

```
<template>
    <div id="app">
   <ejs-tab id="element" :selecting="select">
    <e-tabitems>
                    <e-tabitem :header='headerText0'
:content="content0"></e-tabitem>
                    <e-tabitem :header='headerText1'
:content="content1"></e-tabitem>
                    <e-tabitem :header='headerText2'
:content="content2"></e-tabitem>
                    <e-tabitem :header='headerText3'
:content="content3"></e-tabitem>
                    <e-tabitem :header='headerText4'
:content="content4"></e-tabitem>
                    <e-tabitem :header='headerText5'
:content="content5"></e-tabitem>
                    <e-tabitem :header='headerText6'

Customize selected tab styles in Vue Tab component

You can customize the Tab style by overriding its header and active tab CSS classes. Define HTML string for adding animation and customizing

the Tab header and pass it to text property. Now you can override the style using custom CSS classes added to

the Tab elements.

APP.VUE

```

Create wizard using tab in Vue Tab component

Tab items can be disabled dynamically by passing the index and boolean value with the enableTab method.

In the below Wizard sample, each Tab is integrated with required components to complete the reservation. Each field is provided with validation

for all mandatory option to proceed to next tabs. Using Tab item's template property the components are added intocontent.

Create the following contents for each tab in the wizard.

1. **Search tab:**

Created with DropDownList to select the source, destination and type of ticket. A DatePicker for choosing the date of journey.

2. **Train tab:**

Based on the selected start and end point, populated Grid with random list of available seats and train list. Initially define the columns

and row selected event for validating, after the source and destination chosen update the dataSource

Copyright © 2001 -2024 Syncfusion Inc.

for the Grid.

3. **Passenger tab:**

A table with Textbox, Numeric, DropDownList for adding passenger name, age, gender and preferred berth/seat. Add validation on entering

passenger details to proceed.

4. **Payment tab:**

Calculate the ticket cost based on location, passenger count and ticket type. Generate data for Grid with passenger details, train number

and ticket cost summary.

You can go back on each tab using buttons available in it and tabs are disabled to navigate through tab header click actions. Once you end

the wizard all the data get cleared and wizard goes back to starting tab.

Load tab with data source in Vue Tab component

You can bind any data object to Tab items, by mapping it to a header and content property.

In the below demo, Data is fetched from an `OData` service using `DataManager`. The result data is formatted as a JSON object with `header`

and `content` fields, which is set to items property of Tab.

APP.VUE

```
<template>
    <div id="app">
    <ejs-tab ref="TabInstance">
    </ejs-tab>
  </div>
</template>
<script>
import Vue from 'vue';
import { TabPlugin } from '@syncfusion/ej2-vue-navigations';
import { DataManager, Query, ODataV4Adaptor, ReturnOption } from
'@syncfusion/ej2-data';
Vue.use(TabPlugin);
export default {
  name: 'app',
  data () {
}, mounted(){
  new DataManager({ url:
'https://services.odata.org/V4/Northwind/Northwind.svc/Employees', adaptor:
new ODataV4Adaptor}).executeQuery(new Query().range(4, 7)).then((e) => {
        var result = e.result;
        var obj = this.$refs.TabInstance.ej2Instances
        var itemsData =[];
        var  mapping =  { header: 'FirstName', content: 'Notes' };
        for(var i= 0; i < result.length; i++) {
        itemsData.push({ header: {text: result[i][mapping.header]}, content:
result[i][mapping.content] });
       }
      obj.items = itemsData;
      obj.refresh();
});
}
}
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";

</style>
```

{% previewsample "page.domainurl/code-snippet/tab/how-to/datasource-cs1" %}

Add nested tabs in Vue Tab component

Tab supports to render the nested level of Tabs by using `content` property. You can add the nested Tab element inside the parent Tab `content`

property. To render the nested Tab, initialize the component using the id of Tab from a selected event handler.

APP.VUE

Set state persistence of the tab component in Vue Tab component

State persistence allows the Tab to retain the current modal value in the browser cookies for state maintenance. This action is handled through the enablePersistence property which is set to false by default.

When it is set to true, some of the Tab component model values will be retained even after refreshing the page.

The following sample demonstrates how to set state persistence of the Tab component.

APP.VUE

```
<template>
    <div id="app">
    <ejs-tab id='element' enablePersistence='true'>
        <e-tabitems>
                    <e-tabitem :header='headerText0' :content="content0"></e-
tabitem>
                     <e-tabitem :header='headerText1'
:content="content1"></e-tabitem>
                     <e-tabitem :header='headerText2'
:content="content2"></e-tabitem>
      </e-tabitems>
    </ejs-tab>
  </div>
</template>
<script>

Set custom animation in Vue Tab component

Tab supports custom animations for both previous and next actions from the provided animation option of Animation library.

The animation property also allows you to set easing, duration, and various other effects.

Default animation is given as SlideLeftIn for previous tab animation and SlideRightIn for next tab animation. You can also disable the animation by setting the animation effect as None. Also, please use the following CSS to disable indicator animation for animation effect as None.

`css

.e-tab .e-tab-header:not(.e-vertical) .e-indicator, .e-tab .e-tab-header.e-vertical .e-indicator {

transition: none;

}

`

The sample demonstrates some types of animation that suits Tab. You can check all the animation effects here.

Load tab items dynamically in Vue Tab component

Tabs can be added dynamically by passing array of items and index value to the addTab method.

`ts

// New tab title and content inputs are fetched and stored in local variable

let title = document.getElementById('tab-title').value;

let content = document.getElementById('tab-content').value;

var tabObj = this.$refs.TabInstance.ej2Instances;

Copyright © 2001 -2024 Syncfusion Inc.

// Required tab item object formed by using textbox inputs

let item = { header: { text: title }, content: createElement('pre', { innerHTML: content.replace(/\n/g, '
\n') }).outerHTML };

// Item object and the index argument passed into the addTab method to add a new tab

tabObj.addTab([item], totalItems-1);

`

In the following demo, you can add the tab content by clicking the **+**. Enter the new Tab heading and content details in the available text boxes, click 'Add Tab' button to pass the details as an array and here last index is calculated to append the new tab at the end.

APP.VUE

```
<template>
    <div id="app">
        <div id='tab1_content' style='display: none'>
            <ul>
                <li>Click on the "+" header to add dynamic tab items. </li>
                <li>It displays input elements to get the new tab
information. </li>
                <li>Add details and click the "Add Tab" button to open the
newly added tab.</li>
            </ul>
        </div>
        <div id='form-container' style='display: none'>
            <div class='e-float-input'>
                <input type='text' id='tab-title' required="" />
                <span class='e-float-line'></span>
                <label class='e-float-text'>Enter header title</label>
            </div>
            <br />
            <div class='e-float-input'>
                <textarea rows='5' type='text' id='tab-content'

Create collapsible tabs in Vue Tab component

You can achieve collapse and expand functionality in Tab by adding/removing a custom CSS class in the click event handler for each tab.

- Define a CSS class to set the style property display as none. Here 'collapse' class is added to the content element for hiding it.
- Bind the select event for Tab to collapse the initially selected Tab item and bind custom click handler for the Tab headers.
- In the event handler, add and remove 'collapse' class to hide and show the corresponding Tab content.

APP.VUE

```
<template>
  <div id="app">
    <div class="info">
      Collapsible Tabs
```

```
    </div>
    <span style="margin: 10px;">
      <i>The active tab can be toggled to expand and collapse its
content.</i>
    </span>
    <br /><br />
    <ejs-tab id='collapsible_tab' class='e-background' ref='TabInstance'
:created="tabCreated" :selected="tabSelected">
      <e-tabitems>
        <e-tabitem :header='headerText0' :content="content0"></e-tabitem>
        <e-tabitem :header='headerText1' :content="content1"></e-tabitem>
        <e-tabitem :header='headerText2' :content="content2"></e-tabitem>

Render other components in tab using template in Vue Tab component

You can render other components inside Tab using Vue **template**. Through this, we can add content as other components directly with all functionalities to our Tab. Follow the below guidelines for using the other components as template in tab.

- Declare a template in the **template** section of the ".vue" file. An empty object "data" needs to be initialized in the data option of the default export object in **script** section.
- The template function needs to be assigned to the content property of the EJ2 Vue Tab Component.

Copyright © 2001 -2024 Syncfusion Inc.

APP.VUE

```
<template>
    <div id="app">
    <ejs-tab id="element" ref=element>
                <e-tabitems>
                    <e-tabitem :header='headerText0'
:content='Template1'></e-tabitem>
                    <e-tabitem :header='headerText1'
:content='Template2'></e-tabitem>
                </e-tabitems>
            </ejs-tab>
  </div>
</template>
<script>
import Vue from 'vue';
import { TabPlugin } from '@syncfusion/ej2-vue-navigations';
import { DatePickerComponent,CalendarComponent,
DatePickerPlugin,CalendarPlugin } from '@syncfusion/ej2-vue-calendars';
Vue.use(TabPlugin);
Vue.use(TabPlugin);
Vue.component(DatePickerPlugin.name, DatePickerComponent);
Vue.component(CalendarPlugin.name, CalendarComponent);
export default {
  name: 'app',
  data: function(){
    return {
        headerText0: { text: 'Tab1' },
        headerText1: { text: 'Tab2' },
        headerText2: { text: 'Tab3' },
        Template1: function () {
        return {
          template: Vue.component('DatePickerComponent', {
            template: ' <ejs-datepicker :min="minDate" :max="maxDate"
:value="dateVal" ></ejs-datepicker>',
            data() { return { minDate : new Date("05/09/2017"),
                              maxDate : new Date("05/15/2017"),
                              dateVal : new Date("05/11/2017") }; }
          })
        }

Adding dynamic items with content reuse in Vue Tab component

You can add dynamic tabs by reusing the content using Vue **template**. Tabs can be added dynamically by passing array of items and index value to the addTab method.

Content reuse can be achieved by using the following steps:

1. Declare a template in the **template** section of the ".vue" file. An empty object "data" needs to be initialized in the data option of the default export object in **script** section.
2. The template function needs to be assigned to the content property of the EJ2 Vue Tab Component.
3. Provide separate template function for each vue component

and pass content by dynamically adding tab. It will reuse the content of vue component.

Refer to the following sample.

APP.VUE

```
<template>
    <div id="app">
    <button id="add" class="e-btn" v-on:click="addButtonClicked">Click to
add</button>
    <button id="remove" class="e-btn" v-on:click="removeButtonClicked">Click
to remove</button>
    <ejs-tab id="tabElement" ref=tabObj>
                <e-tabitems>
                    <e-tabitem :header='DatePickerHeaderText'
:content='DatePickerTemplate'></e-tabitem>
                    <e-tabitem :header='DropdownHeaderText'
:content='DropDownTemplate'></e-tabitem>
                    <e-tabitem :header='ReusedDropdownHeaderText'
:content='DropDownTemplate'></e-tabitem>
                </e-tabitems>
            </ejs-tab>
  </div>
</template>
<script>
import Vue from 'vue';
import { TabPlugin } from '@syncfusion/ej2-vue-navigations';
import { DatePickerComponent, DatePickerPlugin } from '@syncfusion/ej2-vue-
calendars';
import { DropDownListComponent, DropDownListPlugin } from "@syncfusion/ej2-
vue-dropdowns";
Vue.use(TabPlugin);
Vue.component(DatePickerPlugin.name, DatePickerComponent);
Vue.component(DropDownListPlugin.name, DropDownListComponent);
export default {
  name: 'app',
  data: function () {
```

```
    return {
      DatePickerHeaderText: { text: "DatePicker" },
      DropdownHeaderText: { text: "Dropdown" },
      ReusedDropdownHeaderText: { text: "Reused Dropdown" },
      DatePickerTemplate: function () {
        return {
          template: Vue.component("DatePickerComponent", {
            template:

Customize tab content height in Vue Tab component

You can change the Tab content height by using the heightAdjustMode property. By default, the Tab content heightAdjustMode property is set to Content value.

- **None**: Each tab content height is set based on the Tab height. This value is used only the tab component having the height property.
- **Auto**: Each tab content height will take the maximum height of all other tabs content.
- **Content**: Each tab content height is set based on their own content.
- **Fill**: Each tab content height is set based on the full height of Tabs parent element.

APP.VUE

```
<template>

Reorder active tab in Vue Tab component

We can able to prevent the changing of the active tab item on resizing the browser when overflow mode is popup by using the reorderActiveTab property. By default, the active Tab should be reordered when we click the tab items from the popup. If we set false to reorderActiveTab property the active tab item from the popup will not be reordered and an active item is highlighted inside the popup. The following code example depicts to prevent the reorder active tab item inside the popup.

APP.VUE

```
<template>
<div id='container'>
    <ejs-tab id='element' ref="element" heightAdjustMode='Auto'
overflowMode='Popup' reorderActiveTab='false' height='150px' width='700px'>
        <e-tabitems>
            <e-tabitem :header='headerText0' :content="content0"></e-

Tab key navigation in Vue Tab component

The tabIndex property of a Tab item is used to enable tab key navigation for that particular item. When a positive value is assigned to the tabIndex property, it allows the user to switch focus to the next or previous tab item using the Tab or Shift+Tab keys. By default, the user can only switch between tab items using the arrow keys.

If the tabIndex value is set to 0 for all tab items, the tab will switch based on the order of the elements on the page. This means that if the tab items are listed in a specific order on the page, the user will be able to navigate through them using the Tab key in that same order.

To use the tabIndex property, you can assign a positive value to the property of each tab item that you want to enable tab key navigation. For example:

APP.VUE

```

import { TabPlugin } from '@syncfusion/ej2-vue-navigations';
Vue.use(TabPlugin);
export default {
  name: 'app',
  data: function () {
    return {
      headerText0: { text: 'ASP.NET' },
      headerText1: { text: 'ASP.NET MVC' },
      headerText2: { text: 'JavaScript' },
      content0: 'ASP.NET is an open-source server-side web application
framework designed for web development to produce ' +
        'dynamic web pages. It was developed by Microsoft to allow
programmers to build dynamic web sites, web applications ' +
        'and web services. It was first released in January 2002 with
version 1.0 of the .NET Framework, and is the successor ' +
        'to Microsoft\'\s Active Server Pages (ASP) technology. ASP.NET is
built on the Common Language Runtime (CLR), allowing ' +
        'programmers to write ASP.NET code using any supported .NET
language. The ASP.NET SOAP extension framework allows ' +
        'ASP.NET components to process SOAP messages.',
      content1: 'The ASP.NET MVC is a web application framework developed by
Microsoft, which implements the ' +
        'model-view-controller (MVC) pattern. It is open-source software,
apart from the ASP.NET Web Forms component which is ' +
        'proprietary. In the later versions of ASP.NET, ASP.NET MVC, ASP.NET
Web API, and ASP.NET Web Pages (a platform using ' +
        'only Razor pages) will merge into a unified MVC 6.The project is
called ASP.NET vNext.',
      content2: 'JavaScript (JS) is an interpreted computer programming
language. It was originally implemented as ' +
        'part of web browsers so that client-side scripts could interact
with the user, control the browser, communicate ' +
        'asynchronously, and alter the document content that was
displayed.[5] More recently, however, it has become common in ' +
        'both game development and the creation of desktop applications.',
    }
  }

{% previewsample "page.domainurl/code-snippet/tab/tab-container-cs2" %}

With this code, the user will be able to switch between the tab items using the Tab and Shift+Tab keys, in the order specified by the tabIndex values.

It's important to note that the tabIndex property only affects the ability to navigate between tab items using the Tab key. The user will still be able to use the arrow keys to switch between tab items, regardless of the value of the tabIndex property.

Textbox

Getting Started with the Vue Textbox Component in Vue 2

This article provides a step-by-step guide for setting up a Vue 2 project using Vue-CLI and integrating the Syncfusion Vue Textbox component using the Composition API / Options API.

Prerequisites

System requirements for Syncfusion Vue UI components

Dependencies

The following list of dependencies are required to use the TextBox component in your application.

`js

|-- @syncfusion/ej2-vue-inputs

|-- @syncfusion/ej2-inputs

|-- @syncfusion/ej2-base

`

Setting up the Vue 2 project

To generate a Vue 2 project using Vue-CLI, use the vue create command. Follow these steps to install Vue CLI and create a new project:

`bash

npm install -g @vue/cli

vue create quickstart

cd quickstart

npm run serve

`

or

`bash

yarn global add @vue/cli

vue create quickstart

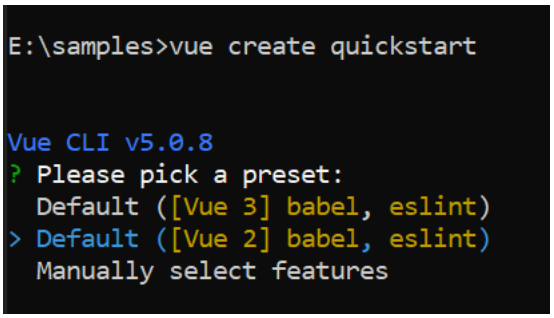
cd quickstart

yarn run serve

Copyright © 2001 -2024 Syncfusion Inc.

`

When creating a new project, choose the option Default ([Vue 2] babel, eslint) from the menu.



Once the quickstart project is set up with default settings, proceed to add Syncfusion components to the project.

Add Syncfusion Vue packages

Syncfusion packages are available at npmjs.com. To use Vue components, install the required npm package.

This article uses the Vue Textbox component as an example. Install the @syncfusion/ej2-vue-inputs package by running the following command:

`bash

npm install @syncfusion/ej2-vue-inputs --save

`

or

`bash

yarn add @syncfusion/ej2-vue-inputs

`

Import Syncfusion CSS styles

You can import themes for the Syncfusion Vue component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and Theme Studio. Refer to themes topic to know more about built-in themes and different ways to refer to themes in a Vue project.

In this article, the Material theme is applied using CSS styles, which are available in installed packages. The necessary Material CSS styles for the Textbox component and its dependents were imported into the <style> section of **src/App.vue** file.

~/SRC/APP.VUE

```
<style>
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
</style>
```

The Custom Resource Generator (CRG) is an online web tool, which can be used to generate the custom script and styles for a set of specific components.

Copyright © 2001 -2024 Syncfusion Inc.

This web tool is useful to combine the required component scripts and styles in a single file.

Adding TextBox to the application

Add the input element with e-input class into the <template> section of the App.vue file in src directory.

~/SRC/APP.VUE

```
<template>
<div id ='wrap'>
<div id ='input-container'>
<div>
<!--element which is going to render the TextBox-->
<input class="e-input" type="text" placeholder="Enter Date" />
</div>
</div>
</div>
</template>
```

Adding icons to the TextBox

You can create a TextBox with icon as a group by creating the parent div element with the class e-input-group and add the icon element as span with the class e-input-group-icon. For detailed information, refer to the Groups section.

`

<!--element which is going to render the TextBox with date icon-->

<input class="e-input" name='input' type="text" placeholder="Enter Date"/>

`

`

.e-input-group-icon.e-input-popup-date:before {

content: "\e901";

}

`

Run the project

To run the project, use the following command:

`bash

npm run serve

`

or

`bash

Copyright © 2001 -2024 Syncfusion Inc.

yarn run serve

`

Output will be as follows:

COMPOSITION API (~/SRC/APP.VUE)

```
<template>
    <div class ='wrap'>
        <div id ='input-container'>
                <input class="e-input" type="text" placeholder="Enter Date"
/>
            <div class="e-input-group">
                <input class="e-input" name='input' type="text"
placeholder="Enter Date"/>
                <span class="e-input-group-icon e-input-popup-date"></span>
            </div>
        </div>
    </div>
</template>
<script setup>
import { onMounted } from 'vue';
onMounted(() => {
        // To get the all input fields and its container.
        let inputElement = document.querySelectorAll('.e-input-group .e-
input,.e-float-input.e-input-group input');
        // Add 'e-input-focus' class to the input for achive ripple effect
when focus on the input field.
        for (let i = 0; i < inputElement.length; i++) {
            inputElement[i].addEventListener("focus", function () {
                let parentElement = this.parentNode;
                if (parentElement.classList.contains('e-input-in-wrap')) {
                    parentElement.parentNode.classList.add('e-input-focus');
                } else {
                    this.parentNode.classList.add('e-input-focus');
                }
            });
            inputElement[i].addEventListener("blur", function () {
                let parentElement = this.parentNode;
                if (parentElement.classList.contains('e-input-in-wrap')) {
                    parentElement.parentNode.classList.remove('e-input-
focus');
                } else {
                    this.parentNode.classList.remove('e-input-focus');
                }
            });
        }
        // Add 'e-input-btn-ripple' class to the icon element for achive
ripple effect when click on the icon.
        var inputIcon = document.querySelectorAll('.e-input-group-icon');
        for (let i = 0; i < inputIcon.length; i++) {
            inputIcon[i].addEventListener('mousedown', function () {
                this.classList.add('e-input-btn-ripple');
            });
            inputIcon[i].addEventListener('mouseup', function () {
                let element = this;
                setTimeout(function () {
```

```
                    element.classList.remove('e-input-btn-ripple');
                }, 500);
            });
        }
    });
</script>
<style>
  @import "../node_modules/@syncfusion/ej2-base/styles/material.css";
  @import "../node_modules/@syncfusion/ej2-vue-inputs/styles/material.css";
